MINUTES OF EVIDENCE

TAKEN BEFORE

THE ROYAL COMMISSION

ON THE

CONDITION OF THE BLIND, &c.

At No. 32, Abingdon Street, Westminster.

Thursday, 17th December 1885.

PRESENT:

The Right Hon. A. J. MUNDELLA, in the Chair.

Admiral Sir E. Sotheby, K.C.B.
Tindal Robertson, Esq., M.D.
T. R. Armitage, Esq., M.D.
W. Auchincloss Arroll, Esq.

F. J. Campbell, Esq., LL.D.
Edmund C. Johnson, Esq.
Robert McDonnell, Esq., M.D., F.R.S.

Charles E. D. Black, Esq., *Secretary.*

Henry Longley, Esq., examined.

H. Longley, Esq.
17 Dec. 1885.

1. (*Chairman.*) You are the Chief Charity Commissioner, I believe?—I am.

2. How long have you been connected with the Charity Commission as a Commissioner?—For 11 years.

3. In your capacity as a Charity Commissioner you occasionally come across charities for the blind, I suppose?—Very frequently.

4. Will you be good enough to tell us what you know of blind charities, so far as they are within the cognisance of the Charity Commissioners?—Our classification of charities, that is to say, of charities subject to our jurisdiction, is not one which is made in respect of their objects, and therefore it may be difficult offhand to give an exhaustive account of all the endowed charities for the benefit of the blind which are subject to our jurisdiction. The number of endowed charities subject to our jurisdiction is over 40,000, and it would be impossible to pick out the blind charities from amongst those without considerable labour and difficulty.

5. Many of them are not designated by their title as being for the benefit of any particular class?—That is so.

6. Many of your charities are applied to various purposes, I suppose?—That is so.

7. At the discretion of the trustees?—Yes; we frequently have cases of charities which the trustees may give to any one or more of several specified objects.

8. At the discretion of the trustees, one of those objects being the benefit of the blind?—Yes.

9. Have you any list of charities that are specifically designated for the blind?—I have had a list prepared, with such accuracy as time would allow, of the charities which we know of which are administered in or near London, to which, as I understood, it was considered desirable to limit the scope of the inquiry of the Commission for the present, and I have a list here of some 24 or 25 charities the position of which is pretty well known, and which are included in the list published in the Charities' Register and Digest of 1882, which was issued by the Charity Organization Society; they are mainly charities administered by one or the other of the City Guilds, the Goldsmiths' Company, the Clothworkers' Company, the Painters' Company, and so on, and then come the very important charities, the existence of which, no doubt, is well known to the Commission; Hetherington's Charity, and the subsidiary charities administered by the Governors of Christ's Hospital. There is hardly any charity in this list which is not tolerably well known to the public, but of course I shall be ready to hand this or any other list in at the pleasure of the Commission. I should be glad to have an opportunity of making it somewhat more perfect, but that, speaking generally, is a description of the charities comprised in the list that I hold in my hand. The application of the income is almost entirely in pensions to the blind, varying for the most part from 5*l.* to 10*l.* Hetherington's charity benefits as many as 700 pensioners, who receive pensions of 10*l.* each; the income as I have it returned is 7,800*l.* a year.

10. That charity is at the disposition of Christ's Hospital?—Yes, the Governors of Christ's Hospital; it is entirely a non-educational charity, there are no educational trusts attached to it. The Governors of Christ's Hospital are appointed trustees of that charity, which has no connection with Christ's Hospital, except that it is administered by the same body of trustees.

11. Do you know the amount of the funds, and how they are invested by the Governors of Christ's Hospital?—The income is entirely derived from stock in the public funds, I have not the amount of the stock here, but the income of the charity is 7,800*l.*

12. You have been framing a scheme for Christ's Hospital for its educational work?—Yes.

13. And it has now been published?—Yes, and it will shortly be submitted to the Education Department.

14. Are these blind charities that are within the jurisdiction of Christ's Hospital exempt from your jurisdiction, or do they come under your jurisdiction?—They are under our jurisdiction in the same way as all endowed charities throughout the country are.

15. Are you empowered by the Statutes under which you work to deal with those funds and apply them for the benefit of the blind suppose, for instance, it was

H. Longley, Esq.

17 Dec 1885.

thought desirable to apply them for the education and training of the blind instead of distributing them in pensions; are you empowered to frame such a scheme?—We could frame a scheme for the administration of that charity on a proper application being made, which could only be made by the Governors of Christ's Hospital; it must be made by the trustees who administer the charity, whatever it may be.

16. Suppose, which we do not suppose, that these funds were not well applied, and that they might be much better applied, you could do nothing except on the initiative of the Governors themselves?—That is so.

17. You say you have in your hand a list of a considerable number of charities?—25 separate charities.

18. What is the estimated income of the whole of those charities?—About 17,000*l.* a year. That 17,000*l.* is the income of the charities comprised in this first list which I have before me, but I ought to add that that excludes the recent Gardner Bequest, which is no less than 9,000*l.* a year; that added to the 17,000*l.* would make 26,000*l.*; then there is the School for the Indigent Blind, of which the Commission are well aware, the income of which, as we happen to know, is 5,500*l.* a year; so that we get an income of over 30,000*l.* a year in the charities comprised in these two papers which I have in my hand.

19. Is that all from endowments?—No; with reference to the School for the Indigent Blind, that 5,500*l.* is in part derived (I cannot at present say what part) from voluntary subscriptions.

20. As far as you know, the endowments for the benefit of the blind are applied to the payment of pensions?—With the exception of Gardner's Bequest they are. I may put it shortly that the old endowed charities for the blind are almost exclusively applied to the payment of pensions.

21. Is it known to you that endowed charities for the blind exist in considerable numbers throughout the country?—Yes, we continually meet with them. Where there is a large aggregate of charities, as there often is in old corporate towns, it is very common to find a charity for the blind. Since I knew that the Commission desired evidence from me, I have accidentally noticed two charities, the existence of which had not been brought to my knowledge before, one at Oxford and the other at Henley-on-Thames. I may also say that endowed charities for the blind are being created almost every day. We have special knowledge of the creation of such charities in this way. By arrangement with the Inland Revenue Office notice is given to us of every will which upon the face of it appears to the officers of the Inland Revenue, who have to do with the payment of Probate Duty, to contain a charitable bequest, and it is our duty then to inquire into it, and see what is being done with it; and we repeatedly find these charities for the blind; within the last two or three months we have had notice of two very considerable charities, one founded by Jacob Nathan and the other by John Harrison; they are neither of them charities yet established; we have an early intimation in these matters, before the executors commence to administer the estate.

22. Can you tell us anything about those charities?—I mentioned those two charities because I thought probably they would not be known to the Commission at present. Mr. Jacob Nathan seems to have lived at Plymouth, and his will was proved as long ago as 1867. I may account for the not very recent date of this bequest by this, that Mr. Jacob Nathan left these legacies subject to certain life interests, and those life interests have only just fallen in. He gave, subject to those life interests, a sum of 1,200*l.* to be paid to the treasurer for the time being of the Hebrew Blind Asylum in London for the benefit of the charity. John Harrison, whose will was proved in 1881, gave 10,000*l.* as an addition to Hetherington's Charity, which is managed by Christ's Hospital. He further directed his executors to set aside a sum sufficient to produce an annuity of 100*l.* (that is 3,300*l.* stock) to be paid to Emma Wood, and after her decease, he directed them to transfer such sum of stock to any charity for the relief of poor blind as his trustees should think fit, and he went on to give the residue of his estate "to "such charities for the relief of the poor blind, and "in such proportions as they (the trustees) in their "sole and absolute discretion" should think fit, and that residue amounts to no less than 24,000*l.*

23. Those are simply two charities that you have come across since you were summoned to appear before us?—I will not say they had not been brought to my notice, but I had not remembered them; and the gentleman who conducts our searches at Somerset House told me that he repeatedly comes across similar charities. Those two to which I have just referred of course are rather larger than the average.

24. But it is within your experience, as appears from the evidence that you have just given us, that the public sympathy with the blind leads to the foundation of a good many charities for their relief; and if any good scheme for their education and training, and for making them independent or self-supporting, was formulated by this Commission, you think public charity would help to support it considerably?—Yes, I think that our experience would tend in that direction. There seems to be no special object more popular with the founders of endowed charities at the present day than the welfare of the blind.

25. These two wills that you have just referred to do not seem to indicate specially that the money is to be given in pensions?—The bequests are somewhat varied, but in answer to your question, I may say that there is nothing which points specially to pensions.

26. With regard to the city of London parochial charities, an Act dealing with those charities was passed in the year 1883?—The Act to which you refer, I take it, is the City of London Parochial Charities Act of 1883, the 46th and 47th Victoria, chapter 36.

27. You are proceeding under that Act at this moment, are you not?—Yes.

28. What is the procedure prescribed by that Act?—The Act prescribes a double procedure. In the first instance, it directs the Charity Commissioners, as soon as may be, to inquire into the nature, tenure, and value of the property and endowments belonging to the City parochial charities, as there defined. Perhaps I need not read the definition. The Commissioners are further to inquire into "the purposes or trusts for or upon "which the same have heretofore been or are now held "or enjoyed, and to which the income thereof has been "or is now applied." Then we are to classify the property in two schedules. In one of those schedules we are directed to place all ecclesinstical charity property, and in the other all property which is not ecclesiastical charity property. We are then to publish the result of this inquiry, giving notice of the division of the property into those two schedules. There is no appeal given against our decision that the property ought to be in one schedule or in the other, but there is an appeal given to the High Court of Justice against anything done by us which may be alleged to have the effect of including in those schedules property which is not subject to any charitable trust whatever. That first step in the procedure is prescribed in sections 5 to 10 of the Act. Then we come to the second step in the procedure. The Commissioners are directed, as soon as may be after the publication of the statement that I have just mentioned, to "proceed to prepare a scheme or "schemes for the future application and management "of the charity property and endowments so classified "by them as herein-before directed."

29. That is to say, you are to prepare schemes for the better application of those funds?—That is so.

30. Has your inquiry been so far completed as to enable you to tell us approximately the value of those charities?—No, I am afraid we have not got so far as that. In anticipation of being asked such a question I have brought the latest authentic statement of the value of these charities, which is to be found in a Return made by order of the House of Commons on the 25th of August 1881, the sessional number of which is 435. That was made on the motion of Sir Henry Peek, and it shows that the gross income of the City charities was 117,000*l.* I am unable to make any definite statement as to the present value, but I have no doubt whatever that it is in excess of that amount.

31. That amount is a growing amount and in a few years hence it will be still larger?—It is an amount which increases every day. Perhaps the Commission will allow me to give an instance which shows the ground upon which I make that statement. I had before me about two years ago the case of a City charity, part of the property of which, situate not far from the Bank of England, had recently fallen out of lease; it had been let under the old lease for 1,400*l.* a year, and it was re-let at a ground rent of 7,000*l.*, the lessee being

H. Longley, Esq.

17 Dec. 1885.

bound to expend 50,000*l.* in buildings upon it. That is merely one instance upon which I base my statement that the income of the City charities is rapidly increasing.

32. When do you expect that your inquiry will be completed, and the statement ready, which under sections 5 to 10 it is incumbent upon you to make?—In our last Report, which was laid before Parliament in February, we stated that we hoped it would be ready before the next Report was presented, which will be at the end of next February, and I do not see any reason to depart from that expectation.

33. Within the next three months probably?—I hope so; it is very far advanced indeed.

34. In carrying out the second part of the Act, that is to say the framing of schemes for the better application of these charitable funds, I presume you would regard yourselves as at liberty to make provision for the education and training of the blind if it was found desirable that that should be promoted in or near London?—I think there is no doubt that such an application of part of the funds would be clearly within the scope of the directions given to us by the Act with regard to the purposes to which the funds may be applied, which, without troubling the Commission as to the details of the distinction between the two classes of those charities, are to be found in section 14 of the Act; and those purposes (I may state them shortly), to which our schemes are to point are, first, the education of the poorer inhabitants of the metropolis, a term which I do not suppose excludes the blind, if they happen to be poor; next, the establishment and maintenance of libraries or museums or art collections within the Metropolis; thirdly, the preserving, providing, and maintaining of open spaces and recreation grounds or drill grounds within the Metropolis; fourthly, the promotion and extension of provident institutions, and of working men's and women's institutes for the benefit of the poorer classes of the Metropolis; fifthly, the establishment and maintenance of convalescent hospitals; and lastly, generally to the improving of the physical, social, and moral condition of the poorer inhabitants of the Metropolis.

35. Under the first and the last of those, evidently the blind could be dealt with by your Commission?—There can be no doubt of that. I may just state, in order to make it more clear, that the whole of the funds of the five larger parishes mentioned in the first schedule, namely, Saint Andrew, Holborn; Saint Botolph, Aldgate; Saint Botolph, Bishopsgate; Saint Bride, Fleet Street; and Saint Giles, Cripplegate, are to be applied for the benefit of those parishes, which are parishes in which there is a considerable mass of poor; on the other hand the funds of the remaining 107 parishes are, under the provisions of the 14th section, after satisfying certain parochial purposes which may still exist, to be applied under the provisions of the schemes which we are to make and in the manner I have just mentioned, for the benefit of the inhabitants of the Metropolitan Police District.

36. The whole Metropolitan area?—In fact a very large Metropolitan area.

37. Does that include the Surrey side?—Yes, it is the largest Metropolitan area.

38. The 4,000,000 area?—Yes, it is the largest Metropolitan area.

39. Under the Endowed Schools Act, you frame educational schemes for endowed schools throughout the country, and you deal, in fact, with all the educational charities of the country under that Act?—With certain exceptions at each end of the list of educational endowments; we do not deal with the large endowed schools, nor do we deal with the small educational endowments.

40. But all the rest are within your jurisdiction?—They are within our jurisdiction doubly; they are within our general jurisdiction in the same way as any charity is, and they are within the special jurisdiction created by the Endowed Schools Act.

41. Under the Endowed Schools Act you can, without the initiative of the trustees, deal with many of those endowments?—That is so.

42. Seeing that you have such large powers, if it was shown to you to be desirable that some of those endowments should be applied to scholarships for the blind either at the normal school or a training school or any other school that might commend itself to you, do you think it would be quite legitimate that you should so apply some of those endowments?—I may perhaps preface my answer to that question by saying by way of explanation that the object of the Endowed Schools Act is to "render any educational endowment most "conducive to the advancement of the education of "boys and girls, or either of them." Those words are in section 9 of the Act, and I conceive that the education of the blind would fall within those words.

43. Let us take a specific instance—you are dealing with Christ's Hospital with its enormous charities—would there be anything illegitimate in your doing something for the blind from the funds of Christ's Hospital?—I do not think that there would be anything contrary to the Act in doing so.

44. As a certain per-centage of the population are blind, they would appear to have an equal claim, to say the least of it, upon the educational endowments of the country, with the sighted members of the community?—Yes. I cannot say that they have not.

45. And yet, because the blind have not been specifically mentioned in connexion with education endowments, the educational endowments have not been applied for their benefit?—No, I do not think that general educational endowments have. I do not, at this moment, remember any instance.

46. I have seen your schemes for five years, and I cannot remember a single scheme in which the education of the blind has been provided for; is not that your experience?—It is.

47. I suppose that that would arise mainly from the fact that in the middle class schools, for which you frame schemes, there would be no means of conducting the education of the blind?—No; our schemes are made, of course, in the majority of instances for existing general schools.

48. Supposing that you were framing a scheme, as you did some time ago, for the whole of Lincoln, and supposing there was a good blind school in that city which would meet all the conditions of your requirements for secondary education, and supposing that, in addition to giving the blind a good secondary education, it trained them in some sort of work by which they might earn their living, there would be no reason why you should not give a scholarship or two for that institution?—No; I do not see anything in the act to prevent it.

49. Have you anything further to state to the Commissioners connected with the subject of their inquiry?—I think not. I apprehend that the Commission have full information as to the Richardson-Gardner Trust.

50. Can you tell us anything about the Richardson-Gardner Trust?—I could merely state facts which are to be found in papers which probably are accessible to the Commission.

51. I understood you to say that you could, if time were afforded you, prepare a rather enlarged statement of the endowments which you considered specially applicable to the blind?—Yes.

52. We will ask you to do that at your convenience?—I will take care to have such a statement prepared.

53. (*Mr. Johnson.*) I believe that the Christ's Hospital Funds which are appropriated to the blind are provided under specific deeds—the gifts are to the Hospital for specific purposes?—Yes.

54. Hetherington's charity consists of a very large number of gifts by different people at different times, does it not?—It does.

55. They have all been left for specific purposes, that is to say, to give pensions, as I understand of 10*l.* a year, to those persons whom the Governors of Christ's Hospital may in their judgment deem fit recipients?—The original trusts of the Hetherington charity are 10*l.* a year each for 50 poor blind people not in the receipt of relief.

56. Is it the intention of the Charity Commissioners to divert any portion of those funds to purposes of education?—We have no such intention.

57. There are a certain number of trusts, the funds of which are directed to be appropriated to certain purposes. Day's Trust, for instance, under a scheme in Chaucery, is to be distributed in pensions in a specific way. Do you believe that under any scheme which might be propounded by the Charity Commissioner, any portion of that trust might be diverted to educational purposes?—I have not got the trusts of Day's charity before me. It would depend upon whether the trusts were strictly

H. Longley, Esq.

17 Dec. 1885.

for pensions; if the trusts were strictly for pensions, I do not think we could under our ordinary powers apply them for educational purposes.

58. I understood you to say that in the scheme for dealing with Christ's Hospital, any diversion could be made of the trust funds or the funds at the disposal of the Governors on the application of the Governors themselves?—I did not intend to convey that any diversion could be made; if the Governors apply we can make a scheme, but in making a scheme we must be guided by the *cy-pres* doctrine of the Court of Chancery.

59. I will put it in this way; supposing the Goldsmiths' Company or the Drapers' Company were to ask you to modify their scheme, you could do it?—We could do it within those limits.

60. The limit must be the purposes for which the trust was left?—The scheme must have regard to the original purposes of the trust.

61. Take Hetherington's as a case in point, it was left to give pensions to 50 blind persons; it now gives pensions to nearly 700 blind persons; but in a scheme expanded to that extent, you could apply a considerable proportion of the funds for the benefit of the blind without distributing them in the shape of pensions, could you not?—Not under the ordinary jurisdiction of the Commissioners, I think. With reference to the large increase of Hetherington's charity, I should like to observe that it is not merely an increase of Hetherington's original charity, but that charity as was stated just now, has been increased by an enormous number of subsidiary gifts; it has been supplemented by others.

62. (*Dr. McDonnell.*) Does your jurisdiction extend in any way to Scotland or Ireland?—No.

63. What is the area of your jurisdiction?—England and Wales.

64. (*Admiral Sir E. Sotheby.*) I am not quite clear whether without the application of the Governors of Christ's Hospital the money can be diverted to other purposes than the pensions?—We can make no scheme whatever without the application of the Governors of Christ's Hospital in the case of Hetherington's charity.

65. (*Dr. Campbell.*) With regard to those charities that are given in pensions, would it be competent for you to frame a scheme to distribute part of the funds in this way. Suppose a large number of blind to have been trained for some occupation, many of them are so poor that even after they are educated it is difficult for them to get employment, from the fact of having nothing to start with. Could the pensions be so diverted that they might be given as assistance in that way instead of being given, under a hard-and-fast rule, in pensions?—A scheme might be framed to modify the detailed rules for the application of the pensions.

66. (*Chairman.*) But that scheme could not be promoted except on the initiative of the Governors themselves?—That is so.

67. (*Dr. Campbell.*) For instance, in such a case as Day's charity, where there are three trustees, if those trustees applied for such power, that might be considered, I suppose?—Quite so.

68. (*Dr. Robertson.*) The Chairman asked you whether, with regard to a city like Lincoln, it would not be possible for you to give scholarships to any training school; it would be possible also, instead of scholarships, to appropriate some of the funds to the maintenance of blind children in those schools?—Yes. I do not think there would be anything incompatible with the provisions of the Act in doing that.

69. (*Chairman.*) There are many charities which are open charities, where it is very much in the discretion of the Charity Commissioners how they should be applied?—The charities to which your question refers are probably those which are given by the founders for the general benefit of the poor in the locality. In framing schemes for those we may take a wide view of the needs of the poor.

70. Assuming that the blind are generally poor, which is the fact, is there any reason why, in framing schemes for general charities, you should not make some provision for the blind also?—None whatever.

71. (*Dr. Robertson.*) With regard to the application of such trusts as Harrison's, and those other trusts which have been mentioned, do those trusts come under the direction of the Charity Commissioners absolutely, or only by the wish of the trustees?—All endowed charities are under our jurisdiction up to a certain point, that is to say, they are bound to render accounts; but when it comes to the question of framing a scheme for an improved application of the revenue, if the income is over 50*l.* a year, the scheme can only be made upon the application of the administering trustees. I did not mention this difference before because the Chairman's question was put in respect of large charities. I may state now, that where the income is below 50*l.* a year a scheme can be made on the application of one trustee, or any two inhabitants of the place in which the charity is administered, or of any person interested in the charity.

72. (*Chairman.*) I presume that the charities conducted under specific Acts of Parliament are not under the jurisdiction of the Charity Commissioners, except so far as you have the right to see that they render accounts?—Yes, they are bound to render accounts. But when the details of the charity are regulated by Act of Parliament our scheme would not avail to alter it.

73. And no application on the part of the trustees would affect that charity?—No, unless the Act contained provisions empowering the Charity Commissioners to alter it. It has been found convenient in later Acts to insert that power, to save the trustees the expense of going back to Parliament for perhaps a slight alteration in the trust.

74. Supposing that this Commission sees its way to making certain recommendations for the benefit of the blind, is it, in your opinion, probable that the trustees of the blind charities throughout the kingdom would be governed in some respects by the recommendations of the Commission?—I do not think that I could answer that question with any certainty.

75. (*Dr. Campbell.*) Take Dulwich College, for instance, that is for the benefit of certain parishes specially; would not it be possible to benefit the blind of those parishes through the College, directly or indirectly?—Yes.

76. (*Chairman.*) I presume it could not be done except by framing a new scheme, or amending the present scheme?—Only in that way.

77. No provision having been made for the blind in the existing scheme, the only way in which the blind could be assisted would be by amending the present scheme?—Yes.

78. (*Dr. Campbell.*) Suppose a blind child in one of the parishes that are benefited by the Dulwich College scheme makes application to the Governors to be received and educated there, have the Governors any power of refusing to admit the child into the school? I suppose the choice is absolutely in the hands of the Governors?—Yes. I have not the scheme here; but our schemes always contain a clause to say that the schools are open to boys of sufficient health; and words of that sort would enable the Governors to say, in the case of a blind child, we cannot undertake to educate you because of your infirmity. Speaking offhand, I think they would be justified in refusing to take a blind child in.*

* The supplementary questions put to the Chief Charity Commissioner and his replies will be found in Appendix 16.

The witness withdrew.

Mrs. A. Westlake.

Mrs. Alice Westlake examined.

79. (*Chairman.*) You are a member of the London School Board?—Yes.

80. How long have you been a member?—Nine years,—since 1876.

81. In that capacity you have taken great interest, I believe, in the education of the blind?—Yes.

82. Is there a special committee for the blind?—There is a special committee for the blind and the deaf and dumb.

83. Were you appointed a member of that committee?—Yes.

84. What number of persons are there on that committee?—Six or seven.

85. When was your attention first called to the question of the education of the blind in connexion with your work at the School Board?—Very soon after I became a member of the Board my attention was drawn to it—it was drawn to it first by the Vice-Chairman, Mr. Rogers, who asked me to take the matter up. There was no member of the Board who, up to that time, had taken up the subject particularly, and from that moment I interested myself in the instruction of the blind. After inquiring into it, I came to the conclusion that the instruction was exceedingly bad and wanted reforming from beginning to end, and after a great deal of opposition from some of my colleagues, I managed to get something done. The first step taken—it took a year or two to take it, because a public board does not move very quickly—the first step taken was to get Mr. Marchant Williams, the School Board Inspector, to make a thorough report upon the methods of instruction of the blind under our care, and the results.

86. There were a number of blind under your care at that time?—Yes; we had at that time a blind instructor, Mr. Finchard, who came from the Home Teaching Society—that he was not a very high class individual may be assumed from the fact that he only got 30*s.* a week. He was appointed in 1875—that was before I became a member—and he was assisted by a young teacher, Miss Palmer, who had lost her sight from small-pox in the service of the Board. She had had no special instruction. Those two, between them, visited the children they could hear of in a casual way, and gave them a certain amount of instruction; the children were left very much to their own resources after this small amount of instruction that Mr. Finchard and Miss Palmer gave them; they just attended a day school if they chose, and, if they did not choose to do so, nobody looked after them.

87. Did Mr. Marchant Williams make the report to you that he was requested to make?—Yes; he made a thorough report on the teaching of our blind children. He visited the principal institutions in England for the instruction of the blind to see the methods which they employed and the results. I tried to get his report,—I asked one of the clerks to look it up, but it has not been found,—it was made in 1878, and I am afraid it has got lost; but we have the result of his report on the Minutes of the Board. He said that the whole instruction of our blind children was exceedingly bad, about as bad as it could possibly be; he advised that a proper superintendent should be appointed—a seeing superintendent—and that blind instructors should be appointed under her to instruct the children in classes, and that a part of their time should be spent in classes and part in ordinary day schools. That recommendation was carried out. The result of his investigation of the methods pursued in various institutions was that he came to the conclusion that the best teachers could be obtained from the Royal Normal College at Norwood, and we induced Dr. Campbell to give up one of his most efficient teachers, Miss Greene, an American lady, to our service, and we began by appointing two of the blind girls from the College as instructors under her, and kept Mr. Finchard and Miss Palmer going on giving a little instruction upon their side.

88. At the present time, in how many centres in the Metropolis do you teach blind children?—There are 20 centres—the number of blind children under instruction varying from one or two children to 15—15 is the highest number that we have in any one. Wherever there are any blind children we try if possible to send an instructor. The visitors are ordered to send to Miss Greene the names of all blind children that they come across in their visiting, and it is her duty to see those children and their parents and to get them into whatever classes she can arrange for them. A good deal of persuasion is necessary in some cases to induce the parents to send their children to these centres.

89. Before you formed those centres, were those children neglected altogether?—I suppose before 1875 they were neglected altogether; when Mr. Finchard was appointed they were attended to to a certain extent, but not in any systematic or regular way.

90. How many blind children have you in connexion with the School Board under instruction at the present time?—120; and we consider that virtually those are all the blind children in London who are living at home, who are not in institutions, with the exception of a few vagrants who move about from place to place, but who do occasionally turn up at one class or another.

Mrs. A. Westlake.

17 Dec. 1885.

91. With regard to the vagrant blind, are they taken about for the purpose of begging?—We always try and catch those if we can, if they come under the notice of our officers in any way. I think there must be very few of such vagrant children.

92. You consider that the number that you at present have under instruction is practically the larger part of the children who are not in blind institutions?—Yes; the children whose parents are at all able to do so manage to get into institutions; and the children that we have are the children of the lowest class as a rule. children altogether neglected who have no friends to help them.

93. Then, practically, you think that the children who are admitted into the charitable institutions are a better class of children than those that you are instructing in your day schools?—The children whom we instruct are improved to such an extent that they are able to get into those institutions; 54 of our children obtained scholarships in open competition for the Royal Normal College at Norwood, but they would not have obtained those scholarships if they had not been previously under instruction in our classes.

94. At what age do you take those children in?—As young as four and five.

95. And you train them with the other children?—We train them first of all in the special classes at the centres for a certain amount of their time, and then they are put into the ordinary day classes nearest their homes for the remainder of the day, where they are treated exactly as the sighted children are; they pass through the same examinations and do the same work almost entirely.

96. When you say that they pass through the same examinations, do the inspectors examine the children?—Yes; there has been only one case in which an inspector has refused to examine the blind children. Mr. Alderson this year refused to examine a blind child because he did not feel himself equal to testing the result of his work; but no other inspector has ever refused to examine the blind children.

97. Their attendances count in the same way as the attendances of the sighted children?—Yes; their attendances count as ordinary school attendances.

98. Can you give us any idea of what is the cost of the training of these children?—It is rather expensive, necessarily—special instruction always is; the instruction of the deaf and dumb is also expensive. The superintendent has a salary beginning at 120*l.* a year, rising to 175*l.*

99. The superintendent is a lady?—Yes, Miss Greene.

100. What does she get now?—150*l.* Then we have five assistants beginning at 70*l.* and going up to 90*l.* a year; and they have reasonable travelling expenses, and guides for them are paid for. We now have only teachers from the Royal Normal College at Norwood. Mr. Finchard retired and Miss Palmer died. We have nothing now but trained cultivated teachers.

101. You think there is a great advantage in having trained teachers?—A great advantage. We have no difficulty whatever with our blind children now. I cannot speak in too high terms of the efficiency, energy, and devotion of Miss Greene, who devotes the whole of her time to this work, and the efficiency of her assistants; and their patience and kindness have a most extraordinary effect upon these blind children, who have been devoid of everything of the sort throughout their lives.

102. What are the comparative attainments of the blind children?—They usually come into the classes excessively ignorant, so ignorant that they are not able to use their limbs—they cannot, as a rule, walk by themselves—in some cases, they are brought by their parents on costermongers' barrows, not being able even to walk. They first of all have to be trained in the use of their limbs—they have to get a little independence, so that they are not fit to go into the day schools at first; but after a few months' training in the special classes they go into the day schools and do quite as well as other children of the same age. If you were to examine the teachers of the day schools you would hear their testimony upon the subject.

103. You think that their intellectual attainments, after a little special training, are equal to those of the sighted children?—Yes, after a little time.

104. And you see great advantage in training them with the sighted children?—A very great advantage.

Mrs. A. Westlake.

17 Dec. 1885.

105. Giving them courage and self-reliance?—Yes, independence; they do not feel cut off from human sympathy and kindness as they would if kept to themselves. Then the effect upon the seeing children is also admirable: it makes them so much more forbearing and kind and sympathetic; they are one and all eager to help the blind children, and do any little offices they can perform for them.

106. Have you been able to compute how much each blind child costs the London School Board in instruction?—I have not taken it out; I could get it.

107. Could you also tell us what grants you receive from the Education Department on account of the blind children?—The ordinary grant for children who have their sight.

108. Your ordinary grant is 17*s.* a head?—Yes.

109. You get as much for a blind child as for a seeing child?—Quite as much.

110. As the teaching is special, and as a much smaller number can be taught by the teacher, naturally the teaching is more expensive?—Yes.

111. Up to what age do you keep them at school?—We do not turn them out till they choose to go, except in the case of a few boys who become too big for the classes; but as a matter of fact the elder children either get drafted off into some institution or they are wanted at home; so after they get to the age of 14 or 15 at the utmost, they do not remain in our classes.

112. You said that 54 of your children had obtained scholarships at the Royal Normal College at Norwood; have those children done well at the College as far as you know?—I believe very well; we are quite satisfied with the reports that we get about them.

113. Do any children obtain admissions from your schools to blind institutions?—I do not know of any other institutions but the Royal Normal College to which they obtain admission.*

114. Have you had any opportunity of comparing the intellectual training given in the blind institutions with that which you give in connexion with the schools of the London School Board?—It would be rather difficult for us to make such a comparison. The only case that I know of of a child coming from any of the blind institutions, is that of a child who has come to one of our classes from the Wandsworth school. That child certainly was rather an unfavourable specimen; he was absolutely helpless and useless; we had to train him from the beginning in the use of his limbs.

115. You consider it desirable that for some time before putting a child into a blind institution or sending him to the College he should have a training with sighted children in a Board school?—I should think it very desirable.

116. You have said that there is an advantage in blind children being trained with sighted children, that is to say, that a great advantage is thereby gained by the blind children, and a great advantage is gained by the sighted children also, inasmuch as the sympathy and kindness of the sighted children is invoked in favour of the blind children?—Yes; I should say that that is the case throughout their career.

117. Do you teach blind children the ordinary subjects that you teach other children?—Yes.

118. Reading, writing, arithmetic, and geography?—Yes.

119. (*Mr. Johnson.*) You follow the standard?—Yes.

120. (*Chairman.*) You teach all the subjects up to the sixth or seventh Standard?—Yes, and physical exercises too, on Ling's system; the girls do knitting and sewing, and the head mistresses tell me that in the earlier stages they can hardly distinguish their sewing from that of the other girls.

121. (*Mr. Johnson.*) I hold in my hand a Report on the Instruction of the Blind, issued I believe, with the authority of the School Board, and in that I find that the average attendance of the whole of the blind children who came under the School Board supervision was 133 for the half year ending the 26th September 1884, and 119 for the half year ending March 1885. You say the number is 120 now; does that 120 represent the whole of the blind children who are under the supervision and education of the School Board?—Yes; of course it does not count those who have been drafted off to Norwood.

122. I find that at present there are 20 principal centres, and at those principal centres I see that the average number of children taught is from 3 to 15; in what part of London is the smallest number of attendances?—In the remoter parts and in the suburbs.

123. How long are those children instructed per day by a special instructor?—Usually half a day.

124. Every day for half a day?—Not every day for half a day; at the Bowling Green Lane school they are instructed every day for half a day. At Stephen Street they get three mornings a week; at Mansfield Street, Bethnal Green, they get three afternoons a week. In remote districts they would have less than that.

125. The superintendent, Miss Greene, is sighted, is she not?—Yes.

126. Are Miss Scott, Miss Weaver, and the others, blind?—Yes.

127. You say that the salary of Miss Greene is 150*l.*?—Yes, it is 150*l.* now. The salary of the superintendent begins at 120*l.* and rises to 175*l.*

128. And the minimum salary of the other ladies is 70*l.*, the maximum being 90*l.*?—Yes.

129. We may take 80*l.* as the average?—Yes.

130. Taking Miss Greene's 150*l.* a year, and taking 400*l.* a year which is paid to the five other ladies; that makes 550*l.* a year?—I do not think as a matter of fact they are paid so much as that, because two or three of them have not been long appointed; if you said 75*l.* perhaps it would be nearer the mark.

131. We will say 500*l.* a year altogether; it is 500*l.* a year for these special instructors for instructing 120 people?—Yes.

132. In your experience the blind children of a grade a little above the lowest grades get into institutions?—Yes, as a rule, I should say so.

133. Therefore 120 would represent the number of blind children educated by the State?—Yes, I think so in London.

134. It is not an increasing number, I suppose; it is not an increasing affliction; it is a decreasing affliction, is it not?—I cannot say; I think when Miss Greene took charge there were only 33 under instruction. The average has kept up about the same. I do not think it has decreased much.

135. Are those ladies who get 75*l.* a year certificated mistresses?—Not certificated by the Education Department; I consider them very superior to ordinary certificated mistresses.

136. I suppose, then, that the 108th clause of the Code of Regulations would not apply to those teachers?—The Education Department has made an exception in favour of these blind classes, and in favour of cookery classes; in neither of those cases are certificated teachers required.

137. You may employ special teachers in Board schools for the blind, who are not certificated by the Education Department?—Yes.

138. These five or six teachers for the blind are special teachers?—Yes.

139. Do you consider that sighted people cannot teach the blind?—I do not think sighted people have sufficient patience to train the blind properly. I do not think they take so much care in all the small details of the training of the blind. I think for the special training of the blind in the use of their limbs and faculties in the beginning, and for the special training that they require throughout their career, you had better have blind teachers. In the day schools the teachers do not teach the various types, they dictate the lessons to the children and take the children's answers. As a matter of fact they cannot read off the type for themselves.

140. But these special teachers teach the types?—Yes.

141. What are the types which are taught at the Board schools?—Mainly Braille's; the Moon system is used to a very small extent, because the day school teachers like to see immediate results; they do not see immediate results from the Braille system, but I believe that our teachers all prefer the Braille system, and we do not interfere with them in the matter.

* I find, on inquiry, that the blind children in the School Board classes do gain admission to other institutions, but such admission is not brought officially to our notice as is the fact of their gaining scholarships at the Royal Normal College.

Mrs. A. Westlake

17 Dec. 1885.

142. I understand you to say that you approve very much of mixing the blind children with the sighted children; do you find that by the use of a shorthand type, that is to say, Braille's or Moon's,—I mean, not an alphabetical type—the blind children are in any way isolated from their sighted companions?—Not more than the different system would necessarily isolate them.

143. In your opinion it is a system for the blind themselves, and not for the sighted?—Exactly.

144. As a matter of education, how should you suggest that a blind person should be taught to communicate with his sighted brother or sister or parent in writing to them?—That is too technical a point for me to give any opinion about.

145. They would not be able to decipher Braille's type, for instance, without a key?—Certainly not. I fancy it is not very difficult to attain the reading of the type. These children communicate with their own friends.

146. You have told us that there are some scholarships to the Royal Normal College at Norwood; what is the nature of those scholarships?—Some of them are technical scholarships given by the Gardner's Trust, and the others are ordinary scholarships. The technical training, I believe, includes some sort of manual labour, modelling, and so on.

147. Are the scholarships for special education or for ordinary education?—Except the Gardner scholarships they are for ordinary education as far as we know.

148. (*Dr. McDonnell.*) Do you know whether the system which you adopt is adopted in other parts of England outside London?—Cardiff and Bradford have followed our example; they have got special teachers, and have obtained information from us.

149. So far as you know, are those the only places where your system has been introduced as yet?—Yes.

150. You think it might be introduced with advantage into all the large towns, where you could get enough blind children to form a class?—Yes; the difficulty, of course, always is the expense.

151. (*Mr. Arrol.*) Do you consider it absolutely necessary to have the blind children taught in special classes before being sent to the ordinary school?—I think so. I think it would be impossible to give them the necessary preliminary training in an ordinary school.

152. After the children are taught in the special classes are there any difficulties in teaching them with the sighted children?—I believe none whatever; the teachers treat them precisely as if they could see, they do not make the slightest difference between them and the other children, except dictating the lessons to them instead of making use of the blackboard.

153. (*Admiral Sir E. Sotheby.*) You say there are 20 centres in London for the education of the blind; do you think from your experience that we have sufficient schools for the whole of the blind children?—I should think so. If we only find 120 blind children in London there must be enough. The visitors report every blind child they come across.

154. You have also said that it is necessary to have blind teachers?—Quite necessary. Blind instructors, I think, are very preferable to seeing instructors for the special instruction of the blind.

155. They are more patient?—They are so much more patient, and they have themselves experienced the difficulty which the blind children feel in acquiring knowledge.

156. Would not sighted people teach blind children quicker if they had more patience?—No, I do not think they have the same delicate touch that the blind have.

157. I did not gather whether these blind instructors go from school to school?—From centre to centre. They take as a rule two centres each, one in the morning and one in the afternoon per day, and they are at great distances apart.

158. The present state of things would be improved if there were more instructors?—There, again, would come the question of expense. I think we have enough at present. Miss Greene has not asked us for any more instructors.

159. You say that children are taken away after a certain age because they are required at home; are blind children required at home?—Yes, I know of one blind girl who has no mother, who is keeping house and looking after the little ones, who has been trained in our schools. The classes have not been long enough at work for the children to have grown up and gone out into the world much. There is one boy who has completed his training at the Normal College as a piano tuner, and who is ready to go out.

160. Is the reason why the Braille type is introduced because it is much quicker to read?—That is a technical question which I cannot go into. We leave the adoption of the particular type to the instructors. Their opinion is that it is easier to read.

161. (*Dr. Robertson.*) Is the instruction that is given to these children gratuitous?—No, they pay the ordinary day fee of the day school which they attend.

162. In the, event of the parent not being able to pay the school fee do you ask the guardians to pay the fee?—We never ask the guardians; we should remit the fee in that case.

163. Practically do you find that they are able to pay the fees?—I have not heard of any difficulty in that respect.

164. (*Chairman.*) The fee would be from one penny to threepence?—Yes.

165. (*Dr. Armitage.*) You said that before the London School Board came into operation the education of the blind children living at their homes was entirely neglected. I do not know whether you know that a large number of those children—all those who were within reach of the various centres of the Indigent Blind Visiting Society—were taught by the teachers of that Society, and most of the children entered the School Board?—I said all those out of the institutions, those who were not taken up by the institutions, were neglected.

166. I think you said that 54 children attending Board schools had obtained scholarships for the Normal College?—Yes.

167. Can you tell us whether there are any others who have gone to other schools?—I am not aware of any others. So far as I am aware they have gained no other scholarships but those to the Normal College. A few may have obtained private admission.

168. (*Chairman.*) I gather from your evidence that you are satisfied that excellent work is being done under the School Board in the way of educating the blind?—Perfectly satisfied. I think the work is admirable.

169. It gives them more courage and self-reliance going daily to the school?—Quite so. It is quite astonishing to see how independent the children become.

170. It develops them both physically and mentally?—Yes.

171. (*Dr. Robertson.*) I understood you to say that the physical condition of the blind children before they were brought to the school and instructed in company with the sighted children was inferior. I wish to ask you whether the physical condition of the blind children improves as they continue in the school, and whether their physical condition generally is found to be equal to that of the sighted children?—I said that the physical condition of the blind children before they enter the special classes as a rule is so very bad that I do not think their contact with sighted children improves their physical condition to such an extent as the special instruction they get in the blind classes—there the instructress gets them to use their limbs by exercise.*

172. In your opinion, from what you have heard with regard to the physical condition of the blind after they get into sighted schools, is it equal to that of sighted children?—Hardly equal; that would be too much to expect.

173. (*Chairman.*) You teach them gymnastics?—Yes, on Ling's system, and they wonderfully improve under it.

174. Their muscles are developed under it?—Yes.

175. (*Mr. Arrol.*) Is the reason why you do not teach them more gymnastics the risk that might be run in your doing so?—Not at all; we teach them as much as we have time for.

Miss Mary C. Greene examined.

Miss M. C. Greene.

17 Dec. 1885.

176. (*Chairman.*) You hold the office of superintendent of the blind education under the School Board for London, I believe?—Yes.

177. How long have you occupied that position?—Since February 1879.

178. Previous to that time what were you engaged in?—I was a teacher in the Perkins Institution for the Blind at Boston, in the United States, for eight years, and subsequently I was for eight years in the Normal College for the Blind at Norwood.

179. For how many years altogether have you been engaged in blind tuition?—About 22 or 23 years, I think.

180. What is your salary as superintendent of the blind under the School Board at the present moment?—150*l.*

181. When you were first appointed superintendent by the London School Board, what was the number of blind children with whom you had to deal?—There were 34 having instruction.

182. And who was teaching them?—Mr. Finchard and Miss Palmer.

183. Mr. Finchard, I believe, has now retired, and Miss Palmer is dead?—Yes.

184. May I ask you what you thought of the instruction at the time; was it good or indifferent?—I did not find it good at all; it was very indifferent.

185. Can you tell us the number of blind children receiving instruction at present?—120 at present.

186. They have been steadily increasing in number from the time you were appointed superintendent to the present moment?—Yes.

187. Do you anticipate a further increase or do you think you have reached all the blind children?—I think there are some still remaining, but I am not sure, I could not say whether or not there will be very much increase.

188. That would be best known, I suppose, to the School Board visitors, who have to search out the children who are neglected?—They know a good deal about it, but I know all that they know, it is their duty to report to me. I hear of cases of blind children occasionally which are not reported to me by them.

189. What kind of cases are those that you hear of that are unreported; are they what Mrs. Westlake has described as cases of vagrant children?—To a considerable extent, children moving about, they are in one place where they escape the visitors, and they move to another.

190. Are they moved about by their parents, or by people who use them for begging purposes?—In most cases I think they go with their parents, who move about from place to place, the parents are a moving class.

191. At what age do you receive children?—As early as the parents are willing to send them, five years of course is the age at which we claim them, but if the parents wish to send them earlier we are very willing to take them in.

192. Do you receive blind children in your infant classes under five years of age?—We have one case of a child who is not more than 3½ years, I think, the mother was very anxious to have it come.

193. What is the physical condition of these children when they are first received?—It varies very greatly, but in many cases their condition is very low indeed physically and mentally.

194. In consequence of their privation they have been neglected, I presume?—Neglected or over indulged.

195. That is to say they have not been encouraged to work or to do anything for themselves, or to be self-reliant?—Just so.

196. What is the condition of their physical health generally?—In some cases it is very good, but on the whole it is somewhat lower, I should think, than in sighted children under the same conditions, they have not had the exercise and the means of development that the others have had.

197. Then with regard to their mental condition, is that low?—I would not say that it was in all cases. We reject none, we receive all that we can persuade the parents to send to school. It is a fact, I believe, that blind children often have the appearance of imbecility before they have had any instruction, and until we had had them with us for a little time and watched them carefully, we cannot judge of their mental condition.

198. You encourage all to come whatever may be their mental deficiency?—Yes.

199. What is the effect on those children of the healthy stimulus of school exercises and school companionship?—Very encouraging. In most cases, and I may say in all cases, I think it has a good effect. With regard to that I think perhaps some of the head teachers might speak from what they see of the children after they are admitted to the day school.

200. You mean the sighted teachers?—Yes.

201. What is your opinion as to the importance of the early training of blind children?—In my opinion it is of the greatest importance.

202. At what age do you think you ought to begin training them?—With neglected children I should be glad to begin as soon as they are able to sit in school, for a little while at a time.

203. That is to say you can hardly begin too soon?—You can hardly begin too soon with neglected children. If they have good homes it is not so essential.

204. Are there many children who are suffering from diseases of the eye, or partial blindness, left at home who ought to be brought to school?—There are many in that condition. We provide for just as many of those as we can draw into the school. In some cases the teachers of the Board schools send them down to us, in other cases we find that they are at home, and are reported by the visitors as being unable to go to school on account of diseased eyes.

205. What do you say with regard to the attainments of blind children generally, as compared with others, so far as you are able to judge?—As I have already indicated we have some who are not capable of learning very much, but with regard to those of fair abilities, they take a fair rank with the sighted children.

206. Do you think that you have taken many children from the streets?—Do you refer to those that have no homes?

207. No, I mean those who if you had not made this provision for them would have had no education?—Yes, undoubtedly, I am sure of it.

208. You think that the class of blind children who are attending the London Board School classes would probably have been neglected but for the provision which you have made for them?—Many of them would, not all, by any means, but many of them, or if they had finally had opportunities of getting instruction it would have been very much later; we begin with them early.

209. That is the most important time?—Yes.

210. When these children have passed the school age, what becomes of them?—A very large proportion of them, before they have passed the school age pass from us into institutions for the blind. That applies to a great many of them.

211. That is to say they are being drafted off into institutions for the blind?—Yes.

212. What institutions do they go to?—By far the greatest number have passed into the Royal Normal College, or the Primary School.

213. But they do go into other institutions?—Into many other institutions.

214. (*Mr. Johnson.*) All over the country as well as London?—Yes, Sheffield, Brighton, Bristol, Nottingham, the St. George's Preparatory School, the St. George's, Southwark, the St. John's Wood, and other schools.

215. (*Chairman.*) And there are they trained gratuitously?—No, not often.

216. They pay something, can you say what it is?—I think they pay 10*l.* or 12*l.* a year.

217. Are the parents able to pay such an amount as that per year?—Some parents are able to pay that amount, I think, but *very* few, probably, unassisted, and in many cases the guardians help.

218. Have you any experience of any of the children going back to their parents after leaving you?—Of those who have partial sight many do go back to their homes, the girls assist their mothers, and the boys assist their fathers, or go out as shoeblacks or something of that kind.

219. Of the 120 some are able to see a little?—Yes, a good many of our children in the Board Schools can see a little. Of the 120 whom we have under instruction a good many have partial sight.

220. Can you give us any idea of the proportion of those?—I am not prepared to give it at this moment, but I could easily reckon them up.

221. (*Mr. Johnson.*) Do you think it is half?—I do not think it is half, when I say I do not think it is half I would include in the one category (that is to say, the category of those who have partial sight) those who cannot see enough to earn their living by the use of their eyes, but who can go about without a guide. I might roughly put it in that way, and in the other category I would include those who cannot go about without a guide.

222. (*Chairman.*) For what length of time do these children remain in the School Board classes?—For the last three or four years there has been a great change going on, and they now remain a much shorter time, they are drafted off more rapidly into other institutions.

223. Is that facilitated by the partial education that you have been able to give them?—To some extent I think it is, it brings them forward to public notice, and the education puts them upon a different footing, so that they are more readily received into institutions.

224. Has there been any considerable fluctuation in the numbers attending the several classes?—The various classes fluctuate greatly. We may have eight or ten in a class one quarter, and the next quarter the number may be diminished to any less number—five or six, or even down to two or three, or a class may be utterly given up.

225. If a certain number pass out to other institutions, there may not be children to replace them?—That is one cause of the fluctuation. The poor of London are a nomadic population. They may leave one part of London and turn up in another.

226. The children attending a school in one quarter may turn up in another part of London?—After a time. Sometimes we lose them for a time; sometimes we lose them wholly.

227. Have you anything to say about the influence that this education of the blind in company with sighted children has on the one class and on the other class?—I find that it has the most beneficial effect upon the blind children for them to be educated in the same schools with the sighted children. They are stimulated by the desire to do as well as the others. If they have the mental capacity to realise what the others are doing they like to do as well.

228. It quickens their ambition?—It quickens their ambition, and there is another advantage in educating the blind along with the sighted children. If they go too young into an institution for the blind they come to feel that they are a separate and isolated class, they are by themselves, they cannot do as other people, and they fancy that they are not expected to do as sighted children do; but if they are thrown into a school where they are required to do what other children do, according to their ability, it takes away that feeling to a considerable extent.

229. The feeling of isolation and dependence?—Yes.

230. And has not it also a good effect upon the physique and the health of a child to be educated with sighted children. Does not it make them more courageous and more enterprising?—I think it does, in some schools. In some schools there is more interest taken in the joint education of the blind and the sighted children than in others, and the children are encouraged to join with the others.

231. Both in work and in play?—Yes.

232. In physical exercises, and so on?—Yes.

233. Are you present often at the instruction in gymnastic exercises in the Board schools?—I am sometimes, not often.

234. You know what Ling's system is?—Yes.

235. Is it good for blind children?—It is excellent for blind children, superior to any other in one or two points.

236. The instruction given in the Board schools under you is given by blind teachers, is it not?—It is.

237. Do you think there is an advantage in employing blind teachers for that purpose?—Yes.

238. Will you explain why you think so?—The blind teachers understand the difficulties of the children for one thing. The very fact that their teachers are blind, and are doing such good work as they know they are doing, stimulates the children to feel that they can reach that point too; that is constantly shown, that is to say, that the children have an ambition to do as their blind teachers do.

239. The consciousness that they have a blind teacher, and that the blind teacher moves about freely and is a well instructed person, stimulates the ambition of the children you think?—Yes.

240. And you think that a blind teacher is more patient with the children and from experience has a better knowledge of methods?—Yes, and he or she also knows better how to meet the children upon their own ground. The blind teacher is far more likely also to gain the confidence of the parent of a blind child.

241. Is there anything you wish to add to the evidence you have given?—I was asked as to the number of children under instruction when I commenced. I said I had 34; I should add that of those nine were not attending Board schools at all, but simply came once a week to a class. Now of our 120 I think all but five are regularly registered in Board schools and attend with more or less regularity.

242. (*Mr. Johnson.*) I believe you were for some time at the Perkins Institution at Boston in America?—Yes.

243. Under Dr. Howe?—Yes.

244. Were you engaged at that time in teaching Dr. Howe's system?—Yes, a part of the time.

245. Dr. Howe has published a very large quantity of literature, has he not?—A good many books. I should think the amount of literature in that system was not nearly so extensive as that now published upon the Braille system.

246. While you were in Boston I suppose the Howe system excluded all other modes of reading and embossing?—It did.

247. Do you know of your personal knowledge whether in that particular institution from which you came, and from which you got such very great experience, any other system is now used?—The point system is in use.

248. What we call the American Braille is adopted by the Americans?—Yes.

249. When you first came to England you were for some time at the Royal Normal College at Norwood?—Yes.

250. And at the Normal College you picked up an experience with which you supplemented the experience that you got in America?—Yes.

251. How long have you been away from the Normal College?—Six years.

252. And you were there some years?—I think I was there eight years.

253. And there you were engaged in the ordinary school tuition?—The ordinary school tuition for the blind.

254. You had nothing to do with music?—No.

255. When you were appointed superintendent of the blind under the School Board, you found, as I understand, 34 pupils?—Yes.

256. What was the condition of their education?—I thought it was pretty poor.

257. On what system were they taught when you first took them in hand?—They were using the Roman system as used in this country; the Braille was used very little; Moon's was used also,—Moon's and the Roman.

258. When you took the direction of the education of the blind under the School Board, there was a certain number instructed in Roman, ordinary letters, the lower case and capitals; were there some books from Worcester?—Yes.

Miss M. C. Greene.

17 Dec. 1885.

259. And some from wherever you could get the Roman type from?—Yes.

260. Moon's was read a good deal?—Yes.

261. Was Braille's at all read at that time?—It was used a little; it was coming into use.

262. Can you tell, when you began with the 34, what was about the proportion of use of those three systems?—It would be impossible for me to say.

263. Could you say approximately?—So far as Braille was concerned I think that they were nearly all beginning to learn it a little; it was taught simultaneously with the other two.

264. But the alphabet and Moon were the established systems, and the other one was only in its infancy when you came?—That is as I recollect it now.

265. At the present time there are 120 blind children under instruction?—Yes.

266. What are the appliances used now to impart knowledge to those blind children. Of course we know almost all of them read in Braille?—Yes.

267. Do you use any other system now?—We use Moon somewhat.

268. Do you do anything with the alphabetical system?—Not at all.

269. You exclude the Roman system?—Yes. We have given it up.

270. On whose authority were these systems initiated or discontinued?—Only on my own, I think. I found that three systems were altogether a mistake, there was no use in trying to keep the three up.

271. On your own authority with your great experience you thought that Braille was better than Moon, and that Moon was a great deal better than the Roman?—The Roman has drifted out of use.

272. What system do you use when you wish to teach children to correspond with their friends who are not blind?—Braille's is the only type that we make a business of teaching for writing purposes.

273. As I understand you, you do not make a business of teaching any system except that of Braille; you have discarded Moon's to a certain extent, and you have discarded the Roman, and you use no other means except that of the Braille type for teaching your blind pupils how to communicate with the sighted world?—No, with one little exception; in the case of some of the older ones who are dexterous of finger, and have stayed with us long enough, we have introduced Moon's writing frames, teaching a square hand; several of my teachers can write it, and they have taught three or four, possibly half a dozen.

274. You use Braille for the ordinary means of instruction in writing, and you also have recourse to Moon's apparatus as a means of enabling them to write in the ordinary characters of the sighted?—Yes.

275. And your opinion is that that is of advantage?—Yes, it is of advantage.

276. On what do you base your objections to what is called the Roman system, that is to say, the ordinary letters of the sighted?—It is not so easily read, it is not so easily learnt in school by the children. It is not a type that they could use for writing.

277. I am talking about reading?—I object to the Roman because it is not a type which can be used for writing, or for writing rapidly, I should say.

278. Do not Moon and Braille adopt signs as indicating letters?—Yes, and so do *all* alphabets; or, more briefly, a letter *is* a sign.

279. In your opinion is it a desirable thing to teach children a sign for a letter. Do not you think that it would be advisible in the teaching of blind children to teach them the formation of the ordinary alphabet of the sighted?—I do not see that it is essential. I consider that the character for A *is* A to them to all intents and purposes.

280. It is a dot to them?—It is A, it means A, and the character for B means B, whether it is a B or not.

281. Could you tell us about the average age of the children that are blind in the Board schools?—It would be a rough guess. I should say 10 years.

282. Are there many of those 120 that you have under instruction who are not very intelligent?—I am afraid some of them are not of average ability; some of them may turn out imbecile.

283. Amongst those 120 you say some of them have some sight; can you tell us in a sort of rough way what per-centage of the 120 are totally blind, those that cannot distinguish light from darkness, and what per-centage of them can get about a little bit?—I am not prepared to answer that question.

284. Do you think that the partially sighted is a large proportion or a small proportion?—A pretty large proportion; by that, I do not mean half, perhaps not a quarter.

285. Do they pass from you into other institutions?—Many of them.

286. A good many of them?—A good many of them.

287. Of course those that pass to the Normal College pass by examination and by scholarships?—Yes.

288. Then others go into other schools for the blind distributed all over England?—Yes.

289. Do you know what proportion go to London blind schools?—I could not say.

290. You say that if they go too early into blind schools they are depressed and isolated; what age, in your opinion, would be a proper age for them to go into blind institutions?—I should not like to fix any age. It would depend on circumstances.

291. In the case of the Normal College they pass an examination; and in the other case it is a question of their friends getting influence to put them into a school?—Yes.

292. You said, I think, that 115 attend pretty regularly?—115 are registered and attend school.

293. (*Dr. McDonnell.*) One question about partial sight; I suppose you consider that practically for your purposes any child is blind that cannot read?—Yes.

294. If you find that children are not able to read, though they may see their way about a little, you still consider them, for your educational purposes, blind?—Yes.

295. You seem to think that there is an immense advantage in mixing the blind with the sighted at this early period of their life. You consider that that is an education in itself, that it is very advantageous for the blind children?—Yes.

296. Has it ever occurred to you whether anything could be done in rural districts, where there are only one or two blind children, for their education along with sighted children. It could be done if the teachers of the schools could be sufficiently interested to do of themselves what I am endeavouring to have them do here.

297. You think that by some encouragement the teachers in ordinary rural schools, though they might not be able to teach drill and so on, would be able to do a great deal towards developing the minds of the blind children that went to those schools?—It would be very much better for the children than staying at home and doing nothing; but before they could be worked up to the level of participation in the daily work of Standard I. the mistress or some friend of the children would have to learn, and to initiate them in the use of their special methods; otherwise they would be at a very great disadvantage compared with the children in London.

298. Still it would be a great deal better than nothing at all in the way of the education of the blind?—It would be better that the children should go to school than stay at home.

299. Has any way occurred to you of encouraging teachers to do that; if they were paid more for the blind children in their schools, do you think they might be induced to take enough interest in the work?—I am too ignorant in regard to the character of the schools and teachers in rural districts to be able to make any suggestion in answer to that question.

300. (*Mr. Arrol.*) I wish to know whether during your connexion with the London School Board you have had any experience in teaching any child that has been formerly in a blind institution?—Yes, sometimes a child has come back after being in an institution for a time.

301. In what condition did you find that child in respect of its training; has it been adequate or very imperfect?—I can call to mind two cases—in one, the girl has improved since she has been from us. I do not know where she has been; she disappeared from us, and within a short time she has come back again into the class, but I omitted to ask to what school she had been; she has improved in some ways a good deal; she takes hold of her work better. My impression is that she has been to Bristol. I am not quite certain.

Miss M. C. Greene.

17 Dec. 1885.

302. What has been the object of pupils in going away from the Board Schools. I do not refer to those that have been drafted into the Normal College, but to those going to other institutions; has it been a desire to perfect their general education or to turn their attention to manufactures?—In most cases it is to get them off their parents' hands.

303. You have made some reference to the mental abilities of the blind; some apparently are very defective, but generally speaking, are not blind and sighted about on a par?—My experience of the London children whom we have would lead me to put the average of their mental ability somewhat below that of the sighted; because, as I say, we take all, and the same cause that has induced the blindness in many cases has induced more or less weakness of intellect.

304. (*Chairman.*) Is there not another reason for that inferiority, that the class of blind children that you get into the London School Board schools are the very lowest class, whereas the sighted are the average class?—I am inclined to think that taking our 120 children all through, perhaps they would average pretty well with the sighted children so far as the class from which they come goes. Of sighted children there are some of the very poorest—we have some of that class, and we have some in pretty good circumstances.

305. (*Dr. Armitage.*) You spoke of the advantage of Braille's system as a means of teaching writing so as to enable the blind to communicate with the outside world; do you consider that that is the principal advantage in it?—No, I do not. I should have gone on to say in answer to Mr. Johnson's question, that in most cases blind children can get some one to write a note for them if needful, but it is of the greatest importance that they should use a system that they can write rapidly, and learn as rapidly themselves, for educational purposes or for keeping up their intelligence as they go on in life.

306. Then I understand you consider that the principal value of the use of the Braille type is to further their education?—Yes, I should put it so.

307. You would put the educational advantage of writing by the Braille system considerably higher than the advantage of its affording a means of communicating through the post?—Very much.

308. You have had a good deal of experience both in America and here in some of the best blind schools, and you have had a good deal of experience in teaching the outside blind; I should like to know whether you think that teaching such as the teaching of the London School Board is capable of supplanting with advantage that which is given in the boarding institutions, whether you think it is a better system of teaching the blind to teach them in day classes or in good boarding schools?—I think that the teaching in day schools is a great advantage in its own place; it provides for those who cannot get into schools, who are waiting to get into schools, but I do not think that it can do the whole work of institutions for the blind by any means.

309. You do not think it would be of advantage to blind children to be educated exclusively in London School Board classes?—No.

310. But you think that it is of advantage for them to receive the first part of their education along with seeing children?—For a large majority of them. I think there are some of our children who would be better for being at institutions at the beginning, or for most of the time, that is to say, good institutions.

311. (*Admiral Sir E. Sotheby.*) You have only a certain number of blind teachers?—Yes.

312. They go from school to school?—Yes.

313. The children do not follow them?—No.

314. What do the children do when the instructors are away?—They form a part of the sighted school.

315. Who teaches them?—They share in the instruction of the sighted school.

316. Do you see any difference between teaching boys and girls as regards quickness of apprehension?—No, I see no difference, on the whole they average about alike.

317. Have you any register showing how the children that come under your notice have become blind, or at what age?—I have not for two or three years past made notes of those particulars. I did at first.

318. (*Dr. Campbell.*) One question in regard to this writing; in your opinion is it possible to make good spellers of the blind unless they have a good system of writing which they can also read?—I think it is impossible. I might qualify that by saying that there are some people who have a born talent for spelling.

319. I mean taking the ordinary run of children—taking the ordinary run of children one with another, in order to teach them to spell they must learn to write?—Yes.

320. It greatly facilitates their learning to spell?—Yes.

321. In regard to this question of sight, the principle upon which the School Board acts is, I think, that if a child cannot be educated as the seeing children are, they consider it a legitimate subject for teaching in the blind classes?—Yes.

322. (*Admiral Sir E. Sotheby.*) Do you find that those children who have come to school as being partially sighted become worse or better?—Some get worse and some get better. Some come to our classes temporarily for a year or two, their eyes are very bad and they cannot use them in school, they come into our classes and make themselves acquainted with our method, and they go on working under it, and then they are ready to go back into ordinary school if their sight improves.

323. (*Chairman.*) They are sometimes under medical treatment, I suppose?—Yes.

324. (*Dr. Campbell.*) Some of these blind children come from the very poorest districts in London, do you find that in many cases where the children seem to be almost unteachable in the first instance it is for the want of food that their health is very much depreciated, and their powers of learning weakened?—We have some such cases; I would not say many, but we have some painful cases of that kind.

325. The child comes to school without having had anything to eat in the morning, and before the teachers can do anything with the child in the way of instruction, they have to give something to the child to eat?—Yes, that has been the case sometimes; they do, sometimes, send out for a roll.

326. (*Chairman.*) Do you desire to supplement your evidence by any further statment?—With regard to what becomes of the children when they pass out of school, I may add this to what I have previously said. Besides those who do not go into institutions, who do not help their friends at home or find employment, there are some who are hoping to get into institutions, but are unable to do so; they have got all they can get in the way of school education from the Board School, and they ought to have some place to go where they could learn a trade; they are capable of doing so, they have had their educational training, and they are now just at the right age to begin to learn a trade.

327. What standards do your children pass into?—We have had them pass to the 6th Standard. At present we have none higher than in the 5th; we have some in the 5th.

328. Those children would be 12 or 13 years of age, would they not?—Yes.

329. Before they leave school they will pass into the 6th standard, will they not?—If they stay long enough.

330. If they do not go either to Blind Institutions or to Industrial Institutions?—Yes.

331. But there is no reason why the blind should not attain to an equal standard with children who have their sight?—Not the least.

332. (*Mr. Johnson.*) Are those in the 5th Standard entirely blind?—Some of them are entirely blind. The question of what we are to do with our children after they leave us, after they have got all the education that they can get in Board schools, will become more and more a serious question as time goes on.

333. (*Chairman.*) You mean to say that as you have always 120 children under training, when those children reach the age at which they will pass out of the Board school some provision ought to be made for them to get an industrial training so that they may earn their own living?—Yes; some of those are applicants at present for admission into blind institutions, but they have to

Miss M. C. Greene.
17 Dec. 1885.

wait till they can get votes; their parents are poor, they must win their bread, and they cannot go round seeking votes.

334. In the meantime they are waiting hanging on till they can get into a training institution?—Yes.

335. (*Admiral Sir E. Sotheby.*) You want to see a National Training School established?—Yes.

336. (*Chairman.*) What do the Americans do in that respect? Does the city of Boston, for instance, make any provision for the training of blind children?—All blind children have a right to be admitted to the Perkins Institution, and there they have an opportunity of learning a trade.

337. (*Mr. Johnson.*) That institution is a State institution?—Yes.

338. (*Chairman.*) Have you anything further to add to your evidence?—There is one item of figures that may perhaps be interesting; of the 120 children who are now in school 52 have been admitted since the end of July of last year, that is since the summer holidays of 1884, and 80 since the summer holidays of 1883; that will show what a constant change there is, a flowing in and a flowing out.

339. (*Mr. Arrol.*) Does that 80 embrace the 52?—Yes, the 80 children have been under instruction only a little more than two years.

340. (*Chairman.*) That is to say, of the 120 children now in your schools 80 have been under instruction not more than two years?—Yes.

341. And 52 of them a little more than one year?—Yes.

342. (*Mr. Johnson.*) You find out where there are blind children by means of the visitors and bring them to school?—Yes, they report to me, and I make arrangements for guides and for overcoming all the difficulties.

343. (*Chairman.*) When the case of a blind child is reported to you by a visitor, you visit the parents of the blind child?—Yes, at once I see the child and see that it is suitable for school. It may be bed-ridden or deaf or imbecile, but if it can attend school I urge the necessity of its attendance at school upon the parents; and sometimes it takes a good while before all the difficulties are removed and the child is really in school.

344. Do the parents object often to send their blind children to school?—Sometimes.

345. On what ground?—They are afraid the child will come to harm, and they are actuated also by the same reasons that lead a great many to wish that their children were not forced to go to school at all.

346. (*Mr. Johnson.*) You find a guide for a blind child?—Yes, if there is not one in the family; I throw it upon the family, if possible, if that cannot be done I make arrangements with some neighbour's child coming backwards and forwards to school.

347. (*Chairman.*) When you have succeeded in bringing the children to school do the parents generally acknowledge that the child has benefited by attending at the school?—In a great many cases they come to see that it *is* good for the child to be at school. In some cases, however, the indifference is chronic.

348. The parents would rather keep the child at home in its neglected condition?—Yes.

349. And wait until they can get it into some institution to take it off their hands?—Yes.

350. Do you do any teaching yourself or are you fully occupied in superintendence and visitation?—I have been fully occupied in superintendence and visitation for the last two or three years. I did teach at first, but as the work increases it takes up all my time. I shared with the blind teachers at first in the work.

351. (*Dr. Armitage.*) When the blind children are being educated in the ordinary Board schools along with the seeing children, can you give us any idea what per-centage of the teaching time is occupied with lessons suitable for the instruction of the blind children?—All the time, except it be the drawing lesson.

352. (*Chairman.*) That is to say, needlework, the drill, the Scripture lessons, and all oral examination?—Yes; geography, grammar, arithmetic, reading, and writing.

353. (*Dr. Armitage.*) What proportion does that bear to the black-board and diagram work?—I think the drawing only occupies one or two hours a week.

354. You have maps in geography?—Yes, our children can take the maps into school, and follow the instruction that the sighted children have.

355. (*Chairman.*) You have the raised map, the German map?—Our globes in relief are German, but the *maps* are English.

356. Do you think the blind children realise geography?—Yes, when they are well taught.

357. (*Mr. Johnson.*) Do you think they realise it in a tangible form or mentally?—As the sighted children realise it with the eye and the mind, so do the blind children realise it with the touch and the mind.

358. In your opinion the raised maps are of use in the early education and training of blind children?—Certainly; raised maps and globes.

The witness withdrew.

The Reverend H. D. Pearson, M.A., examined.

Rev. H. D. Pearson, M.A.

359. (*Chairman.*) For some years up to last November you were a member of the London School Board?—I was.

360. For how many years were you on the Board?—I think from 1879 to 1885.

361. Were you Chairman of the Committee that superintended the instruction of the deaf and dumb and the blind?—Yes.

362. And I believe you took a good deal of interest in the work of the Board?—Yes, certainly.

363. You were a member of the Committee that appointed Miss Green as lady superintendent?—No; I think Miss Green was appointed in Sir Charles Reed's time.

364. Do you consider that there is an advantage in providing special instruction for the blind in Board schools?—Certainly, I think it is very important indeed.

365. Can you tell us anything about the working of the School Board in respect of bringing the children in; I assume the ordinary compulsory powers are applied?—Quite so; the visitors, as they are called, bring children into the schools. I am not quite satisfied with the way in which that is done; I think we ought to have more blind children than we have.

366. You think that there are still children who escape the compulsory powers?—Yes, I think there must be.

367. Have you any evidence of it?—No, we have only the evidence that we have so few, if that may be called evidence, we have only 130.

368. Is not it the fact that a great number of children who are blind get into other institutions?—Yes, but I do not think that that thoroughly explains it.

369. We have it in evidence before us that there are a number of children who are moved about by their parents whom you do not get hold of?—That is the case, no doubt.

370. Which is the more numerous class, the deaf and dumb, or the blind?—The deaf and dumb are the more numerous. I suppose there would be 50 or 60 more in London Board schools.

371. All the children over seven are submitted to Her Majesty's Inspectors for examination?—Yes.

372. Have you anything to say as to the results in the case of the blind?—They do not seem to go beyond the 4th Standard.

373. They are not in the higher standards?—I do not think they have gone into the higher standards hitherto.

374. The majority of them I understand go out into other institutions?—Yes, that may explain it. I think the blind show very great intelligence, and probably their being received into other institutions would be the explanation.

375. How do you think that they compare with the sighted children as to intelligence?—I think they compare very well indeed.

376. Can you give us any information as to their opportunities or chances of earning a livelihood after they leave school?—That is a very important question, of course there are two systems which apply to all education of an elementary kind; there is the system which consists in laying the groundwork, and leaving the rest to the development of intelligence, and there is the system of positively giving what may be called technical instruction.

377. You give no technical instruction in the London School Board Schools?—It has been attempted to some extent.

378. To what extent?—We have some instruction in two schools in carpentering; it is only a slight beginning, but I hope to see it developed.

379. For the blind?—No, not for the blind.

380. You give no training or technical instruction to the blind?—No, I sometimes hope that in the end the blind might partake in that technical instruction.

381. You charge the ordinary fees, I suppose?—Yes; I may say we have a very able superintendent. She is a very able instructor indeed, and, as far as her opportunities go, I am sure she has done everything she could in the very best possible way.

Rev. H. T. Pearson, M.A.
17 Dec. 1885.

382. (*Mr. Arrol.*) Could you tell us how many children there are in London that are blind of from 5 to 15 years of age?—I could not tell you that. It is said that there are about 3,000 blind persons in London.

383. It is not from want of ability that the children do not pass into the 5th and 6th Standards?—No, I think not. So far as I have known them they are exceedingly intelligent.

384. (*Chairman.*) The reason why they are not to be found in the higher standards is because they pass to other institutions before they get to the higher standards?—Yes, I think that that explains it.

385. (*Dr. Robertson.*) Does Miss Green undertake any of the education herself or does she simply superintend the education?—She superintends the education. I think, in some instances, she teaches, but not as a rule; she has quite enough to do in superintending.

386. Have you formed any opinion as to the advantages of the several systems for the education of the blind?—We have adopted Braille's system generally, but Moon's has been sometimes used.

387. Can you tell us the reasons why the Braille system has been adopted?—We were guided by the judgment of our superintendent.

The witness withdrew.

Adjourned to to-morrow at 12 o'clock.

32, Abingdon Street, Westminster.

Friday, 18th December 1885.

PRESENT:

THE RIGHT HON. A. J. MUNDELLA, M.P., IN THE CHAIR.

ADMIRAL SIR E. SOTHEBY, K.C.B.
W. TINDAL ROBERTSON, ESQ., M.D.
T. R. ARMITAGE, ESQ., M.D.
W. AUCHINCLOSS ARROLL, ESQ.
F. J. CAMPBELL, ESQ., LL.D.
E. C. JOHNSON, ESQ.
ROBERT MCDONNELL, ESQ., M.D.

CHARLES E. D. BLACK, ESQ., *Secretary.*

GEORGE MARTIN TAIT, Esq., examined.

G. M. Tait, Esq.
18 Dec. 1885.

388. (*Chairman.*) You are secretary to the Home Teaching Society for the Blind?—Yes.

389. How long have you occupied that position?—15 years.

390. What are the objects of that society?—Briefly stated, the objects are to visit every blind person not in an institution, that is the primary object. Blind persons are also visited, where permission is granted, who are already in institutions, particularly the industrial classes; but as I have said, the primary object of the society is to visit every blind person in his or her own home, and its sphere is in the first instance naturally London, where the head quarters are. It has now under its visitation 2,210 blind persons in London; of those 1,493 are readers, able to read in Moon's type. Besides the visitation of the blind and teaching them to read, the society has a mission sphere of work, chiefly with regard to the social, religious, and moral improvement and welfare of the blind. The prime object in the first instance when the society was instituted had very much of a religious character. It was first thought that the work might have been well done by the London City Mission (when I mention the name of the London City Mission you will see that the religious aspect of the work had very prominently entered into the minds of the founders of the society), but it was not found that they could enlarge the scope of their work and hence the society was formed in 1855. It grew from merely a small beginning, the employment of one teacher. Dr. Moon himself was among the first of the teachers, it grew from a very small beginning until now in London there are 18 teachers employed, all of whom are blind except one, so that the society now has a large sphere of work before it. It also affords opportunities for the employment of a considerable number, not a large number, but a considerable number of trained blind persons who may have passed through institutions or are qualified in other ways for the office of a teacher. At the present moment we have six teachers who have passed through the several institutions in London as trained persons. I may say that those were blind at an early age, and consequently they had their training in institutions in London or elsewhere, and the remainder of them, like a large majority of the blind, became blind at a later period of their lives, but being qualified in various ways for the office of a teacher they were appointed by the Committee to carry on the work to benefit those with whom they come in contact, educationally, religiously, morally and socially. Briefly stated, those are the objects of the society, and those are the instruments which we adopt. With regard to the method of teaching, it was founded in the first instance by warm advocates of Dr. Moon's system. As the Commission will understand, in the year 1855 when the society was established, the question of types was a very crucial one, and a very difficult one. Dr. Moon's system, I might say, had for its chief characteristic that it was a very near approach to the Roman characters. It was felt that the Roman character was not sufficiently easily learnt, particularly by the aged blind, amongst whom of course the society largely works. Moon's type is a type nearly akin to the Roman type. Hence the society being carried on in the first instance by Dr. Moon himself, and afterwards developed as it has been, has been faithful to its first love, that is to say in maintaining its particular partiality for a type which is adapted not only to the young but to the blind of all ages. The result of the work is this, that as it stands now we are

G. M. Tait, Esq.

18 Dec. 1885.

able to present very remarkable statistics to the Commission in reference to the use of that type, which are given with some degree of detail in a statement which our Committee have ventured to lay before the Commissioners.

391. You tell us that the first object of your society is the educational, religious, and social improvement of the blind?—Yes.

392. And you say that you visit the blind at their own homes in order to give them religious and other instruction?—That is so.

393. And you visit blind persons of all ages?—We visit blind persons of all ages.

394. In all parts of the metropolis?—In all parts.

395. And in nearly every case through the agency of the blind themselves, they instruct the blind?—That is so.

396. You say you instruct them at their own homes?—That is so.

397. Do you have any classes at all for instruction?—We do not as a society. Some of the teachers do hold classes, but that is not our special work. We have no particular desire to promote that. The formation of classes is done throughout the metropolis, but that is rather promoted by the Indigent Blind Society. It is a sphere which they have very fairly taken up, and we do not interfere with their work in that respect. There is a class at Greenwich conducted by our teachers, there is a class in Chelsea conducted by our teachers, and classes elsewhere, but that is quite extra to their ordinary duty; it is a voluntary work on their part. I may say that the reason why we do not take any part in the promotion of the formation of those classes is partly this—there is a system of doles attached to the classes, which is not our system, and of which we do not approve. Perhaps I ought not to say that we disapprove of it; at any rate we have never had anything attaching to our society which is in the nature of doles or payments to learners, either for attendances or otherwise.

398. Your society is confined entirely to instruction?—Yes.

399. Mission work?—Yes.

400. And you employ 18 teachers, blind men, whom you pay; how much do you pay them as teachers?—We pay them from 14*s.* a week to 30*s.* a week, and in addition they get guide money, which is 3*s.* a week.

401. Do you divide the metropolis into districts and assign one district to each visitor?—Yes. I will give a list of the districts. We have seven districts north of the Thames and four districts south of the Thames. We have a city district, with one teacher employed; he works in the city and his district extends to Pentonville. We have an eastern district, in which three teachers are employed, and their work extends to Stepney, Plaistow, Stratford, Wanstead, Leytonstone, Walthamstow, Hackney, Dalston, Clapton, Ilford, and Barking. We have a west central district, in which two teachers are employed, and this includes Bloomsbury, St. Pancras, Marylebone, Paddington, and Camden Town. We have a western district, in which two teachers are employed, which includes Westminster, Kensington, Notting Hill, and Bayswater. We have a northern suburbs district, in which three teachers are employed, which includes Islington, Stoke Newington, Holloway, Tottenham, Edmonton, Enfield, Southgate, Barnet, Finchley, Edgware, Stanmore, Potter's Bar, Totteridge, Ponders End, and Cheshunt. We have a north-western suburbs district, in which two teachers are employed, which includes St. John's Wood, Hampstead, Kentish Town, Hendon, Willesden, Brondesbury, Kilburn, Harrow, &c. We have a western suburbs district, in which two teachers are employed, which includes Acton, Ealing, Brentford, Hounslow, Fulham, Hammersmith, Isleworth, Kingston, Surbiton, Twickenham, &c., and extending to Windsor and Eton. On the south of the Thames we have a south-western district, in which one teacher is employed, which includes Lambeth, Clapham, Wandsworth, Putney, Barnes, Mortlake, Richmond, &c. We have a southern district, in which two teachers are employed, which includes the Borough, Bermondsey, Newington, Brixton, Camberwell, Balham, Streatham, Dulwich, &c. We have a south-eastern district, in which one teacher is employed, which includes Rotherhithe, Deptford, Greenwich, Lewisham, Woolwich, and Plumstead. We have a southern suburbs district, in which three teachers are employed, which includes Croydon, Carshalton, Tooting, Sydenham, Bromley, Chiselhurst, Eltham, &c.

402. You have an area of 20 miles round London?—Yes.

403. You go as far as Potters Bar?—Yes.

404. And you say you have on your list of persons visited more than 2,200 blind persons?—That is so.

405. How much time can be given to each person that you visit, and how often is each person visited?—The 18 teachers have on an average more than 100 each on their list.

406. And their instructions, I see, are to visit the blind at their own homes and teach gratuitously all who are able and willing to learn to read in Moon's embossed type; secondly, to act as colporteurs to lend and exchange the books of the Bible and to instruct the blind in its meaning, and also to lend other useful books, to act as Scripture readers to those who from advanced age or infirmity are unable to learn to read by the touch of the finger?—That is so.

407. Having this work to do, extending over a very large area, how often can one of your teachers visit a person who is on the register of his district?—They are instructed to visit all who can read, and who may have been taught by themselves or others, and exchange books once a fortnight. Others who are learning they are instructed to visit at least once a week, and it may be oftener, so that they graduate their visits according to the necessities of those whom they visit.

408. That is once a week to those who are uninstructed, and once a fortnight to those who are instructed?—That is so.

409. Deducting the 1,493 readers from the 2,200, you have about 800 who cannot read at all; the teachers read to them according to your third instruction; they act as Scripture readers?—Yes.

410. Are there any district committees to guide the visitors or aid them in their work?—In each district we endeavour to have a lady superintendent to superintend the teaching as a local work, we find this a very helpful thing for us, because from the centre it is impossible for us to superintend over such a large area the details of the work, those ladies are ladies of influence and position. I may say the lady superintendent of the district in which you are now sitting is Mrs. Lysley, the daughter of Sir Charles Lowther. She is the lady superintendent of the western district; that is merely illustrating what is existing elsewhere. Where we can secure ladies like Mrs. Lysley, we endeavour to do so, it is difficult to do it always, but we have several, and we have the clergy also, to whom the teacher looks up for guidance and direction as to visiting, so that the work is kept under local superintendence as well as central direction.

411. Does the teacher report to the local superintendent, or to the clergy, or to whom?—The teacher reports to them locally, but he also reports to me as well. The teachers bring their visiting reports to me once a fortnight, and I divide them into two divisions for this purpose.

412. Once a fortnight the teacher brings to you a report of the work that he has done within the fortnight?—Yes.

413. Can you give us a specimen of those reports or describe their character?—Here is a specimen. I have brought this to show the Commission the nature of the work done by the teacher as it goes along; this is not a specimen of the teacher's daily visiting journal, but the register which he keeps, and it tells the history of the blind persons visited in a very interesting manner. First, there is the number on the roll book or district, then the name and Christian name, then the number of years old when first blind, then we have got his residence. Then the next important question is, could he read before he was blind? Then, what type can he now read? and that tells whether he has been taught or been at an institution before. Then, date of first lesson. Then we ask, after he has been taught by us, in how many lessons he has been taught? We find that Moon's type is an easily taught system, very often even old persons learn to read it in two lessons. Then there is a column for hindrances to progress from incapacity and from physical causes which entirely prevent their learning. Then sometimes they will not learn, and they positively refuse the lesson. The question is put then, why not? Then, the number of years blind is another column, and an extremely important column of information. The causes of blindness are put down, inflammation and so on. (I have a specimen register here.) Next we have,

present means of maintenance. What was his former occupation, and now what he is doing? and then there is a column for observations. So that this which I have brought as a specimen tells us the personal history of every blind person with whom we come in contact. I may say that we have never used this information as a public matter, but it enables us to have the private history of those persons with whom we come in contact.

414. I understand that these returns are obtained through your own teachers?—Yes.

415. And they are made to you by 18 persons employed by the society?—Yes. The reports are going on continuously. Every fresh case as the teacher comes in contact with it is added to his list. From the registration book kept by the teacher we obtain the history of all the blind people that we come in contact with. That is our initial step; then there is a regular daily journal in which the teacher posts all his visits, all the books he lends, and in which he registers the lessons he gives.

416. From what sources are the funds of your society derived?—Entirely from voluntary contributions.

417. Annual subscriptions? — Annual subscriptions and donations. There are 3,000*l.* vested; that has grown during my short time; we began with nothing when we took it up 15 years ago, there was only 300*l.* a year income, and we have so advanced that our income approaches 2,000*l.* a year.

418. From subsciptions and donations?—Yes. We have also the small fund of 3,000*l.*, which is our entire reserve, which has been accumulated and added to from little balances.

419. This money is expended in the payment of teachers?—Yes, and the purchase of books.

420. What is the cost of administration, the secretarial and other work?—372*l.*; that includes all office expenses, printing the reports, and the postages of appeals in order to get money; it is hard work to do it, and a costly thing, to obtain even the funds which we receive.

421. I see "salaries, 240*l.*"; how is that expenditure made up?—By paying me 200*l.* a year and a clerk 40*l.*

422. You say that you take no cognisance of any doles?—None.

423. Or parochial gifts?—None.

424. And you dispense no relief whatever?—No.

425. Your society is entirely a teaching society, a mission society?—Yes.

426. You have branches in the country, have you not?—Yes, a very large number.

427. But those branches do not subscribe to your central association, I suppose?—At this stage I should be glad if you would allow me to give a further explanation of our work, because this introduces a new phase of the work. Side by side with our London work we have always maintained a distinct agency for promoting the formation of branches throughout the country, and the result has been that a very large number of them have been formed through our own agency, some of them have been formed by friends of the blind, and without our intervention, but a large number of them have been formed by ourselves, and I would give you an illustration to show how the work has been done. This year we have sent one of our teachers, who for this purpose is a sighted man, and the Commission will see that for this work there are special reasons why a sighted man should be employed——

428. For organisation?—Yes, he has to break up new ground; he has to visit the clergy and others, he has to get quickly over the ground, and gather up facts, and therefore we feel that in this case it is necessary to employ a sighted man. Our sympathies are very much with the employment of blind men, and not only are our sympathies in that direction, but we find that in practice they are best adapted for our special work, for in addition to the facility with which they are able to deal with those already blind, they meet with the least objection in their visitations, being blind themselves; and therefore in the ordinary work of teaching and visiting the blind, we have found not only that our sympathies are best met, but our work best done by the employment of blind teachers; but when it comes to the other work to which I have referred, for the reasons I have already stated, we employ a sighted man. He goes from place to place according to instructions. The last instructions were to go to Walsall, and he has been there nearly the whole of this year. It has taken him the whole time to arouse sufficient interest in this one locality. The first objection that is always made is that there is no necessity. I do not say this as a reflection on Walsall at all. I should be very sorry to do that, because it is not so. The general objection to new work is very great throughout the country; friends say their hands are full, and they cannot undertake fresh work. However, we never give it up when once we find a sufficient number of blind in a particular locality to warrant the employment of special teachers till the work is taken over. The teacher arouses as much interest as he can, and in the case of Walsall after about a year a ladies' committee has been formed assisted by the vicar of the parish and the clergy. We have generally advised the formation of a ladies' committee for this work, because ladies are peculiarly adapted to carry on the work. They can help the clergy in the work of collecting money and managing the business. At Walsall the work is begun and is now well established. As soon as it is so we feel that we are relieved from responsibility, and we then throw it entirely upon the local persons. We do not ask them to contribute anything to us for our work; we simply say we have brought the matter before you, we feel that it is Christian work, a philanthropic work, a work that you should take up for yourselves, and now the responsibility is yours, and we leave it to you; and that society then becomes one of our branches, but it has no relation to us in any way whatever except that we originated it.

G. M. Tait, Esq.

18 Dec. 1885.

429. Does the country association report to you at all?—Not officially; we receive reports from them, but it is perfectly voluntary, there is no responsibility on their part to us or on our part to them; we feel that our initial work is done when we have so started the work. One reason for not calling for reports is this: that we do not wish to saddle our central expenses with more expense than is necessary. To show what we do in regard to this work, which is additional work to our London work, I may give three illustrations showing how it proceeds. In 1873 we sent our teacher to Sunderland. After his visitation, and after arousing local interest, I was invited to go down to Sunderland to attend a drawing room meeting; this is the usual sequel to the teacher's pioneering work. The meeting was held in the house of the late Mr. Edward Backhouse of Sunderland, and was attended by friends of influence in the locality, and immediately after the meeting was held there was a society formed for home teaching; but friends of my own who were there and others when they saw the necessity for home teaching said, "Yes, "but there is something else to follow, we must find "them employment," and hence very shortly after the home teaching was taken up, an industrial institution was formed at Sunderland which I believe for successful work is a model for others to imitate.

430. The forming of these branch societies creates an interest in the blind and other developments follow very shortly?—Yes, that was so at Sunderland; it was the same at Wolverhampton, and also at Oldham, where a distinct industrial feature has followed as the result of the interest created by our first movement in arousing interest for home teaching, and in the two latter cases the work is done on an industrial line without any special buildings; they have merely a little room for their working. At Sunderland they have a large building which was opened with great éclat, and which is a very good institution, but at Wolverhampton and Oldham they have a small shop. These three cases illustrate the advancement of the work beyond reading to the employment of the blind industrially.

431. I see you claim that you have been instrumental in stirring up the school boards to take up the education of blind children?—Yes, in fact I am the father of that movement. In 1875 Mr. John Macgregor, a friend of my own, was on the school board, and in communication with myself the subject was brought before the London School Board. The late Reverend John Rodgers, who was then chairman of the school management committee, after correspondence and after I had attended their sub-committees to explain what I proposed, moved this resolution, which was passed. "That the "school management committee be empowered to "authorise Mr. G. Martin Tait to nominate for "appointment by the board a teacher who shall visit "the blind children in board schools for the purpose of "giving them technical instruction, the salary of such "teacher to be 30*s.* a week exclusive of travelling "expenses." That was the origin of the movement. The reasons why I took a part in the first commencement of it are these. I felt that up to that stage the blind

G. M. Tait, Esq.

18 Dec. 1885.

children had been entirely left to the noble work of charity. The institutions of St. George's, St. John's Wood, York, Edinburgh, and elsewhere, had relieved the country of its responsibility in reference to blind children, but when Mr. Forster's Act came into operation and school boards were established, it occurred to me that there was no reason why blind children should be left out in the cold. I considered that the country should assume its direct responsibility, so far, at any rate as those children outside of the institutions that I have named, or similar ones, were concerned; hence the reason that I took the action, in order that the children throughout the whole country might if possible have the advantages at least of elementary instruction in ordinary day schools, so preparing them the better for the advanced technical instruction which they might be put to at a later stage in the various existing institutions. That was the reason which moved me at the time, and the work has very fairly advanced in connexion with the school board. I should wish further to say that I did hope and do still hope that the work in connexion with the ordinary day schools shall so develop that it will not be necessary—I mention this for a particular purpose—I hope it may not be necessary always that blind teachers shall be imported into ordinary schools, for the purpose of mere elementary instruction at any rate. Of course it is a great bar to the extension of the movement for the education of the blind if it be thought necessary that in all cases specialists shall be brought in merely to teach the elements to a blind child. I hope the time will come when the Education Department will not only make it worth the while of ordinary sighted teachers throughout the country to feel an interest in the blind (as I know they do. I have abundant testimony that they are kind and sympathetic towards the blind), but make it worth their while, by sufficient payment, to learn the elements of blind instruction, so that the children may have directly from the appointed instructors of the school all the necessary elementary instruction, and so that there would be no bar to any children coming to an ordinary school, and being taught by the ordinary teachers.

432. Do you think if there is a solitary child in a rural school that the teachers in that school can carry it on from standard to standard without a large amount of special instruction on the part of the teachers, and a large amount of devotion to that particular child which would be really impracticable?—I have a very strong feeling and opinion that the elementary part of the instruction (I am speaking of the elementary part only) of blind children can be sufficiently given by sighted persons without any very great effort.

433. Do you know anything at all of what is done in countries where the blind are all well educated and trained and cared for; have you any acquaintance with foreign systems?—I am fully acquainted with all that has been written on the foreign systems.

434. We will take Saxony for instance, or Prussia; are you aware that in Prussia the children are drafted into institutions after about eight or ten years of age, and that from that time forth their general education and their industrial training are conducted coincidently?—I am perfectly aware of it.

435. You could not do that in the case of a solitary child?—I am speaking of children before they reach ten years of age. I was only referring to the elementary part of the work. I feel that ordinary sighted persons are amply well qualified to carry on that part of the work with a very small amount of encouragement.

436. You think there would be no difficulty in providing the necessary books for a solitary child in a rural village?—None.

437. You said, I think, that you are quite satisfied with the character of the work which is done by the London School Board?—No, I said I was thankful to see the progress that had been made.

438. Do you think that more ought to be done?—Certainly.

439. In what way?—In the first place, there is a very limited number of children in the school board schools; and I think this is a point I ought to emphasise a little—it can never be a large number of children to start with. I hope the Commission understand that in dealing with the blind children reached by the London School Board you are dealing with a very small moiety of the blind. The London School Board have nearly got to the end of their tether in regard to the number; in fact, there is a decreasing number at present, and it is not likely to increase, because I believe if the statistics are fully gone into, it will be found that the London School Board have got pretty well all the blind that it is possible to get within their walls, very nearly all, and notwithstanding they are dealing with a comparatively small number; they have a very expensive staff to carry on the work of teaching the blind. I do not say a word against expenditure on such an object; still that is a matter to be considered. Then the children are sent to the ordinary school board schools for oral instruction, but for technical teaching they are brought to centres, and even then they only get a lesson twice a week, and on an average sometimes only once a week, from a technical teacher, except in two instances where a considerable number of blind children attend, and lessons by the blind teacher are given on five mornings a week. So that, unless you carry out my idea of qualifying your sighted teachers somewhat to carry on the elementary part of the work, say up to the age of ten years, those children are not getting the benefits in connexion with the school board system which I personally had hoped for.

439*a*. Your proposal is that every certificated teacher shall be qualified to teach the blind?—Certainly.

440. Have you anything more to say about the school board?—No; I think perhaps I have said enough upon that point.

441. You have about 100 children on your list over five and under 15 years of age that you visit in London?—That is so; that was two years ago.

442. Are those children all attending school now?—Nearly all; they are also visited by our teachers, and they receive from our teachers the books which the parents are only too glad to have, so that there is a kind of *pari passu* work going on in regard to the teaching of the children. We do not accept the responsibility. In fact, I have said enough to show that the responsibility rests on the country, I think, with regard to children. Still we continue to visit blind children, and leave books with those who wish to receive books, so as to supply them with reading, and to supplement any instruction in Moon's type which they may need or desire.

443. You say the responsibility rests with the country. You mean to say it is your opinion that it is the duty of the State to make provision where it is not otherwise provided for the education and training of all blind persons?—For their education; industrial training is a distinct feature. I have not come to training; I am not aware that industrial training is a part of the duty of the State.

444. Where the two have to be carried on simultaneously, is not it difficult to say what part should be done by the State and what part by voluntary effort?—If the State accepts the responsibility of the industrial training of any portion of its children, that is to say, of the sighted children, I say by all means let it accept the responsibility with regard to the blind.

445. Then in your opinion the blind children in London now that are not attending school may be said to be very few, if any?—Those who are not in attendance are children who have sufficient physical disqualification to prevent their going anywhere.

446. We have been told that there are a number of vagrant blind children constantly on the move; is that your experience, that parents carry about blind children?—No; I do not think that the carrying about of blind children is very extensive; if there was anything of that kind done nobody could get at it better than myself, but I have never had that brought before me at all.

447. In paragraph 14 of the letter which you have laid before us you give some statistics with regard to the blind. Those statistics are derived entirely, are they not, from the census returns?—Yes, those can be checked by anybody; they are matters of fact: there is no question of opinion about them at all. When you get to paragraph 23 and the following paragraphs you get to statistics which are my own compilation, which I am quite prepared to show the correctness of and to extend, because when the paper was sent in returns were only received from 50 institutions. Since then I have received returns from other institutions, making now altogether 70 institutions, and the figures as they now stand, taking in the information which I have received from those additional institutions, will be as follows: The number of blind under visitation or in schools at the present time in connexion with those 70 institutions is, in connexion with home teaching societies and workshops, 8,177; and in schools for the blind, 535. Out of those 8,177 the number of blind who can read in Moon's type is 4,381, and the number in schools (out of the 535)

363. The number of blind who can read in Braille's type in connexion with home teaching societies and workshops is 521, and in schools 232. The number of blind who can read in any other raised type in connexion with home teaching societies and workshops is 343, and in schools only 89; so that the readers in Moon's type are by the thousands, while all the other types put together are by the hundreds.

448. You obtained this information by the issue of circulars to institutions throughout the country?—Yes.

449. How many circulars did you issue?—I issued circulars to every institution that I could find.

450. How many circulars were issued, and how many replies did you receive?—I received 70 replies. In some cases, particularly in London, they declined to send replies, hoping to give the information direct. My object was to give every one an opportunity of replying. There are several who did not reply. There are only two institutions in London, I think, that have replied—a small institution at Kilburn and another.

451. This information must be taken *quantum valeat?*—About 125 circulars were issued and 70 replies were received. The replies that I have received represent three-fourths of the blind. The small societies did not reply; even a good number of those in connexion with us did not reply.

452. (*Mr. Johnson.*) How did you get a list of the institutions?—From Turner and Harris's list and the list published by the Charity Organisation Society. I sent circulars to every Society that I could find. I have received from Ireland only two replies, one from Belfast and one from Dublin, but there is not very much work for the blind carried on in Ireland; but from Scotland I have received replies from nearly every institution there, and very largely throughout England. Then going to paragraph 25, the figures as they now stand will be a follows:—The number of books for the use of the blind in Moon's type in home teaching societies and workshops is 29,935, and in schools 2,517; the number of books for the use of the blind in Braille's type in home teaching societies and workshops is 621, and in schools 803; and the number of books for the use of the blind in any other type in home teaching societies and workshops is 161, and in schools 284; so that the books in use are by the thousands in Moon's type against hundreds in any other type.

453. (*Chairman.*) In paragraph 28 you quote some opinions with regard to pensions for the blind; what do you find in your experience to be the working of the pension system?—I should be sorry to discourage philanthropy towards the blind, but I am distinctly of opinion that there is a tremendous struggle to obtain a pension on the part of every blind person. Further, I may go so far as to say this. In my opinion the general hope among the blind in regard to this Royal Commission is that every one shall have a pension, and I think if that is not the result, they will be very much disappointed. I give that as an illustration indicating the general struggle of the blind man towards getting a pension. Everything is sacrificed to it, almost, I am sorry to say. I do not think upon the whole that pensions have encouraged self help.

454. You are speaking of England and Wales, you know nothing of Scotland or Ireland?—I was speaking generally on the subject of pensions; the large amount of pensions of course is in England.

455. The evidence that you have given and your experience applies more to England and Wales than to any other part of the United Kingdom?—What I am speaking of refers to the whole country. With regard to Ireland the information is very small. Anything that I have to say would include Scotland. I am quite prepared to answer questions with regard to Scotland, because there the work is splendidly done and the blind well cared for and attended to.

456. Are you of opinion that industrial training might and ought to be much further developed, and that the blind should be made much more reliant upon their own resources?—I am very much of that opinion; the difficulty is how it is to be done, and that has been the difficulty of every philanthropist who has given attention to the subject. There is no question about the desirability of it; the only question is how to do it; there are many different opinions as to how it is to be done. I may say that almost up to the present moment the general practice has rather been that the blind should be associated together for work. My distinct opinion is that it would be the greatest benefit in the world if the blind, not only in regard to education (I speak more particularly with reference to that), but with regard to employment, should no longer be an isolated class, but should form such a part of the community, that they could take their place side by side with the sighted persons both in schools and in daily work.

G. M. Tait, Esq.

18 Dec. 1885.

457. You think that as far as it is possible to be done in education and training they should be associated with sighted persons?—Yes, as far as possible.

458. You think that that gives them more courage and self reliance?—With regard to courage and self reliance I have not the smallest doubt that it does, it is a matter that I have inquired very carefully into from our own teachers, who are of course blind, and who have a large field of inquiry. I asked them this question last Friday, for I was particularly anxious not to put my own opinion forward; some of them have already passed through schools, and they are excellent teachers; some of them were blind when young, and I asked them, "what is "your opinion; are you of opinion that the children of "the blind would do best being taught with sighted "children or with the blind alone?" and their unanimous opinion is that for the elementary part up to a certain stage, say to the age of ten years or so, the children should be as far as possible associated with the sighted, but when it came to a specialty such as music, or when they were advanced to higher training, it might become necessary, and perhaps it would be better and more helpful to them, that they should be associated together, so that all the advantages derived by the many might be shared in by the few. At the Worcester Institution they have brought in sighted children to be trained with the blind, they have adopted the principle, but carry it out conversely; they say, to get the advantage of association we will have sighted pupils with the blind pupils. At Worcester they have developed high education, and they produce men who can take their place side by side with the sighted in the highest professions in the land.

459. Can you tell us anything with regard to the general condition of the blind; do you consider that they are much improved in their condition of late years?—I distinctly consider that they are improved, they are improved from the very beginning, the young themselves are improved, and I think perhaps the others are not in the degraded condition that they formerly were, in fact I am sure of it, they used to be found shut up alone and in a dreadful condition of misery; no one thought that anything could be done for them. The late Lord Shaftesbury often spoke of how in his early days the blind used to be shut up in cellars and places like that when it was thought that nothing could be done for them; that is now very much altered, the visiting of our blind teachers and others like them has tended immensely to improve their condition in every way.

460. Is not it the fact that a considerable number of blind in London are to be found begging in the streets?—That introduces a subject which is of course very important. I can assure you that it is not always the case that the blind who beg have nothing to do by way of employment during the day.

461. Is not it the fact that a considerable number of blind are to be found in the streets of London begging?—It is the fact that many are.

462. Are they not to be found frequently playing musical instruments of some kind or other?—That is so.

463. Or standing with a black patch over the eye or with a badge round their neck asking for alms?—Yes.

464. Standing at the corners of streets with a dog?—Yes.

465. Or sitting reading the bible aloud to the passers by, and asking for alms?—That is so; it is not done to such an extent as it formerly was.

466. Those persons who beg then have some other occupations?—I am sorry to say it is so with a number of them; even some of those on the rolls of industrial work in London supplement their earnings by begging; some of those who have been trained in the highest colleges for the blind in the land come down to begging almost as a profession.

467. They find it so profitable I suppose, the public are so generous, that it pays better than any other mode of getting a living?—I would not like to put it in that way.

468. Then why do they do it?—In the first place they fall back. Perhaps they are started fairly well with some industrial work, or as musicians, but there is a very strong inducement to make a profit out of what they con-

G. M. Tait, Esq.
18 Dec. 1885.

sider a piece of personal property, namely, the sympathy of the sighted for the blind man. It is a stock in trade to them, and has a great power and influence, and very many are induced to make use of it. It is only fair to say that in dealing with the blind we have to deal with a class who are very poor; their condition at the beginning to a large extent is almost beggary.

469. Why should they be beggars naturally?—They are the very poorest of the poor; blindness is very largely caused by vice and evil surroundings. Once you get the houses of the people improved, their condition improved, their education improved, and their surroundings improved, you will find that blindness will depart from our midst to a very great extent.

470. Blindness is the consequence of vice and neglect to a very large extent?—Yes, we must not say altogether, but very largely so.

471. It is so in its first stages very often, is it not?—Yes.

472. And to a large extent it is confined to the poorer classes?—Very largely. Out of the 2,200 I will tell you how many are supposed to be fairly well off. There are only twelve persons who are supposed to be gentlemen and ladies, as it is understood, not requiring to work.

473. Have you any suggestion to make to the Commission as to the way in which you would deal with the difficulty of preventing begging and preventing this dependence of the blind?—The suggestions I have to make are summed up at page 8 of this paper I have laid before the Commission, and they are as follows:—
"(1.) That the Educational Acts should be so amended "(if necessary) as to include (*a.*) the compulsory "attendance of blind children of school age at the "ordinary day schools; (*b.*) that school managers be "required to provide suitable appliances and trained "teaching power for the purpose; (*c.*) that the capita- "tion grant in respect of blind children be increased "and sufficient to reward the teacher for the extra "trouble involved in the preparation for and discharge "of the work; (*d.*) and that such education of blind "children be *free*. (2.) That the law be so amended "(if necessary) as (*a.*) to include grants in aid of blind "schools, workshops, &c. engaged in the technical "training of the blind; (*b.*) and that such institutions "receiving grants be placed under Government inspec- "tion. (3.) That so far as the appliances for the educa- "tion of the blind relate to embossed types; (*a.*) the "evidence in favour of the use of Moon's type justifies its "being taught and called the *reading type*, for the blind "of all ages; (*b.*) that Braille's type be also taught, and "that its practical value in general education justifies "its being called the *writing type*; (*c.*) and that grants "in aid of both should be made by the Government in "order to reduce the cost of the books to the purchasers. "(4.) (*a.*) That the technical training of the blind in "special schools should have a definite object in view "throughout, and that only such pursuits should be "encouraged as will enable the blind when they leave "school to turn the same to practical account; (*b.*) that "inasmuch as the experience at Belfast, Bradford, "Carlisle, Edinburgh, Greenwich, Leicester, Liverpool "(Cornwallis Street workshops), London (Berners Street "workshops), Sunderland, &c. has proved that the "blind can earn fair wages in workshops, the extension "of such agencies in populous localities is much to be "desired; and (*c.*) that as other experience also proves "that some blind can undertake the conduct of business, "and in some instances are doing so with remarkable "success (just as ordinary sighted people do), the "training should aim at self-dependence, self-help, "and the fulfilment, as far as possible, of the ordinary "occupations of life similar to those engaged in by their "relatives and friends."

474. Do you aid the blind at all in procuring employment?—That is an interesting question. I should like to say that the teachers, though it is not our work, privately very often give blind men whom they meet hints how to occupy themselves, and even teach them (because some of them have been practical workers) how to cane a chair and so on. In that way voluntarily the teachers do considerably assist them in taking a step towards earning something towards their maintenance.

475. In paragraph 21 you speak of the occupations of the blind, and you give the number of pianoforte tuners and musicians as 30; can you state anything as to the earnings of tuners?—They range from 25*s.* down to 10*s.* or under. I have a statement in my hand of peculiar interest, being a statement of the chief occupations of the blind in the 18 districts to which I have referred. It gives the occupations of all the blind who have been trained in institutions who are now on our list and who are doing something to gain their livelihood by the occupations that they were taught in the schools.

476. The whole number of blind on your list who are now doing work and who were trained in institutions appears to be 155?—Yes; then there are a great many who do no work at all.

477. How do they live?—Many by begging, I am sorry to say; others are dependent on their friends.

478. Those 155 upon your list are the pick of the trained blind who are earning their living by labour?—I will not say the pick, they are all the blind who have been trained in any institution, and who are earning their living by occupations which they were therein taught.

479. How many have you on your list altogether who have been trained?—389.

480. Of the 389 trained persons 155 only are now earning their living by labour?—By occupations which they were taught in the institutions. Some of them may be earning their living by selling newspapers, but they were not taught to sell newspapers. Some of them who have been trained are earning their living by turning a mangle, but they were not taught to turn a mangle; you cannot say that institutions exist for the purpose of teaching the blind to turn a mangle or even to play a fiddle in the streets. The 155 ought properly speaking to be reduced by leaving out the type writers, I do not think they were taught that as a trade.

481. (*Mr. Johnson.*) What do they get?—3*s.* a week for writing in Braille's type.

482. (*Chairman.*) Have you any further statement to make with regard to the occupations of the blind who have been trained in institutions?—I have before me a return from a suburban district, and it gives the names of the institutions where the blind were trained and what they were doing. Out of 63 blind on the register of that teacher's district nine have been trained in institutions, two at Brighton, and of those one is in the workhouse and one is supported by his friends; four were trained at St. George's, of whom three are begging and one turning a mangle, he and his mother earning about 15*s.* a week. (Though turning a mangle is not very honourable it is remunerative for the blind if they have the means to take to it.) One was trained at the Normal College and is now begging, one at Walworth who is too old to work. Then another teacher says, "Dear "sir, I have 22 who have been trained in institutions, "but who are not getting their living by the trades "they learnt, viz., St. George's (8), two turning "mangles and one selling newspapers; Milton House "(4), one seller of oil; Normal College (3), one seller "of tea and one street musician; St. John's Wood (1); "Plymouth (1), street musician; Liverpool (1); Man- "chester (1); Alexander (3). Those who are not ac- "counted for are doing nothing." Those are two illustrations to show the condition of those who have been trained in institutions, but have come down to their former level of nothingness or beggary. I could enlarge the statement to any extent; it is painful to find that so much of the noble efforts that have been made for improving the condition of the blind should so miserably fail.

483. There is according to your testimony a considerable amount not only of dependence but of degradation amongst the blind?—Yes.

484. Do you think that the suggestions which you have read from your paper will meet the case?—Those have received very careful consideration and are the best views that I can lay before the Commission on the subject. In paragraph 1 we recommend that the education of the blind should be free. I feel myself, in the first place, that if the education of any children should be free it should be those who are blind. Then, in the second place, no blind child can go to school without a guide, the parents are poor and they must either be under an obligation or make a payment for the purpose of sending their child to school, and I do think myself that if there are to be any recipients of free education throughout the country the blind should be those persons before all others. Everything that has been done hitherto for the blind, or almost everything, has been free so far as the blind or their parents are concerned. They are no doubt sent to institutions that require payment, but it is not from the blind themselves or from their parents that the payment comes. So far as their parents are concerned their education is free and in my opinion in any system for the education of the blind in ordinary schools, if any children should have free education the blind should have it, and I think there should be some provision in the Education Acts to that effect.

485. In paragraph 3 you recommend that grants in aid should be made by the Government for the production of books for the blind?—Yes; books are a very expensive feature in the work for the blind. The sale of books for the blind must necessarily always be of the most limited character, even if the types were to be reduced to one or two.

486. Owing to the poverty of the blind?—Owing to the limited number of readers.

487. (*Mr. Johnson.*) Your society have to buy the books of Dr. Moon?—Yes.

488. You have nothing to do with Dr. Moon except that you advocate his system: you buy books in his type for the use of your people?—Yes.

489. At a large cost?—Yes, at very large cost.

G. M. Tait, Esq.
18 Dec. 1885.

490. (*Dr. Campbell.*) There is one point upon which I should like to ask you a question, and that is whether either your parent society or any of its branches has made a careful examination in any portion of England in regard to the number of the blind who are not entered in the census as blind, that is to say, those who have a little sight, but who have not sufficient sight to enable them to read or write or follow ordinary occupations; and whether you can give us the per-centage of increase of blind people, or people who do not see sufficiently to follow ordinary occupations?—I cannot give you that information; my impression is that the census tables are very inclusive; they count people as blind when they are only partly so, so that it would cut both ways.

491. (*Chairman.*) Is there any other point to which you would like to refer, or have you any other suggestions to make to the Commission?—No.

The witness withdrew.

The Rev. J. P. Faunthorpe, M.A., examined.

Rev. J. P. Faunthorpe, M.A.

492. (*Chairman.*) You are Principal of the Whitelands Training College?—I am.

493. Have you had any experience in the teaching of the blind?—I have had no experience in the teaching of the blind; but in examining the blind I have had some considerable experience. I have examined the Blind School at St. George's twice or three times, and the Blind School on Wandsworth Common twice; I always examine now for the Committee, at least I get it done, I do not do it myself. I inspect the schools myself.

494. Are those training institutions, or only day schools?—You cannot call them day schools, the children live there.

495. And receive industrial training?—At St. George's there is industrial training as well as education; at the preparatory school on Wandsworth Common there is education only.

496. What do you say with regard to the general education that the children receive at those institutions?—I should say that it is thoroughly excellent.

497. How does it compare with the education of sighted children?—I should say, taking the difference of sight into consideration, that the blind children are taught as well, and the results show that they are taught quite as well as sighted children, mainly because the teachers are trained. The mistress of the Blind School at St. George's is one of my own students, and the mistress of the preparatory school on Wandsworth Common is also one of my students, therefore the children are taught by trained students. The same methods are used as for sighted children, and with equally good results, taking the difference of sight into account.

498. Are you of opinion that ordinary certificated teachers can teach the blind without any special training for it?—Undoubtedly; better than others I should say, I am of course speaking only from my own experience.

499. You are of opinion then that sighted teachers who have been trained for ordinary teaching are quite efficient for teaching the blind in all the elementary schools in the country?—Not only quite efficient, but out of all comparison excellent I should think, "quite efficient" does not quite describe them.

500. Do you think, taking the case for instance of a solitary blind child in a rural school, that if that child attended the rural school, and the teacher was supplied with the necessary books and apparatus, that teacher could train that child as well as any special teacher, that in fact the teacher would not require a special training?—The teacher would not require special training; but the question that you put to me is a very difficult one to answer, because in a country school a teacher has 50 or 60 or 70 children in each of the six or seven standards, and if you give a solitary blind child to that teacher a difficulty would be felt in giving special instruction to that child.

501. Your opinion is that that child would require special instruction, which would occupy a great deal of the teacher's time?—Yes, clearly. For example, in teaching the child to read. In all lessons which are connected with hearing the child would be taught just as well as the others, for example, in geography or history, or any subject of the school curriculum, a blind child of ordinary intelligence would be taught quite as well as the others. But in reading and in arithmetic and writing the child would be no where, and the school teacher would not be able to give the requisite time to the child.

502. What the teacher could do would be to teach the subjects which are taught orally, but when it came to writing and reading, and, indeed, geography, the child would require special teaching?—The teacher could do it, but there are only 60 minutes in the hour.

503. You would require an increase of the staff?—Yes.

504. (*Mr. Johnson.*) Do you think that a trained mistress could easily learn the method and appliances for teaching blind children?—Undoubtedly; she would have no difficulty. There can be no question about that, because the mistresses appointed to St. George's and Wandsworth, who were students of my own, have learnt them, and learnt them quite easily, and they are carrying them out at this moment.

505. (*Chairman.*) You are of opinion then that blind teachers are not suitable for teaching blind children in special work?—My own opinion is that blind teachers for blind children are a great mistake, and a cruel mistake; it seems to me a cruelty to put a blind person to teach blind children. You are necessarily employing a worse agent when you have a better agent to do the work.

506. But reading and writing are taught to the blind by feeling rather than by sight, are they not?—Yes; but the sighted teacher has the feeling and the sight as well.

507. Is it not the fact that the touch is much better developed in a blind person as a rule than in a sighted person?—Yes, I think so.

508. And is it not the case that the deprivation of one sense tends to reliance on and development of other senses?—Yes, that is a matter of certainty, but I cannot see why in the matter of teaching you are to rely merely upon the more excellent touch which the blind are said to have, which is only one sense after all, when in the case of a sighted teacher you have every sense.

509. Is there not another important factor in good teaching with which you are well acquainted, that is sympathy?—I myself believe that a sighted person would have more sympathy with a blind child than a blind teacher would have. The only difficulty that I had in getting my students to take the charge of blind children was the question of sympathy; their fear was that they might be knocked over by it; they said to me, We are afraid we shall be so touched by their deprivation of sight that we shall not be able to work so well as if we were dealing with sighted children. I said you must put their condition out of the question. You must speak to them as if they were sighted children, and not allude to their deprivation. You must always speak to them as if they could see you; and now the practice is to speak to the children as if they could see.

510. Have you seen anything of the teaching of blind children by blind teachers?—Yes, there is a blind

Rev. J. P. Faunthorpe, M.A.

18 Dec. 1885.

monitor at Wandsworth, a very efficient little teacher, but unless she were under a sighted teacher I should say she would not be good for much.

511. Is there anything within the sphere of your experience which you think it desirable that the Commission should be made acquainted with, which you have not already mentioned?—I can only emphasise what I have already said; that my mind as to the relative merits of sighted and blind teachers is entirely made up, and my opinion is absolutely justified by facts; it is not merely a question of opinion and theory but absolute proof. When I was elected first upon the Committee of the Blind School at St. George's, by the request of the Committee I examined the schools myself, and the blind teaching both of the boys and the girls was not less than deplorable, they knew very little that they were supposed to have been taught. There was an untrained teacher of the girls, and an untrained teacher of the boys.

512. (*Dr. Robertson.*) Were they sighted teachers?—They were sighted teachers, but untrained and uncertificated; the results were very poor as I reported to the Committee in everything, and they said to me, How do you recommend that we should improve this state of things, which we quite agree is not so good as we would wish?—I said, immediately, appoint certificated teachers. Then they asked me if I could put them in the way of appointing certificated teachers. I said I thought I could, and I did so, to the Wandsworth Common School first; I suggested that they should be appointed to both schools at once, but the Committee were a little difficult to move as all committees are; however, when they themselves had ample experience of the success of the trained teacher at Wandsworth Common they of their own motion appointed a certificated teacher to St. George's; and now this last month they have appointed also a certificated master, so that now at St. George's they have three certificated trained teachers who have been in sighted schools. I read the other day Mr. White's report on his Christmas examination of the boys at the Blind School, who had been for the preceding year under a sighted teacher, but uncertificated. Mr. White, is the secretary of St. John's College, Battersea, a trained teacher, a barrister, a member of the London School Board, quite a competent man to examine and to give an opinion.

513. (*Chairman.*) He is the secretary of a private institution; he is not one of Her Majesty's inspectors?—No, he is (1885, but resigned at Christmas) secretary of the St. John's College, Battersea. He pointed out that the teaching was altogether inefficient, that there was a great talk of arithmetic, but when he asked the boys the simplest questions in mental arithmetic they were altogether at sea and could not answer them; they knew verses and little pieces of poetry, but these conveyed to their minds very small notions, if any, and he said that a certificated teacher would naturally have seen that those boys understood what they were taught as well as that they exercised their memory.

514. In your opinion the training of sighted children by uncertificated and untrained teachers would be highly unsatisfactory?—Of course.

515. For certain parts of the work of teaching the blind would not blind teachers, supposing they were trained and certificated, be well qualified?—Yes, certainly, but I cannot see what the object is in training them for it when you have sighted persons more competent to do it. Why should you go about to train a less competent person when you have a more competent person to your hands? You have plenty of sighted men and women anxious to be trained as teachers, why should you therefore choose a blind person to teach? There will be in every number of blind persons say one per cent., there may be more, but there will be always one or two, who will get to the front and will get to be made teachers whether you train them very much or not. At present at St. George's, there is a very excellent teacher of music, a blind person. Music is generally thought to be that for which the blind have a more especial faculty, as it goes by touch. I myself once knew a blind organist. But to train blind boys or girls with a view to their getting their bread partly, or if you like wholly, by teaching music, or by becoming professors of music, or even organists, is in its way a very great mistake, because you necessarily are keeping out more competent persons. A sighted person must be able to do it better all things considered than a blind person. I think that the blind should be taught if possible to supplement what they can do in any way, but not to oust those who are sighted. I think all blind people should be taught music, for example, as a civilising element, but as a way of getting their bread I think never.

516. When you speak of ousting those who are sighted you would not close the avenue of employment to the blind in any vocation for which they may be fitted?—Certainly not, but I would not put special facilities in their way by training them for particular lines as against sighted persons.

517. You have just given an illustration, you said you believed they might make very good musicians; music is taught both by feeling and by sight, in teaching reading to the blind it is taught entirely by touch?—I think that a sighted person would teach the blind to read very much quicker than a blind person, in fact I do not think so, I am sure.

518. (*Mr. Johnson.*) Does that apply to music too?—It applies to music too.

519. (*Chairman.*) Are you of opinion that it would be a good thing if all blind institutions were inspected annually by some competent person as to the kind of education that is being given?—I think they ought to be inspected. Those which I myself am personally connected with are not only inspected, but examined, using those two words in the sense in which they are used in the Council Office.

520. Do you think that the State ought to be called upon to intervene in that inspection and examination?—That is an extremely difficult thing for me to say: I think the State ought to intervene in all education.

521. In that case you would agree that it would be better to have State inspectors and examiners in order that there might be something like an uniform standard applied to the various institutions?—Certainly as far as possible.

522. Because if you had different examiners you would have different standards?—Yes; but I should make the same remark as to secondary schools apart altogether from the question of the blind.

523. You think it would be a great advantage to the work that is going on in the various blind institutions in the country if the educational part of it was examined into periodically?—Certainly, I quite think so.

524. For instance, such defects would be remedied, as you pointed out to us, in the institution which you give as an illustration, where the instruction was found to be very bad, because the teachers were entirely untrained?—Incompetent.

525. That would be at once pointed out and remedied?—Yes.

526. (*Mr. Johnson.*) And is remedied now by the appointment of certificated teachers?—By the appointment of certificated teachers.

527. (*Chairman.*) It was remedied through your recommendation to the Committee?—Yes, the Committee made an experiment.

528. You recommended the experiment?—Yes.

529. You first pointed out that the teaching was bad?—Yes.

530. And you pointed out to the Committee that in your opinion they ought to have a trained teacher?—Yes.

531. And in consequence of that recommendation they tried a trained teacher, and the success of that experiment has induced them to extend it?—Yes, they tried one, and now they have three.

532. The same thing applied to all institutions of the country would probably bring about the same beneficial result?—Yes.

533. (*Mr. Johnson*).—Do you consider that the system of examination in the charities with which you are connected is as perfect as it might be? At St. George's it is at present carried on, as I understand, by persons nominated by the Committee to examine the school from time to time?—The examination is annual upon a fixed syllabus; the syllabus is drawn up by the teacher at the beginning of the year, is forwarded to the Committee and submitted to me and approved of, and at the end of the year I send one of my own governesses, an experienced teacher and examiner, to examine and report, and then I myself inspect.

534. The ordinary standards of education are not followed at those schools?—No, it would be impossible that they should be.

535. You have seen Dr. Stainer's report on the music as taught at the School for Indigent Blind at St. George's-in-the-Fields?—I have read it.

536. Do you concur with that he says?—I entirely agree with everything he says. I think it altogether a most admirable report.

537. How many children are there at the branch school?—Between 50 and 60 to one teacher.

538. Have you any monitors?—A blind monitor.

539. Are they taught any physical exercise?—I believe they are drilled; the mistress herself teaches music, and marching, and things of that sort; it requires good discipline in a blind school for 60 children to move about from one place to the other. The children move about with great ease and facility, and if you were to see them moving about you would not know that they were blind.

540. (*Chairman.*) Is it a school for boys and girls?—Yes.

541. Are there no gymnastics?—There are gymnastics at the bottom of the garden. There is a drill sergeant appointed to drill them in all kinds of exercises, the mistress herself, I know, does something in the way of drilling them also.

542. (*Mr. Johnson.*) I believe it is proposed at the parent school to add gymnastics?—I have heard that mentioned on the Committee. I think it a very admirable thing to be done.

543. (*Dr. McDonnell.*) You seem to think that a blind teacher is not a good teacher for teaching the blind?—I certainly do not.

544. But the blind will look a subject from a point of view of their own; the blind see with their fingers and see with their ears, if we may say so, and one would on the face of it think that it would be very useful as an aid in teaching the blind that a blind person could instruct them by conveying knowledge to the mind through the same channels as they have got their own knowledge by?—You say as an aid in teaching, I agree with you that it would be an aid in teaching, but there is a difference between the aid in teaching that might be given by an assistant, and the work that would be performed by a chief teacher. I think it would be an advantage for a head teacher to have a blind monitor, but I should not appoint a head blind teacher, and give him a sighted monitor. I think that the head teacher should be a trained teacher.

545. You would think that for certain purposes a blind teacher would be as able to convey knowledge to the mind of a blind person through the channels by which knowledge is admitted to the mind of a blind person as a sighted teacher?—I quite think so. I have experience for example of a blind monitor.

546. Inasmuch as a blind person will consider and contemplate and learn about a subject in a totally different way from a sighted person, do not you consider that a blind person would be of great assistance in teaching the blind by conveying knowledge to the mind of the blind through the channels by which he has obtained his own knowledge?—The blind may assist in teaching the blind, but if you want the blind to be taught efficiently you will certainly have a sighted teacher. A sighted person in learning what a cube is learns it by touch, helping himself by sight, but a blind person is cut off from sight, and therefore has to help himself more by touch. If you want to teach a blind person what a cube is, you put the cube into his hand, and a blind teacher will be very much longer in getting the idea of a cube into a person's mind who does not know what it is than a sighted person will. A sighted person will give the knowledge to the blind person not simply twice as fast, but four times as fast, or perhaps more, and the same would apply to all things that have to go through the touch, what is called in ordinary schools, Lessons on Form. A sighted teacher would use his sight as an aid to supplement the want of that particular faculty of a blind person, and he would call up all his power of illustrating the thing, of course mainly through the touch, he would say, "Touch here," or "See there," which is a common expression in a blind school, the children say "See here" when they are touching anything. If they have a raised map before them a child says, "See these mountains here."

Rev. J. P. Faunthorpe, M.A.

18 Dec. 1885.

547. (*Mr. Arrol.*) Do I rightly understand you to consider that because the blind have been deprived of one faculty it is not advisable to give them increased facilities to cope with the sighted for professional purposes?—Everything that is kind and good and just and merciful and holy, if you wish, should be done for them, and in anything which they could do better than a sighted person of course they should be employed.

548. (*Chairman.*) Or as well?—Or as well; but in a large number of cases, almost in all cases, it is impossible for them to do it as well, as far as my experience goes, and therefore if you give them aid to do what is in the nature of things impossible I think it is a mistake.

549. (*Mr. Arrol.*) Do you consider that it is impossible then for the blind to fit themselves for a professional sphere?—Certainly not. Mr. Fawcett was Postmaster-General.

550. (*Dr. Armitage.*) Have you had any personal experience of the power of well qualified blind persons to teach?—Yes, I have come in contact with a blind teacher of music at St. George's, and I knew a blind organist at Battersea, and I was familiar with the way in which he learned new tunes. When he had to learn a new tune he always required a sighted person to be with him, a person who could read music, and who was himself a musician. It would take a sighted person with no knowledge of music, or a small amount of knowledge of music, a very long time to teach a blind organist a new tune.

551. I was speaking of school teaching?—With regard to school teaching I have had a good deal of experience as an examiner.

552. Have you any personal experience of qualified blind teachers as teachers of classes?—No.

553. Are you aware that all the professors of the *Institution Nationale des Jeunes Aveugles* at Paris, who are appointed by the French Government, are blind?—I am not.

554. (*Dr. Campbell.*) Have you any experience in regard to the teaching of the blind beyond the school at St. George's and the branch school at Wandsworth Common?—None.

555. Your experience is entirely limited to those?—It is entirely limited to those.

556. (*Dr. Robertson.*) You said that it was not a question of opinion, but a matter of absolute proof, that a sighted person could teach better than a blind person: will you tell us what the facts are which make it a matter of absolute proof?—I found what I say on my own experience.

557. (*Chairman.*) You spoke of a very clever blind monitor, who you said was doing her work exceedingly well. She is steadily gaining experience in tuition?—Certainly.

558. And will some day be a skilled teacher?—She will be skilled up to her ability.

559. When that child comes to be a teacher do not you think it possible that she may be able to teach the blind very much better indeed in some departments than some of the young women who are so very ably trained in your own training college?—I should say never.

The witness withdrew.

Rev. B. G. Johns, M.A., examined.

Rev. B. G. Johns, M.A.

560. (*Chairman.*) You are chaplain and secretary of the school for the indigent blind at St. George's-in-the-Fields?—Yes.

561. How long have you occupied that position?—I have been chaplain 34 years; I have been chaplain and secretary for the last four or five or six years, but I have been there altogether 34 years.

562. What number of persons have you in your institution?—Altogether about 230; we have about 150 actual pupils at St. George's, then we have 50 in the branch school, and we have 28 adult workers attached to St. George's-in-the-Fields.

563. You have 150 ordinary pupils at St. George's, of what ages?—Those 150 range from about 12 to 20.

Rev. B. G. Johns, M.A.

18 Dec. 1885.

564. At what age do you admit them into your institution?—From seven to 20, including the branch, the branch being intended for the younger children.

565. The branch school is for the younger children under 12?—The branch takes in children as low as seven.

566. Is that a day school or a boarding school?—The children live there entirely.

567. Do you receive any grants at all from Government?—None whatever.

568. Your school is not an inspected school?—Not under Government; we are inspected and examined.

569. By whom?—On Friday last the boys' school was examined by Mr. White, who is a barrister-at-law, and who is secretary and mathematical master to the Training College at Battersea; he inspected the boys' school; the girls are inspected and examined by picked and trained mistresses from Whitelands, head teachers.

570. Your lower school, the branch school for the younger pupils, is taught by certificated teachers?—Yes.

571. How many teachers do you employ in that school of 50 pupils?—One sighted teacher and two monitors.

572. Are the two monitors blind?—They are.

573. Have you had any experience at all with blind teachers?—Yes, a good deal.

574. Do they teach well?—I have watched them carefully, in this way; the teacher at our school at St. George's, who is a sighted teacher, has the power of selecting any clever boy, and making an under teacher of him, and I have watched that person at work. We also have had blind teachers once or twice in the different trade shops; those are watched, and we have seen what they could do, and what they could not do.

575. Are you satisfied with their efficiency as teachers?—If I could not get a sighted man as a teacher of course I should be very glad to get a blind teacher.

576. You prefer sighted teachers to blind teachers?—Yes. Perhaps you will allow me to qualify that a little. There are some few blind teachers who can teach blind children better than a sighted teacher can, but on the other hand there are a very large number of things which a sighted man can teach which a blind man will not teach so well, and for this reason, that a teacher to be worth his salt at all must be in possession of all his faculties; he must have keen sight, keen hearing, keen speech, keen intelligence, and a man who has lost one of those is hardly so well qualified as a man who has them all.

577. You think that he is at a disadvantage in many respects?—Yes.

578. You said that there were some departments of tuition that the blind would excel in?—Yes.

579. What would they be?—I did not use the word "excel," but I said that there were some blind teachers who could teach blind children some things a little more quickly than a sighted person. I have known a blind teacher teach a blind child to make a particular part of a basket much more quickly than a sighted teacher would; I think from one great reason—that the two had sympathy with one another, the one blind man knew exactly what the other blind man wanted, and how he was to be set to work. I think that that applies right through in a measure, but more to industrial work than other work.

580. Would not it also apply in teaching reading?—No, I do not think so.

581. You have blind monitors?—Yes.

582. They are efficient we hear?—We get all the good we can out of them.

583. What department of tuition do they undertake?—They teach whatever the master for the time being may wish them to teach or fancies they can do best, for instance, if a boy is a clever arithmetician the master will pick him out to teach the arithmetic class, a boy who is a good reader is picked out to teach others to read, and a quick speller helps in spelling. I do not think there is any one thing which I can say a blind man does specially well.

584. You think that in most occupations he is at a disadvantage?—Decidedly, and it would be so in the case of teaching. I can recollect one or two blind teachers who came to us in the brush shop for example, and I think once in the mat making shop, but the committee after very careful consideration were obliged to get rid of them.

585. What are the conditions upon which you admit these poor blind children?—The blind with whom we deal are of the poorer class; not those who are able to pay 40*l.* or 60*l.* a year to go to larger or more expensive or more ambitious institutions, but children of the poor out of the streets, out of ragged schools, and out of worse places sometimes.

586. How long do you keep those children in your schools?—Six years is the average, the committee reserving to themselves the power of giving a boy six months additional for any special work in which he requires further instruction, music, or whatever it may be.

587. But you do not consider that a child coming to you at seven years of age can in six years be educated and trained industrially?—Quite so; if he comes to us at seven years of age he goes to the branch school and there he will probably remain until he is 12, then he will come to the central school and get his six years.

588. The central school is occupied in industrial training chiefly?—Chiefly; not entirely.

589. But continuing the education at the same time?—Yes.

590. At the central school they get industrial training and instruction in music?—Yes.

591. You complete their education there, in fact?—Yes, as far as we can carry it.

592. Do you receive any payment from any of these children?—None, whatever; the instruction, the clothing, and the board is gratuitous.

593. Your institution is supported by what?—Voluntary subscriptions and donations.

594. Have you any endowments?—No.

595. Have you any funds invested?—Simply the result of what has been saved by the committee in former years, which forms a reserve fund

596. What is the amount of your reserve fund?—About 144,000*l.*; it has gradually grown within my knowledge to exceed 100,000*l.*

597. That comes from legacies and donations?—It is accumulations from legacies and donations.

598. (*Mr. Johnson.*) Gardner's trust left you 10,000*l.*?—Yes.

599. (*Chairman.*) Can you tell us what becomes of the majority of your students, after you have trained them, when they leave the institution?—Such of them as are well qualified for the work which we carry on we take into the adult shop of the adult workers so far as the capacity of the room will provide for them, but a great number of them do not live in London, and they go back to the place from which they came, and there they work at their trade if they can get any market for their trade.

600. Have you any evidence to show how many of them pursue their trade and earn the whole or part of their living by it?—I should say off-hand that a very large proportion of them do earn by their trade a considerable sum towards their living.

601. What trades do they work at principally?—I think basket making and mat making are the two trades in which they succeed best.

602. Do they work at brush making?—Yes.

603. Rope making?—Not rope making, they make sash* line, and where they can get orders they succeed admirably, but with regard to brush making the difficulty is, when they get away to a remote village to get anybody who will give them employment. If they live in London they will probably get employment; they will go to brush makers and the brush makers will see what they can do and give them employment, but in the country it is more difficult to get employment, in fact that is the great difficulty with them when they get away how to find employment. The squire, or the vicar, or some kind patron sets them at work for a month or three months, then he gets rather tired of it, then the

* The sash line used at Windsor Castle is made by our pupils.

orders begin to get slack and the boy falls into difficulties and writes up to us or to some other school to know if he cannot get taken in as an adult worker or whether we cannot get him some employment.

604. Many of them relapse into habits of beggary and pauperism?—Of that I have no evidence to show me. I should think a few do. For example those who divided their time between music and industrial work and achieved no great success in either, who went away indifferent fiddlers and indifferent mat makers, would drift into the street; they get a tin whistle or a fiddle and away they go, but a boy who has learnt to make a tolerable basket and who has had the training that he gets while in the school would rather go on making baskets if he could.

605. But there are various degrees of efficiency and skill among the blind?—Yes.

606. Some can earn fair wages as compared with the sighted and others cannot earn half as much though they may be equally industrious?—That is so.

607. And you have no means at your disposal for supplementing those earning or controlling your pupils after they leave the institution?—No power whatever.

608. Can you tell us what provision, if any, is made for poor adult workmen who become blind between the ages of 30 and 40?—I have no experience of them; if they are over 20 years of age we cannot touch them. We have them from 7 to 20. By a special byelaw of the corporation, the committee have the power of dealing with a case where the age is 21 under special circumstances, then it requires special formalities, a certain number of persons to be present, and so on, so that, as a rule, we do not get anybody above 20.

609. Are there any former students who are properons, and carrying on successful trades and businesses?—Yes.

610. Really saving money?—I do not know about saving money.

611. Not only maintaining themselves, but carrying on a business of some kind, and making a little money?—Yes, I know one or two cases where boys have got on well enough in addition to their doing work, to open a little shop and to get a pony or donkey and to go about and get orders to carry on their own trade, and sell things as well. I know such cases.

612. Are there any branches of industrial business besides those which you have enumerated in which the blind can as far as you know be profitably employed?—There is basket making, brush making, mat and rug making, making sash line, knitting and netting. Something may be got out of any or all of them, and in some of the Scotch schools mattrass making is carried on.

613. Do you teach music in your school?—We do to all who have a decided ability for it.

614. What is your experience of the results of musical teaching?—The gateway of success is barred at the beginning. I have known an exceedingly clever organist trained, but the difficulty when he has been trained has been to get a situation. Then I have known people say to me, that is because you do not teach them enough; you do not know how to do it at St. George's. You cannot teach them music thoroughly well, if you did you would get them situations. I speak after a good deal of experience in the matter. I have answered that in this way, we take an intelligent boy who really has got a positive musical talent, we do the best we can for him, we teach him to be able to conduct a musical service as well as it is conducted in thousands of churches in England. Out of the few that we have sent out as trained musicians no one person has ever been objected to if he got an appointment, but the bar is that the moment you send him out they label him a blind person, and the vicar or churchwardens say, or somebody says, We cannot have him if he is blind, he cannot do the work; they do not give him a chance of playing and finding out whether he can, but when I answer an advertisement they say, We are very sorry, your boy may be as clever as he likes, but we could not have a blind man in our church. They will not give him a chance. In spite of that we have obtained situations as organists for a very fair number; we have now a fair number of persons scattered about in one place or another earning as organists, I am sorry to say very small salaries, but not smaller, I am told on very good authority, than people with eyes are getting, as low as 30*l.* a year; in one case I know it is less than that. One man I know at the present time is earning 40*l.* a year, but he is looked on as a prince; a very exceptional person altogether, and he is not nearly as clever as a boy that I am going to send out next week to Blackheath, who will only get 25*l.*; he has got the appointment.

Rev. B. G. Johns, M.A.

18 Dec. 1885.

615. They get a little money probably by some musical tuition?—Yes, I have known cases of our own blind getting a little tuning and a little teaching, but it is only a little.

616. As a means of refinement and recreation it is a great advantage to the blind to be taught music?—In that respect you cannot praise it too highly; it does for the blind even infinitely more than it does for the sighted in the way of refinement and amusement and recreation and all that music has ever been supposed to do. The few that we can obtain appointments for as organists get barely enough to live upon with a little teaching or tuning; they are taken out of reach of want.

617. If they get only 30*l.* a year as organist, still it occupies but a very limited portion of their time and they can apply themselves to other work by which they can supplement their income?—Yes, I know one man who at this time makes baskets in the week, but he would be very thankful if he could get tuning or teaching.

618. Do you train any of them as piano tuners?—Every organist who leaves us is able to tune a piano. With regard to the other section of music, that is to say, playing on instruments, if the Commission wish me to say anything about that I think there is something to be said. I am now referring to those who are not specially taught the organ, but who make up a part of our band of 30. I have had it asked me, "What is the "good of teaching this boy the fiddle? Will he get "his living by it?" I say, "No, he certainly will not, "and I hope he will not go to the public house or any-"where near it, but there is the risk."

619. Is not it the fact, and too often so, that they have recourse to the public house and to the street with their violin for the purpose of getting a living?—Yes, that is the danger. My committee are thoroughly aware of that, and to guard against it in a measure they take care that the boy shall be a good basket maker as a more important thing than his becoming a good fiddler, still we let him do what he can in the time that is given to the fiddle so that he may have a means of amusement and recreation.

620. Can you tell us what is the cost of the training of each of the inmates of your institution, that is to say, the whole cost of lodging, feeding, clothing, teaching, and training?—I have not any figures. I will give a sort of estimate. I have had that question asked me many times, and I have answered it generally in this way. We spend, say, on an average 10,000*l.* a year, and we educate or train 200 blind persons; therefore if we divide 10,000*l.* by 200*l.* that roughly is what each child costs.

621. You put the cost of boarding, lodging, clothing, educating, and training blind persons in your institution, of from seven to 20 years of age at 50*l.* a year?—I should think in round numbers about 50*l.*

622. That in supposing that your buildings are provided for you and you have no rental to pay?—Yes, our building is our own.

623. Your figure of 50*l.* is assuming that the schools and buildings are already provided, and you have nothing to do beyond maintaining?—Yes, in the case of our branch school we have to pay a very heavy rent.

624. (*Mr. Johnson.*) With regard to the branch school that is an institution entirely separate from the one in St. George's?—Yes.

625. There is a rental of how much a year on that?—300*l.* at least.

626. For 50 children?—Yes.

627. Was there any expense in adapting the buildings?—Considerable expense because the committee have added an infirmary and several detached buildings and a new schoolroom.

628. The buildings at St. George's, I believe, occupy a space of nearly three acres of ground?—Yes.

629. And they were erected many years ago before the existence of any members of the present committee of management?—Yes.

630. The buildings are very extensive and they were erected under the old system of education?—Yes.

Rev. B. G. Johns, M.A.

18 Dec. 1885.

631. (*Chairman.*) Have you any figures to give us to show the cost of boarding, lodging, teaching, and training in other institutions as compared with your own?—Three years ago I printed a little memorandum in which I went a little into the question of the expenses in various institutions. I took the Midland Institution for the Blind at Nottingham, the Wisconsin Institution for the Blind in North America, the Wilberforce School at York, and the Normal College at Norwood, and I endeavoured as far as I could to get a rough idea for my own information and for the information of the Committee what the cost really was. It varied very widely I think in different years, and I think for this reason, that in some years the outlay in the case of a particular institution was very much larger than in other years.

632. That would be in consequence of some addition to the building or plant?—Yes, if you take one year your estimate falls and in another year it rises very much.

633. But you may exclude the fixed capital?—I found that about that period, that is to say, 1881, in our own institution the cost was somewhat above 50*l.*; in the institution at Wisconsin it was beyond us, it was over 70*l.* there. At the Wilberforce Branch School in round numbers it was about 80*l.*, and at the Normal College it was considerably above that.

634. What was it at the Normal College?—About 100*l.* for that year, 1881.*

635. (*Mr. Johnson.*) No doubt that was a year when there were extra expenses?—I suppose so.

636. (*Chairman.*) With regard to the curriculum of your schools; what do you teach besides reading, writing, and arithmetic in your lower school, your branch school?—There we teach the elements of history and geography, and all that may be included under the words religious instruction, Bible history, the catechism, and so on.

637. In the upper school, do you continue that same education to some extent, do you continue the instruction in history and geography, and so on?—Practically the result of the foundation of the junior branch school has hardly begun to tell upon us very much yet, but the committee hope that there the foundation will be laid for the work we carry on at St. George's. We look forward to their eventually supplying us with really all that we can take in. We shall get our boys through that channel rather than getting boys of 17 who cannot say the Lord's Prayer, which is a very common case.

638. Where have you hitherto obtained your pupils from?—From all parts of England, even remote parts of Cornwall, and as far north as the remote parts of Yorkshire, so that any blind child in the country, if he is only poor and badly off has his chance.

639. Is yours a voting charity?—Yes, but when a boy has failed four times the committee take him in, that is to say when he has failed at four half-yearly elections.

640. Your balloting takes place every half year?—Yes. Say it is the third time that the boy has failed the committee say, very well if you do not get in the next time we will take you in.

641. Have you a considerable number on your list of applications that you cannot admit?—A very considerable number.

642. How many have you at any one time?—I think at this present time we have 30 males for the next election, and I should think in round numbers about 15 girls.

643. Do those require nomination or does a mere application suffice?—An application may come from anyone.

644. Suppose you are unable to take them in have you any idea what becomes of them?—But we do always take them in.

645. You do at the end of two years, but in the meantime do not some of them disappear?—No, nine-tenths of them get in before two elections are over, then to the remnant that is left we say we will not leave you to wait long, we will pick you up, if you will hold on to the third time we will take you in.

646. What is your test of poverty, your school is entirely for the indigent, what is the test of indigence in your case?—We have in point of fact none but the extreme poor and a few of the next class above them, children of little shopkeers and tradespeople, but nothing beyond that.

647. Practically you have the children of people who cannot afford to pay for the education of their children?—Yes.

648. You do not receive any partial payment?—None at all except in the case of pauper children.

649. Then you may receive something from the guardians?—Yes, the guardians make us an offer; we do not exact it from them, they say if you will take this child we will give you 1*s.* 6*d.* a week.

650. (*Mr. Johnson*) What is the largest contribution that you receive from any board of guardians?—I think we have as much as 2*s.* 6*d.* a week in some cases.

651. That is entirely voluntary?—Yes.

652. It would be as well that you should tell the Commission the sort of education that you pursue, and the types which you recommend for employment?—In one of the papers which we send out we say that we undertake to teach them to read, write, and cypher, the elements of geography and history, and it has been said to me more than once, Why cannot you do something more for them? Why cannot you go to a higher point? Why cannot you raise your training to this or that point? And I say, the object of these children coming here is to be taught a trade which will enable them to maintain themselves partially or wholly, and to be made decent, respectable, steady-going people. In order to teach them a trade, say basket making, we require (so the trade masters tell me) to devote a certain portion of every day to teaching the boy that trade, consequently there is only a small portion of the day that we can give in the school room to ordinary education, which will be given now in a great measure by the primary school, so that when a boy comes to us he may be able to learn a great deal more. No doubt we could do more, and people have said, Why do not you do more? Why do not you teach them this and that? You see what a blind man can do when you teach him. They forget the object which we have in view, they forget the class of children that we have to deal with, the children of poor people who are going back to poor homes in a poor neighbourhood, where they can get but scanty employment.

653. What is your opinion with regard to teachers, do you prefer sighted teachers or blind teachers?—We could not carry on the work of the school-room unless we had a sighted teacher.

654. Are you in favour of the employment of blind teachers as monitors and assistants?—We use them ourselves.

655. What are the average earnings in the trades that are carried on in the adult workshop?—I should think they range from 10*s.* to 20*s.* I have known a boy get more than 20*s.*

656. (*Chairman.*) In what branch of business?—Rug making. I have known more money made at rug making than at anything else; basket making is exceedingly good too.

657. (*Mr. Johnson.*) At page 14 of the report of your school the average earnings of those who are employed in the workshop at St. George's are given, is that a correct statement of the average earnings in the various industries?—Yes.

658. Will you read it?—Average earnings of basket makers, 15*s.* 11½*d.* per week; average earnings of mat makers, 16*s.* 3½*d.* per week; highest average of basket makers, 1*l.* 10*s.* 3*d.* per week, lowest average of basket makers, 8*s.* 9½*d.* per week; highest average of mat and rug makers, 1*l.* 1*s.* 5½*d.* per week; lowest average of mat makers, 11*s.* 2*d.* per week; average earnings of wood choppers, 9*s.* 6*d.* per week; average earnings of Emily Boxall, 3*s.* 7½*d.* per week; H. Sagon (a former pupil), brush maker working at his own home, 9*s.* per week; J. Johnson (a former pupil), brush maker working at his own home, 6*s.* 3*d.* per week.

659. With regard to types; what is in your opinion about the best type to be employed for teaching the blind?—I have had very considerably difficulty in making up my mind about that, but after some years experience I incline to this view, which I may state very briefly and broadly to the Commission, I think as a foundation I should take that type which brings the blind person as closely as possible to the rest of the world. As all the world read by the Roman type more or less I would give them that; if they could not deal with that I would give them the next nearest to that whatever it may be. On that principle I think we have gone, but we have supplemented it in this way. It may happen that a boy cannot learn the Roman type, or

* On this point *see* para. 210 of the Report. C. E. D. B.

Rev. B. G. Johns, M.A.

18 Dec. 1885.

Moon's type, or what happens to be the nearest to the Roman, and then we have said, We will see if you cannot learn something else. We have said we will try Lucas, which is a crabbed unintelligible business, though some of them learn it, we have said we will try Frere's, but that is now altogether exploded. We try them with any type, we teach them anything that they can do. With regard to the Roman type I should prefer to adopt that or the next nearest to it on the very broadest principle, that that which binds the blind to the rest of the seeing world as closely as possible must be an advantage, they themselves like the Braille type, they learn it quickly, and they use it with dexterity, they like it because they can talk to each other in a cryptograph which nobody else can read.

660. (*Dr. McDonnell.*) What proportion of the blind are capable of being taught music?—That is a very wide question.

661. Among your own pupils what proportion would be capable of being taught music?—15 out of 16 believe that they have a gift for music, 10 out of 16 believe that they have a Heaven born genius for music.

662. Have you formed any estimate of what proportion of the blind in your school could be taught music fairly well?—A very large proportion.

663. Half?—Yes, I should say half.

664. One of the things that strikes a person like me is the extraordinary capability that the touch has of being educated very highly; do you think the ear is also capable of being very highly developed in the blind?—I certainly do. I think that that is one result of the condition of blindness itself. One hears occasionally of the extraordinary and preternatural gifts of the blind, but the fact is that by their being deprived of sight they are driven to rely upon their other senses, and by relying upon them, and working them, they are educated and developed and become keener.

665. Do you keep up any immediate connexion with the blind people after they leave your institution?—As far as we can, and in this way. When a blind child leaves school I say, give me your right address, and whatever you do let me know how you are getting on, and get somebody to write for you if you cannot write yourself, let me know at any time how you are getting on and what you are doing, and in a very considerable number of cases I hear of them again from time to time, but in a very large number of cases I never hear of them again, and what is more, I cannot find them out; a boy goes to Sheffield for instance, he changes his lodging after he has been there six months, and the letter which I have written to him comes back to me.

666. So that in fact you could not give anything like reliable statistics as to what happens to your boys after leaving you?—No; I could give you the names and addresses of a large number who have left us, and to whom I have written with the result of having the letter returned.

667. In answer to one of the Commissioners you said, speaking off hand, a considerable number of your pupils do succeed in earning or partially earning a livelihood?—Yes.

668. But I suppose you are not able to give any precise information upon the subject?—I cannot give you the identical places where they live, but my evidence is derived from letters which I have received, and from that sort of flying intelligence which goes on among the blind themselves. I will say to a boy, Have you heard of Smith who went away last half? And he will say, When I was down in the country another boy told me that Smith was keeping a shop, and making so much a week, in that way I hear a good deal as to what has become of the boys who have left us.

669. You would not consider it anything like precise information?—If a boy told me, I know Smith is making 8*s.* a week in making baskets, I should think he would have no motive in telling me that if the fact was not so.

670. But with regard to the exact number of your former pupils so earning a living, your information would be indefinite and not reliable?—I am not prepared to give accurate details, but I am sure of this that a large proportion of them do earn a very considerable amount towards their living.

671. How many of your own old pupils return to these adult workshops?—They are perpetually full and more than full.

672. How many of your old pupils have you in those workshops?—We have 28 there now.

673. (*Chairman.*) Have you any means of supplying materials to the blind when they go into the country?—That we constantly do. Only last week a clergyman wrote to me from some place near Swindon, and said, "A boy who left your school a year or two back is very "much troubled with fits, and you were obliged to get "rid of him on that account; we find he can do a little "basket work; his friends are very poor, and I cannot "get material for him, will your committee allow him "to have material at wholesale price or a cheaper "price." He will get that material from us for far less than he could buy it elsewhere, and he will have his tools given him.

674. One of your difficulties with regard to the special class from which your pupils come is to find decent homes for them to go to when they leave you?—I think they can generally as a rule carry on their trade at the homes to which they go. Many of the homes to which blind children go on leaving us are no doubt dreadful in many ways, especially in London.

675. (*Mr. Arrol.*) Are the 26 adult workers resident in the institution?—No, not resident, they live close by.

676. You pay them wages, are those wages supplemented by any subsidy?—We give them a dinner only.

677. When one of the adult workers leaves your institution do you give him an outfit?—When he leaves us we give him an outfit. We give him his tools and a suit of clothes. The workers are paid what would be generally called journeymen's wages. They are not paid specially as blind men, so that the shop is a self-supporting shop.

678. (*Chairman.*) They are paid as the same sort of workmen would be paid for the same work?—Yes, the only supplement to their wages is that the Committee give them a dinner.

679. (*Dr. Armitage.*) You said, I think, that you have some monitors; are those monitors pupils under instruction, or have they finished their instruction?—The two in the junior branch school have both ceased to be under instruction.

680. They have left school?—One has actually left to come back to us as a monitor, the other was drafted from school because she was found to be a girl fitted for the work that she was wanted to do; by-and-bye, perhaps, when she has been a year or two at Wandsworth she will come back to us to finish the course to which she may think she is entitled.

681. In the main school at St. George's are the monitors pupils who have left school and come back?—No, the master picks out a boy that he thinks best fitted to do a given thing, and he is made a monitor.

682. Do you pay your monitors?—A small reward at the end of the half year.

683. You said that you expect that in time the branch school will supply most of your material for St. George's?—I think that is the aim of the committee.

684. And you think the age at which they would come to St. George's would be about 12 years?—Yes.

685. And you look forward to a time when your pupils will, as a rule, leave you at the age of 18?—In round numbers it would be that.

686. Do you think that as a general rule a pupil is old enough at 18 to succeed in establishing himself in a trade?—If he ever does anything as a basket maker, I think, from what I hear from the trade teachers he will be sufficiently proficient when he has arrived at that age to be able to carry on the trade, no doubt, if he happens to be sickly or weak or slow, he would be better off if he had two years more.

687. You are not able to give two years more?—We are not able to give more than the six years after he has been to the branch school; but the committee might do anything they chose, and in individual cases they will relax their ordinary rule. If I said to the committee, here is this boy, Smith, it would be a good thing for him to get three months more or six months more. I think the committee would at once say, if you can find a hole for him put him in it.

688. (*Chairman.*) Some pupils are more proficient at 18 than others would be at 19 or 20?—Yes.

689. (*Dr. Armitage.*) Do you know any one who is making a living at sash line outside the school?—I know one or two who are making sash line.

Rev. B. G. Johns, M.A.
18 Dec. 1885.

690. Can you tell us how much they make?—Only girls work at this trade, and those who can *procure order* (here lies the difficulty) may earn 5*s.* or 6*s.* a week but; it requires two persons to work together to be really available.

691. Do you keep any register of your pupils?—We keep a list of them.

692. Can your get at them easily after they have left the school?—Yes, we have the date at which they enter, the time they are there, the date when they leave us, and their address.

693. How many blind persons scattered through the country at present have passed through your school?—I could not tell you off hand, we admit about 30 or 40 children a year,—that presupposes that about 30 or 40 leave us, but carrying it further back we have a smaller number, when I first came to the school we had very much smaller buildings, we had no branch school, and no adult workshop. I do not know that I could give you the exact number.

694. Do your musical pupils as a rule learn trades as well?—As a rule we try to insist upon it, but if a boy believes he is going to be a Handel or a Mozart he will not believe in baskets, and he will not touch baskets if he can get away to a violin or organ. The committee say to me let him learn the fiddle but make him a good basket maker as well, and so we teach him both; but as a rule he does not succeed in both.

695. As a rule you teach both?—We try to teach both, a clever violin player may be a very fair average boy in his industrial work, but the moment he goes away from us he will get away from his industrial work if he can.

696. Are any of your pupils in the adult workshop married?—A certain number of them, and some of them, unhappily, married to blind women.

697. Can you tell us how many are married to blind women?—I cannot tell you off hand, I should think a third of them, more than half of them are married.

698. Do you encourage blind men marrying blind women?—We try to prevent it in all the ways we can, but it is very difficult to prevent it, we probably do not know of it till the event has taken place. I know the committee have more than once said to me, do whatever you can to prevent such a misfortune coming upon a man, because they had one case before them of an unfortunate wretch who had a blind wife and three or four children, one of whom was blind, that was a mere chance of course.

699. (*Chairman*) You do not believe in congenital blindness?—No, but the case was so wretched and so deplorable that the committee have done all they could to prevent it, but it is exceedingly hard to check.

700. (*Dr. Campbell.*) Do you regard your musical department for various reasons as being of importance?—Yes, I think so certainly.

701. Is the musical instructor a blind teacher or a sighted one?—The resident musical instructor is blind, and he was a former pupil of the school, but he has two sighted assistants, one on the boys' side and one on the girls' side.

702. But he is the principal teacher?—Yes.

703. As you do not think blind teachers are so good as others, would not it be advantageous if you employed a sighted musical instructor?—He is reaping what he did not sow. Mr. Monk, who had uncommonly good eyes, was the musical director for a good many years, and he only left us about two years ago, since which the blind resident instructor has taken it up and has worked most admirably and with very great skill and unwearied diligence.

704. In your opinion he is successful as a teacher though he is blind?—He is, with the help of the sighted assistants.

705. In your choice of pupils for the musical department do you have regard to the mental capacity as well as the ear of the pupil?—I think both, but the decision rested with Mr. Monk while he was director, and now it mainly rests with Mr. Marchant himself; he tries a boy, he puts him on test for a month or two months, and at the end of that time he will perhaps say to me, "I do "not think it will be worth while for me to go on with "Smith, he will never do anything worth doing at "music, you had better let him go back to basket mak-"ing." He tests the boy in very many ways, by ear, by readiness of touch, and by manifestation of a musical taste. Most of those who come to us have a little knowledge of music, they all have a taste for it, and can play something, and it is easy to find out how far that goes.

706. You spoke of the poverty of the children with whom you have to deal, and you put that as an important point; do you think they are so very much poorer than the children taken in in other schools, say Norwood, for instance?—Yes, unquestionably.

707. Are you thoroughly conversant with the condition of the children at Norwood as regards poverty?—I am not thoroughly because I have no means of knowing them individually, but I conclude, and I suppose fairly, that children whose parents are able to pay 50*l.* or 60*l.* a year must be far better off and move in a totally different condition of life from those who can hardly afford to pay the child's railway fare to our school.

708. Can you tell me how many children that come to Norwood pay 50*l.* or 60*l.* a year?—I have no knowledge of the Normal College at Norwood.

709. (*Admiral Sir E. Sotheby.*) You mentioned that the expenditure at St. George's is 10,000*l.* a year?—In round numbers.

710. Does that include the expenses of the industrial department?—It includes all the expenses, teaching and everything.

711. Then the education, boarding, and lodging of each child would not cost 50*l.*?—It would be less than 50*l.* if you deduct the expenses of the workshops.

712. What are the expenses attending the industrial branch of the institution?—The cost must be very considerable; I should think it must be 10*l.* or 12*l.* a week in wages, there you have 600*l.* a year at once, then there are the wages of the teachers in the adult shop.

713. So that if you deduct those expenses it would reduce the cost for each child very considerably?—Very considerably.

714. Can you give us an estimate of the expense attending the adult workshop?—Coals, gas, water, dinners, 88*l.* per annum; wages of teacher and finisher 3*l.* 9*s.* per week.

715. Do you get a ready sale for all the goods that you make?—For more than the adult workshop can make.

716. At what age do the boys commence learning a trade?—A boy who came in at 12 years of age would begin at once.

717. From 12 to 18 he would be at a trade?—Yes.

718. That is six years?—At least six years.

719. Do you consider that at the end of six years he can make a perfect basket, and so on?—If he ever becomes a trained man he probably will become one by that time.

720. (*Dr. Robertson.*) Did I rightly understand you to say that the interest on the capital supposed to represent the fabric and the ground was included in your estimate of the expenditure?—No, nothing is allowed for that.

721. With regard to music, on what system is music taught, is it by notation or by ear?—By notation.

722. By Braille?—In a great measure by Braille, but not wholly by Braille. For instance, I suppose Mr. Marchant in teaching a boy a new chant would first of all play it to him; he would tell him what key it was in, then he would play it to him, and then he would say, the first chord is F, A, D, or whatever it may be; the second is so and so, and the third is so and so, now play that bar; and when he had played that bar he would tell him the chords in the second, third, and fourth bars, and he would say, now play those bars; and when he had played those bars, if he be deemed to be correct in them, he would give him the fifth bar and so on; then he would get him to play it all through; then he would say to him if he had not got it in Braille, If you are in doubt about this I will Braille it for you or you shall Braille it for yourself.

723. You are aware that there is a great difficulty in getting work for the blind after they leave school; can you give the Commission any suggestions as to how that difficulty might be met; have you any suggestions to make with regard to their future lives?—I think as far as industrial trades go the establishment of some central depôt or place where materials could be got and to act as an agency for providing work would be very important.

724. Do you mean that you would establish such depôts in large cities?—In centres. For instance, one or two in London so distributed as to take in all London, where the blind could go and say, I come from such and such a place, I have a decent character, I can make a good basket, will you let me have a little material, and can you tell me where I can get work? But with regard to the case of a musical boy who after he leaves us says, I can play the violin or the flute, what am I to do? Shall I go into the streets or the public-houses with a dog to lead me? I say, You had better get out of that way; they will not care much for you or your dog.

725. (*Chairman.*) Would it not be an advantage if those who have left the institution and who are engaged in earning a livelihood should only receive pensions or eleemosynary assistance through some agency in constant correspondence with them having the means of knowing their circumstances, their habits of life, and what they are earning, and that the pensions given to them should be in proportion to their needs and to their character?—I am very glad that you have asked me that, because it is a point that has continually occurred to me. I will take the case of one of our old pupils, a young man of 25; he writes to me, or somebody writes for him, and tells me that he has got a grant from a charity of 20*l.* a year. I write back and say, "I am exceedingly "sorry to hear it, because you, being active and a "clever basket maker, ought to be working for your-"self. If you were 60 years of age and incapacitated "for work, and not able to get a living, it would be a "different thing." To give such a man a pension when he is 20 or 25 years of age I think is the worst thing that you can do for him.

726. The mischief is that the persons who give the pensions have no previous knowledge of the training and aptitude and character of the blind person and that those who have trained him are not consulted, so that the result is that pensions are often given where they would have been better withheld, and withheld where they might with advantage have been given?—Yes. With regard to the two distinct gifts which are attached to the school, one is an old foundation, the gift of a blind man. Under those gifts there are two sets of pensions and 12 pensioners. Into the case of each of those the committee inquire. In the case of another little pension society with which I have something to do, there is a form of questions sent out so as to give those who administer the pensions some information not only with regard to what the applicants for the pensions have in the way of help or means of support, but also with regard to their general character, which form is countersigned by the clergyman of the parish or a magistrate, so that we have that little check.

727. Suppose that in the case of your own former pupils an arrangement was made whereby all pensions to them should be given through you and on your recommendation, and suppose that you had a constant correspondence with them and surveillance over them, do not you think that the pension system would be liable to much less abuse than it is at present?—Far less. I think that that would be a very great improvement.

Rev. B. G. Johns M.A.
18 Dec. 1885.

728. And if there was more concert amongst those who devote themselves to the training of the blind, and the pensioning of the blind, and the general assistance of the blind, do not you think that the money now spent upon the blind might be spent to much greater advantage both for themselves and for society at large?—Unquestionably.

729. (*Admiral Sir E. Sotheby.*) Are there many blind people who receive pensions from more than one source?—The society that I have referred to says: if you have any pension from any other society you cannot get it from us; but that does not hold good in other cases. I might mention one case which fell under my notice about a month ago. An old pupil of our school married a blind woman, and I said to him, "How are you getting on"? He said, "I am getting on all right. I have just got a pension and so has my wife." I said "Where did you get them from?" and he told me. Both those have got a pension. I do not know that that man did not deserve a pension, but he certainly did not deserve a pension for his wife. He was earning very good wages as a basket maker.

730. (*Chairman.*) It was a discouragement to industry and thrift?—Quite so.

731. (*Mr. Arrol.*) With respect to parochial relief are you in favour of doing away with the test clause under which a blind person is required to go into the house in order to obtain parochial relief; would you approve of that being done away with so that the blind will be allowed to remain at their own homes?—I do not think that I have ever thought of the matter before; I suppose the difficulty would be to make one law for the sighted and another law for the blind man.

732. (*Mr. Johnson.*) You mentioned something about pensions; do you know how the application is made in the pension societies?—I think that the application generally comes from the blind person himself. In the case of this charity which I was alluding to the blind person must write for it himself.

733. Backed up by a recommendation according to the rules of the society?—Yes, he fills up a form and sends it in.

The witness withdrew.

Adjourned to Friday, 15th January 1886.

32, Abingdon Street, Westminster.

Friday, 22nd January 1886.

PRESENT:

THE RIGHT HON. A. J. MUNDELLA, M.P., IN THE CHAIR.

THE RIGHT HON. SIR LYON PLAYFAIR, K.C.B., M.P.
THE RIGHT HON. SIR HENRY SELWIN-IBBETSON, BART., M.P.
ADMIRAL SIR E. SOTHEBY, K.C.B.
W. TINDAL ROBERTSON, ESQ., M.D.
T. R. ARMITAGE, ESQ., M.D.
W. AUCHINCLOSS ARROL, ESQ.
E. C. JOHNSON, ESQ.
ROBERT MCDONNELL, ESQ., M.D., F.R.S.

CHARLES E. D. BLACK, ESQ., *Secretary.*

GEORGE MARTIN TAIT, ESQ., recalled.

G. M. Tait, Esq.
22 Jan. 1886.

734. (*Chairman.*) I believe that you desire to supplement the evidence that you gave on your previous examination. In the first place, as I understand, you wish to supplement your evidence as to the ability of the ordinary teachers to undertake the duty of teaching blind children; is that so?—That is so. In answer to a question from the Chairman on the last occasion I expressed my own view on the subject to the effect that I thought there were no insuperable difficulties in it, and I wish to-day to call the attention of the Commission to the report on that subject of a special committee of the Charity Organisation Society. I hope the report is before the Commission; if not I would desire that it should be specially before them. This subject of the education of the blind, in all its various features, was inquired into in the year 1875 by an influential committee, which was in fact composed of nearly all the gentlemen who were technically qualified at that time, and some

G. M. Tait, Esq.

22 Jan. 1886.

of whom are on this Commission; General Cavenagh, Dr. Armitage, and Mr. Johnson were on that committee. It was a very important inquiry which was then instituted, and it ranged over a number of subjects and took a great amount of evidence. No one ought to be unacquainted with this report, and I shall be glad to leave it on the table. The 7th resolution of that committee was in these words:—"The Committee "think it highly desirable that blind children should "be educated during a portion of their time with the "sighted, and are of opinion that efforts should there-"fore be made to provide in elementary public schools "for those not in special schools; also that, to induce "teachers to receive blind children willingly, full in-"formation as to the details of their management in "schools should be circulated, with an account of the "results of this system in Scotland and in London." That resolution was then followed by a remark on page 13 to the following effect, this being the comment of the committee: "Doubtless at first objections may "be raised on the part of teachers to assuming the "additional responsibility" (that is to say of teaching blind children in the ordinary day schools), "but it is believed that these objections may be overcome, and "that, with the aid of the necessary appliances, such "as books in raised type, embossed maps, and frames "for writing and arithmetic, and a suitable set of rules "for their guidance, the tuition of the blind may not "cast any undue strain upon the attention of in-"structors, or in any way interfere with the per-"formance of their ordinary duties. Fears have been "entertained lest the blind might be subjected to ill "treatment from their sighted school fellows; but ex-"perience shows that these are groundless; on the "contrary owing to the feeling of compassion with "which they are generally regarded, they meet with "the greatest kindness."

735. This is supplementing what you said in reply to question 439*a*, wherein you stated that you proposed that every certificated teacher should be qualified to teach the blind?—That is my first point. I wished to add these quotations in support of the suggestion which I made on the last occasion; and I wish to add that since I was before the Commission last time I have had the opportunity of conferring with two practical teachers, a teacher of boys and a teacher of girls, on these subjects. Both of them have had experience in London of blind children in their schools. The male teacher said at once that there was no difficulty whatever in reference to Moon's type, in thoroughly superintending the lessons and exercises of the blind children; and the female teacher, who had great experience in Braille's type, said that without instruction at all she had sufficiently learnt it from observing what was done by the special blind teacher, and that she, herself, would have no difficulty in instructing the blind children even in Braille's type.

736. Were those school board teachers?—They were school board teachers.

737. Teachers employed by the London School Board?—Yes.

738. But did they give you any opinion as to how far it would necessitate an increase of staff if they had any number of blind children under their care?—Of course I could not go into that particularly, but the point in their mind was this: that it was not impossible or impracticable; but the question of the staff and the additional means necessary, of course, was a further question. The point that I wish to put forward is only that it is a practicable thing.

739. You wish to emphasise what you stated in your former examination, that ordinary sighted certificated teachers might easily be enabled without special teaching to teach blind children in the elementary schools, always provided that the staff was sufficient to give the necessary superintendence and care?—That is so.

740. But you would not say that a teacher having a number of blind children to teach could manage anything like the same number of children as a teacher having only sighted children?—It seems to be very obvious that there would be greater difficulty in the case of the blind. My object was this, having in view what I read from this report, and my own opinion as expressed, and seeing that the number of blind children throughout England is a very small number compared with the whole blind population, being only 1,710 of school age, that is to say, between the ages of 5 and 15, out of 23,000 in England and Wales (and I hope the Commission will bear this in mind, as it is a very important fact to remember), those 1,710 children are scattered about, one here and another there. Therefore if you have to give the children any kind of preparatory training, you cannot get them in large numbers at any one centre, they are so distributed throughout the general population that those children who are to be helped on from the early stages must be brought into the elementary schools, and get such advantages as can be given them by the ordinary sighted teachers.

741. How do you get the fact that there are only 1,700 blind children between the ages of 5 and 15?—You will find it in the census tables.

742. Does that include all those in institutions and everywhere?—Yes, everywhere.

743. Does that 1,710 include only those who are totally blind, and not those who are partially blind, and have to be taught as blind children?—The figures are taken from the census returns. When I was last under examination I was asked questions about those who were partially blind. I myself believe, although there are differences of opinion about it, that parents very often call their children blind when they are not blind. That is proved by their being brought to schools and being called blind when they are not really so. Mr. Johnson knows this very well, and so do others of experience. Therefore the 1,710 is an inclusive number in my opinion.

744. Of those who are totally and partially blind?—I do not say partially blind, because I only take the census returns for what they are worth. The census return gives 1,710 blind children in England and Wales between the ages of 5 and 15 out of a total of 23,832. And here is a remarkable fact, that while the average age of the whole of the ordinary population is about 25, the average age of the blind is 50, and the commencing age of blindness on the average is 33 years, which shows how large a proportion of the blind belongs to the adult class.

745. You derive those statistics exclusively from the census returns?—I can prove that in two ways. I have proved it from the census returns, taking the averages as nearly as I could in the periods given there, and I have proved it from over 2,000 cases in London. In the London cases, the average age was a little over 49; so far as I could rake out from the census returns the average age of the blind in the United Kingdom is 50.

746. But averages are very often misleading; can you tell us what proportion of the 23,000 blind become blind or partially blind, and require special teaching under the age of 15?—The statement may be taken to apply to any given time. The individual blind are always changing, but it will be the same average of 1,710, of the ages from 5 to 15.

747. You mean to say that there are 1,710 blind persons between the ages of five and 15; because of course there are a great many under five years of age, and those under five I should think would form a considerable proportion of the 1,710?—There are only 586 under five years of age. I was referring to the blind of the ages of 5 to 15. The 586 are in addition to the 1,710.

748. You say that there are 1,700 children under 15 years of age in England and Wales; have you any returns as to Scotland and Ireland?—At the time that I obtained that information, I had not got the census returns for those two countries, but I will give the per-centages of the whole of the population of England and Wales in periods. Under five years of age there are only three per cent. of blind.

749. (*Sir Henry Selwin-Ibbetson.*) Of the totally blind?—Of the totally blind. Between the ages of five and 15 there are only seven per cent. and between the ages of 15 and 45 there are 28 per cent.

750. (*Chairman.*) Can you give the per-centage between the ages of 15 and 20?—My impression is that if you take the ages from five to 20 the per-centage will not exceed 15 per cent. of the total.*

751. You wish, I believe, to make some reference to the special action of certain school boards with respect to the blind?—That is so. I mentioned on the last occasion of my being here a very interesting aspect in the work at Sunderland. When I gave my previous evidence, I had not the report from Sunderland before me, but since then there has been a special action on the part of the Sunderland School Board, which I think it will be very interesting for the Commission to know

* The total number of blind persons in England and Wales according to Census Returns (1881) of the age of 5 and under 20 was only 2,699, or an average of 11·8 of the whole blind population.—G. M. T.

something of. The honorary secretary of that Sunderland Society, Miss Ada Byers, sends me this report, which I wish to lay before the Commission. She says: "We "would recommend that school boards undertake the "education of blind children wherever there is no "existing institution specially for that purpose. The "school board of this town has for the past three years "undertaken this responsibility. They employ a blind "teacher and rent a room in our institution, where the "classes are held daily, the children attending as in an "ordinary board school, the fees being regulated "according to the circumstances of the parent; in case "of poverty the board remit the fees, as they do in the "case of sighted children. The board has the same "power to compel the attendance of blind children at "school as it has over sighted children. This power "has been enforced here. The great obstacle to be "contended with is the unwillingness of the parents "to send their children regularly. This plan has so "far acted satisfactorily, and the children are receiving "an excellent elementary education, without the many "*drawbacks* of the *asylum* system, and at comparatively "small cost to the town. As far as possible the blind "should be treated in the same manner as sighted "people."

752. I think you advocate that the blind should be treated in every respect as sighted children?—As nearly as possible.

753. And that they should be compelled to attend school in the same way as sighted children where provision is duly made for them?—Yes.

754. And you see every advantage in that?—All the evidence from all the associations points to the necessity of the children being taken early in hand in this way. If they are left simply until they are put into an institution the delay and mischief that arise from the lack of training and education are most detrimental to any good work connected with the blind.

755. And there is in your opinion greater advantage to the blind, not only as to education but as to giving courage and self reliance, in training them with sighted children?—Immense advantage.

756. You wish, I believe, to make some further statement as to blind children in workhouses, and as to what is done in the metropolis on their behalf?—Yes, I may say also that I have had this letter from a lady who has worked for about 30 years as one of our lady superintendents, and who knows the blind, young and old, in Clapham and Richmond and various parts, and she writes to me thus:—"Might not a reference be made with advantage "to workhouses? When a person becomes blind after "childhood the union is sometimes the only refuge, and "if instruction were provided for such as were able to "receive it expense would be saved in the end, and the "man or woman might return to their homes and be self "helpful instead of being a life-long burden on the parish. "A room and teacher might be appropriated for this "object in the union, and also outside people receiving "parish relief encouraged to join. The case of a young "man here, aged 23, has brought this before me."* I may say that our 18 teachers visit all the unions in London.

757. You mean the teachers of your society?—Yes. We have the permission of the authorities to visit all the blind in all the workhouses, and some of the blind are young. Of course the difficulty in acting on such a suggestion as this is the congregating of the young together to form a class, and to make it worth while to set apart a room and appoint a teacher for them; but in London, if there were a general rate, there might be united action, and what I have in view is that the blind children in the workhouses might be brought together for their education and training.

758. Is there in your experience a number of blind children in the union workhouses in London not receiving special training?—Nothing special, excepting that which is afforded by our own teachers.

759. Their only training being the visits which your teachers can give to them once a fortnight?—Yes, or once a week, as the case may be.

760. Then those children are not put in asylums for the indigent blind, and properly taught and trained to get their living, but are merely visited by your teachers occasionally at the union workhouses?—Yes, as a benevolent work, as a pure charity.

* The suggestion of the correspondent has reference to the industrial training of the adult blind, as well as to the teaching of the blind children.—G. M. T.

761. Then, in fact, those blind children who are in workhouses are really, so to speak, trained for pauperism for the rest of their lives?—Quite so. Some of the workhouse authorities do not know what to do with them.

G. M. Tait, Esq.

22 Jan. 1886.

762. And they either remain as paupers in the workhouse or depend upon the workhouse for the rest of their lives, or they supply the class of blind persons that we see begging in the streets?—That is so.

763. You are aware that boards of guardians have power under the Act to send blind children to blind asylums?—Yes.

764. How is it that they do not exercise this power?—I do not know to what extent they do exercise it, but some of the guardians I know have fully availed themselves of the power under the Act.

765. Have you any reason to believe that the state of things which exists in the metropolis exists elsewhere with relation to the blind children of the workhouses of England generally?—I have evidence to prove that there are blind children in the workhouses throughout England, but the number I do not know.

766. (*Dr. Armitage.*) Do you know of any case of a blind child who is capable of being taught, who is an inmate of a workhouse?—I cannot name a case at this particular moment, but I could easily supply a list of all the blind children in workhouses if required. Perhaps I might be allowed to supplement what I have already said on the point of the workhouse children. I see that there is in the printed paper which I asked permission to lay before the Commission evidence from Liverpool on the point. This is the answer that is given to the question relating to the defects of the present system: "The educational defects are many. 1st. The "gathering of large numbers of blind children into "large and often very dreary asylums (the very name "objectionable), where they are taught generally in an "unreasonable manner to do things by rote, as reciting, "and no real attempt made to get them to think. Not "being brought into contact with sighted children, they "often become dull, stupid, and also, for want of "sufficient exercise and physical training, grow up weak "in health. 2nd. Blind children being to some extent "a drag upon their parents often gravitate to the work-"house with even more lamentable results." That is from the Home Teaching Association in connexion with the Cornwallis Street Institution in Liverpool.

767. (*Chairman.*) Supposing that all the blind under 20 years of age were trained, have you any suggestion to make as to what should be done with those to whom you have referred who become blind after the age of 20, and as to how they could be enabled to contribute to their own livelihood?—My suggestion is embodied in this report of the Charity Organisation Society. There are very valuable suggestions on that point. They refer chiefly to the formation, if possible, of centres for workshops and also centres for the promotion of the sale of the goods made. You will find all those very fully worked out in this report, but I will give you my own individual opinion upon the matter. I expressed the opinion in my previous examination that this question as to how the blind were to support themselves, was one which had troubled philanthropists on this subject all their days. I also said, in answer to a question which was put to me by the Chairman, as to whether pensions had contributed much to the real benefit of the blind, that I thought they had not contributed towards self-help. I wish to say that if the pension funds, which amount to about 30,000*l.* per annum in London, could in any way, without interfering with the intentions of the donors (I have no intention or desire to do so), if they could be so applied that those funds might be used to supplement the earnings of skilful workers, care being taken that when a pension is given it should be to a person who deserves it, and who, because of his work, has earned a pension, that would be an immense stimulus. But at the present moment pensions are not distributed on any principle of that kind whatever, and sometimes the results are very unsatisfactory. I know many blind men whose chief object it seems to be to get a pension. They are strong, healthy, and vigorous men, but if they can get a pension of 10*l.* or 20*l.* a year they will not put forth their energies to do much more, and they are satisfied for life.

768. When they get the pension is it really granted, as a rule, from these funds as a pension for the rest of their lives?—As a rule it is.

769. And it is not at all conditional upon their good behaviour or upon their industry?—No, there is nothing of that kind.

G. M. Tait, Esq.

22 Jan. 1886.

770. There is no visitation to test whether they are industrious and helping themselves?—None whatever. In asking me that question you have exactly hit what I mean. If the pensions could be so used as to encourage industry instead of discouraging it I believe you would then have a lever to stir up men to be active and self-helpful.

771. Then you would be glad to see something like the German system, which makes the pension dependent entirely both in amount and in continuity upon the industry of the person to whom it is awarded from year to year?—Yes, I would quite agree to that, and I believe the intelligent blind would welcome it.

772. Can you give us any statements as to the success of the blind who have had industrial or professional training as compared with those who have not had such advantages?—By a very careful inquiry which has been recently made, more recently than that to which I referred in my previous examination, it appears that out of 2,088 blind persons who are now visited in London by our teachers 350 have had training in industrial, or special blind schools in the metropolis and throughout the country; but only 155 of those 350 are now following the occupation which they were taught in the schools. That is the first position I take with regard to the trained blind.

773. Can you give us any description of what the rest are doing?—A very large number of the rest are begging and dependent on their friends, or perhaps they have got a little pension or receive monthly doles from the various charities. So far as I can get this information (it is rather difficult to get) out of the whole 2,088 there are 483 in receipt of regular annual pensions of 5*l.*, 10*l.*, 20*l.* and so on. A good number of those are satisfied to do but little when they have got their pensions.

774. (*Mr. Johnson.*) What sort of trades are they that they follow?—I gave the outline of that in my previous evidence, *vide* Questions 475 to 482.

775. All manual and musical?—You will find that in the evidence which I have given. Then, notwithstanding that, although there are only 155 following the occupations in which they were trained, there are between 500 and 600 blind persons, including these 155, out of the total of 2,088 who are doing something for their own living in London by selling newspapers, turning a mangle, or various occupations which involve purely manual labour.

776. (*Chairman.*) And which could be pursued by a person of good physical strength?—Yes. I have one very melancholy case of a young man under 25, as fine a looking young man as one could see, who came to me for employment; he had been trained in two schools, in one of which a large fee was paid and in the other where he had been for five years. He left his home, where he had been turning a mangle, to go to these institutions, and he left those institutions and went back again to turn a mangle.

777. (*Mr. Johnson.*) Was he incapable of learning?—No, it was from want of employment. He was one of the best readers I ever knew; he could read Moon's type as well as any of us here could read sighted type. I should have been delighted to employ him if we had had the means.

778. (*Dr. McDonnell.*) What wages does he get for turning the mangle?—He has gone back to his mother, and he is only helping her to turn the mangle. The result of the whole education of this poor young fellow, who is now 25 years of age, is that he goes back to the same condition as he was in before he went to these institutions.

779. (*Mr. Johnson.*) To what trade was he trained?—That makes it necessary for me to name the institutions. He first of all went for a time to the Normal College, Norwood, and then afterwards he went to St. George's-in-the-Fields.

780. Was he trained for music or was he trained for a trade?—I cannot tell. He did not come to me for manual employment. I have no manual employment to give; I can only give employment to persons as teachers.

781. There is not any question with regard to the training or the teaching of either of those institutions; it is a question as to the difficulty of getting employment for those who are trained?—That is so.

782. (*Chairman.*) And you think he was well adapted for teaching?—He appeared well adapted for manual labour or anything; he is an intelligent fine fellow.

783. (*Admiral Sir E. Sotheby.*) Do you know where he applied for employment?—He applied to me, and I have no doubt that he applied to the school that he came from. My point is that a fine fellow comes before me who is anxious to get employment, and I can give him none.

784. (*Mr. Johnson.*) And it is the same thing that happens to everybody connected with the blind when they try to get them employment?—Yes, they cannot get it in a vast majority of cases.

785. (*Chairman.*) You have something to say, I think, with regard to the training in the institutions in relation to the probable future position of the pupils?—I have a good deal of evidence which points to this, and I think the managers of institutions have it before their minds; there is a strong desire on the part of those living in the country that if the children have to go back to their parents their training should have relation to the occupations of their parents, or to the manufactory or industry with which they are likely to be associated. For instance, it is no use training a child to make rope unless there is a rope factory, or cord unless there is a cord factory in the neighbourhood in which he is going to live. The training should have relation to the probable surroundings of the person when he goes back to his home, so that he may earn a living by some kind of industry.

786. But the industry should be one, should it not, which is in general demand in every locality?—It should, very largely.

787. And in that respect basket making is a useful industry, is it not?—It is very useful.

788. And is not brush making also a valuable industry?—It is, but brush making is a difficult matter to carry on at home. Chair-caning and basket making may be more easily carried on at home.

789. Cane work is also very useful as a domestic industry?—Yes, very.

790. And any domestic industry that is a universal requirement is the kind of industry to which they ought to be trained, is it not?—That is so.

791. (*Mr. Johnson.*) Have you any experience of blind people working with sighted ones in sighted establishments?—Yes, there are several to be found in small ways. There are blind men who are employing sighted people, so that they get the advantage in the reverse way. I know of one case of that sort. By that means the blind are using and paying for the sight which they need.

792. You think that it is desirable, if possible, to associate the blind with the seeing in manufactures?—It is an immense advantage. I think there has been a great injury inflicted in the use of charities, so far as the industrial part of it is concerned, in not making use of sighted superintendence and sighted teaching.

793. What I wanted to know was whether in your experience blind persons were employed with sighted people in sighted manufactures. For instance, do you know a case in which any blind man assists in a carpenter's shop, or in which any blind man assists in a tailor's shop, or in any other place except as a teacher?—I should think that there are some instances to be found, but they are very rare. A very good specimen of that is the Leicester workshops, where they do bring in sighted superintendence and sighted work to help on successfully the work of the blind.

794. Is that in the shoe trade?—No. I suppose you will call Mr. Harris, of Leicester Institution for the Blind, as a witness; he is a very important man, and he will be able to speak as to that.

795. (*Chairman.*) You wish to say something, do you not, as to the chief defects of the present system?—There is one point which I wish further to speak upon with regard to the blind who have had no training. There are a good many of the blind who do fairly well, although they have had no training at all in any institution. Their previous education when they had their sight helps them well in their after affliction. I have made very careful inquiries on this one point. "Is "there any case (I say in my inquiry) throughout the "country where any blind person trained in an institu-"tion has really advanced to a degree of competency "and independence?". And I have not been able to find one case. But on the other hand there are some cases in the country of blind men who are carrying on very remarkable work, and who largely employ sighted persons. In one case in Edinburgh a remarkable man, whom I commend to the Commission for examination, a Mr. Gray, has not only been successful himself, but he has, I believe, placed his sons well out in the world. He carries on a good business, house agency, and so on. He has gone throughout nearly all the institutions in the country to ask this one question, and he came to me to ask it. He said, "Can you point out to me a single "person trained in the institutions throughout the "country who is now in a position of comparative in-"dependence?" And he has never been able to find one, nor have I. Mr. Gray himself is an instance of a man who has not been trained in an institution, yet nevertheless does a good business and does it well. There is also an instance of another man at Gateshead, who has a good business, but more in manual labour. Mr. Gray told me of him. There are those cases and a very few others that he mentioned. Those are cases in which the untrained blind have done well, but Mr. Gray tells me that he has to pay "for his sight," which of course handicaps him, and the blind generally in the struggle of life.

G. M. Tait, Esq.

22 Jan. 1886.

796. I understood you in a previous answer to state that you knew of blind persons who were actually employers of sighted labour?—I know of one or two cases in London, but they are in a very small way.

797. Your fifth suggestion is with regard to the chief defects in the present system and the remedies for them; have you anything further to say upon that point?—I think it would be unfair to our workers throughout the country if I did not ask to be allowed to submit the most valuable series of answers which is contained in this paper which I have here. Answers have been received from practical workers to this question: "What in your "opinion are the chief defects in the teaching, training, "and employment of the blind in this country and what "remedies do you suggest"? These are most important opinions, and I should be glad to be allowed to submit them to the Commission as my reply to the question.

798. I understand that you wish to make some statement with respect to the types used for the education of the blind, and with respect to their comparative merits and success?—Yes, this is a very important subject, and I think I ought to begin by asking the Chairman to look at this book (*producing a book*). It is a specimen in Moon's type adapted to 250 languages. It is a marvel of execution and a beautiful book. It contains not only languages, but various illustrations which Dr. Moon, through a life-long devotion to the work and with immense power, has produced. I can only lay it upon the table, and I hope that at some future time it will be handed back again; but I should like to lay it before you as evidence when the question of types is more fully considered. I wish in the second place to say that the books in Moon's type have now sold to the number of 161,000 volumes, and that the annual sales amount to 6,000 volumes. I have received the following statement from Dr. Moon:—"In addition to the Bible, and a "considerable number of single chapters and psalms, "the library for the blind in Dr. Moon's type now "comprises, in English, 342 volumes, large and small, "and are as follows:—

	Vols.
"Religious works	59
"Biographies	67
"Books of tales and anecdotes	56
"Poetry	53
"Scientific and general subjects	17
"Ancient Britons	1
"Saxon Heptarchy	3
"English History	22
"History of Scotland	7
"Natural History	8
"Geography	2
"Astronomy	1
"Biblical dictionary	9
"Reading books for schools	27
"Spelling books	2
"English grammar	1
"Primers	2
"Music	5
"Total No. of English books	342
"Total No. of scripture books, "English	123
"Total No. of foreign books	179
	302
"Total No. of English and foreign	644

"There are also various astronomical maps and a good "variety of pictures. The Lord's Prayer and some "portions of scripture in 251 languages and dialects are "also embossed for the use of missionaries in foreign "lands, as a first lesson for teaching the natives to read. "Larger portions are prepared as required. Nearly "half of the English volumes, not including the "scriptures, are the large size books, and thick ones of "the small size."

799. By whom was this enterprise conducted?—By Dr. Moon. Now I come to the question of cost, because this tells the story of it. I asked this question of Dr. Moon, "Will you tell me the cost of the books com-"pared with the selling price?" And the answer I got from him was that the price charged for the books to the poor and to the home teaching societies is for materials and workmanship, embossing and binding, no charge being made for type, packing, clerkship, wear and tear of machinery, and so on. The cost of stereotype plates, which now number 40,000, is entirely distinct from the production of the books, and no charge is made for this in the price of the books. The management of the affair by Dr. Moon is free of cost for the work, but must be paid for at some future time in case of his death.

800. At whose cost is all this labour performed?—Dr. Moon gives his own labour gratuitously, and the plates and the works which are not included in the cost are the result of benevolent and charitable contributions.

801. (*Mr. Johnson.*) Sir Charles Lowther, I believe, contributed largely?—Yes, he is a large donor.

802. (*Chairman.*) Can you give the Commission any approximate idea of the amount of expenditure as the result of voluntary effort in the production of blind literature?—I cannot, but I think that Dr. Moon would be able to give full information and details as to that.

803. You wish to say something, do you not, as to the comparative merits of the different types for the blind?—Yes, I do. Since I was last here I have been able to put the figures more completely together from all the schools and institutions and home teaching societies throughout the country; and now I have returns from 70 instead of 50 as appears in the printed paper. The total number of books in Moon's type in use at the present time in connexion with those institutions is 32,005. The total number of books in Braille's type in connexion with the same institutions is 1,334. The total number of books in all other types put together is only 485.

804. Moon's type then seems to be in almost general use throughout England in preference to all others?—Very nearly so.

805. But in continental countries it is Braille's system that is used almost exclusively, is it not?—No, Moon's type has a large circulation in America, and it has a large circulation also on the Continent; but in reference to the circulation and where the circulation lies, Dr. Moon of course would be able to give full information.

806. Is it true that Braille's is the system which is generally or universally adopted on the Continent of Europe both for teaching and for reading and correspondence?—I think probably it is, but I do not think that the works on the Continent are to be compared with the works in England in circulation or in execution.

807. You think that the blind literature of the Continent is much smaller than that of England?—A great deal. My impression is that Moon's circulation and sales will probably amount to those of all the rest put together; and as I have been asked the question about comparative merits, I will say this with regard to the actual use of the types. Of course the numbers tell their own story; there is scarcely any question about that; but, practically, with regard to the blind I have spoken of 2,088 persons in London of whom I have personal knowledge (I do not know them individually, but I know them through our teachers), and 1,486 blind out of the 2,088 can read in Moon's type. For years and years very great efforts have been made to teach not only children but grown up persons to read Braille's type; and I give this as the result, not of my own knowledge but of information obtained through my teachers. At the present time in London they could not bring me 50 cases (in fact I think the number was 10) of those engaged in manual labour, by which the touch is deadened or hardened, who could read fluently in Braille's type.

808. Then are we to infer from that statement that in your opinion Moon's is superior for all practical purposes to Braille's?—For all purposes for the eventual

G. M. Tait, Esq.

22 Jan. 1886.

use of the blind. You have to deal with the grown-up blind population, and those who grow older you hope to train to some industry, and you must teach them at any rate to read something which, by and bye, will be of use to them. The only type which is of use to a blind person when he gets to be a working man is the Line System of Moon's. The dotted system is what they call a mere nut-meg grater, nothing more; the indistinct dots are to them merely like a nut-meg grater, they convey no distinction to their senses if their hands are hardened by manual labour. Of course, with regard to the question of the blind children of those who are fairly to do, and those who are going in for music, and so on, I say that by all means Braille's type ought to be taught; it will never hinder them in the use of Moon's by and bye, and, of course, it ought to be used for the purposes of early instruction.

809. (*Sir Lyon Playfair.*) Is it not the case that blindness has very much diminished?—It has only relatively diminished; it has diminished in proportion to the total population.

810. (*Mr. Arrol.*) The ratio is diminishing?—Yes.

811. (*Chairman.*) I understand that you wish to make some statement as to the necessity of cheap literature for the blind?—Of course it is very obvious that one of the chief difficulties in this question is the great expense in the production of books, and how that is to be met I do not know I am sure; but I hope it will eventually result from your inquiry that there may be a stronger concensus of opinion in favour of producing the books; at any rate if only in two types are recommended, that would be something, and the public mind would be settled with regard to the types. It has been said to me that publishers would themselves undertake to publish books if they only knew what the blind wanted, but at present the public mind is so uncertain as to what the type should be that no man of enterprise will go into the field at all, so that the books at present are in the hands of charitable workers, men who do it either because they have a particular fad, or because they are promoting a charitable work.

812. What are the books ordinarily in the possession of a blind working man; has he the Gospels?—The Bible, of course, is in a large number of volumes, and a working man can scarcely obtain it.

813. Do most of the blind men possess the Bible?—No, certainly not, excepting through us. We lend them portions regularly.

814. But I mean, do they possess them of their own?—No, a Bible costs 5*l.* or 6*l.*

815. Do they not possess some of the Gospels, or some parts of them?—Yes, they have some parts. Many persons make an effort to possess, at any rate, a part of the Bible, and sometimes we present copies, and the Bible Society is very good in making grants to blind people who are recommended to them, so that there is a fair distribution; but that is through the benevolence of the public, and not because the blind can afford it.

816. A blind man has access to literature by being read to by members of his family?—He has; but of course being read to is a very different thing from reading yourself. Especially is this the case among the poor.

817. (*Dr. Tindal Robertson.*) With regard to pensions, do you know of your own knowledge of any cases where a person receives more than one pension?—Several.

818. Can you, without giving the name of the person, give us an instance in which there are two or three pensions received by the same person?—Yes, I could. It is a very tender point, but I do know cases where blind persons have two or three pensions. I have in my mind, without going back very far, the case of a man who has something like 50*l.* from various pensions.

819. With regard to the children in the workhouses, are you aware, not speaking of London at the present time, but of the country, the guardians have the power of sending the children to the different asylums in the neighbourhood, and that they have exercised that power?—I am aware that they have that power, and I think it is exercised here and there, but I am not aware that it is exercised generally.

820. Are you aware also that they have the power of sending bliud people to learn trades, and that that power is also exercised to some extent?—Yes, they have that power too, and it is I believe to some extent exercised. They send them to some workshops, and I believe there are some cases in London where that has been done.

821. How would you propose to deal with the children in country districts, in villages, for instance, where the blind cases are so scattered that there is no opportunity of bringing them together for instruction in schools otherwise than at asylums?—I should have every one of them sent to the ordinary day schools. board schools, or denominational schools, whatever school the ordinary children went to.

822. (*Dr. Armitage.*) I should like to put some questions to you with regard to your former answers. In answer to question 397 you say that you object to the classes which are held in London for the blind on account of the doles that are given; will you tell us what those doles are?—The payment of guide fees, and other inducements to attend the classes.

823. You object to the guides being paid who bring the blind to the classes?—I know myself that the blind will almost compass sea and land even for the guide money. They walk from Deptford to Chelsea to obtain the guide money.

824. In answer to question 400 you say that you yourselves pay your guides 3*s.* a week?—Yes, that is for real work; they are instructors. We pay for the sight that is necessary for the teacher to carry on his work.

825. You are aware that what you call doles are paid to the blind for their guides in order that they may come safely?—Yes. I believe there are a good many doles other than those that are given to mere guides.

826. In answer to question 431 you state that you are the father of the movement for the teaching blind children in the board schools?—Yes, in London.

827. You are aware that in Glasgow blind children were taught in board schools long before they were so taught in London?—My answer is with reference to the school board of London.

828. Then it merely refers to London?—That is all.

829. And you were asked to nominate a teacher; was the teaching satisfactory that was inaugurated at that time?—It was satisfactory. I specially asked Mr. Barnhill, who was very well known to every man in connexion with the work in Scotland, and who commenced the work in Scotland some seven years before it began in London, to come and examine the work and go round to all the schools where the work was being done; and the result was that he presented a report to me in which he expressed his very great satisfaction. He was the first to inaugurate the movement in day schools, and at my special request he went round to the various schools where the teachers were doing the work in London, and the result was that he expressed himself highly satisfied with it.

830. Have you seen the report of the school board inspector of the system at that time?—No.

831. In answer to question 441 you say that you have 100 children between the ages of five and 15 under visitation, and that you lend those children books; in what system are those books?—In Moon's type.

832. Are those children attending schools?—Yes; the numbers relate to the statistics taken two years ago.

833. What system do they learn at the schools?—Both Moon's and Braille's.

834. Are they attending the London Board Schools?—Yes, some of them are.

835. I thought we had it in evidence that Braille's was taught exclusively there?—I do not know about that; I did not give that evidence.*

836. If the children wish to have the Braille books in which they read in their classes would you lend them?—If we had them, by all means, but we have not got them.

837. You tell us that Moon's system is very much more read by the blind; is that system exclusively taught by the Home Teaching Society?—I think almost exclusively. There are a few branch societies that I believe do a little work in the teaching of Braille's system amongst the young.

838. But the London Society teaches Moon's exclusively, does it not?—Entirely so. We have no books for teaching Braille's system.

* After a special conference with various experts, the London School Board passed a resolution approving of the teaching, by the use of Moon's type, in the board schools.—G. M. T.

839. And you think that most of the others teach Moon's system exclusively?—Yes, nearly all.

840. Do you not think that the very large number of Moon readers throughout the country may be partly accounted for by the fact of a large organisation like the Home Home Teaching Societies, of which you have told us there are over 70 in the country, exclusively teaching one type?—I hope so, or our work would of course go for nothing.

841. Would the Home Teaching Societies generally supply books in the other type if the blind whom they visited wished to have them?—I have never had a request for a book in any other type.

842. In answer to question 447 you stated that in connexion with Home Teaching Societies and workshops there are 521 blind persons who read the Braille type; and I think you have enlarged it now, and you say that having inquired further you find that there are a greater number than that?—That is only because I have received more returns since.

843. (*Chairman.*) That was the number on the returns received at that time?—Yes. I should like the Chairman to look at these returns (*handing in some returns*).

844. (*Dr. Armitage.*) And in schools there were 232?—Yes.

845. What is the number of blind children attending schools, including board schools and day schools, in the United Kingdom?—I have given no evidence on that point. I have returns up to this time of 951 persons in connexion with workshops and schools. My returns are all optional.

846. Your answer therefore referred not to workshops and schools, but to schools for the training of the young?—Yes, in that instance.

847. Can you tell us how many young persons, say up to the age of 20, are being trained in the different schools of the United Kingdom?—That is easily obtained, because you will find all that information tabulated in the York report. There is a table there setting forth all the particulars.

848. Is the number about 1,500?—The exact number is there given as 1,465; but it is well known that there are many persons in schools above the age of 20.

849. Are you aware that in almost all our schools the Braille system is generally taught, and that in many it is exclusively taught?—I am not aware of that; in fact my knowledge leads me to quite the contrary conclusion. I have a return here which shows that Braille's is not used even in schools as much as Moon's.

850. I am speaking of schools for children?—I have a return here of those. In my return from those schools the figures stand in the proportions which I have given. Those who are taught in a few workshops combined with the schools I cannot quite dissect, but even putting them together there are 555 readers of Moon's type against 271 readers of Braille's type even in schools and workshops.

851. That is simply according to the returns which you have received?—Those are facts; those are from the persons who have certified to the facts themselves; so that even in schools the proportion of Moon's readers is largely in excess of that of Braille's.

852. You have mentioned the number of Braille books as compared with Moon's that are in circulation; can you tell me how many books there are in circulation?—I have said that there are 32,005 volumes in Moon's as against 1,334 volumes in Braille's in circulation and in use.

853. Do you mean that that is the number of books that have been issued in past years?—No, I mean that they are at the present moment in use. There have been 161,000 issued of Moon's in past years.

854. Is that the number that are in use?—There are 32,000 now in use, but 161,000 have been issued from Moon's establishment.

855. Does this number of books simply apply to the schools?—The number that I am giving you now of 32,000 applies to both schools and Home Teaching Societies.

856. But did the number of 1,334 of Braille's books apply simply in schools or to the general circulation?—To home teaching societies and schools combined; the total returns I gave this morning as 1,334.

857. Have you seen the report of the British and Foreign Blind Association?—I am sorry to say I have not.

G. M. Tait, Esq.

22 Jan. 1886.

858. You are not aware that the yearly issue of books is between 3,000 and 4,000 in the Braille type?—I have no doubt that the Commission will call for evidence from the British and Foreign Society. The literature issued is composed very largely of written or manuscript books.

859. You say in answer to question 453 that you do not think that pensions encourage self help, and you have given evidence to-day that you think it would be desirable to make pensions conditional upon self help of an industrial character; you would not, I suppose, confine that to such institutions as Hetherington's Charity, where people do not get pensions until they are 61 years of age?—I should like to see the whole of this pension system revised by an Act of Parliament, so that this limit of 61 might be altered, and greater facilities given for the use of the funds in question. It cannot be done under the present constitution, but the limit of age of 61 is a very serious drawback.

860. You were speaking of the training of blind children at Sunderland; do those children at Sunderland attend schools with the seeing?—I have given very important evidence about Sunderland this morning, showing that the blind children of Sunderland have a special provision made for them by the school board system, and that they have appropriated a class room in connexion with the blind institution there to which I referred in my former evidence, and that the system is a very remarkable success.

861. I must repeat my question. Do the blind attend schools with the seeing?—In this case they do not. They come to the blind institution to receive instruction as a special class.

862. Then the Sunderland school is simply a day school for the blind?—That is so, in connexion with the institution. But it is adopted by the school board of Sunderland as their mode of dealing with the blind. I gave it this morning as an illustration of another method to that adopted in London of dealing with this important subject.

863. (*Dr. McDonnell.*) Does Dr. Moon publish works suitable for use in Roman Catholic schools for the blind?—All the secular works are suitable for use in such schools. There is a very large list of secular works.

864. In your opinion they are suitable, but it might be that they would not in the opinion of Roman Catholics be suitable. Has Dr. Moon printed a Douay version of the Bible either in French, Italian, or English?—I do not think so.

865. (*Mr. Arrol.*) I think, in your evidence as printed, reference is made to the fact of poverty and evil surroundings having much to do with the increase of blindness; can you state the age at which blindness is produced by those causes, and the proportion in which it is produced?—No, I am sorry to say I cannot. That is only an opinion, and I felt at the time that I was rather giving an opinion which I might have reserved. It was an opinion which I feel is true, but as to any statistics upon the subject it is impossible to give them.

866. (*Chairman.*) Is blindness hereditary?—It is a cause of blindness in succession.*

867. (*Mr. Arrol.*) You are averse to the system of children being trained in institutions for scholastic purposes, may I ask the reason why?—I have not expressed an opinion about that adversely. I have not said in my evidence that I am against the congregating of children in any of the great schools, but there are many children who cannot be so congregated, and who must be taught, and it is to those who are outside of such institutions and who have no such privileges that my evidence points very largely. I have submitted evidence from others who are very much against the asylum system, as they call it, and who think that it does not tend to the real welfare of the children, but I have not expressed it as my opinion.

* I know of one case in which the grandfather, the father, and the son have become blind in succession as they advanced in life. The latter became blind about the age of 25. I know of one family in which a blind man is married to a sighted wife: they have four children, three of whom are blind. Another case is known to me of a blind man married to a blind woman, and their one child is also blind. There are more than 60 cases in London, known by the Home Teaching Society, of blind men married to blind women. Their children, as a rule, however, have sight.

G. M. Tait, Esq.

22 Jan. 1886.

868. With regard to the system of grants for the blind, would you recommend a special grant for those learning trades between the ages of 15 and 25, with a larger scale for those who lose sight after the age of 25, and who are not able to learn a trade?—I have not considered the question of grants at all in connexion with industrial training, nor have I given any evidence upon that. The question of pensions, of course, is another matter.

869. We will substitute the word pension for grant?—I do not speak of pensions to be given to young people. I think that a pension should be given, if at all, at a later stage of life, when a pension would be awarded as the result of industry or for other satisfactory causes. The question is how best to stimulate the blind to learn well; if a little money given to them would help to stimulate them, I do not see any objection to it.

870. Would you recommend that endowments should be used to assist persons from 15 to 25 years of age while they are learning a trade?—I should be extremely glad if endowments could in any way be used to help in the training, but I do not see that it should necessarily be a personal matter.

871. (*Chairman.*) You think that they should assist them to be trained?—Yes.

872. (*Mr. Arrol.*) From your experience are you disposed to recommend that the house test should be abolished for the blind?—I think it would be a very great mischief to take away the blind from the homes of their parents. I do not myself think that anything should be done which would tend to relieve parents of the responsibilities of their home life, and I should be very sorry to see anything done which would tend to relieve them almost entirely of that responsibility.

873. With respect to Dr. Moon's works, are they all with the exception of the Bible given in abridgment?—There are very few abbreviations, and there is only one alteration which he is now about adopting, which is not altering the characters, but only putting together "t" and "h," which stand separate at present. The "t" is really the top of the "t" with a down stroke removed, and the "h" is to be put above it, the two letters to occupy the space of one letter, so that there will be a great economy of space in printing; and there are one or two other small abbreviations.

874. But does Dr. Moon publish his works *in extenso* as they are given for the sighted, or are they abridged?—I think some of them are abridged. Encyclopedias, and so on are abridged. That is a question which Dr. Moon can answer better than I can. And I may say it resolves itself chiefly into a question of expense.

875. (*Sir Henry Selwin-Ibbetson.*) Did I correctly understand you to say that in your opinion it would be wise to make the attendance at school compulsory on blind children in the towns and in the country?—Yes, I think so.

876. And at the same time I think I understood your evidence to be (and you have repeated it to-day) that you are in favour of their being taught when they are at these schools by the sighted teachers and not by special blind teachers?—I do not object to the blind teachers at all. My evidence was to show that it is practicable to be done by sighted teachers. In London, where a number of blind are congregated, it is possible, and may be well to have special teachers, but in the country, where they are dispersed, I think the ordinary sighted teachers can do it very well.

877. It is not your opinion that a sighted teacher approaches the teaching of a subject better with regard to blind children than a blind teacher?—I think that in that respect a blind teacher has some advantages over a sighted teacher in the case of teaching a blind child.

878. In country districts, in cases where it would be almost impossible to get the teaching from the blind, and where therefore it would fall entirely upon the sighted teachers, you do not think that there would be any great difficulties in the teachers devoting time enough during the school curriculum to the blind children as apart from the sighted children?—I do not think so, and at present in London even the ordinary day-school teacher does so. A great portion of the time the blind are taught by the sighted teachers.

879. That is in board schools; but I am asking with regard to our village schools, where the teaching power is very small, as it is in many of the village schools of the country, and where the teacher has to superintend himself a small number of children but a great variety of classes; if there were one or two blind children he would have practically, would he not, to devote himself to those as a separate class?—I do not think so.

880. You think that he could take those in conjunction with the sighted children?—I think so.

881. Because otherwise it would be a great additional burden upon the teacher?—I do not think the work would be great. All the oral teaching there would be no difficulty about; and with regard to the literary work it is easy; but the arithmetic work would be a little more difficult.

882. With regard to the question of type, I think I understood you to say that in London to your knowledge there were not above 50 cases where the Braille type was in use?—I meant that in London amongst the working people, those who have really got manual occupation, whose hands are hardened by use, there are not fifty cases of people who can read fluently in Braille's type.

883. Then from your experience, for a person in after life who is engaged in manual employment, the Moon type is far easier to acquire than the Braille type?—Unquestionably.

884. (*Admiral Sir E. Sotheby.*) You said, did you not, that there was great unwillingness on the part of parents to send their blind children to school?—That was the evidence from Sunderland which I was quoting.

885. Do you think that in London there is greater unwillingness on the part of the parents of blind children than there is on the part of the parents of sighted children?—I do not think so. There have been one or two cases in connexion with the London School Board where there has been a little difficulty, but nothing more than is met with in the case of ordinary sighted children.

886. You referred to masters in schools being able to teach the children; would that have the same effect in workhouses?—I think so, certainly.

887. You think there would be no difficulty in masters in workhouses teaching the blind children?—Not at all.

888. I suppose you are aware that blind people can read much more quickly in the Braille system than in the Moon system?—I am not aware of it. If you put a fluent Braille reader side by side with a fluent Moon reader, I should say that the fluent Moon reader would read even more quickly than the fluent Braille reader, even with equal advantages, notwithstanding the less space to be covered by the fingers.

889. From your experience are the guardians willing or otherwise to pay for having blind people taught at these institutions?—I have heard of cases where they have done it, and I have heard of no unwillingness when it has been brought before them. I think that some of the guardians are fully alive to their duty.

890. (*Mr. Johnson.*) You were in the habit of instructing the blind in Moon's type in the board schools, were you not, in the beginning of the movement?—In the beginning of the movement one of our teachers was appointed for the very purpose.

891. For how long were the pupils in the board schools at that day instructed in Moon?—For, I should think, three or four years.

892. When was it discontinued in the board schools to instruct them in Moon?—I am not aware that it is discontinued now. They have books in both Moon's type and Braille's type. Of course immediately the teachers from the Normal College were appointed they set about introducing the Braille type.

893. Is it your experience that they teach Moon's system now in the board schools?—I do not know; I am not aware of its being discontinued. I have nothing whatever to do with the board school teaching now.

894. You say that there are Moon's books printed in 250 languages; does that extend over the Continent and over the world?—There are specimens of all languages of the Continent and of pretty well all over the world.

895. Do you know of any Braille books being printed in any other languages except English, French, and German?—I do not know particularly about that.

896. What do you suppose is the number of books existing now on sale in Braille's type?—I cannot tell.

897. Do you think that the number is larger or smaller than of those in Moon's type?—It is much smaller I should say.

G. M. Tait, Esq.

22 Jan. 1886.

898. What are the books in Moon's type; do they consist of religious and educational subjects of all kinds?—Yes. I have given a full classified list this morning. (*Vide* Question 798.)

899. Have you any reason to believe that there is any special teacher in the board schools now teaching Moon?—No; I have not any reason to think so. In fact I feel that as a charity we have nothing whatever to do with the children; it is the country that has to do with it. I have given evidence to show that I felt that as a charity it was not our work, but that it belonged to the country, and that the blind were entitled to all the benefits of the education which the country provided for the sighted. I have nothing whatever to do now except to superintend, by the parents' request, the evening visits of our teachers, and by lending them books, and so on. That is all that we now do for the children in London.

900. As I understand, in your opinion the larger number of people who have come under your observation read by Moon?—Yes, out of all proportion.

901. You have mentioned the subject of pensions and you have told us that your desire is that some alteration should be made in the age at which pensions are given; have you any idea of the number of pension societies which give pensions below the age of 60; I suppose there are very few?—Very few I suppose, but I think Day's Charity, with which you are very well acquainted, does it.

902. Are you aware of any other?—No.

903. Does the Protestant Blind Society do it?—There is a full list of all the pensions in the report of the committee of the Charity Organisation Society, which I have submitted to the Commission, and it contains the ages and all the particulars and all the information.

904. That report was issued 10 years ago?—Yes; but the conditions of age remain. There is only one addition, and that is Gardner's Trust, and I do not think there is any limit of age there, and they give money I believe to the extent of 3,000*l.* per annum.

905. And they have certain rules and certain questions to be answered with regard to the character of persons, and the cases are investigated, are they not, before pensions are given?—Very carefully, I think.

906. I suppose you know that such inquiries are made in other pension societies?—Yes, very fully. I think that very great effort is made now more than formerly to prevent the overlapping of these charities, but very much has been done since this inquiry by the Charity Organisation Society.

907. I understand you to say that you see no difficulty in sighted schoolmasters and schoolmistresses giving what is called special education to the blind?—Ordinary education; I should not say special education.

908. Writing and reading?—Yes.

909. Of course you attach some value to the assistance of blind teachers as well, under sighted supervision?—Yes, in special schools, certainly.

910. And it is the case in almost all the special schools, is it not, that there is sighted supervision?—That is more the case now than it was formerly.

911. Have you any experience with regard to the supervision which is exercised in workshops?—It is nearly all sighted.

912. And with regard to the teaching of music, they are generally sighted teachers, are they not?—There is one illustration that is quite the opposite; at the Normal College the chief instructor, I believe, is blind.

913. So that in almost all the institutions in the country connected with the blind there is now supervision by sighted people?—Yes.

914. And those sighted people are very often assisted by blind assistants, are they not?—I should think so, but I have not a very intimate acquaintance with the industrial institutions or the special schools.

915. You mentioned the Sunderland institution with which Miss Byers is connected; that was originally a branch of your society, was it not?—It was founded by us, and as I explained in my previous evidence it has grown into a very successful industrial work, and now the education of the children is carried on side by side, and all the blind in the town are also visited by a home teacher, so that you have a threefold combination there; it is what I consider to be almost a model, and if the same system could be adopted throughout every town you would have a perfect provision for the blind. That institution had its origin in our visit to Sunderland, and telling them of their wants and getting it started.

916. The home teacher there is a blind man, is he not?—He is a blind man.

917. He is examined by Government, and he gets a grant from Government, does he not?—I do not know that particular fact.

918. In that particular school that you have instanced the two systems are taught concurrently, are they not?—Both the Braille and the Moon.

919. The Braille more for the correspondence, and the Moon for reading and tangible use?—Yes.

920. (*Dr. Tindal Robertson.*) Is there any system of writing by Moon's plan?—Yes, there is a writing press and a whole system.

921. With regard to that, may I ask what is your opinion as to the comparative facility with which people can write by the Braille system and by the Moon system?—I think Braille is infinitely superior in the way of writing. I have no interest in promoting one system beyond another.

922. (*Mr. Johnson.*) In your experience, is there any other system that is at all used besides the Braille and the Moon system, have you any experience of the Roman system being used at all?—It is used to a very small extent indeed, in fact, it is dying out. The Roman system is most used at Worcester College and at York School for the Blind. They have what is called the Worcester system, which is composed of capital letters, but beyond that I think it is dying out.

923. Can you tell us the reason why it is dying out?—The reason is this, that the large majority of the blind cannot feel the Roman characters, there are too many lines. The number of people who read the Roman character is almost nil, except at those two colleges which I have mentioned.

The witness withdrew.

Miss Best and Mr. David Hodge examined.

Miss Best and Mr. D. Hodge.

924. (*Chairman, to Miss Best.*) Are you a head teacher of a London board school?—Yes, in Bowling Green Lane, Clerkenwell.

925. (*To Mr. Hodge.*) Are you a head master of a London board school?—Yes, of the Cook's Ground Board School, Chelsea.

926. (*To Miss Best.*) You have a number of blind children in your school, have you not?—Yes, at the present time the number, I think, is 12 or 14; I am not quite sure which.

927. Are they taught in the different standards according to their respective abilities?—Yes, they are classified by standards just the same as the sighted children.

928. And are they in the same classes with the sighted children?—They have separate instruction in the morning by a teacher who is totally blind, but they mix with the other children in their standards in the afternoon, and take their work with the sighted children.

929. The special instruction is, I suppose, for the work that they cannot be taught with the sighted children, is that so?—No, they could be taught it if there were opportunity to teach them separately; but the difficulty is that one teacher cannot very well teach two systems, that is to say, teach the work to the sighted children and teach a separate system to the blind children.

930. Would you think that even one blind child, say, in an elementary school in a country village, would require some additional assistance and would cause additional labour to a teacher?—Undoubtedly it would cause additional labour.

931. (*To Mr. Hodge.*) Can you give any approximate idea as to how many sighted children that addition would be equivalent to?—It all depends, I think, upon

Miss Best and Mr. D. Hodge.

22 Jan. 1886.

the capability of the blind children and of the sighted children that you have to teach.

932. (*To Miss Best.*) Are you of opinion, from your experience and observation of the teaching of blind children, that every certificated teacher can teach blind children?—If he or she will take the trouble to learn the system I am aware that it is quite possible.

933. Is there much difficulty in acquiring the necessary qualification for teaching blind children on the part of a certificated teacher?—I should think not. I thought I would learn to read it myself, so as to be able to check their work, and I learnt the greater part of the alphabet in twice going over it with the teacher. The Braille system is reduced to a rule, and if you learn it in a given way, for instance, that a single dot in the right-hand corner is A, you can very soon get the alphabet by heart.

934. Do you, in your school, teach the blind children in all the subjects that are taught the sighted children?—Yes, I think there is no exception but drawing.

935. What are the subjects that are taught in your school?—Reading, arithmetic, writing, spelling, grammar, poetry, singing, needlework, and drawing; but the drawing the blind children do not take part in.

936. You have no other class subjects?—No.

937. And no specifics?—There are no specifics now.

938. Except the drawing, the blind children are taught all those subjects?—Yes.

939. What assistance have you from blind teachers; have you more than one teacher?—No, I have one blind teacher.

940. And that blind teacher gives the special teaching in reading and writing to those children?—Yes.

941. And sewing also?—No; but in arithmetic also.

942. And all the rest is taught by the ordinary teachers with the sighted children?—Yes. The blind teacher has a room to herself.

943. A little class-room?—Yes, it was a committee room at one time, and it is utilised now as a class-room for the blind school. The blind teacher is quite away from the rest and she has the children with her the whole of the morning, or rather they assemble in the girls' school with the rest for scripture, and then when scripture is over they go to their own room, and they remain with her from 10 minutes to 10 till 12 o'clock. Then they assemble with the rest at a quarter to 2 and remain with them until half-past 4, the blind teacher having another school at Shadwell in the afternoon.

944. Then she practically teaches two schools, one in the morning, and another in the afternoon?—Yes.

945. Do you know what her salary is?—I think it is 65*l.* a year, but I am not quite sure.

946. And for that she teaches probably 24 children, 12 at one school and 12 at the other?—I think the other class is not so large as mine; it will not exceed it, at any rate, but I think it is under it.

947. How do you consider that the blind children compare in their attainments with sighted children?—Taking them on an average I do not think they are quite so quick at their work as sighted children are.

948. Is there any branch of their work in which they excel, in memory work, for instance?—Yes, decidedly.

949. The absence of sight seems to make them less reliant upon sight and more reliant upon memory?—Decidedly so.

950. Their poetry and their grammar, and such subjects as that, I suppose, are well acquired?—Yes, anything that is memory work they seem to be particularly quick at doing; but the absence of observation of course renders them less quick in points that require observation.

951. Is it your opinion that the teaching of these blind children with the sighted children is of advantage to the blind?—Decidedly. I would not wish myself to see them shut away by themselves all day.

952. It makes them more cheerful and more self-reliant, I suppose?—Decidedly; and the other children too seem to take more interest in them, and it gives them almost unconsciously the idea of helping those who are not quite so well able to help themselves.

953. So to speak it educes the sympathies of the sighted children, and it acts to the mutual advantage of both sighted and blind?—Decidedly so, in my opinion. I find in the matter of dismissal, for instance, as a blind child leads out in a line with the others they will always make room for her without being told, they do not seem to think that they are doing it, but they naturally let her pass on first or else one will stand aside with her as circumstances may require. I have never come across an instance of any harshness or unkindness or thoughtlessness towards a blind child.

954. Then sympathy and courtesy and kindness are the result to the blind children of training them with sighted children?—Decidedly so.

955. What standards may these children be in?—I have five in Standard I., one in Standard II., and then the next set of children are in the boys' school. They are both taught together by the blind teacher, but they separate in the afternoon.

956. Have you ever had any blind children in the higher standards?—I have two girls in the fifth standard.

957. Of what age?—One 11 and the other 12, I think.

958. That is a very fair attainment, is it not?—Yes, very fair indeed.

959. May I ask how long those children who are in the fifth standard have been under education?—I do not know; they were there when I took charge of the school.

960. How long ago is that?—This is my second year.

961. What standard were they in two years ago?—They were in the third standard then. I know that they have gone up from the third, but I think they have gone up from the second.

962. Then practically they have gone from the second standard to the fifth standard in the London Board School?—Yes.

963. And if they remain until they are 13 years of age they will probably get to the sixth standard, or may even get through it?—Yes. If I am examining the remainder of the standard I always send for the blind children to take their part at the examination, and they do the same work, and generally achieve very much the same result as the sighted children.

964. And they enjoy their work, I suppose, in the school?—Yes, and they always like being sent for to come up and be examined with the rest. They think it is quite a little holiday to be sent down to and told that the school is being examined, and that they can come upstairs.

965. When the school is examined by Her Majesty's inspector how are those children examined?—In reading they read to him; he puts a book before them and he judges of their reading by what he hears, and he usually questions them as to the meaning of what they have read in the same way as he would another child. In dictation the child spells out to him from her own writing, or else he gives it to another blind child of another standard to spell; then as she goes through he writes on a piece of paper any word that she has not spelt to him correctly. In arithmetic she reads her answers, and he says whether they are right or wrong. The grammar is oral usually.

966. And they come in I suppose for the average grant of the school?—They are on the schedules exactly the same as the other children.

967. And they are paid just the same?—Yes.

968. And I dare say your school will earn 17*s.* a head?—It was 18*s.* 4¾*d.* at the last examination.

969. Then the grants have steadily augmented in your school; that does great credit to your teaching, but I suppose I may assume that you have a very good staff right through the school?—Yes, I am satisfied with my own part of the staff.

970. What number of children have you to teach?—I have 300 on the books, and I have a staff of four assistants and myself.

971. Including the blind one?—The blind children are on my register; they do not have a separate register, but I have four assistants without the blind teacher.

972. You have the blind teacher in addition?—Yes, she does not count on my staff.

973. Have you any pupil teachers?—I have one candidate, but she goes to the centre.

974. Then that is about 60 children to a teacher?—Yes, I have Standard I. on my own hands.

Miss Best and Mr. D. Hodge.

22 Jan. 1886.

975. Do you consider that there is any advantage to the blind child in employing a blind teacher; is there more sympathy, or any advantage in any other way?—Yes, I think there is this advantage. If a blind teacher can do it the child feels that it is not beyond her power to do it; but if she is told to do a thing or shown how to do anything by a sighted teacher, there is an inclination for the feeling to rise in the child's mind, "Oh, you can do it because you can see." But I find that if the teacher is blind the child sees no reason why she cannot do what her teacher can do who is blind also.

976. (*To Mr. Hodge.*) May I ask you what is the number of children in your school?—The number on the roll is 495. The number of blind children in my own department alone is three now; we have had as many as 12, but the blind class is formed, of course, of children from the boys, girls, and infant departments. I think now the blind teacher has about eight. At one time we had 13 or 14 blind children, and the teacher then used to devote the whole morning every morning in the week to the children; but since the number has been reduced she comes now three times a week.

977. What standards are your children in?—I have now one in Standard I., one in Standard III., and one in Standard IV.

978. Are your observations as to the capacity and intelligence and attainments of the blind children entirely in agreement with Miss Best's?—I rather disagree with her. I think my blind children on the whole are equal to any of the sharpest of the children in my school, with one exception, and that is a boy in the first standard who is mentally incapacitated from some cause or another. With that exception the blind children are very bright children indeed.

979. Do you agree with Miss Best that they excel in some departments?—Yes, they do decidedly in memor work. I may say that we have one little boy named John Gill who got a Gardner Scholarship, and who is in the Normal College. Another boy named Louis Cockburn is also in the Normal College at Norwood. Another boy named John Carter went, but I think he committed himself in some way or another when he was there and was expelled, and I think the poor fellow has since died.

980. But you agree with Miss Best as to the influence upon blind children of being taught with the sighted children?—Yes, in every respect.

981. And you agree with her as to the advantage of having a blind teacher?—Yes, I think the fact of having a distinctive blind teacher in the morning sets them on their course. The plan adopted with us is this. The blind teacher generally at the beginning of the year inquires for instance in arithmetic what rule we are going to teach first and generally how we are going to teach it, so that she may begin teaching it exactly in the same way as we do. Therefore the blind child gets its start in the morning with the blind teacher, and in the afternoon it comes and practises with us almost in the same rut as the other children are in, having been taught by the sighted teachers.

982. What standard did the blind boys who have obtained scholarships attain in your school?—John Gill was in Standard II., Louis Cockburn and John Carter were boys who came into the school for a time almost expressly that they might go and qualify themselves for scholarships. They came in and did what work was necessary for them to get a scholarship.

983. How old was this boy, John Gill, who was in Standard II.?—I fancy he was perhaps a year behind what a Standard II. boy generally is, but then the difficulty was with the parent, I think. His mother was very anxious indeed that he should not come to school, and there was very great difficulty about it, and she thought we were treating her very hardly when I set the school board officer on him, and would have him there. For a very long time she raised all sorts of objections. The boy was simply minding a baby in the streets, and getting into all sorts of mischief; but when he had to come to school and bend to the work, he proved himself a very good fellow indeed.

984. Are you of opinion that it is a matter of kindness to these children to put them under the Elementary Acts, and compel attendance at the same age as other children?—Yes. I have another case of a boy named Greenaway. He came from the infant school to me, he is not totally blind, but he requires blind teaching; that young gentleman has not been near me for a considerable time, and I cannot get at him. Immediately I put a school board officer on to him they flaunt a medical certificate that he is not fit to come to school; but so far as I can see, the boy ought to be at school. I saw him only yesterday.

985. The tendency on the part of the parents of these poor children is to keep them out of school?—The tendency on the part of the parents of these children is to coddle and spoil them altogether.

986. And so to unfit them for life?—Just so. Another boy, I think, called Butler, came to us from Pimlico, and he went, I think, to the Normal College at Norwood for some time. He had been kept at home and coddled up and made much of and shielded to a terrible extent, and that boy was like a little frightened thing for a long time when he came amongst us; simply, I think, from the treatment that he had had. The boy was a sensible boy, but he was so timid that he was afraid to come amongst the rest, and I think they had to send him away from Norwood.

987. You think that blind children's coming to school developes self reliance and courage?—Yes.

988. And that it is a proper training, fitting them for work and for the world?—Yes, for their life; I should like to impress, too, very strongly upon the Commission the idea that Miss Best gave just now, that it has a very refining effect on the other children. I have noticed frequently, as she has said, that sympathy for the blind children is brought out to a very large extent indeed.

989. Do the sighted children take them backwards and forwards to school?—Yes.

990. Is that done voluntarily?—In most cases I believe the parents of the blind children give them a few pence. They volunteer to do it, but I believe the children would undertake to do it even without the pence.

991. (*To Miss Best.*) Have you found any difficulty in getting your blind children to school?—There was a difficulty some time back, and I think that that is how it is that at the same age they compare unfavourably with the other children; but it seems now to be very much dying out. I think the parents see that the children are really happier and better off at school, and that they are well treated and cared for, and therefore the difficulty is being removed.

992. And I suppose when the child is at school more attention is given to its cleanliness, and therefore to its health?—Yes; there are many cases where if a child is not coming to school it is not properly washed till midday, and perhaps not even then; but if it has to appear at school it must be washed in the morning. (*Mr. Hodge.*) With regard to the case of John Gill, I may tell the Commission that he writes from the Normal College to his mother with the Braille type, and she frequently brings the letter to the school for one of the boys to read it to her. I believe that at the very last Government examination, when Mr. Campbell came into our room, I had two blind boys reading John Gill's letter to his mother.

993. And you had no difficulty as to inspection?—None whatever. Gill has passed his standard, Stevens has passed his standard, and Marshall passed his standard in the ordinary way; he worked his sums, he read the type to the examiner, and he read from his book, and the same with the dictation, and they all passed.

994. I dare say you have had experience in your earlier career of small schools. Let us take a village school where there are perhaps 50 children and there is one blind one amongst them, do you think it is possible for that child to benefit by the instruction that is given by the ordinary certificated teachers, and for the teacher to conduct that school without considerable additional labour?—Personally, I think it could be done. I recollect that Gill was the first boy I had, and he read from Moon's type, I think the raised type, and after a while I got to read that quicker with my eye than he could read it with his finger; and the same with arithmetic, I could tell his figures by the angle at which he put his type. As he came up from the blind teacher he had to make rows of ones and twos and threes, and by constantly looking at those rows of figures to see that he was doing them right I learnt them. Of course I had to depend upon him entirely; if he had put down a row of threes and called them ones, I should not have known any better, though I might have found it out from the blind teacher.

Miss Best and Mr. D. Hodge.

22 Jan. 1886.

995. But I am supposing that you were the master of a small village school and that a blind child in that village required teaching; what should be done in that case?—Personally speaking, I think if I knew the system of the type for the arithmetic and could read in the raised type, I should see no difficulty whatever in teaching a blind child any more than a sighted child.

996. Do you think that every teacher when sent to a training college should be taught to read blind type?—I suppose that every teacher who is sent to a training college is an intelligent individual. It would certainly be an addition to the curriculum. (*Miss Best*). I think it would require very little labour to get a general idea of blind type because it is reduced to a system. That arrangement of the type you can learn by looking at it in a very few minutes; all the even numbers go either vertically or horizontally and all the odd numbers go at the angles.

997. You have been at a training college, I suppose?—Yes.

998. Where were you?—At the Home and Colonial College.

999. Do you think that you might without any disadvantage to you in your career at the Home and Colonial College have learnt just enough of the best system of teaching the blind, without interfering with your general proficency?—With the aid of a good text-book, I think so; that is to say, if there were black dots in the text-book, representing the pricked dots of the Braille system, I think it would take very little time.

1000. Then you think it might reasonably be required of the training colleges that they should give some elementary instruction in the teaching of the blind?—I think it would have to be very elementary, I do not think that they could go in for much of it.

1001. But you think that we might require some elementary instruction?—I think the subject might be brought under their notice and sufficiently started, so that if cause arose for their teaching it they could follow it up; but I do not think it could be thoroughly taught in college with all that there is to do, and with the pressure that there is. (*Mr. Hodge.*) I think it is not that the teachers could not do it; the question is whether they have the time, having to do what they have already. As regards their capability of doing it I have no doubt they are quite capable of doing it. (*Miss Best.*) I think time is the only question that comes in as to their being able to do it, either learning it or teaching it.

1002. (*Sir Lyon Playfair.*) It is very much, I suppose, a question of organisation, is it not. If you had a school in a parish, and had very little aid, do you think that one blind person coming to be taught might not interfere considerably with the organisation of the whole school?—That is just the difficulty, that you must teach that child individually. Of course, our method with classes is collective teaching, but you could not teach a blind child in that way. Therefore, if you have a class of 30 children, and there is one blind child amongst them, 29 children must be doing non-superintended work while you are teaching that one blind child.

1003. (*Chairman.*) And where there is a minimum staff it would break down the organisation of the school?—Yes.

1004. (*Sir Lyon Playfair.*) And while one child would receive the benefit of individual teaching, the 29 might suffer by reason of the want of individual attention during that time?—Decidedly, with the present code to work to.

1005. (*To Mr. Hodge.*) You spoke of your blind pupils having been reduced so much; what do you consider is the cause of the reduction?—We have lost two who have gone to the Normal College, and Stevens is exempt from school attendance altogether; I have lost sight of him entirely; I rather fancy that he has gone away from the neighbourhood. But there are one or two that ought to come in to supply their places; in one case I know the child is running in the streets. I think too the school board officers rather sympathised with the parents in not wishing to place the blind children at school; I do not think that we have the blind children put on the schedules as we do in the case of the sighted children.

1006. You do not believe that there is a reduction of the blind in your district, because the reduction from 12 to 3 is a great reduction?—It is a great reduction, but I could not say what the cause is. My impression is that a blind child, simply because he is a blind child, would be allowed to run riot.

1007. In large towns where you can get the services of a blind teacher going from one school to another, you think there will not be any practical difficulty in teaching the blind with the sighted, whatever it might be in the country schools where the same facilities did not exist?—I think there would be none whatever in large towns.

1008. (*Dr. Tindal Robertson.*) You have both of you spoken of the comparative mental equality of the blind children and the sighted children; have you noticed any difference in the physical condition of the blind children and of the others?—Yes; I should say that the blind children are not nearly so robust as the others. (*Miss Best.*) I think that is so in most cases; I was just thinking my own school through. I do not know that I could say so with respect to those who form the class at the present time. There is one child that perhaps looks more delicate, but the rest who are at present in school seem to be in very good health.

1009. (*To Mr. Hodge*). Do the blind children go through the same kind of physical training in the board school as the sighted children?—They just do the extension drill. (*Miss Best.*) The girls do the Swedish drill with the rest.

1010. (*Chairman*). That is the Ling system is it not?—Yes.

1011. (*Dr. Tindal Robertson.*) (*To Mr. Hodge.*) Have you any idea as to the cause of difference physically?—I have thought several times whether it is that they are kept more at home and that they do not get the run that the ordinary sighted children get.

1012. Then it is that system of coddling which you spoke of in your evidence that does the mischief?—Yes, I think so.

1013. (*To Miss Best.*) Have you any idea what the reason of the difference is?—I should agree with Mr. Hodge there. I think that in those cases where the children do seem to be weaker it is that the mothers think that because they are blind they cannot do anything and must stay at home, and they have nothing to develop them at all physically. I find that in those cases where they begin to come to school early they lose that timidity which absence of sight seems to give a young child, and as they lose that timidity so they seem to strengthen physically, because they join more readily with the other children.

1014. (*To Mr. Hodge.*) Do they join in the games with the other children?—Very little, but to some extent they do. (*Miss Best.*) They do not seem willing to play in the play ground, because there the children mostly play games which consist of running about after each other, and there are many obstacles. (*Mr. Hodge.*) I have noticed in the case of one of our girls in particular, who is now at school, that in round games where the girls take hands and go round, she is just as lively and boisterous as the rest of them, but she has a girl on each side of her, and they go round together. I frequently notice that blind children are not only blind, but are generally afflicted in some other way as well.

1015. (*Mr. Johnson.*) I suppose that as a class the blind are more feeble physically than the sighted, are they not?—I think they are, taking them as a whole.

1016. And that is your experience from the number of blind that you have had?—Yes.

1017. Have you had much experience beyond those eight?—No, I have had no experience except those who have come under my notice at school.

1018. You do not, I suppose, think there is any difficulty in teaching them the elementary subjects by the appliances which they use for blind people, that is to say, if you were in a country village and you had one or two blind children coming to your class, if you had time you would find no difficulty in instructing them in the raised type?—I think not.

1019. You think, I suppose, that any intelligent person might learn the use of those appliances in a week, or in a day perhaps?—I should think so. I have never really set myself the task to understand it; it is simply what I have to do in my ordinary work as the blind children come under my notice just the same as the sighted children. I want to know what they are doing just the same as the sighted children; and I make them read what they are doing from their slate and I make them read like the rest. I treat them exactly like the sighted children.

1020. (*To Miss Best.*) You do not think there would be any difficulty in the training colleges in getting this primary instruction given to the future schoolmistresses?—Not so far as learning it goes; it is only a question of time.

1021. So far as the learning goes it would not occupy very much time, would it?—I should not think so. As Mr. Hodge says, I have never set myself to learn it, but it seems to be a thing which you become acquainted with by just associating with the blind children.

1022. You do not consider that it should be a *sine quâ non* to appoint blind teachers of the blind; you think that sighted teachers could teach them almost as well?—Yes. I think there is only that one point which I have mentioned before that the child feels, that the sighted teacher has the advantage of her by being able to see. I do not know of any other difficulty in the way.

1023. Do you think there is any advantage in having sighted teachers by reason of the sympathy which they are able to give to the blind pupil?—I think the blind teacher having confidence herself is rather inclined to inspire confidence in them. You may show too much sympathy sometimes and injure them by excessive sympathy as you might injure them by the want of it. Our blind teacher says to me sometimes, "Do not make "any difference with them; do not make them think that "they cannot do the same as the others." She is always anxious that they should not be excused from anything that the other children do.

1024. (*Mr. Johnson.*) In the school which you superintend what is the system that you teach them to read in and to emboss in?—The Braille system.

1025. Do you teach the Moon system at all?—No, I have never seen it. (*Mr. Hodge.*) Our boys had the Moon system at first, I believe, but now they use the other system.

1026. The Moon system is not taught in either of your schools?—Not now.

1027. (*Dr. Armitage, to Miss Best.*) What do the blind children do during play hours?—In the morning they always go out to play themselves; that is to say, they have a recreation time and they go for five or ten minutes, just as the case may be; but the other children are not out at the same time, and so they have not the difficulty of getting in their way. The blind infants, I believe, go out with the other infants; but in the girls school they do not have play time.

1028. You have Swedish exercises, I think you said, at your school?—Yes.

1029. (*To Mr. Hodge.*) Have you the Swedish exercises?—No, we have the ordinary military drill, in which the blind children go down and take part with the others. I recollect, I think it must have been two winters ago, that Gill used to go and join in the sliding between two boys in the playground; they made an artificial rink by sprinkling down water in the playground; and I think Sparkes does the same now.

1030. Can you give us any idea about any ordinary school teaching that goes on independently of the blind teacher; about how much of that teaching is applicable to the blind children, that is to say, how much of it does not appeal directly to the eye?—In the teaching of geography, for instance, a blind child could not see the map; but in our case the blind teacher has a raised map downstairs, and goes over the geography of England with a blind child with the raised map, and he brings his raised map upstairs and has the geography lesson upstairs with us as well.

1031. My question rather referred to this, it is evident that a blind child cannot profit by teaching unless it is by the ear; about how much of your teaching in school is done on the black board?—The black board is used nearly every minute of the day; a teacher cannot get on without his black board; if he is worth anything at all he must use his black board every minute.

1032. How does a blind child follow the lessons that are taken on the black board?—He cannot take them at all.

1033. Then that is lost to him?—That is lost to him.

1034. Can you give us an idea how much lost time there is in that way?—I cannot tell you exactly. I know that a blind child must of necessity lose that part of the instruction; but in taking arithmetic, for instance, while the teacher is working a sum on the black board, the blind child works it in type, and if the teacher says "four eights are thirty-two" on the black board, the blind child is doing "four eights are thirty-two" with his type. And the same in dictation, if the teacher is spelling a word the blind child is pricking it down, and although the teacher may be writing it in chalk for the sighted children, he is also spelling it for the blind child to put it down with his pricker.

Miss Best and Mr. D. Hodge.

22 Jan. 1886.

1035. He does read the figures for the blind child as well as writing them for the seeing?—In working a problem the teacher would give out the problem, and the blind child would proceed to work it; and then the teacher works it on the black board for every one to see it done as a pattern, and then the blind child works it with the teacher as the teacher is doing it while the other children are really looking on and working.

1036. Do you think that in the case of a country village where perhaps there is only one blind child it would be practicable for a lady or gentleman in the place, taking an interest in the child, to learn the special system of arithmetic and of reading and writing, and to teach the child outside and then to let it come into the village school to work with the other children?—That would be just the system I think that is carried on by the London School Board. A special teacher would give a start in the blind work and then the ordinary teacher would carry it on.

1037. I am speaking of a volunteer teacher?—That would be just the same, except that you would have volunteer teachers instead of paid teachers.

1038. Do you think that the special teaching which a blind child would require is too difficult for an ordinary volunteer teacher outside the school to undertake?—I do not think so.

1039. (*Mr. Arroll.*) Is knowledge more rapidly imparted to a blind child by a sighted master than by a blind master?—You cannot tell that because a blind child gets its initial start from the blind teacher downstairs.

1040. (*To Miss Best.*) Have you any experience of that?—I have no experience of that either. I only see the teaching by the blind, so that I cannot judge which they would get on more rapidly with.

1041. (*Sir Henry Selwin-Ibbetson, to Mr. Hodge.*) I do not know whether your experience has been gained from country schools or whether it has been entirely in board schools?—Mine is entirely in the London board schools. (*Miss Best.*) And mine also.

1042. (*Chairman.*) The difficulty which occurs to me with regard to our village schools where the teaching power is very small is as to whether the teachers can devote sufficient time to make a separate class for their blind children?—Unless they had outside assistance in teaching them I do not see that they could. (*Mr. Hodge.*) I recollect that when I was a pupil teacher I had a boy at school who was a dumb boy, and I firmly believed from the beginning that he was simply dumb because he was deaf, and I got that boy to pronounce my name and to say "chalk," and several other words, simply because I got hold of the idea that he was not really dumb, but simply deaf. I used to make him take hold of my throat and pronounce the word, and he used to produce the sound of the word.

1043. (*Chairman.*) That is the German system?—I did not know it was the German system; I thought it was my own at the time. (*Miss Best.*) With regard to the question which was put by one of the members of the Commission as to being in school, although the children may not be able to be thoroughly taught in a village school with a small staff, I should by no means keep them out of school. Let them be in school, I should say, by all means.

1044. (*Sir Henry Selwin-Ibbetson.*) You think that the mere association with other children is of great advantage to them?—Yes, there are many lessons in which they would get great benefit if it was only by the ear. I would not in any case let a blind child be kept out of school, even if it could not be taught any system.

1045. You think, in fact, that it would be a benefit to the children if it was made compulsory that blind children as well as other children should attend school?—Decidedly. Of course in a village it would not be hard upon a teacher, because our Exception Schedule would extend to a blind child. (*Mr. Hodge.*) I see no reason why a blind child should not go into the school under any circumstances, whether it could go the length of the other children or not. There would be many lessons in which the teacher could give a little more attention to the blind child.

Miss Best and Mr. D. Hodge.

22 Jan. 1886.

1046. (*Chairman, to Miss Best.*) And under the present Exception Schedule the child would be counted on the register and paid for just as though it was a sighted child?—Quite so. I had an instance at the last examination; I found that a child had been sufficiently long in the school to be on the Government Schedule, but not in the Blind School long enough to pass Standard I. The inspector allowed her as an exception, although I had a blind school in the building. (*Mr. Hodge.*) I have a similar case.

1047. (*Admiral Sir E. Sotheby.*) Have you observed amongst the blind children that there is more musical talent than amongst the sighted?—I have not noticed that. They take the singing with the other children. (*Miss Best.*) I have not found any child so much before the others as to call attention to it.

1048. (*Mr. Johnson.*) They are too young to show exceptional talent, I suppose?—Yes, they would hardly show it.

1049. (*Chairman.*) You only teach vocal music, and they are taught collectively and sing all together?—Yes, you hardly know the individual capacity of them in music.

1050. (*To Mr. Hodge.*) Are these blind children as a rule of the poorest class of the community; do you think that they come from a lower class than the average of your children?—The majority of mine do.

1051. (*To Miss Best.*) What do you say to that?—I think about half of my class are quite amongst the poorest. The other half are just able to go on comfortably. I have a very poor school, taking it altogether

1052. You are at Clerkenwell, I think you said?—Yes.

1053. Are the fees generally remitted to those blind children or not?—I have no blind children whose fees have been remitted. I have one blind child, and a sister who is in the school because of her; they come from a distance; the board will not remit the fees, but they do not pay the fees.

1054. That is to say, the fees become in arrears and payment is not enforced, is that it?—Yes, they go in arrears terribly, and if you attempt to speak to the parents they say, "Well you insist upon their coming "to school; we do not want them to come to school, "and why should we pay the school money." (*Mr. Hodge.*) In some cases they get fined and they take the fine out of the school fees afterwards; they do not send the fees until they have made the fine up.

1055. Do you think that the parents can afford to pay the fees?—A large number cannot afford to pay the fees, it strains them to do it.

The witnesses withdrew.

Adjourned to to-morrow at 12 o'clock.

32, Abingdon Street, Westminster.

Saturday, 23rd January 1886.

PRESENT:

THE RIGHT HON. A. J. MUNDELLA, M.P., IN THE CHAIR.

THE RIGHT REVEREND THE LORD BISHOP OF LONDON.
THE RIGHT HON. SIR LYON PLAYFAIR, K.C.B., M.P.
THE RIGHT HON. SIR HENRY SELWIN IBBETSON, BART., M.P.
ADMIRAL SIR E. SOTHEBY, K.C.B.
W. TINDAL ROBERTSON, ESQ., M.D.
T. R. ARMITAGE, ESQ., M.D.
W. AUCHINCLOSS ARROL, ESQ.
E. C. JOHNSON, ESQ.
ROBERT MCDONNELL, ESQ., M.D., F.R.S.

CHARLES E. D. BLACK, ESQ., *Secretary.*

Miss LOVELL examined.

Miss Lovell.

23 Jan. 1886.

1056. (*Chairman.*) You come from the Home for Blind Children in Goldsmith's Place, Kilburn Priory?—I do.

1057. Is that an institution which is supported by voluntary contributions?—Yes.

1058. What number of children are there in the Home?—33.

1059. Are those children supported entirely at the expense of the subscribers to your institution?—Not entirely.

1060. Do their parents pay part of the cost?—Ladies subscribe for most of our children; they send them to us, and guarantee the payment of 8*l.* a year.

1061. Do you teach and board those children?—Yes.

1062. They reside in your Home?—Yes, they live with us.

1063. At what age do you take them?—At 3 years of age.

1064. And how long do you retain them in the institution?—We have some now who are 20 years of age.

1065. But do you retain them from their third year to their twentieth year?—One girl is now 20, who came to us when she was 5 years old, when the Home was in Worcester.

1066. Do you keep them after that time or do you train them up to a certain age, and then do they enter upon some industrial career?—We have made no rule for it except with boys, and we pass the boys off now at 12 years of age. The girls we have kept, so far.

1067. What becomes of the boys after 12 years of age?—Most of them have gone into other institutions.

1068. For industrial training, I suppose?—Yes. One went to the Norwich School last year.

1069. What is the cost per head of the maintenance and training of the children in your institution?—Two years ago it was about 21*l.* per head.

1070. Have you any report and balance sheet of your institution?—Yes, Mr. Johnson has one.

1071. Are you yourself a teacher, or are you the lady superintendent?—I am teacher and superintendent of the education.

1072. Have you had any experience in teaching before you became a teacher in this institution?—I never taught the blind. I had taught in sighted Government schools; I had a Government School in Lincolnshire.

1073. Then you are a trained teacher?—I am not exactly trained, although I passed examinations and obtained a certificate years ago.

1074. (*Mr. Johnson.*) You were trained at Lincoln, were you not?—I was not trained (weak health at that time prevented).

1075. You were at the training college there, were you not?—I never stayed in the training college, but I passed examinations there.

1076. (*Chairman.*) Are the children at your institution, exclusively of the poorer classes?—Yes, exclusively.

1077. Do the parents contribute anything towards the maintenance of those children?—Yes, a few pay something towards it but I cannot tell you how much.

1078. What is the kind of teaching that you give these children?—I try to take them through the standards so far as I am able to, with the books and so on that we have. I aim at that so that they may be systematically taught.

1079. Are they examined annually?—Only by the lady superintendent.

1080. Up to what standards have you succeeded in carrying any of these children?—The fifth standard has been reached only in the case of one child, because they begin so late; they have only begun to learn systematically in the last four years.

1081. What subjects do you teach beyond the ordinary standard subjects, reading, writing, and arithmetic?—Only music at present; we have not gone farther yet. I include geography, grammar, and history amongst ordinary subjects.

1082. Do you teach them sewing?—Yes, we teach them sewing, knitting, and chair caning.

1083. At what age do you begin teaching them cane work?—We teach them chair caning at about 12 years of age. Knitting, of course, we teach them as early as they can begin.

1084. Do you find that those children are capable of acquiring knowledge of reading, writing, and arithmetic with as much facilty, or with very nearly as much facilty, as sighted children?—Yes, nearly, those that are capable. We have many who are incapable, I am sorry to say, who really have brain weakness, and other weaknesses.

1085. Is it your opinion that the blind children are as a class physically weaker and mentally weaker than sighted children?—The larger proportion of them are, only that as other homes have not taken them in we have, and therefore we can hardly speak fairly on that subject, as we have so many who are incapable. We have taken them really out of pity.

1086. Your institution would hardly be a fair representation of the class, because you have taken children that other houses were not willing to take; is that so?—That is so.

1087. You have, I believe, some suggestions to make as to the general domestic training of blind girls; the Commission will be very glad if you will be good enough to make your statement upon that matter?—I find from experience that a great many of the elder girls are physically strong; but they have no special talent for anything as regards music, or lessons, or hand work, and yet they would like to do house work, and we have lately let them do some, and they do it very fairly and enjoy it.

1088. What kind of house work and domestic work are blind girls capable of doing satisfactorily?—They began by sweeping and scrubbing, washing all their own tea things and breakfast things, and so on, laying tables and clearing away, making beds, cleaning boots, and cleaning plate.

1089. Doing general household work?—Yes. We have not tried every kind of work, of course we have only begun it; but we find that it makes them happy.

1090. Do they not require some superintendence and assistance from sighted persons?—A great deal more at first than others of course.

1091. Do you believe that it would be possible to find employment for blind persons in this capacity?—I wish I could say that I believe it; I wish it could be so, but I cannot say what employment could be found for them.

1092. You never allow them to light fires I suppose, or to deal with fire in any way?—We have never tried it, so that I cannot speak from experience; I only tell you what I know from experience. It would be dangerous, of course, to let them have anything to do with fire.

1093. You wish to suggest to us the need for the very early training of blind children; the Commission will be glad to hear what you have to say upon that point?—I think there is great need of that, and that parents should be very strongly impressed with it.

1094. We have had evidence before the Commission that it would be of the greatest possible advantage to the blind children that they should be brought to school very early with sighted children, and that they should associate with sighted children; do you agree in that?—Yes, I think it might be very good for them.

Miss Lovell.

23 Jan. 1886.

1095. Is it your experience that this gives them courage and self reliance and cheerfulness?—Cheerfulness ours have a great deal of: they are very cheerful and bright. They are all blind, but they are very happy. I should have stated that a few of the children are not totally blind.

1096. You have suggested on the paper which is before me that these children should be trained early before the inertness which is so natural to them becomes a settled habit, which is quite in conformity with the evidence which we have had; is that your view?—Yes, we had a great many brought to us at the age of eight who could not hold a spoon, and they would not know the top of a pinafore from the bottom of it; you would have to take six or seven weeks to teach them a little thing like that. It quite hinders all other work with them for a long time. Some of them never come to anything, and it is just because they have been brought up as babies, nursed, and fed and carried down stairs and their clothes put on, and never told which was one thing and which was another.

1097. They are treated from childhood by many parents as perfectly helpless persons, and that habit clings to them through life?—Yes, it does, and they bring them to us and we can never get it out of them whatever we do.

1098. You have suggested that blind children should be taken through the standards year by year; is that your opinion?—Yes, I think so, all that are capable. It gives them something to aim at, and I have found them get on much better since I aimed at it.

1099. Will you tell us what assistance you have in teaching these children?—I have none now, excepting the blind girls themselves.

1100. For instance, the girl of 20 whom you say you have in the institution could be very useful to you, could she not?—Yes, the elder girls do everything for the little ones. We keep no nurse for the little ones since those elder girls grew up, and they do the work very nicely. One girl of the age of 20 teaches the young ones music.

1101. Are the Commission to understand that in your opinion blind teachers can be very usefully employed in teaching?—Very usefully with sighted supervision, but not much so without it; the deportment is so bad, the children sit in such bad positions, and so on, that they get into very bad habits if you have not always your eyes upon them.

1102. It has been stated by teachers before the Commission that blind teachers encourage the children very much to pursue their studies; that it gives them the faith and confidence that blind persons can acquire considerable knowledge and usefulness, and that that is the advantage of blind teaching; is that your opinion?—Yes, it is, they can teach them the elementary parts of their education much better than I can. They can teach them their letters and show them how they have done it themselves much better than I can.

1103. We have also been told that blind teachers are sympathetic with blind children, and understand them much better than sighted teachers; is that your opinion?—Yes, I think they do. The blind teachers are very hard upon them very often, and I think that does them good.

1104. Do you find an indisposition on the part of the parents of the poorer class of blind children to send their children to school and to train them early?—Very great. They have even brought them to us and taken them back again because they could not bear to have them disciplined and taught properly; and those children have gone back just to go to the workhouse and do nothing probably.

1105. You have suggested that there is a need of more class books for teaching; what is your reason for saying that?—If we went through the standards there would be that need because it makes the work of a sighted teacher so hard if you have to dictate everything and give everything orally to two or three standards. You cannot set them down much to class work in geography, though we have, in a measure, guides to the maps; but there are a great many class books that we should need if we came under Government inspection, otherwise our work would be so hard that we could never succeed at all.

1106. We had evidence yesterday from London School Board teachers that these children pass very good examinations?—Yes they would I am sure.

Miss Lovell.

23 Jan. 1886.

1107. And that some of them are in some departments of knowledge in advance of sighted children, that is, in memory work?—Yes, they would be.

1108. It has been stated that their memory is strengthened by their having to rely less upon books than upon their memories; is that your experience?—Yes, where there are a great many teachers.

1109. Where they have a sufficient staff?—Yes.

1110. You have had experience of teaching sighted children; are you of opinion that it requires a much better staff to teach blind children than to teach sighted children?—Yes, decidedly.

1111. Have you taught in small rural schools?—Yes, I have.

1112. Supposing that in a rural school there were one or two blind children, do you think that a teacher who was conducting a rural school with a minimum staff could manage to teach one or two blind children?—Yes, I do think so with the Braille type, because they can write from dictation just the same as the others; and as regards arithmetic, if we could have arithmetics written in Braille, I think they could quite go with the others in everything if they were capable children, if there was no other weakness but blindness.

1113. Assuming that all other things were equal except the blindness, you think that they could do as well as the other children?—I do.

1114. Do you teach the Braille system?—Yes, on alternate days. Of course I teach it entirely in writing but I let them read other types.

1115. Do you teach them the Moon type also?—Yes, because we have it in a great many books, and I let them learn it. I do not find that it hinders them, they get on with both. I had a little girl came from Oxford two years ago, and she passed first in the Second Standard, and she is now in the Third Standard, and she learnt both types in three months.

1116. How old is that child?—She is 10 years old now.

1117. She is not much behind other children, and if she had been brought to you at the age of five, I suppose she would have been quite up to them?—She would have been quite up to them now.

1118. She would have been in the Fourth or Fifth Standard, I suppose?—Yes, she would.

1119. Have you found great difficulty in acquiring knowledge of the type and methods of tuition for the blind?—No difficulty at all; it came to me. I never took much trouble to learn it.

1120. Do you think that ordinary teachers might acquire in the training college, without much additional labour, sufficient knowledge of the types for teaching the blind, and of the methods?—I do, easily.

1121. Without, you think, entailing too great a strain upon the teachers?—Yes, I am sure they could.

1122. And it would not be a very difficult thing?—No, not at all difficult, very easy.

1123. And in that case an ordinary blind child coming into a rural school, and being taught with the other classes, would not be a great burden?—If it were a capable child, like many that we have, it would not be at all a burden. I should enjoy teaching it, and it would not make any difference.

1124. (*Sir Lyon Playfair.*) Supposing that you had charge of a rural school, do you think that if you had one or two children who were not already trained, it would take up much of your individual attention for some time?—Yes, it might.

1125. After their early training, I suppose you find that they can be taught collectively with the others?—Yes, but not before it.

1126. They do not require the same individual attention?—They do not now; but I do not think that an untrained child, as we have them, could possibly go with others, because we have to teach them every little thing of ordinary life, and that makes it very hard for us too.

1127. (*Dr. Tindal Robertson.*) Would it be possible for you to let any of the older girls train the very young in the first instance as to the more elementary parts of their education?—They can train them better than I can.

1128. That being so, supposing that you had a school in a rural district, composed of some 50 or 60 pupils, could you as a sighted teacher not get one of your older children to teach the elementary parts to a blind child before you yourself took her in hand in general class?—I do not know whether sighted girls would. I think those girls who can see would be very injudicious with blind children.

1129. I am speaking of sighted girls in an ordinary rural school, the higher educated girls?—But the girls who can see are very injudicious in their mode of treating the blind; it is the blind girls who can do it best.

1130. With regard to music, you said that the music was taught in your school by one of the old pupils; from whom did she acquire her knowledge of music?—From a master.

1131. Is there a regular master in the school?—No, we have one who comes in every week.

1132. On what system does he train them in music?—Upon the sighted system.

1133. Do you mean by Braille, by notation?—He teaches it them as if he was reading it from one of our own books, but he is blind.

1134. Then does he teach by the Braille system by notes?—No, he does not.

1135. Does he allow them to feel the notes when they are learning music?—No.

1136. He teaches them simply by ear?—Yes, and by explaining all the theory of the notes and telling them what they are like; and we also have the raised type notes so that they can feel it for themselves when the master is not there.

1137. But are they encouraged to do that?—Oh, yes.

1138. That is what I wanted to get at, whether they really knew the music except by ear alone or by ear and notation also?—They know it by notation also.

1139. (*Dr. Armitage.*) Can you tell us how many of your children are paid for by the guardians of the parishes?—I cannot tell you how many are paid for by the guardians of the parishes, but there are several I think. Some are paid for out of the Gardner Fund. I find we have five children wholly paid for by guardians of parishes, and one partly, the parents assisting.

1140. You might let us know that perhaps if you can find it out?—Yes, I will let you know.

1141. I did not quite catch from your answer what becomes of your girls when they leave; do you think that any of your girls after they leave you become self-supporting or nearly so?—Only one has left us who has become so.

1142. What is she doing?—She is doing chair caning, knitting, and domestic work. She quite supports herself and partly her mother too. That is in Gloucester.

1143. Is she paid for her housework?—No, she is with her mother, and she does her mother's housework, and she does knitting, and chair caning, and entirely supports herself and partly supports her mother.

1144. Do you know of any case in which a blind girl is either paid for housework or gives her work for her board and lodging?—I only know of one of our girls who is kept now for that, and that one not entirely for housework.

1145. But not outside?—No.

1146. Do you practice your children with any kindergarten work?—No, not yet.

1147. You have no straw plaiting or paper plaiting?—They have done straw plaiting for hats in former years, but now that is out of date. They did a great deal of straw plaiting at one time, and they used to be paid for that.

1148. Is that given up?—Yes, they do not use it; we do not have any demand for it now, so that they have not done it lately.

1149. Was that in your time?—No, not much of it it was done a little after I came.

1150. Have you formed any idea as to whether it is a useful thing for blind children to learn to use their hands by straw plaiting and other kindergarten work?—I think that anything which employs their fingers is very useful.

1151. But at present you have no experience of that?—No, their fingers seem to be employed all day in lessons and knitting, and other things now.

1152. (*Mr. Arroll.*) I think you stated that the average cost of each child was 21*l.*; does that include clothing as well as maintenance and education?—No, they pay for their clothing.

Miss Lovell.

23 Jan. 1886.

1153. Do you teach the young people gymnastics and Swedish exercises?—Yes, as much as we have time for; we have children of so many ages that we find very little time to get the things in, but I give them such exercises in spare moments.

1154. Although you are the superintendent of a blind school, you would be disposed to recommend that blind children should be sent to sighted schools so as to make them shake off their indolence and helpless habits?—I should think it would be good for them. I cannot speak from experience, because I never saw a blind child before I was in a blind school, but I know that the indolence is dreadful. It is the one great thing that we have to battle with from hour to hour.

1155. (*Admiral Sir E. Sotheby.*) Do you find much musical talent amongst your children?—Not any more than there is amongst sighted children I should say.

1156. You say that you teach them to make cane chairs; do they ever try to draw bristles and make brushes?—No, not at all.

1157. They are particularly suited for that work, I believe. Then to go to another matter, the arithmetic, you say is taught on the Braille system; that is because it is more easily written, I suppose?—Yes, that system is much more easily written than any other.

1158. Have you ever tried them at making their own clothes?—They have helped; they have done a little in that way.

1159. Can they do part themselves?—I think they could, but we have not had much experience in that way

1160. Will you tell us what is the system on which you proceed; is the education taken in the morning, and the domestic work afterwards?—Before breakfast they make their beds. One girl sweeps her own little room, and they fill all the water jugs and bottles in all the rooms.

1161. Is the work divided, half being educational and half other work?—Yes. Our children only do house work now out of school, the same as other children. They come into school at a quarter past nine, and then we have Bible class, and then we have lessons from 10 to 12; then they go for their walk and they have their dinner, and they come back into school at half past two, and stay till half past four.

1162. How much of that time is employed in caning chairs?—The afternoon.

1163. For how long?—For two hours. Some of them cane chairs out of school. We get a great many chairs to cane. We had about 100 or 150 last year. Then they do beaded cuffs, and they knit.

1164. Can they make the beading of the chair?—Yes.

1165. Then you make a good profit, do you not?—Yes, that brings in a good deal in time. They make hundreds of pairs of bead cuffs. They are always knitting for outsiders. We get a great many more orders than we can execute speedily with so many little ones.

1166. Can any of them cane more than one chair in the day. No, not more than one, I think, as a rule. They have never been able to sit down to it all day, so that I could not say. They do other little things as well.

1167. (*Mr. Johnson.*) I believe you have 32 pupils at the present time?—We have 33 now.

1168. 21 girls and 12 boys?—Yes.

1169. Is that your ordinary number?—We vary very much.

1170. What has been the largest number that you have had in the school at one time?—We have had 34.

1171. What should you say would be the average number?—27 or 28. We have never since I have been there got much below 30.

1172. They pay 8*l.* a year, do they not?—Yes.

1173. But that does not include clothing?—No.

1174. I understand that they pay 4*l.* a year extra for clothing; is that so?—Yes.

1175. And they pay 2*l.* a year extra for music?—Yes.

1176. You say that the music is taught orally with notation?—Yes, it is.

1177. It is taught by a blind organist, is it not?—Yes.

1178. Does that blind organist attend very often?—Once a week.

1179. Have you many pupils under instruction in music?—Five, with the music master, and three others, with the girl teacher.

1180. I believe that you have at the present moment eight who remained till they were 20 years of age?—We have only two who are actually 20; but there are others getting up to 20. We have about eight elder girls.

1181. Eight elder girls out of 21?—Yes.

1182. What are the ages of the youngest ones that you have?—Three and a half and four.

1183. How many have you of about that age?—Only two, but the one who is three and a half years old cannot walk or talk.

1184. Then these very young ones are not able at the present moment to receive much education?—No, not any.

1185. It is more physical training with them, is it not?—Yes.

1186. Have you any calisthenic exercises?—Yes, we do a little at that; but not so much as I should like.

1187. Is there no drill?—Yes, we have a little of it, but not so much as we might have if we had more time.

1188. You say that some of the children are employed in caning chairs; how many as a rule are employed in industrial work in your school?—They are so young. We have not more than eight elder ones, I think, the rest of them are young and a good many of them have only come lately.

1189. I see in the balance sheet that the caning of chairs last year amounted to 7*l.* 5*s.* 0*d.*; does that represent the profit only?—Not quite all profit. I cannot ascertain how much of the sum is so.

1190. What raised systems do you teach them in the school?—The Moon and the Braille, and they take up Roman, some of them out of school, the Worcester College type.

1191. The Roman type I believe you used for the purposes of communicating with their friends?—Yes, Roman writing.

1192. Otherwise they write in Braille, do they not?—Yes, always.

1193. Do you teach Braille and Moon consecutively in the school on alternate days?—Yes, in the way of reading.

1194. Do you find that they have as much facility for learning the Roman type as for Braille or for Moon?—No.

1195. I do not mean the Worcester type, I mean the ordinary Roman letters?—I rather think they learn the Braille quickest; I cannot say which they learn the quicker of the two. We do not use Roman in school.

1196. But they learn Moon quickly too, do they not?—Yes, both of them; they learn one as quickly as the other, I think.

1197. Do you in the education of the children follow entirely the Government code?—Yes, as far as I possibly can with myself only.

1198. I think it would be satisfactory for you to put in this as evidence: that of the 12 examined, 12 passed in reading, 9 in writing, 8 in arithmetic, 12 in geography, 6 in grammar, and 5 in history; I am quoting that from your own report?—Yes. The history and grammar seem to be rather bad because we did not state as we ought to have stated that only five were examined in history. It is the first time that we have stated anything of the kind.

1199. (*Chairman.*) Who passed them?—The lady superintendent. We have not had an opportunity for inspection. The lady superintendent took the sums and so on out of the "Schoolmistress" newspaper which you most likely know.

1200. The superintendent, I suppose, is the person who resides in the house and superintends the household affairs?—No, the lady superintendent lives away from us.

1201. She is, I suppose, the lady who has the superintendence of the home generally?—Yes, she is the only lady belonging to the home.

Miss Lovell.

23 Jan. 1886.

1202. And this is the result of her examination?—Yes.

1203. (*Dr. Tindal Robertson.*) Is any time allowed for play and for physical exercise, and if so, to what extent?—All the younger ones play from a quarter to nine to a quarter past nine. The elder girls go and do house-work instead. We cannot always let those who are 19 and 20 years of age play, but the younger ones all play for that half hour, and then they play when they come from their walk for half an hour till dinner time. Then they have a little bit of play after dinner perhaps, if dinner is over pretty early, and then they stay up till 7 o'clock after tea, when they play at games, and so on. Then they have another half hour from half past 4 to 5 at play.

1204. (*Chairman.*) Practically they have more time for play than the children of poor persons, because there is very much more done for them?—Yes, for the younger ones. Of course the elder ones have work to do all day long.

1205. Is there any playground attached to the house?—There are nice playgrounds, one in the boys' part and one in the girls'.

The witness withdrew.

MISS ROSE HISCOCK examined.

Miss R. Hiscock.

1206. (*Chairman.*) You are mistress of the Juvenile School for the Blind, I think, at Wandsworth?—Yes.

1207. How many children are there in that school?—Fifty.

1208. What are their ages?—From 7 to 13.

1209. You are a trained certificated teacher, are you not?—Yes.

1210. Where were you trained?—At Whiteland's College.

1211. How long have you been teacher of this school?—Three years.

1212. Where did you acquire the requisite knowledge of the type, and the method of instruction?—At the school itself.

1213. What assistants have you?—I have two blind monitors.

1214. What ages are they?—One is 18 and one is 24.

1215. Have they been trained in the school?—Yes, they are old pupils who have left.

1216. What standards have they passed?—I do not think that they have passed any standards.

1217. They were instructed before you went to the school, were they not?—Yes; the elder one I have only had for the last three or four months.

1218. Where was she instructed?—At St. George's.

1219. But that school is now examined, is it not?—Yes.

1220. Have you no evidence as to her standard of attainments?—I think she left before they were examined.

1221. Are they good teachers?—Yes, very good.

1222. What is your own estimate of their attainments? Are they persons who would have passed the 6th or 7th Standard?—I think the elder one might have passed the 6th Standard, and the younger one might have passed the 4th Standard.

1223. Then they assist you, I suppose, in teaching, reading, and arithmetic?—Yes.

1224. Do you teach your children according to the standards of the Code now?—No, I divide them into three sections. The younger teacher takes the quite young children and the elder one takes the second division, and I take the first myself.

1225. Will you tell us the subjects that they are taught in your schools?—Scripture, of course, reading, writing, and arithmetic, geography, and English history.

1226. Do you teach sewing?—No; we teach knitting.

1227. Do you think that the blind children are generally as strong physically as sighted children?—No.

1228. Do you think that they are defective in point of physique?—Yes, I do.

1229. In respect of mental capacity, what do you say of them?—I think that the majority of mine are above the average.

1230. Do you mean above the average of sighted children?—Yes.

1231. Are they quick and clever, then?—Very quick.

1232. And do they learn as quickly as sighted children?—Yes, I find that the elder ones learn more quickly.

1233. What are the subjects that they learn more quickly; is it chiefly memory work that they learn more quickly?—Yes, chiefly.

1234. That is to say, poetry, history, and everything relating to facts, grammar, and so on, they acquire and retain better than sighted children?—Yes.

1235. Then at what age do they pass out of your school?—At about the age of 12 or 13.

1236. They pass out of your school to go to the school at St. George's-in-the-Fields, do they not, for industrial training?—Yes.

1237. Are they quick at mental arithmetic?—Yes.

1238. Taking your children from 11 or 12 to 13 years of age, what standards do you consider that they are equal to?—About the Fourth Standard.

1239. Then when they leave you at 13 years of age you think that they would pass out equivalent to the Fourth Standard?—Yes, the majority of them.

1240. But you know that that is not the standard in which the sighted children pass out at the age of 13?—No, it is not; but we do not have them from the age at which sighted children begin. We have some of them perhaps at 10 or 11 years of age, and then they begin to learn their letters.

1241. And when they come to you first to learn they are often very helpless, are they not?—Yes, very helpless.

1242. Have any of them who have come to you ever been at school with sighted children, say, in the London Board Schools?—I do not think they have been in London Board Schools. I have country children who have been to a country school.

1243. Are those children better for having attended a school with sighted children than those who have not been to school at all?—Yes, I think so.

1244. In what respect. Are they more self-reliant?—Yes, and they are quicker if you talk to them. They have a better sense of answering what you want, and their ideas seem to have been cultivated.

1245. Do you teach them physical exercises and play?—I do not teach them that in school; they have a drill master.

1246. Is it military drill that they are taught?—Yes.

1247. They are not taught the Swedish drill or any gymnastic exercises?—No.

1248. Then the subjects taught are two different systems of reading, are they, that is to say, the Braille and the Moon?—There are three different systems of reading.

1249. What are they?—Alston's, the Moon, and the Braille.

1250. Which do you find that they acquire easiest?—I think that they acquire Moon's easiest.

1251. Which do you consider is the most useful to them?—Alston's system, the Roman letters.

1252. What have you to say as to the modes of embossing?—They have two modes of embossing, the Roman letters and the Braille.

1253. Do they use the Braille mostly for correspondence?—No, I think they use the Roman letters.

1254. That is for correspondence with sighted persons?—Yes.

1255. What are the various occupations which you regard as suitable for these blind children?—They learn to do almost all kinds of house work, such as scrubbing, and of course they learn to do knitting to a very great extent, and they make their own beds, and a few of them sew.

1256. It is a mixed school, I suppose, boys and girls?—Yes.

1257. (*Dr. Tindal Robertson.*) Do they generally pass from your school to the parent school?—Yes.

1258. Do you prepare them generally according to the same plan that they adopt there?—Yes.

1259. You said that they did not do sewing except in a very small way; is that because there is a difficulty in teaching them sewing?—Yes, they want so much individual attention.

1260. But you think that it would be very useful to them in the future if sewing could be taught systematically?—Yes, I think it would, certainly.

1261. (*Dr. Armitage.*) You say that you consider the Alston system the most useful; what are your reasons for saying so?—Because I think that it does not isolate them, they are to a certain extent on an equality with sighted people and sighted children.

1262. Do they all read Alston?—Yes.

1263. Do you find that they learn Alston as easily as they do Moon?—I always teach them Alston first, and then after that I find that they learn Moon's very quickly, but I have not tried the other way of teaching Moon's first.

1264. What length of time does it take a child on an average to learn by the Alston system to read fluently?—I should say perhaps six months.

1265. What time does it take by Moon's?—After they have read Alston's they will read Moon's in two or three weeks, or at any rate in a very few weeks.

1266. Do you teach by Braille?—Yes.

1267. Before Moon or after?—I teach Braille the last.

1268. About what time does it take to learn the Braille system?—I have only taught that lately, and I have found that that has taken perhaps three months before they could read it at all fluently.

1269. Have you any school books on the Alston system?—Yes.

1270. What books have you?—I have the Psalms, the Gospel of St. Mark, and two volumes of English History.

1271. But the English History is the only school book?—We use all the others in the school, and we have a primer.

1272. What school books have you in Braille?—I have no school books in Braille.

1273. You know, I suppose, that all the standard readers are published in Braille?—I did not know it.

1274. Do your children do much by writing; do they write out exercises, and write out their lessons?—Yes.

1275. By what system do they write?—By Braille and by Roman letters.

1276. What is the difference in rapidity between writing the Roman letters and in Braille?—They write the Braille much more quickly.

1277. Can you give us an idea how much more quickly?—Quite twice as quickly.

1278. Do you teach music?—No, only singing by ear.

1279. Are you under Government inspection?—No, but we have an inspection.

1280. (*Sir Henry Selwin Ibbetson.*) I understand you to say that you teach all three systems?—Yes.

1281. The advantage of teaching the Roman character, the Alston character, is principally in regard to communicating with sighted people, I suppose?—Yes.

1282. (*Admiral Sir E. Sotheby.*) I suppose you thoroughly understand all these systems yourself?—Yes.

1283. (*Mr. Johnson.*) You told the Commission just now that you had children from the age of 7 to the age of 12?—Yes.

1284. I suppose the object of your school is merely educational?—Yes.

Miss R. Hiscock.

23 Jan. 1886.

1285. And when you have done with them in your school then they are drafted off into the larger school, where a similar education is continued, is it not, by a certificated and trained master?—Yes, and mistress.

1286. What do you suppose is the average age of the pupils on their admission to your branch school?—Ten.

1287. May we take that as the age at which they first come in?—Yes.

1288. They come into the school at the age of 10 on an average?—Yes.

1289. Do you suppose that if they were to come to you earlier, by the time that they left the branch school, they would have made very much more progress than they do?—Yes.

1290. Your difficulty is, I suppose, in getting them at 10 years of age perfectly untrained and untaught?—Yes.

1291. You believe that if these children were trained earlier with the sighted children in a board school before they came to you, you would have a much better element to deal with?—Much better.

1292. You have stated that the three systems are taught in a school; which do you think is preferred by the children themselves?—I think there is not much preference with them between Alston and Braille.

1293. Do you think there is any advantage in the Alston over the Braille?—Yes.

1294. For what reason?—Because, as I say, it does not isolate them from the sighted people.

1295. When a child writes in the Alston system, any other child not specially educated could read it?—Yes.

1296. But if any child writes to his friends in the Braille system they must have a key before they can decipher it?—Yes.

1297. Are you aware of the reasons which lead the committee to teach the three systems?—No, I am not.

1298. Do you believe that the Moon system is nearly approaching to an alphabetical system?—Yes.

1299. There is very little difference between the formation of the letters?—Very little, indeed.

1300. Then you recommend the Braille system for correspondence amongst themselves and for taking notes?—Yes.

1301. And you recommend the embossed Roman letters for the purpose of communicating with the sighted world?—Yes.

1302. Do you believe that it is an advantage that the blind should be associated as much as possible with the sighted?—Yes.

1303. Your reason for saying so being that it does not isolate them so much?—It does not.

1304. (*Chairman.*) Is there any maximum age for admission to the school?—I think not.

1305. What is the oldest age at which they send any children to you?—I have had them sent at the age of 13.

1306. And you have kept them how long?—Perhaps a year. If they were below the average we have kept them 18 months.

1307. Before you passed them to the higher school?—Yes.

1308. Supposing that a child comes to the school knowing either a Braille or a Moon, or both, is he taught the Alston characters?—Yes.

1309. Is the Alston type used for the purpose, of education, or only for correspondence with the outer world?—For both.

1310. In fact you teach the Alston system first, do you not, to learn the letters, and to learn to spell and to learn to read, and then you teach them the Moon and the Braille afterwards?—Yes, in the third section of the school with the younger children they are taught the Alston type only. When they pass up to the second section they learn Moon, and when they pass up to the third they learn Braille.

The witness withdrew.

Miss Weaver examined.

Miss Weaver.

23 Jan. 1886.

1311. (*Chairman.*) You are a teacher under the London School Board?—Yes.

1312. You are quite blind?—Yes, quite.

1313. Where were you trained?—I received the first part of my education at Brighton, and after that I went to the Norwood College.

1314. At what age did you enter the institution at Brighton?—I think I went to the school when I was about 11. I lost my sight when I was 10 years old.

1315. Previously to the loss of your sight had you been at school and received instruction?—Yes, regularly.

1316. And you had obtained a fair knowledge, I suppose, of reading, writing, and arithmetic before you lost your sight?—Yes.

1317. May I ask to what circumstances your misfortune is attributable?—I lost my sight quite suddenly. I was treated by the doctor at the time for the digestive organs being out of order, but it was a kind of low fever that I had. We never really knew what was the matter with me. I lost my sight in one night quite suddenly.

1318. And then you went to the Brighton Blind Asylum?—Yes.

1319. How long did you remain there?—About five years.

1320. You received there nothing but mental training, I suppose?—That was all.

1321. When you left there you were 16 years of age, were you?—Yes; I did not go to the college until some time after that.

1322. At what age did you go to the Normal College?—At the age of 21.

1323. How long did you remain there?—Two years.

1324. What instruction did you receive there?—I studied the organ in the first place when I went, and after that I went more in for the school work, as my attention was turned in that direction. Then I took up the ordinary school branches more thoroughly.

1325. And you now teach in certain schools for the London School Board?—Yes.

1326. What schools do you teach in?—I teach in five schools at present.

1327. Which are they?—The schools at Wornington Road, Notting Hill; Stephen Street, Marylebone; Cook's Ground, Chelsea; Waterloo Street, Hammersmith, and Church Street, Kennington.

1328. How often do you attend those five schools?—That depends upon the number of children in the centre.

1329. How many blind children are there at each of those schools that come under your instruction?—At Stephen Street, Marylebone, I have seven in attendance now; at Wornington Road eight; at Cook's Ground two; at Hammersmith two; and at Church Street seven.

1330. Do you teach all the blind children who are in those schools, or only the younger ones who require your special instruction?—I teach all the blind or partially blind children.

1331. Those that require blind teaching in fact?—Yes.

1332. Then you attend, I suppose, on certain mornings in the week, or on certain afternoons, at each school?—Yes.

1333. You go from school to school?—Yes.

1334. What is the nature of the instruction that you specially give?—I prepare them for their class work.

1335. What kind of instruction do you give to these children?—I teach them reading, writing, slate arithmetic, a little geography, and a little grammar; a little of each as far as I have time. The time is limited, and I am not able to do very much in that way, but as far as I am able I give them a little of all that they will receive in school.

1336. All the code subjects, I suppose?—Yes.

1337. How much time do you spend in each school generally?—Two hours; that is half a day in each.

1338. Then if you have five schools you can give to each school about four hours a week, I suppose, that is two mornings or two afternoons a week?—At present I am teaching at Stephen Street three mornings a week, that would make six hours there; and at Wornington Road I am teaching three times a week, six hours there; because there are more children. I only teach once a week at Cook's Ground, once a week at Hammersmith, and twice at Kennington.

1339. You distribute your time, I suppose, according to the number of children that there may be in each school?—Exactly.

1340. What is the age of the youngest children that come under your instruction?—The youngest that I have is 3½ years old.

1341. What do you teach that child?—He simply learns to count, and he learns several letters of the alphabet.

1342. You teach him to tell the letters by touch?—Yes. He learns to count and do various little things like that, though not very much, of course.

1343. Are you of opinion that it is a good thing for these children to come to school as early as possible?—Yes, indeed I am.

1344. What is the advantage of their coming as early as possible?—I think that directly they mix with other children they enter into their games, and they feel that they are one with them at once; I find it so with the children that I have to deal with.

1345. It takes away their sense of isolation and of dependence, is that so?—Yes, I think so.

1346. And it makes them more courageous and self-reliant?—Yes.

1347. If a child comes later to the school, say at eight or nine or ten years of age, do you find greater difficulty in teaching that child?—I do not know that I find it more difficult, but they do not then quite take their place amongst the other children for a little while. For instance, if a child comes to us at 10 or 11 or even 12 years of age, as is very often the case, not knowing anything at all, that child is very backward as compared with other First Standard children.

1348. Is it not the case that the child is not only backward in learning, but also very often, through being kept at home, very helpless?—Yes, indeed.

1349. And you think that the education with the sighted children is in every way an advantage to the blind children?—Yes, I think so.

1350. Would you from your experience recommend that the children should go to the ordinary day school with the sighted children, as far as possible, to obtain their early education, and that they should then be trained for industrial occupations afterwards?—I quite believe in that, because I know from my own experience how I felt when I lost my own sight. For a time I was kept away from school, and when I did go I disliked being with blind children, and yet I had an uncomfortable feeling in being with those that could see. I quite know how it is. If I had been thrown into school at once I believe that I should have found my level and taken my place directly.

1351. Do you find that the blind children whom you are accustomed to teach make very fair progress in comparison with the sighted children?—Yes, I think they compare with them favourably.

1352. Are they specially quicker at any kind of work than at another?—I find them as a rule very quick at mental arithmetic.

1353. And in all kinds of memory work, I suppose?—Yes.

1354. And you think that the habit of relying upon memory developes that faculty, and that they do their memory work better than the sighted children perhaps?—Yes, I think so.

1355. Do you teach them poetry?—Yes, a little.

1356. Are they fond of poetry?—Yes, very.

1357. Is that one of their favourite studies?—I think, as a rule, they like mental arithmetic and geography better than anything else; I find that they are very fond of those two subjects.

Miss Weaver.

23 Jan. 1886.

1358. Do you think that a blind teacher can impart instruction in certain branches to the blind as well as or even better than sighted teachers?—If I may be allowed to say it, I think so, and the reason why I think so is because a blind teacher is able to meet their difficulties better than those who can see.

1359. And you have sympathy with them?—Yes, exactly.

1360. Do you think that the sighted children treat the blind children kindly and sympathetically, and that it is good for them also?—As a rule I think so. There are cases in which they are not as kind as they might be, but I think as a rule they are kind.

1361. You have a guide, I suppose, who accompanies you from school to school?—Yes, a little girl.

1362. Do the School Board provide you with a guide?—No, I have to make my own arrangements for a guide.

1363. At your own expense?—No, not at my own expense.

1364. They pay the guide?—Yes.

1365. And you think that for teaching reading and writing, which have to be taught by touch, a blind teacher can do quite as well as a sighted teacher?—Quite as well.

1366. Can you teach knitting, for instance?—Yes.

1367. And do you?—Yes, in some cases.

1368. Do you teach sewing?—I have never tried to teach sewing, but I can sew myself, and if there was more time I should try to teach sewing.

1369. The subjects that you teach are entirely mental subjects?—Yes.

1370. Have you anything to do with the infant class at all?—Our children are mixed, they are of all ages; we cannot have a separate class for the infants, they are mixed with the others.

1371. Do they do any kind of Kinder-garten work?—Yes, a little, and with the other children in school they do a good deal of that.

1372. Do you teach them any Kinder-garten work, such as the use of the fingers in plaiting or in paper work?—I have tried to teach them to weave baskets and things of that kind, and to make paper mats in one or two cases.

1373. And you think it is a good thing for them to be taught the use of their fingers?—A very good thing.

1374. (*Dr. Tindal Robertson.*) Will you kindly tell the Commission what you did in the interval between the time when you left the Brighton School and the time when you went to the Normal College; were you engaged in educating yourself during that time?—I was at home with my parents.

1375. Were you working with the view of becoming a teacher?—Not while at home. I had a good deal of reading, and I spent more time in music than anything else. I did a little knitting. As a child, till I lost my sight, I always meant to be a school teacher, but that I could, being blind, seemed wholly hopeless, until I heard about the Normal College, when I determined to gain admission and try what I could do.

1376. From your subsequent experience can you tell us what were the defects, if there were any, in the training at the Brighton Institution?—At that time I did not think it was defective.

1377. But from your subsequent experience in what respect do you think it could be improved?—The lessons were entirely oral at that time. We had no raised maps or globes or figures or anything that the children are using now.

1378. With regard to the system of teaching by the different types, do you find that as is the case with sighted people, the fact of writing a thing down two or three times impresses it upon the memory?—In my own case I found it a very great advantage.

1379. In the case of children have you found that it impresses it upon their memory if you make them write it down?—Yes, I think so.

1380. For that reason would you recommend the use of any particular system in order that that may be managed?—I use the Braille system myself for writing.

1381. Have you ever tried any other system of writing?—No. I keep up my own writing from having seen how to write; I still keep that up myself, and I have taught the children in several cases to write with pencil.

1382. On the card?—Yes, and with Moon's apparatus.

1383. Is there any great difference as to facility between Braille's system and Moon's system?—Oh, yes.

1384. Which is the easier?—Braille, I think.

1385. By very much?—Yes, by far.

1386. (*Dr. Armitage.*) What system of reading have you?—Braille and Moon.

1387. You use Moon as well, then?—Very little. Some of my younger children I teach the Moon letters to.

1388. Do you begin with Moon?—When they are little children I do.

1389. Do you find that your children become good spellers?—As a rule they do. They seem to have a very good ear for catching up the sound of the letters. I have one or two children who will never learn to spell, I think, but as a rule they spell well.

1390. Do you think that the blind children are as good spellers as the seeing when they have been the same time in school?—Better, I think.

1391. Do you think that that has anything to do with their writing exercises?—No, I do not think so. They generally spell according to the sound, I find.

1392. You think that their writing from dictation has not much to do with their power of spelling?—No, I think not.

1393. What class books have you?—We use Nelson's Royal Readers principally, and the geography.

1394. Are they published in Braille's type?—Yes.

1395. Do you find it an advantage to have the same class books that are used in seeing schools?—Yes, a very great advantage.

1396. What maps do you use?—We have the hemispheres, and we are also using the maps of Scotland, Ireland, and England.

1397. You have raised maps?—Yes.

1398. Do the children learn geography from raised maps easily?—Yes.

1399. Do you think there is much difference of difficulty between a blind child learning from a raised map and a seeing child learning from an ordinary map?—I think it takes a much longer time to impart the same amount of knowledge to the blind children, because they want individual teaching. I find in my own classes that being so mixed as regards their powers, having the little children and the bigger ones together, they are not always able to take the same kind of instruction. I find a little difficulty in that way.

1400. Do you think you could teach geography satisfactorily without maps?—No.

1401. Have you a globe?—Yes.

1402. What system of arithmetic do you use?—Taylor's arithmetic.

1403. Do you use the octagonal slate?—Yes.

1404. Are you satisfied with it?—Yes, quite.

1405. (*Dr. McDonnell.*) We are all struck by the development which the sense of touch undergoes in blind persons. From your experience of the blind, not specially of children, but from your experience at Norwood and other places where you have met with adult blind, do you think that the sense of hearing is much increased and becomes more acute in blind people?—I think so; in my own case it does. I notice sounds I think very much more quickly than others.

1406. What we ordinarily call "ear" is something distinct from hearing; a person may hear very well and yet have no ear; do you think that the ear for music is capable of considerable development in the blind?—Yes, I think so.

1407. Have you known in your experience cases of persons who in their earlier days were not supposed to have good ears who became good musicians afterwards?—Yes, certainly.

1408. Do you think that the ear is capable of as great development in the blind as the sense of touch is capable of becoming developed?—Yes.

1409. Have you observed anything of the same kind in regard to the sense of smell; do you think that the

Miss Weaver.
23 Jan. 1886.

blind recognise each other by smell?—I have never found that they do.

1410. Is their sense of taste acute?—I have not noticed that either.

1411. You are perhaps aware that there are some persons in these islands who make a good deal of money by their sense of taste, wine tasters and tea tasters, for instance make very large incomes sometimes; do you think it would be possible to develop amongst the blind that sense of taste so as to make it of profit to them in this way?—That I cannot tell.

1412. Have you ever known anything of that kind?—No.

1413. (*Mr. Arroll.*) Do you teach music?—No.

1414. (*Admiral Sir E. Sotheby.*) You said, did you not, that you were prepared to teach music?—I did not say so.

1415. Have you gone on with your music at all?—I play the organ a little.

1416. Not the piano?—I play a little, but I do not keep up my practice much. I did play a few years back more than I do now.

1417. Is that because you have not sufficient time or because you have no inclination for it?—I have not sufficient time.

1418. But have you the inclination?—Yes.

1419. (*Mr. Johnson.*) I believe you stated that you attend five schools?—Yes.

1420. The average attendance is 5, is it not, 7 in three schools, and 2 each in two others?—At present. The numbers vary.

1421. Is your time in those schools entirely devoted to the special education of the blind children, teaching them types and teaching them how to read?—Yes.

1422. The sighted teacher does the rest of the ordinary education, does she not, and you do what may be called the extraordinary?—I try to supply what they cannot get in school.

1423 You teach them subjects which if you were not there would be taught in the ordinary school?—They could not learn to read or write or to do their arithmetic with another teacher I think.

1424. You teach those three things?—Yes, and geography.

1425. And you prepare them for their work?—Yes.

1426. How many read fluently amongst the pupils that you have under your instruction?—That depends upon the length of time that I have had them at school.

1427. But how many can read fluently at present?—Out of the seven at Stephen Street perhaps four can read fluently.

1428. Do those four read both Moon and Braille?—Both Moon and Braille; Braille principally.

1429. Do you give equal instruction in Braille and Moon?—In Braille principally.

1430. What is the proportion of time that you give to Braille as compared with what you give to Moon?—I prefer teaching Braille entirely.

1431. That is not my question. I only ask you the time that you give to each?—I cannot tell the time that I give.

1432. Do you give half to each?—No.

1433. Do you give one-third to one and two-thirds to the other?—I should hardly think so.

1434. Do you give one-fourth of the time to one and three-fourths of the time to the other?—Not more I should think.

1435. Three-fourths to Braille and one-fourth to Moon?—Yes, about that, so far as I am able to say.

1436. Have you any knowledge of any other system of embossed writing besides Moon and Braille?—The Roman system I have a little knowledge of.

1437. Can you read yourself in Roman type?—I have never been a successful reader in the Roman type.

1438. Did you ever write in Roman type?—Not now, but I used to do so.

1439. May I ask where you learned to emboss in Roman type?—At Brighton.

1440. During your time I believe they almost always instructed the pupils in writing in the Roman character, did they not?—Yes.

1441. Did they teach you Braille at Brighton?—No.

1442. When did you first begin to learn Braille?—Not until I went to Norwood.

1443. As I understand, you were educated first at Brighton, then there was an interval of four years, and then you went to Norwood?—Yes.

1444. Might I ask whether you went to Norwood under any one of the Scholarships?—No.

1445. You went simply being selected by the Committee of Norwood?—I went through the kindness of Mr. Bevan and other friends who were interested in me.

1446. If you were asked your opinion, which system of embossing and reading should you say was most advantageous to the blind?—The Braille system I should say, undoubtedly.

1447. Do you not think that it is more advantageous for the blind than for the sighted because it is a system that the sighted cannot themselves understand without a key?—In my own case I found that all my friends took it up with great interest, and they both read it and write it.

1448. They learnt it?—Yes.

1449. But it is a system that must be learnt separately?—Yes.

1450. That is to say, that if there were the same facilities in Roman type an ordinary sighted person could read your letter without any key, whereas in the Braille system they must have a key to decipher it; is not that so?—Yes, a key at first, not afterwards.

1451. (*Chairman.*) Have you a good supply of books and apparatus for teaching in the London Board Schools?—Yes.

1452. And good embossed maps for geographical teaching?—Yes.

1453. And embossed globes?—Yes.

1454. Do you consider that the education of the blind children at the London Board Schools is good and successful on the whole?—Yes, I think so.

1455. How does it compare, in your opinion, with what you have had at other schools?—In what way do you mean? I have had no other experience at other schools.

1456. Do you think it is better or worse than what is taught at blind schools?—Better, I should think.

1457. Without naming particular institutions, do you consider that the education which is now given to blind children in the London Board Schools compares favourably with that which is given in blind institutions so far as you know them?—Certainly, I do; the other is not to be compared with it so far as my own experience goes.

1458. In your opinion the advantage of being educated with sighted children up to the age at which the blind child leaves school is great?—Yes.

1459. The association and teaching in common and listening to the oral teaching is all to the advantage of the blind children?—Quite so.

1460. And you think that the staff is ample for teaching the blind; when you are away from the school, for instance (because you only go to some schools two hours a week), do you think that for the rest of the time the children are well taught?—I think so, as a rule.

1461. Can you tell us anything about the standards that any of them take; how do they keep their place when they come to school early with the sighted children?—They pass from standard to standard. I find no difficulty whatever in that.

1462. Do they pass a standard a year?—Yes.

1463. Have you had any blind children in your time that have passed the Fifth Standard?—Yes.

1464. Have any gone higher?—Not of my own children.

1465. Have you had any being taught in the Sixth Standard?—Yes, I had one girl in the Sixth Standard.

1466. What age would she be?—She was 16.

1467. Will you sum up in one answer what in your opinion are the advantages to the blind children of being taught by blind teachers?—They see and know what the blind teacher does, and they feel that if one blind person does it they are able to do the same. I know that my own children feel that.

1468. It encourages them?—Yes.

1469. You think that being taught by blind teachers gives them more ambition and more confidence as to what their attainments may become than if they were taught by sighted teachers?—That is my experience.

1470. Have you any suggestion to make as to the better training of the blind either educationally or industrially? Have you formed any scheme in your own mind as to how the blind should be dealt with?—I think there is a little difficulty in finding employment for some who are not able to be trained as teachers, or as organists, or as pianoforte tuners; but I have not thought of anything that could be done in that way, although the difficulty has occurred to me several times.

1471. The difficulty is that of finding employment for them, I suppose?—Yes.

1472. And the fact that in most industrial employments they are at considerable disadvantage as compared with sighted persons?—Yes, I think so. *Miss Weaver.* 23 Jan. 1886.

The witness withdrew.

I called Miss Weaver's attention to the apparent discrepancy between answers 1378 and 1379, and answer 1392.

She explains that in the former her mind was upon her personal experience, and upon that of her children in other matters than spelling; while in replying to the last question, she had in mind two or three children who will copy page after page of Braille without mistake, but who would fail in spelling the very words they had just written, or even words that they had been made to write several times over, showing that the writing in their cases was purely mechanical.

M. C. Greene.

Miss Scott examined.

1473. (*Chairman.*) You are a teacher of the blind children in the London Board Schools?—Yes.

1474. And your district is mainly amongst the poor of Clerkenwell and Shadwell, is it not?—Yes.

1475. How many children do you teach?—I have 25 at present.

1476. Are they in two schools?—Yes.

1477. Do they occupy your whole time?—Morning and afternoon.

1478. And you give half a day to one school and half a day to another; is that so?—Yes.

1479. May I ask if you were born blind?—No.

1480. At what age did you become blind?—When I was two years old.

1481. Where were you yourself trained and educated?—I was at the Edinburgh School for the Blind for five years, and then I went from there to Norwood.

1482. At what age did you go to the Edinburgh school?—I was seven years old when I went to the Edinburgh school.

1483. And you left it at the age of 12?—Yes.

1484. At what age did you go to the Norwood school?—When I was 13.

1485. And you remained there, how long?—Till I was 19.

1486. At the Edinburgh school you received, I suppose, a purely elementary education?—Yes.

1487. You had no industrial training whatever, I suppose; you were merely taught reading, writing, and arithmetic?—And a little knitting.

1488. Then when you went to the Royal Normal College what was the course of your education there?—I learnt music, and then I was trained for a teacher.

1489. A musical teacher?—No; I learnt music a little, and then they thought I would make a better school teacher than a music teacher, and they had me trained for a school teacher.

1490. And during the six years that I think you said you were at Norwood you received a general education and training for teaching?—Yes.

1491. How long have you been in the service of the London School Board?—Six years and a half.

1492. During that time you have been preparing the children in those districts to which you are now attached for general elementary education; is that so?—Yes.

1493. You give them, I suppose, all the teaching that is necessary for enabling them to read and write and do arithmetic by touch?—Yes.

1494. And the other teaching is done in common with the rest of the sighted children?—Yes.

1495. Are you of opinion that it is desirable that blind children should begin very early in the board schools?—Yes, I think that it is better. I went to a sighted school myself when I was three years old, and I think that I learnt almost more there than I learnt at the Edinburgh school.

1496. You think that your going to a sighted school from three to seven years of age laid the foundation for better instruction even than you received at the blind school?—I am sure it did.

1497. Then may the Commisson gather that in your opinion the blind should be educated in day schools with sighted children?—Yes, until they are ready to go and learn a trade or learn music. I am sure it is better. *Miss Scott*

1498. You would not recommend that blind children should be kept apart from sighted children and put into institutions up to the age of 13 or 14?—No; not unless they were feeble minded blind children who wanted special training.

1499. But an average blind child who was healthy and of ordinary capacity you would have trained just as you would train a sighted child, with sighted children?—Yes.

1500. And you think it is an advantage that he should be so trained, do you not?—Oh, I am sure it is; they do not feel their blindness; it is not such an affliction. They take their place with the other children, and then it really makes them children; they join in all childish games, and the girls are anxious to learn needlework, and to knit, and to do just what the other children do.

1501. It excites emulation amongst them, you think?—I am sure it does.

1502. I should be glad if you would give to the Commission, irrespective of any questions that I may put to you, your views upon the advantages of the day school beyond what you have already stated?—I think that when an ordinary blind child goes into a sighted school it teaches that child independence, because he sees that the sighted children run up and down stairs and go about alone, and he is anxious to do the same. Then of course he sees the other children skipping and running in the playground, and the little girls knitting and doing needlework; and when the others are drawing many of my blind children will learn to hold a pencil and try to use it, though it is of no use to them except that it teaches them to do it properly, and makes them ambitious.

1503. You say that it is of no use to them?—No, it is of no use to them so far as teaching drawing is concerned, but it becomes useful to them by and bye, when they come to write with a pencil; they do not hold it awkwardly.

1504. Did you ever know blind children do any modelling in clay?—Yes, the blind children at the Norwood College do modelling, but our children have done none yet.

1505. Do you think it is an advantage that blind children should be taught by blind teachers?—I think that the children are more willing to do what their blind teacher tells them, because of course they know that you cannot see, and that you have had to do exactly the same as they have; and, further, the parents place more confidence in a blind teacher than they would in a sighted teacher.

1506. Why is that?—I think it is sympathy, because, having blind children of their own, they feel for you, and the mothers will often say to you, "Ah, miss, you "know what it is to be blind, and you can feel for "him," and they will trust you.

1507. You think that it also gives the parents the courage and self-denial which induce them to send the children to school?—I am sure it does. If I have a very bad case in a dreadful neighbourhood, if anybody who could see were to go to the parents, more likely than not

Miss Scott.

23 Jan. 1886.

they would not trouble to answer them, or they would pretend they were not at home; but they would never do that if I went, and generally you can get the parents to send their children. The more rough the parents are the more kind they are to us.

1508. Do you go sometimes to the rough parents if they will not send their children to school, and remonstrate with them?—Yes, I always go if necessary. I give the name to the visitor, and if I think it is a difficult case and the visitor cannot persuade the parents to send their children to school, our superintendent will ask me to go, and generally in most cases I can persuade them.

1509. May I ask you on what grounds the parents are reluctant to send the blind children to school; is it from a mistaken sense of their helplessness?—I think that is it mostly; and if the blind children are useful, active children, the parents are glad of the excuse to keep them at home to mind the little ones, or to help them in any way.

1510. In your visits to the parents of the blind children you always encourage them to send their children to school?—Yes, I just tell them how I got on, and how other children have got on that I have had, and then that always induces them to send the children to school.

1511. Do you find that the children who come early to school lose their sense of helplessness and become more courageous and self-reliant than those who come later?—Yes, I am quite sure they do. I have an instance now of a boy who is attending my school at High Street, Shadwell. He came to me at six years old; he is now eleven, and for the first three years, through being at home until he seemed six, he was quite imbecile. It took me all that time to break him of all his imbecile ways, and now he is really quite an active boy; everybody notices what an improvement there is. Had he stayed at home he would have been an imbecile. His mother sees it now. They were so fond of him that they would never have parted with him to go into an institution, so that of course he would have been obliged to stay at home if his parents had not been persuaded to send him to day-school.

1512. You are Scotch, are you not?—Yes.

1513. Taking the case of a solitary blind child in a rural parish of England or Scotland, do you think that if the child was sent early to school the teacher could manage to master enough of the system of teaching the blind to be able to give that child instruction up to a certain age?—Yes, I am sure that if the teachers were interested and anxious for the child to get on they could do so if the child had ordinary intellect.

1514. But you think that the isolation of blind children and the neglect of their cultivation has a tendency to deteriorate the activity of the intellectual faculties, and in fact to hinder their development?—I am sure of it.

1515. And they become stupid and helpless?—I do not think we get nearly so many imbecile children now as we used to get when we first began in board school work, because now we get them at the age of three and four. Parents send them now without half the trouble there used to be. When I went first half my children were 12 or 13 years old, and they had been neglected all those years, and of course I could not do so much for them at that time.

1516. You think that putting them in blind institutions at an early age with blind children is not nearly so good as educating them during the same years with sighted children?—I am quite sure it is not, because they go into institutions and they have their food and their bed and every comfort, and they never realise where it comes from; and then when they come out of the institutions they are helpless. They have no idea of the use of money. Then they are apt to despise their homes because they are so much poorer and less comfortable than the institutions; whereas when they stay at home they know what the struggle is and they can help in it.

1517. (*Mr. Johnson.*) That applies to all blind institutions, does it not, whether in London or in Edinburgh or anywhere else, and sighted institutions too?—Yes. I think that if the children stay at home until they are 12 or 13 years of age they are old enough to realise that their homes are poor and that their mothers and fathers have to work hard for the money.

1518. (*Chairman.*) And they are in sympathy with their parents and willing to help in the struggle; is not that so?—Yes, I am sure it is.

1519. Would you like to supplement your evidence in any way by stating anything that suggests itself to you, either for the better teaching of the blind educationally or for their better training, or for helping them in after life?—The only thing is that of course it is very hard when the children have finished with us to find institutions into which to send them; it is such a great trouble to get them into the institutions. You have to try to get them in by vote. Of course we cannot do that, and in many cases the parents are ignorant and do not know how to go about it; and so unless we take a great deal of trouble the children are obliged to stay at home after we have finished with them. We have got scholarships for many in the Norwood College, but in the case of those who cannot learn music and who have to learn trades we have great trouble to know what to do with them.

1520. When you have finished the education of the children at the London Board Schools, the difficulty is to get them properly trained to earn their living?—Yes, if they cannot afford to pay, and when the guardians do not feel justified in paying it. When the father is able to work they perhaps think that the father might pay; but then sometimes it is hard upon the parents if the payment is 10*l.* or 12*l.* a year where there are many little ones.

1521. Then you would like to see the children educated in the ordinary schools up to the age of 13 or 14 until they have passed the Fifth Standard?—Yes.

1522. And then you would like that they should be placed in institutions in order to give them an industrial training for five or six years before they are sent out into the world to get their living; is that so?—Yes. Some institutions into which they could get by good character and ability if the cases were deserving without so much trouble; now it is almost impossible sometimes.

1523. Have you any suggestion to make as to the kind of occupation which the blind might follow with advantage, other than those that are generally known to the public, such as basket weaving, brush making, mat making, chair caning, and musical teaching?—No.

1524. Do you think that the blind have a special facility for acquiring a musical education or not?—I think some blind people have, but I think they only average as sighted people generally. It is because perhaps your eyes are shut and you listen more to music, and that makes people think that blind people are more fond of it.

1525. Do you not think that some of the faculties of the blind are more developed than those of sighted persons?—Yes, that is just because you have to use them more, just the same as if you were without one hand you would have to make the other do more.

1526. And so the senses of hearing and touch are better developed in the one than in the other, are they not?—Yes.

1527. May not that lead to a better capacity for musical instruction?—Yes, I think it does.

1528. You think that where blind persons are capable of being taught music there is a better opening for employment than if they are taught the ordinary trades which the blind are taught?—Yes, if they are taught music and can do it successfully I am sure there is. There is more money to be made at music than there would be at a trade, because of course a blind person cannot generally work so quickly at a trade as a sighted person.

1529. Have you any blind acquaintances or friends who have been successful either as performers on the organ or as musical teachers, or otherwise?—Yes, I have several blind friends.

1530. (*Mr. Johnson.*) Earning money?—Yes; I know several in London now who are earning money and doing well.

1531. (*Chairman.*) Are they earning a living?—Yes, I bought myself a piano some weeks ago from a blind friend who is in a piano business at Brixton, and who is doing very well. He has a small warehouse and sells pianos.

1532. Is he making a living?—Yes, he is making a living. He has four little children, and they seem very comfortable and happy.

1533. I gather from your remarks that in your opinion the teaching which is now given in the London Board Schools is good and satisfactory?—Yes, I think it is.

Miss Scott.

23 Jan. 1886.

1534. How does it compare with the teaching that you had yourself at the Scotch institution?—It is over so much better than what I had, because of course the Braille methods of reading and writing were not invented when I was at school, and we could only write with the greatest difficulty and we had no nice reading books at all.

1535. You think that the Braille method is a very valuable invention for reading, writing, and arithmetic?—Not for arithmetic, but for reading and writing it is.

1536. But for all practical purposes of instruction, for the dictation and for the exercises which the children have to do in school?—Yes, and it is most valuable to us. I copy most of my school books and grammars and geographies and anything I may want in Braille, and of course in any other system of writing that would be impossible.

1537. Then the blind children actually learn from the same school books as the other children do?—Yes, we have the Royal Readers in Braille, and of course the other children use them.

1538. But for grammar and history and dictation you make copies, do you, for them?—Yes, they make copies upstairs. The blind children are obliged to listen to the other children reading from their grammars and histories, because different districts use different histories and grammars, and we could not have them all in Braille. We have one history and one grammar.

1539. (*Sir Lyon Playfair.*) When your children go up to the classes of ordinary sighted teachers to learn, for instance, arithmetic, do those teachers know the systems at all, and can they look at the children's sums and see that they are correct?—Many of the teachers are so much interested that they learn the system, and those who do not, call the children up to the table and they read the figures of their answers, and then the teacher can tell if they are right.

1540. Then they try to co-operate with you in carrying on your system?—Yes, the teachers are most interested and kind.

1541. Do you find that your children going up under the ordinary teachers progress as rapidly as the other children?—Yes, I think that ordinary blind children progress as well as ordinary sighted children, and a very clever blind child will sometimes do better than almost any child in a class, because it attends to its work when the other children might look round.

1542. And in mental arithmetic it is specially so?—Yes, in any oral lessons.

1543. So that you find no practical difficulty in getting the ordinary sighted teachers to co-operate with you in the education of the blind?—No, I have no difficulty, unless the blind children are feeble-minded, and then, of course, it is impossible for the teachers to do anything for them any more than letting them sit still; and of course I cannot do much myself under those circumstances.

1544. (*Dr. Tindal Robertson.*) Judging from your experience at the different schools at which you have been, and from your experience as a teacher under the London School Board, could you give us any suggestions as to what would be the best way of teaching in a rural district, supposing that there was a large school there and only one or two blind children in that school?—I should think it would need some person who thoroughly understood the work to begin with the children; and after the children were nicely started, if the teacher were interested the children would get on.

1545. Do you think it would take a great deal of time on the part of the teacher to acquire sufficient mastery of the system to be able to instruct those one or two children?—No, it would not take long.

1546. Would they be able to acquire the knowledge of it in their ordinary preparation for school teaching without encroaching too much upon their time?—I think so, because of course the arithmetical type one can learn in the matter of a minute or two; the Braille system is very easy. Many of the sighted teachers can now read it and write it sufficiently to be able to teach it, and of course in geography the teacher can see the maps as well as the children.

1547. (*Dr. Armitage.*) In the case of a blind child in a rural school where there are no other blind children, have you thought at all what would be the best way of bringing that child up?—I should think it would be best to leave it at school; but of course there would need to be some one to start it when it was put into the school, and to go to its home and talk to its parents. That is what I try to do. When I go to the parents I ask them to teach the children to dress themselves and let them be useful at home, and wash up the tea things or do anything that they think is useful.

1548. Do you think that if some lady resident in the place could take an interest in the children, she could learn sufficient of the special system used for the education of the blind to enable her to ground the child and prepare it for the school?—Yes, she could; but I think that as with sighted children it would be better to have some one who was really a trained teacher and understood it. Although a lady would be better than nothing it would be better to have a trained teacher.

1549. I understood you to say that you did not think the teacher would have the time to give to one special case?—No, I do not think that a teacher in a rural school would have the time unless the blind child had been started by some special person; but I think that if a blind child was started by a special teacher, and if it was a blind child of ordinary ability, then the teacher would be sure to give the time and would get the child on.

1550. How would you suggest starting this child by a special teacher?—Of course there would need to be some special teacher appointed by the school board, or by some one, to start the child.

1551. What system of reading do you teach?—Braille and Moon, Braille principally. Moon I use a little. I use Moon more where the children are feeble minded, or where they have lost their sight at eight or nine or ten years of age, when their fingers are hardened and they cannot so readily learn Braille.

1552. Which do you think is the more useful system as an educational system?—Braille is much more useful, I think; many of my children who have poetry to copy out that they are learning for their examination, would copy it out in Braille in a drawing book, and then when the other children use their books the blind children can se theirs too.

1553. Have you any experience of Alston's system?—I can read it a little, but I have never used it.

1554. Do you think Alston's system is as useful, as an educational system, as Braille?—No. I can write with Alston's system too, but then it takes such a very long long time, and with that system a blind child could never hold its place in a class in a dictation lesson, whereas with the Braille system it can.

1555. Can you read what you have written in Alston's system?—Yes, but then it is so slow.

1556. About what is the difference of time between writing a page of the same size in Braille and in Alston?—I could not say; it is so long since I have used Alston. I think I wrote it fairly well when I used it, and it used to take me a very long time.

1557. You think that it is much slower at any rate?—I know it is.

1558. Are your children good spellers when they have been with you a couple of years?—Yes, especially when they go into school young, and have been in the infant school for several years, they are all good spellers. If they come into school late they are not good spellers.

1559. Do you think that the power of writing from dictation improves their spelling?—Yes, my children copy down the same words to spell as the sighted children every day, and then I see that they learn them, and of course that must improve them.

1560. Then you think that they learn to spell better in consequence of their having to write a good deal of their work?—Yes; still I think their being in an infant school from four to seven years of age enables them to spell almost more than anything, because they thoroughly learn the sounds of the letters there.

1561. What maps do you use?—The maps of the British and Foreign Blind Society.

1562. Do you think that blind children learn as easily as seeing children from maps?—Yes, I think an ordinary child will. Of course they want a teacher to show them the map first of all, and to show them where the principal places are, and then they will soon find the other places.

1563. Do they use the guides which are published with the maps?—Yes, when they are in the upper standards I always give them the guides.

1564. Do you think them a help?—Yes, I think them a great help.

Miss Scott.
23 Jan. 1886.

1565. (*Admiral Sir E. Sotheby.*) What do you think would be the best employment for the blind children after they have left these schools, trades or music?—It depends upon their ability. Some of them would work well and do well at trades that would not do at all well at music.

1566. And there are others that are better suited for learning trades than for learning music?—I think that part of them are suited for trades and part for music. The class of children that I think would do best at trades are the partially blind children. We have a great many of those, and they would have been neglected altogether if they had not come to us. Their eyes are too bad for them to go upstairs and do lessons with the others, and they come to us and get their education; and then they do almost as well at trade as if they could see.

1567. But you have no experience yourself of blind people being taught trades?—I learnt a trade myself before I went to Norwood.

1568. What trade was it?—Brushmaking.

1569. That was merely the drawing of bristles, nothing more, I suppose?—That was all.

1570. Women's fingers are more supple than men's for drawing bristles, are they not?—Yes, I suppose they are.

1571. You made, I suppose, hair brushes?—Yes.

1572. Did I rightly understand you to say that the Norwood School only gave scholarships for music?—I take it that scholarships are not based upon musical tastes, but upon good abilities and educational progress. In the case of any of my children who are musical I get a form and fill it up and let them go and try.

1573. But if any of the children were highly educated and had arrived at the Sixth Standard they would not be entitled to the scholarship, would they?—Yes, because they examine them in education, they would not take them if they were only musical.

1574. I thought you said before that scholarships were confined to those who learnt music?—I did not mean to convey that idea.

1575. (*Mr. Johnson.*) You were educated at the Edinburgh school, were you not?—Yes.

1576. You were there some years, were you not?—Yes.

1577. How long is it since you left the Edinburgh school?—Twelve years now.

1578. And you went through the regular curriculum of education at the Edinburgh school?—Yes.

1579. And you were taught in the various types?—They taught me to read Moon.

1580. And Alston?—Yes.

1581. That is the ordinary Roman type?—Yes.

1582. And you read that very well, do you not?—Pretty well.

1583. At that time there was no other type used in Edinburgh, was there, but Moon and Alston?—No; they had just got their Braille set.

1584. You left Edinburgh when you were twelve years old; is that the ordinary time at which you think children leave institutions in Scotland?—Oh, no, I think many of them stay longer than that; but in Edinburgh the school was apart from the institution. The children were supposed to stay in the school until they were 14. Then you had to get another form to be filled up to go into what is called the Blind Asylum there to learn a trade.

1585. Then you were at the school in the country. I know Edinburgh very well, and the three institutions there; which of them were you at?—I was at a little blind school in the town which does not exist now.

1586. It has been moved into the country?—Yes.

1587. Did you go into the industrial portion?—No, I left the school, and they thought I had learned all I could at home.

1588. Your time was up in short?—Yes.

1589. Then you had four or five years interval before you went to Norwood, had you not?—No, only eighteen months, and in that time I learnt brushmaking.

1590. Where did you learn brushmaking; did you learn it in the institution?—No.

1591. Did you find it a lucrative employment?—I am afraid I was not long enough at it, and I was not old enough.

1592. You did not make very much progress in it?—I learnt it, but not to make anything by it.

1593. Then you went to Norwood?—Yes.

1594. With a scholarship?—No, the Edinburgh Committee paid part and my friends at home paid part. There were no scholarships from Edinburgh.

1595. You went to Norwood to learn music, I think you said?—Yes.

1596. Why did you not continue with your music?—I always wanted to be a teacher from the time that I was little, and Dr. Campbell said that if I would like to be a teacher he would have me trained.

1597. They only train pupils at Norwood who have a special talent for music, do they?—No, they will train you for a school teacher as well.

1598. How many school teachers have been turned out from Norwood in your experience?—There are five of us now under the London School Board.

1599. You write, I suppose, in the Alston mode yourself now?—No, I hardly ever use it now.

1600. Do you think there is any advantage in teaching the children the three systems, Alston, Moon, and Braille?—No, I should never teach Alston myself in school; I think that one system is almost as much as the children can master, the same as sighted children.

1601. At that early age?—Yes, I am sure it is.

1602. You have told us something about partially blind children; have you many of those under you?—A great many.

1603. Can you tell us anything like the proportions?—Out of my 25 children I think there are about 10 who are partially blind, but of course that depends upon the neighbourhood, and it depends too upon the interest of the school board visitors. Sometimes parents are willing to send their partially blind children to school; in other cases again they cannot bear the idea of sending them to a blind class because they are not quite blind, and they will not send them.

1604. I suppose you are aware that partially blind children are not, as a rule, admitted into blind institutions in the country?—I thought there was only one institution into which they were not admitted. I know there is one institution which does not admit the partially blind; I did not know there was any other.

1605. (*Chairman.*) Do you consider that the training which you received at the Normal College was very good for you as a teacher?—Oh, yes.

1606. You think that you were really well prepared for teaching purposes?—Yes.

1607. And you learnt the art of teaching at the Normal College?—Yes.

1608. And do you think that whatever education you might have received you would have been as good a teacher without that special training?—I know I should not.

1609. Practically the Normal College is to a blind teacher what a training college is to a sighted teacher?—Yes, it is just the same.

1610. (*Dr. McDonnell, through the Chair.*) The children whom you describe as partially blind require the same teaching as the totally blind, do they not?—Yes.

1611. And for all educational purposes they are practically blind?—Yes, although many of them can see so much that perhaps they can see large print or write on a slate for a little time; but directly they do it for any length of time their sight fails them.

1612. Very often they are children who are in process of becoming blind, are they not?—Yes, very often they are.

1613. And if a strain was put upon their eyesight it would probably confirm the blindness, would it not?—Yes, it would. I have one child in particular who came to me at six years old, being then almost blind. He learnt with me; now he is 12 or 13, and his sight is coming back to him, and he is gradually learning to read and write like the sighted children; but then of course it comes easy to him after having passed his standards. He is now in the Fifth Standard, and if it had not been for our school he would have been sitting at home all these years doing nothing.

Miss Scott.
23 Jan. 1886.

1614. And probably his faculties would have been benumbed, and he would have been a stupid child?—Yes, I am afraid he would.

1615. (*Mr. Johnson.*) Do you think that the number of blind children that come under your observation is on the increase or decrease?—I think it is on the increase, but I do not think that it is because of the increase of blindness, but because they are better looked up than they used to be.

1616. (*Chairman.*) You think there are some who are not yet reached by the London School Board officers?—No; I think that all the really blind children are reached by the London School Board officers; I do not say that they are all in school, because there are some cases in which the parents will not send them; they say that they are delicate, and they send doctor's certificates, and you cannot compel them. Then there are some who are really delicate and cannot come. But I think there are many partially blind children that we do not get that we might have. I think we ought to have the name of every child who does not attend a sighted school owing to bad eyes, and then we could find out about them. When I go to the parents they know that I should not say that I wanted the children to attend a blind school if it was not really necessary; and the parents will trust us and take our judgment generally.

The witness withdrew.

Adjourned to Monday next, at 12 o'clock.

32, Abingdon Street, Westminster.

Monday, 25th January, 1886.

PRESENT:

THE RIGHT HON. A. J. MUNDELLA, M.P., IN THE CHAIR.

THE RIGHT HON. SIR LYON PLAYFAIR, K.C.B., M.P.
THE RIGHT HON. SIR HENRY SELWIN-IBBETSON, BART., M.P.
ADMIRAL SIR E. SOTHEBY, K.C.B.
W. TINDAL ROBERTSON, ESQ., M.D.
T. R. ARMITAGE, ESQ., M.D.
W. AUCHINCLOSS ARROL, ESQ.
E. C. JOHNSON, ESQ.
ROBERT MCDONNELL, ESQ., M.D., F.R.S.

CHARLES E. D. BLACK, ESQ., *Secretary.*

The Rev. B. G. JOHNS, M.A., further examined.

Rev. B. G. Johns M.A.
25 Jan. 1886.

1617. (*Chairman.*) You attend here to-day in order to supplement your evidence of the 18th of December last?—Yes, I shall be quite ready to answer any questions that may be put to me.

1618. You propose, do you not, to give us evidence as to the industrial employment of the blind?—Yes, I think I have a few things to say on that subject.

1619. Will you be good enough to make your own statement as to the trades which in your opinion are found to be the most practically useful for the employment of the blind?—Yes; by practical trades I mean those which are found to be the most useful and most profitable to the blind boy when he leaves an institution. Those that seem to me to be the most practical in that sense are basket making, mat making, weaving, chair caning, knitting, and netting.

1620. Would you not include brush making?—Most assuredly; I had omitted that.

1621. You are aware, are you not, that on the continent brush making is very largely taught the blind, and that the Government contracts even for the confederated German army of the German States are tendered for by the blind institutions there?—Yes, I can to a certain extent corroborate that by the fact that all the brushes that we can make at the school find a ready sale; and we even supply, I think, Lincoln and Bennett, the great hatters (I only mention this as an index of what the quality of the work is), with all their hat brushes, so that I am very glad that you were good enough to point out that omission.

1622. Have you ever had any Government contracts?—Not for brushes, but we have had for many other things; for many kinds of mats and rubbish baskets, and such things as those. I should speak of those trades as being the most practically useful, because there are some others which are carried on in many institutions, I believe, with some success, possibly with some considerable success, and which owe their success in a great measure to their being locally useful; such as at seaports the making of various kinds of ships' fenders, and ropes which are found useful there, but which are not found useful elsewhere. I should not include those as being amongst the most practically useful trades. We ourselves at the school made shoes at one time, and in fact all the shoes worn by the children in the institution were made by the boys; but that was given up; it did not answer thoroughly well. They made shoes, but they were awkward and coarse and clumsy, unless they had a good deal of sighted supervision, more than it was found practicable or possible without great expense to give them.

1623. Whilst we are on the subject of shoe making, I should like to ask you whether you are aware of any attempt having been made to employ blind persons in the great shoe-making districts, such as Northampton, Kettering, Leicester, and Stafford?—No, I am not aware of any such attempts, but I can quite imagine that it could be practically done if there was good sighted supervision.

1624. Would it not seem that if it were possible to find some trade in which the blind could be employed in some department of the factories it would be of great advantage to the blind?—Most eminently useful.

1625. I see that you include weaving among the trades in which you would employ the blind; to what kind of weaving do you refer?—To the making of cocoanut matting chiefly.

1626. That is hand-loom weaving I suppose?—Yes. Then there are mats of fine wool which you might almost say were woven; they are made by a similar plan, not as the ordinary door mat is made. I mean a mat with a coloured centre and coloured border; those are woven of a very fine kind; but the cocoanut matting I suppose, would stand the best chance, and be considered in the trade exceedingly good of its kind. Then I class amongst those trades that are not so practically and so widely useful one more besides the making of shoes, and that is the making of sash line, and for this reason, that although we at the school can make exceedingly good sash line, and sell what we make, it involves the working of two blind people, or at all events of two people. When a blind boy or a blind girl goes away able to make sash line, they very often fail and are unable to carry it on because they cannot get someone else to work with them. The machine itself requires a person on each side of it to make an interchange of the strings, a girl could do it by herself, but it would be a very slow and tedious operation, and very poor work.

Rev. B. G. Johns, M.A.

25 Jan. 1886.

1627. Is not sash line already made by steam power?—I think so, but ours is so good that it is very often sought for; it is made so strongly and of such good material, and any other kind that we offer to supply will not be accepted. Then the rope making to which I think you alluded when I was examined before I should class among the local trades, and not as being so widely useful, because a boy when he gets away from us, unless he happens to go to a place where there is a rope walk, has no chance.

1628. But there again I think you are in competition with steam power and factory labour, are you not?—I am not aware that rope is made by steam power.

1629. I know that in the making of cords and twines, and all the ordinary kinds of cordage which are used, steam power is now employed very largely and with very great success?—Very probably.

1630. And a much finer article is produced by steam power, I believe. Do you include, for instance, in your rope making the making of cables, and the making of ropes for shipping purposes?—Yes, it would apply to that, but I do not think that any blind man has ever attempted making anything beyond ordinary rope. The sash line that we make is such as you would hang ordinary pictures with; it is very strong indeed, but small. Then I should call some trades more practical again, and others less practical, because a place to work in cannot always be found; and what might do for a basket maker will not do for a weaver, so far as regards accommodation. If a man has a loom he may not have any place in which to set it up, and he cannot always get a place. Then there are one or two trades which require some sighted supervision to help them to make work that is good enough to sell, and it depends in a great measure upon whether that supervision can be got or not.

1631. I assume that basket making and cane work are the things which are in most universal demand; is not that so?—Yes, I quite think so.

1632. And in the provincial towns and even in the rural districts basket work and cane work will find employment for blind people, will it not?—Yes, all I know would confirm that idea most strongly.

1633. Then is not the difficulty one of organisation; that the blind person requires to have a room for his special working, and to be supplied with his material; is not that so?—It is so.

1634. Is there no kind of association in the country that keeps up a regular correspondence with the blind people scattered about the country, and that supplies them with raw material?—Not that I know of.

1635. Do you think that it would be a great advantage if there were some central depôt for supplying blind people with raw material at wholesale cost prices, and corresponding with them in matters relating to their industry?—Yes. There is a suggestion that I should like to make on that point. I should say that, on the whole, the commoner and simpler the employment, the better for the blind. That would corroborate what you said about chair caneing and basket making as being commoner and simpler work, and being carried out without any great trouble as to the place of working, and as not requiring a large quantity of tools. Chair caning can be carried on almost anywhere in fact. Then I say the commoner and simpler the employment for the blind the better. That also more or less includes there being no colour employed, because if he had to use colours a blind man would be apt to be in difficulty if he were left alone in a cottage, so that he could not make coloured baskets or use coloured wools in the making of rug work, such as he would be able to understand and make very well with a hint now and then from a sighted teacher, whereas if he were left alone he would make mistakes and not be conscious of his mistakes. Then I mentioned the time that is necessary for mastering a trade; that is a point upon which I think you would find it useful to get some information.

1635*a*. Will you tell the Commission at what age you think the blind should begin to acquire a trade?—The trade masters, so far as I have met with them, say that on the whole they would prefer a boy, even if he were a clever boy, to be not under the age of 12 or 13.

1636. Then it would seem that the course to be pursued with the blind should be very much like that pursued with the sighted; you would first give them a good elementary education?—Yes.

1637. Accustoming them to manipulate objects with their fingers, such as, for instance, to begin with the infant school, the Kindergarten work, and a little modelling with clay?—Yes.

1638. And then when they had completed their elementary education you would recommend that they should, say at 13 years of age, be instructed for a certain number of years exclusively in industrial employment?—Yes.

1639. We have had before us evidence, upon which I wish to ask your opinion, to show that blind children educated with sighted children up to 13 years of age make very much greater progress as compared with blind children who are educated together with blind children; have you had any experience on that point, or has your experience been confined entirely to the education of the blind with the blind?—Not entirely; I have had some experience the other way, inasmuch as I have had to deal with a boy who came from being taught amongst sighted children. His testimony speaks both ways. If he happened to have an exceedingly clever teacher he perhaps would be all the better for having been with sighted children; but if he had an ordinary hum drum sort of teacher he would learn nothing at all. It must in a measure depend upon the cleverness and dexterity of the teacher.

1640. It would depend upon whether the boy was properly taught?—Yes.

1641. But supposing that he was properly taught by both blind and sighted teachers in company with sighted children, and that he had been accustomed to mingle in all the games, and to receive the same instruction as the sighted children, and to go backwards and forwards to his home, and had so gained confidence and courage, he would be all the better for industrial purposes, would he not?—If the thing had been thoroughly well done; but that is a very strong if.

1642. Have any children as yet come to your St. George's School, where you train the blind, from the London School Board?—Not that I can recollect. We had one boy, I recollect, about a year or two ago who had got into some board school for a time, but they were very glad to get rid of him, because I imagine no provision had been made for him at all, so that he knew nothing or next to nothing.

1643. What age was that boy?—I should think, as well as my memory serves me, he was about 14 when he came to us.

1644. Then if you received a boy at the age of 13, properly instructed so far as the elementary instruction goes, you would put him in the blind institution and train him with other blind persons by the aid of sighted teachers?—Yes.

1645. How long would it be necessary to keep him there?—Do you mean both for educational and industrial purposes?

1646. I am assuming that he came to you having passed in the fourth or fifth standard of elementary education, which he ought to do. Supposing that he had done that, would not all that he would require for elementary education be to keep up that education?—Yes.

1647. So that an hour or so a day would be sufficient to maintain and improve his elementary education, and the greater part of his time would be devoted to industrial training?—Quite so.

1648. That being the case, how long must that boy remain in an institution to be taught those industries to which you have referred?—From what the industrial masters themselves tell me, and from what I have seen myself personally, I should think that you could not do it thoroughly under four or five years.

1649. Of course the capacity varies very much with the blind; some would have to remain till 17, some till 18, and some till 19 years of age?—Yes; that would entirely depend upon the chances of early life, and upon whether or not they had been neglected and left to lie about as useless.

1650. It would depend upon their early development?—That is so. If a boy has been left in a corner, and it has been said, "Oh, he is only blind, let him get out of the way," and they have taught him nothing and trained him in nothing, it takes a year even before he can learn how to split a bit of withy for the beginning of basket work. He cuts his fingers, and cannot do anything.

1651. We have had evidence that there is nothing so injurious to the blind as to isolate them and keep them at home, and, as some of the witnesses have said, to coddle them, the result being that they become helpless and stupid and entirely dependent?—Yes, and vicious.

1652. And you believe that the earlier you begin to train them and make them self-reliant the better it is not only educationally but industrially?—Yes, from the age of seven. I do not think you can do much before the age of seven.

1653. Would you confine your teaching to one department of industry, or would you teach them basket making, mat making, and weaving, and so on?—That I can answer very clearly, because I think we have found it almost universally true that a boy who attempts to master two trades fails in one certainly, and possibly in both.

1654. You think that he should either take up basket making or brush making or mat making, as the case may be, whichever he is best adapted for and shows ability for?—Yes; and for two reasons, not only that he will not master both under training equally well, but that when he has left us he cannot carry on both. I have known a boy come to me and say, "Can you move me, "sir, out of the basket shop into the mat shop? My "teacher says that I have learnt all I can of mat making; "will you move me so that the rest of my time I can "give to the other trade?" In bygone years I have done that, and the master has said, "Well, he is a "thoroughly good mat maker; he has two years more "to spare; probably he will pick up some knowledge "of basket making which will be useful;" but I do not remember any one instance in which he has carried on both trades successfully, though he has tried to do so. So that on the whole I should discourage it.

1655. Which should you regard as the simplest trade for them to acquire?—I suppose chair caneing would be the most simple, and next to that basket work. If a boy cannot do very finished and very fine basket work he can learn to make a rubbish basket and to make it exceedingly well, as well as a sighted person; but he may fail in the very fine things, even although he acquires a certain amount of dexterity. The French people will beat him and undersell him even if he makes it exceedingly well.

1656. Is there any large trade in England in the kind of basket making that is common in one of the blind institutions of Germany; that is to say, travelling baskets, such as are used in place of portmanteaus, supplied with bars and locks?—We make a very considerable number. We make the Prince of Wales's clothes baskets, for instance, which are all square, and which are all supplied with locks and bars. They cost a good deal of money. I only mention the Prince of Wales because he happens to be one of the people who can afford it, but we make them for those who can buy them. We make them of very capital material and strength.

1657. Are you able to make those and sell them as cheaply as they can be made ordinarily?—We have to contend with the trade in the open market, and if we did not sell them as cheaply as people can get them elsewhere nine tenths of our customers would not buy them at all.

1658. (*Sir Henry Selwin-Ibbetson.*) Have you gone in at all for the parcel post baskets?—We have made a very large number of baskets for the parcel post, and we hoped we should get them to repair, but the Post Office were not as good as their promise.

1659. (*Chairman.*) What would be the cost of the training and maintenance, say for five years, of a blind boy or girl; of course they all board in the establishment?—Yes. That is not a very easy question to answer offhand, but I think in my former evidence, in answer to question 633, I gave you what I supposed to be a fair average for four institutions.

1660. But when you spoke of 50*l.* as being the cost did you refer to your St. George's School, which is purely industrial, as I understand?—It is not entirely industrial.

1661. It is industrial, supplemented by a little education, because the younger children attend the Wandsworth School?—Yes, but that has not been in operation yet long enough to affect us very much. We are only just beginning to receive children. Perhaps you will allow me to supplement this in one point. You were asking me about the five years' time necessary for mastering a trade. I see I have put in a note here: "A "part of each day being kept for school." That part during the first three years that a boy comes to the St. George's School is about an hour and a half, or perhaps an hour and 40 minutes, in the schoolroom, and the rest of the day is occupied mainly in the industrial work. I would say also here that the change from the one work to the other is good for the boy. He gets a little relief; after three or four hours of basket making he goes in and has an hour at arithmetic, or reading, or what not. That would partly answer the other question you asked me, about the little time that is given to education in the St. George's School. It is little, and it decreases as years go on. In the fourth year he would give up a little of the schooling; in the fifth year he would give up a little more; and in the sixth year he would get no schooling, and nothing else but industrial work.

Rev. B. G. Johns M.A.

25 Jan. 1886.

1662. (*Mr. Johnson.*) You forgot to mention music?—Yes, I should have said industrial work and music.

1663. (*Chairman.*) The music is partly industrial work; you teach some of the blind to earn a living as piano tuners, do you not?—As piano tuners and organists.

1664. We have dealt hitherto with those who have been blind from early childhood; have you any who come in who have become blind after having reached 18, 19, or 20 years of age?—Yes.

1665. For how long do you train them?—For just the same time.

1666. Do they require as much training after having been sighted up to 18 or 20 years of age as a blind child requires?—In some cases they require even more, and if you will allow me I will tell you why I think so. It would seem, of course, at first sight that a boy of 18 or 19 years of age would be much more easily taught than a boy of 12 or 13, both being blind; but a boy of 19 may come to us who has not been blind perhaps more than a couple of years. I say to him, "How did you lose your sight?" and he will say perhaps, "I had a "stone thrown at me a year or a year and a half ago, "and that has gradually blinded me." Then I say, "What have you been doing ever since?" and he says, "Oh, that knocked me over to such a degree that I did "not recover from it; it completely upset me, and I "could not do anything." I say, "Have you done anything?" and he says, "Nothing whatever; I have "merely stayed at home in my father's cottage; I have "done nothing ever since this accident; it completely "prostrated me." Then if he has been affected by fever and he has lost his sight in that way he is more shattered than if he had become blind at an early age.

1667. It becomes a new departure in life to him?—Yes, so that a boy of 19 in many cases requires quite as much care and quite as much training and quite as much teaching as a boy of 13.

1668. Of course he is totally unable to read or write or correspond, or to do anything which the blind usually do?—Yes, and if he has been neglected for three or four years before he comes to us at the age of 19 he has forgotten an immensity of things which he once knew. Even the knowledge of Roman letters, which he probably knew as well as he knew his own name at one time, fades out of him, so to speak, and he has no knowledge to help him practically.

1669. Up to what age do you take adult persons in your blind institution?—The age ranges from 7 to 20.

1670. But supposing that a person has become blind at the age of 25, what course would you adopt with him?—We cannot by our charter take them at such an age as that.

1671. Are there any institutions, as far as you know, that give instruction to persons becoming blind after 20 years of age?—I am not aware of any.

1672. Then persons becoming blind after reaching manhood or womanhood can get no instruction?—They can get instruction from us in this way. The committee have founded an adult shop, and into that shop they occasionally admit a blind man of 25 or 30 years of age if he shows enough capacity to be taught without very much special teaching. They do not undertake to take in grown-up men as a rule who know nothing, because that would require a very large number of teachers.

1673. Do you find that the teaching of music is of advantage as a trade to earn their living other than as a recreation to the blind?—I think I spoke of that strongly in my former evidence. I do not know that I can add to that.

Rev. B. G. Johns, M.A.

25 Jan. 1886.

1674. Will you proceed with your statement as to the difficulties in the way of the blind?—I would, if you please, make this one remark. I think I spoke of music as being exceedingly good and useful in every possible way as a recreation and an amusement, but I think I may say even more than that. I have known cases where it has softened a boy in such a way that he was taught in every way more easily and better by having learnt music. A rough, uncouth boy by getting into the choir and being taught to play the piano or the organ got softened down and the door was opened in many ways to him, so that it has a most admirable effect in every possible way. But if you ask me whether I would send a boy out at random into a place 100 miles away to get his living as an organist or as a tuner, I think the chances are 19 out of 20 that he will come to grief.

1675. But as a means of enjoyment and recreation for the blind music is excellent, is it not?—It is most excellent in every way. Then as to the difficulties in the way of the blind generally, and the difficulties which beset the average blind boy or girl who leaves the school, the first thing I think that he finds in his way is the competition against him as a basket maker, which is very fierce. I have known the case of a blind boy, for instance, being in a little town where there were two other basket makers. They were exceedingly angry that this boy was able to make a good basket, and they did all they could to prevent his getting trade. If he lowered his price they undersold him. Now that sort of difficulty I do not say is very common, but it is one of the difficulties; they have to meet with competition. A few customers will buy from him because he is blind, but a great many will not buy from him because he is blind; they think that it is an inferior basket that he makes. Then a difficulty which he meets with, and a great one, is the lack of orders. He makes a thoroughly good basket, but he cannot go round and offer it for sale, and he cannot get the orders to go on making them, so that he starves, or is in danger of starving. Then good materials, good withies, or whatever he wants for his trade, are exceeding scarce in the country, and they are not only scarce, but they are dear. Then there comes a temptation to him that he should buy a second rate sort of material instead of a good one. Then he makes a second-rate basket, and when he has made a second-rate basket then he gets the name for making inferior baskets, and then he is worse off than ever.

1676. You are quite satisfied that it is important that he should have access to raw material of the best quality, and at the lowest cost price?—Yes. Then I should venture to suggest, at all events in rough and in mere outline, such remedies as these if they could be applied. You would want a great central depôt or central depôts here and there, which would undertake to keep a register of good workers who were blind, and a register, if possible, of customers who would patronise the thing if good baskets were made, and of people who would supply to the blind good materials at cost price. Then would come the very thing to which you alluded just now, viz., central workshops for adult skilled workers; but that would not include the training of adult workers, because in their case the difficulty is where they are to learn. If you opened a great adult workshop and said that you would take in basket makers and weavers, you would find that you could not possibly take in skilled workers and people who need teaching at the same time; they would upset all your plans at once. Those seem to me to be some of the difficulties in the way of the blind, and I have also suggested some of the remedies which in my opinion would in a great measure remove some of the difficulties.

1677. So far as your experience goes, can you give us an idea of what would be the earnings of an average blind person in some of those industries to which you have referred?—That I think would be partly answered by our report on page 15. I take it that the earnings which are given there as the earnings of the basket makers in our adult shop would be the average earnings of a man if he was a good workman and if he could get employment in his own place, because those men are only really paid what journeymen's wages are. Perhaps we make the thing as easy as we can for him, and offer facilities which he could not have in his own home; but this would not be far above the average.

1678. On page 15 of your report you state the average earnings of basket makers at 15*s.* 11½*d.* per week; is that in your workshop?—That is in our adult workshop.

1679. And you put the average earnings of the mat makers at 16*s.* 3¾*d.* per week?—Yes.

1680. Those being the earnings, do you make a profit or a loss upon the manufactured article?—I think the shop barely pays its expenses. It pays its expenses and there is a trifling profit.

1681. But supposing that those persons were working at home, because they cannot remain in the institution after you have thoroughly trained them, what should you say their average earnings would be?—I think that you would then have to take off perhaps 10 per cent.; they would get less because we offer them facilities in the shop. In the first place they are in the presence of a sighted supervisor; then they have a comfortable room to work in, they have good tools, they have space, and they have all they want.

1682. And you provide them with fire and light, do you not?—We provide them with fire and light, and with their dinner.

1683. When those persons leave your establishment to set up for themselves in the country their earnings will not compare with these, will they?—No.

1684. And as a matter of course the blind are always handicapped in competition with the sighted by not being so quick as a rule?—Some of the clever workers in that adult shop I do not think would be beaten in point of quickness.

1685. Do you think that in brush making, basket making, and weaving some of the blind are as quick as sighted persons?—Some of them.

1686. But that is not the average?—No, not the average. But you see many of these adult workers, as we call them, have had their six years' training in the school, and then they have had perhaps three or four years in the adult shop, so that they have gradually become very clever workmen in point of fact.

1687. Is there any such organisation known as this: that when the blind leave the institution for the country, for some country village or provincial town, certain persons are appointed to correspond with the parent institution, and to act practically as guardians over them, and to assist them in their efforts to obtain a living?—I am not aware of anything of the kind.

1688. Does it not suggest itself to you as being an excellent thing that there should be some system of that kind in operation?—I do not quite understand the system which you suggest.

1689. I will give you one instance to illustrate my point. They are trained, we will say, in Dresden; they belong, say, to the town of Chemnitz, a town of 100,000 inhabitants; there are nine blind persons there, and the clergy and some of the benevolent persons are appointed by the parent institution at Dresden to look after those nine blind persons; the Dresden institution supplies them with raw material, and will even lend them 5*l.* to begin business with; and all the assistance which they get through life they get through the parent institution, and if the first year they fall short of 5*l.* or 10*l.* this is given to them instead of a pension to eke out their earnings, and so it continues all through their life; and any begging or immoral habits, or anything that is discreditable to them, would forfeit the protection of the parent institution. You see that that is a very highly organised system; do you not think that something of that kind would be very desirable in our own country in every county in England?—In the case of such a school as you suppose, in England, as a rule, they would not have the power of devoting their funds for that purpose.

1690. But I am supposing that there are, as you know there are, very large endowments, that are now given as pensions, and you yourself gave very important evidence in your former examination upon that point?—I have a final word, if you will allow me to add it, upon the question of pensions. I left off at this point at which I should like to resume: that the central workshop for adult skilled workers is one of the remedies, and one which, if it were thoroughly carried out, would partly effect that which you wish to effect by the system which you have spoken of as being in operation at Dresden. If you have a central depôt for good workers, a list of customers, a register of skilled workmen, good materials at cost price, and a workshop where they can carry on their trade, you have covered an immense deal of ground.

1691. But even after that would there not be many of the adult blind who would not be able to earn their own living?—There would be some, but the thing would be almost gigantic if such a system as you indicate were carried out in England. The only other final point that I have down is this: the Commission were good enough to ask me to furnish them with a list of persons to whom they might write and ask how the blind persons were getting on. That list is almost completed for you, and I should like to have the opportunity of saying one word in connexion with that, as to the danger that exists in dealing with returns from the blind people themselves, arising from the fact that there is a tendency on their part to make the worst of their condition rather than to make the best of it. I have found that in trying to get returns from the blind people the cause of their making the worst of their condition was this, that they had an idea that the inquiry into their condition meant that you were going to help them in some way. Perhaps the Commission will allow me to say that I know that, speaking generally, there is now amongst the blind a sort of general expectation that a great number of them are going to get pensions, that that is to be the final result of the matter, and that it will settle them all comfortably for life. I know that that idea is widely afloat amongst the blind, so that I think that when the answers to the inquiries of the Commission come to you, you will find that John Smith, for instance, makes the worst of his condition, and says that he is only earning about 3*s.* a week, and that he is awfully badly off, and he hopes that you will do something for him. As to pensions I have written down this as a note: "The "worst thing that could befall them as a rule." I am speaking of people of 25 or 30 years of age, or up to a time in life when they cease to be able really to set about good honest hard work. I think it is the worst thing possible, and yet I know from continual experience that pupils and other blind persons who have not been pupils have written to me saying, "Well, the fact is I "am 25 or 30 years old now, and I cannot get anything "to do. Do for mercy's sake get me a pension. You "are connected with this and you are connected with "that, and if you only represent my case you are sure "to get me something;" and they look upon the Commission as the powerful machinery that is going to rectify the whole thing, and think that there is a golden age coming.

1692. You regard the pension system as being thoroughly demoralising?—Yes, I do, on the whole; unless it is for an old person, or for a person who is suddenly incapacitated or plunged into very heavy misfortune.

1693. (*Mr. Johnson.*) Or as an aid to industry?—Yes, occasionally as an aid to industry.

1694. (*Chairman.*) What would you recommend should be done with the large funds now in existence which are applied to pensions?—That is a very wide question, but possibly I might say this much, that I think they should be devoted mainly to those who are incapacitated in the way that I indicated, that they should not be given to people of 25 or 30 or 35 years of age, but that such people should be content to wait until they had tried every possible chance of getting work, and were either unable to get it or had never been trained in work, and in fact could not get their living in any other way.

1695. Then you would use the pensions to aid and supplement industrial effort, and not to supersede it?—Quite so; that is the very thing that I would do if I had the chance.

1696. Is there any other matter that you would like to state to the Commission before you are cross-examined?—No.

1697. (*Mr. Johnson.*) While we are on the question of pensions, I should like to ask you whether you have any experience with regard to the societies which grant pensions to people younger than 60 years of age?—Yes, I have a thorough knowledge of one society which grants small pensions of 6*l.* a year to persons who are not under 40; but it rarely happens, even in that society, that the pensions are given to persons so young as 40, because the great majority of the candidates have reached 50, some 60, and some 70 years of age.

1698. Then the societies for giving pensions to persons under 40 years of age are very few; there is Day's Charity and your own charity, but I do not know of any other?—Speaking of our charity, we do not give them below the age of 40.

1699. I believe Day's Charity is the only charity that gives a pension as low as the age of 21?—The Gardner Trust I believe gives pensions without reference to age. In the case of Hetherington's Charity I think the age is 60.

1700. And I believe that in the case of almost all the City Companies the age is 60, is it not?—It is so in the case of a considerable number of them, I believe, but I will not be sure about all.

Rev. B. G. Johns, M.A

25 Jan. 1886.

1701. Do you think that it would be an advantage if those pension societies could be amalgamated under a central control?—The idea never occurred to me, but it would be an exceedingly difficult thing to amalgamate them in that way. Take the little society, for instance, which grants pensions to persons who are not under 40 years of age; that has been kept alive by individual effort, and if it was proposed to merge it into something else, that individual effort would come to an end, and the thing would die.

1702. I am not speaking of the very small charities. The society for granting annuities to the poor adult blind is almost entirely, as I understand, subsidised by the friends of the society; but I am speaking of great societies, such as Hetherington's, the Cordwainers, the Clothworkers, and what are called the City Companies?—I see no advantage that would arise out of their being amalgamated. If they were wisely managed and the pensions distributed as they are now, and not given to people below a certain age, I do not see why they should not work just as well.

1703. I suppose you are aware that several of these trusts have been established with specific conditions, such, for instance, as that they are only to be given as charities for people who live in certain districts, and so the people who live in another district are excluded?—Yes.

1704. And that would be a difficulty, I suppose?—Yes; and in some cases they are limited to freemen of a certain company.

1705. It would be difficult, as interfering with existing rights and with the intentions of the donors, I suppose?—Yes.

1706. But you recommend that the pensions should not be distributed in the way in which they are now distributed?—That they should not be scattered at random.

1707. Have you any knowledge of the way in which pensions are applied for?—I think there are separate rules for each class of pensions. With regard to Gardner's Trust (and it is about that only that I can speak with anything like knowledge), I imagine that anyone can apply, and he makes the best of his case, and I do not know that there is very much individual inquiry, except that perhaps such a reference as this may be made, as it has been made to me more than once: "This person says he was once a pupil with you in "your school; did he leave you with a good character, "because we think of giving him a pension?"

1708. In the Pension Society, with which you yourself and I are connected, what are the steps which you take before a candidate is recommended for a pension?—He must have the following qualifications: He must be not under 40, he must not have any other pension, the harder he is at work or the more proof he can give of being at work and doing something for himself the better that is considered. Then the petition itself, so far as regards the exact facts, is verified by a clergyman or a magistrate, and we request him to tell us anything he can with regard to the candidate.

1709. And then the applicant is placed upon the list of candidates?—He is placed upon the list of candidates.

1710. And then he is submitted to the votes of the subscribers?—Then the subscribers see that list of cases and hear what the man's qualifications are, and vote for him if they think that it is a deserving case.

1711. So that his case percolates first through the committee, and then goes on their recommendation to the body of subscribers?—Quite so.

1712. That is the only Pension Society that you know of, I suppose, that is conducted in that way?—I am not aware of any others.

1713. You have given an account of the average earnings of the trades which are carried on in your adult workshop; are all the people in the adult workshop former pupils of the school?—Almost all of them.

1714. And they have almost all been trained at the school?—Yes.

1715. That, I suppose, is the pick of your institution, is it not?—Well, we do not shut a man out because

Rev. B. G. Johns, M.A.

25 Jan. 1886.

he is not first class, if he comes with a good character and is a tolerable weaver. Of course we had rather that he was a first-class man, but we do not shut him out because he is not.

1716. In your experience, taking 100 people educated for a trade under very good masters, under the best masters that can be provided, what do you think is the proportion of excellent workmen that are turned out as compared with the indifferent ones?—I should not like to state a fixed number, but I should say that the average would be one-third good ones, in fact very good ones half certainly would be what might be called fair average workpeople.

1717. And that one-third, you think, if they were placed in proper positions and with some help, would be able to support themselves?—Unquestionably.

1718. Then what about the other 60?—They would earn a little, that is to say, probably three or four shillings a week.

1719. Then you believe that taking as a basis 100, 30 out of the 100 would become good workmen?—At 30.

1720. How many do you think would become what you call inferior workmen, or very moderate ones, who would not be able to compete with the outside trade?—Perhaps a quarter.

1721. And then what would you say as regards the residuum?—They would probably fail, and fail to such a degree that they would be hopelessly bad, so that the committee would probably communicate with their friends and say, "We have tried them for two years "and we are afraid that we cannot teach them anything," but that is a small number.

1722. I suppose that the committee of your school take the greatest precautions they can to get the very best masters that the market produces?—The very best; and if long training and good wages will procure them, we have got them.

1723. I think it would be satisfactory to the Commission to know what the masters in your institution cost. You carry on an educational occupation for something like 70 to 75 boys, do you not?—Yes, the number rises to 80 sometimes.

1724. Could you tell us what the trades cost to carry on; I mean what are the wages of the necessary masters. You have got a trade manager, of course?—We have a trade manager.

1725. What do you give him a year?—I think you have the details in the note which I furnished the Commission officially.

1726. Is it 175*l.* a year?—Yes.

1727. How many sighted masters have you in the basket shop?—In the basket shop there is a sighted workman at the head of it, and an old blind pupil who works under him.

1728. And that basket-making teacher gets 84*l.* a year, does he not, and the assistant blind man gets 48*l.*, does he not?—Yes, and his dinner.

1729. Then with those two teachers you carry on your basket instruction for 70 or 80 pupils?—Yes, but they are not all in that one shop; about 40 of them are in the basket shop. Then you go to the brush shop and the mat shop.

1730. In the brush shop you have two masters again?—We have three there.

1731. Your principal man gets 87*l.* a year, I believe?—His wages are I think 37*s.* 6*d.* a week.

1732. And there is one assistant at 30*s.* a week, is there not?—Yes.

1733. And the other assistant gets 30*s.* a week also, does he not?—Yes.

1734. Then you carry on the mat making also by means of a superintendent?—Yes, a sighted man.

1735. At 40*s.* a week?—Yes.

1736. And a shopman at 26*s.* a week?—Yes; the shopman is only for the sales, he does it all.

1737. And that is about the amount that the trade costs in wages?—Yes, not including the two sighted teachers in the adult shop.

1738. Then the out working department, where you have the old pupils who are working after they have been thoroughly instructed in the institution, is managed also by two other assistants, is it not?—Yes, by two other sighted teachers.

1739. One for the mats and one for the baskets?—Yes.

1740. (*Chairman.*) I suppose that all this expenditure is included in the 50*l.* each per annum?—Yes. Whilst I am upon that I may mention that sighted supervision is actually and essentially necessary, because we have tried the other plan and found that it did not answer.

1741. (*Mr. Johnson.*) I suppose you do employ blind assistants whenever you find an opportunity of doing so?—Yes; for example we have had this young man in the basket shop for the last 10 years, and we shall probably have him for the next 10 years.

1742. Then your opinion is that the blind in trade work should be supervised by sighted superintendents?—Otherwise it would be checkmated in a month.

1743. Of course in the branch school which you have been speaking of, at Linden Lodge, there is no industrial work?—There is not.

1744. The salaries of the officers and the cost of the domestic arrangements come to considerably less than 50*l.* per head per annum, do they not?—Probably they do.

1745. But taking all the instruction, and all the food and clothing, and education, and doctoring, and lodging for the whole of the children, they come to less than 50*l.* per head, do they not?—About 50*l.*; I do not say that they would come to under 50*l.*

1746. With regard to some portion of your examination as to type, have you any experience as to the number of books which are printed in Moon's type and in Braille's type; I do not mean embossed by hand?—In Moon's type I have a very large number.

1747. Is it a very lasting embossing; does it give way very much?—It lasts fairly well; pretty much the same as that Roman type which you have before you.

1748. You have put upon the table a book in the Roman type; has this been in use for some time?—That has not been in use, but it was printed 25 years ago, and it has stood so far the test of time. How much it will stand in point of usage I am not quite sure.

1749. Do you think that the Braille type stands as well up in relief after use as the Moon type?—I should think that it varies a little. So far as my knowledge goes that which is done by a clever Braille writer by hand is stronger on the whole than what is done by machinery or by the other process. I believe Dr. Armitage would probably tell us that there is some which is done by machinery.

1750. But as a matter of fact you do not make use, I suppose, of printed books on the Braille system?—A few of the small ones.

1751. But most of the books that you do use are embossed by the pupils themselves for their own use?—They are embossed by Marchant, the resident musical instructor, and by one or two of the boys whom he has taught for musical purposes only.

1752. To go back to the question of trades for one moment; do you think that even very specially clever blind workmen can compete largely with the trade?—They do.

1753. Do you not think that there is large competition against them?—A very fierce one.

1754. Is not one of the difficulties of the trade the getting rid of the manufactured produce; in other words is not the market the difficulty?—That is the difficulty, the demand.

1755. Have you any suggestion to make, beyond what you have already made, to increase that market?—I do not see any other way.

1756. I suppose you think that the more excellent the work the more readily they can compete or be on the same level as the ordinary trades?—Unquestionably.

1757. Have you any experience upon the question of blind people working in ordinary workshops with sighted people?—I have known one or two cases of basket makers, but they are looked upon disagreeably, as it were; the sighted people do not help them as they might, and as you would expect that they would. They seem to think that it is a sort of interference with their chartered rights, and that the blind man ought to be somewhere by himself out of their way.

1758. You were a member, I believe, of the committee of the Charity Organisation Society which prepared that very elaborate report?—Yes.

1759. Do you remember that at the time there were efforts made to ventilate the question of whether blind boys could not be apprenticed to sighted people and employed in sighted workshops, and that great difficulty was experienced?—Yes, I know it was discussed.

1760. (*Admiral Sir E. Sotheby.*) You say that there is great competition in the making of baskets; I suppose that arises very much from the foreign and prisons trade?—In a great measure. I know it did in the case of mats for some years in our school.

1761. The prison mats under sell you very much, do they not?—To a very large extent.

1762. I suppose they sell at about half the price?—I do not know that it can as far as that, but my trade manager said that they sold considerably under the cost of the material, without allowing anything for workmanship.

1763. You say that the two occupations which are best adapted for blind people are basket making and brush making?—And chair caneing.

1764. Can a blind person finish a basket by himself without any help?—I think so, a clever one can.

1765. Can a blind person complete a brush without any help?—He cannot absolutely finish it, but he can get work from a brush factory, and do a certain part of it up to what you might call nine-tenths of the work, and the other tenth must be done by a sighted person.

1766. Can they make the backs?—They cannot bore the backs; they must have the backs given to them bored already for them. Then they draw the hairs and do the rest of it, and then some sighted person must finish it.

1767. As a rule can they do much more than draw the bristles?—The clever ones can.

1768. Do you teach them at your shop more than the drawing of bristles?—Yes, a little more.

1769. What do you say is the maximum age at which you dismiss your pupils?—We give them all six years, and the average age, I suppose, of those who come to us now will be about 12 or 13, and we hope to be able to keep them until they are about 18 or 19.

1770. You say that you are not aware of any institutions that take in adults as pupils to learn a trade?—No, I am not aware of any.

1771. You are not aware that they do so in the General School for the Blind in Berners Street?—No. I thought that they mainly received them there if they were masters of a trade; I did not know that they took them in to teach them.

1772. Do you think that, as a rule, the pensions are fairly bestowed, or do they go by favouritism?—I think they go a great deal by favouritism. I think that where the matter is left to the individual choice of a board the individual knowledge which they have helps them.

1773. Have you any sick fund amongst the blind people at your institution?—In the adult workshop they have a little sick fund of their own.

1774. Are they able to support themselves when they are out of work?—Entirely: they keep it afloat by themselves without any help, so far as I know, from outside.

1775. Are you aware that Kent, the large brush-maker, employs blind people?—Two of our blind girls have got employment in brush drawing, but I am not quite sure whether it was there or not. I am very glad to hear that he does employ blind people.

1776. (*Sir Henry Selwin-Ibbetson.*) I think I understood you to say that after the education was over in your institution, or in any institution where the men have to provide for their own living, you would like to see central depôts established for them with registers of the men scattered about the country, and with registers also of customers likely to employ them?—Yes.

1777. That applies to those who are good workmen, I suppose?—Yes.

1778. Then I understand you to say that there are a certain number who after two years are turned out almost practically hopeless so far as trade is concerned?—There are very few of those.

Rev. B. G. Johns, M.A.

25 Jan. 1886.

1779. But I understand you to say in one of your former answers that there was a considerable percentage of them who were in that position?—If I said anything which implied that I did not intend to say so. I find that a very small per-centage of them fail entirely. A boy may go on for six months and he cannot do anything, at 12 months he cannot do anything, and possibly he may go on for 18 months and then suddenly something comes to him; he either learns a bit of music or he gets on with his reading, or something or other seems to waken him up, and then suddenly he is able to do in his basket work what he seemed hopelessly unable to do six months before, and we save him.

1780. I understood you also to say that there were a certain number who, not being sufficiently skilled, would be unable to earn, say, above 3*s.* a week?—Yes.

1781. And those on going out into the world would not of course be able to earn more than that?—Less, if anything.

1782. You have suggested what you think ought to be done with the skilled workmen; have you any suggestion to make to the Commission as to how you would deal with those men who would be scattered in their homes, some of them only being able to earn a very small amount, and some of them not being able to earn anything at all?—I do not know what to do with them, because the things which were made by them would command no sale; they would only be able to make a very inferior basket which nobody would buy.

1783. And they would be of no use in that central workshop which you talked of?—No, for the same reason, that nobody would buy the things which they made, unless, as is sometimes the case in the institution with which I am connected, the trade manager reports to the committee that a large number, or a considerable number, of baskets have accumulated, having been made by pupils in *statu pupillari*, when they were quite beginners, and asks what he is to do with them, saying that he cannot sell them as first-class goods. In that case the committee say, "You must get rid of them, "sell them for what you can."

1784. Practically those inferior workmen would be left to become street beggars still?—Yes. Then those baskets are sold as inferior goods, and some of the wholesale people have bought them from us in that way. We say to them, "Will you take 50 of these "baskets?" They say, "They are not worth much, "but we may find a sale for them, and we will give "you so much apiece for them."

1785. And it would be no use keeping these people longer in an institution, because as a man got on he would not develop a further power for learning?—He might; in fact, I recollect one case of a boy who went away apparently hopelessly stupid, but he seemed to set to work, and by dint of plodding on he recovered himself in about a year or two and was getting a living.

1786. My only object in putting these questions to you was to find out whether you had any suggestion to make with regard to those who, not being skilled at a certain age, were turned adrift?—I do not know what you can do with them. I think that they must subside into the average which seems to exist in all trading operations; they are inferior workmen, and there is an end of them, so to speak.

1787. (*Mr. Arrol.*) Would your experience induce you to say that the mingling of the blind with the sighted in early years tends to make the blind more independent?—In a certain sense possibly it might, if by independent you mean more self-reliant; but I have had no experience on that point.

1788. Should you be disposed to recommend that the young blind should be educated in sighted schools up to the age of 12 or 13?—I do not see that the advantages outnumber the disadvantages, so to speak; I do not see what the great gains are. If one boy, for instance, in a class is blind and the others are sighted, I do not see what the blind boy gains by being among the sighted ones that he could not gain, perhaps with some addition, if he were amongst 20 blind boys.

1789. Do you not think that the congregating of the blind in institutions and drawing them away from their families is injurious to the family and also to the child?—I am not aware of anything that would lead me to hold that opinion. I think that everything should be done that is possible not to cut them off from their families, above all not to cut them off from the rest of

Rev. B. G. Johns, M.A.

25 Jan. 1886.

the world as if they were different except in the mere matter of the loss of their sight. I think that everything should be done that could be done to bind them fast to the rest of the world, but I do not know that they become more cut off by being associated with other blind boys.

1790. Is not that the tendency in institutions?—I think not, so far as I am able to judge.

1791. In answer to question 658 you have been good enough to give the Commission some general information as to the scale of the wages of the blind; could you state what are the annual average earnings of the workers?—The average weekly earnings of a basket maker are 15*s.* 11*d.*

1792. I am aware of that; but you may find some who are indifferent workers, and some who are very good workers, the average being 15*s.* 11*d.*; we do not see how many men earn that amount; could you not give the Commission some information as to the average annual earnings of the blind?—Taking it all the year round the average earnings of a thoroughly good basket maker I should say would be about 15*s.* per week.

1793. Have you any knowledge of the system upon which the Blind Pension Society distribute their pensions?—Which blind pension society do you refer to?

1794. The society in London.—I have only actual knowledge of that one of which I have spoken to the Commission.

1795. I suppose that is St. George's?—No, that is a small society called the Society for Granting Pensions to the Poor Adult Blind. I have a thorough knowledge of that.

1796. (*Dr. Armitage.*) Mr. Arrol, no doubt means the society which used to be called the Protestant Blind Pension Society?—I have no personal knowledge of that, except that I know it has grown up from a small beginning to a very wide charity, and they distribute, I believe, a very large sum of money.

1797. (*Mr. Arrol.*) You have no knowledge of that society?—I have no personal knowledge of that.

1798. (*Dr. McDonnell.*) You have males and females in your institution, have you not?—Yes.

1799. Is intermarriage among them common?—It is not common.

1800. But it occurs?—It occurs.

1801. Do you look upon it favourably or do you discourage it?—I look most unfavourably upon it, and I do all that I can to prevent it.

1802. You would like to discourage intermarriage amongst the blind as far as possible?—Most unquestionably.

1803. On the subject of pensions you evidently do not think that the pension system as it has been hitherto worked for the benefit of the blind has been on the whole good?—Not taken as a whole.

1804. Of course there are pensions and pensions; there is nothing in the pension system which is necessarily demoralising, but you think the way in which it has been worked is objectionable?—Yes, that is to say that a pension may be given to the right person, but unfortunately in a very large number of cases it is given to the wrong one.

1805. Pensions to soldiers, for instance, are not demoralising?—Not at all, because soldiers do not get them until after they have done good service.

1806. Let us suppose that instead of anything like a pension system, which we all know to be very objectionable, we change the word to an assurance against blindness. Let us suppose that there was a large national insurance company to which we all contributed, and that in the event of any of our children being blind, or in the event of any of ourselves being afflicted with this calamity in later life, we should be absolutely entitled to a certain sum, say 3*s.* or 4*s.* a week, so that an industrious blind person would have his pension plus his earnings, and plus the benefits of his good conduct. Do you think that that would lessen some of the evils arising from the pension system as it is at present worked?—Yes, but it would hardly reach those who are in the greatest need of it.

1807. I propose it as an universal national system of insurance against blindness?—But how are you to get people to pay?

1808. I am assuming for a moment that the amount necessary comes out of the taxes, and that it is in the nature of an insurance company, and that every blind person, rich or poor, these gentlemen at the table, and others, however wealthy or however poor, should be entitled to a small pension, say 3*s.* or 4*s.* a week. Under this system, as you see, every blind person would be raised above absolute starvation, but the blind person who was industrious would be raised considerably above starvation, and would in fact be very well off. Do you think that such a system as that would bring more to the front real industry, and real intelligence amongst the blind?—That is very hard to answer. It is so wide a scheme that I scarcely realise how such a thing could be worked, and therefore I can hardly give an answer to your question. It seems to me to be a scheme of universal benevolence, which of course will produce some good fruits, but I do not quite see how it is ever to be got to work.

1809. In fact you do not like, without further consideration, to answer a question upon such a large basis as that?—No, it has never occurred to me in that light.

1810. (*Dr. Armitage.*) To follow up one of the questions put to you by Dr. McDonnell, you said that you would discourage blind intermarriages?—I would so far as I possibly could.

1811. Have any of your work people at your blind workshop intermarried?—Yes, some have.

1812. Can you tell us how many?—I cannot tell you exactly, but I know that there are several who have married blind women.

1813. You do not, I suppose, make that a bar against their employment?—Oh, no! Such marriages as I speak of have, I believe, been contracted after admission to the adult shops, but we should not make it a bar. Some of them have married without telling us that they were married, and we found it out afterwards.

1814. If a workman whom you employ marries a blind person, you do not on that account dismiss him?—No, we do not, but the committee discourage it and think it is highly disadvantageous. It would be infinitely better for a blind man to have a sighted wife.

1815. In what way is it discouraged?—I can give you an individual case. I knew a blind boy who announced his intention of marrying a blind woman, and I was asked if I would speak to that boy, and do all I could to prevent his marrying the girl, and divert his attentions to another quarter. I did my best, but he persisted and said that he was determined to marry that blind woman, and she announced her intention of never marrying anybody else, and so the marriage was carried out. I tried all in my power to prevent it, and I let it be known in our shop that the committee decidedly objected to it; and I gave them the strongest reasons I could give.

1816. Can you tell us whether in any of the cases in which your blind work people have intermarried, both the man and the woman have been trained at your school?—Very few of them, I think, but some of them were trained there.

1817. Could you tell us how many?—No, I could not, because the cases are rather scattered over a wide number of years, and the marriage has been the result, not of any intimacy in the school, for there they have practically no possibility of intimacy; they are unknown to each other, many of them even by name, but in spite of that the intimacy has sprung up afterwards by meeting at classes and meeting at places where blind people congregate. There they get on affectionate terms very quickly.

1818. What practical evil do you think results from such intermarriages of blind persons?—I will tell you of a visit which I paid to one such person. He was a man who had three children, the wife herself being blind. The place was in a most miserable condition of dirt and squalor, not the mere result of poverty, but from the fact of the wife being a blind woman, and being unable to do many things and see many things which a sighted person could rectify. The man was as unconscious of all this misery and squalor as was his wife. If he had a sighted wife who could look about, she could keep the children clean, and the floor clean, and the bed clean, and the house clean, and the whole place clean, and herself clean, and her husband clean. They were both very dirty. I do not think that they seemed aware of it, though the man was a hard working man, and did what he could.

1819. Have you a large number of applications for admission to the workshop?—A very considerable number, but then we cannot entertain many of them, simply because they must be more or less able to work.

1820. Has it ever occurred to you that a very good way of discouraging intermarriage amongst the blind would be to refuse to employ those who have intermarried?—The idea has been brought forward, but I think that the committee were rather unwilling to adopt it as being a very strong measure; and they also found that it was evaded in a measure, and that the marriages were contracted quietly after the admission had taken place. It is very difficult to find out. If the man lives in Shoreditch, for instance, we do not know quite whether he is married; tidings do not come to us, and the man takes care not to tell us. We see him everyday in his workshop, and he does his work, and that is all we know about him.

1821. I am speaking not only of admission, but of dismissal?—The committee have never undertaken that.

1822. Are you aware that it is done in many workshops?—No, I have never heard of it. I did not know that they went the length of dismissing them.

1823. (*Chairman.*) Are the children of such marriages often blind?—Not to my knowledge. In the case of which I have spoken all three of the children have most wonderful eyes, splendid eyes.

1824. (*Dr. Armitage.*) Your objection to these intermarriages is, I suppose, principally on account of the pauperising effect upon the parents?—On account of the misery it brings upon the parents.

1825. (*Chairman.*) And upon the children?—And upon the children.

1826. (*Dr. Armitage.*) You say that you expect that for the future a very large number of your pupils will come to St. George's from Wandsworth?—We hope so.

1827. The time for which the children are allowed to stay at the school is six years, I believe?—Yes.

1828. Does that include the primary school at Wandsworth?—No; I think the committee are now about to make a formal resolution to the effect that the training at Wandsworth shall not be a part of that six years; that if they need it they shall have six entire years when they come to us at St. George's.

1829. So that a child trained at Wandsworth, and coming into St. George's, will have the right of staying there six years?—If he needed it. If it was found that he was a good basket maker at the end of five years, I imagine that the committee would say to him, "Well, "now, we have done all we can for you."

1830. Supposing that a case is admitted, say at the age of 10 years or 12 years, at St. George's, the child would stay for six years and would have to leave at the age of 16 or 18?—Very rarely at the age of 16.

1831. Say at the age of 18?—Yes, he would have to leave at the age of 18 or 19.

1832. Speaking from your experience, do you consider that a blind man, however good a workman he may be, is capable of battling with life at the age of 18?—I do not think that he is likely to be more capable at 19 or 20 possibly.

1833. You think that he has as good a chance of success in life if he starts at the age of 18 as he has if he starts later?—If he is an average man in point of physical strength and intelligence, and is a good workman, I do not see why a blind man of 18 should not do what a blind man of 19, or even one of 20 years of age can do.

1834. When a pupil comes into St. George's you say he continues his education; what system of reading have you?—If he comes to us as an ordinary pupil we give him the Roman letters first. We try him with that, and if he cannot master that we try him with Moon, and while that is going on he will probably pick up a little Braille, and he will probably do that in addition to one of the two other things.

1835. What class books have you in the Roman letters?—We have a primer, an English grammar, and English history.

1836. Have you any other printed class books in use either in Braille or in Moon?—No, I think not.

1837. I mean books like the Royal Reader, or books of that description?—We certainly have not any in Roman letters.

1838. Have you none in any system?—We may have a few books which we have had given us, or which a few individual pupils have bought, but they are not in regular use in the school rooms.

Rev. B. G. Johns, M.A.

25 Jan. 1886.

1839. I understand from what you say, that with the exception of the primer and the grammar, and the English history, you have no class books in use either in the Alston system or in any other system at the school?—We have no regular set of books.

1840. I am speaking of the books that are used in the classes?—We have no such books; I do not know that any such exist.

1841. You are not aware that nearly the whole series of the Royal Readers are published in Braille?—I was speaking of Moon.

1842. I was speaking of any system. Do you consider that the blind are capable of studying geography?—To a certain extent.

1843. Do you teach it?—Yes.

1844. Have you any maps?—Yes, we have a few maps, but what we rely upon most is oral teaching in geography, and perhaps you will allow me to say why. When you asked me pointedly whether we used any embossed maps, I may tell you that I do not encourage the use of them for the main reason that so far as I can judge from what I have seen of the system of teaching by embossed maps, the blind, as a whole, do not realise what they seem to realise when they touch an embossed map, that they have no very accurate or due conception of distance or size, and I do not think that they are helped by embossed maps.

1845. Then in point of fact you do not use maps?—We rarely use them at all. We use a large globe.

1846. With regard to the shoemaking, you say that has been given up?—That has been given up.

1847. Are you aware that shoemaking is carried on to a large extent at Copenhagen, and that it is considered to be one of the best trades that the blind can work at at home?—I was not aware of that.

1848. You do not happen to know that there are a few blind workers in London who live at home?—No, I am not aware of that. Some of our old pupils tried a little mending and cobbling, but they were never able to make a new pair of shoes and that has been given up.

1849. Was that carried on in your time?—Yes.

1850. Can you tell me what mechanical aids the blind had for making shoes?—It is so many years ago that I cannot give you any accurate information as to that.

1851. Had they any guides for cutting out?—Yes, they had, and they had the partial help of a sighted teacher, but even with that they did not get on.

1852. Have you noticed the exhibits of shoemaking from Copenhagen in various exhibitions?—Yes, I have.

1853. What did you think of them?—They struck me as being good.

1854. Where they something of the same sort as you use at St. George's?—The manufactured articles were what I saw.

1855. I mean the guides?—I do not think they existed in our day.

1856. Did you observe the methods by which the work was done?—Yes, I did. Those did not exist in my day. I am speaking of 25 years ago.

1857. Then you are speaking of shoemaking as not being a good trade for the blind without the improved methods that are used now?—I hardly know enough of the improved methods to tell you.

1858. You did not refer to shoemaking carried on by the kind of system that they adopt at Copenhagen?—I did not know that it was carried on there, nor do I know even enough to assure me that a blind boy in a village could without help make a pair of shoes.

1859. They do it in Denmark?—In the schools?

1860. In the villages. Shoemaking is found there to be one of the best trades that the blind can follow at home. You say that the blind do not succeed in getting employment at the seeing manufactories; can you tell us the reason of that?—I think it is partly through jealousy on the part of the workmen. I remember an individual case where it was so, where the master of the shop said he would take a blind boy in and the other sighted workmen said, "If you take him in we will "make it hot for him."

Rev. B. G. Johns, M.A.

25 Jan. 1886.

1861. (*Chairman.*) Was this in London?—No, it was in a country place.

1862. (*Dr. Armitage.*) Have you ever heard the objection stated by seeing manufacturers, that the blind work slower than the seeing, and that as they occupy the same space they are less profitable as workers?—No, I have not heard the objection put forward in that exact shape.

1863. You say that weaving is carried on extensively at St. George's?—Yes.

1864. Do you find that it is profitable after the blind leave the school?—If they can get customers for their work.

1865. But do they get customers?—They get some.

1866. Do you know how many blind weavers who work at home are able to make eight shillings a week?—I could not give you that off-hand, but the result of the inquiries which the Commission are about to make will probably supply you with that information. I cannot give you off-hand their names and trades, but I know that there are some who are working with looms at the present time. There are not, however, many, for the very reason that the Committee in those cases where it succeeds at all must give a loom, and they will not give it until they know that the man has got a place to set it up, and a chance of getting employment.

1867. Are you aware that the cocoanut mat weaving is carried on very extensively in prisons?—I have not that knowledge. I know it is made, but I did not know that it was extensively made. I know that taking it all round we can sell what we make.

1868. But you stated, did you not, that you sold it at higher prices than those which are charged by the ordinary shops?—No; I said that in some cases the prison manufactures under sold us, but that was in the case of mat making. I made no mention, as well as I can recollect, of anything about any other sellers of goods.

1869. I was speaking of prison mat making as competing with your mat making?—I said that the people who made mats in the prisons under sold us.

1870. Then it follows from that that a blind man working at home could not sell his mats except as a matter of charity?—It might not interfere with him at all. They under sold us because they wanted to shut us out of the market, but a single blind boy working in a town or village might make enough mats without being interfered with by prison labour at all.

1871. We have been speaking of a central depôt; would it be in your opinion practical for the blind school itself to supply the raw material to its former pupils at cost price; do you do it yourselves?—If an old pupil writes up to the committee, and says, "I am in want of material; "will you let me have it of good quality, and I will pay "for it," the manager lets him have it; but it is not a part of the systematic work of the schools. If an application was made in that way I believe the committee would entertain it.

1872. Do you supply it at the wholesale cost price?—The manager would let him have it at the very smallest price at what it cost us, which is wholesale.

1873. The institution would make no profit upon that?—None whatever.

1874. In speaking of trades you have not mentioned mattress making; have you any experience of mattress making?—We have never tried it. I saw one of the Scotch schools where they told me they made a considerable number of mattresses, but when I come to inquire into the number of sales, although a great number of mattresses were made, it was rather foggy how many were sold; so that on the whole the committee, who had sent me to Scotland to see that school amongst others, thought that unless we had the chance of a good sale we had better let it alone; and I think in addition to that that a blind boy could hardly carry on mattress making single handed.

1875. (*Mr. Arrol.*) May I ask when you were in Scotland?—I think it was about 12 years ago.

1876. (*Dr. Armitage.*) I think it would be interesting to the Commission to know the conditions and manner in which you admit your workers to the workshop?—An outsider, that is to say, one who has not been trained in the school, fills up a paper stating his age and everything about himself and what he can do, and bringing forward some testimony as to his character. That goes before the committee, and they see if he is a well conducted good man, and he is what he states in his paper, and then if they have room for him they take him in. If he is an old pupil we know all about him when he makes his application; we know what he can do and we know pretty well what his character is; and if we have an application from an old pupil we give the preference to him.

1877. Can you tell us about how many there are in the shop who are not old pupils?—That I cannot tell you off-hand.

1878. But there are some?—There are some.

1879. How long do you retain your outworkers?—There is no definite limit; they are retained *dum bene se gesserint*, while they conduct themselves well and can work.

1880. In selecting your outworkers do you take the best of your old pupils who apply; that is to say, if six pupils applied for a situation would you take the best out of the six?—That never happens, but if such a thing did happen we should probably take the best. I do not remember the case of any two coming at the same time, because you see they leave really at intervals; they are scattered over the country, and the applications come chiefly from those living in London. Therefore we do not get any two or three applications at one time; we generally get one.

1881. About how many vacancies do you have annually?—For the last year or two we have scarcely had any vacancies, for the reason that the shop was full.

1882. Then I understand that practically the workshop at St. George's is like any ordinary workshop disconnected with the school, for the purpose of giving work to adult workpeople, no matter whether they have been trained at St. George's or not?—Yes, exactly.

1883. And to give them work permanently so long as their conduct is satisfactory?—Yes.

1884. Has it ever occurred to you, or to the committee, that it would be a desirable thing to alter the constitution of that workshop somewhat in this way: instead of allowing workpeople to come in there and stay for life, to make it a sort of transition stage between the school and the outdoor world, so that your basket makers who have been trained in the school should pass through the workshop, remaining a couple of years, say, so as to finish them still further in their work, and that from thence they should go to their homes?—I do not think it has, for one reason, that the people appointed were men of good character, and so long as they behaved themselves and worked hard there seemed to be hardly any strong reason for turning them out; and the majority of them then would have only been in London, and they might have been driven up for employment again in the same way as when they applied to us.

1885. My question had reference rather to the training of your pupils; supposing that such a system were adopted the workshop would always be considered as a transition stage; do you think that if there was a transition change of that sort your pupils would be likely to succeed better than they do now at home?—I do not know that they would; they might gain. Of course they would have the advantage of a year or two's further experience in their trade, but there would be no great permanent difference between them when they came in and when they went out.

1886. You stated in one of your answers that at St. George's, the principal institution, there was not more than about one hour and a half or an hour and 40 minutes given to the intellectual training of each pupil; did you mean that answer also to apply to the pupils who are training for musicians?—No, I was not speaking of musicians then, I was speaking of the work in the school-room.

1887. (*Chairman.*) You were speaking of their general education?—Yes.

1888. (*Dr. Armitage.*) But you have a great many, have you not, who are being trained as musicians?—We have not a great many; we have some.

1889. Can you give us an idea how many there are learning to be organists and piano teachers and tuners; are there five or are there 20?—I should think there are about a dozen altogether. Every organist who is trained learns tuning as a part of his business.

1890. What is the intellectual training apart from the musical training that they have; about how many hours a day does it occupy?—A boy goes to school in one of the two divisions in the morning for five days in the week.

1891. How long does that last?—That takes an hour and a half or an hour and forty minutes.

1892. Then the intellectual training for a musician takes about an hour and a half or an hour and forty minutes?—No, that has nothing to do with musicians.

1893. I am speaking of musicians?—I am speaking of work in the schoolroom.

1894. (*Chairman.*) You have stated, I think, that the intellectual training is plus the industrial training, and you spoke in your evidence in chief of acquiring a knowledge of the organ and pinno tuning as part of the industrial training, the same as basket-making, or anything else; is that so?—Yes.

1895. (*Dr. Armitage.*) I do not think I have made myself quite intelligible. You have somewhere about a dozen blind persons who are being trained as musicians, have you not?—As organists; but if you ask me whether those are the only persons who are being taught music, that is not so; there are 30 instrumental performers in the band who are all having instrumental instruction.

1896. For the sake of simplicity we will confine ourselves to the organists. In the case of a boy who is being trained as an organist, how many hours a day schooling has he in the first place intellectually and then specially musically?—This musical instruction is not carried on in the schoolroom at all.

1897. Where is it carried on?—It is carried on by the musical instructor in his own music room; that is cut out of the industrial training.

1898. Outside the school?—No, in the school; but I spoke of the instruction in the schoolroom as that which was given by the schoolmaster; he has nothing to do with the music.

1899. But surely your musical instruction is carried on in the building?—Yes, but not in the schoolroom where the ordinary reading, writing, and arithmetic are taught.

1900. I do not mind in what part of the building it is carried on; but I wanted to know about how many hours a day an organist has to learn music?—Then I have altogether misled you, because I did not know that you were dealing with the point of music alone. His musical teaching and work is altogether apart from his ordinary work in the schoolroom in the morning. Perhaps you will let me tell you, so far as I can, what an average boy's run through the day is, and then you must gather what particulars you can from it.

1901. Will you give us an organist's day?—An organist's day only differs from another boy's day in that a certain portion of his time is given to practice with his musical instructor. I think that my way of proceeding would have answered your question in a measure. A boy, for instance, this morning goes to chapel at half-past 8 o'clock; at 9 o'clock the bell rings, and he goes into the schoolroom; he is there with his division say till 10.40; if he belongs to the second division he goes in at 10.40 and comes out at 12.30. During that time, if he be a musician, unless it is for a special reason, he does not receive any musical instruction, but as soon as that is over the musical instructor, who is himself a blind man, takes anyone of those boys that he wants, and gives them a lesson or half an hour's practice, or an hour's practice, till the dinner time comes. During the afternoon he again gives him at such times as he thinks good and can arrange with the other musical pupils, either half an hour or an hour as the case may be, such instruction as his individual knowledge and talent require. One boy has a little more and another boy a little less, and that time is taken out of what would be called his industrial training. If I were to say that an organist has so many hours a day I should not be speaking accurately, because one man may not have so much and another man a little more. The instrumental performers in the band have some additional practice, which an organist, if he is a pure organist only, has not. A performer in a band may have practice on his trumpet or special practice with his teacher at a time when an organist has not any.

1902. I think there has been some misunderstanding of this question. Are your organists trained as pure musicians, or do they combine the music with some trade?—The aim of the committee is that if possible a basket maker should be sufficiently good as a basket maker to be able to do something with that trade, and also as an organist. They certainly do not give him the idea that he is only going to be an organist, and that he had better give up his industrial trade.

Rev. B. G. Johns, M.A.

25 Jan. 1886.

1903. Then your musicians also learn a trade?—If possible. In a former part of my evidence the Chairman was good enough to ask me whether, if a boy was a basket maker or a mat maker there was much chance of his being a clever organist, and I said that in the very great majority of cases the organist liked the organ a great deal better than he liked the baskets, and that he shirked the basket making if he could; but still the wish of the committee is that he should not shirk it, so that if he fails as an organist he may have something to fall back upon, and as the great majority of organists do fail, it is exceedingly advisable that they should have something to fall back upon.

1904. May I be allowed to sum it up in this way in order to see if I have correctly understood you, an organist gets about an hour and forty minutes, or an hour and fifty minutes in the school in the morning, and then he gets about an hour at various times with the music teacher, and the remaining part of the day he is in the workshop?—I cannot tell you the exact time that he gets in practice and teaching, he may get far more than an hour, he may have as much as two hours.

1905. And the remaining part of the time he spends in the workshop?—Yes, then he may also devote some of his leisure time to music.

1906. (*Chairman.*) He may practise?—He may practise and he does.

1907. (*Dr. Armitage.*) You spoke of sash line making as an occupation I think for girls mostly?—Yes.

1908. Do you know of any case in which a girl who has left the institution is maintaining herself by sash-line making?—No, not maintaining herself.

1909. Do you know of any case where that is carried on?—Yes, I do. I know a case for instance at the present time where I was asked to send a blind girl who could teach sash line making, in order that she might teach some other blind girl to make sash line.

1910. I am speaking of a blind girl who at home is carrying on the trade of sash line making; do you know any case in which that is done?—No, and I think I in a measure indicated that, because I said that it requires two people to make good sash line.

1911. You do not know of any case in which a blind girl is carrying on that trade at home?—Yes, I think that several are doing what they can, but they cannot get orders for their work.

1912. If they cannot get orders they can do nothing I suppose?—Then it turns upon the meaning of the word "can"; they could do something if they had the chance, but practically they get very few orders.

1913. Do you think that it is very desirable in a school to continue to teach a trade which is found by experience to be of no use?—Certainly not, if they were taught that only; but the girl who learns sash line making learns knitting and netting, and chair caning, if she has the power for it; she is not taught sash line making only.

1914. But you think that so far as the sash line teaching is concerned their training is thrown away on them afterwards?—I think "thrown away" is rather a strong term for it.

1915. But if they cannot get orders for the work surely it is thrown away?—But they do get orders in some cases; I cannot say that it fails altogether.

1916. You were speaking of the pension society that you are connected with; can you tell us how many blind people are receiving pensions from that society?—45 I think.

1917. Are they male and female?—Male and female.

1918. What do the pensions amount to in the year?—6*l.* each.

1919. So that the amount of pensions given is six times 45, that is to say 270*l.* a year?—Yes.

1920. (*Dr. Tindal Robertson.*) With regard to the matter of inter marriage amongst the blind you are aware, are you not, that there are certain cases of intermarriage?—Yes.

1921. Do you know, or have you ever heard, of a case in which the result to the children has been either that

Rev. B. G. Johns, M.A.

25 Jan. 1886.

they have been blind or that they have suffered from any other kind of infirmity?—Not so far as my knowledge goes.

1922. With regard to pensions; do you happen to know of your own knowledge that there is more than one person enjoying pensions from different societies?—I have found such cases.

1923. (*Chairman.*) Where people have been enjoying a plurality of pensions?—Yes.

1924. (*Dr. Tindal Robertson.*) Are pensions generally granted by the system of votes or by the system of gifts from the governors?—I think they are granted by the system of gifts; in the case of the City Companies I believe entirely so.

1925. Can you tell us from your own knowledge whether there is any kind of communication between the different pension societies before they give the pensions to those different persons who seek for them?—Yes, I know that the application must come in some shape from the blind person himself.

1926. That is not the point, the point of my question was this: do you know whether there is any communication between the different pension societies, or between the persons who give pensions, as to the persons who make the applications for those pensions?—I think there is a little, because I have received communications, though very rarely, from some other society which granted pensions, or from some other body of governors, asking whether I know anything of so and so who had applied to them, and whether we gave him any help.

1927. Is such communication in your knowledge general, or is it only occasional?—It is very rare.

1928. With regard to the question of these large endowed societies which have large pensions to give, supposing that there was no legal obstacle in the way, do you think that they could be administered better and more to the advantage of the blind than they are by the present system?—Yes, I think that if a set of more searching questions were framed, and closer inquiry was made amongst people who knew the applicants in their own parishes, for instance, more good might be done. I think that a man who is not worthy of support very often gets it, because they know very little about him, and his case happens to be pushed.

1929. You made some suggestions as to the remedies which you would adopt for the better employment of the blind; I am not taking the question of education at all now. Supposing that you had a rural school in a country district, do you think there would be any difficulty in the sighted teacher who taught the 50 or 60 children belonging to that school giving elementary education to the one or two blind children who might be there?—None at all.

1930. With regard to the remedies which you suggest, you propose in the first instance that there should be depôts from which materials might be sent at cost price, and that then the blind should be subsequently looked after in some way or other; would you propose that that should be simply carried out in London, or that it should be done in the provinces as well?—I imagine that you would want more than one depôt in London; you would want them scattered.

1931. But the point is whether you would extend that to the provinces, or whether you would have it administered by one large depôt in the metropolis?—I would establish as many depôts as were needed in the chief centres throughout the country; for instance at York, Leicester, Exeter, Plymouth, and so on.

1932. Would you have those administered under Government superintendence, or under what one might call voluntary superintendence?—So long as it is thoroughly efficient I do not think it matters which way it is.

1933. You have had a long experience, of 30 years or more I think; from your experience which plan would you consider to be most certain to be advantageous?—I should think that a thoroughly efficient body of six or eight men, if you could find them, would do it best.

1934. In each district?—Yes.

1935. That would involve a very large number thoroughout the country, would it not?—Surely in most average towns you would find six or eight people who would work it; if you could not you would be obliged to come back to the ordinary machinery.

1936. Would you propose that there should be any system of Government inspection at all with regard to the education of the blind, or with regard to these depôts which you suggest should be established in different districts?—I see no special advantage that would be obtained in that way that could not be obtained in the ordinary way.

1937. Would there be no advantage in the way of taking some kind of united action which they could not possibly do I suppose if they were in different centres?—No, I do not see that there would be any special advantage in having a Government connexion.

1938. Then could you give us any suggestions as to whether Government help or interference or superintendence might be used advantageously to the blind?—I do not see upon what ground you could reasonably argue that that which would be done by a central department of the Government could not be done by the ordinary machinery.

1939. What ordinary machinery do you refer to?—Such machinery as now rules ordinary institutions.

1940. You refer, I suppose, to the present system of pensions, and the present system of non-education in the rural districts, and, in fact, the present system which we are met to try to remedy?—No; when I speak of the ordinary machinery I mean that which accomplishes the best part of what is being done now, which it will be taught to do better. When you ask me pointedly whether I see any advantage that would be likely to arise from the management by a special Government Department, I say that I do not see that that which could be accomplished by a special Government Department could not be done by the ordinary machinery.

1941. (*Sir Lyon Playfair.*) But supposing that special Government grants were made to institutions for the efficient education of the blind, how would those grants be received unless there were some Government supervision?—That would follow as a matter of course. If an institution applied for Government aid and wanted help, then, as a matter of course, the government would say, "Well, if we help you we must see what you are "doing with the money."

1942. Supposing, for instance, that one of the recommendations of this Commission (I do not know what the Commission will recommend) was that a stimulus should be applied to the education of the blind by giving grants for the efficient education of the blind, you do not see any objection to Government supervision of those grants?—Certainly not.

1943. (*Chairman.*) Do you see any objection to the mere educational part being inspected by Government inspectors, so that there might be a comparison of the various methods of education that are in vogue throughout the country, and the results might be given in an annual report to Parliament?—No, I can see no decided objection to it.

1944. Would not great benefit probably arise from such inspection, as bringing to light the best methods and systems of instruction?—It might; but thorough inspection would do that under any condition, whether it were Government inspection or not.

1945. Not whether Government or not, because you could not have a thorough inspection unless you had a uniform test to apply to every institution, and a volunteer inspector might have a standard of his own quite different from that of a Government inspector?—Quite so.

1946. Are you of opinion that the institutions which are not subsidised by Government would object to the inspection of their educational systems?—I am not aware of it.

1947. It could be offered to them, at any rate, and they might accept or decline as they pleased?—In the case of the institution with which I am connected we have had a very wide range of inspectors and examiners. The London Diocesan Board have sent us one gentleman for several years, and we have lately had an examination and inspection by first-rate trained teachers; and the gentleman who examined this year and last year in the boys' school was the secretary of the Battersea Training College, and the mathematical master in it, and a barrister-at-law, so that he would be of the same rank and position and training as a Government inspector.

1948. Always providing that he applied the same tests and the same standards?—Quite so.

1949. In the course of your evidence, in answer to a question that was put to you, you spoke of the advantage that you thought would accrue from the amalgamation of the pension charities; did I understand you rightly to use those words?—No; I do not see how an amalgamation could take place. Inasmuch as many of the charities connected with pensions for the blind are the result of purely individual local voluntary subscription and voluntary effort, I do not see how you could fuse them. For instance, in the case of this little society of which I spoke, I remember the foundation of it. I recollect that two or three gentlemen took it up and individually set to work and went about getting money for it until they had got money enough to elect two annuitants. They fought the battle on year by year and year by year till they had got the number to 10, 20, 30, and 40 annuitants. It was mainly through the efforts of those gentlemen and their friends that they got it to float, and I think that they would strongly object to being fused into anybody else, and reasonably so. The subscribers to that fund would say, "We started with "these men for this object, and we decline to be fused."

1950. Of course persons who are raising voluntary subscriptions have a right to dispense them as they please, but I am referring more particularly to pensions given from endowments; would it not be a great advantage that those endowments should be fused or amalgamated and given upon some recognised principle?—That I entirely agree with; that is a distinct question altogether.

1951. I am requested to ask you whether in the Braille system there are any books of the Scriptures, so far as you know?—I think there must be some, but I have not any personal knowledge of any.

Rev. B. G. Johns, M.A.

25 Jan. 1886.

1952. But you said, did you not, in answer to Dr. Robertson, that you saw no difficulty in a single child being taught in a rural school if the teacher was disposed to teach it?—I did.

1953. Is there not this difficulty, that you require a special literature for that single child, which would be expensive?—It would require a special book to read.

1954. It would require more than a single book, a single book would not be sufficient?—Say one or two books.

1955. You must begin with a primer, and you must carry it through as the child goes up the standards; he would require special books, would he not?—He would, but he would read with his fingers among the rest while the rest of the class read with their eyes; and for all oral lessons he would be equally qualified with the rest of the children.

1956. Do you think that the ordinary certificated teachers could, without much difficulty, master enough of the principle of blind teaching to instruct a blind child?—Yes, because the teaching of a blind child in no very broad strong sense differs from the teaching of a person who is not blind. He needs to be taught the same letters, and to read and write and cipher, and so on, so far as the elements go, in the same way.

The witness withdrew.

Mr. CHARLES FARRER examined.

Mr. C. Farrer.

1957. (*Chairman.*) You are foreman of the industrial department of the Association for Promoting the General Welfare of the Blind in Berners Street, are you not?—Yes.

1958. What instruction do the blind receive at that institution?—In brush making, basket making, wood chopping, and chair caning.

1959. How many persons are there in your institution?—There are about 47 indoors at work.

1960. You do not board them, do you?—No.

1961. It is simply day employment, is it?—That is all.

1962. Are those for the most part persons who have had a previous training?—No, a very few indeed; in fact I do not think there are any.

1963. Are they persons who have become blind after they have reached manhood and womanhood?—More than two-thirds of them.

1964. Have you in your institution any persons who have become blind, say, after 30 years of age?—I think there are about two or three cases.

1965. Then between the ages of 20 and 30 you have more perhaps?—Yes, a great many more.

1966. What is the principal cause of blindness in persons of that age?—I have hardly gone into that question, but I know that there are only about 3 per cent. who lose their sight by accident.

1967. Then is it mainly through some disease, or the *sequelæ* of a disease that persons become blind?—There is not the slightest doubt about it, aggravated by fever.

1968. Then would you say that fever is the most frequent cause of blindness?—Yes; small-pox, rheumatism, and all that sort of thing.

1969. And those persons who come to you having become blind at from 20 to 30 years of age are naturally in a perfectly helpless condition when they come to you, are they not?—I would sooner have those between the ages of 12 and 20 than those who are older, because after the age of 20 they are generally labourers, carpenters, and so on, who lose their sight.

1970. And they have never had any kind of industrial training I suppose?—Very little indeed.

1971. But supposing that they had had a previous industrial training and had been accustomed to work with their heads and their hands, would they not more easily pick up a trade?—Oh, no, because when they lose their sight they become helpless and they lose confidence in themselves.

1972. And the first thing that you have to do, I suppose, is to inspire them with confidence and self-reliance?—That is the main point.

1973. Those who come to you between the ages of 12 and 20 have had a previous education, I suppose, so far as mental education is concerned?—Yes.

1974. And you can give them the industrial training?—That is all that we devote our institution to.

1975. How long does that industrial training occupy?—With some much longer than with others; it all depends upon the person himself.

1976. It depends upon his ability?—Yes, and upon his touch chiefly.

1977. When those persons who have come to you between the ages of 12 and 20 have been trained by you do they pass out of your institution?—No, we are obliged to keep them as a rule and find employment for them.

1978. Have you applications from many persons for whom you cannot find employment?—I think there are about 200, if not more, on the books now wanting to come in.

1979. And you have no room for them?—We have no room, and we have not sufficient work to give them.

1980. What do you find that those persons who cannot get into an institution do as a rule?—They depend upon their parents or else perhaps they beg in the streets.

1981. Do they receive alms from the workhouse?—To a small amount; it is not much, not sufficient to keep them.

1982. If they once get into the habit of begging in the streets it is rather difficult to reclaim them, is it not?—Very, because they get more in the streets than they would in the workshop.

1983. In begging in the street they get into the habit tramping from place to place, do they not?—Yes.

1984. And of course they must have somebody to accompany them, and they are in association with persons of more than doubtful character, are they not, generally?—I have not come in contact with many of them.

1985. But from what you hear of those who tramp from place to place, is not that so?—Those that I have heard of do not care about institutions whatever, and they would rather keep to their old calling.

1986. And that is begging from place to place?—Yes.

1987. What is the obstacle to your employing many more of those; is it that you have not room for them,

Mr. C. Farrer.

25 Jan. 1886.

or is it that you cannot find employment for them?—We cannot find employment for them.

1988. Do any of your workmen beg also?—I do not think there are any; there was one, but he gave it up. If they do, it is unknown to me.

1989. But you forbid begging, do you not?—Oh, yes.

1990. What sort of wages do those people whom you employ earn?—The average is about 13*s.* a week, but some earn more than that.

1991. Do the men earn more than the women, or how is it?—The men earn double what the women earn.

1992. Do they not do the same work?—Yes, the women do the brush making, but they are so very slow as a rule. At all the institutions which I am acquainted with they find that the women are the greatest obstacles that they have to contend with; they are so very slow, and the class of work that they do they cannot get rid of.

1993. Is it your opinion that a blind foreman or a blind teacher can give instruction to the blind better than a seeing teacher in some of these departments?—He may show a blind person how to work better, because the way in which a sighted man uses his tools may not be the same way in which a blind man uses them; but after he has learnt that, I think that the supervision of a sighted person is very good.

1994. In the superintendence of those 47 persons whom you employ what assistants have you?—I have only one under me, to whom I give the material, but I see to all of it myself.

1995. Is the one under you a sighted person?—Yes; he does the writing for me.

1996. Then he is useful in directing the application of colours, is he not?—Yes; that I could not do by any means whatever.

1997. That is his principal source of usefulness, I suppose?—Yes, in picking out the different coloured hairs for brushes.

1998. Do you think that if you had larger workshops you could find employment for a larger number of persons than you now have?—The greatest difficulty that we have is how to dispose of our goods after we have made them. We can make a great many more with the number of hands that we have, but the difficulty is where to get rid of them.

1999. Are any of those persons in your employment in the enjoyment of a pension?—A few of them, not a great many.

2000. What sort of pensions do they get?—They get Day's pension, that is about 12*l.* a year, and the Clothworkers' pension is about 5*l.* I think those are the principal pensions that they get.

2001. When they get pensions do you think that it disinclines them for industrial occupation; are they less eager to work?—No, I do not think so, because the pensions that they get are so small; they are only about 12*l.* a year in one case and 5*l.* a year in another.

2002. Is the pension given irrespective of age?—I think that in the case of the Clothworkers' pension the blind person must be 50 years old; but in the case of Day's there is no limit.

2003. Do you know any person who is in the enjoyment of two pensions?—There may be some in our institution but I am not acquainted with them.

2004. I do not mean in your institution, but in London?—I believe there are some in London who have got several pensions.

2005. Do you not think that that is a very bad system?—Well they do not do any work if they get two or three pensions.

2006. Have you any suggestion to make as to the better training and employment of the blind generally in industries?—That is such a very difficult question that I cannot form any opinion upon it; but I think it would be far better if the sighted and blind worked together in a shop.

2007. And if there was some mutual assistance?—They would require that.

2008. Do you think that if the blind and the sighted worked together, the number of trades in which the blind could be employed might be very largely extended?—I do indeed. There are many things which a blind person cannot do entirely, but which he might do if he were assisted by a sighted person.

2009. You are aware, I dare say, that more than half the blind become so after they are 20 years of age?—I have been acquainted with about 300 blind persons during my 32 years' experience, and I think that two-thirds of them are over 20 years old.

2010. But were they over 20 years of age when they became blind?—We will say from 12 upwards, because there are very few children born blind.

2011. You know that it is possible to train those who are blind under the age of 20; but there are no institutions that I have heard of, except your own, training those over 20; do you know of any?—No, unless it is the Leicester Institution, because I have been there myself for a fortnight to instruct them some years ago.

2012. Do you ever admit persons of 40 or 45 years of age to your institution?—We have done that, but as a rule they are very slow in learning.

2013. Do they ever acquire sufficient dexterity to contribute materially to their own living?—No, as a rule they are very very slow, because in general they are so feeble, because blindness brings on nervousness.

2014. Has your long experience suggested anything to you that can be done to improve the general condition of the blind?—No, I have not thought much about that, only that I think the principal thing is to provide workshops for them; it is the best thing that you can find to do.

2015. And as far as possible with sighted persons?—Yes, but as you know there are very few sighted workshops where they will take a blind man in.

2016. What is the objection?—Because they require two persons to do the work of one.

2017. Have you had any experience at all of the education of blind children with sighted children?—I was in St. John's Wood School for five years myself.

2018. Is that a blind school or a sighted school?—A blind school.

2019. You have not come in contact with any of the children educated in the London Board Schools recently have you?—Not any, that is a thing that might be done to bring up the blind with the sighted in the schools.

2020. That develops their self-reliance and courage does it not?—Oh, yes.

2021. (*Sir Lyon Playfair.*) I see you give 1*s.* per week as a gift to the women; is that because they earn less than the men?—They earn a great deal less, in fact they only earn on an average 2*s.* per week, they are so slow, and we give them 200 per cent. in order to enable them to get 6*s.* per week.

2022. Is that found to be the result of female labour generally?—It is indeed.

2023. Do you give anything to the males above their earnings?—Twenty per cent. above the general wages that are paid to the sighted. For instance we will say that the proper wages for a woman are 1*s.* 4*d.* a dozen for brushes, and we pay her 4*s.*, that is an addition of 200 per cent.

2024. (*Dr. Tindal Robertson.*) You say that the women are slow in their work; do you attribute that slowness to their being feeble, it is not that their fingers are less gifted with touch, or anything of that kind, is it?—No, they are very good with the touch, but they are naturally slow.

2025. Does that proceed from their being more feeble, or do you attribute it to any other cause?—It is a thing that I cannot fathom at all; but it is so in the case of those that I have been acquainted with.

2026. Is it possible that the fact of the men having been trained to labour, and the women not having been trained to labour might account for it?—It might.

2027. But you have formed no idea about it yourself have you?—No, none whatever.

2028. Is it so with the younger ones that go in?—Just the same. Of course there are one or two exceptions that I have come across, but they are not worth mentioning.

2029. Are the exceptions cases in which they are stronger in physical capacity?—Yes, they are indeed.

2030. So that it might proceed from that cause?—Another reason I think is that most of the women have lost their sight in infancy, and they have been brought up as useless.

Mr. C. Farrer.

25 Jan. 1886.

2031. You were taught yourself in St. John's Wood I think you said?—I was self-taught in most things.

2032. How long have you been blind?—I have been blind close upon 40 years.

2033. What age were you when you become blind?—I was 11 years old.

2034. Do you use any particular kind of type?—I use them all for a change.

2035. Do you do any of your accounts yourself in connexion with the home?—Yes.

2036. In what way do you keep them?—I generally use Alston's system if I use any system at all.

2037. You keep your accounts in that way?—Yes; but I do very little in it, that I trust to sighted persons.

2038. For correspondence what system do you use, if you have to correspond with a blind person?—I should use the Alston letter for a blind person because the blind and the sighted can read it.

2039. Then you would use that altogether in preference to any other system?—I should.

2040. Have you ever been taught the Braille system?—I know it to some extent.

2041. Have you ever used it for the purpose of writing?—No, there are so many dots and so many contractions in the system that it is puzzling.

2042. (*Dr. Armitage.*) Did I rightly understand you to say that you kept your accounts by Alston?—Yes, if I want to keep any at all.

2043. In what way do you use Alston in keeping accounts?—You know the shape of the letters I suppose; it is the pin type; you prick it through the paper, and it raises it on the opposite side the same as you do with the dotting system.

2044. You use the pin point type for keeping your accounts?—I do not say that I do use it, but I should if I required it.

2045. Then you do not use it in fact?—No, I do not.

2046. You would use it, only you do not use it?—I look upon it as the best, because if I say to a sighted person, "Can you read this"? he says, "Yes"; and if I use the Braille, and ask him whether he can read it, he says "No" directly.

2047. My question was this: Practically in keeping your accounts do you use Alston's system?—I do not. The quickest to use is Lucas's.

2048. When your pupils first come to you do you find much difference in them whether they have been trained intellectually before or whether they have been ignorant when they have come to you; do you find that those who have been to school and have learnt to read and write as long as they had their sight, and who have been otherwise trained become better workmen than those who have received no such training?—They may, but I am sorry to say that I have become acquainted with very few indeed who had received previous training.

2049. (*Chairman.*) You know a great number of blind persons; are the majority of them very ignorant; are they able to read and write as a rule?—Very few of them I think; of course we have some who can read and write, but I do not think that there would be more than 10 per cent. who can read and write.

2050. Only 10 per cent. of the blind persons of your acquaintance can read and write properly?—I do not think there are more than that.

2051. Take reading to begin with?—There are more that can read.

2052. What per-centage do you think can read?—More than half of those in our institution can read.

2053. But those who are in your institution are above the average of the class, are they not?—I do not know whether they are or not. I do not think that there are more than 10 per cent. in our institution who could read before they lost their sight, if so many; I should question whether there are more.

2054. (*Dr. Armitage.*) You say that you discourage begging?—Oh, yes.

2055. If any of your people take to begging will they not be dismissed for it if they continue begging?—If it came to the committee's ears I have no doubt they would.

2056. Have such cases occurred?—In Mr. Levy's time they have occurred, and he has warned them about it, and some of them have left on that account. Some of them would rather leave than give it up.

2057. Did you say that the only institutions that you know of in which they trained blind workpeople, who are over the age of 20, are those in Berners Street and at Leicester?—I think there are more than that, but I am not acquainted with them.

2058. You do not know that it is the usual thing that almost all workshops do it?—I think that they may take them in over the age of 20 at the Liverpool Institution, but I know they have done so at Leicester.

2059. You do not know that it is the usual thing, and that almost all workshops do it?—I would rather have them under the age of 20.

2060. What occupations do the blind women follow in Berners Street?—Brush making and chair caneing.

2061. Can they only earn 2*s.* a week at chair caneing?—Our two best hands take sometimes 9*s.* per week; but then we put 50 per cent. on to their wages.

2062. I thought you said it was 200 per cent.?—That was in the case of brush making. On the chair caneing we put 50 per cent.

2063. What is the highest wage earned by a woman at brush making?—The highest wage that I have known them to earn is 8*s.* a week; that is to say, they take 8*s.*, but they only earn one-third of that.

2064. They earn rather less than 3*s.*?—Yes, 2*s.* 8*d.*, or something like that.

2065. What is the average wage?—The average earnings of a woman is about 5*s.* 6*d.* a week at brush making.

2066. That is what they take?—Yes.

2067. But they earn only one-third of that?—That is so.

2068. If a woman receives 6*s.* a week she only earns 2*s.* a week; is that it?—That is all.

2069. Do you employ them at all at knitting?—No, only when a little order comes in for a few stockings, or anything of that sort.

2070. What is your experience of sash line making as an employment?—That we have given up for sometime, it paid so badly.

2071. Do you know any outside blind women who are supporting themselves by sash line making?—I do not; and another thing, I know that they cannot.

2072. (*Dr. McDonnell.*) In your experience among the blind workpeople, do you think that teaching them to read is a matter of great moment?—It is a pastime to them, but I do not think there are many of them who take to it unless they are in a school.

2073. But if they are taught reading in a school in their early days, and are trained in that, you can teach them other things better afterwards, I suppose?—Yes, they will continue it.

2074. It developes their intelligence?—Yes. I say that everybody ought to learn it, young or old.

2075. So that you are greatly in favour of instruction, and I gather from your evidence that you are in favour of educating the blind with the sighted?—Yes, I think that ought to be done.

2076. You stated that under some circumstances the blind would get more in the streets than they do in the workshops; supposing that every blind person in London was entitled to a small pension as a matter of right, in the same way as a soldier is entitled to his pension after his service in the army; supposing, for instance, that the public knew that every blind man in London got 4*s.* a week, and therefore was not in a state of absolute indigence, is it not probable that then alms would not be so freely given in the streets to the blind?—But that would not keep them out of the streets.

2077. Do you think that if these blind people had a pension in addition to the wages that they earn they would not be much more comfortably off than they are now with what they get in the streets?—I have no doubt that some of them would give up going into the streets if they could get sufficient without it.

2078. Do you think that a system in which every blind person would be entitled to something would,

Mr. C. Farrer.

25 Jan. 1886.

upon the whole, have the effect of bringing more blind persons to your workshops to add to their 4*s.* a week and make into 10*s.* ?—Yes, they would do it then.

2079. That is done now actually, is it not, to a certain extent in your shop, because you add 50 or 100 per cent. to their earnings?—That is so.

2080. Supposing that the whole of the blind people in London had to start with something like 2*s.* or 3*s.* a week, and then if they come to you to work they could increase that 2*s.* to 6*s.* or 8*s.*, you would not be obliged to give them the assistance that you now give?—No; but the main point in taking blind persons into our shop is this. They say, "Can you give us constant work? if not, we are better off where we are." That is the question they generally ask.

2081. They look for constant work, and you think that constant work is a matter of great consequence?—I do, indeed. Of course, we have some that would not go into the streets on any account, whatever temptation might be held out to them.

2082. You said that men with four or five pensions do not do any work?—No, but there are very few of those; I have only heard of them.

2083. Still I suppose that any man with a pension has less inducement to do work than a man that has not any?—There is not the slightest doubt about that.

2084. But if you gave every man, to start with, the right to a small pension, then all of them would have the additional inducement to work to get more?—Yes.

2085. And you think that the additional inducement would tend to make them work, in order to add to their small pension?—I think there would be an encouragement to work if they had a pension given to them.

2086. You said that the blind were greatly aided in their work by having sighted people working with them; do you think that the blind and the deaf and dumb could be employed together, so as to increase the employment open to both?—That is a question that requires thinking about, because the deaf and dumb, as a rule, are rather spiteful, and the blind not being able to see them would get some nasty knocks at times.

2087. A deaf and dumb brush-maker, for instance, could do the boring of the holes for the brushes very well, and the blind could do a great deal of the other work in brush making; have you ever known any cases in your own institution where a deaf and dumb man with eyes was used to help a blind man without eyes?—We have never had such a case; but we have had cases in which they have been blind and deaf.

2088. Then you have had no experience of that kind in your institution?—No.

2089. But you think that the deaf and dumb are often so cranky and crotchetty that perhaps they would not get on well together with the blind?—Perhaps they might not; if they were looked after well they might; but I have known them very spiteful myself, so that I can speak from experience.

2090. Do you know whether in the trades unions in England there is any indisposition to allow blind people to be employed in the factories with sighted people?—There are few cases where they have taken them in, but they are very few indeed.

2091. Have the trades unions any objection to allow it to be done?—That I cannot answer. I know that they are very prejudiced against blind persons working at all.

2092. I have been assured that there is a very strong prejudice, and I want to know whether you know within your experience if such is the case?—I have been told by blind people who have tried to get employment in sighted workshops that it is very difficult indeed. Mr. Kent, the brush maker, is the only person I ever heard of who gives employment to blind people.

2093. Have you ever heard of a blind man being head over an establishment, and finding it impossible to employ blind people in his shops?—No, I never heard of that.

2094. (*Mr. Arrol.*) Does the average wage of a workman of 13*s.* include the subsidy of 20 per cent.?—Yes, it is about from 16 to 20 per cent. upon the wages.

2095. Have you turned your attention to the question of firewood making?—Yes, we do a very large quantity of that.

2096. Do you find it very profitable?—We do not, only it helps to keep the trade together.

2097. (*Admiral Sir E. Solwby.*) Are there any pensions given by the association to old work people who are too old to work?—Yes, we have several.

2098. They are paid by the institution?—Yes.

2099. Do you think that the blind can make fitch work?—Some of them can do it pretty well, but it requires sight to do it well.

2100. Can any of your blind people bore?—Yes, they can do the plain boring for the backs of brushes.

2101. You say that Mr. Kent had some blind people in his establishment; do you know why they left him?—The wages that he paid them were so very low.

2102. Then he did not encourage them to stop?—No. We have a woman at our place who used to earn 2*s.* or 2*s.* 6*d.* a week, and of course when she came to us she took 6*s.*

2103. Do you think that the making of baskets and brushes are the best trades to encourage blind people to learn?—If they are to depend upon their own work they are.

2104. Is the making of baskets better for them than the making of brushes?—Most decidedly.

2105. Can a blind person complete a brush as a rule?—I know one or two who can, but there are very few.

2106. Does the society that you belong to take adult pupils?—Yes.

2107. What is the age of the pupils that they take?—We have taken them from the age of 17.

2108. And what is the maximum?—About 25.

2109. Do they learn much after that?—In two or three cases they have got on very well indeed, but they are only exceptions.

2110. What is the length of time that it takes before a man can make a good basket?—They give a sighted man seven years, and I think you ought by rights to give a blind man 14 years; but we only give them three years.

2111. You say that you have known no instance of a deaf and dumb sighted person working with the blind; have you known any instance of a deaf and dumb and blind person working with the blind?—Yes, I have known three cases.

2112. How have they got on?—Very well indeed.

2113. Had you a man from Swansea?—We had a long time ago, but he left us.

2114. Do you know why he left?—No; one reason I think was that we had not sufficient work to keep him going.

2115. Was it not because the guardians would not pay for him any longer?—That was one point; but we had not sufficient work for him; the contract was finished.

2116. You say that the women only earn 2*s.* a week at brush bristle drawing; are they constantly at work during the day?—The work from the time they come in till 6 o'clock at night, and very nearly all their dinner hour.

2117. And they could not earn more?—I have had experience with them for the last 25 years in the case of women alone, and I have never found it so.

2118. Do you make your calculations mentally or in writing?—I can do it both ways, but I make them chiefly mentally.

2119. Can you state to the Commission what is the origin of the institution that you belong to; was it to give employment, or to teach, or what?—It was established in the year 1854 on purpose to find work for the blind at the rate of 6*s.* a week, and to give them the full amount that their article brought, the institution finding the means of getting rid of it.

2120. And did they get rid of it?—No, in the year 1856 they had to raise subscriptions and form it into an institution to enable the shopman to pay the rent of it and dispose of it.

2121. Do they get rid of most of their work that they do now?—We have done it.

2122. Is the place overstocked?—No, we manage to get through all our material.

2123. And have you been able to keep the people employed?—Up to the present time we have.

2124. At the wages you have stated?—Yes, up to the present time.

2125. (*Mr. Johnson.*) Have you got any amount of stock on hand just now?—I do not suppose that we hold three months' work.

2126. Then you keep all the hands on in your institution whether you have got sale for the work or not?—That is our motive.

2127. Then sometimes you get a great accumulation of stock, do you not?—Many years ago we did. We have taken Government work to keep it down.

2128. Have you any difficulty in getting Government work?—Yes, because we have to compete with the sighted prices, and we lose on the average; in fact on the women's work alone we lose 2*s.* 6*d.* a dozen.

2129. But what you consider a loss upon that is made up by the charity of the institution?—Exactly; we do not lose on the real value of the articles.

2130. Then how do you arrive at what is the proper price to pay; are you guided by the price outside?—I guide myself by that, by the trade book.

2131. And then what you add to that is the supplemental charitable gift to them?—Yes, exactly.

2132. You were, I believe, educated at St. John's Wood School?—Yes, I was there five years.

2133. You were with Mr. Levy, were you not?—Yes.

2134. And there you learnt, of course, the Lucas system of reading?—I did.

2135. I heard you say that you prefer the Roman character because you think the sighted can read it as well as the blind?—That is only in corresponding with sighted people.

2136. Do you think that there is any value at all in Lucas's system?—I can read it twice as fast as any other system.

2137. But you have been long trained to it?—Yes, I have.

2138. Do you find many people reading that system?—Not so many as there used to be.

2139. What is the system that they mostly read now?—Moon's.

2140. Have you any classes connected with the institution for teaching them to read?—Not now.

2141. There used to be in the time of Mr. Levy, were there not?—Yes, several.

2142. I understood you to say that there were only 47 workers?—That is indoors.

2143. I see that you have got in the list that you have five attendants, 14 basket workers, and 33 brush makers?—Yes, those are indoors and outdoors; but I am speaking of those on the premises who actually work at the trades.

2144. But the 103, including those that work in and out of the house, are all treated with regard to subsidising their wages in the same ratio, are they not?—No. For instance, you will find a tuner put down there; we find him jobs to do.

2145. But you do not supplement his wages?—Not at all.

2146. He only gets what he earns?—That is all.

2147. What do you suppose that one tuner gets?—I do not know. I have known tuners to earn a pound a week, but that is in very few cases.

2148. Do you think there is much opening in the occupation of pianoforte tuning for the blind?—Only in the factories.

Mr. C. Farrer.

25 Jan. 1886.

2149. Have you any knowledge whether they are largely employed in the factories?—I am told of one firm up at Camden Town that employs six.

2150. What do you suppose are the wages that those six get?—Strohmenger, in the Goswell Road, pays two guineas to one man because he is a very fine tuner.

2151. You do not teach tuning, do you?—No, nothing besides those trades that I have mentioned.

2152. What is the average earning on wood chopping?—We pay them 15*s.* a week.

2153. What per-centage of that is earned and what per-centage is given as a grant or subsidy?—We pay the wood choppers about 8*l.* a week and they make on the average 10,000 bundles; and the sighted wages would be 1*s.* per hundred.

2154. (*Chairman.*) You double it?—Yes, or as near as you can come to it. I have calculated it many times; it is 1*s.* 11*d.* per hundred.

2155. (*Mr. Johnson.*) Supposing that you did not subsidise them, what do you suppose would be the real earnings of the wood choppers?—7*s.* 6*d.*, or from that to 8*s.* a week.

2156. I have the return of another institution in my hand in which they say that the earnings of the wood choppers amounts to 9*s.* 6*d.* a week without any subsidy?—You must bear in mind that they work more hours than our men do whatever institution it is.

2157. Do you approve of sighted supervision in workshops for the blind?—I think it ought to be encouraged.

2158. And you think that the work is more efficiently and properly turned out under sighted supervision?—Decidedly.

2159. But of course you would avail yourself of any blind talent in the way of assistance?—By all means.

2160. What in your opinion is the best market for the productions of the blind?—I really do not know.

2161. Do you think that the market is exhausted now, or do you believe that if you had double the number of people employed you would be able to get just as much patronage for your work and sell your work as easily as you do now?—I think we might dispose of a good deal more than we do if we had premises in a good open thoroughfare.

2162. That was tried, was it not, in Oxford Street?—It was, but the lease fell in.

2163. Have they not done as well in the bye street as they did in the open thoroughfare?—No, they have not.

2164. Then you are of opinion that it would be a great advantage if there were other depôts established for the sale of articles of blind manufacture?—I am, indeed.

2165. I see that you grant pensions in your society to 26 pensioners; how are those pensions bestowed?—The average is about 6*s.* a week, and to some we pay more.

2166. Are those pensions given to old people who have grown old in the employment of the society?—No, not altogether. Some years ago some of them were elected for pensions without work.

2167. And the society took the old grants over?—Yes.

2168. I think you said that you preferred the Roman type to any other?—No. I said that if I was corresponding with any person I should use it.

2169. In consequence of using the pin type?—Yes.

The witness withdrew.

Adjourned to Wednesday, the 3rd of February at 2 o'clock.

32, Abingdon Street, Westminster.

Thursday, 4th February 1886.

PRESENT:

LORD EGERTON OF TATTON IN THE CHAIR.

THE RIGHT HON. SIR LYON PLAYFAIR, K.C.B., M.P.
THE RIGHT HON. SIR HENRY SELWIN-IBBETSON, BART., M.P.
ADMIRAL SIR E. SOTHEBY, K.C.B.
W. TINDAL ROBERTSON, ESQ., M.D.
T. R. ARMITAGE, ESQ., M.D.
W. AUCHINCLOSS ARROL, ESQ.
E. C. JOHNSON, ESQ.
ROBERT MCDONNELL, ESQ., M.D.

CHARLES E. D. BLACK, ESQ., *Secretary.*

MR. WILLIAM HIBBERT examined.

Mr. W. Hibbert. 4 Feb. 1886.

2169*a*. *(Chairman.)* You are one of the senior teachers of the Home Teaching Society for the Blind?—Yes.

2170. How long have you been in that position?—Nearly 13 years.

2171. Will you state how long you have been blind?—I have been totally blind for rather more than about 15 years.

2172. What was the cause of your blindness?—An accident. My father was a veterinary surgeon and farrier. I was following the same occupation, and the point of a nail entered one of my eyes, and sympathy destroyed the second. I was about 18 years old when I met with the accident, so that I have been for 15 years totally blind.

2173. You had had a good education before your accident?—I was preparing for college.

2174. As a veterinary surgeon?—Yes.

2175. What is the district that you visit?—The south-west district, commencing at Charing Cross, and embracing Westminster, Pimlico, Chelsea, Knightsbridge, Brompton, and Kensington.

2176. What is your salary?—28*s*. a week.

2177. And you have an allowance for your guide?—Three shillings.

2178. In your district how many blind are there, as far as you are aware?—124 that I myself visit.

2179. What proportion of those are over 20, and what proportion under 20?—I have but four under 15 years of age; one is a child of three years, one a child of 11 years, and of the other two, one is 13, and the other nearly 15.

2180. Can all those above 20 read in any particular type?—The majority of them read in Moon's type.

2181. A few read in Braille's type, I believe?—About half a dozen.

2182. Do any read in Frere's type?—About four. Frere's type is not much used now.

2183. Then there is Alston's type, the Roman type. How many read in that type?—Five of them who have been educated in St. George's.

2184. How many have been trained in institutions?—Twenty-six.

2185. London institutions?—No, in London and provincial institutions.

2186. Do you find any difference in the training of those who have been trained in London, and those who have been trained elsewhere?—Those that have been trained in London, I should say, are certainly the best; others come to London after they have left the institutions in the country.

2187. Do the blind generally come up to London from all parts of England?—Many come up to London as being the centre where they can obtain either employment or something equivalent to employment, that is to say, in the way of pensions.

2188. They come for pensions principally?—Or employment.

2189. How many books have you for your district?—In my library there are 450.

2190. All in Moon's type?—Yes.

2191. What is the number of blind in your district who receive pensions?—Twenty-two.

2192. What do the blind in your district do to get their livelihood?—The majority of those who have been in the institutions are now earning their living in the street.

2193. In what way?—In various ways; music, singing, selling things, and begging, some in reading.

2194. What is the course you pursue in teaching the blind in your district?—The first thing that we introduce to them is the alphabet card, a card which we have with the alphabet embossed upon it; they get their fingers over the respective letters till they become familiar with them.

2195. How long does it take you to teach any one who is totally unacquainted with reading?—That depends upon the intelligence of the person; some that I have given a card to have learned it then and there, whilst others have been months before they could master the different positions; we have about eight or nine characters, which, when reversed in position, represent different letters. In Moon's system, the characters are grouped. The letter A would stand for four characters, as would also B and C and E, so each of those would represent four characters by reversing the position. Some minds would grasp that at once, whilst others would be months in doing so.

2196. Have you a regular course in your district; do you visit the same people once or twice or three times a week?—Once a fortnight; the ground is rather extensive in which the people are. One end of the district is Charing Cross, and from there it extends through Westminster, Pimlico, Chelsea, Knightsbridge, Brompton, and Kensington.

2197. Do you devote one day a fortnight to each blind person?—No.

2197*a*. How many people do you visit in a day?—The average number visited would be from 10 to 12 per day.

2198. How long a time would you remain with each person?—It depends. If they only require books to be changed, a few minutes; if they require a lesson, probably it is an hour.

2199. How many of those whom you visit merely require a change of books?—All the readers; those who have become readers after they have been taught require nothing more than a change of books.

2200. Which trades do you think are the most suitable trades to teach the blind?—Basket work, I should say, would be about the best; not chair caning and mat making.

2201. As a rule do you find that the blind stick to the trade which they have learnt and endeavour to get their livelihood by it?—There is no opportunity of their exercising it after they leave the institution.

2202. Is there no general depôt for the sale of the work of the blind in London?—No.

2203. Is there no shop in each district where work done by the blind could be sold?—No.

2204. Has any endeavour ever been made to start a depôt of that kind?—Yes. There have been efforts made in that direction.

2205. Have they failed?—Yes. There were two persons of the name of Colmer who started something of that description in the Gray's Inn Road; they were nephews of the Secretary to the Indigent Blind Visiting Society, but they failed in their endeavours.

2206. Was there any opposition upon the part of the tradesmen in the district to the establishment of such a depôt?—Not that I am aware of.

2207. Has any impetus been given to the basket making trade since the parcel post has been introduced?—I did hear that there was a great pressure for baskets at the time the parcel post was coming into existence, but since then, after the immediate demand was supplied, I do not think there has been much difference.

2208. Do you know if the blind make hampers to any great extent?—I suppose they do.

2209. There is a very large sale for them, is there not?—Yes.

2210. You say you suppose they do make them; do they or do they not?—I doubt whether they are properly taught to make those things.

2211. No one in your district makes any?—No.

2212. Have you any schools for blind children in your district?—No, except the board schools.

2213. You mentioned that there were four blind children under 15 year of age in your district?—Yes.

2214. Are they at school or not?—One has just left school, she is now nearly 15; one is at one of the board schools; one is in the workhouse, she is crippled as well as being blind. I believe they sent her to a school in the country, but they returned her as not being capable of managing for herself; and the other is a child of three years.

2215. Do you attach great importance to blind children being taught as early as possible?—Yes.

2216. Both their letters and some trade?—No, I would not join the two together by any means.

2217. You mean that you attach importance to their being taught their letters at an early age?—Yes.

2218. But you do not attach equal importance to their being taught at an early age some way of earning their livelihood?—No; I would have them taught a trade at the proper time, but not in childhood.

2219. How early ought they to begin to learn a trade in your opinion?—Certainly not till they are 14 or 15 years of age.

2220. Do not you think that a boy or girl of 10 or 12 years of age could learn to make baskets or hampers?—No, I do not believe that they would properly learn it before they were 14 or 15, because before they had become intelligent enough to understand what they were doing they would have completed their time in the institution in which they were, and so they would be neither fit for one thing nor the other. I can give several instances where blind persons who have come out of schools at the age of 17 have not learnt the trade they were supposed to have been taught; and have afterwards gone and learnt something else.

2221. You think that the schools do not teach them their trade?—The fact is through their going in too early to learn a trade. If they had been kept to their general education till a certain time and then put to a trade it would have been far better; the two ought not to be mixed in my opinion. Sighted children, whether boys or girls, are not apprenticed till they are 14 or 15.

2222. Do you think it would be possible to educate blind children in company with seeing children?—Certainly.

2223. You think that it would be an advantage to them to be taught with seeing children?—Yes.

2224. Do you think that the pension system is necessary?—Seeing that there is very little chance of the blind earning their livelihood except to a limited extent I should say that the giving of pensions to the blind was about the best thing that could be done for them.

2225. You do not think it possible that the blind could earn their own livelihood?—No, apart from institutions it is utterly impossible.

2226. I suppose there would always be a preference given to the seeing over the blind in any trade?—Sighted workmen work three or four times as fast; even in chair caning a blind person would take from four to five hours for one chair which a sighted person could do in one hour, taking the day through. A blind person works much slower than a sighted person.

Mr. W. Hibbert. 4 Feb. 1886.

2227. Have you known any cases of blind men being married to blind women?—Yes, I have had a great deal of experience during the last 12 or 13 years of such cases. I have four blind couples now in my district. I had five up to last week, I have four now.

2228. Who arranges these marriages?—They arrange them themselves.

2229. Is any artificial stimulus given to the intermarriage of blind persons?—I think rather the opposite.

2230. You do not think it advantageous that blind men should marry blind women?—No.

2231. Have they generally large families?—No.

2232. What is the ordinary number of children they have?—Three or four.

2233. Are they generally all sighted?—Yes, every one.

2234. Can you tell us anything about the houses of the blind; do they differ from the houses of sighted persons in cleanliness, for instance?—No, in the case of those four blind couples that I spoke of, their houses are equally clean, but I have frequently found where there is a sighted wife and a blind husband that the rooms are not so clean.

2235. Where they are both blind you say that the rooms are well kept?—That is my experience.

2236. Are the children of blind parents sent to school the same as other children?—Yes, the same as other children.

2237. You say that a certain number in your district earn their livelihood by begging in the streets; do you know at all what their earnings are in the streets weekly?—No.

2238. Can you judge whether they get enough to live comfortably?—They earn more, undoubtedly, than they would by working at any institution.

2239. Can you draw a distinction between those who are actually begging and those who are earning their livelihood in other ways in the streets?—There are about nine singing and playing in the streets. I do not know whether you would call that begging.

2240. Are there any bad characters among the blind in your district?—There are some who bear a rough name.

2241. Are there any who have been brought up before the magistrates?—Not that I am aware of. I am only there once a fortnight.

2242. You say that they earn more money by begging in the streets than they would if they worked in an institution?—There are some who have other employment; for instance, they have mangles at home, and I have known a blind man and a healthy strong woman earn as much as 30*s*. a week at mangling. Some are engaged in wood chopping on their own account, by which they would earn a similar sum, that is to say, a man and a sighted boy.

2243. How many in your district earn as much as the amount you have mentioned by mangling or by cutting wood, or any other occupation?—That I am not quite positive about.

2244. You have told us that some earn as much as 30*s*. a week with the assistance of a sighted son or a sighted wife?—Yes; I do not say that that is at the present moment, but I have known of such cases. I have had two such instances during my time.

2245. Therefore you would qualify your former statement in this way, that whereas a man being blind working by himself could not earn his livelihood, a blind man with the assistance of a sighted boy or a sighted wife could earn his livelihood?—Yes. There is one man now in Chelsea who is earning his living in that way, and he has said that he has earned 30*s*. a week, he and his boy; that is at wood chopping, firewood making. He prepares the wood and sells it on his own account.

2246. Why should not blind boys be apprenticed to sighted masters, and in that way be enabled to earn their livelihood when they grow older?—I see no reason why they should not.

2247. Of course the difficulty would be on the part of the master?—Yes, but the deaf and dumb are put out in that way; they are put out under hearing and speaking and seeing masters.

Mr. W. Hibbert.

4 Feb. 1886.

2248. There is a prejudice against having blind apprentices, I presume?—In some cases blind have been apprenticed after leaving school.

2249. I understand you to say you think it would be a good thing if that practice were generally adopted?—Yes; if it was made worth the master's while he certainly would see that the blind person mastered his trade, and being under the supervision of a master he would have a far greater chance of becoming a perfect worker than if he were left to himself.

2250. You think the blind should work in combination with and under the supervision of others rather than be left to themselves?—Quite so.

2251. Do you know anything about the blind in workhouses?—Yes; I have three workhouses in my district.

2252. Do the blind in those workhouses work at anything?—No; they do a little knitting as an amusement. The majority of them are advanced in years.

2253. What workhouses are there in your district?—The Chelsea, the St. George's, and Kensington.

2254. And in neither of those do the blind do any work but knitting?—No; in a district in which I was formerly the blind worked at wood-chopping; that was St. James's, Westminster.

2255. I suppose under the supervision of sighted persons the blind could do a great deal of that kind of work in a workhouse?—Yes; it depends upon the age of the person.

2256. You say that the majority of those in the workhouses in your district are aged?—Yes.

2257. What proportion of the blind persons that you visit have become blind after they have arrived at the age of 40, for instance?—The majority of those that I have met with have become blind later in life, say, after they have arrived at the age of 40 years.

2258. From accidents?—From various causes.

2259. Have those who had learnt trades before they became blind been able to do anything for themselves?—In one or two instances I have known them follow their trade; for instance, one man that I visited had been a tailor, and he still continued his trade by the help of his wife; he made me an overcoat on one occasion.

2260. I suppose he could turn a sewing-machine with the assistance of a boy?—He did it all by hand.

2261. I suppose a blind tailor could work a sewing-machine with the assistance of a wife or child to guide the work?—Yes; the sewing-machine was taught in an institution called the "Alexandra," at one time.

2262. With regard to the various types for the blind, have you any preference for one over the others?—Moon's type is certainly the simplest and easiest.

2263. Have you any suggestions to make to the Commission with regard to the treatment and education of the blind?—I do not think I have anything further to add to that I have already suggested, that they should be educated with sighted children.

2264. And work under sighted masters?—Yes; that would give them, in my opinion, a better chance of earning something towards their livelihood.

2265. And you think pensions are a necessary evil?—Rather a necessary good.

2266. You speak of those who are unable to follow any trade, persons who have become blind late in life?—Yes, when it is impossible for them to be taught trades to earn anything by; because if they learn a trade they never gain sufficient speed to do anything; the young ones are very slow who are taught from childhood, and the elder ones must necessarily be slower.

2267. (*Sir Lyon Playfair.*) How many of the 124 in your district are in workhouses?—About 25, I think.

2268. You said that of the 26 who have been trained in institutions, the majority were on the streets. How many are earning any livelihood at all by their work?—Five or six of those 26 are now working at the institutions.

2269. Are all the remaining 20 on the streets?—No; some are at home.

2270. You said that there are three children under 15, 26 trained in institutions, and 25 in workhouses; that leaves 70 other persons; are those 70 all receiving pensions, or doing some sort of work?—Some of them are receiving pensions, and some are working at home.

2271. But they are not on the streets?—No.

2272. Are there many of them making any livelihood?—They are assisting, or helping towards it.

2273. And some are kept by their own friends?—Yes, and by the aid of pensions.

2274. Are there a good many in receipt of pensions?—Yes.

2275. Are you aware, of your own knowledge, whether any of them have duplicate pensions, pensions from different institutions?—Yes.

2276. Are there several such cases?—Yes.

2277. They succeed in getting pensions from different institutions?—Yes, a few of them.

2278. What would be the amount of a pension?—10*l.* is the amount of a Christ's Hospital pension.

2279. Would several of them receive 10*l.* from one institution, and 10*l.* from another institution?—Yes, some would have four or five, or five or six smaller pensions.

2280. (*Dr. Tindal Robertson.*) Would you adopt any different method in teaching a child under 15 to that which you would adopt in teaching one over that age?—No, the method would be the same if there was the intelligence.

2281. I mean as to the system of teaching?—We have but the one system.

2282. Do your society give any facilities for enabling you to teach in any other system than that one?—No.

2283. Do you teach writing by that system?—There is a writing system, I believe.

2284. Do you teach writing by it?—No, our instruction is simply in reading.

2285. Do you know the writing system yourself?—No; it is easily acquired, but it is more tedious to use, and the Braille system would certainly be preferable.

2286. Have you any acquaintance with the Braille system?—Yes.

2287. Should you, if you had facilities for teaching that system, think it advisable to teach young children (who have greater delicacy of touch than grown up people) by that system in preference to any other on account of its being so much easier to write by that system?—As a writing system; I should not as a reading system.

2288. What is the difficulty in it as a reading system, I mean in the case of a young child whose touch is sensitive?—There would be no difficulty if his touch was equal to it.

2289. Do not you find that the touch of young children is perfectly equal to it?—Their touch is more sensitive than that of the aged.

2290. Is not it so, as a rule?—Yes.

2291. You spoke of the disadvantages of blind people intermarrying, but you said that their children were not blind, and you said also that, as a rule, their houses were kept clean. Will you tell us what you think are the disadvantages therefore in two blind persons marrying?—They must have eyes of some sort to supervise, and those eyes must be paid for.

2292. Then it is a question of money mainly?—They may manage to keep their own house clean, but for any business or other purpose some one must supervise.

2293. Do the blind people make their own fires?—Yes.

2294. Would they be capable, if fairly intelligent, of doing as much as other people without any sighted assistance?—Under fair circumstances they would.

2295. You are principally confined to teaching; you do not know much about trades, except from what you see in your visiting?—I have learnt a trade myself since I have been blind.

2296. But your experience is more with regard to teaching than with regard to trades?—I have to do with those who have been taught trades.

2297. What plan would you suggest for making the blind more dependent on themselves, or, in other words, more able to earn a living?—My suggestion was that they should be placed under sighted masters, under whom they would have facilities for acquiring a knowledge of ordinary trade. In an institution, after they have been taught a business or trade, they have no idea of the ordinary operations of buying and selling.

2298. Do you think that if a central depôt were established in London, and other depôts were established in the provinces, where the blind could have opportunities of disposing of their work, it would be an advantage to the blind?—Yes, it would be a decided advantage over the present system.

2299. Could you suggest any other system which would be preferable to that?—If these blind pupils were placed under sighted masters they would obtain work with those masters eventually, or with others, when it became general. I think the system would gradually develop, so that the blind would be able to work by the side of sighted workers.

2300. My question had reference to providing some means whereby the work of the blind, when produced, might be profitably disposed of. At present the evidence is that they are not able to get a sale for their work?—The establishment of such depôts would, no doubt, be an advantage.

2301. What are your reasons for thinking that it would be an advantage that blind children should be brought up side by side with sighted children?—They would be more fitted to occupy a position in the world than they are by being shut up together; they contract habits which are prejudicial.

2302. Suppose you take a school in a rural district where there are 50 or 60 sighted children, and one blind child was introduced into that school, do you think that the sighted children might be educated so as to be able to communicate sufficient instruction to that blind child?—They could do so, certainly, with a very little help from the schoolmasters or teachers.

2303. (*Dr. Armitage.*) Do you visit the workshop at Kensington?—No.

2304. Do you know any blind who are employed there?—Yes, I have known some.

2305. Are there any in your district who are employed there?—No.

2306. You do not visit a blind man of the name of Northmore?—I do not.

2307. You say there are five in your district who can read Alston's system?—Yes.

2308. Have you heard them read?—Yes.

2309. And you know that they can read fluently?—No, I will not say that.

2310. How many of the five can read fluently?—They can read passing well.

2311. What age are they, are they adults?—Yes.

2312. How many mat makers have you in your district?—None.

2313. Do you believe that mat making is a good occupation for the blind at home? Are mat makers who work at home able to sell their work so as to be able to make a fair profit by it?—The difficulty is in selling at all.

2314. Have you visited any mat makers since you have belonged to the society?—Yes.

2315. Can you give us the approximate weekly earnings of blind mat makers?—No.

2316. Are there any who are supporting themselves by mat making?—Not in my district.

2317. Have you any sash-line weavers in your district?—There are some who were taught it, I believe, in school.

2318. Have you any who carry on sash-line weaving at home?—No.

2319. You say there are no schools in your district except the board schools; do you know the class that is held in Ebury Street?—Yes, that is not for the education of children. I think his Lordship referred to the general education of the blind.

2320. (*Admiral Sotheby.*) You say that you go round to the blind people in your district once a fortnight; do you think a fortnightly attendance is sufficient?—When they have been once taught to read we supply them with books which they read themselves. We teach them to read, and after they have been taught to read I simply call and change their books.

2321. With regard to those you are teaching to read, is a fortnightly attendance enough for them?—Frequently I call once a week and sometimes oftener than that at the beginning; but our usual visits are once a fortnight.

Mr. W. Hibbert.

4 Feb. 1886.

2322. You say that the making of baskets is the most profitable industry for the blind to be taught?—Yes, with chair caning.

2323. Why do you think so?—Because there is more to be earned at that work than any other.

2324. Can a man complete a basket for himself without any help?—Yes.

2325. Is that the only work that the blind can do without help?—There is chair caning.

2326. Anything else?—Some say they do brush drawing, but there is the finishing.

2327. Can they bore holes?—Yes, that is done by the aid of a machine.

2328. How much do basket makers earn?—I have heard them say that they have earned 20*s.* or 30*s.* a week.

2329. Working at home?—Yes.

2330. When they work at home where do they get the material?—There are business houses, in the Borough particularly, where rods and canes are bought.

2331. They buy the material in small quantities?—Yes.

2332. If they bought it in large quantities they would get it cheaper, would they not?—Yes.

2333. They could get this material from institutions much better in quality and cheaper?—If the institutions would supply them.

2334. Those institutions that have brought up these blind people would supply them if they were asked, would they not?—They have not been supplied from any institution that I am aware of.

2335. You say there are no shops attached to institutions where they sell things made by the blind; do you mean things made at the institution?—No, I was speaking of those things that would be made by outside workers, after having left the institution. Each institution has it own workshops, and its own sale-shop.

2336. Why do not the blind make hampers?—They do, those who are able.

2337. You say that a blind person can cane a chain in four or five hours?—Yes, and some would even do it in three hours.

2338. What profit would he make upon that, I mean an ordinary chair?—An ordinary chair would be caned for 1*s.*

2339. And the profit on that would be how much?—Eightpence, and if the chair was beaded with a piece round the upper side it would be 3*d.* more, that would be 1*s.* 3*d.*, and that would cost the worker a halfpenny more.

2340. And he would do four in a day of 12 hours?—A very fast worker would, but the majority would not do much more than two.

2341. That would be 1*s.* 4*d.* a day?—There is one advantage in chair caning, that it requires no tools and it takes no room.

2342. A blind person working at chair caning would make 8*s.* a week at that rate?—Yes, if fully employed.

2343. Can they get employment in chair caning as a rule?—They do get some, but not sufficient.

2344. Suppose they went about the streets, as sighted people do, they could get sufficient employment, could they not; sighted chair caners get plenty of employment, I am told?—But they sit down and do one chair in an hour; in the way it is done in the street it is done in half an hour; they do it by the Dutch system; that is a very inferior way of caning chairs.

2345. How do you know that the rooms of a blind couple are much cleaner than they are when the woman is sighted?—I do not say that they are always much cleaner, I simply say that I have found them cleaner.

2346. How do you find that they are cleaner, if you are blind?—I can tell by the smell for one thing, and if they offer me a seat I can put my hand on it before I sit down.

2347. If the people are not clean in their habits, what do you expect to find?—What I do not want, that is what I have found.

Mr. W. Hibbert.

4 Feb. 1886.

2348. Do you think, as a rule, that the blind are more immoral than the sighted?—I think they are not.

2349. You said you had not heard of any blind people being employed by sighted masters?—I did not say that there were not any, because I have heard of one here and there.

2350. Are you aware of blind people being employed by Kents, the large brush manufacturers?—Yes, some years ago they employed some, I believe.

2351. Have they not blind people in their employ now?—Not that I am aware of.

2352. Do you know why they left off employing blind workers?—I do not; their works are at Bow, which is out of my district.

2353. Do any of the blind work as carpenters?—I have heard of one who lived over in South London, who had done some carpentering.

2354. Do you know a man of the name of Farrer, who is a carpenter?—No; I know one who is a brush drawer, who is foreman at the institution.

2355. Do you know whether he is a good carpenter?—No.

2356. You say that you have been taught a trade; what trade have you been taught?—Brush drawing and chair caning.

2357. Have you tried to get a livelihood at brush drawing, or did you merely learn it as a recreation?—I learnt it to try and do something by it, but brush drawing was of no use outside the institution; the chair caning I carried on for some time.

2358. How much did you earn a day at it?—I never did more than two chairs in a day. I did five in two days, once.

2359. That is 1*s.* 4*d.* a day?—They were rather large chairs.

2360. You said that it would be better that blind children should be brought up with sighted children, because when they are brought up by themselves they are apt to acquire prejudicial habits; what habits were you referring to?—They distort their features for one thing; they wriggle and twist and shake themselves about, and all manner of things.

2361. (*Dr. McDonnell.*) I think you said that the blind make towards London; do you think that the proportion of the blind to sighted people in London is larger than in other parts of the United Kingdom?—No, I do not know that it is.

2362. I understood you to say that the blind make towards London?—Yes.

2363. If so, would not the proportion of the blind in London be larger; if there is a determination of the blind from the provinces to London, do you think that the proportion of blind in London is larger than in other parts of England?—No, I only say they would make towards towns wherever they were located. The reason I say that is because I have several who have come from various parts of the country.

2364. You said that apart from institutions it is quite impossible for the blind to earn a livelihood. I presume you mean in general?—Yes; and when those who have been taught in an institution leave it, there is no market open for anything they may do; and that being so it is impossible, apart from an institution, for them to earn a living.

2365. That is to say, though you have known exceptional cases where they may earn 20*s.* or 30*s.* a week, yet, as a rule, the blind are not able to get on so as to earn a livelihood without some assistance from an institution?—That is what I mean.

2366. You spoke of the pension system as a necessary evil, that is to say, the pension system as at present worked. But suppose an insurance fund for the blind were established, out of which I or any of the gentlemen at this table, in case we became blind, would be entitled to a pension or an insurance, do you think that that would be equally objectionable. Supposing your father had paid a small sum annually, by virtue of which he would have been entitled in the event of himself or any of his family becoming blind, to get 15*l.* or 20*l.* a year for the rest of his life, do you think that would have been objectionable?—I do not see any objection in it at all.

2367. You think that a system of insurance for the blind on a large scale might be an improvement upon the pension system as at present worked?—Yes, I think myself that if they were assisted when they first became blind it would prevent a great number of them seeking the streets or the workhouse. A working person who becomes blind is reduced quite to beggary before he can get any assistance at all, and the moment he accepts parish help he is then debarred from these pensions.

2368. Suppose that there was a great system of insurance, to which everyone in London subscribed a small sum, so as to insure himself or any member of his family against want in the event of their becoming blind, and that consequently everyone would be entitled to 10*l.* or 15*l.* a year if such a misfortune should befall him; and suppose that in the case of children who became blind this money was expended in their education, and that when they came to an age at which they were able to work it was given to themselves to supplement the wages they were able to earn, so that if they were able to earn, say, 20*l.* a year they would have the insurance besides to help them; do you think that that would be less objectionable than the pension system as it is at present worked?—That would be preferable if it could become universal.

2369. Do you know what wages the blind are able to earn at the institutions?—Of course there are different institutions, and the wages would differ at the different institutions. In London there are three or four different institutions, and they all differ, but I believe they would range between 30*s.* and 2*s.* 6*d.* and 3*s.* It would be only foremen who would get 30*s.* There is a very great margin between them and those who would come next to them.

2370. (*Mr. Arnold.*) You stated that you have 26 in your district that have passed through institutions, and you said that the majority of those 26 are earning a livelihood on the streets and in various callings. Can you state whether your society has done anything in the way of obtaining employment for the majority in institutions?—I do not believe that we have anything to do in that direction at all.

2371. Are we to understand that your society does not endeavour to assist those that have been trained in institutions to get employment?—I have no idea whether they have assisted them or not, but that is not the object of our work; we simply teach blind people to read.

2372. Do you not think your society might advantageously extend its operations by endeavouring to get employment for your blind?—I have no opinion to give in regard to that.

2373. Are any of your blind employed in public works; I mean in manufacturing establishments, in spinning straw ropes, or anything of that sort?—No, not any.

2374. You stated that there were 25 in your district in workhouses; would you be disposed to recommend that those should be allowed to remain at their own homes, that is to say, that they should have out-door relief?—The majority would gladly accept it, while some would perforce be compelled to remain in the workhouse through bad health or infirmities.

2375. (*Sir Selwin-Ibbetson.*) Though out-door relief might be discouraged in general, yet with regard to the blind you think it would be an advantage to make an exception?—Yes, because when a person becomes blind and suffers in health he is compelled to seek refuge somewhere, and the workhouse of the parish to which he belongs is the only place open for him. Then when once he has entered the workhouse his little home is broken up, and he is obliged to remain in the workhouse, as there is nowhere else for him to go to.

2376. I understood you to say that your work lay principally among grown-up people?—Yes, among adults.

2377. And you also said that in the case of children you would discourage their being taught trades in their early lives?—Yes.

2378. You would confine their teaching in early life to the acquisition of general knowledge?—Yes.

2379. Have not you found that children learn a trade quicker when you have to teach them as children than when you have to begin with them at a later period of life?—I should say myself that from 14 to 15 would be quite early enough to teach a trade. At that age those who were being taught a trade would fully understand what they were about, and what value it would be to them afterwards, and they would themselves endeavour to do the best they could, whilst if you were to endeavour to teach them a trade when they were a few years younger than that their minds would not be so alive to the value of the education taught, and I think they would not be so capable of acquiring a knowledge of a trade as they would if they were a little older.

Mr. W. Hibbert.

4 Feb. 1886.

2380. In the case of sighted children of the age of from eight to 16, I have found that where you carry on their general education and their industrial work at the same time, the children easily acquire a knowledge of their trade, which is of inestimable value to them in after life?—Sixteen would be just the age at which they would be benefited more than during the whole five or six previous years.

2381. You said that a person who learned a trade late in life was so slow in accomplishing his work that he competed badly with sighted men. May I ask you whether you do not think that if he had had some instruction in his trade from childhood upwards, he would be quicker at the work and more able to compete with the world in general?—Those that I was speaking of as being so extremely slow, are those who have lost their sight when they have got to be 40 or 50 years old; all their movements are slower.

2382. You think that it would be an advantage to have institutions to which blind persons could be drafted after their general education was completed, and where they might be taught a trade from the age of 14 or upwards?—It would be decidedly better that they should be drafted to such institutions after the age of 14.

2383. So that they would go out into the world at 17?—I would give them up to 20.

2384. I suppose, in your opinion, there ought to be attached to any scheme of industrial training some means of registry by which the capabilities of the blind could be ascertained, and I presume you would be in favour of establishing workshops where the goods of blind workers could be placed for sale?—Yes, until such a place is in operation, of course, what they learn when they leave the institution is almost valueless.

2385. If such a registry and such a depôt were established, the training which the blind got in the institution could be afterwards utilised for their maintenance in life?—Yes. The German blind institutions carry on that system with their pupils so long as they require any assistance or help.

2386. They are always kept under the eye of the institution, and they are assisted in their work?—Yes, and I should say that such a system would be an incentive to morality.

2387. Do you think blind children could be trained to do household work?—Yes.

2388. There is nothing to prevent their being trained as household servants?—No, they could do a great many things in a house.

2389. They could even light fires?—Yes.

2390. Do you know of any who have been trained to do cooking and other household work?—Yes, those who are married; in some instances blind women have married, and they have always performed the household duties, even to washing and ironing and mending and making.

2391. There is nothing to hinder them from taking the position of household servants, if they could find such employment?—No.

2392. (*Mr. Johnson.*) In what institution did you learn chair caning and brush making?—At St. John's Wood. I undertook the travelling there for some years.

2393. It was in that institution you gained your knowledge of industrial work?—Yes.

2394. You say that there are 124 people in your district; what is the average age of those people?—The greater part of them would possibly be over 50, certainly over 40.

2395. Half of them would be over 40 or 50?—More than half.

2396. Do you visit at all or have you anything to do with the Ebury Street class?—No, I have nothing to do with the class, I only have to do with those who go there.

2397. Do you visit any of those who attend the class?—Yes.

2398. What is the system of reading which is pursued there?—Moon's I believe principally; formerly Frere's was in use, and latterly the Braille system has been introduced.

2399. Is there any instructor in that class from your society?—No.

2400. Do you receive any pension yourself?—Yes.

2401. What from?—From the Blind Man's Friend.

2402. Day's Charity?—Yes.

2403. Do you receive any pension from anything else?—No.

2404. You stated that you knew of instances where blind people had three or four or five pensions;—Yes.

2405. Are those instances very numerous?—No.

2406. How many such cases do you know of?—I daresay I could give you a dozen.

2407. From what pension societies generally do they draw their pensions; is it from the city guilds?—Yes, in addition to those outside.

2408. Principally from the city guilds?—Yes.

2409. And the Blind Protestant?—Yes.

2410. In fact from all the societies?—Yes, Gardner's Trust as well; but as soon as the blind try to help themselves they withdraw their assistance.

2411. Do you know of any who have a pension from Gardner's Trust who have pensions also from other sources?—Yes, several.

2412. When you say several how many would you say?—I would say two or three.

2413. They get it by mistake if they do get it?—We may suppose so.

2414. Do you think that at the present time these pensions are distributed in an equitable way, or would you suggest any other mode in which they should be distributed?—I would adopt the suggestion put to me by a member of the Commission, that is to say, to establish a universal insurance; that is the only other mode that occurs to me.

2415. You say that there are a number of persons who receive two or three pensions, and that points to the fact that those pensions are not distributed in a proper way; can you tell the Commission in what way you think pensions should be distributed so that there should not be a duplication of pensions?—It would require some consideration to devise a plan by which that evil might be remedied.

2416. Do not you think that it would be a desirable thing if a register were kept of all those people who received pensions?—Yes; I believe they do keep a register at some of the institutions.

2417. Do any of the people in your district hawk things in the streets?—Yes, there are some I visit now.

2418. What articles do they hawk?—One makes shoelaces and sells them in the street.

2419. Is there a large proportion of those 124 you visit that hawk things about the streets?—A few go out with lights and papers and such things.

2420. A certain number of them get their living in that way?—Yes, or help towards getting a living.

2421. You stated that you have heard that blind persons can earn wages of from 25*s.* to 30*s.* a week by wood-chopping?—That is a man and his sighted boy.

2422. Have you any experience of blind people who are wood-choppers without sighted assistance?—At the institutions I believe they earn about 15*s.* a week.

2423. How have you arrived at that information, that they earn about 15*s.* a week?—Only from themselves.

2424. At what institutions do they earn 15*s.* a week?—At Berners Street, the Association for the General Welfare of the Blind.

2425. Are you sure that they earn 15*s.* a week there?—That is what they tell me.

2426. That is with the help of machinery?—The work is divided, I believe; some saw, some chop, and some tie, but they are each paid, as far as I can gather, separately.

2427. Are they paid journeymen's wages or by piecework?—By piece-work; there is so much per 100.

2428. I think you said that the average earnings of basket makers in your experience were something

Mr. W. Hibbert.

4 Feb. 1886.

between 1*l.* and 25*s*?—Not the average earnings. I have known them to earn as much as that.

2429. Is that at their own homes?—Yes.

2430. What do they earn at institutions. I mean at workshops attached to institutions?—The hours are limited, and they would not be able to work as long as they would in their own homes. I have known them work at their own homes up to eight or nine o'clock at night, whereas at an institution they would leave off at five or six.

2431. You said that there were 25 of those you visit in workhouses?—Yes.

2432. Chelsea, St. George's, and Kensington?—Yes.

2433. Are any of those employed?—One or two of the females do a little knitting, that is all.

2434. Is there any school that they can attend, or any instruction given them in reading?—Only what I give them.

2435. The only instruction is in Moon's type then?—Yes.

2436. There is no instruction in Braille?—No.

2437. And no instruction in Alston?—No.

2438. Do the parish authorities find books?—No, the society supply them, and I teach them every fortnight.

2439. Do you think it would be desirable to have schools established in workhouses in which the blind might be taught by permanent teachers?—No, many of the blind in workhouses are not able to read at all.

2440. Do you mean by that that they are not capable of being instructed?—Yes, they are past instruction.

2441. What is the average age of the 25 in the workhouses?—Sixty or 70, I suppose, some are 80.

2442. Then there are very few children?—Only one, and that is a girl who is a cripple in addition to being blind.

The witness withdrew.

Mr. William Tibbles examined.

Mr. W. Tibbles.

2443. (*Chairman.*) I believe you are one of the teachers of the Home Teaching Society for the Blind?—Yes, a junior teacher.

2444. Have you been blind all your life?—Yes, since I was three months old.

2445. Was it from any accident that you became blind?—From inflammation.

2446. What is your salary?—1*l.* a week and 3*s.* a week for a guide.

2447. What is your district?—It includes Kentish Town, Hampstead, Kilburn, Hendon, and Portland Town.

2448. What is the number of blind people on your register in that district?—112.

2449. What is the number of children under 15 years of age?—21.

2450. What is the number of married blind?—37.

2451. What is the number of those who work?—28, and in those I include those who work partially.

2452. How many of those who work earn their own livelihood?—About 14.

2453. Out of the 28?—Yes, I do not say that those 14 are all in my district who support themselves; there are others that I could not account for who do certain things.

2454. What is the number who have been at blind institutions?—22.

2455. What is the number in workhouses?—20.

2456. Of those in the workhouses how many work in the laundry?—Two.

2457. Is one a child?—Yes; and the remainder are old and incapable of work.

2458. What number are in institutions or schools visited by you?—28.

2459. What number read in Moon's type?—95.

2460. How many read in Braille's tyye?—20.

2461. How many read in Lucas's type?—26.

2462. What are the ages of the 22 who have been trained in institutions?—They would be between 20 and 60.

2463. Are those included in the 28 who work?—Yes.

2464. Have all those who earn their livelihood been brought up in some institution?—Yes.

2465. You are sure of that?—Yes.

2466. What is the work which they do?—Some are tuners, some are music teachers, some do basket work and chair caning, and one knitting.

2467. What would be the highest and the lowest wages that they would get?—25*s.* would be the highest, that would be what the tuners would get.

2468. At basket making what would the earnings be?—The remuneration in basket making is very uncertain; some get very little at basket making.

2469. Are they able to make vegetable hampers as well as baskets?—I have not put that particular question, but I should think so.

2470. You do not know whether they do it or not?—No.

2471. What number of books have you in your district in Moon's type?—348.

2472. How many of the blind in your district receive pensions?—About 15.

2473. Do you know of many who receive pensions from more than one society?—No; there are one or two.

2474. What would be the amount that they receive from one or more institutions?—I cannot answer that.

2475. What age are those who receive pensions; out of the 15 are there any under 40?—Yes.

2476. How many are there under 40?—Two or three, I should think.

2477. And the remaining dozen would be over 40?—Yes.

2478. Have you much acquaintance with the earnings and occupations of the blind?—I know something of them.

2479. Have you any views as to the best way of enabling the blind to earn their own living?—I should advocate for one thing, as a means of getting more work for the blind, the formation of district committees.

2480. For the sale of the work of the blind?—For the purpose of procuring work for those engaged in industrial work.

2481. When do you think that the training of the blind in industrial work should begin?—It should begin early, I think, not later than 10 or 12.

2482. The education in reading should begin, of course, as early as possible?—As early as possible.

2483. Was it so in your case?—Yes, I went to school very early, I should think at about seven or eight.

2484. How old were you when you were able to read Moon's type or any other type?—I could read Lucas's type after being at the institution some little time.

2485. Could you read it when you were 10 years old?—I could read Lucas at 10.

2486. How long did it take you before you were able to read it—About two years.

2487. What institution were you trained at?—St. John's Wood.

2488. Were you taught any trade?—A little music.

2489. Has it been of use to you?—No.

2490. Have you any special taste for music?—I have not a particular talent for music.

2491. Did you attempt to learn any other trade?—I did a little brush work, but that I did not follow.

2492. Do you think that it would have been to your advantage to have been taught some trade thoroughly?—I must say yes. I should have felt it very much if I had not obtained my present appointment.

2493. How long is it since you obtained this appointment which you hold now?—About 10 years, when I was 21.

2494. When did you leave school?—When I was about 17.

2494*a*. Then from the time you left school, when you were about 17, till you were 21, how did you manage to support yourself?—I lived with my friends.

2495. Have you any pension?—No.

2496. You did not attempt to earn your own livelihood in any way at that time?—No.

2497. Are you of opinion that it would be a good thing for blind children to be sent to school with sighted children?—Yes, decidedly.

2498. And do you think that rather than teach the blind to work by themselves, they should always be taught to work with sighted people?—I think that isolated training for the blind in any case is decidedly bad.

2499. You do not approve of the system of training the blind in institutions by themselves?—No.

2500. Are you married?—Yes.

2501. Have you married a lady who is sighted?—Yes.

2502. Do you think it very objectionable that blind men should marry blind women?—Decidedly.

2503. Have you been married long?—Yes.

2504. You do not assist your wife in any way in the house, or in any work that she does, you being a teacher?—No, I do not.

2505. But you would be able to assist your wife in many of the duties of the house if you had not other occupation?—Yes, certainly.

2506. Can you give us any information as to the lives and history of the blind in your district? Should you say that the blind in your district are a moral well-behaved class?—Yes, I should think that the blind in my district would compare favourably with the blind in any other district that I know of.

2507. Do any beg in the streets?—There are one or two street readers.

2508. The blind in many cases not being able to earn their own living are living in idleness; do you find that that has any tendency to make them immoral?—There may be one or two exceptions, perhaps, but speaking generally I think they are moral.

2509. You say that those who receive pensions are 15 in number?—Yes.

2510. Do they do anything to earn their own livelihood?—Some of them.

2511. Do you think that the receipt of those pensions takes away any stimulus which they otherwise would have to earn their own livelihood?—I think not.

2512. You think that pensions are necessary then in many cases?—Yes, I think it desirable to give pensions to those blind who are in part supporting themselves.

2513. Blind persons who are over 40 or over 50 years old?—Or even under, if they are unable entirely to support themselves, but are doing something to support themselves.

2514. Have you any suggestions to make beyond those which you have already made with regard to the teaching of the blind?—I have already implied that I should advocate the sending of blind children to board schools.

2515. And after that would you send them to some industrial school of a general character or of a special character?—Rather of a general character than of special.

2516. Do you think that there should be greater means of facilitating the sale of the work of blind people?—Yes; and with a view to affording such facilities I think the formation of district committees, taking under their charge the working portion of the blind in each district, would be a great advantage.

2517. Do you think that the failure of many of these depôts for the sale of the work of the blind has been due to the fact that they were not conducted on ordinary commercial principles?—I am not qualified to give an opinion upon that, but I think the opinion of those who are well informed upon the subject is that that is the reason.

2518. (*Mr. Johnson.*) I understood you to say that 15 of those you visit receive pensions?—Yes.

2519. And that one or two receive double pensions?—Yes.

Mr W Tibbles.

4 Feb. 1886.

2520. Can you tell me about the ages of those who receive pensions?—The majority of them would be over 40 or 50.

2521. And I understood you to say that two or three were under 40; from what societies do they draw their pensions?—I have not been directed to inquire specially into pensions, and I have not done so.

2522. Are you aware that a great many of the pension societies do not give pensions to persons under the age of 40?—Yes.

2523. How would you suggest that these district committees, to further the sale of work of blind people, should be established?—I should suggest, in the first place, that a number of ladies and gentlemen really interested in the blind should meet in each district; that to them should be given the names of the blind able to work at different trades; further, that each institution should keep a register and should supply to the committee of each district the names and addresses of pupils leaving; that it should be the object of the district committee to seek in all ways to induce their friends and the public generally to give their work to the blind.

2524. You would so dispose of the work done by the blind at their own homes?—As far as possible.

2525. You think it would be of great advantage in certain districts to have workshops established?—Certainly.

2526. In connexion with these district committees?—In connexion with these district committees, if it could be done, or even independent of them. I think that workshops should be established in different districts.

2527. Are you of opinion that the blind would be benefited if a central depôt were established where they could purchase material at cost price?—Certainly.

2528. Have you been able to ascertain in your visitations whether the blind workers have found a difficulty in getting a market for their productions?—No, I have not experienced that so much. There is some difficulty in the blind getting work.

2529. At the institutions or at their own homes?—At either in some places.

2530. Are there many amongst those whom you visit who carry on industrial work at their own homes?—One or two.

2531. Out of the 112?—Yes.

2532. Are there any out of that 112 who are working in institutions?—A few at St. John's Wood and Kilburn Institutions.

2533. About what number?—Seven or eight.

2534. Do I rightly understand that out of the 112 there are 100 not doing any work at all?—No, 14 out of the 112 are earning their own livelihood.

2535. What are the resources upon which the other 100 live?—Twenty out of them would be in the workhouse.

2536. Have you any experience with regard to the selling of manufactured work?—No.

2537. You were at the St. John's Wood Institution?—Yes.

2538. Had they any difficulty at that institution in disposing of work done by the inmates?—I think not.

2539. They had no surplus stock?—They may have had some.

2540. With regard to getting sighted labour to assist the blind; is there a difficulty in getting blind people into sighted workshops?—I understand there is a difficulty.

2541. Have you any experience with regard to that?—No.

2542. Do you think it a desirable thing that blind boys should be apprenticed to sighted manufacturers?—Yes, and that is an opinion generally entertained.

2543. Have you any experience in London of blind workers being employed in sighted workshops?—I have one who works for a sighted man.

2544. But there are very few such cases, I suppose?—Very few.

2545. You yourself were instructed in some trade or employment besides that of music?—A little brush work.

Mr. W. Tibbles.

4 Feb. 1886.

2546. But in nothing else?—No.

2547. You had no capacity for it probably?—I do not know. I left St. John's Wood Institution when I was only 17.

2548. However, you gave it up?—Yes.

2549. Amongst those whom you visit, do any obtain a livelihood as musicians or tuners?—Yes.

2550. How many?—About four.

2551. What do you suppose their earnings are?—One tuner makes 25*s.* a week.

2552. Do any of those you visit play any instrument in the street?—I have one case of that kind.

2553. What instrument does he play?—A little organ.

2554. Do any of them get their living by singing in the street?—No, I think not.

2555. Do any of those whom you visit live by begging?—That would depend upon whether reading in the streets and selling cigar lights would be considered begging.

2556. I mean begging in the streets?—No, none of them. The police would stop that.

2557. You have told us that you think 10 years is the proper age at which instruction in industrial work should be begun; what is your experience that leads you to that opinion?—I think that it would be an advantage that blind children should be brought up with seeing children in an ordinary school till they are about 10 or 12 years of age; that would give them more courage and confidence and they would be more thoroughly taught to use their hands; and in every way I think they would be brighter and quicker.

2558. Among the blind that you visit in your district are there any blind couples?—None.

2559. You disapprove of blind persons intermarrying?—Decidedly.

2560. (*Sir Selwin-Ibbetson.*) You say that you would not only like to see blind children educated whilst they were young, but you would like industrail training to be mixed with their general education after the age of 10?—Yes, 10 or 12.

2561. You think that if they are taught industrial work at as early an age as that it gives them greater facility in the work that they may afterwards have to depend on for their livelihood?—I think so.

2562. A knowledge of a trade acquired as early as 10, makes them more proficient in that trade than if they learned it at a later time?—Just so, but it depends upon the training being sufficiently prolonged.

2563. (*Mr. Arrol.*) You recommend that blind children should be educated at the board schools?—Yes.

2564. Do you see any objection to their being educated at blind institutions?—Blind institutions are useful, but I should consider that the education at a board school was preferable.

2565. Have you any further reasons than those you have already given that would lead you to recommend that blind children should be educated at a sighted school?—I believe that being taught to do things on sighted principles really widens the capacity of the blind altogether.

2566. Do you think that it renders a young child more self-reliant?—Decidedly, and if young blind children are put with seeing children at an early age they will be prevented from forming bad habits. I do not mean immoral habits, but objectionable habits which the blind are in the habit of forming when they are kept by themselves.

2567. On the question of pensions, you, I think, said that you were in favour of giving them to people under 40 years of age. At what age might you be disposed to recommend that pensions should begin?—I would say at 30 years of age, if it could be shown that the man or woman was doing all he or she could, but was yet requiring some further assistance; I would say that people of that class ought to be pensioned.

2568. Do not you think that those who were learning a trade from 15 to 25 ought to be pensioned whilst they were not able to earn anything for themselves?—Yes, I think that too would not be undesirable.

2569. As regards blind people in workhouses, you say you have 20 in workhouses in your district. Do you not think it advisable in the case of the blind that they should get out-door relief in place of being required to go into the workhouse?—Not in all cases perhaps; some of the blind are very old, and they would really be incapable of taking care of themselves; out-door relief might be desirable where they have friends.

2570. You think that they are better attended to in the workhouse than at home?—I speak of the two workhouses I visit; I can say that the blind inmates of those workhouses are well attended to.

2571. (*Dr. M'Donnell.*) Are any of the blind in your district in receipt of out-door relief?—Not to my knowledge.

2572. All those that are relieved by the rates are under the compulsion of going into the workhouse?—I believe that is so.

2573. Do you think that in many cases, if not in all cases, of blindness out-door relief might be given, blindness being taken as a sufficient test?—Not in all cases, certainly.

2574. If you selected any, on what grounds would you select them: every blind person is on the brink of being poor, if not absolutely poor?—If a blind man can earn by a trade 1*l.* a week, I do not know that he ought to come upon the rates.

2575. Suppose you give 5*s.* in out-door relief to a man not earning anything, you are then rewarding him for his want of industry, and giving nothing to a man who is industrious and who earns 1*l.* a week. Is that a good plan?—I would assist the working man, perhaps, with a pension rather than by giving him parish relief.

2576. It would become a pension?—I thought you meant it in the form of parish relief.

2577. If 5*s.* was given by the parish to every blind person it would be a pension. Suppose every blind person got 5*s.* out of the parish in out-door relief, and every industrious man had 5*s.* in addition to his 1*l.*, while every idle man had nothing but 5*s.*, that would be giving an encouragement to the industrious man. Do you think there would be some advantage in that?—Yes, looking at it in that way there might certainly.

2578. That would be less objectionable than giving out-door relief upon an irregular and bad system?—Yes; I am certainly in favour of assisting those who in part support themselves.

2579. So that if out-door relief could be given so as to encourage industry, you think that would be a good system?—Yes, if it were given in a way to encourage industry.

2580. You spoke just now of children brought up in blind institutions acquiring bad habits; you mean eccentric and odd habits, making faces, and so on?—Yes, I said I did not mean immoral habits.

2581. (*Admiral Sir E. Sotherby.*) Do you know of any blind children in your district who do not go to any school at all?—I have four or five.

2582. What means are being taken to induce or to make them go to school?—In two cases perhaps feeble health is the reason that they do not go to school.

2583. They are too sickly to go to school?—Yes, the children are extremely delicate. I know, in the case of one of them, a girl, it was found that she had other ailments in addition to being blind.

2584. Is it not the fact that when sickly children go to school they become much healthier afterwards, particularly the blind?—I think it is very likely.

2585. Do you know anything about the wages that the blind get outside institutions?—It is uncertain.

2586. Do you know anybody who maintains himself by a mangle or chopping wood?—Yes, I know of one man who maintains himself by a mangle.

2587. What are his wages?—I could not speak definitely; mangling is a thing that fluctuates very much.

2588. What are his maximum earnings, do you think?—He might earn 10*s.* or 15*s.* a week.

2589. Do you know anybody who maintains himself by chopping wood?—No.

2590. What institutions are those in who support themselves?—They are not in institutions; some of them do work for institutions.

2591. What institutions?—Some of them do work for the St. John's Wood Institution.

Mr. W. Tibbles.

4 Feb. 1886.

2592. Do they work for any other institution?—One, I think, works for the Berner's Street Institution.

2593. What work do they do for the St. John's Wood Institution?—Two are teachers, they live out of the institution.

2594. They do not make anything?—Not those, and in addition they are musical.

2595. Do you think that the blind as a rule have more musical talent than the sighted?—No, I do not see why they should.

2596. You say that you were brought up at the St. John's Wood Institution; what were you taught there?—General education, a little brush-making and a little music.

2597. You work in Kentish Town?—That is part of my district.

2598. Is there no institution there for the blind?—No.

2599. Which is the nearest?—I think St. John's Wood; then there is the Home at Kilburn, chair-caning is done there.

2600. What work do they do at the St. John's Wood Institution?—I believe they have started a new industry in the shape of rope making.

2601. Do they sell much of their work out of doors?—I do not know.

2602. (*Dr. Armitage.*) Have you any mat makers in your district?—No, I think not now.

2603. Have you any sash-line weavers?—No.

2604. (*Dr. Tindal Robertson.*) Were you taught at St. John's Wood any other system than the Lucas system?—That was the only system taught when I was there.

2605. Have you since made yourself acquainted with any other system?—Yes, I read Braille and Moon and Lucas.

2606. You do not teach any other than Moon?—No.

2607. Suppose you had children, and you had facilities, would you attempt to teach them any other system. Suppose you had time enough and proper facilities, would you think it an advantage to teach them any other system?—I think the Braille system is of advantage for educational purposes.

2608. You were not taught music by Braille's system?—No.

2609. By what system were you taught?—By ear.

2610. By ear only?—No; we were taught chords, the proper arrangement of scales, and so on; we were not taught simply by ear in the sense of a teacher playing a passage and expecting it to be caught up by the ear. The teacher would, of course, tell you certain notes to play, he would tell you what notes formed a chord, he would read out the chord to you, and you would learn it in that way.

2611. You are aware that by Braille's system you can teach by musical notation?—Yes.

2612. Do not you think that a very great advantage to those who learn music?—Certainly.

2613. And they may be able to learn it more scientifically and correctly that way?—I consider that the Braille system is of advantage to musicians.

2614. With regard to the system you suggest of establishing district committees, suppose you had a large depôt in each of the large towns of the country, where material might be bought and things might be sold, and where a register of the blind people might be kept, do you think that would serve the same kind of purpose?—Not altogether. I think it should be the object of those district committees thoroughly to urge upon their friends to give the blind their work.

2615. You should canvass in fact in order to sell the work?—Each gentleman would have considerable influence among his friends if care was taken in the selection of the committee.

2616. Do you think a voluntary system would be better than a State-aided system, or a system under the control of the Government?—I think there is ample room for the two.

2617. Do you think you might rely upon the voluntary system?—No, I think State aid is required, but I think that a voluntary system might assist the State as far as possible.

2618. (*Chairman.*) Did I rightly understand you to say that the school board looks after all the blind children in your district by its attendance officers?—I have some few who do not go to school.

2619. With the exception of those who are prevented by infirmity from going to school, do they all attend school?—No, some of those 21 are in St. John's Wood School and Kilburn Institution.

2620. But the school board sees to the education of all the children in your district who are not in institutions or who are not prevented by physical infirmity from attending school?—Yes, I think so.

2621. We have been told by a previous witness that the houses of the blind who have married sighted women are sometimes less well kept than those where they are both blind; do you find that so in your experience?—I have not had any cases in which both the man and the woman have been blind.

The witness withdrew.

ROBERT BRUDENELL CARTER, Esq., F.R.C.S., examined.

R. B. Carter, Esq., F.R.C.S.

2622. (*Chairman.*) Are you connected with any of the blind institutions, or ophthalmic hospitals?—I have been connected for many years with ophthalmic hospitals. I am ophthalmic surgeon to St. George's Hospital and consulting surgeon to the Shropshire Eye Hospital, and was formerly surgeon to the Royal South London Ophthalmic Hospital. I am a surgeon practising in ophthalmic cases solely and have been so for many years.

2623. The Commissioners would be glad to have some evidence from you with regard to the preventible causes of blindness; looking at the Census Returns for 1881 for England and Wales, we find that there were 1,958 cases of blindness from birth. Judging from your experience would you say that blindness can be transmitted from parents to children?—In the first place I should like to say that I should much doubt the accuracy of that census statement. I should think in all probability the cases returned of blindness from birth would include a very large number of persons who had lost their sight in the first few days of life, because cases of blindness from birth are very rare.

2624. Would you say that blindness in the case of infants, say, under the age of five years is preventible, or is it an infantile disease which no human precaution can absolutely guard against?—The best way in which I think I can answer that question is by referring to an analysis made by Dr. Cohn of Breslau, who took the causes of blindness in 2,573 lost eyes (his table does not state in what proportion they were cases of double blindness or of single blindness), and he divided them into three classes. Class 1 includes cases which in the present state of knowledge could not have been prevented, for example, blindness arising from tumours of the brain or congenital blindness; Class 2 includes cases which might probably have been prevented by prompt and skilful treatment; and Class 3 includes cases which might and ought to have been prevented. The relative proportions of the three classes are 225 per 1,000 for the first, 449 per 1,000 for the second, and 326 per 1,000 for the third. The value of Dr. Cohn's table is largely diminished by the fact that it includes cases occurring at all periods of life, whereas in referrence to the question of the prevention of blindness it is chiefly important that we should have figures showing the causes of blindness at an early period of life. The Ophthalmological Society of London appointed a committee, of which I was a member, to ascertain as far as possible what amount of blindness was caused in this country by purulent ophthalmia in early life, from which cause, if persons were guided by adequate knowledge, no eye would ever be lost. We found that rather over 30 per cent. of the inmates of asylums were blinded from that cause, and we calculated that there were then in the United Kingdom, including Ireland, about 7,000 persons who had lost their sight from that cause; those persons suffering from blindness, caused within the first few days of life, which ought to have been and could have been prevented by a very small amount of

R. B. Carter, Esq., F.R.C.S.

4 Feb. 1886.

pains and trouble. The blindness which is produced by disease occurring during the first few days of life is entirely preventible. The disease itself might always be prevented by washing the eyes of the child with disinfectants just after its birth, and might always be cured by calling in the aid of a doctor in time.

2625. A great number of persons become blind between the ages of 45 and 65; are there any special occupations in which the workers are liable to lose their sight before that age?—I think not. I think the next most fruitful cause of blindness is the severe ophthalmia which is apt to become epidemic in large schools or in armies, a form of ophthalmia which occurs at any period of life; it was first introduced into Europe on the return of Napoleon and the French army from Egypt.

2626. It had been chronic in Egypt?—Yes, and like many other diseases, when brought on new soil it flourished amazingly. In the year following the return of the French army from Egypt it broke out as an epidemic in Belgium, where it is said to have destroyed in a single year one eye of 10,000 people, and two eyes of 3,000. An epidemic of very much the same kind, though much less severe, prevailed some time ago in some of the great schools which are maintained by London boards of guardians for workhouse children. There was a school at Hanwell where nearly every child had this epidemic ophthalmia, and there was another school at Anerley where the children were similarly affected. The causes of the disease were thoroughly investigated and were removed, and both those schools have been ever since free from ophthalmia, and are not likely, I think, ever to suffer again from it.

2627. What were the causes of that epidemic ophthalmia?—Overcrowding mainly, bad arrangements in the dormitories, insufficient food, and so forth. I have no doubt that the epidemics affecting those schools would tell very much upon the existing statistics of blindness in the United Kingdom, because though not a very large number of children lost their sight as the immediate consequence of the attack of ophthalmia, the eyes were frequently left in a condition in which they would go on from bad to worse, and many of those cases would terminate in loss of vision at some later period of life. The same statement would apply to an earlier period in Ireland; a somewhat similar epidemic raged in that country, but the persons attacked by it were in most cases children or soldiers, because they were the two classes of the community who were most brought together in large numbers. Putting such outbreaks as those out of the case, I do not think there is any special liability to blindness at any period of life beyond the age of infancy. There may be a special liability to it in particular crafts and trades.

2628. Has your attention been called to any way of guarding against that liability in those particular crafts and trades?—The liability would be I think chiefly from accident. In some trades the workman is exposed to flying chips of metal, and in others to flying pieces of glass and so forth. The means of prevention in those cases would be wearing mica or gauze spectacles, but that practically the workmen will not do.

2629. Are not there a good many cases of soda-water bottles bursting and injuring sight?—A good many undoubtedly. In St. George's Hospital every year there are two or three such cases; still the aggregate number is not very considerable.

2630. Blindness which comes on between the ages, say, of 45 and 65 you would regard as one of the consequences of age or disease inherent in human nature and not preventible?—Yes, age or disease. The disease called glaucoma is fatal to sight in a large number of cases; loss of vision is due sometimes to kidney diseases, heart diseases, diabetes, diseases of the brain and nervous centres, and other diseases, but preventible blindness is mainly blindness of early life, and all our investigations showed that about 30 per cent. of the blindness traceable through asylums or educational institutions in the United Kingdom was traceable to a single preventible cause.

2631. Have you observed in cases where two blind persons marry whether the offspring have a tendency to blindness?—I have not observed anything of the kind.

2632. Short sightedness is hereditary?—No doubt.

2633. But you have not found blindness to be hereditary?—No.

2634. A short-sighted eye is an eye prone to disease?—Yes.

2635. Have you observed anything in the course of the instruction given in our schools now which has a tendency to produce short-sightedness; has it affected the sight of the rising generation?—I think it has. The conditions under which instruction is carried on in this country throw great strain on the eyes of the rising generation, more among the better classes than among the lower classes; it throws a greater strain upon their eyes than a certain proportion of them are well able to bear. I should not say that the proportion is a very large one.

2636. Do you think that that produces blindness or simply weakness of sight?—Weakness of sight; generally speaking, it produces distress and trouble in the use of the eyes. I would like to mention that there is a very well known table of 2,528 cases of double blindness prepared by Professor Magnus; he takes as his test of blindness inability to count fingers beyond one foot, and he takes only cases of double blindness. He returns infantile ophthalmia as causing 10·88 per cent., but that does not refer only to blindness in the earlier periods of life, but it includes persons of all ages. The statement I made with reference to 30 per cent. applied to inmates of asylums and institutions, who nearly always go into those places young.

2637. Have you any suggestions to make with regard to the prevention of those infantile diseases affecting the eyes?—What I think we want is a better diffusion of knowledge among mothers and nurses with regard to the nature of this affection. The Committee of the Ophthalmological Society sent a deputation to the Local Government Board some time ago, to urge upon the Board that a printed paper of instructions should be given to parents by the registrars of births, using the Registrar's Office machinery for that purpose in the same way that the Post Office machinery is used for various purposes; but the officials of the Local Government Board were not inclined to carry out the suggestion, owing to the extra trouble that it would cause, and the matter fell through. Though that course, if adopted, would have had no effect in preserving the sight of the particular child registered, the registration coming later than the disease, yet it would have been the means of diffusing information among the poor about the curability of the disease if early treated, and the great danger to sight involved in its neglect. One day or two days' neglect may make all the difference between saving vision and losing it.

2638. You would advise that a properly qualified medical man should be consulted at once when anything appeared to affect the eyes of a newborn infant?—Yes.

2639. You know that on the Continent, by a system of Government publications, information with respect to such matters is circulated throughout the country; do you think that it would be a great advantage if either the Post Office or the Local Government Board were to publish a short summary of the precautions to be taken or the symptoms to be watched in the case of young children?—In the case of newborn infants I think that it would be of great practical utility. My first experience in ophthalmic matters was gained at Nottingham, in the centre of a great coal mining district, and I saw there an enormous number of people who had lost their vision from purulent ophthalmia in early life; they were the children of miners living in villages a long way from a doctor, and who had no idea of the importance of early treatment.

2640. All properly qualified medical practitioners are fully aware of the danger of neglect in cases of infantile purulent ophthalmia, and the nature of the treatment?—I should say, fully.

2641. You would not say that that was the case with regard to midwives?—No, I think the instruction of midwives in the matter is a thing greatly needed; and we have during the last 12 months obtained excellent results in some of the lying-in hospitals by disinfecting systematically the eyes of all newborn children in the first washing after birth; the means of doing that are very simple, and there is no reason why midwives generally should not do it. I see no reason why that should not be done universally. If that precaution were adopted, the result would probably be to extinguish the disease. The disease originates in inoculation at the time of birth, from secretions getting in the child's eyes at the time of birth.

2642. The disinfecting treatment at the time of birth would prevent that?—In an enormous majority of cases.

R. B. Carter, Esq., F.R.C.S.

4 Feb. 1886.

2643. Are there no means at present adopted of circulating information among midwives and mothers with regard to the precautions that should be taken for preventing the disease?—None whatever, but the disease is a cause of blindness which a certain amount of diffusion of information would entirely remove, because the disinfectant is so cheap and simple, and so harmless, that nobody could hesitate to employ it.

2644. Are those precautions adopted in the cases of births of children in workhouses, for instance?—I could not say, but if they are adopted, it would not be officially in any way; it would depend on the medical officer of the workhouse.

2645. The adoption of proper precautions in the case of infantile purulent ophthalmia is what you would rely on principally as a means of preventing blindness in this country?—Yes. I have here a note by Dr. Magnus of the causes of blindness among 87 inmates of the blind institution at Breslau, and he found the following percentages:—Infantile purulent ophthalmia, 34 per cent., about what we find in this country; eruptive fever, measles, scarlet-fever, and so on, 18 per cent., in many cases that would be remediable; atrophy of optic nerves, 10 per cent.; congenital blindness, 10 per cent.; and sympathetic ophthalmia, at this, loss of one eye following injury to the other, another 10 per cent.; leaving 8 per cent. not accounted for. There among 87 inmates of a blind institution we have only 10 per cent. of congenital blindness, children born blind.

2646. Measles and scarlet fever are both causes of blindness?—To the extent of 10 per cent.

2647. Is there any treatment which is an absolute preventive in such cases?—I should say not, the conditions vary so much in individual cases. In some cases in those eruptive fevers, where the vital powers are very much depressed, you may get loss of an eye practically from mere death of tissue from exhaustion and extreme weakness; in other cases, in scarlet fever especially, you may get loss of sight from brain complications affecting the optic nerves; in measles you may get a chronic state of surface irritation, but then the patient seldom loses his sight unless the disease is of such severity as seriously to endanger life.

2648. (*Dr. Tindal Robertson.*) Would a weak solution of alum be of use in these cases of infantile purulent ophthalmia?—The solution that I have found most useful is a weak solution of perchloride of mercury, of 1 in 1,000.

2649. I ask that question because I have heard that in some parts of the midland districts it has been the custom of some philanthropic or medical society to send round packets of alum to be distributed by the officers of the parish, or some persons connected with the union, to women who are likely to give birth to children?—I should say the alum lotion is not the best astringent that could be used, though it might be very good for the treatment of the disease I doubt whether it would have much influence in preventing it, that is to say, whether it would destroy the infectious quality of the secretions; but it is a good application for the treatment of the disease, not so good as nitrate of silver.

2650. If any substance that was found to be the best for the treatment of infantile purulent ophthalmia could be sent round in the way in which alum has been sent round in the particular districts of which I speak, do you think that would be a useful thing?—A very useful thing.

2651. That might be done to a certain extent through the intervention of the Government, by the Local Government Board giving direction to guardians to have it done by their officers?—I see myself no difficulty if the Local Government Board would undertake it. We know that Government boards do not like to be saddled with additional work and responsibility if they can avoid it.

2652. As to what is called tobacco-amaurosis do you think tobacco is a cause of blindness?—I think one meets with a few cases, perhaps one or two in 1,000, in which tobacco has had a bad influence on the optic nerves. I made inquiries into that subject some years ago through ophthalmic surgeons practising in Egypt and Turkey, where everybody smokes all day long, where if any inquiry of this kind was being conducted the chairman would be smoking and I should be smoking, and I am told that loss of sight from nerve atrophy is very rare in those countries.

2653. (*Dr. Armitage.*) To follow out the question put to you by Dr. Robertson, suppose that remedies were furnished in order to disinfect the eyes of newborn children by nurses and midwives, it would be very important that, if possible, those remedies should be non-poisonous; do you know of any other remedies besides perchloride of mercury and nitrate of silver which would answer the purpose tolerably well?—I must draw a distinction between remedies to prevent the disease and remedies as a means of cure. The perchloride of mercury is a means of prevention, but the solution of perchloride of mercury that is used is so weak, containing only one part in 1,000, that there could be no danger of any kind attending its distribution or use; and I do not think we have any other disinfectant equally trustworthy and equally harmless. All the preparations of carbolic acid, which are so much used in general surgery in performing operations antiseptically, are detrimental to the eyes; they are apt to disturb the translucency of the surface, and till the perchloride of mercury solution came into use we had no thoroughly trustworthy antiseptic for eye operations. In all my eye operations I use a solution of perchloride of mercury. There are 480 grains in an ounce of distilled water; you would have something under one grain of perchloride of mercury in two ounces of distilled water; the ordinary medicinal dose of perchloride of mercury, which people may take for weeks together, is one sixteenth of a grain, so that a teaspoonful of that solution would be an ordinary medicinal dose which an adult would take three times a day, and a teaspoonful would be all that would be necessary to use for a disinfectant for the eyes.

2654. Have you any statistics showing that myopia is gradually increasing in English schools?—No such statistics have been collected, so far as I know; the only English statistics bearing upon the point are some statistics obtained at Marlborough School by one of the masters, in whose methods of examination I should not have entire reliance, and those statistics appear to show that about one-fourth of all the boys in Marlborough School are myopic.

2655. Is it your impression, from what you have seen, that myopia is less common in English schools than in German schools?—I should think so; if one walks through a German town and observes the number of persons with concave spectacles, one comes to the conclusion that the number of such people in proportion to the population is much greater than in England.

2656. Do you consider that the smaller proportion of persons in England suffering from myopia, as compared with the number of persons similarly afflicted in Germany, is due to the prevalence of out-door games in the English schools?—Certainly. The increase of myopia during the periods of study depends on the elongation of the eye-ball produced by the convergence of the two eyes upon a near point, and the production of myopia is a mechanical result; the eyeball tunics being not strong, not tough and firm as they should be, yield to this continued traction of the muscles upon the eyeball. Obviously, the better the standard of physical health of the child or student the less liability there would be to that yielding of the eye tunics from mechanical traction. American statistics have proved very clearly that underfed and badly housed children suffer in a greater proportion than others. I should also say that the mischief is mainly done in elementary schools; it is the first step that does the mischief. Some very interesting investigations were made by a Philadelphia committee under the chairmanship of Dr. Risley, which showed that it was in the beginning of education that these eye troubles came into prominence, and that the more advanced schools but carried on what others had commenced.

2657. What means would you suggest with a view to counteracting this tendency to myopia in elementary schools?—As in the case of infantile purulent ophthalmia, it becomes a question of diffusion of knowledge. The parents and teachers should be made thoroughly aware of the fact that there is a certain proportion of children, I have no means of saying what proportion, but not a very large one, whose eyes might be described as weak or vulnerable, whose eyes are not well calculated to bear the wear and tear of ordinary school life; and the arrangements of schools, which must always, of course, have reference chiefly to the requirements of the majority, are sometimes injurious to a certain minority. Now if parents would test the vision of their children, would see that before the child went to school it had normal vision and could see types of a certain size at a

R. B. Carter, Esq., F.R.C.S.

4 Feb. 1866.

given distance, and would take early notice of the whole question of the vision of the child, not accusing it of stupidity or carelessness because it did not learn its lessons so quickly as other children, which is constantly done, I think all those children whose eyes were likely to be troublesome might, without much difficulty, be picked out from the rest, and with intelligence on the part of the schoolmaster there would be no difficulty in giving them certain advantages, giving them seats with a better light, for instance, and so on. I think a great deal might be done if the school books in common use were better printed, if the type were not so crowded together. I think great strain is thrown on the eyes of children from the way in which the books are printed which they have to use. There would then remain a small residuum of children unfit for school education, and whose education ought to be conducted in a special way with a view to the requirements of their eyes.

2658. Do you think that in the selection of school games it is desirable rather to select those in which quickness of the eyes is trained as in our English school games, or do you think that the German gymnastics are as good?—I should think our English games are very much better. I should like to see acuteness of vision made a point of excellence in all physical contests. I should like to see it taken up by volunteers or athletic clubs. I should like to see them give prizes for excellence of vision. A great many of the errors committed by parents and teachers with regard to children arise from the fact that they have not the least idea what a child ought to be able to see; they have no standard of vision. Everybody knows how high a boy of a certain age ought to jump and how far he ought to run in a given time, but people do not know what he ought to see; and I think they should know what he ought to see.

2659. (*Admiral Sir E. Sotheby.*) Do you know what are the comparative numbers of rich and poor children who are blind?—I have no idea. I should think the excess would be largely on the side of the poor, simply because the rich have important advantages in the way of early treatment.

2660. Are any instructions given in the lying-in hospitals generally with respect to the application of disinfectants with a view of preventing infantile blindness?—I could not say. That would depend on the medical staff of each hospital.

2661. Have you had any experience of cases of blindness or diseased eyes among the children of poor people from exposure to cold after measles or scarlet fever, from being turned out in the streets three or four days after they have recovered from measles or scarlet fever?—I have not seen cases of that kind which would be likely to terminate in loss of sight. I have seen cases of bad eyes from that cause, inflamed eyes or troublesome ulceration, but not cases leading on to total blindness.

2662. (*Dr. McDonnell.*) Could you give us a good and simple definition of blindness?—This definition was one adopted by Professor Magnus, that the scientific definition of blindness is the absence of light perception, and the practical definition of blindness is a state in which no occupation can be followed for which vision is required; and that involves cases and conditions that may differ very materially from each other. For example, I may mention a case of a gentleman under my care who had totally lost central vision, he could not see the point at which he was looking, he could not see anything straight before his eyes, he could not see to read or to write his name; but some of the lateral portions of his retina had been saved and he had a considerable amount of lateral sight; but his vision was of no use to him, he was practically blind. As I have already said, Dr. Magnus gave as a practical definition of blindness a state in which no occupation can be followed for which vision is required, and he took as his test in forming his tables finger counting at three feet, a person who could count fingers at three feet he excluded, and in some subsequent calculations be made the test still more rigid, he took finger counting at one foot.

2663. With reference to the preventive solution, the use of which you have recommended, do you think it would be safe to trust even so weak a solution of corrosive sublimate among the poor themselves for bathing their children's eyes?—I should think so, they would hardly be likely to administer it to the child, and at any rate could hardly administer a sufficient quantity for any great harm to be done.

2664. You think perchloride of mercury incomparably the best preventive?—Yes.

2665. And you think it is safe enough?—Yes.

2666. You think it better than any solution of alum?—I do, I have no evidence about the efficacy of alum.

2667. You think so dilute a solution of perchloride of mercury might be safely used?—Yes, certainly.

2668. I do not know how far they are reliable, but in the statistics with regard to blindness from ophthalmia in Ireland, in the census of 1861, 1,900 cases are returned as cases of blindness arising from ophthalmia, and 523 in the census of 1881; was not it known that there was an epidemic of ophthalmia in the first period?—Yes; I referred to that epidemic in Ireland in an earlier part of my evidence.

2669. Are you able to give the date of that epidemic?—I could not.

2670. However, it would be within that decade?—Yes, that period would cover it.

2671. (*Mr. Arrol.*) You have referred to certain outbreaks of epidemic ophthalmia in England and Ireland; could you give us any information with regard to any similar outbreaks in Scotland?—I have no information about Scotland.

2672. Do you think poverty and vice have much to do with the increase of blindness?—No, I should say not, except that they are contributory causes. A child brought up in a poor and vicious home would have less power of resisting any noxious influence and would have less power of recovery; but I do not think vice and misery have any special influence beyond that.

2673. You have no doubt found in rural districts that the number of blind is very limited in one district and very large in another; can you give any reasons for that?—I have sometimes seen accidental results of that kind. I remember that there was a village in Gloucestershire in which a very large number of the inhabitants were affected, not with absolute blindness, but with disease terminating in great impairment of vision, due to inherited syphilis. Syphilis had been introduced into the village, and many of the inhabitants suffered more or less from it. Putting such cases as that on one side, I do not think I have noticed any sharp lines of division between districts, except that in some villages, owing to their being a long way from the residence of a doctor, there have not been the same facilities for obtaining medical advice that there have been in other districts.

2674. You have not had brought under your notice the great difference in the number of cases of blindness in different parts of Scotland, the number in Kelso being some 76 per million, and in Shetland 2,323?—No, I am not conversant with the Scotch figures.

2675. (*Mr. Johnson.*) Do you know anything of blindness proceeding from particular trades; do you know whether shuttle blindness, for instance, exists to any great extent?—I have not met with it. It would be very easy for the Commission to get statistics of the employments of the patients of the London ophthalmic hospitals, and probably provincial ones; but I do not carry them in my head.

2676. (*Chairman.*) Probably you would be able to furnish the Commission with such statistics?—I will endeavour to do so.

2677. (*Mr. Johnson.*) Mr. Mundella stated that he had heard of certain cases of blindness resulting from following certain trades?—The only trades of that kind that occur to me at this moment would be those in which there was an obvious liability to accident to the eye. Then there is a condition of the eyes occurring among miners which does not produce blindness, but interferes a great deal with vision; they get oscillation of the eyes, technically called "nystagmus," which seems to depend on working for a long time in an exceedingly bad light.

2678. Shuttle blindness would probably be caused in the same way?—I am not conversant with shuttle blindness at all. I lived for several years in Nottinghamshire, where Mr. Mundella's goods are manufactured to a great extent in the cottages by framework knitters, but I do not remember to have seen any blindness at all traceable to that.

2679. Do you think that blindness from secondary syphilitic causes is on the increase or on the decrease?—I should think it is on the decrease, because the conditions of the disease are better understood and more readily recognised and the disease is better treated.

2680. You could not suggest to the Commission any other application instead of perchloride of mercury which would act almost as well and yet would not be so poisonous?—I have no personal experience of any other antiseptic which answers so well. A considerable number of experiments have been made in France on this point by Dr. Credé, and I could send to the Commission the formula that he has employed.

R. B. Carter, Esq., F.R.C.S.

4 Feb. 1866.

2681. With regard to the epidemic at Hanwell and Anerley was there any evidence of it having been brought to those schools, or did it originate from dirt and overcrowding and want of good food?—I do not think any great attention was called to it until the early history of it was past investigation. When I went to investigate the conditions I could not get at anything to show how it had been brought there, but I found a state of things which was specially arranged to promote its diffusion, and when once established it went all over the place. I think out of 1,600 only 100 escaped, or something of that kind.

2681*a*. (*Dr. Tindal Robertson.*) With regard to myopia, you said that people suffering from it were more likely to become blind in later life than people who were not myopic: would you be inclined to recommend that there should be a periodical inspection by some competent person of children in schools, in order that attention might be drawn to any defect which might be coming on?—It would be very advantageous, but I cannot help thinking that it is a matter the responsibility of which should rest rather with parents. I think that they might be trusted to look after the eyesight of their children as they would look after their welfare in other respects.

2682. Take the case of board schools; do not you think in such cases where the parents were probably unlikely to know even that it was necessary or advisable to submit the children to such examinations, that it would be an advantage to have periodical inspections of the sight of the children?—I think it would be an advantage, but I rather doubt the practicability of it, and it seems to me that the better plan would be for school boards to instruct their schoolmasters to be on the watch for defective vision on the part of the children, and to call the parents' attention to any defect as soon as they noticed it, because with the abundant hospital provision in most of our large towns, there would be no difficulty in getting the necessary investigation made.

2683. The schoolmaster, if instructed, might refer those cases to the nearest ophthalmic surgeon, or to some ophthalmic institution?—Yes, or he might instruct the parents that something was wanted.

2684. (*Chairman.*) If you have any fuller statistics in your possession with regard to causes of blindness in Germany than those you have already given, the Commission will be glad to have them?—I will furnish the statistics *in extenso*. There are statistics of that kind which I think I could place before the Commission. In an encyclopædia now in course of publication, under the editorship of Dr. Eulenberg, there is an article on blindness, written by Dr. Cohn, of Breslau, and it contains a good many figures and facts.

2685. (*Mr. Johnson.*) Can you explain why it is that near sightedness and blindness are so much more prevalent in Germany than in England?—The wave of compulsory education swept over Germany before it reached this country.

2686. (*Admiral Sir E. Sotheby.*) Do you suppose that much blindness is due to syphilis?—Syphilis causes a certain proportion of blindness, but not a very large amount, I could not say how large.

2687. Has the action which has been taken with regard to the Contagious Diseases Acts had any effect?—It may have some effect, but syphilitic cases are better treated than they used to be; the character of syphilis is better known than it was. One great fact about syphilitic affections is that they are generally curable.

The witness withdrew.

Mr. JOHN NEATE examined.

Mr. J. Neate.

2688. (*Chairman.*) What age are you?—Twenty-four.

2689. Where were you educated?—At St. George's School.

2690. When did you go there?—In 1878, when I was 16.

2691. When you went in at 16 had you learnt anything?—Ordinary reading.

2692. Where you blind from birth?—No.

2693. You were able to read before you lost your sight?—Yes, ordinary type, but I had also learnt Moon's system and other systems before I went to St. George's. I had learnt Moon's and Braille's and Lucas's.

2694. What did you learn at the institution?—I learnt brush and broom making and chair caning.

2695. Were you taught music?—No.

2696. Perhaps you had no talent for it?—No.

2697. You did not ask to be taught music and were refused?—No; I was not refused. I did not ask. I was in the band.

2698. Were these the only trades that you were taught, brush making and chair caning?—Chair caning is not taught there as a trade. We learnt chair caning, but the chair caning is not a trade taught generally among the male pupils.

2699. Have you anything to say with regard to the institution?—No.

2700. Were you well treated when you were there?—Yes.

2701. And when you went out did you go out expecting to get work?—Yes.

2702. What means did they take to give you work?—I was furnished with a good set of tools.

2703. Did the institution undertake to buy everything that you made?—No, that is where I found a difficulty in obtaining employment.

2704. Have the institution any place of sale for work done outside the institution?—Their place for the sale of work is only for journeymen in the employment of the institution and pupils.

2705. Therefore your work could not be sold there?—No, without I was a journeyman.

2706. Did you try to sell any brushes or brooms at any of the retail shops?—Yes.

2707. Did you fail?—Yes.

2708. What shops did you apply to?—All manner of shops, oilshops, and in fact any shop that I could go to.

2709. Did you actually make those brushes and offer them for sale at those shops, or offer to make brushes for those shops?—I have nothing to do with brush drawing, it was pitchwork that I undertook.

2710. Have you made any brushes or brooms for sale and offered them to shops, or have you only gone to shops and asked for work?—I have made them and offered them.

2711. And you could not sell them?—No.

2712. What did they say, did they say that they were already supplied?—Yes, generally speaking.

2713. Did you ever receive any order from a shop to make any brushes?—No.

2714. How many shops did you go to?—I went to a great many.

2715. In what district?—All about.

2716. Where were you living?—Westminster; I went to Marylebone.

2717. Have you applied to any institutions to give you a pension in consequence of your being unable to sell your work?—No.

2718. How are you supporting yourself now?—With a little work that I can sell to people at times, and by writing the Braille system.

2719. How do you get money by writing the Braille system?—I am paid for writing books by the British and Foreign Blind Association.

2720. How much a week are you paid for writing books?—What we can earn.

2721. What do you earn a week or a month?—We are paid by the fortnight, generally speaking.

2722. How much a fortnight?—12*s*. or 14*s*. I have earned.

Mr. J. Neate.

4 Feb. 1886.

2723. Do you depend on private charity at all now?—No.

2724. Have you any friends?—Yes, a mother.

2725. Do your friends do anything to support you?—Yes, they contribute.

2726. Can you make any suggestion with regard to any improvement in the system of obtaining employment for the blind?—No; I think if there were more workshops set up for the blind we might get on a good deal better, because the existing workshops can scarcely support their own journeymen.

2727. Do you think that is because the fact that the public may purchase the work of the blind at those workshops is not sufficiently known?—Yes.

2728. Do you think if there were more places for the sale of the work of the blind in various parts of London, shops in good thoroughfares, that there would be a more ready sale for their work?—Only for pitch-work. I do not believe that there would for basket or mat making.

2729. Do you know of any cases where blind people have worked with sighted people and have gained their livelihood in that way; for instance, in cutting wood?—Not in cutting wood, but I knew a blind man in Manchester who worked several years at basket-making with sighted people.

2730. Have you ever tried to get employment in a sighted firm?—Yes, I have.

2731. Were you refused employment?—Yes, they said they did not employ blind.

2732. You find a prejudice against blind being employed generally?—Yes, I do.

2733. (*Mr. Johnson.*) You were in the St. George's School?—Yes.

2734. For how many years?—Six.

2735. And you went through the brush department and the pitch department very well?—Yes.

2736. You were a very good workman?—Yes.

2737. Did you get a good report from the trade manager?—I believe so.

2738. You had learnt a good deal before you came to the school in general education?—Yes.

2739. Where did you learn of Braille, Moon, and Lucas, before you came to the school?—At various classes.

2740. Which classes?—Ebury Street, Red Lion Square, and Willis's.

2741. You were one of the early boys put to pitch-work?—Not one of the earliest.

2742. You were one of the early boys?—Yes.

2743. Were you given pitch tools when you went away?—Yes.

2744. Were you given an apparatus by which you could warm pitch at home?—Yes.

2745. Did you work at it at all?—Yes.

2746. And did you take any of the work that you produced to the school?—No.

2747. Why did you not?—They would not purchase it of me.

2748. Did you ever apply to the trade manager to know whether he could employ you?—No; there was no journeyman's shop at the time.

2749. It is sometime ago that you are speaking of?—Yes; I have left school 18 months, there was not a journeyman's shop for the pan work at the time I am speaking of.

2750. Can you work the pan work at your own house?—Yes.

2751. With success?—Yes.

2752. Do you know any others who have done so?—Yes.

2753. Have you made many brushes at home with our apparatus?—Not many, because I have no sale for them.

2754. What are the average earnings a day of a pitch worker in full work?—If I was in full work I could earn 5*s.* a day.

2755. That is the reason, I suppose, why pitch work has become so favourite an employment lately among the blind?—Yes.

2756. And the only thing is that you want a market for it?—Yes.

2757. You think that if the pitchwork were developed and a market were open to you it would be a very good occupation?—Yes, it would supersede every other.

2758. Therefore you think if workshops were established where you could work, or where you could dispose of what you did at home, it would be very advantageous?—I do think so.

2759. How many people are employed in printing Braille?—I do not know.

2760. Do you do the Braille printing work at your own house?—Yes.

2761. Who reads to you?—I get little children at times to read to me; sometimes I have to copy what others have written.

2762. You make two or three copies of a certain book or portion of a book?—Yes.

2763. What is the average that you get per day for that work?—They pay so much a sheet.

2764. What is the average that you can earn?—7*s.* or 8*s.* a week.

2765. That is paid for by what society?—The British and Foreign Blind Association.

2766. Is it at all done by the Indigent Blind Visiting Society?—Yes, it emanates from the Indigent Blind Visiting Society.

2767. Then the Indigent Blind Visiting Society and the British and Foreign Blind Association work hand in hand?—Yes.

2768. Do any of the persons who emboss Braille get pensions or doles from the Indigent Blind Visiting Society?—Yes, several.

2769. Is it done as a help to those people who are writing Braille?—I do not know; each recipient of the pension must get a subscriber.

2770. Are the doles or pensions from the Indigent Blind Visiting Society given to those persons who are embossing Braille for publication?—No; not in consequence of that.

2771. Have you any pension yourself?—No.

2772. Have you applied for any pension?—For Day's.

2773. When did you apply for Day's?—About 12 months ago.

2774. What amount have you been able to sell of your own work irrespective of any institutions. I do not mean this 7*s.* a week for embossing work, but what have you been able to sell of your own work amongst your own connexion without the aid of any institution?—I could not say. I have not sold more than 20*l.* worth of work since I left the institution.

2775. For want of a market?—Yes.

2776. (*Dr. Armitage.*) At what age did you lose your sight?—I lost it first at five years of age and recovered it again.

2777. Had you been trained in sighted schools?—No, I had not had a thorough training in sighted schools, I went occasionally.

2778. For what reason did you leave St. George's?—My time was expired.

2779. (*Admiral Sir E. Sotheby.*) You say that you do pitch-work better than any other?—Yes.

2780. Can you finish a hand broom without any sighted supervision?—Yes.

2781. If you pull the hairs will any come out?—No.

2782. You can finish your work at home as well as in a workshop?—Yes.

2783. At home you are able to prepare your pitch and apply it, and to put the bristles into the back of the broom so well that you can get a sale for that broom?—Yes.

2784. That is the only sort of work that you have endeavoured to get a sale for?—Yes.

The witness withdrew.

Adjourned to to-morrow at 12 o'clock.

32, Abingdon Street, Westminster.

Friday, 5th February 1886.

PRESENT:

LORD EGERTON OF TATTON IN THE CHAIR.

THE RIGHT HON. SIR LEON PLAYFAIR, K.C.B., M.P.
ADMIRAL SIR E. SOTHEBY, K.C.B.
W. TINDAL ROBERTSON, ESQ., M.D.
B. ST. JOHN ACKERS, ESQ.
T. R. ARMITAGE, ESQ., M.D.
W. AUCHINLOSS ARROL, ESQ.
E. C. JOHNSON, ESQ.
ROBERT MCDONNEL, ESQ., M.D., F.R.S.
CHARLES E. D. BLACK, ESQ., *Secretary.*

Mr. JOHN LANCELOT SHADWELL examined.

Mr. J. L. Shadwell.

5 Feb. 1886.

2785. (*Chairman.*) You are a member of the Council of the British and Foreign Blind Association?—Yes.

2786. Have you been so since its foundation in 1868?—Yes.

2787. Will you tell us the reason that prompted the Council to found it?—In order to examine into the different systems of educating the blind.

2788 What were the systems then existing, that is to say in 1868, when the association was founded?—The Roman system in different forms, Alston's type, and another Roman type printed at Worcester, and there were Moon's type, Frere's type, and Lucas's; all these were used in England, and there was also Braille's type that was used in France, and another type used in New York.

2789. Did the association come to any conclusion with regard to the superiority of any of those types over the others?—Yes, we came to the conclusion that the Braille type was the best generally, but that Moon's was the best in certain cases, for people who were either too stupid to learn a complicated system, or whose fingers were too hard to feel the point letters which were used in the Braille system, I mean letters consisting of points instead of lines as the letters in the Moon, Frere, and Lucas' types do.

2790. Was your idea that Moon's type was more suited for people who became blind late in life, and Braille's for those who learnt it in early youth?—I do not know that we came to the conclusion that lateness in life had very much to do with it; it is rather a question of hardness of the fingers.

2791. In the lower classes the hands of those who have in early life been accustomed to hard work are more hard and horny, and therefore perhaps less adapted to learn any delicate pointed type?—That is so.

2792. Can you tell us anything of the constitution of the Executive Council?—It was a rule that every member of the council should be so far blind as to be unable to read ordinary type with his eyes; and also that he should qualify for his position by learning at least three different systems.

2793. At the first commencement of the association did they put themselves in communication with all the leading associations at home and abroad?—When the association was founded the secretary put himself in communication with all the blind associations and institutions.

2794. What practical conclusion did the council come to?—The practical conclusion which they came to was that steps should immediately be taken to introduce the Braille type into all blind institutions in this country, and as far as possible to discourage the use of all other systems except that of Moon.

2795. You have already told us the reasons why you selected the Moon and the Braille out of the others may I assume that you are of opinion that it is not desirable to select one type as the only type to be adopted for the blind, either in this country or over the world?—I am of opinion that Moon's should be retained for the hard handed blind, and with that exception I think that the Braille system should be universally adopted.

2796. One of the objects of this association is to print books suitable for the education and reading of the blind?—Yes.

2797. And you think that the Braille type is more suited for educational work than any other?—Certainly.

2798. Can you state the number and the character of the books which have been printed by the association?—I have a list in my pocket. I counted the books, and I made out that about 60 different books have been stereotyped besides the Bible; but I believe that about 400 others have been what we call written; that is, not printed in a stereotyped frame, but copied by hand.

2799. In the cases where the books are stereotyped the embossed characters are stereotyped so that you may strike off any number of copies?—Yes.

2800. The others are only individual copies?—Yes, as to the character of the books, I should say from looking over the list that they are generally history and poetry. we have had several plays of Shakespeare printed, and several short poems of Gray, Wordsworth, Cowper, and others, we have had books on Universal history, parts of Green's History of the English people, and any interesting book that we can hear of which is not written in too diffuse a style. And as regards the manuscript books we have poems and books of travel and stories, anything which way be used educationally or which may interest the general reader.

2801. Has the result of printing those books been the improvement of the education of the blind throughout the country?—Yes, most decidedly. Before the association was established nothing of any consequence had been printed for the blind except the Bible, and if the blind wished to consult any other book it had to be read to them.

2802. Do you supply the other blind associations with books at a reduced cost, or how does your society work?—We supply a great number of schools, I think generally below cost price. I think never above, and if any schools subscribe a guinea a year to the association they are entitled to have all our books at half-price.

2803. Are your books used in every blind institution in England?—I think now they are used in all of them.

2804. Are they used in schools under the school boards?—Yes, I think they are read in all the schools of the country.

2805. Have you also issued maps?—Yes.

2806. Of what countries?—England and Wales, Ireland, and Scotland, the United States, Holland, Belgium, France, Europe, and Australia.

2807. Are those raised maps?—Yes.

2808. With the mountains raised and the rivers depressed?—The mountains are raised and the rivers are sunk, and the coast line is raised above the sea. It is impossible to emboss the names of places on the maps, as the names would take up too much room; but we put numbers on the map itself, and then we issue with the map a guide, explaining what those numbers mean.

2809. Was arithmetic taught before the Braille system was used in England?—Arithmetic, I believe, has always been taught in the schools, and the introduction of the Braille system has had little or nothing to do with arithmetic; although there is a system of numbers connected with the Braille alphabet. It is not at all a convenient system for working out sums, because the writer does not feel what he is writing; the numbers marked in the Braille system appear upon the opposite side of the paper to that which is turned towards the writer. For arithmetic it has always been usual to employ a board with holes in it, and to indicate the numbers by pegs stuck into those holes.

2810. Do they not employ, what you see universally in Russia, a series of wires with balls on them, what is

Mr. J. L. Shadwell.

5 Feb. 1886.

called an abacus?—I have only once found an abacus in use in a blind institution, and that was in the Istituto Margherita di Savoia at Rome, which is under the management of nuns. I found a large abacus in the school room, by which the children were learning arithmetic.

2811. Why has it not been introduced into England?—I think it would be useful for merely teaching children how to add, but I do not think you could work out a multiplication sum in that way. I have not tried it myself.

2812. Are you aware as a fact that all monetary transactions in the shops in Russia are carried out by means of those beads?—My brother, who visited Russia about 20 years ago, told me that he had to bargain the shops in Russia by means of an abacus, but I do not know that a multiplication sum could be worked out in that way.

2813. Can you say why it could not?—I never worked with an abacus myself.

2814. Does your association do anything with regard to the employment of the blind?—We employ about 50 blind people in printing or copying out books for us.

2815. Do you send your books all over the world?—Yes.

2816. Is there any other establishment for printing the Braille type in England?—Some books in the Braille type are printed at Worcester at the college for the blind sons of gentlemen; those, I believe, are chiefly Latin and Greek books.

2817. Have you any suggestions to make with regard to the education of the blind generally?—I have nothing further to suggest than that the Braille type should be universally used.

2818. Have you any views with regard to the employment of the blind after they leave the institutions at which they have been trained?—I think that the best occupation for them is that of music.

2819. But suppose they have no turn for music?—If they have no turn for music, I believe that the best employments for them are basket making, brush making, chair caning, and mattress making.

2820. Are you aware of the difficulty which the blind experience in finding employment, and in selling their manufactures after they leave the institutions?—Yes, they find it very difficult, I know.

2821. Is there any unity of action among the blind institutions in London or in England, or do they all work independently of each other?—They work independently of each other.

2822. Have you been in the habit of having conferences either annually or at stated times, in order to take counsel as to the work in which you are engaged?—No; I have only attended one conference myself, and that was held about 10 years ago under the auspices of the Charity Organization Society; and there was one at York, I think, about three years ago.

2823. Is there any general agreement among the societies in London as to what improvements might be carried out or recommended, both in the education of the blind and in their employment in after life?—I think there is a pretty general agreement as regards the superiority of the Braille system for educational purposes, and I think there is a pretty general agreement as to the manual trades which can be practised by the blind.

2824. Do you think that it would be advantageous that the blind institutions should watch over and follow in their after lives those who have been trained in those institutions?—I think it most desirable.

2825. We have been told that as soon as they have left the institution, if they do not work as journeymen at the institution, the blind have no means of selling their work, they have no longer any connexion with the institution in which they have been brought up; is that so?—That is so. I think it would be very desirable for the institutions to look after their pupils after leaving, and to start them in business, to introduce them to customers, or to persons who would become customers, and give them advice as to the proper method of succeeding in business.

2826. Could not any advantageous changes be carried out by the institutions themselves in London without any interference by the state, or any legislation on the subject?—I think so.

2827. Is there any jealousy between the different societies which has prevented a mutual interchange of opinion?—I think there is.

2828. What do you imagine is the cause of that. Is it the question of rival alphabets?—Mainly I think it is. There is a natural unwillingness on the part of people who are accustomed to one system to listen to any proposal for innovation.

2829. Do you think that this Commission may be the means of bringing those various societies together, by calling attention to the subject and diffusing information?—I think it may do a great deal of good in the way of diffusing information, but I am not at all sanguine that the mere diffusion of information will do away with the mutual jealousy of the different societies.

2830. With regard to the education of the blind, do you think that they ought to be educated in the school board schools in London with sighted children, or that they ought to have separate training?—I think it is better that they should have separate training, but failing a good special school I think that the school board classes can do a good deal for the blind.

2831. Supposing the children were sent to schools with the sighted, do you think it advisable that they should have had some previous training or education in reading or writing in the Moon or the Braille system?—I think so.

2832. They could hardly be sent, could they, to schools with other children without some previous education?—They might.

2833. Would it not give very considerable trouble to the schoolmaster if they were sent without some previous education?—It would, unless the school board provided, as it does at present, special blind teachers for them.

2834. Of course it might be possible to have blind teachers in the towns, but in the country districts, where perhaps only one or two blind children at the outside might be found within the area of the school board, it would be a considerable additional expense to have a well qualified teacher for the blind, would it not?—It would certainly.

2835. Because I assume that even if it were made compulsory upon a certain number of the teachers in our national schools to have some knowledge of the system of teaching the blind, it necessarily must be extra work, and must be paid for accordingly?—Certainly.

2836. And the cost in the school board schools in country districts would be a serious question?—Certainly.

2837. (*Sir Lyon Playfair.*) We have had it in evidence that in towns blind children are well taught in board schools if they have blind teachers; have you any experience of teaching the blind by blind teachers in the ordinary schools under school boards in London?—I have not myself visited any schools to see how it is done. I knew a boy who was taught at a board school; I found that he had learnt something. I could not say that he had learnt very much, but he was not a promising child; he was rather a weakly boy. I have no personal knowledge of the working of the system.

2838. You are probably aware that the teaching of blind children in board schools is carried out to a considerable extent in London?—I am aware of that.

2839. The difficulties which you think arise under that system would chiefly arise in the case of country schools, where there would be fewer blind children?—Yes, it would be more difficult to introduce it in the country.

2840. You probably know that it is the practice to have a circulatory teacher in some country districts; do not you think that some of the difficulty might be got over by having teachers circulating throughout the small rural villages, where only one or two blind children would have to be taught?—I think that would be a help.

2841. Have you any decided opinion that it is desirable to collect blind children into schools, specially for the blind, before their general education begins?—I have a decided opinion that blind children would do better in special schools than in ordinary schools. I think that whereas for an ordinary child a home is, generally speaking, better than a school, for a blind child a school is better than a home. If a blind child is at home, its parents and brothers and sisters are constantly liable to do too much for it, whereas at a school, where everybody cannot be waited upon, the blind children are forced to wait upon themselves, and that is a very good thing for them.

2842. You say that you have had no experience with regard to the teaching of the blind in board schools?—I have no experience to speak of.

2843. (*Dr. Tindal Robertson.*) Do you epitomise, before they are printed off, any of the books which are stereotyped in the Braille system; are they printed in extenso or are they epitomised?—They are printed in extenso.

2844. Have you had any experience of writing in any other system than in the Braille?—I have had some experience of writing in the New York type.

2845. What is your opinion of that system as compared with the Braille system for writing?—I think the New York type is decidedly inferior.

2846. Do you think there are any other systems by which writing can be accomplished in anything like the same way as by the Braille system?—There are no others.

2847. With regard to music, have you any personal experience as to learning music by the Braille or by any other type?—I do not understand music at all myself. I know nothing about learning it or teaching it.

2848. As to conferences, are you aware whether any conferences have been held periodically, international conferences with respect to the blind?—No periodical conferences are held in this country that I am aware of.

2849. Are there any international conferences periodically held?—I do not think there are any periodical international conferences; the German teachers of the blind hold a conference every three years, and I think the American teachers meet every year, and to both of these some foreigners are invited; I believe they are ready to welcome foreigners if they choose to come, but they are not international representative conferences.

2850. Have you any knowledge of the results which have been obtained from those conferences which have been held in different parts of the Continent and in America?—I have read and heard something about the results arrived at by conferences in Germany, in France, and in the United States.

2851. Have you heard of any results from those conferences, first with regard to the education of the blind, and secondly with regard to the subsequent employment of the blind?—I do not think any conclusion has been come to with regard to the employment of the blind.

2852. Do you know whether any conclusion has been come to with regard to the education of the blind?—The general decision, both in France and in Germany, has been in favour of the Braille system; I think that in America it has been generally in favour of the New York system.

2853. Can you describe the New York system?—It is a point system, the letters are formed of points, somewhat in the same way as those of the Braille system, but whereas the Braille letters are each written in a separate cell, the New York letters have no separate cell for each letter; they are written continuously, so that a space which may at one time be occupied by a letter is at another time left blank. The Braille letters are higher than they are broad; the New York letters are broader than they are high, that leads to some inconvenience in writing, and more particularly in correcting, The chief difficulty we have found in writing, practically, in the New York system is that it is extremely difficult to correct when we have made a mistake. If I make a mistake in writing in the Braille system I have only got to count the letters which I have written until I come to the faulty one, and then to correct it. If I make a mistake in writing in the New York type, I have not merely to count the letters, but I have to remember what each one was, and how much space it occupied, until I come to the faulty letter, and then to correct it.

2854. Then your opinion is that the Braille system is preferable altogether for writing and for reading purposes?—Yes.

2855. Can you give us any idea as to the comparative speed at which one may write by those two systems?—I made some experiments many years ago when the association was founded, as to the speed of writing, and I think I could write rather quicker in the New York type, but the difference was not very material.

2856. Is there the same facility for acquiring music by notation in the New York type as there is in the Braille type?—I do not understand music myself, but I am told that the New York notation is very cumbrous.

Mr. J. L. Shadwell.

5 Feb. 1886.

2857. (*Dr. Armitage.*) You say that about 400 manuscript books have been issued by our association, did you count our list of manuscript books?—I did not. I did not know where to put my hand on it.

2858. There are 280 manuscript books on that list. I thought perhaps you meant that the others had been written out by other societies?—No, I meant published by ourselves.

2859. You did not state what number of copies of each manuscript book in your list it is usual to issue; can you tell us what the number is?—I believe four copies are written of each.

2860. That you are not sure about?—That I am not sure about.

2861. In the printed books I do not think you mentioned the school series, Nelson's Royal Reader Series?—No.

2862. Have those been published?—Yes.

2863. Do you consider that those are of much value in blind schools?—I think so.

2864. You are aware, you say, that the blind are being educated to a considerable extent in the London board schools?—I am.

2865. Do you think that when blind children are being educated in schools for the seeing it is a desirable thing that they should possess the same reading books that are used by their seeing companions?—I think so.

2866. So that they should be able to read in class?—Yes.

2867. Was that the object with which Nelson's Series was chosen as the class books of the association?—It was.

2868. With regard to isolated blind children in village schools I think you said that it was necessary before they entered the classes of the seeing children that they should have some knowledge of the special methods used by the blind?—I think so.

2869. You know the primer issued by the association?—Yes.

2870. You know that the Braille letters are interlined with ordinary Roman letters in black?—Yes.

2871. Do you think it possible that when an isolated blind child in a village is found out, some lady might be induced to learn the system sufficiently to teach the blind child before going into the school?—Yes.

2872. So as to avoid the necessity of the schoolmaster spending his time upon that child?—I think that the clergyman's wife would generally be glad to do it, and well able to do it.

2873. Is it a difficult thing for the seeing to master the Braille alphabet?—It is a very easy thing to master the simple alphabet, it takes a long time to master all the contractions, and some people are deterred by the trouble of doing so.

2874. Do you think it is necessary for blind children in a village school to understand the contractions in order to be able to write?—In order to read or write with much facility.

2875. Do you not think it better that a blind child should read without contractions than that it should not read and write at all?—Certainly.

2876. Do you think it would be an advantage for the blind children in a village school to learn to read and write uncontracted Braille?—Yes, I think so.

2877. And that you think a lady might be able to teach?—Yes.

2878. Are you aware that a very large number of seeing ladies, about 20 or 30, are at the present moment engaged in writing out books for the blind?—Yes.

2879. Do they write in contracted or uncontracted Braille generally?—Contracted.

2880. Then they have learnt it?—Certainly.

2881. So it would be possible, you think, for any one taking an interest in blind children to master even the contractions?—Certainly.

2882. You were speaking about the use of an abacus for blind children at school. Do you think it would be convenient for each blind child to have its abacus before it?—I think it would not be so convenient as the arithmetic board, but it would be a convenience for the child.

Mr. J. L. Shadwell.

5 Feb. 1886.

If I am to judge by the specimens I saw at Rome, they take up a great deal of space if each child has one.

2883. What arithmetical board is recommended by the association?- The octagonal board, a board with octagonal holes.

2884. Have you any experience of its use?—I have not used it further than simply practising, in order to learn the system. I have not taught it, nor have I used it myself in any calculations.

2885. Do you think the octagonal board fairly supplies to a blind child all the wants of written arithmetic, —that is, that the octagonal board is to a blind child very much what a slate and pencil is to the seeing?—Certainly.

2886. Are you aware of any improvement that could be made upon the present octagonal board?—I am not.

2887. I think you said that it was a board with octagonal holes, into which square pins could be fitted?—I did not say the pins were square. I do not know whether they are square or octagonal.

2888. But you think that the octagonal board fairly supplies to a blind child what a seeing child has by its slate and pencil?—Certainly.

2889. In speaking of the employment of the blind given by the association you mentioned the writers, are the stereotypers blind?—Yes.

2890. How many stereotypers are employed by the association?—Two.

2891. Is the person who corrects the manuscript books and the stereotype plates blind?—I do not know who corrects the stereotype plates; the person who corrects the manuscripts is blind.

2892. And makes a living by it?—He does.

2893. I think you said that there was a jealousy existing between the institutions, and that that caused a difficulty in co-operation; is it your opinion that that is partly due to their being private institutions and having to get their funds from the public?—I think it is.

2894. (*Dr. McDonnell.*) You are aware, I suppose, of what we have been told, that in several of the board schools in London 8 or 10 blind children are taught by a blind teacher for a part of the day, and mix with the other pupils at oral instruction during the rest of the day?—I am aware of that.

2895. Have you visited any of those schools yourself?—I have not.

2896. (*Dr. Armitage.*) You have recommended that the young blind should be educated in blind institutions; do you not think that that induces them to acquire peculiar habits of deportment, throwing their limbs about and contorting their faces, and so on?—I do not know that it does.

2897. Would you not suppose that educating the young blind with the sighted would give them greater self-reliance?—No, I think it gives them less.

2898. On what grounds do you say that?—I think that the sighted children are too much inclined to help the blind; that the blind get too much in the habit of expecting things to be done for them, so that they do not learn to do things for themselves.

2899. Have you any experience upon that point?—Yes, I have a little experience of it; I mentioned a boy whom I was interested in a short time ago, who was in a board school. I found that his mother did a great deal too much for him, and that when he was sent to a blind school he learnt to dress himself and do things for himself which I had previously advised his mother to make him do, and which he had never done.

2900. You have not, I think, told us what those 50 whom you employ to emboss your books earn weekly?—I cannot say.

2901. Are your books costly?—They are costly as compared with ordinary books for the seeing.

2902. How are they, compared with Moon's books?—They are very much cheaper.

2903. What would be cost of the one compared to the other?—That I cannot say. I do not remember the prices of Moon's books now, nor do I remember those of our own.

2904. As your books are very expensive, would you be disposed to recommend that the Government should subsidise those who printed books for the blind?—No. I should not recommend it.

2905. (*Admiral Sir R. Sotheby.*) Do you consider that the blind have a greater talent for music than other people?—I do not think that the blind have any particular talent for music.

2906. You think that the blind can gain a livelihood by making baskets, brushes, and so on, just as well as by teaching music?—I do not think they can earn anything like so much at basket and brush making as they can at music.

2907. Do you mean a few individuals, or do you take the mass of blind people?—I mean the mass of blind people, people who are blind in childhood.

2908. Can you state to the Commission what wages those who are teaching music get?—I believe that they earn from about 100*l.* to 250*l.* a year.

2909. Can you state where they earn 250*l.* a year?—Pupils who have been trained at the Normal College, and who go out into the world, can earn for themselves from 100*l.* to 250*l.* a year.

2910. Can you give the names of any such people, and state where they are employed?—I have heard a good many names; they are all set out in the report of the Normal College.

2911. Have you any personal experience of any of those musicians obtaining such high salaries; I do not know any of them personally.

2912. You go entirely by the report of the Normal College?—Yes.

2913. Do you know anything of the pursuits of the outside blind people in London, and how they gain their livelihood, when I say outside, I mean people who have been taught trades, do you know whether they beg in the streets or how they gain their livelihood?—I know that many are employed in the workshop in Berners Street. I know some beg, and I know that some are employed as visitors by the Indigent Blind Visiting Society. Some of them are employed as teachers by the Home Teaching Society for the Blind.

2914. Do you know the number employed at Berners Street?—I think it is about 74 altogether.

2915. They get employment there and receive wages?—Yes; I think that 74 includes some who are not actually there. I think some are employed as agents out of London, to sell the goods made at Berners Street.

2916. Do you know whether there are any outside blind people who receive orders from Berners Street to make different things?—Yes, there are some; there are some who work at their own homes, and who receive orders from Berners Street.

2917. Do you know whether they get any orders or employment from St. George's?—I do not know.

2918. You have no knowledge about St. George's?—No.

2919. You stated that you considered that the Braille system was the best?—Yes.

2920. Why is it better than Moon's?—Because it can be written, that is its great advantage, and because it is so contracted that books can be got into a much smaller space; the letters are so constructed that they take up a less space.

2921. Owing to that contraction, is not it very difficult for adults to learn to read it?—It takes some time to learn, it is so far difficult.

2922. Do you think that a person of about 30 or 40 could learn it?—Certainly. I have heard of a lady of 77 who learned it.

2923. That would be an exceptional case, of course?—It is an exceptional case for a lady of 77 to take the trouble. I do not think it is exceptional being able to learn it.

2924. You said that ladies might learn to read, in order to teach the blind. Would they not learn Moon's system much quicker than they would the Braille system, in order to be able to teach?—Certainly. Any educated person could learn Moon's system at a sitting, as I did. You have only to take up one of Moon's books, and if you know the ordinary alphabet, you ought to be able to read two or three pages pretty easily before you put the book down.

2925. Then Moon's system would be better for sighted people to learn with a view of teaching blind children?—If the object were simply to enable blind children to read, and to save the teacher trouble, certainly.

2926. You say you do not approve of blind children being taught with the sighted?—I think it is better that they should be in special schools.

2927. It gives them a sort of emulation?—Yes.

2928. (*Mr. Johnson.*) You have had some experience with regard to the treatment of the blind on the Continent, have you not?—I have been over a few blind institutions in Italy.

2929. Are you aware that they use the Braille system in Italy, as well as the Roman system?—I am aware that they use the Braille system. I only found the Roman system in use in one institution.

2930. Where was that?—At Naples.

2931. Have you been to Milan?—Yes, I did not find the Roman system in use there, I found the Braille system alone.

2932. You did not see specimens of the Roman system from Milan in the last exhibition?—No.

2933. Do you know that in some portions of Germany the Roman system is in use?—I have heard that there is a Stuttgart type, a Roman type; I have not visited Germany myself.

2934. Are you aware that the Roman type is also used in Amsterdam?—I am not.

2935. You have not seen the report of the conference at York?—Yes, I have read the report, if it is mentioned in it, I have forgotten it.

2936. Has the Braille system which is used on the Continent the same abbreviatons as the Braille system in which the books published by your society are printed?—I do not know what abbreviations are used on the Continent, but in French a number of signs are used for accented letters, and those signs we have used for abbreviations. I have read some Italian books printed in Braille type, at least I have read one Italian book printed in the Braille type, and I found that the same signs as were used in French were used there for accented letters, but I did not find abbreviations used either in French or in Italian.

2937. Supposing any of your books were used in French institutions, they would have to learn the contractions adopted in your system?—They would.

2938. They do not adopt contractions as a rule, do they?—No; of course the contractions which suit the English language would not suit the French or Italian language.

2939. Those contractions render the acquirement of the system more difficult, do they not?—Certainly.

2940. Would you say much more difficult?—Yes, it is much more difficult to learn 62 signs than to learn 26.

2941. I believe in the Moon system there are very few contractions?—Hardly any.

2942. And in the Roman system none at all?—Not as far as I know; I have never seen a book printed in the Roman system with contractions used.

2943. What is your opinion with regard to the relative value of the two systems, the Moon and the Braille, putting out of the question the Roman system; do you think that the Moon system should be taught generally for the purposes of reading, and that the Braille system should be taught for the purposes of writing?—Certainly not. I think that the Braille system should be taught universally for the purpose of reading and writing, and that in those cases where a man has lost his sight late in life, and his hands have become already hardened by work, or in the case of people who have lost their sight young, and whose hands have become hardened afterwards, if they care about reading at all they had better use the Moon system.

2944. Of course the sighted could not read Braille without the key?—Certainly not.

2945. Therefore if a child were to write to his parents in Braille the parents could not decipher what the child had written without an accompanying key?—No, certainly not.

2946. And you do not think that is a disadvantage?—No, I do not think it is a disadvantage to speak of, because I think if the parents care about corresponding with the child they ought to take the trouble to learn the system.

2947. Are you aware that there is a means of embossing by the ordinary Roman system, with pin points, by which not only the seeing can read it, but the blind can feel it?—I am aware that there is a system of pin point printing, because I have tried it myself. I got a press and tried to print with it, but I found that so far from the blind being able to read it, I could not read it myself.

Mr. J. L. Shadwell.

5 Feb. 1886.

2948. Your touch was not sufficiently acute?—My touch was not sufficiently acute for that.

2949. Are you aware that it is employed very extensively amongst the blind schools in the United Kingdom?—I am not.

2950. You say you qualified yourself to give the preference to the Braille system by learning different systems; what were those different systems?—I learnt the Moon, the Lucas, the Frere, the Roman, the Braille, and the New York. I learnt them all.

2951. Why were you led to discourage all the different systems except that of Braille?—Because none except that of Braille and the New York system could be written.

2952. The New York system is Braille in a modified form, is it not?—Yes.

2953. You did not decide upon the ordinary Braille system of the Continent, but you took that Braille system with the addition of contractions?—I think we decided in favour of Braille before we introduced our contractions.

2954. Your society introduced those contractions?—It did.

2955. Are you aware that there is a very large literature in Moon's type?—I am not. I consider that the literature in Moon's type is very small.

2956. You have not seen the list which has been laid before the Commission?—No.

2957. We have had it in evidence that Moon's system has been printed in a great number of languages; have you any idea of how many languages it is printed in?—It is printed in 48 languages, but it is only the Bible over and over again in all those.

2958. Are there no educational books?—A few. I know when I lost my sight I wished to get books, and I got a catalogue from Moon's, and I found the choice of books was extremely limited.

2959. Have you any knowledge of the books that have been printed at Worcester?—I have some knowledge of them.

2960. Have you seen the list?—I have the list in my pocket; I have not used many of their books.

2961. Are you aware that a large number of books have been issued from the press at Worcester, and that amongst them is a number of classics, Virgil and Cicero, and some of the Greek classics printed in the Greek character?—I am aware that several classical books have been printed at Worcester. I have myself the Alcestis of Euripides printed by them, not in the ordinary Greek type, but in the Braille type.

2962. There are some printed in the ordinary Greek type, are they not?—I have been told so.

2963. In the balance sheet of your society I see that your subscriptions are about 300*l.* a year, and your sales 635*l.* a year. Do you give away any of the books?—Yes.

2964. What number do you give away?—That I do not know.

2965. Is the number considerable?—No. I think we try to sell all we can. I think if there is a new institution, and we think they deserve any help, we are generally glad to give them books. I myself took over a map to Montreal to help a struggling institution there.

2966. Your society is principally founded for the propagation of this particular system of Braille?—It was not founded for that.

2967. But that is one of your great objects?—It is now.

2968. Therefore you give away books where people are unable to buy them, as it were, to propagate the system?—Yes.

2969. As Moon does to propagate his system?—Yes.

2970. I see in your balance sheet that 214*l.* out of the 900*l.* expenses is paid in wages to the writers of manuscript books, can you tell me what they get a week, as

Mr. J. L. Shadwell.

5 Feb. 1886.

I understand you employ 50 people in embossing books?—Yes.

2971. I see the writers have 214*l.* a year between them. I should like to know what are the wages paid to each person who embosses, per day or per sheet?—I think the pay is 1½*d.* per sheet.

2972. How many sheets are they able to do in a day, do you think?—I think they can do 10 sheets a day.

2973. That would be about 1*s.* 3*d.* a day?—Yes.

2974. We have had it in evidence that one man who is a great expert got 7*s.* a week; is that about the average?—I daresay. I do not know.

2975. Do you employ any women?—Yes.

2976. Do you pay them equally?—I believe we pay them the same price per sheet.

2977. What are the women able to earn a day by embossing books?—I do not know.

2978. Are most of your books that are for sale printed by hand or by stereotype?—Mostly by hand.

2979. Have you ever been connected at all with any great scholastic institution for the blind?—I have taught myself in a class under the Indigent Blind Visiting Society.

2980. You have been connected with no educational institution for the blind?—No. I have only visited them. I have gone over them.

2981. Do you think it would be advisable to obliterate altogether from the education of the blind the employment of the ordinary Roman type?—Certainly.

2982. (*Chairman.*) At what age did you become blind?—I became blind at the age of 17.

The witness withdrew.

General ARTHUR SCOTT MOBERLY examined.

General A. S. Moberly.

2983. (*Chairman.*) Will you tell us what society you are connected with?—The Workshop for the Blind of Kent.

2984. Are you on the council?—I am the secretary and one of the committee.

2985. How long has that society been at work?—It started at Christmas 1877.

2986. Where is it situated?—In South Street, Greenwich.

2987. What number does it employ?—At present we have 14 men, and there is one outside workman. We have 14 blind men working in the shop.

2988. Are your foremen sighted?—We have sighted foremen in two of the departments; in two of the departments we have blind men.

2989. How many sighted men have you to superintend the workshop?—There is the manager only.

2990. Where do your blind come from?—We have one from West Malling, near Maidstone, and another from Sevenoaks; but, generally speaking, they are from the neighbourhood. We have two men from Woolwich, and we have two men from the Greenwich Union.

2991. Do you take in all those in the county of Kent who wish to be employed?—Yes, we profess to have started it for the county of Kent.

2992. Have you ever had more people apply than you have been able to take in?—Not from the county of Kent.

2993. Do you take in people from the outside?—Some time ago we took in a man from the outside; but, as a rule, we strictly adhere to the county of Kent.

2994. What employment do you give them?—We make baskets and ship fendoffs, we cane chairs, and latterly we have taken to mattrass making.

2995. Do you do anything in the way of rope making?—No; we have made cork cushions, life-saving cushions; we made them at the suggestion of our president, Lord Dartmouth.

2996. Is there any special work in connexion with a seaport town that you can do, and which could not be so conveniently done inland?—Ship fendoffs and the life-saving cushions.

2997. Are the fend offs made of coir?—Yes; we exhibitedthem at the Fisheries Exhibition. We had no remarkmade about them.

2998. Between what ages do you take your blind people in?—From 14 to 40; we do not, as a rule, find that anybody after 40 acquires a capacity for any work easily; but we have, on one or two occasions, taken a man just over 40.

2999. We have been told that there is great difficulty in finding employment for the blind after they leave an institution in which they have been brought up and instructed. Do you put yourself in communication with blind institutions in order to receive the blind people into your workshops as soon as their course of training is finished in the institutions?—No.

3000. You simply wait till an application is made to you?—We have sent round circulars in the county of Kent asking the boards of guardians to send blind people to us, but we have had only a few responses to those circulars.

3001. Does that arise from there being no blind in those particular districts or from unwillingness of the blind to do work?—It must arise from this, I think, because we require tuition fees to be paid with the blind; ours is a small institution, and a very poor one, merely supported by voluntary contributions, and with any blind that we take in we want certain tuition fees, and we also require a guarantee that the parties sending them will maintain them properly in the neighbourhood.

3002. The work you give them, and the money they earn, is hardly sufficient to maintain them?—Quite enough I think. Some are earning 16*s.* and 18*s.*, and some 1*l.* a week.

3003. Then why do you ask tuition fees?—When they first come they do not earn anything; but when they have learnt their work they can earn sufficient to support themselves.

3004. Do the guardians pay the tuition fees in some cases?—In some cases the guardians do; but sometimes it is the blind people's own friends that help them; in one case the Charity Organization Society has done it.

3005. Of course it is at present voluntary with the guardians to send blind persons to your workshops?—It is voluntary.

3006. Do you wish the law to be changed so that it should be compulsory on boards of guardians to send them?—Yes, I think it would help the boards of guardians very much; I believe they are quite willing to send their blind to us.

3007. If they are willing to send them, and it is optional with them to send them, why do not they send them?—Because of the Local Government Board.

3008. Do the Local Government Board refuse to give their consent?—I think you will find that it is so.

3009. From your experience in dealing with boards of guardians, can you tell us of any case in which the Local Government Board have refused their consent to the payment by the guardians of tuition fees?—Yes; we used to have subscriptions from the Woolwich Board of Guardians till about two years ago, then the clerk of the guardians died and a new clerk was appointed, who pointed out that it was contrary to the Act that they should pay tuition fees. There were two men with us for whom the Woolwich Guardians were in the habit of paying, and on the advice of their clerk they said, "We must refer the matter to the Local Government Board;" and the Local Government Board then said that according to the Act they could not pay these tuition fees, that it was only allowable to subscribe for the maintenance. We had a correspondence with the Local Government Board about it, and at last they gave leave to the Woolwich Guardians to subscribe ten guineas annually to the Workshop for the Blind of Kent, but that does not cover the tuition fees.

3010. What are the tuition fees?—We have to pay 3*s.* a week to the teacher himself. In some cases it takes two or three years before a man is fit to carry on the work himself.

3011. Do you mean that it takes two or three years before a man can earn his livelihood and pay for his maintenance?—Sometimes it takes four or five years; in basket making, for instance.

General A. S. Moberly.

5 Feb. 1886.

3012. It takes four or five years before his services can be remunerative?—It varies according to the capacity of a man; some men will pick it up in 18 months or two years, and earn a very fair amount, others will go on for three or four years before they are proficient.

3013. What are the tuition fees that you ask?—Three shillings a week; we used to have 5*s.* at first, but it was on the understanding that we gave the blind person something in order to help him to get his clothes and things. We had 5*s.* from the guardians, and we gave 3*s.* to the teacher and 3*s.* to the blind person; then we were losers of 1*s.*, which after a time we hoped to recoup ourselves as the man was able to do work.

3014. Then the 10*l.* 10*s.* you at present receive from the Woolwich Guardians does not pay for more than one blind person and a half?—About that, whereas we have two men from Woolwich.

3015. Cannot you get the board of guardians to subscribe more liberally?—It is the Local Government Board that interfere; they authorised them only to pay 10*l.* 10*s.*

3016. Do you know whether the guardians have applied to subscribe 15*l.*, say?—I do not know that. I do not know what the guardians have asked; we understood that that was all the amount they were authorised to subscribe. I want to call attention to these words in section 10 of the Act 42 & 43 Victoria, chapter 54:—"The provisions of the said section shall extend to "authorise the guardians, with such consent as is there- "in mentioned, to subscribe towards any asylum or "institution for blind persons, or for deaf and dumb "persons, or for persons suffering from any permanent "or natural infirmity, or towards any association or "society for aiding such persons," (I draw attention particularly to those words,) "or for providing nurses, or "for aiding girls or boys in service, or towards any other "asylum or institution which appears to the guardians, "with such consent as aforesaid, to be calculated to "render useful aid in the administration of the relief of "the poor: Provided always, that nothing herein con- "tained shall authorise any subscription to any asylum "or institution unless the Local Government Board be "satisfied that the paupers under the guardians have or "could have assistance therein in case of necessity." I wish to draw particular attention to these words in the preceding paragraph, "to be calculated to render useful "aid in the administration of the relief of the poor." This matter was brought up some years ago; the late General Bainbrigge attended before a committee, and gave his evidence, and from papers he has left I know that this clause was intended, among other things, to enable guardians to pay for the instruction of paupers at workshops, where they are taught but not maintained; and it was so construed by the Local Government Board until March 1884, when suddenly the paymants of the Woolwich and Greenwich Boards of Guardians were disallowed, and they were informed that "payments "from the rates could not legally be made for "instruction given to blind people in this work- "shop, because the statutes refer to maintenance only." We appealed against this decision, and I also had an interview with the late Mr. Fawcett, who it is well known took great interest in anything to do with the blind, and who promised to speak to Sir C. Dilke about the matter. No answer was returned by the Local Government Board until the autumn of 1884, when, as I have already said, permission was given to the Greenwich and Woolwich Boards of Guardians to subscribe 10 guineas per annum, nothing more being then said about maintenance. We had at that time two pupils from each union, three of whom had been paid for at the rate of 5*s.* per week, and one at the rate of 3*s.* a week, because he was sent from the Union (Greenwich) and fetched away, so that we did not give him anything back, and it seems to us much fairer for both parties that payments should be thus made, rather than by a fixed annual subscription. It is clear that county unions would not care to subscribe regularly on the chance of wanting to send a pupil at rare intervals, though the guardians in such places might be very glad to pay tuition fees for a short time, when they happened to have a blind pauper needing instruction. On the other hand neighbouring unions are likely always to have pupils to send, and the subscription of 10 guineas per annum does not anything like cover the cost of tuition for two men. If the word "subscribe" in an Act of Parliament does necessarily mean only to "give a fixed annual contribution," then I think it would be well to insert another clause authorising guardians to pay tuition fees for adult poor blind persons while receiving instruction in trades at workshops, and at the same time to maintain them with sufficient outdoor relief in lodgings. It seems specially desirable that the words "tuition fees" should be used, because last year when the Malling Guardians and afterwards the Sevenoaks Guardians asked leave to pay for the instruction of pupils at our workshop they were told that "the Local Govern- "ment Board does not think that the statute authorising "guardians to subscribe to any institution for the blind "enabled them to pay tuition fees only." On both occasions permission was eventually given for subscriptions of 10 guineas to be made annually; but it appears that the words "useful aid" are too ambiguous, as the question of their meaning is constantly raised afresh.

3017. The board of guardians by subscribing 10*l.* 10*s.* annually and the Local Government Board by authorising the subscription would seem to have conceded the principle, and therefore it is only a question of the amount to be given?—As I have said, from 1879 to 1884 the Woolwich and Greenwich Board of Guardians paid us 5*s.* a week per pupil, and they had no objection to continuing to do that, but unfortunately just at that time the clerk of the guardians at Woolwich died, and his successor read the Act in a different way and he got the guardians to turn.

3018. Is there any institution like yours in London?—I do not know of any; the nearest approach to it is Berners Street, I believe.

3019. Have you any suggestions to offer with regard to an extension of the principle of providing workshops for the blind throughout England?—I think it would be advantageous to extend it in every county if possible.

3020. And you would propose that it should be made clear that the guardians might contribute such sums from time to time as might be necessary in the first instance to teach the blind a trade?—Yes.

3021. And to assist them in maintaining themselves?—Yes, I strongly advocate payment by piece work. I would not give blind men weekly wages, but I would pay them distinctly by piece work, and I would not supplement their earnings with any grants on the excuse that they are poor blind. I think doing so has a tendency to pauperise them.

3022. Have you any acquaintance with the pension system?—No.

3023. Do none of your men receive pensions?—I believe there are one or two who do, not regular pensions, but they get small doles.

3024. They are eligible to receive certain doles or pensions?—Yes.

3025. And you think some of them do receive either doles or pensions?—There was one man who had learned basket making with us who went to Dover. I learned that he had a small pension; I think those with us now only receive a small pension from some society that gives 2*s.* 6*d.* a month, and coals in the winter; most of them get that I believe.

3026. Can you tell us of any men who have been trained with you who have been able to maintain themselves by industry afterwards?—I do not know about maintaining themselves. I have not heard lately from this Dover man, but I was told he was getting on very fairly there; he had been a policeman, and his health failed, and he was obliged to leave us, but I have heard since that he is helping himself in a good measure down there. There was one man who came to us at the commencement, a young man about 21 years of age; he was sent to us from the workhouse; he was a sharp clever young man, and within a year he was earning his guinea a week at ship fendoff making. After being with us a few years he was so insubordinate and impertinent to the manager, and to some of us, that at last we had to turn him off.

3027. Had he been blind all his life?—No, he had been a sailor. Then there was one man who came to us from New Zealand; he had lost his sight in New Zealand from having been thrown out of a cart, and the people out there thought that the only chance for him was to come home. He came home and he saw some medical man who said there was no chance of his ever recovering his sight. He came to us and learned basket making and got on very well; he was quite a young man, 21 years of age, when he came to us he was with

General A. S. Moberly.

5 Feb. 1886.

us for two years and then he went out again to New Zealand. He wrote a letter in which he said that he hoped to be doing a very fair business out there, but he has not sent us any more information.

3028. Is there any other point with regard to the blind upon which you would like to lay your views before the Commission?—As to piece work, we tried helping our blind pupils a little by loans at first when they were learning new work, but we found it a failure, and now we have come strictly to piece work; we find it much better for them; it makes them work harder and more energetically.

3029. Do you know whether any of your men after they have left you have gone about the country begging?—I do not know what became of this young man that I was telling you about, the sailor whom we had to dismiss. Somebody gave him 5*l.* and he got a cart and went about hawking; but we have lost sight of him, and I have not seen or heard anything about him. I do not know what has become of him. Then another man who was with us has gone to New Cross; the Gardeners Trust have lent him money to buy some cane through us, and he does a little work there now. He comes to us now and then, but he does not manage to support himself.

3030. Do you think that some assistance in the way of pensions is required in most cases by the blind?—Yes, not as long as they can earn sufficient to support themselves.

3031. Do you think they can earn sufficient to support themselves?—I think as a rule they can. The plan we adopt in our workshop is to pay them as much as we possibly can, suppose the selling price of a basket is 5*s.*, and the cost of materials is half a crown, we as a rule take 2*d.* or 3*d.*, according to the size of the basket, for conveying it out, and we give the rest to the blind man So we leave the rent and the other expenses to be provided for by voluntary subscription.

3032. (*Mr. Johnson.*) Have you a market for all you can produce?—No, we get on pretty well with our ship fend offs we sell them almost as fast as we can make them, but not the baskets.

3033. Have you any surplus stock in hand?—Yes.

3034. Have you any difficulty in getting rid of those?—We get rid of the old stock as we can; we have some surplus stock, and it will be left on our hands, I fancy we made the wrong things at first; we endeavour now as far as possible to produce articles for which there will be a demand.

3035. One of the difficulties in the way of workshops is to get a market for all they produce, is it not?—Yes.

3036. In consequence of there being different degrees of excellence in the workpeople?—Yes.

3037. Do you think a central depôt would be a good thing where blind people could buy material at trade prices?—Yes, I think it would be.

3038. What are the average earnings of your workpeople?—That must depend on the time they have been with us. We have some men who are earning their 16*s.* and 18*s.* a week now. We have one man who came to us when he was 27, a basket maker; he came to us seven years ago, and he is earning 14*s.* a week now.

3039. How many basket makers have you?—We have nine basket makers.

3040. What are the average earnings of the basket makers; would they be 10*s.* a week all round, do you think?—About 14*s.* a week.

3341. What is the average earnings of the ship fender makers?—We have only two men at that work; each of them earn about 16*s.* a week.

3042. (*Admiral Sir E. Sotheby.*) You say your men are paid by piece work; how do you arrange the prices that you pay for piece work?—We take the price the article will sell for, deducting the cost of materials. We find out what a sighted man gets for baskets, and in that way we get at the price for piece work.

3043. You do not make brushes?—No.

3044. Have you tried it?—No.

3045. Will your establishment hold more than 14?—Yes.

3046. And you take blind men in if they offer themselves?—Yes.

3047. Do you give work to outsiders?—We have only one man working outside, who was formerly in the workshop.

3048. How many have you discharged?—Only one; when you use the word "discharged," I do not know whether you mean dismissed?

3049. No. How many men have left the institution since it was commenced?—About seven or eight.

3050. Did they leave because they were proficient in their work?—Not all of them; one of them we dismissed for insubordination. The Dover man went away because of his health, and one went to New Zealand, because he thought he was proficient. One man said he had got a place as a teacher, but he is since dead.

3051. You keep them as long as they like to stay with you?—Yes, as long as we have room for them.

3052. Do you give them their dinners?—No.

3053. You give them merely what they earn?—Merely what they earn.

3054. You do not supplement their wages in any way?—No.

3055. Have you any report of your institution?—These are the reports for the last six years (*handing them in*).

3056. You spoke about pensions, would you recommend pensions to be given to old workmen?—Yes.

3057. As a sort of inducement to men to work well, and to conduct themselves properly?—Yes.

3058. You would not recommend pensions to be given to young people?—No, unless it was just merely to help them till they could earn something, as long as they could earn something I would not give them any pension.

3059. Why do you not introduce brush making at your workshop?—We have only a small place, and we do not think we could very well introduce it; we have just introduced mattrass making.

3060. You have two sighted teachers?—Yes.

3061. What do they teach?—Mattrass making and ship fend off making.

3062. Not basket making?—No, the basket maker is a blind man; he has been blind 50 years. He is a man of 56 years of age, and a very experienced basket maker.

3063. Is he as competent to teach people to make baskets as a sighted man would be?—That I do not know.

3064. Comparing your baskets with those made by the sighted, are they equal in appearance?—Yes, I think so; any produced by this man, certainly.

3065. Are those which are produced by those that he teaches equal to ordinary baskets?—It depends on the men; some men turn out really good basket makers, and others not so good.

3066. (*Mr. Arrol.*) Would you be disposed to recommend that the boards of guardians should give outdoor relief while the blind are learning a trade?—Yes.

3067. Would you be disposed to extend that to the aged blind, so that they might not be required to go into the union?—I have never met with any case of the kind; they might take the relief in the shape of a pension, if they are getting old and off work and are deserving.

3068. (*Dr. Armitage.*) You say you have just introduced mattrass making?—Yes.

3069. What kind of mattrasses do you make?—We have only started that kind of work two or three months, the Greenwich Union have sent us some mattrasses to renew.

3070. Are they hair or flock?—Hair.

3071. Have you the means of steaming and cleaning mattrasses?—Not of steaming them.

3072. Have you accommodation to put up steaming apparatus?—No.

3073. Then, that you do outside?—Yes.

3074. How many men have you at work on mattrasses?—Two.

3075. Have you any women employed in the work?—We have no women at work on mattrasses in our shop.

3076. Do the men sew the ticking?—We give that to a woman outside; we engaged a woman for it.

3077. Do not you think it might be desirable to employ blind women in that work?—We would rather not have any blind women working with the blind men.

3078. But might you not give the work to blind women for them to do at their own homes. You are aware, I suppose, that in Scotland, where the mattrass manufacture is carried on to a greater extent than anywhere else in the United Kingdom, blind women are employed in sewing the ticking?—We have not been long enough in the business to take that subject up.

3079. Have you found from your experience in basket making that the form of the basket is one of the most difficult things for the blind to learn?—Yes.

3080. Do you find that they soon learn to make all clothes baskets, for instance, correct in form?—Yes, we find they do if carefully watched; our manager sometimes looks after them himself. The teacher is supposed to look at every basket as it is being made.

3081. Do you use moulds for your baskets?—No.

3082. Has it ever occurred to you that it would be a great advantage to use moulds?—No.

3083. Can you sell your fend offs readily?—Yes.

3084. Do you make a profit on them?—Very little.

3085. What wages can a blind man earn at making fend offs?—16*s.* a week.

3086. Have you any prison competition?—No.

3087. Who are your principal competitors in the market for fend offs?—I am not aware of any; there are several ships' companies who make their own fend offs; we have written to shipowners, and they say they employ their sailors when in dock to make them.

3088. (*Dr. Tindal Robertson.*) Have you ascertained whether the persons who come to work with you have been educated?—No.

3089. You do not know whether they are educated or not?—No.

3090. Do you know whether any of them are visited by the agents of any society for the purpose of teaching them to read, or for the purpose of reading to them?—I do not know.

3091. You have said that you think it would be advisable to establish workshops similar to your own in each county?—Yes. *General A. S. Moberly.* 5 Feb. 1886.

3092. Do you think that those should be carried on under voluntary superintendence, or by state supervision?—I think they should be carried on under voluntary superintendence.

3093. Do you think that the guardians would be likely to contribute unless there was some kind of Government supervision of the way in which their money was administered; would not they be more willing to contribute if a central workshop could be established in each county, which should be regularly inspected by some one appointed by the Government, that is to say, a workshop carried on by voluntary effort but superintended by Government?—I think small workshops would be better; you might have four or five centres.

3094. You said that you thought that such workshops should be established in each county?—Yes.

3095. My question was whether you did not think that if the guardians contributed a certain amount, as they do now, to workshops which were carried on by voluntary committees, it would be more satisfactory if they were superintended by some Government official?—I do not see why it should be more satisfactory that they should be so superintended. I may mention that we have guardians on our committee.

3096. (*Chairman.*) Where did your blind teacher come from?—He was at first at Southsea, and then at Berners Street.

3097. Have you any sale for work not made by the blind at your institution?—We get some things from St. George's which are made by the blind. We have sold a few fire screens which are not made by the blind. We have got them from a wholesale place where we could get them cheaper than persons could buy them, and we have sold one or two of them. Other things we have got from St. George's; as a rule, when persons have applied to us for mats we have got them from there.

The witness withdrew.

Miss BAINBRIGGE examined.

3098. (*Chairman.*) Have you been connected long with the same institution?—Yes, my father founded it in the year 1877, and I have known it from the time of its formation. *Miss Bainbrigge.*

3099. Do you confirm what General Moberley has said with regard to the institution?—Yes, in a general way.

3100. Is there any point upon which you wish to add anything to what he has said?—I think the guardians are very willing to co-operate with us; they have been very liberal in the out-relief that they have given to the men, and they do not raise more difficulties than they can help.

3101. Then the difficulty seems to be the legal difficulty?—Yes, as to the meaning of the words "useful aid," and also as to the meaning of the word "subscribe;" they interpret the word "subscribe" as meaning an annual subscription; they do not read it as enabling them to give a contribution towards the funds; and we think that it would be much better if the guardians were enabled to pay so much per man and so much per week from time to time for tuition fees, the guardians would be better able to carry out their arrangements than if they thought they had to pay an annual subscription.

3102. The Local Government Board seems to have conceded the principle?—Yes, but the question is always being raised afresh as to the meaning of the words "useful aid," it is assumed that they imply "maintenance," and the settlement of the question in each case involves a great deal of trouble; there seems to be some ambiguity about the words.

3103. Have you taken much interest in the employment and education of the blind generally?—Only in this particular workshop. One thing that seems to me to be wanted very much is the establishment here and there of small workshops, under the management of local committees, for the production and sale of work of the blind, to which men could be drafted from our institution when we get too many men and when the work that we are producing is too large for the demand. Last year we were getting too large a stock of baskets, and if it had not been for a good contract I do not know what we should have done with the stock. I think if there were such workshops established at, for instance, Maidstone, Chatham, and Dover, to which two or three of our men could be sent after they have learned a trade, it would be a great advantage.

3104. That could be done now under the existing state of things without any legislation or Government aid; it is merely a question of organization?—Yes; I do not know whether such workshops would want any subsidising; I daresay the thing might be done by private effort.

3105. Your idea would be to establish small workshops in various parts of each county, where two or three men drafted off from some central workshop should work together?—Yes. I think in every county or every centre of population there should be one large workshop where the men could be taught, and then there should be in connexion with this central workshop a number of these small shops supervised and managed by local committees. A house in a tolerably good position might be taken for the purpose, and the upper part of the house might be rented to the blind workers.

3106. Do you know of any pensions in Kent specially devoted to the blind?—I do not know of any special Kent ones.

3107. The blind go up to London for pensions?—Yes, I think so.

3108. Have you anything further to say with regard to the employment of the blind?—I do not think it would be a good plan to have these workshops too large in any particular district. I do not think it would be a good plan to get too many blind people together in one neighbourhood. I would not greatly increase the number in our institution, but I would establish a number of small

Miss Bainbrigge.

5 Feb. 1886.

workshops to which men who had been trained at our workshop could be drafted. Our head basket maker told me that of the men that we had in our shop now, he considered at least three were quite competent to set up for themselves without his supervision if they were sent into some country town or seaport town.

3109. Have you any other suggestions to make to the Commission?—I think it would be a good thing if a provident club or a friendly society for the blind could be established; embracing the whole of the United Kingdom, something like the Foresters' or the Odd Fellows'. Those societies do not take in blind people.

3110. That is a thing which could be started by private effort, is not it?—I do not think it could. I think the blind stand on a different footing to other people. I think they want more help in such things as that.

3111. (*Dr. Tindal Robertson.*) If you established a large number of small workshops in different parts of the country, would not you increase the expense very much?—I think local subscriptions would come in quite readily; it would be a great advantage to excite local interest, and to get local custom where the men are known. If the men were sent back to the places from which they had come, the people in the neighbourhood might be induced to take an interest in them, and to give them work.

3112. With regard to education, do you find that the men who come to your workshops have received any education of any kind?—I think most of them must have received a considerable amount of education, they are very intelligent, they seem to take a great interest in politics, and are very fond of being read to, but as a rule they do not very much care to learn to read; I have been disappointed at finding them so disinclined to learn to read.

3113. Are there any means in connexion with your institution, either directly or indirectly, of educating those who are found not to have received any education whatever?—The Society for the Home Teaching of the Blind has an agent in our neighbourhood, and he visits them, but he has been rather disappointed, I think. They seem to prefer so much to be read to rather than to learn to read themselves. There is one man of 25, who has just lately come, who is very anxious to learn; the agent is lending him books.

3114. (*Dr. Armitage.*) Do you think that the objection to learning to read depends a good deal upon the hardening of their hands by work?—Yes; that is the case generally. One man complains that it affects his head, that it gives him headache.

3115. What are your hours of work?—From 8 to half-past 5, with an hour interval.

3116. Do you think some of the disinclinations for reading may arise from the men being tired when they have finished their day's work?—I think it may. I think that is why they prefer being read to.

3117. We have been told by General Moberley that as a rule you do not sell work made by the seeing in your depôt?—That is so.

3118. Have you ever considered whether it would be desirable to do so?—Yes, we have considered it.

3119. What was your reason for deciding not to sell work made by the seeing?—We did not like people to think that things were made by the blind when they were not.

3120. You do not think that selling work made by the seeing, that is to say, the work which is found in ordinary basket shops, for instance, assists in selling the blind work?—I daresay it might, but we have a prejudice against it.

3121. You said you had had a large contract for baskets. Was that a Government contract?—No, it was from the docks.

3122. Would it be a material assistance to your workshop if you had large running contracts from public bodies, or from the Government?—Yes, if we could get a fair price; but we have never been able to get a Government contract. We have tendered, but I suppose our prices have always been too high.

3123. Do you think it would be desirable for the Government to confine their contracts for work which the blind are capable of doing, and doing well, to the blind?—Yes, I do.

3124. Do you think it would be desirable if they did that, that they should pay for the work at the usual price at which contracts have been taken for the last 10 years or so, without calling for tenders, so that an institution might have the opportunity of saying, we will take so much of the contract at such a price?—Yes, I do think so.

3125. That is to say, that the Government should fix the price and the institution should say whether they would take the contract or not?—Yes.

3126. You think that would be a great help to the institutions?—Yes, I think it would.

3127. (*Dr. McDonnell.*) You suggested that a provident club for the blind should be established. Suppose that all people in the United Kingdom were compelled to pay a certain sum annually, so that if anyone became blind he or she would be entitled to a certain allowance, I will call it an insurance, do you think that that would be an improvement on the present state of things?—That idea never occurred to me.

3128. Suppose that every person who became blind was by the mere fact of blindness entitled to receive from such an insurance fund, a certain sum annually, say 10*l.* a year. Suppose that in the case of a child the 10*l.* was spent in helping its education, and in the case of a young man who was being trained for some industrial occupation that it was spent in aiding the institution that gave him that industrial training, and that when he came to be an adult he should get the 10*l.* annually himself, that 10*l.* being an addition to the product of his industry, do you think that would be a good arrangement?—I think possibly it might be.

3129. You think that would be a better plan than the giving of pensions as they are given at present?—Yes.

3130. Have you any experience of pensions as they are given at present?—No, I do not think I can say that I have.

3131. You are aware that a good many blind people get small pensions from various institutions?—Yes.

3132. We have it in evidence that a great many get several pensions?—I believe that is so.

3133. That very often leads them rather to idleness than to industry?—Quite so.

3134. Under the plan that I am proposing every person would by right be entitled to a certain sum annually in case he became blind, so that if he were industrious he would have the 10*l.* in addition to what he was earning, and if he was idle he would still have something to fall back on?—I do not think blind people should have pensions if they can work.

3135. We will not call it a pension, we will call it an insurance; the man would be entitled to it because he or his father had paid his insurance money?—I should be inclined to have some limit of age, unless a man was disabled.

3136. Why should you limit the age; because, if you put a limit, those below that limit become idlers?—The only man that we have who does not seem to get on properly is a man who has a pension of 7*s.* a week.

3137. (*Mr. St. John Ackers.*) Do you find any opposition in the different trades against those who have been taught partly by charity?—No.

3138. You have not experienced that at all or heard of it?—No.

3139. (*Admiral Sir E. Sotheby.*) Do not you think that the best plan in giving pensions would be to give the pensions to the old workpeople?—I should like that the blind should pay 2*d.* or 4*d.* or 6*d.* a week, according to their wages, and that when they reached a certain age, or if they became disabled, they should have a pension.

3140. I am speaking of the pensions which are given to the blind by various institutions; do not you think they ought to lay down the rule that they will pay those pensions to people who have been at work and who are incapable of maintaining themselves any longer, instead of giving them to those who do no work but who are capable of work?—Decidedly.

3141. (*Mr. Johnson.*) Your expenditure seems to bear a large proportion to the wages. 1,186*l.* is the total expenditure, and all that goes into the pockets of the workpeople is 397*l.*; the rest is for materials, collecting, stationery, rent, and so on?—Yes; we could employ more men without being put to extra expense.

3142. The expenses of carrying on your work appear to be very large?—We have room for a good many more men, but we have not yet sufficient custom to employ more men. We have had applications made to us by older men, who I think might be employed at the mattrass work, but we have only lately started the mattrass work, and we cannot take on any more hands, and the older men are not very apt at learning basket work.

3143. However, the wages paid to your workmen are, say, 400*l.* as against a total expenditure of 1,100*l.*?—But you must remember that the material is included in that 1,100*l.*

3144. The actual profit distributed to the blind is in round numbers 400*l.* in the year, and in order to enable you to distribute that, 1,186*l.* has been required to be found?—You must take into consideration that the materials are included in the 1,186*l.*

Miss Bainbrigge.

5 Feb. 1886.

3145. 331*l.* was the cost of material out of the 1,186*l.*?—We built a new room out of the 1,186*l.*

3146. 400*l.* a year was the amount actually paid in wages to the blind people employed, there being 15 employed?—I think I said there were 14. We have 15 at present. Some of those who were pupils at the date of the report which you have before you are now earning more than they did then, they are counted in the number.

3147. What wages do you pay your pupils?—3*s.* a week, by way of encouragement, for the first six months, and then whatever they earn by piece-work.

The witness withdrew.

Mr. Alfred Midwinter examined.

Mr. A. Midwinter.

3148. (*Chairman.*) You are trade manager at the School for the Indigent Blind?—I am.

3149. How many years have you been connected with the institution?—Something more than 35 years.

3150. Where were you educated?—At Reading.

3151. How many blind do you superintend?—Male and female altogether the average number would be 150 or 160, or perhaps more.

3152. What are the trades carried on in the school which you superintend?—Mat making, matting weaving, brush making, basket making, sash-line making, and chair caning; and then there is some other work the girls do, such as knitting, netting, and that sort of thing.

3153. What is the value of the goods sold at the institution annually?—Something over 3,000*l.*

3154. How many blind and how many sighted teachers have you under you?—One blind teacher and five sighted male teachers, and one female teacher.

3155. How many blind can a seeing teacher superintend?—That depends upon the description of work that they are teaching.

3156. You say you have 150 people working under you?—Yes.

3157. What proportion of superintendents have you to each trade?—In the mat making there is one to about 16; in the brush making there is one to 14 or 15; in the basket making there is one to perhaps 40, at least one with a sighted assistant.

3158. Who does the blind teacher look after?—The blind teacher assists the seeing ones as a general thing.

3159. Have you always a ready sale for your work?—Yes; I have been there for 35 years, and there has never been more than an occasional job lot sold off; we have never had to have a general sale of accumulated stock.

3160. How do you sell your goods, through a warehouse of your own, or through retail shops?—We have a retail shop of our own, and the goods are sold through that.

3161. Exclusively through that?—Yes.

3162. Have you any income from endowments or trust funds?—I have nothing to do with the finance of the institution.

3163. Is the institution a paying one apart from endowments or trust funds?—You can hardly call it a paying concern, because it comprises two different parts; there is a school, and there is also an independent out-working department, and I think the independent out-working department is something more than self-supporting.

3164. How long do you keep the blind in your institution?—The pupils are kept for six years; sometimes the committee give them an additional six months.

3165. What do they do when they go out?—They return to their friends, those who have friends to return to, but eventually they get their living as they can.

3166. You do not follow them outside your institution?—No, in that respect it is like any other school.

3167. Do you hear from them afterwards?—We are in communication with a few of them, but as a general rule I do not know what becomes of them.

3168. You do not know whether they are able, having learned trades with you, to earn a livelihood afterwards?—It is only in a comparatively few instances that we hear of them.

3169. Have you any recommendation to make to the Commission with regard to the employment of the blind?—No. I did not come prepared to make any recommendation.

3170. Do you think that the blind had better be left entirely to voluntary charity, both for education and for training for a trade?—I do not see myself how any great improvement could be made in the present system.

3171. You have told us that you do not know what becomes of those who have been trained in your institution. The object, of course, of your training them there would be that they should earn their own livelihood; but as you do not follow them after they have left you, you do not know whether your instruction is doing good to them or not?—Only in the cases where we do hear of them from time to time. I know of instances where the benefit has been very great, but there are many instances where I do not know what becomes of the pupils at all; they came from long distances frequently, and it is very difficult to follow them.

3172. Do not you think it would be a great advantage that an institution such as yours should endeavour to keep up some relations with those who have been trained in it, so as to know what becomes of them, and then the institution might be able to assist them when they are out of work, and find employment for them in those trades which they have been taught in the institution?—I think it would be desirable if possible to know what becomes of them, and how they are doing, but I do not know that it would be so easy to ascertain that, and I do not think it would be very easy to find employment for a very large number in any central position.

3173. Then you think that the training which they get is very often thrown away by their not making use of it in after life?—There are occasional cases of that sort I have no doubt, but it depends very much upon the natural disposition of the person himself; if a person is energetic and persevering he can contrive to get a living; if he is somewhat indolent and apathetic, inclined to trust rather to Providence than to his own exertions, then he goes to the bad.

3174. Do you think there is greater temptation to the blind to throw themselves on the generosity of the charitable public by begging rather than working?—I think there is, but I think a great many of the blind would very much prefer to earn their own living.

3175. Is not there some excuse for their not working from the difficulty which they have in getting work, and selling their work when they have done it?—Yes, and I do not think that some of the blind look upon the act of begging exactly in the same way as a sighted person would.

3176. Do you know anything of the system of pensions; do you know of any blind people who receive pensions from one or more societies?—Yes.

3177. From how many societies?—I do not know.

3178. From more than one?—I know some who received pension from Day's Charity, and I know some who received a pension from the Protestant Blind Relief Society, and from the Clothworkers, but not all the same persons. That is a point upon which I think something

Mr. A. Midwinter.

5 Feb. 1886.

might be done, if there has not been anything done already, because I think there are some blind people who are naturally of a cunning and scheming disposition, and who are enjoying two or three pensions, while another more deserving does not get a pension at all.

3179. Do you think that the blind should be educated along with the sighted, if possible?—Yes, I think so, if possible, in some trades, but it does not matter in others; in basket making it would be better if they could be educated among the sighted, but it is next to an impossibility to do it unless there were a larger number of teachers employed.

3180. Is not there a natural prejudice against a blind man being received as an apprentice with the sighted?—Yes, a blind man would take up exactly the same amount of room as a sighted person, and he would not do half the work.

3181. (*Mr. Johnson.*) You said that the out-working department is self-supporting?—Yes.

3182. Do you give the workers anything besides their wages?—The committee give them a dinner.

3183. They are paid exactly what they earn?—Yes, they are paid as far as possible by the printed list used out of doors by sighted workmen.

3184. That list is put up at the school?—Yes.

3185. I suppose the work done in the school by the pupils brings very little profit?—I can hardly say anything about that.

3186. I suppose there is a great deal of waste?—There is a great deal of waste attached to it.

3187. The out-working department makes up for the deficiency, does it not?—Yes.

3188. Do you think that a central depôt, where the blind could purchase their materials at a cheap rate, would be advantageous; that is to say, a depôt at which the materials should be sold to them at the cost price?—At the School for the Indigent Blind we always have a large stock of materials on hand, which we sell to any blind person who thinks proper to come there, at the cost price, and we do not take 10*l.* a year.

3189. Your committee have long recognised the idea that it is an advisable thing to supply material at cost price to out workers?—When I first took my present position I was instructed by the committee that if any blind person, I believe it was limited to any old pupil, wished to purchase materials at the school, he should have the privilege of doing it at cost price; and I do not think that a central depôt could sell it any cheaper than we do ourselves.

3190. What is the per-centage, do you think, of blind people trained and taught in your institution that rise to become good workers so as to compete in the market?—In the mat making and matting weaving, I should say that more than three-fourths of them become good workers, in the basket making there would not be so many, the basket makers labour under the disadvantage of more or less imperfect teaching, they require long experience, though it is the best trade possible, perhaps, for a blind man to learn young, because he is able to begin and finish his work without any sighted assistance when he has learnt the trade, that is not the case in any other trade that I know of which the blind are capable of working at, and in order to get the necessary skill to be able to work with sufficient dexterity and quickness to enable him to get a living, he requires a long practice because there is an infinite variety in basket making.

3191. The other trades are not so remunerative as basket making?—I was not speaking of the remuneration, but they are not quite so remunerative as basket making.

3192. What are the average earnings of people employed in the out-working department, who, of course, are good workmen?—The average earnings of the very best would be something about 21*s.* or 22*s.* a week, that is at basket making; the earnings of the mat makers do not differ very much from that.

3193. Then they would average about 1*l.* a week?—Somewhere about 1*l.* a week.

3194. What proportion of those whom you have turned out of your institution would be good workmen, and what would be the proportion of those that you could do nothing with?—There is a great difference now as compared to the time when I was more engaged in the teaching; the pupils for some years past have come into the institution so young that the per-centage of good workmen has fallen off. When I first went to the School for the Indigent Blind I had, I think; 40 under me, and they were nearly all young men, and the per-centage of those who became fair workmen sufficiently well to get their living was very considerable. I should think 75 per cent. of them.

3195. Can you tell the Commission anything about the market for the sale of blind men's work. Do you think that the market is capable of being further extended for the disposal of the work of blind people?—I do not know. If the trade were carried on to a very considerably larger extent, so that you could employ properly qualified travellers to get a sale for the work, then I think very likely you might get employment for a great number; but you must be able to get the men to do the work, and that is the weak point.

3196. Are there any that have been through your school that cannot get work because they are not efficient workers?—I have never known a good basket maker who has not been able to get his living. With the matting makers it is somewhat different. They will not have them to work in the shops with the sighted men, and it is a difficult job for the men to get employment. They can do the work exceedingly well, better than they can do anything else, perhaps.

3197. You think there is no difficulty in getting a market for all goods that might be made by good blind workmen in London?—I think not. I do not think there would if the trade was large enough to enable you to employ the necessary people to do the work.

3198. I believe you have executed some contracts for the Government for Woolwich?—Yes.

3199. And also you have made baskets for the Parcel Post?—Yes.

3200. You made the principal part of those?—A good many of those.

3201 And you have made wine baskets for the officers at Woolwich?—Yes.

3202. (*Admiral Sir E. Sotheby.*) What sort of baskets do you make?—We make all descriptions of baskets except the fancy work.

3203. You do not make any fancy baskets?—No.

3204. Do you consider that your sash-line making is remunerative?—We get a good fair profit on it.

3205. Do you do any pitch work?—Yes.

3206. How many men do you employ in pitch work?—We have only one journeyman employed at pitch work at present. We have a number of pupils.

3207. Does pitch work pay?—I hardly know whether it pays; if we get anything over the cost of materials we consider it pays.

3208. You have only one man employed at pitch work?—We only commenced last week.

3209. You said that you never had occasion to get rid of your things except when you have sold a job lot occasionally; what do you mean by a job lot?—That has been when the stock has accumulated. When I first went there I found a large stock of mats, perhaps 400 or 500; we have nothing that we want to get rid of at the present time; during the last 20 years we have sold all we could make.

3210. Whether by pupils or journeymen?—Yes.

3211. Do you sell all your things at the market price?—Yes.

3212. At the same price as the sighted would charge?—As near as possible.

3213. Do you employ any travellers as agents?—No.

3214. Did I rightly understand you to say that you give dinners to your workpeople?—Yes.

3215. What is the cost of those dinners per person per day?—From 6*d.* to 8*d.*

3216. That would be equivalent to giving them 4*s.* a week?—Yes.

3217. Are you aware that any blind men hawk about goods made by the sighted, representing them as being made by themselves?—I have never known any such instance, but I strongly suspect that it is done.

3218. Do you think that a general registration of pensions would be a good thing?—Yes; it would enable those who have the disposal of them to see whether one man was getting a lot of pensions.

Mr. A. Midwinter.

5 Feb. 1886.

3219. Do you think it would be a good rule to have pensions given only, or principally, to old workpeople?—That depends; there are some people who are so entirely unable to do anything for themselves that they must be supported in some way or other; I think there are a great many blind people who if they had a small pension would be able to get their own living.

3220. How do you pay your bristle drawers?—The masters who do that have likewise the teaching of the brush work; they are paid by the week and that is done in the time.

3221. At what price is that work paid?—They are paid so much a week, and they do that as a portion of their work; they are not paid by piece work as basket makers usually are in the trade.

3222. Do they bore their own holes?—That is done by the sighted.

3223. Could they not bore them?—I knew one instance of a blind man who used to do his own boring, but it was very indifferent work.

The witness withdrew.

Adjourned to Wednesday next at 12 o'clock.

32, Abingdon Street, Westminster.

Wednesday, 10th February 1886.

PRESENT:

LORD EGERTON OF TATTON IN THE CHAIR.

THE RIGHT HON. SIR HENRY SELWIN-IBBETSON, BART., M.P.
ADMIRAL SIR E. SOTHEBY, K.C.B.
W. TINDAL ROBERTSON, ESQ., M.D.
E. C. JOHNSON, ESQ.

CHARLES E. D. BLACK, ESQ., *Secretary.*

Mr. ALFRED MIDWINTER further examined.

Mr A. Midwinter.

10 Feb. 1886.

3224. (*Chairman.*) Have you any further information to give the Commission, or any suggestion to make on the subject of their inquiry?—I do not know that I have much further information to give you, but I may refer in the first place to a question which was asked me with regard to the employment of the blind as teachers. I do not exactly remember what answer I made to that question, but I should like to say that I think, from my experience, the employment of blind persons as assistant teachers under sighted superintendents would be very advantageous in teaching basket making, but in any other trade that I am acquainted with it would be perfectly useless.

3225. You mean that with blind teachers a certain amount of sighted superintendence would be required?—Yes.

3226. You stated that you did not employ shapes in making baskets?—No, we teach the blind to make baskets exactly as we should teach a sighted person; we do not require any sort of appliances at all for the blind in making baskets, except those that they make themselves. There are some appliances required for figured work in the mat making, because it is drawn on a pattern similar to ladies' needlework. That is indicated to them by raised characters.

3227. Would not it be advantageous in making a circular basket to have a form, in order to get the circle true?—They simply make the round hoop themselves, the little appliances they have they make themselves, they use those constantly.

3228. With regard to the work done by your institution, have you anything further to say?—I may say that from my experience, looking at the number of people I have known who have been trained in the institution, I think that for an unendowed charity it has done a very large amount of good; it has been a frequent experience of mine to hear persons who have been there as pupils say how thankful they were at having been brought up at the institution.

3229. You say it is an unendowed charity, but I suppose you are aware that it has funds in hand which have been accumulated by the savings of a number of years?—Yes. I believe that according to the charter under which the institution is incorporated a sum of 20,000*l.* must be kept in hand.

3230. You say it is an unendowed charity?—It is their own money; they cannot invest it in any other way than in consols, if I understand the thing rightly.

3231. In fact there is an endowment of 20,000*l.* which they are obliged to invest in consols?—Yes.

3232. You say that you have always been enabled to get rid of the work which is produced, which has been a difficulty in other institutions of a similar character?—A large amount of our work is mats, cocoa-nut fibre matting. I do not know any other institution where they make them, or if they do it is only a few that they make. I think they make a few at Sunderland, but it is very few. We can make them quite equal to any that are made in the trade, and therefore they have given satisfaction to our customers, and one has recommended them to another.

3233. Are you speaking of door-mats?—Yes.

3234. You are probably aware that those are made in prisons to a great extent; do you find that the prisons compete with you?—Yes, they have done in times past, but not so much now; we find great competition in basket work in the prisons.

3235. What means do you take to sell the goods that you make to the best advantage?—The means that I took when I first had the management of the trade to a certain extent was to have some circulars printed, and whenever I had occasion to write to customers or other persons I always enclosed one of these circulars stating what we sold, and giving a short abstract of the prices.

3236. Do you advertise publicly?—An advertisement once a week appears in the "Morning Advertiser." I think we have got a considerable amount of custom from that advertisement.

3237. Do you think that many of those institutions have failed in getting rid of their work from their not acting as any other commercial concern would act, by taking the best means to advertise their work?—I think they have failed through the work not being done properly. I think persons who have started institutions have had an idea that basket making, for instance, could be taught in the course of a few weeks, or the course of a month or a twelvemonth; and they supposed that as soon as a man knew how to make one particular sort of basket he would be able to go on his own resources and get a living, that is not so; there is an infinite variety in basket making, and though it might be easy enough to teach a man to make a particular kind of basket in three months, he wants long practice so as to be able to go out into the world and obtain a living by it. I have just been glancing through the old books to see how

Mr. A. Midwinter.

10 Feb. 1886.

many of those who have been in the school are now, to my knowledge, getting their own living, and the number who are getting their living is very large, not to speak of a very large number who are dead. Many of them I know the addresses of. It is a much larger number than I thought when I was here before.

3238. What number of places have you got in London or in the provinces where your manufactures are sold?—We supply mats to the Association in Berners Street.

3239. To any other association?—To the Surrey Association, and we supply them or have supplied them up till lately to Kensington; and we sometimes send them down to Sunderland.

3240. You do not sell them to retail shops?—No.

3241. Why not?—We are not able to produce them quite cheap enough to compete with the ordinary outside manufacturers; a great deal of mat-making is done in Suffolk and Norfolk, they pitch upon a place where labour is very cheap, and where the rents amount to a mere nothing, and then they get the goods manufactured at a very low price indeed; whereas we are obliged to pay London prices; in some instances we have to pay quite cent. per cent. more wages per foot for making.

3242. Do you see any objection to having a central depôt in London where all blind work could be sold?—No, I do not think there would be any objection to that.

3243. There is no such depôt, is there, at the present time?—Not at the present time.

3244. Do you consider that your institution pays better than any other institution?—I am not sufficiently acquainted with the other blind institutions to be able to say whether it does or not.

3245. You have commercial relations with them?—I think ours is the only blind institution where they sell exclusively the work of the blind; all that we sell at our establishment is really the work of the blind.

3246. What is the objection to selling other work if people will buy it?—That is a question that I have never had to deal with at all. I should say the objection is this, that it enables other people to sell the work of sighted persons under the pretence of selling the work of the blind; unprincipled people who sold both kinds of work would put it up on their doors that they sold the work of the blind.

3247. Do you think there is any large demand for the work of the blind of the same character as yours, could you sell more?—I have no doubt that all the work that can be done properly, in a workmanlike manner, by the blind can be sold, but there is a very considerable number of blind people who would not work in an institution, and who would not work in an ordinary workshop established for them, because they do better in working for themselves.

3248. Do you find that those who have been trained at your institution leave London and go into the provinces?—Yes, they go all over the country.

3249. Do you find that there are some blind people who are difficult to teach and whose work never turns out well?—Yes.

3250. What becomes of those failures when they leave you?—After they have been in the school the specified time they leave, we having done the best we possibly could with them, and of course they have to do whatever they can. I have known instances of men taking to wood-chopping, which requires no special teaching; I have known others who would get an opportunity perhaps to turn a washing machine or a mangle, or get a little job to ring a bell at a church, or blow the organ; they get numberless little employments that do not bring them in much, but they contrive to live.

3251. Do you think that pensions should not be given except to deserving people, to supplement earnings?—I do not think that a pension should be withheld from a person because he is able to earn something.

3252. What I was putting to you was this, do you think that pensions should rather be given to supplement wages than given to people who do not earn anything?—I think it is desirable to encourage those who endeavour to help themselves as far as possible, but not to shut out the others altogether.

3253. Of course there would always be a certain number who from age or illness would be incapacitated from doing work, they are proper subjects for pensions?—Yes, among the blind there will always be a certain percentage, as there is among the sighted, of people who are comparatively helpless, shiftless people, who never can do anything, except it is the simplest description of labour; for instance, in the trade of basket making there are plenty of sighted persons who are not anything like good workmen, and never can be made good workmen; and it is the same in every other business that I know anything about; with the blind it is just the same, there is a certain per-centage of them incapable of learning, be as careful with them as you will; but even then they contrive to do something when they get out, in the sort of way that I have mentioned.

3254. Have you had in your institution any who have been trained in the schools of the London School Board?—Not that I am aware of. I do not know anything about the previous education of those who have come to us.

3255. (*Admiral Sir E. Sotheby.*) Have you ever tried forms for baskets?—Yes.

3256. Do you think there is any advantage in having them?—Not any at all, over and above what they can make themselves; for instance, our men, when they make a square basket, will take four lathes and simply cut some notches and fit them together, that is all they require.

3257. Is there no advantage in having a set form?—Not any at all.

3258. Do you know of any of your pupils being taken into any other institutions in London and given work there?—Yes.

3259. Will you say what institutions?—There have been several at Berners Street; I do not know whether they are there now or not.

3260. What is your counter custom?—About 3*l.* or 4*l.* a day, sometimes it would go up to 7*l.* or 8*l.*, and sometimes go down to 30*s.*

3261. You are not in a thoroughfare, are you?—We are at the end of five thoroughfares.

3262. It has been stated to the Commission that there is a jealousy amongst the blind institutions; do you think that that is the case?—I cannot say, I am not a member of any of the committees. I cannot speak to that.

3263. But you said that other institutions had dealings with you in the way of purchasing your mats, and so on. Would not that tend to show that there was not any such jealousy?—I do not know that there is any particular jealousy as regards trade; they have been customers of ours, and we have been customers of Berners Street for brooms and brushes.

3264. Do you know why the Berners Street Institution get their mats from you?—I should suppose they get them from us because they answer their purpose, and they can get them as cheaply as anywhere else.

3265. Are you aware that they do not make them on the premises?—I do not know; they never used to make any on the premises when I used to go there.

3266. There is not room?—I do not think there is.

3267. You say you do not sell anything in your institution except what is made by the blind?—Nothing, except some trifling article to save some customer trouble; we do not keep anything at all in stock that is not made by the blind. For instance, if anybody sent for a gross of clothes pegs, and ordered at the same time a lot of baskets, we should get the clothes pegs and send them down with the baskets; but that is only an accommodation to the customer.

3268. Do not you think it would be an advantage to sell things not made by the blind, in order to secure custom?—I have no doubt that the income of the institution might be augmented in that way.

3269. Would not you sell more things made by the blind if you could sell such things as sponges and leathers, and those sorts of things?—I do not think that we should sell any more.

3270. Would not it be to your advantage if, when a servant came for brushes and baskets, you could also supply him with sponges and leathers, if he wanted them?—We should not sell any more baskets in that case. We could sell leathers if we kept them; we are often asked for them.

3271. Do not you think that a servant would be more inclined to go to a shop where he could get all the articles he required at once than to go to one shop for one article and to another shop for another?—I have no doubt they would like to save themselves trouble.

Mr. A. Midwinter.

10 Feb. 1886.

3272. Then you think it would be an advantage if you sold such things as sponges and leathers, for instance?—It would be a pecuniary advantage, but there is another side of the question. We profess to sell the work of the blind, and if we did not sell the work of the blind we should be sailing to some extent under false colours, if we professed not to sell the work of the blind solely, but to sell certain things with the work of the blind also, it would be another thing.

3273. Would not you sell more things made by the blind if you sold other things?—It is just possible that we might sell a few more, but in our institution I do not think it would make much difference.

3274. With regard to pensions would not you advise pensions to be given to old people no longer able to work?—Yes, I certainly should. I think after a blind person is 56 or 60 years of age, if a pension is available for him, it is very desirable he should have it.

3275. (*Dr. Armitage.*) You say there are a great many who have been trained to trades in your institution who you know are supporting themselves?—Yes.

3276. Could you tell us how many and what trades they follow?—No, I did not come prepared to give that evidence; but I might say with certainty, without having any special means of knowing, that is, without any touch being kept with pupils who have left in the regular way, I know from 70 to 80.

3277. Can you tell us how many of those are basket makers and how many are mat makers?—I should say that at least four-fifths, and perhaps more than that are basket makers.

3278. Do you keep up any correspondence with the old pupils?—Not any at all.

3279. Then how do you know that there are 70 or 80 of your old pupils who are now earning their living?—They call at the school occasionally, if they happen to come to London, and I hear about them from one and the other.

3280. Have you any record at the school?—We have a record of all the pupils that have ever been admitted, and the trades they had learnt at the time they went away, but nothing more than that.

3281. What I was going to ask you was this: do you keep any record of those who have left the institution and who are earning their own living. When you hear of such a case do you take the name and address of the former pupil and the particulars of the case?—No, the knowledge that I have of the matter is entirely unofficial.

3282. You are merely speaking from memory?—Merely from memory; as I said just now, I glanced over the books this morning and looked at the various names of blind people who had been admitted into the institution since I have been there, and I could recognise 70 or 80 that I could if I had the the time account for, who I believe at the present moment are gaining their livelihood.

3283. Could you tell us of those living in London, how many are basket makers and how many are mat makers?—No.

3284. Do you think that it would be desirable for the school to keep such a record as I have suggested, and to keep up a continual correspondence with their old pupils, so that they should know exactly what they are doing?—I should think that that would be rather desirable if it were practicable.

3285. Has it ever been suggested to your knowledge?—I think I have heard it spoken of.

3286. But it has not been tried?—Some 30 years ago every pupil was written to whose whereabouts could be found. I am only speaking from memory, but I do not think so many answers came back as were expected. I am not certain that I am saying that which is quite correct, but I believe I am. There was a form, if I recollect aright, printed and sent out from time to time to every address that could be ascertained.

3287. As to the use of forms in basket making you say your basket pupils work just as the seeing do, without any appliances?—Except such as they contrive themselves.

3288. Are you aware that the seeing basket makers do use forms?—I never saw one used.

3289. Do you know anything about basket making in Canada, at Ontario?—No.

3290. You do not know that they have found forms most useful there?—No.

3291. You said in your previous evidence, I think, that basket makers are making 16*s.* a week, and mat makers 15*s.*?—I spoke from memory, but I think I stated that the wages ranged from 10*s.* to about 24*s.* I find on looking at the report that the average earnings of basket makers for 1884 was 15*s.* 11½*d.*

3292. Was that the money that was paid?—Actual money.

3293. Are your work people employed regularly all the year round, or do you only employ them when orders come in?—I think we have only discharged two since the shop was opened, and they were discharged for misconduct; we have never temporarily discharged anyone up to the present time.

3294. You have never suspended any from want of work?—No.

3295. (*Dr. Tindal Robertson.*) You said that a considerable number of persons who had been at your institution were, to your knowledge, getting a living; can you tell us what is the average income of those people?—No, I could not tell you that. There would be a very wide range in their earnings. One, for instance, who came to the school when he was 21 years of age, and he had not a friend in the world, he is now the owner of very considerable freehold property at Maidstone; he has been married three times, if not four, and he has a large family of daughters, and he is the owner of a considerable amount of house property and land at Maidstone. There is another who has only left the school a few years at Uxbridge, who told me that he could retire when he thought proper. There is another at Greenhithe, who should have saved up enough to give him a sufficient income to live on; if he has not it is his own fault entirely, at all events he has always got a respectable living.

3296. They earn, at all events, over a certain amount per week?—They earn so much per week; those who are out of the workshops earn more than they would in the workshops; many of them are working in workshops at Bristol, for instance, some at Cardiff, some are working at the docks in London; there are some working at Berners Street, and some at Peckham, and some at Greenwich.

3297. (*Mr. Johnson.*) With regard to the mode in which the trade accounts are kept at your institution, I believe they are very clear, are they not?—Very clear.

3298. Do you think it would be an advantage if all the institutions kept their accounts in a similar way. I do not mean that the accounts of your institution should necessarily be taken as a model, but do you think it would be an advantage if all the accounts were kept in one form?—I should think that it would be a great advantage; they could not have a simpler or clearer form than ours, because we dissect the things as we go on.

3299. It is important to ascertain what the labour costs and what the material costs. Have you any plan at your institution by which you tabulate those items of cost?—Yes; there is a debtor and a creditor account kept of each trade, the basket makers' accounts are kept together, and a debtor and creditor account is kept, and the debtor account shows so much for wages and so much for material, and so on, in the plainest manner.

3300. You have a book or ledger in which you keep an account of the articles manufactured in the week, and the money received?—Yes; we have an abstract book which goes before the Committee.

3301. Have you that book with you?—Yes.

The witness handed in the book and explained it to the Chairman.

3302. At your institution, I believe, the whole of the accounts are kept by Messrs. Prideaux, the chartered accountants?—Yes.

3303. Could you tell us why that course was adopted of having the accounts kept by an accountant and not by anybody connected with the establishment?—I believe that the accounts as they were kept previously were not very satisfactory, and it was thought better to have the authority of a firm of public accountants in order to testify to the correctness of the accounts, to give the public testimony as to their correctness.

Mr. A. Midwinter.

10 Feb. 1886.

3304. Do you know whether any inquiry has ever been made by anybody connected with your institution, by the Chairman or Secretary, or anyone else connected with the institution, with regard to old pupils who have left the institution?—As I have said, inquiries were made some years ago.

3305. But lately?—Lately I do not think there has been any official inquiry.

The witness withdrew.

Mr. JOSEPH JOHNSON MILLS examined.

Mr. J. J. Mills.

3306. (*Chairman.*) You are the trade manager of the Surrey Association for the General Welfare of the Blind?—Yes.

3307. Is that an industrial school only?—A workshop, more especially, not a school.

3308. What number of workers have you?—We had 29 last week; we fluctuate, next week there might be 31 at work; our average, I suppose, for the last 12 months would be 26.

3309. What trained teachers have you for them in the different trades?—No teacher whatever but myself.

3310. What trades do you teach?—Mattress making. We commenced mattress making about three years ago on the recommendation of our worthy President, Dr. Armitage.

3311. Do you teach basket making?—No, we do not teach basket making, we make baskets; we employ blind men who can make baskets.

3312. You say you teach mattress making, do you teach anything else?—Covering ladies' dress baskets, chair caning, making poultry and fish bags.

3313. What number of pupils and what number of journeymen have you respectively?—We have only two pupils at present.

3314. Are the rest of the people whom you employ journeymen?—Yes.

3315. Have you no applications for pupils to learn trades?—Yes, frequently.

3316. Have you generally more than two pupils?—No, we have not more than two pupils, as a rule; we only teach mattress making and chair caning, and covering of ladies' dress baskets. If we could teach basket making, making fish and poultry bags, we could take on a great number.

3317. Why do you confine yourselves to teaching the three descriptions of work you have mentioned?—We are not a school, we are only a workshop for the employment of the blind.

3318. Your association calls itself an association for the general welfare of the blind; is not it for the general welfare of the blind to be taught a trade?—There is a blind school in Surrey already for teaching them; we have not the appliances or the capital to teach on a proper scale, there is no sighted labour employed but myself, there is no foreman, and there is not anything taught, except what I have mentioned. I have to teach myself, and the amount of instruction I can give must be limited when I have 26 to look after.

3319. Do you employ the blind to assist in teaching pupils?—We have one teacher in chair caning.

3320. At what age do you admit pupils?—We have no restrictions as to age; we take them in if we have got work for them, or if we can teach them anything that will be good for them.

3321. What is the age at which they usually come?—The youngest that we took in was a boy of 12.

3322. Is that as early as you think you can teach them any industrial occupation?—Yes, I think so.

3323. Do you think that they ought to be at school till then, or do you think that they ought to remain at school longer?—I should think that a blind boy ought to begin both his general education and his industrial training long before he is 12.

3324. Do you think that a blind boy ought to continue his general education for some time after he has arrived at the age of 12, before being put to industrial training?—A great deal depends on the boy himself, some are quicker than others; one blind boy might be easily taught to make a brush when he was 12, and others, I think, would not learn to make one.

3325. How long do you keep your journeymen, as long as you can find employment for them?—Yes, we never discharge a man; since I have been manager we have never discharged anybody but for misconduct, we manage to find work for them somehow.

3326. When you find that they are good workmen you keep them at work?—Yes, we have hitherto, but it is a hard job to do so; at present trade is very dull.

3327. What means have you of selling the goods made at your institution?—We have a retail shop, and every now and then I take an hour of a morning and travel as much as I can; and we have a man who travels on commission who does a little, that has been for the last two or three months.

3328. Is he a sighted man?—Yes; he has only been on this last three months, he sells very little.

3329. Do you send round any circulars to shops where the goods that you make are usually disposed of, offering them for sale through them?—We issue a price list, and distribute it pretty generally where we can.

3330. Have you found a general willingness in the public to buy the work of the blind?—Yes.

3331. Do they give you any perference over manufacturers of the same sort of goods?—No; a few may, but very rarely; you must offer them goods at the same price as those of other people or they will not deal with you, that is my experience.

3332. What amount of goods did you sell last year?—1,435*l.*

3333. That is an increase on the previous year?—Yes, that is the largest return that we have ever made.

3334. Do you get any per-centage yourself on the things sold?—No, I have only a salary.

3335. What proportion of the price of the manufactured article goes to the workman; does the whole, minus the cost of material, go to him, or do you take a per-centage to cover the cost?—No, we pay the basket makers the trade price for making, the chair caner's we pay so much a chair.

3336. Then all the incidental expenses are defrayed by private subscriptions?—Yes, we have a subscription of about 150*l.* a year.

3337. That covers the expenses of your salary, and the building and so forth, I suppose?—I do not think it does.

3338. Are you in debt?—Yes; I am not prepared to speak to matters of finance. I simply keep the trade books, the secretary could give you better information upon that than I can.

3339. Do you think it advisable that there should be a central depôt in London where goods manufactured by the blind could be sold?—I think it would be desirable that there should be some way of bringing more trade to the workshop; which is the best way of doing it is a matter on which there is considerable difference of opinion.

3340. Do you sell your goods through any other blind institutions?—No; we deal at the blind school to a small extent; we buy mats there and sell them again at a profit, they supply us on wholesale terms, and we sell at the retail price; where we buy things outside, if we can buy them of blind institutions we do.

3341. Do you find that journeymen leave you and set up in the provinces or in London for themselves?—No, I have no experience of that kind.

3342. Are your men married men?—Yes, most of them.

3343. To sighted wives?—Mostly to blind wives.

3344. Do the wives earn anything to support themselves?—Some of the wives do.

3345. You do not have the wives in your workshops?—No, we do not recognise blind inter-marrying with blind at all. If a blind man marries a blind woman he is discharged.

3346. But you say that you have blind men at your workshop who have married blind wives?—Those are men that have been there for some years.

3347. You were speaking of your policy at the present time; in future you will not allow blind men to marry blind women?—No; a little while ago a blind man married a blind woman and he was discharged.

Mr J. J. Mills

10 Feb. 1886.

3348. Can you speak of the institution previous to you coming there?—No.

3349. Is it in a better state than you found it?—Yes.

3350. You have told us that the sale of work has increased?—Yes, it has increased within the last four years; I think four years ago our return was not above 800*l.* a year.

3351. Has the increase been only in the sale of work or has there also been an increase in the number of people employed?—In the sale of work and in the number of people employed also.

3352. Have you, from your experience, any suggestion to make generally as to the employment of the blind?—It seems to me that a great many of the blind are unable to earn a proper living, either from being unable to learn or from being inefficiently taught; the bulk of the men who have come under my notice have not been instructed so that they could make a basket without as it were coming to an association like ours as improvers, that is my experience of the men who come out of the blind institutions as baskets makers; they probably keep the best men for themselves, and only turn out the duffers as it were, those are the people we get and then we have to improve them.

3353. Do you find some hopelessly stupid?—Yes; we have two women in our place whom we cannot discharge, they have been so long with us, but they fail to earn sufficient to pay for their food, which is 3*s.* a week. Both of them have had a course of six years tuition in the blind school.

3354. Are those two included in the number of workers that you have given us?—Yes.

3355. You employ women but you do not employ the wives of the blind?—That is so; these are blind women who are not married.

3356. How many women have you altogether?—We have seven women altogether.

3357. Do you think there are some blind people who never will be able, however long they are taught, to earn sufficient to keep themselves?—There certainly seem to me to be such people; those two women that I speak of I should almost fancy had not been thrown sufficiently upon themselves when they were young, there had been too much done for them; the more you throw blind people upon their own resources the better for them; and I think a great many blind are spoilt from not being dealt with in that way.

3358. Do you think special institutions for the blind have this disadvantage, that they do not teach the blind sufficient self reliance?—Some of them I think fail in that respect; I have not much knowledge of any institution beyond my own, but I have formed that opinion from coming in contact with several blind people like those two women I have mentioned; there is no energy in them, there has never been any effort made apparently to bring out their energy.

3359. Have you ever had to dismiss any who have come to you for work on account of their inability or unwillingness to work?—Yes; I have tried them at making baskets and they have utterly failed, they have been so stupid. I tried for a week to get one man to make a clothes basket, that man had been six years in the Blind School, and he utterly failed to produce anything bearing any resemblance to a clothes basket at the end of the week.

3360. What do you think ought to be done with those cases?—There is nothing but the workhouse for them that I can see, they are perfectly unable to earn their own living; the man I am referring to was a strong healthy man, such men might be useful in turning some sort of machine.

3361. Do you think that inability to acquire proficiency in industrial work is a great deal owing to the want of early training?—In some cases.

3362. Their hands are not adapted to any handicraft?—In the case of this man it was more stupidity than anything else.

3363. And unwillingness to work perhaps?—No, I do not think he was unwilling to work. As to these two women, if they had not been blind I should have said it was laziness. I believe one of them would sit by the side of the fire and starve sooner than exert herself; I had to be very sharp with her to make her do four chairs a week, and we have plenty of men in our place that will do three and four a day.

3364. Do you think pensions are necessary for the blind when they are old and sick?—Yes, I think it is a great assistance to them, but it seems to me some of them get more than their share, and others go without.

3365. You think pensions are given indiscriminately without regard to the merit of the recipient. City Companies give them to men who are not always the most deserving or necessitous, whilst others who really want them do not get them, through not having the necessary amount of influence or energy to seek after them.

3366. Do you think that the money which is now devoted to pensions would be better employed in setting up some institution where the blind could be taught and made to work if possible and earn part of their livelihood?—I think it would be much better; or else that the money should be put into some common fund and distributed amongst the more needy blind. There is one man in our place, one of our best workmen, whose pensions I know amount to nearly 50*l.* a year.

3367. (*Mr. Johnson.*) In your average of 26 men, the seven women are included?—Yes, in the 26.

3368. What are the women employed in?—Chair caning, making fish bags, that is to say, bags for poulterers and the fish markets, sewing mattrass cases, and knitting.

3369. What are the average earnings of the women?—7*s.* a week.

3370. Do they get the dinner in addition?—No, they have to pay for their food out of that.

3371. They pay the 3*s.* a week out of the 7*s.*?—Yes.

3372. What is the average earning of the men?—A basket maker will earn on the average 16*s.* a week; one man has gone as high as 28*s.* a week, but the average would be 16*s.* a week.

3373. What do you think are the lowest wages that your worst basket makers earn?—Only one of them ever takes less than 9*s.* a week.

3374. Do you do any wood chopping?—Yes.

3375. Do you find that pays?—No.

3376. What are the average earnings of the wood choppers a week?—I can hardly give them, they vary so much. Where one will earn 10*s.* a week, another will not earn 3*s.*

3377. Have you a fair market for all you produce?—There is no profit on it; we simply sell it at what it costs us, we do not push the sale of it really.

3378. Do you find a good market for all the things that you can produce?—No.

3379. Which articles do you find that you have the best market for?—Baskets, and fish and poultry bags.

3380. Do you think you could sell any more baskets if you had more hands?—No, it is a hard job to get work for the present hands at the present time.

3381. Do you find it difficult to sell what you now make?—Yes.

3382. Your men are all journeymen, are they not?—All.

3383. All having learned their trade at some institution outside your institution?—Yes, except two pupils, some of the wood choppers, fish bag makers, and mattrass makers. One basket maker has never been in an institution, he was a wood chopper; he is rather a sharp man, and with the assistance I and the journeymen have given him he is a very fair basket maker.

3384. You are not only the supervisor, but you teach?—All the teaching is done by me.

3385. Do you believe it is necessary to have sighted supervision in all workshops?—Certainly.

3386. Are you in favour of having blind foremen?—I cannot speak to that, I have never tried it.

3387. You have no blind assistants under you?—No.

3388. You have one teacher in chair caning who is blind?—Yes, he works himself and teaches the pupils who are learning chair caning.

3389. 1,435*l.* is the whole amount of money that is received by your institution?—Yes.

Mr. J. J. Mills.

10 Feb. 1886.

3390. Is that from subscriptions?—That represents the returns from the shop; it has nothing to do with subscriptions or donations.

3391. How much of the 1,400*l.* goes to the wages of the blind workers?—I think something over 650*l.*; Out of the 1,435*l.*, 650*l.* has been paid in wages.

3392. And the 700*l.* or 800*l.* went in the purchase of materials and expenses?—Yes.

3393. What do you suppose is the proportion of material to wages?—I cannot say.

3394. You employed a traveller?—Yes.

3395. Have you found that that answers?—We give him 7½ per cent. on all he sells, and some weeks he has earned 1*l.* I think that was the highest, other weeks he has only earned a few shillings. He is doing next to nothing, but when I go round for an hour or two I can sell goods, and I do not see why someone else could not.

3396. You pay him no salary besides his per-centage?—No.

3397. You said that most of the blind men in your institution have blind wives?—Yes.

3398. Do you know what the proportion is?—I think all with the exception of four have blind wives.

3399. Your Committee disapprove of that now, and they would discharge any blind man in their employ who married a blind wife if they knew it?—Yes, that is one of the rules of the place, that any man marrying a blind woman is discharged.

3400. With regard to a market for your manufactures, have you much stock on hand?—No, our stock is worth about 350*l.*

3401. That is about the average stock in hand, is it?—Yes, that is about the average stock in hand at stock taking.

3402. (*Dr. Tindal Robertson.*) You said that you find a great many of the blind persons who applied for work at your institution had been very badly trained?—Yes.

3403. Does that apply principally to basket making, or does it apply to other trades as well?—Principally to basket making. I have had more experience with basket makers than with the others.

3404. Suppose the people who come to you were better trained as basket makers, could you find more employment for them, do you think?—Yes, I think the work would sell more acceptably in many places, because the work of many for the first six months after they come in is deficient in a great many particulars, and it is only in certain places that you can sell it. A particular man who understood a basket would not buy it.

3405. With regard to education, you think it would make blind persons more energetic if they were trained well in the first instance. Do you think if blind children were trained with sighted children it would be more likely to give them energy?—I do.

3406. And they would be more likely to succeed in after life?—Yes, the more you mix the blind and the sighted together the better.

3407. In early life as well as afterwards?—Yes; it has occurred to me that it is one of the most serious faults in all blind schools, having all blind together.

3408. With regard to the establishment of a central depôt, do you think if a depôt, or more than one depôt, were formed in London and in some of the large provincial towns, at which materials could be sold cheaply, and at which the goods might be sold also, and at which a record of the blind people who were anxious to have their goods sold could be kept, that that would be an advantage?—I think it would; it would depend entirely on the way the depôts were managed, but anything that would give the workshops an increased market for their goods must do good.

3409. Such a scheme as I have suggested, that a central depôt should be established where the blind would find material and find a sale for their goods, and where also record should be kept of all the blind people, whether in a workshop or out of a workshop, who applied to the depôt for the sale of goods would be a scheme which you think might beneficially be carried out?—I think so.

3410. One question about the inter-marriage of blind persons. Will you tell us the reasons why your committee disapprove of the inter-marriage of blind people?—They conceive that a blind man wants a sighted woman to look after him, in the same way that a blind woman wants a sighted man; it is considered that a blind couple are not able to look after themselves properly; they get to be neglectful in their persons, and in their homes too. That is my experience, though I know of some cases where it is quite different, where their homes are a pattern of neatness and cleanliness; that is generally where there are sighted children; it must be impossible, to a certain extent, for the woman to know when things are clean.

3411. Has your committee any other reason than that you have mentioned for prohibiting the inter-marriage of blind persons?—I think not.

3412. (*Admiral Sir E. Sotheby.*) How much do you charge for your pupils?—We have no set charge; the pupils we have at present to learn chair caning pay 5*s.* a week, which is sufficient to pay for their food and for the material they spoil.

3413. That is paid by the people who send them in?—Yes, or by the Charity Organisation Society.

3414. What is your salary?—150*l.* a year for self and wife who acts as housekeeper.

3415. You say your journeymen workmen have been brought up at schools; what schools have they been taught at?—The School for the Indigent Blind, and Henshaw's School for the Blind at Manchester.

3416. Have you any who were at St. John's Wood?—Yes, one man.

3417. Have you any dead stock in hand that you cannot sell?—No, we have no more stock than we should keep as a shop.

3418. Do the women cane the chairs?—Both women and men do chair caning.

3419. How many chairs can a woman cane in a day?—A good caner could do two ordinary chairs in a day.

3420. What do you charge for those?—1*s.*

3421. Do you give the workers anything extra besides what they earn?—No, we give them 7*d.* for every chair.

3422. Two chairs a day would be 12 a week; that would be 7*s.*?—Yes.

3423. Your women therefore can earn 6*s.* or 7*s.* a week in caning chairs?—Yes.

3424. Do all the women earn that?—No, that is about what the best workers get.

3425. How much would the worst get?—The worst are those two that cannot earn sufficient to pay for their food.

3426. How many women have you at work caning chairs?—Three, two of them being those stupid women that I have referred to.

3427. You have only one woman who can earn 6*s.* or 7*s.* a week?—Yes, at chair caning; we have women who can earn 7*s.* at fish bag making and sewing mattrass covers. I may mention that one man last week earned 11*s.* at chair caning.

3428. You have a sighted traveller?—Yes.

3429. Do not you think it would be better if you had a blind traveller?—I do not think so; a man travelling nowadays must be keen to avail himself of every opportunity in going about to different places.

3430. Is your secretary a paid secretary?—No, honorary.

3431. Who keeps the accounts?—Mr. Kimpton, the superintendent. I keep my wages accounts and trade accounts, but the books are kept by Mr. Kimpton, the superintendent.

3432. Does he receive any salary?—No, he is honorary superintendent. There is no one in connexion with the institution in receipt of a salary except myself and the female in the retail shop and errand boys.

3433. How much do you pay to the blind teacher who teaches chair caning?—I give him a shilling for each pupil that he has.

3434. What does he earn per week on the average?—9*s.* a week.

3435. He is content with that?—Yes.

3436. Can you make baskets yourself?—No.

3437. Though you are not able to make baskets, you can teach blind persons how to make them?—Yes; when I say I could not make baskets, I daresay I could sit down and make one.

Mr. J. J. Mills.

10 Feb. 1886.

3438. (*Sir Henry Selwin-Ibbetson.*) As the result of your general experience, do you find that there is a greater capacity in the male workers than in the female workers?—I cannot say that I have found it so. I have some very bright men and I also have some very bright women.

3439. You do not think that the men acquire more proficiency, and are able to do a better day's work than the women can do as a rule?—No, I do not think so. You could hardly arrive at a proper conclusion with respect to their comparative capabilitiy, unless you put them to the same work.

3440. You do chair caning in which both men and women are employed?—You could not draw a general conclusion from isolated cases in which a few men and a few women are employed. To give a definite answer to the question you put to me, one would require to have had an experience gained from having to do with large numbers of male and female workers, and that experience I have not had.

3441. We have had evidence before us tending to show that women generally are less able to do work than the men?—I know of nothing to lead me to suppose such a thing.

3442. I understand you to say that the youngest who came to you was 12 years old?—Yes, I think that is his age, speaking from memory.

3443. You would advocate teaching blind persons a trade earlier than that?—Yes.

3444. You think it would be better to combine industrial training with general education before they come to you, instead of confining their instruction to general education?—A boy ought to start his industrial training when he is about 10 years old, after he has learnt to read and write.

3445. So that while his touch was more sensitive than it would be at a later age, he would be able the more easily to learn his trade?—Yes.

3446. With regard to sales, I understood you to say just now that the work produced by some of the blind people during the first six months that they were with you was anything but perfect?—That is so.

3447. Can you sell all that inferior work so produced?—Yes, we have to sell it.

3448. At a reduction I suppose?—Yes. When we have mis-shapes we sell them to laundry people and others at a cheaper rate than other baskets, they are equally as strong, but they are unsightly.

3449. Do you sell them at a large reduction?—In some cases, in others not.

3450. The price that you get for them would cover the cost of material?—More than that, it would cover the cost price.

3451. You think that it would be a great advantage if besides your own market there were an organised market to which blind work generally could be sent for sale?—Yes, the workshop suffers from being on too small a scale; we cannot compete with people on the same footing as we ought to, we want the capital; we are small people, and small businesses do not pay in the present day.

3452. Do you sell in your shop any articles which you do not make yourselves?—Yes.

3453. Do you find that an advantage?—We have a female in the shop, and whilst she is there she might as well be selling articles, though not made by us, to make a profit for the institution.

3454. Do you find that you have a better sale for your goods if you sell articles not made by the blind as well as your own articles?—Yes; if we did not sell articles not made by the blind as well as those which are made by the blind we should not sell half the goods that are made by the blind that we do.

3455. A butler or a footman wanting two or three different articles would not be so likely to come to your shop for them when he could only get one of those articles, he would prefer to go to a shop where he could get all the articles that he required at the same time?—Yes; most of our trade is with ladies, we could not make the shop sufficiently attractive unless we sold things not made by the blind; we should not otherwise induce ladies to come in at all.

3456. (*Chairman.*) Supposing a blind man to have been dismissed from one of the blind institutions, would you have any means of ascertaining that he had been so dismissed and the reason why he had been dismissed?—I should ask the man where he had been; if he concealed the fact that he had been dismissed from any particular institution, I should have no other means of knowing it; if he told me where he had come from I could apply to the institution.

3457. You said that very often you have blind people sent to you who have been found incapable at other institutions?—I said they had been found incapable, but I have no means of knowing that they have been turned out of other institutions as being incapable. I only know that they could not do the work that I put them to.

3458. Have you asked them whether they have been dismissed from any institution because they were incapable?—No, they are not dismissed, they are men who have served their full time at school and leave to seek employment. I have two who have served their full time in the School for the Indigent Blind, and when they came to us they could not make a basket properly till they had been six months under me as improvers with the other journeymen basket makers; and even now if I were to put them on a different sort of work to what they are used to they would not make a saleable basket.

3459. Have you always found the other institutions willing to give you information if you asked them?—Yes, but there is no organised means of giving that information.

The witness withdrew.

Miss Rye examined.

Miss Rye.

3460. (*Chairman.*) You are the secretary of the East London Home and School for Blind Children, are you not?—We have no secretary, but I am the superintendent and manager; in fact, I opened the home.

3461. Was it entirely your own doing?—Quite so.

3462. Do you obtain any voluntary contributions in support of it?—Yes. It is partly self-supporting.

3463. You have children there from two years of age and upwards, have you not?—Yes, two years is the age from which we receive them.

3464. What number of children have you there now?—We have 16 at present.

3465. Are all the children totally blind?—They are, with the exception of two or three who can see a little, but who cannot see sufficiently to read.

3466. Are you yourself able to see perfectly?—No, I have had sight, near sight. It was sympathy with the blind, having suffered myself from childhood, that led me to commence the work. My defective sight is constitutional.

3467. Have you a committee to assist you in the management of the home?—No, I have not now. It was commenced with a committee. When first the scheme entered my head I formed a committee, but they did not get on with the work, and I found that it was only hampering me, and the committee broke up; and the ministers who were then on the committee kindly offered to become my referees, and they are now my referees.

3468. Do you mean by "ministers" the clergy?—I have ministers as referees in the report, a copy of which I have brought with me. As the committee did not succeed they advised me to take the work back into my own hands again, and they kindly offered to become referees; and I have not troubled about another committee, because the work is not larger than I can manage myself at present.

3469. What cases do you take in?—They are poor children, and they pay according to circumstances. I have brought with me a copy of the rules. If ladies place children in the home and undertake to pay for them they pay us 10*l.* a year, or in some cases they pay 5*s.* a week, which is 13*l.* a year; but we reckon that each child costs us 15*l.* a year, everything paid.

3470. What staff have you under you?—I have only three workers, matron, a governess, and a servant.

Miss Rye.
10 Feb. 1886

3471. You have no blind assistants on the establishment then?—No; there is one elder girl who assists with the housework. She is placed with us on those conditions: When the lady first placed her with us she paid 5*s.* a week for the girl. The girl did not lose her sight until she was 16, and she had not been educated at all; when first she came to us she could simply say her alphabet and nothing more. The lady who placed her with us paid for her for two years, and she has been educated as far as she could be in so short a time. The lady is not now able to pay the whole amount, and she asked me to reduce the amount and let the girl assist in the housework, and she has been very useful in that work. The lady now pays me 2*s.* 6*d.* a week for the girl and she assists in the housework in the morning and goes into school in the afternoon.

3472. You have a governess who teaches the children as soon as they are able to learn?—Yes; the governess is a sighted person.

3473. How soon do you begin giving them instruction?—Directly they enter. The youngest that we have admitted lately is three years of age. We have had them as young as two years of age, but of course for about six months or twelve months they do not learn much when they are as young as that; we have simply taken care of them and trained them.

3474. How long has this institution been founded?—Since 1874. That information is given on the back of the report.

3475. Have you turned out any children from your institution who have been able to earn their own livelihood?—There is a boy in Jersey who has left us, but we did not finish him off; we only keep the boys until they are 14 years of age. When this boy left us he went to Brighton, and there he learnt basket work. While he was with us he learnt chair caning, which we teach, and I believe he is getting his living at that now. I had a letter the other day from the lady who is interested in him, and she gives a very satisfactory account of him. He gets a small pension from the Government out there, and he earns what he can by chair caning. He also learnt music with us.

3476. At what time do you turn the children out from your institution?—The boys do not remain after they are 14 years of age, when they have to leave us. It is a mixed home for boys and girls.

3477. Why should they not leave you before if they get into some industrial home?—That is simply the age that we specify.

3478. Would it not be desirable that the boys should at an earlier age than 14 be taught something which would enable them to earn their living afterwards?—Perhaps so, but I do not think that they would learn very much at trades before they are 14. We teach them chair caning, and, of course, that is a trade.

3479. Do you teach them reading and writing?—Yes, we have a regular system of instruction. We have all kinds of educational works in the raised type, and we give them a good education.

3480. What type do you use?—We use Dr. Moon's type and the Braille type, we teach them both.

3481. Do you teach them writing in the Braille type?—Yes.

3482. And reading in both?—And reading in both. We also teach them writing in the Austin system, the Roman letters. They write letters to their friends in that system, because the Braille can only be read by those who have learnt the system. We teach three kinds of writing and two kinds of reading.

3483. Have your children earned anything by the work they do?—We have one or two girls who have earned sufficient in the holidays at chair caning, knitting, and so on, to buy themselves a few garments, dresses, and things. They knit stockings and shawls, and petticoats, and all kinds of useful articles.

3484. How soon do you begin to teach them knitting?—Directly they are able to hold knitting pins.

3485. Do you not think that it is very advisable that they should learn some handicraft as early as possible, so as to teach them how to use their fingers?—I do; but, of course, when children are so young their education is the principal thing at first. I believe in giving the blind a better education than some of them receive, and we go in for a thoroughly good English education. Children have come to me from other asylums who did not know how to spell correctly. We like them to be good English scholars.

3486. Have you a well-trained governess?—Yes, she has been accustomed to a school, she has been brought up in a school.

3487. I suppose your governess is not what is called a certificated teacher?—No, she has not a certificate, but she is quite up to her duties, and she gets the children on capitally. We had a Government inspector to examine the children some time ago, since the home has been opened, and he was quite satisfied with what they had attained.

3488. Who was the inspector?—I do not know his name; he came from the school board, I believe.

3489. Did the school board send to inquire whether your school was an efficient one within the meaning of the Act?—I believe so. I asked the inspector where he came from and he told me he came from the school board.

3490. In what year was that?—It was I think about five years ago, shortly before we moved from Bow. The home was commenced at Bow.

3491. Is your school visited by the subscribers?—Oh, yes.

3492. You say that you have no committee?—No. The rector of the Parish of Hackney, the Rev. Arthur Brooke, and several friends in the neighbourhood, have been to see the children, and our subscribers come on visiting days; we have two visiting days, Mondays and Thursdays.

3493. Do any ministers of religion visit you for the purpose of giving religious instruction to the children?—The rector comes and gives them Bible lessons occasionally.

3494. Is that part of your training?—We have the scriptures taught; we have Bible instruction every day; we are very careful about that. I am happy to say that one or two of my children have joined churches as they have grown up. We are unsectarian, so that I do not bind them down in any way; they join just where they like; some prefer church and some prefer chapel.

3495. Do you send them to church as soon as they are able to understand the service?—Yes, directly. We take our youngest now, and he is only three and a half years old.

3496. I understand that you keep them entirely throughout the year?—Yes, entirely. They have six weeks' holiday in the summer.

3497. Then at that time do they go back to their parents?—Those do who have parents.

3498. Or friends?—Yes, or friends; and some who have no parents or friends we board out for a few weeks.

3499. Is the institution closed then?—Yes, for repairs; we always cleanse and repair in the summer. Those six weeks are the only holidays that they have during the year; they do not have any holidays at Christmas.

3500. Do you teach the girls sewing?—Ye, we have a sewing class once a week.

3501. Do you teach them ordinary sewing, or sewing by the sewing machine, or both?—We do not teach them to use a sewing machine; it is ordinary sewing that we teach them.

3502. I suppose you would consider that the blind are capable of using the sewing machine?—No, I do not. I have never had any experience in teaching the blind the use of the sewing machine, but I have been told that it does not answer. We have not introduced it into our home.

3503. Are you in communication with the other institutions for the assistance of the blind throughout London?—I happen to know Miss Newbury of Kilburn, who has a home for young children, and we are on very friendly terms; but I cannot say that I know much of the other societies.

3504. What means do you take to get children for your home; do you advertise?—We adopt no particular means. We occasionally advertise, but not often. I sometimes advertise in the "Christian World," and the "Christian." Messrs. Morgan and Scott kindly receive subscriptions for the "Home." Then of course it is published in books such as Lowe's Handbook of the Charities of London, and books of that kind. I suppose that is how we have heard of some children. Then several have been recommended from St. George's Fields. I know the managers of that institution, and they have sent us several who were too young to be received by them. Miss Newbury also has recommended me one or two who were too old for admission into her Home; she does not receive them when they are over ten years of age, I think.

Miss Rye.
10 Feb. 1886.

3505. I see that in your report you publish a list of annual subscriptions and donations?—Yes; most of our subscriptions, as you see, are very small.

3506. You have also received legacies from time to time, have you not?—We have had two legacies; there was one of 100*l.* and one of 50*l.* I cannot say though that the 50*l.* was a legacy; it was sent by a lady, but I do not think that she died.

3507. You mean that it was given as a donation in her lifetime?—Yes, it was given as a donation in her lifetime. The 100*l.* was a legacy.

3508. And you have no funded property?—None at all.

3509. Have you any private means, may I ask, to enable you to keep up the institution, or do you depend entirely upon voluntary subscriptions?—I have no private means; we depend upon the contributions and the payments for the children.

3510. May I ask what you did before you started this institution; had you any responsible post?—No, I was living with my friends. My father was a surgeon; he is not alive now, but I was living at home at the time that I commenced this work.

3511. And when you were left to yourself you started this institution?—I have a mother living, and my mother acts as matron; she lives with me.

3512. I am obliged to ask you these questions, in order that we may know exactly how the home is worked?—I have not the least objection to answer them My mother has a little income of her own, and she receives no emolument from the home for acting as matron. No one receives anything from the home except the governess and the servant. My mother has always given her services ever since I commenced. I am obliged to be out a good deal amongst the subscribers; I do a great deal of the collecting myself, and my mother takes charge of the home when I am away from it.

3513. Is the house that you are in your own; is it purchased?—It is purchased; the purchase-money was paid off last summer.

3514. You have, in point of fact, devoted the surplus of the subscriptions and any donations and legacies that you have received towards the purchase of the house?—Yes, together with the proceeds of concerts and bazaars, and those kinds of things. We have raised the money somehow or other; we have been five years doing it. We removed into the Collett Avenue five years ago, and we have been just five years paying off the purchase-money.

3515. Is this balance sheet issued annually?—Every year. I keep an account of the receipts and expenditure in a large book, and then each year I make up my report from it.

3516. Are those books inspected by professional auditors?—No, not by professional auditors; by gentlemen, by some of my subscribers, for instance. Gentlemen friends have audited the accounts each year, and if anyone wishes to look at the books I am very pleased to show them. I keep an account of everything, and I have all the vouchers at home, and anyone can see the account book at any time.

3517. You are yourself responsible for the whole?—Yes, I am quite responsible.

3518. Do you clothe the children as well as feed them?—Partly. The parents are supposed to find them in clothes if they can, but what they cannot supply we have to make up.

3519. Is the house vested in yourself alone or in trustees for the benefit of the institution?—At first the deed was in my own name, because I should not have been able to get any gentlemen to be trustees for a house that was not paid for. I bought it with the arrangement that it was to be paid for by instalments, and until it was paid for I could not think of asking anyone to be responsible; so that, I being solely responsible for it, of course the deed was drawn out in my name.

3520. Are you inclined to extend the operations of your institution?—Certainly, if it grows; but we do not require a larger place at present.

3521. Is the number that you have now as many as you can look after personally with the staff that you have?—No; we could increase our number to 20.

3522. With the same staff?—With the same staff.

3523. Have you had any applications that you have been unable to entertain?—We have applications standing over, and I do not think that it will be very long before our number reaches 20.

3524. Have you had to refuse applications from want of funds?—Yes. I must tell you that we are supposed to admit free pupils as far as the funds allow. Our rules express that. We have at present two free pupils in the home, and we have two or three who are only paying half-a-crown a week. At present we cannot extend our number of free pupils, but we should very much like to do so. We have had one little child placed with us by the Gardiner Trust, and another one will enter shortly. Two of the children who are in our Home are going to be paid for out of the Gardiner Trust Fund.

3525. Are any of your children paid for by the guardians of the parishes in East London?—Yes; we have one little boy from Hackney parish, and we had a little boy from St. Pancras, but he is too old now for our school, and he has left.

3526. Are you in communication with the guardians of East London?—Yes.

3527. With all of them?—No, only with the parish that we receive children from. The boy that we have from the Hackney Union is the only one from the East of London.

3528. Have you any children from outside London?—We have only one, I think, from outside London; we have a girl from the Hitchin Workhouse. Those are the only two parish children that we have.

3529. Do you give the children any physical training besides teaching them in the school?—Yes; we exercise them.

3530. In calisthenics or athletics?—Yes.

3531. Where do the children play or take exercise?—In the playground, we have a beautiful playground at the back of the house, 120 feet long.

3532. Are they able to play any games?—Yes; they play with skipping ropes, and they have a swing in the garden, and they have a rocking-horse in their playroom. Of course they are not able to play many of the games that children who can see can play.

3533. For that reason do you think it is desirable that blind children should be associated as far as possible with seeing children?—No, I do not. I believe the blind children are far happier by themselves than they are with the sighted children. Sighted children tease blind children very much.

3534. But do you not think that it produces in the blind children a feeling of isolation in after life if they are brought up with the blind?—No, I do not see that, because they could never play exactly as sighted children play. Our children do play with many things that sighted children play with. For instance, they play with tea-things, and they manage to pour what they want into the cups by feeling with their fingers whether the cups are full. They could not do more if they were sighted children.

3535. Do you encourage them to assist one another in dressing and in household duties?—Yes, that is one of our chief points. Sometimes when they come to us at eight years of age they are not able to put on their own stockings and shoes; we allow them a month to learn how to dress themselves, and we expect them in a month to be able to dress themselves.

3536. Do you teach them any household duties, such as cooking?—We do not teach them cooking; we are afraid to let them have anything to do with fire or gas; but we teach them to sweep and dust and scrub and wash up tea-things; and one of our girls peels potatoes very nicely; she does not take out all the eyes, the servant has to overlook her, but still she does it very well. We want to make them domesticated as far as possible.

3537. Do you teach your children in the same way as they are taught in the national schools; would they be able to pass the standard?—Yes, they are taught in classes according to their abilities. They are taught mostly from the sighted books on general subjects. They have a regular course of lessons during the week;

Miss Rye.

10 Feb. 1886.

they have certain days for certain subjects, one day for grammar, and another for geography, another for arithmetic, and another for history.

3538. Do you teach them music?—Yes.

3539. How soon do you begin to teach them?—At about the age of seven.

3540. What proportion of the children that you have show any special aptitude for music?—Only a small proportion at present; I am teaching four out of 16.

3541. Do you think it is desirable that all of them should have an opportunity of testing whether they have any aptitude for music?—Yes; that is one branch of the work that I am particular about. You are sometime deceived in children; you cannot always tell whethe they have a taste for music or not unless you put them to it; so that we give every child three months' trial, and if in that time they show any taste for it, and get on with it nicely they continue it; if not we simply drop it. It is of no use teaching them music unless they have an excellent ear and taste for it, because otherwise they would never do anything at it.

3542. They could not be tuners unless they had a good ear?—No; it would not be possible.

3543. (*Mr. Johnson.*) I suppose your school is almost in the form of a private one, is it not?—It is more like a large family at present.

3544. It is a private school in which you are not responsible to anybody except yourself?—I suppose I am responsible to the public who place confidence in me, to do the best I can with the funds and the best I can with the children.

3545. Do you furnish the Charity Commission with your balance sheet?—No, I have not done so; they have never made any application to me.

3546. I suppose you are aware that every society that expends more than 50*l.* a year is liable to have to send its accounts to the Charity Commissioners?—No, I was not aware of that.

3547. What is the amount that you get from Hackney and from St. Pancras for those two pupils that you have from those unions?—We get five shillings a week for each of them, and we feed and clothe and educate them.

3548. The board of guardians pay that, and you ask for no more?—That is so.

3549. That is your ordinary charge, is it not?—Yes.

3550. Your governess is not trained, I suppose?—She has been brought up at boarding school; she is well educated, but not certificated.

3551. She has not been trained at a training college?—No.

3552. Nor at any college for the blind?—No.

3553. Do you employ the school board standards in your education?—No, we do not.

3554. I understood you to say that your children were examined by a school board inspector?—Yes.

3555. He did not examine on the standards then?—No.

3556. (*Chairman.*) It was some years ago that that took place, I think you said?—Yes.

3557. (*Mr. Johnson.*) Out of the 16 children in all, you say that two or three have partial sight; do you find it any advantage to have children with partial sight mixed with those who have no sight at all?—We prefer it, because they are able to help to lead the others. We find it very convenient both in going for their walks and in going to a place of worship to have one or two that can see.

3558. But you do not think that as a rule it is a right thing to mix the sighted with the blind?—Not in the case of thoroughly sighted children, but none of ours can see sufficiently to be called sighted; they can only see just sufficiently to guide themselves about, and if you put them in a strange place they would not be able to manage at all. They can only see when they are familiar with the place.

3559. What is the total amount of subscriptions that you receive in the year?—You will see that on the balance sheet; I cannot remember exactly what the subscriptions amount to altogether. We have a good many subscribers, but the amount of the subscriptions is small.

3560. (*Dr. Tindal Robertson.*) Now that the house has been bought, do you propose to transfer it to trustees?—I am considering that; I have not made up my mind either way yet. In like way: I should not like to be trammelled in any way. In case the house got too small and I wanted to purchase another house, if the house had been transferred to trustees I could not do so without the consent of the trustees; and supposing that they would not sanction it, a difficulty would arise.

3561. Do you not think that if you showed them that the object was a good one, they would consent?—I do not know; trustees are sometimes rather difficult to deal with.

3562. By what system do you teach music?—From our own music; we teach them from memory. We have raised music but we do not find it answer very well for them.

3563. What kind of raised music do you use?—Dr. Moon's, of Brighton.

3564. Do you ever attempt to teach at all by notation by the Braille system; do you understand anything about teaching music by that systen?—No, I do not.

3565. Therefore it is not taught?—No, it is not.

3566. I understood you to say that you thought it better for blind children to be educated by themselves than with sighted children; do you not think that it gives more self-reliance and energy to blind children if they are accustomed to mix with sighted children?—Personally I do not believe in mixing them. I do not think that they would get on so well. I am quite satisfied that they feel their affliction far more when they are with children who can see, and they are not nearly so happy as they are by themselves.

3567. Have you seen it tried?—I have invited little friends to take tea with them, and that kind of thing, and I have always noticed that they have not got on so well together.

3568. That is an occasional thing; but you have not had experience of it generally?—No, I have not had sighted children mixed with the blind children.

3569. Therefore your idea is not founded on experience; it is simply an opinion?—Exactly.

3570. What should you think with regard to what I said about its making the blind more self-reliant if they are mixed with the sighted?—Certainly, I should desire them to be self-reliant, and it is our best endeavour to make them so; that is what we want to do, but you cannot make them self-reliant beyond a certain extent. We must always remember that they are blind, and that it is impossible for them to do many things that sighted children can do.

3571. Have you had any experience of children taught in board schools in London?—I have.

3572. What is your opinion of the system there?—I do not approve of it.

3573. For what reason?—One reason is that they are giving the children an education too liberal and far beyond what is desirable. And there is another reason. If a child attends a board school, and it is quick and clever, it will learn; but if it is dull you may as well keep it at home, as it will not learn. We have two little children now who have come from a board school; one little boy can see his way about, and he has been at a board school since he was two years old, and he cannot spell a word of three letters.

3574. What age is he now?—Eleven.

3575. Do you know what school he was at?—I do not know, but I could ascertain from the parents. This boy comes from Wandsworth. He tells me that he has been at school ever since he was two years of age, and I cannot think what he has been doing all that time; he has not learnt anything even from memory. We have another, a little girl, who is 11 years of age, she comes from Bromley-by-Bow, and she has also been at school and knows scarcely anything.

3576. (*Admiral Sir E. Sotheby.*) Do you mean to say that this little boy has been nine years at a board school?—Yes, ever since he was two years of age.

3577. That can hardly be, because I do not think board schools have been in existence nine years?—I think it is a board school; however, I could find out, it might possibly be a national school, but the girl I am speaking of I know has been at a board school.

3578. (*Dr. Tindal Robertson.*) Have you yourself ever had any experience of the teaching at a board school, and have you seen the system that is adopted and practically tested it at all?—No, only by experience of children who have been at the board schools.

Miss Rye.

10 Feb. 1886.

3579. Have you personally taken the trouble to test it?—No, I have not; it is only from observation that I speak.

3580. From observation of what?—Of children who have attended board schools.

3581. But you said you were not quite certain whether this boy had been at a board school?—No; but the girl had. I am not sure whether it was a board school in the boy's case.

3582. Then your experience is only derived from one case?—It is derived from the case of one little girl at present. I believe that the national schools are all amenable to the board and are under some Government inspection. This boy used to pay fourpence a week; I do not know what the fees of the school board are.

3583. (*Admiral Sir E. Sotheby.*) As a rule which system do you consider the better to teach these children, Moon's or Braille's?—I prefer Moon's for some things and Braille's for some. The Moon is best for reading and the Braille for writing.

3584. Are all your children paid for?—No, we have two free pupils at present.

3585. How were they sent there?—Their friends applied and they were very worthy cases and I took them.

3586. Then you have no elective system?—No. One of the free pupils is a little boy four and a half years old; his mother took him out of the workhouse and sent him to us; he lives at Watton in Norfolk.

3587. Have you observed a great improvement in the habits and so on of these children after they are taken from their homes?—Very great. They are brought up by their friends so as to be simply helpless; they are taught nothing.

3588. How do you account for their being so helpless?—Because the parents do not teach them to be self-helpful. They do everything for them, because they are blind, I suppose; but it is a mistaken kindness.

3589. Is the 5*s.* a week that the guardians pay for children sufficient?—No. We reckon that each child costs us 15*l.* a year.

3590. Have you ever applied to the guardians for more pay?—No.

3591. I believe you might get more?—I do not believe we should get more.

3592. (*Sir Henry Selwin-Ibbetson.*) You say that you have a child from Hackney and a child from Hitchin; what do the guardians pay in the case of those children?—They pay 3*s.* a week for the Hitchin girl and the rest is made up by a charitable lady.

3593. Do you get anything from the Gardiner Trust Fund for the two children of whom you spoke?—Yes, they have allowed a grant of 25*l.* for two pupils; that will be 12*l.* 10*s.* each, that is to say 10*s.* short of 5*s.* a week each.

3594. And that is about the amount that is paid generally by the children?—No, we have two at 2*s.* 6*d.* a week, two or three at 10*l.* a year, and some at 13*l.*

3595. You are evidently not an advocate of their being educated with sighted children?—Certainly not.

3596. Do you think that they ought in early life to be taught industrial as well as educational work?—No, not too early. I believe in educating them first. What can you teach a little child of three or four years of age in industrial occupations. Directly they are old enough to begin to knit we teach them to knit, but not so young as that.

3597. I understood you to say that the boys remain with you until they are 14 years of age?—Yes.

3598. From the age of 10 to 14 do you not think it would be of use to teach them such work as chair caning?—Yes, we do so.

3599. And do you teach them basket making?—Not basket making. I should not commence so early. We do teach them to cane chairs.

3600. Is it not a fact that their power of work afterwards depends very much upon the dexterity acquired while the fingers are supple and sensitive?—Yes, to a certain extent, of course. We do not allow them to sit with their hands before them all day. We teach them little simple things. The little ones make soft balls, and that kind of thing, but they do not learn any trade to commence with.

3601. We have had evidence that when many of the old pupils begin learning their industrial work, such as basket making, it takes them a very long time to acquire the knowledge, and that therefore the work they do is unprofitable work, because it is imperfect; do you not think that if, as children, together with their educational work, some of that industrial work was ingrained into them, they would go out to the workshops and schools afterwards better fitted to compete with the trade?—In some schools I believe they are taught basket making when they are as young as 10 years of age.

3602. Do you not think that it would be of advantage in your school, from the age of 10, say, to graft on to your educational work some industrial training of that sort beyong the teaching of chair caning?—We should prefer to keep ours more as a children's home; we think that there are plenty of institutions for teaching trades. Of course we teach chair caning, and they teach that in other institutions; and the girls we teach the same as they teach them in other institutions, but we have no idea of introducing basket making into our home.

3603. (*Chairman.*) Do you, with your experience, think it desirable that there should be more preparatory schools for the instruction of infants, beginning at the same age as you do?—No, I do not. As a rule, blind children are not placed at school until they are over seven years of age. In special cases where, perhaps, the mother is a servant and the little one has no father, the mother is very thankful to place the child away young; but as a rule mothers and fathers do not care to part with their blind children till they get about seven years of age.

3604. But inasmuch as you say that the mother does not teach the blind child anything, but does everything as far as possible for it, do you not think generally in the case of the children of the poorer classes who are blind, that they should be sent to preparatory schools at the same age as children are sent to the national schools in London?—Yes, for that reason it would be good, of course; they would get more self-helpful; I did not think of that.

3605. But you think that there would be great unwillingness on the part of parents to part with their blind children?—Yes, I do not think it would answer. I do not think that mothers would part with their blind children so young if they could possibly keep them at home. We have a case now of a little boy whose mother will not part with him, and since that, after a lady had nearly arranged with us to send a child, the mother would not part with him because she said he was too young, and he was between three and four years old. The other little boy I was speaking of is five years old, and the mother will not part with him now until he gets older.

3606. Do you think that there would be no general approval of the law being made compulsory in the case of blind children as it is in the case of sighted children?—No, I think not. I think there would be great difficulties in the way of getting them so young.

3607. Have you any views with regard to the industrial training of boys and girls after they have left school, after they are 12 or 14 years of age?—I have often thought that it a great pity that some employment for the blind cannot be introduced which is more lucrative. The handicrafts that they learn are so badly paid for. Knitting is very slow work, and it is impossible for a woman to support herself entirely by knitting stockings.

3608. You have never tried to teach them the use of the sewing machine?—No, I have heard or read of another institution where they tried sewing machines some years ago, but they found that they did not answer. I have never thought about trying it, and it seems to me that it would be dangerous for a blind person to work a sewing machine. It requires good sight to thread the needle: she cannot thread the needle by feeling; she would be obliged to have some one to thread it Then I should think there would be a danger of her running the needle into her finger if she were entirely blind.

3609. But if there was a machine which did away with the necessity of their threading the needle would they

Miss Rye.
10 Feb. 1886.

not be able to work it?—Yes; but then how would they get work? It is not likely that blind people would be employed in preference to sighted people. That is the great difficulty, to find some handicraft which the blind could learn and which would be lucrative, and which the sighted people would not be likely to supplant them in.

3610. Have any of your children ever got any appointments as tuners when they have grown up?—No, we have not been established long enough to send children out. We have only parted with two, and they went to other schools. The boy that I told you of went to Brighton after he left us, and he learns basket work, but his hands were not strong enough to work at it; consequently he does not do it; he still continues at chair-caning. We consider that chair-caning really pays better than anything that they could learn, if they could get plenty of it to do, and it requires very little capital to set them up in it.

The witness withdrew.

Adjourned to to-morrow at 12 o'clock.

32, Abingdon Street, Westminster.

Thursday, 11th February 1886.

PRESENT:

LORD EGERTON OF TATTON IN THE CHAIR.

THE RIGHT HON. SIR HENRY SELWIN IBBETSON, BART., M.P.
ADMIRAL SIR E. SOTHEBY, K.C.B.
W. TINDAL ROBERTSON, ESQ., M.D.
T. R. ARMITAGE, ESQ., M.D.
E. C. JOHNSON, ESQ.

CHARLES E. D. BLACK, ESQ., *Secretary.*

JOHN ROBERT FASSETT BURNETT, Esq., examined.

J. R. F. Burnett, Esq.
11 Feb. 1886.

3611. (*Chairman.*) You are chairman of the London Society for Teaching the Blind to Read, at Upper Avenue Road, St. John's Wood?—Yes.

3612. How long have you been chairman of that institution?—I was elected chairman in my absence in the country in July or August last. I was away for some time, and I was only in town for a month, and then I was away at the Isle of Wight till Christmas, so that it is really only since Christmas that I know much about the practical working of the institution.

3613. What is the number of your committee?—There were 24 gentlemen elected upon it; several have resigned since, and there have been three or four elected. I think that at present the committee consists of about 18.

3614. What number of inmates have you in the institution?—At the present time there are about 25 males and 15 females, about 40 altogether, independently of the matron and servants and the schoolmaster.

3615. Do you simply teach them trades, or do you give them also a general education?—There is very little doing in the way of teaching trades now, only basket making and chair caning. Our pupils are taught generally in the schoolroom.

3616. What are the ages of your inmates?—They vary from eight up to 20, and over. Some of them are older than 20. Some of them have been brought up in the school, and are now acting as assistants in the school. The second master, for instance, was brought up there, and he is now acting as assistant schoolmaster.

3617. What staff have you?—In the first place there is the schoolmaster. He takes charge of the embossing part of the business.

3618. You say the schoolmaster takes charge of the embossing part of the business. What do you call the embossing part of the business?—The printing; it is only in Lucas's type. The school was originally established, I believe, for the purpose of teaching Lucas's system and embossing in Lucas's type, 48 years ago. We now teach Braille as well.

3619. Do you emboss the Braille?—We do not print it. All the embossing that is done in Braille is done by the pupils in writing from dictation as part of their lessons; we do not publish any books in that system

3620. Have you any limit of age at which you admit pupils?—The limits of age are 8 and 21; there is a difference of age between the males and the females of one or two years.

3621. What is the difference?—We receive males between the ages of 8 and 17, and girls between the ages of 8 and 21.

3622. Do you make any charge for boarding?—Yes, there are boarding pupils, free pupils, and day scholars.

3623. Will you state the charges that you make for the boarding pupils and the day scholars?—From 20*l.* to 25*l.* for boarders. With regard to day pupils, some come for general instruction, and some for particular classes only. One, for instance, recently came only to learn the Braille type.

3624. You said that you taught your pupils basket making and chair caning; do you teach them any other trades as well as give them a general education?—There are no other trades at the present time, except that the girls do a little knitting and netting and we have just started sash line making.

3625. Do you sell any work made in the institution?—Yes.

3626. Can you state what the amount of the sales has been in the past year?—I think there is not very much trade, there might be more if we had greater facilities for working. We have facilities to a certain extent in our workshops, but for mat making and weaving, and those kinds of trades, we require larger workshops.

3627. Do you mean you want larger premises?—We have plenty of room, but we are in a sort of transition state at present. There has been a negotiation going on the last three or four years with the vestry, who are anxious to bring a new road through there, and they have been wanting to take a portion of the ground, and give us some other ground in exchange, which in some respects would benefit the institution because we should get a rather larger plot of ground, and it would open the premises to two more roads, so that we should have a frontage three ways; but we cannot do anything in the way of preparing for a workshop or anything of that kind till that is settled. The plan for the new road has been altered four or five times, and it is only since the last snowstorm that a final plan has been prepared, showing the line they are proposing to take.

3628. What is your income—from endowments, first of all?—We have no endowment; our income is entirely from annual subscriptions and donations, and the proceeds of what money is invested.

3629. You have savings invested?—We have some savings invested which were augmented very considerably by the Gardner bequest.

3630. Will you state what the amount is?—It is about 14,000*l.* altogether, I believe.

3631. That is something in the nature of an endowment?—I do not call it an endowment, because it simply represents legacies left to the place, which we invest as far as we are able to do so, if not required for the general purposes of the institution. If the income from annual subscriptions, donations, and so forth, was not sufficient to meet the expenses, and a legacy came in of 500*l.*, and supposing 200*l.* was wanted for the expenses of the institution, the remaining 300*l.* would be invested. We could sell the whole of the money out to-morrow if we liked.

3632. Therefore you have funds available for the extension of the workshops and other buildings necessary for carrying on your work?—Yes.

3633. What are your subscriptions?—Our subscriptions have fallen off very much of late; for some years they averaged over 600*l.* a year; but they dropped from over 600*l.* in 1879 to 275*l.* in 1884. I have ascertained, however, from the secretary that in the last nine months up to the 31st of December we have received about 450*l.* of annual subscriptions, some portions of which, I have no doubt, are arrears.

3634. Do you attribute that to the fact that you had not done so much work in the years previous to last year; and also to the transition state to which you alluded?—I attribute it to the transition state entirely; because during that transition state there have been no elections; there have been no elections during the last two or three years.

3635. Your operations have been suspended, in fact?—Yes.

3636. You have no doubt that if your operations were extended you would be able to find funds from subscribers in addition to the income from the capitalized sum which you have mentioned?—I have no doubt of that, because in the subscriptions which we have received up to the 31st of December last there is upwards of 50*l.* from new subscribers; and in addition we have had 200*l.* in donations during the same period.

3637. Do you communicate with the other societies for the blind in London?—Yes, at times.

3638. Do you meet together from time to time to consider your course of action?—No.

3639. Do you think it desirable that there should be some common action on the part of the different societies connected with the blind in London?—I believe it would be desirable if common action could be taken with regard to a universal type for the blind. I think the societies work in different spheres. Some are able to do a large trade, and some are able to devote themselves more exclusively to education of one sort or another. I do not think any great benefit would result from common action in those directions.

3640. Do you think that voluntary efforts are quite equal to cope with the necessities of the blind, both in their education and in their industrial training?—I think so.

3641. After your pupils leave you, do you follow them in their career in the world afterwards?—I am not aware of what has been the plan as regards that. I believe that an arrangement has been made to do so, which will be eventually carried out; that is a matter that I was discussing the last time I met some of the committee.

3642. Do you know anything with regard to the subject of pensions to the blind; are you aware of the practical working of the pension system in London with regard to the blind?—I am aware that there are pensions for the blind, but I have had very little to do with the distribution of them.

3643. Have you had any experience in the industrial training of the blind at any other institution than that of St. John's Wood?—I have had considerable experience in the School for the Indigent Blind, and I know that a very great benefit is derived by a number of blind people from the work that they are now enabled to do from what they learned when they were in the school; in fact, many of them are able to materially assist in their maintenance, if not altogether to support themselves.

3644. Have you any shop, or do you propose to have any shop, in connexion with your institution?—There is no shop now, but if we are able to carry out our views with regard to the workshops, no doubt we shall have a shop at the corner where two roads meet, at the other end of the premises which we shall acquire if the exchange is made.

3645. Do you think that there ought to be any difficulty in disposing of the work of the blind if proper arrangements were made and if the thing were conducted on proper commercial principles?—No.

3646. We have been told that there is a difficulty in disposing of the work of the blind?—I do not think there is any difficulty in disposing of the work of the blind if it is properly executed, which can only be done if the work is properly supervised; if the workers are left to themselves they will probably make very badly shaped baskets, and there is a difficulty in disposing of them.

J. R. F. Burnett, Esq.
11 Feb. 1886.

3647. You think that the blind ought to have proper supervision in all cases?—For trade purposes, certainly.

3648. Do you think that the blind work better working under sighted supervision than if they are left to themselves to work on their own account?—Certainly; in fact, there are some descriptions of work that the blind do, and do satisfactorily, which they cannot do without sighted supervision.

3649. Some of the institutions employ a considerable number of journeymen; have you any journeymen?—That is one of the points about which we are very anxious at the present moment. It came to my knowledge in the last week or so that in our immediate neighbourhood, Portland Town and so forth, there are something like 80 blind people, whom it would be a very great benefit to employ, if we could find a workshop for them to come to; it was only at the last meeting of our committee, on Monday, that we made arrangements for ascertaining exactly the number of such people, through the clergymen and district visitors, and we hope very shortly to be put in possession of more information with regard to those people.

3650. We understand from the evidence which we have received, that one great difficulty in dealing with the blind after they have left the different institutions is to find constant work for them, and you propose to make arrangements with the view of meeting that difficulty. You propose to employ journeymen in a workshop, and to provide means for the sale of their work?—We propose to do so.

3651. Have you any suggestions to make to the Commission with regard to the education or industrial training of the blind beyond what you have already stated?—Only this, that I think if there was one universal type for the blind it would be very much better than having several, as there are now. I think that the Roman type is certainly one of the things that the blind ought to know; the Braille I believe to be the easiest and quickest mode of communication for the blind *inter se;* but there is this disadvantage in it, that when the blind write in Braille to a sighted person, the sighted person requires a key. I have a friend in Belgium who, when he writes to my daughter, is obliged to send a key with his letter, whereas, if he wrote in the Roman type, she would be able to read it, or if she wrote to him he would be able to read it, and his children would be able to read all her letters to him. It is like a boy having to turn Greek into Latin, and having to find every word in the dictionary.

3652. Do you think that there would be any advantage in having one type for printed matter and another for written matter, say, the Roman type for printed matter, which might be used for communication with the seeing, and the written type Braille, for communication among the blind themselves?—Yes, I think decidedly the Roman type and the Braille are the only two types that would be of very great advantage to the blind; and certainly in England. I believe Braille is more universal on the continent.

3653. Do you know anything of Moon's type?—I only know it as being used to a certain extent in our schools.

3654. Do you teach it?—We have some of the books, some of the pupils know it, but it is not taught in the school.

3655. Do you consider it inferior to the other types?—I think Moon is better than Lucas's because it is the one that approximates nearest to the Roman type, and anyone who knew Moon's would very soon learn the Roman or vice versâ.

3656. Have many of those now in your institution been born blind, or have they become blind in later years?—I should say about three in ten have been born blind.

3657. (*Sir Henry Selwin Ibbetson.*) I understand you to say that at present the only industrial training that the inmates of your institution get is a certain amount of chair caning and basket making?—And the girls get sash line making and knitting and netting.

3658. The sash line making has only just started?—It has only just started; it was started at my suggestion since my return from the Isle of Wight at Christmas.

J. R. F. Burnett, Esq.

11 Feb. 1886.

3659. You attach importance to the blind being taught a trade early?—I do not think they should begin too early.

3660. At what age would you begin their industrial training?—It would depend on what the trade was; some trades they should begin to learn earlier than others. I do not think they ought to begin to learn basket making before 13 or 14.

3661. You do not think an earlier tuition in industrial work enables them to acquire more rapidly a full knowledge of their trade than if they begin later?—From my experience with regard to basket making, I think that a boy who begins to learn at 14 will be a better basket maker at 18 than he would at 20 if he began at 12. If he begins too young he has not the power in his hands to bend the twigs or shape the basket in a proper form, and if a boy breaks the twigs instead of bending them properly, and gets the basket into an improper form, he never gets into the way of making a basket properly.

3662. Therefore you think he should begin to learn such work at about 14?—Boys vary so very much that it is impossible to fix the age. There are some at 12 who are really more children than others at 9 or 10, both in stature and intellect.

3663. From what you have said as to your intentions, I suppose you attach considerable importance to combining industrial training with general education in any institution?—Yes, certainly.

3664. And you would propose to increase the usefulness of the institution by not only keeping a record of those who have gone through the institution, but affording them facilities in the way of workshops to continue profitable labour after they have left you?—Our object is to establish workshops in which blind people of good character, who have learned any trade, such as mat making, basket making, weaving, or any other trade, may come and work for journeyman's wages.

3665. Do you or do you not think that it would be an advantage if the societies generally who have the benefit of the blind at heart were to unite together not only for supplying material at cost price to these workshops, but for finding a market for the work done. Supposing there was some combined working between the different institutions, you would probably be able by that combination to get a greater sale for your goods than you can working separately?—I do not think there would be any material benefit derived from that. I think it would probably tend to concentrate workshops too much, and the various institutions would do better in their own localities. If they got a sufficient sale it would be of no use to have a huge workshop to bring the workpeople from any distance to, they must live in the neighbourhood of the workshop; they are not like sighted people, they want guides to take them to and from their work.

3666. My question was whether you did not think that a central depôt for the sale of work made by the blind would be a benefit?—I do not think that a central depôt would.

3667. You think that the advantage would be greater in having shops in the different localities?—Yes.

3668. Attached to each institution?—Yes. If you had a large central depôt for the work of the blind you would have nothing but wholesale trade to look to, whereas if you have a number of small depôts in various localities you get a great deal of retail trade in the neighbourhood.

3669. Do you think that the sale of the work of the blind is a paying trade unless you combine other articles with the work that the blind do, that is to say, would a retail shop merely for the sale of articles made at any particular institution by the blind be a paying concern?—I think it would, but I think you must also supply other articles if required. A person sends an order for various articles made by the blind, mats, brooms, brushes, and those things; and also an order for a cinder sifter, for instance, which is an article that the blind do not make, and he is annoyed if he does not get it from the same place. You are obliged to be able to supply such things; you are not obliged to keep a stock of them, you can always procure them and send them with the other things.

3670. You would not limit your shop to the sale of articles made by the blind?—No.

3671. With regard to the pension question, are any of your people that you keep an eye upon after they have left you in receipt of pensions?—I only know one of our people who has a pension.

3672. Do you know of any cases in which an individual enjoys more than one pension?—I believe there are some.

3673. Do you think it would be an advantage if some regular system was established by which endowments for the purpose of providing pensions to the blind were distributed more satisfactorily than they appear to be at present?—No, I do not think it would.

3674. You do not see any necessity for a reform in the present system of distribution of pensions, under which one man gets far more in the way of pensions than he ought to get, and therefore many others are excluded?—No, because the pensions are not of such a character as to necessitate it; they are very small; they are not like large pensions; probably if a man has two pensions he does not get much more than 10*l.* in the whole

3675. We heard of one man getting about 50*l.* in pensions from different trusts or institutions?—I should think that that was a most exceptional case, but I should think that the managers of an institution, if they had reason to think that a man had more than one pension, would communicate with each other as a matter of course.

3676. That implies that there should be a system of correspondence, at all events, between the different pension societies?—It would be an advantage to some of the pension societies if they required information to communicate with the others. I do not think it should be compulsory.

3677. You do not think that it is a disadvantage for a man to have more than one pension?—It depends upon the amount of the pension.

3678. (*Admiral Sir E. Sotheby.*) You said that you had 40 inmates altogether?—Yes.

3679. You said that your staff consists of a schoolmaster, an assistant-schoolmaster, and a schoolmistress. Are they all sighted people?—The assistant-schoolmaster is blind; he was brought up in the school as a boy, and has been retained as an assistant.

3680. You make baskets?—Yes.

3681. Who teaches your pupils to make baskets?—There is a basket maker.

3682. Sighted or blind?—Sighted.

3683. Have you any other instructors to teach trades besides the basket maker?—He teaches cane work also.

3684. Do you know where he was brought up?—No, he was engaged by the late committee; he has been there about seven years.

3685. You say that you have got about 14,000*l.* in legacies. Is your house freehold property?—It is on a 99 years lease, of which I think something like 60 years is unexpired.

3686. Have you ever calculated what the value of that property is now, supposing you wanted to get rid of it?—I have not.

3687. What should you say it would be?—If this new road comes it will cut through a portion of the ground; and the other ground that we should have would be on a 99 years lease.

3688. Do you pay so much a year ground rent?—We paid the ground rent for a certain time, and that was bought up, so that now we have a freehold for 60 years.

3689. Have you calculated what is the value of that freehold?—I have not gone into that; it has been calculated, I understand, by the surveyor.

3690. It is a very valuable piece of ground?—It is a very valuable piece of ground; I believe that the value of the ground was calculated to be about 8,000*l.* or 9,000*l.* merely as building ground, without any buildings upon it at all, but that was some little time ago.

3691. How much do you pay the man who teaches basket making?—He has 50*l.* a year.

3692. Is he a very competent teacher?—That I will not undertake to say; if we got a larger extension of our trade we should probably change him.

3693. How are the pupils selected?—The paying pupils are taken on the nomination of a subscriber, and the free pupils are taken by election.

3694. How many are rejected at elections in proportion to those who are taken?—I cannot say; there has been no election for the last two or three years; there will be one in April next.

3695. You say you would have no difficulty in disposing of your goods if you had a good shop. What experience have you had in selling things made by the blind?—I have been for 25 years connected with St. George's. I know we do a considerable trade there.

3696. Do you think that you would have the same success as they apparently have had at St. George's?—I see no reason why we should not; it is an increasing neighbourhood. There has been an immense number of houses built there in the last four or five years. I do not see why we should not have as good a trade as they have at St. George's.

3697. Have you any shops in your neighbourhood which sell the same articles that you produce?—Very few, I think.

3698. Is there any disadvantage in blind people living away from the place where they work?—The only disadvantage is that if they are in a very populous neighbourhood they require assistance in getting across the streets.

3699. Does not their living some distance away from their work ensure them exercise?—Yes.

3700. (*Dr. Armitage.*) Can you tell us why you recommended the introduction of sash-line making?—It was considered to be a good employment for the girls. I had seen it worked very beneficially at St. George's, and I thought that it would be a very good thing to introduce in our school.

3701. Is that for the benefit of the school, or for the benefit of the pupils after they leave the school?—Both.

3702. You think that it benefits the school?—Yes, if there is a sale for it, certainly. We only began it since Christmas.

3703. Have you any experience of sash-line making as an employment for the blind?—I have this experience, that we make a very large quantity of it, and have a very good sale for it at St. George's.

3704. Do you know of any case of a blind girl who, after leaving St. George's school, has got her living by sash-line making?—I cannot say that I do.

3705. Do you not think it advisable to teach such trades at your school as the blind can work at when they leave, so as to earn their living?—Certainly, there is no reason why they should not make sash-lines after they leave.

3706. But you say you do not know of any girl who makes a living by sash-line making after leaving the school?—No.

3707. Do you think that it is an occupation which is likely to be useful to blind persons?—It may or it may not be. Of course it requires two to work at it.

3708. You say that a certain number of your pupils are introduced by election. Can you tell us about the proportion of those at present at the school who have been elected?—About half that are here now have been elected.

3709. Is that election for the whole period of their residence in the school?—They are elected in the first instance for three years; then they have to come for election again, which I think is a very bad arrangement. They have to be elected again after three years.

3710. Do I rightly understand that if they do not succeed in being elected at the end of three years, they have to leave the school?—They have to leave the school.

3711. You think that that is a bad plan?—I think it is a bad plan, certainly, because I do not think children ought to begin industrial work too early; and if they are elected for three years, and they do not succeed in being re-elected, they may have to leave before there is any possibility of teaching them anything by which they can benefit themselves afterwards.

3712. You were speaking of the different systems of reading and writing; have you any personal knowledge of them?—No.

3713. You merely speak by hearsay?—I speak from my observation for some years in visiting schools. I understood you to ask me whether I was able to read and write the different systems.

3714. What I intended to ask you was whether you had any personal experience of those systems?—Yes, certainly.

J. R. F. Burnett, Esq.

11 Feb. 1886.

3715. Do you think that in selecting a system that system should be selected which is the best for the blind, or that which is the easiest for the seeing?—I think that a system which would enable the blind to communicate with one another and also with the seeing public would be the best.

3716. I am not speaking of letter writing, but of school education, that is to say, the education of a child in a school; do you think that that system ought to be selected which is the most useful for the blind, or that which is the most easy for the seeing teacher?—I think the one that is most useful for the blind, the one which would be the most easy for the blind to communicate between one another by, is the Braille system, and at the same time they should be educated in the other system, which enables them to communicate with seeing people.

3717. My question was simply with regard to education in school?—For education in school Braille's is of course the easiest.

3718. Do you think Braille's is the best for use in the school education of the blind?—I think it is; it is very quickly learnt, it takes up much less room, and perhaps it is the easiest system by which the blind can communicate *inter se*.

3719. Do you think it is important in school education for the blind to have the means of readily writing out exercises and doing their work as seeing children do at ordinary schools?—Certainly; a system that will give them the greatest facility in doing sums, writing from dictation, and so on I should consider the best.

3720. Do you know of any system that fulfils these conditions except the Braille?—Certainly, but not so easily; the children can do the same, as far as writing from dictation goes, by the other system, but not so easily.

3721. Now, as to correspondence; have you any experience of how long it takes an ordinary intelligent seeing person to learn the Braille system?—I should think not very long.

3722. Have you any experience of how long it would take?—No.

3723. If children write home to their parents or friends do not you think the parents or friends would willingly spend half an hour or an hour in learning a system in order to communicate with their children, supposing that system to be the best for them?—A parent might no doubt take a little trouble to learn a system in order to be able to communicate with his child; it would not take him very long to learn, and no doubt he would do it.

3724. (*Dr. Tindal Robertson.*) Have you any market outside your own institution for the Lucas books?—We have sent some to Australia and some to Plymouth, but the demand is certainly decreasing for them.

3725. Is there any great demand for them?—No, the demand has decreased very much; some years ago the average sale of books was 75*l.*, but it has dropped down to about 40*l.* a year.

3726. With regard to the average time which it would take a person to write by the Roman system and by the Braille system, have you any idea what the difference would be?—No.

3727. Can you form an approximate idea of what the difference would be?—I look upon the Roman system and the Braille system as being almost the same as writing and shorthand writing.

3728. Can you tell us what system of teaching music is adopted in your institution?—I cannot say anything about the system that is adopted; the matron was schoolmistress for some years before she became matron, and she will know more about those matters than I do.

3729. What means are taken to promote the healthy exercise of the inmates of your institution?—They go out walking when the weather permits; the boys go out in charge of the master; they have a drill sergeant every week, and we are just now about putting up a gymnasium; they have had poles and various things, but the place has been in abeyance, and they have been all let go to rack and ruin the last few years.

3730. I suppose there is a playground?—Yes.

3731. Is it the intention of the committee to provide different kinds of games for the children in future?—Yes.

J. R. F. Burnett, Esq.

11 Feb. 1886.

3732. Is it the idea of the committee that that kind of thing would be most important for blind children, that is to say, the promotion of their physical health by means of outdoor games and exercises?—Undoubtedly; at present indoors the schoolmistress exercises them a good deal, she makes them march to music, and she makes them dance and all sorts of things to exercise them.

3733. Do you think the putting of blind children with sighted children for educational purposes is of advantage to the blind children, or that it would be better to aggregate blind children together in one place and teach them separately?—For educational purposes I think there would be an advantage in mixing them together; but I doubt very much whether they would get on so well together in learning trades, because sighted children would naturally very soon surpass the others, and discourage them very much if they found they were not doing so well as they might.

3734. I was not speaking of learning trades; I was simply speaking of general education?—In general education it might be of advantage to them, because they might get considerable assistance from the sighted children.

3735. Do you think that the blind children would suffer from this disadvantage, that they would be teased by their sighted friends?—No doubt they would; in any ordinary school, if any boy comes in who has any peculiarity about him he gets pretty well teased at first.

3736. Do you think the fact of a child being blind would not evoke the pity and sympathy of the other children?—Yes, I think it would with the majority; but at the same time he would be likely to be exposed to a great deal of taunt and disagreeableness in the first instance; probably it would be got over in time.

3737. As to the central depôt which has been spoken of, we know that there are many districts in London and in the provinces where there are no such institutions as your own and the St. George's School. Do not you think that a central depôt which would provide articles at cost price to blind people who might work at home, which would also give them the opportunity of selling their work, and which at the same time would enable a record to be kept of them, so that they might send their names to this central depôt, and have their work exposed there for sale, would be of advantage?—I should doubt it very much.

3738. For what reason?—I think that each school would do better in looking after its own people.

3739. I am speaking of places where there are no institutions for the blind such as you represent?—I have not given that matter much thought, but I should very much doubt the advantage of it.

3740. You have no special reason that you can give why you think such a central depôt would not be advantageous?—I hardly gather whether you mean that the central depôt should be a place to which work should be sent for sale.

3741. There may be districts where such schools as your own are not known in large provincial towns or small provincial towns where those institutions do not exist. Do you, or do you not, think it would be an advantage that there should be a kind of a depôt established where materials could be bought at cost price by the blind who chose to go there, and where the goods when they were made might be exposed for sale; and where, also, a record of the blind people might be kept, so that they could be followed up and looked after?—It might be advantageous in some districts, but it would be only in places where there was a considerable neighbourhood, and where there was a likelihood of getting a sale for the goods.

3742. (*Mr. Johnson.*) You say there are 18 members of the committee of your school?—I think that is about the number.

3743. Are those 18 entirely new members, or do they consist partly of members of the old out-going committee and partly of new ones?—Twenty-four members were elected in July or August last, 12 of whom were selected from the old committee, and 12 were new members; seven of the old committee have resigned.

3744. The new members of the committee start entirely upon new lines?—Entirely.

3745. That is to say, some persons connected with the institution thought that the school had not been managed as efficiently as it might have been?—Yes.

3746. Therefore a new committee was appointed?—I believe that to be the case.

3747. And this new committee are bent upon reforms, I suppose, according to the present advanced notions with regard to the education of the blind?—Yes.

3748. I understand that your school was established in the first place for printing Lucas books?—Yes.

3749. And the late committee, before your time, had for the last two years printed those books?—Yes.

3750. Could you tell me whether there was any sale for those books?—There was a sale for them some years ago; the sale some years ago averaged 75*l.* a year, and some years it averaged 50*l.* a year; lately the sale has fallen off very much indeed.

3751. Is it the case that the present committee do not intend to continue the printing of those book?—They only intend to continue it so far as there is any demand for the books.

3752. I understand the present committee would be willing to make use of all the other modes of embossing and printing which are now in vogue for the blind?—Yes; it is only want of type which prevents their doing it.

3753. Do you teach music at the school?—Yes.

3754. Do you teach it to any extent?—Yes.

3755. How many pupils have you under musical instruction?—12 or 14.

3756. Can you tell the Commission why there has been no election into the school for the last two years?—I believe the old committee did not think it desirable to have any election, because the school was in a state of transition, and it was very uncertain whether it would remain in that neighbourhood or not, and whether it would not be amalgamated with the school at Norwood.

3757. Is it the intention of the committee to introduce drill?—We have drill; last night I spent an hour in the room while the man was drilling them; and we are about to erect a gymnasium.

3758. In the manufacture of sash line it takes two people to do the work, and therefore it is not a description of work that a blind woman could carry on at her own home, but if you had an out working department or workshop connected with your institution, former pupils who had been taught sash line making might come into that out working department and carry on the work?—Yes, the same as basket making or anything else.

3759. You had not much experience of this school till within the last six months?—Not till within the last three months.

3760. And you were elected as the chairman of the reformers, I may say?—Yes.

3761. One question with regard to a depôt. Do not you think that it would be a desirable thing in London to have central depôts where blind workmen who had been instructed in institutions could apply to procure materials at cost price, so that they could take them to their own homes and produce work and take it back to the depôt for sale?—In my opinion it would be very much better that they should work in a workshop.,

3762. You think that if they did work in a workshop the workshop would have a sufficient market to get rid of their work?—I think it would, because the work would be done under supervision and the people who were not able to do satisfactory work would not be retained. If blind people do their work at home they do it without supervision, and a great deal of the work done in that way is unfit to be taken into the sale shop.

3763. Would not a wholesale shop or depôt, whilst not interfering with the retail shops in each district, be of advantage by affording a means of disposing of articles made by the blind?—I do not see how a large depôt in any neighbourhood could exist without interfering with the retail trade.

3764. Do you think that it would be possible for the Government to aid the different workshops for the blind by purchasing work for them at contract prices?—If the Government would give the contracts; but there is this difficulty with regard to contracts of that kind: there is an immense amount of material used in making the articles and the Government officials at the wharves or docks are very arbitrary in rejecting them, and very frequently a very considerable loss is entailed by their doing so.

J. R. F. Burnett, Esq.

11 Feb. 1886.

3765. You have had some little experience with regard to that?—Yes, I have.

3766. (*Chairman.*) Do you think that some of the money which is now spent in pensions might be advantageously spent in providing some central place where blind workpeople could sell their goods?—I think it would be a very great injustice to the blind to deprive them of pensions, because there are many blind people who are enjoying pensions who are utterly unable to do any kind of work.

3767. My question applied more particularly to those who can work and will not work?—That is a matter which must rest in the discretion of the people who dispense the pensions; they ought to make inquiries as to whether those to whom they grant pensions are proper subjects for such pensions.

3768. Do they make the necessary inquiries?—I cannot say; I have nothing to do with the distribution of pensions.

3769. Do not you think that it would be an advantage that pensions should be used to supplement the earnings of the blind rather than that they should be given to blind people who will not work though quite capable of working?—I do not think you can lay down any hard and fast rule as to the distribution of pensions. I think every case ought to be judged on its own merits.

3770. Do you turn blind persons out of your institution if they fail to do their work, or if they misconduct themselves?—We turn them out if they misconduct themselves, certainly.

3771. Do you turn them out if they fail to do their work?—If we turn them out on that ground, it would only be after a very considerable trial; they must show perfect incapacity or disinclination to learn.

3772. Supposing they are idle or hopelessly stupid, do you turn them out?—We do not turn them out for idleness, certainly, but for incapacity we do; that is to say, if they are perfectly stupid or approaching imbecility. If they are perfectly incapable of learning what is taught in the institution, then, of course, they would be sent away.

3773. You said that at the end of three years they have to be re-elected; do you know whether any have been dismissed at the end of three years for those causes?—I think they have generally been re-elected.

3774. Have you any personal knowledge of the institutions on the Continent?—I have seen the institution at Bruges; but most of the institutions I have seen on the Continent were deaf and dumb institutions, and not blind institutions.

The witness withdrew.

Miss PHŒBE HAMILTON examined.

Miss P. Hamilton.

3775. (*Chairman.*) How many years have you been matron of the institution in St. John's Wood?—I have been matron only four months.

3776. Your experience in connexion with the institution has been principally as schoolmistress?—Yes.

3777. Has your teaching been entirely confined to the girls, or do you take the younger boys?—I only teach the girls.

3778. Will you tell us something about your system of teaching blind girls?—There has been a rather arbitrary rule that they should learn only reading until they have really conquered the Lucas system; that is a rule which we want done away with.

3779. Do you mean that you keep them doing nothing else but reading the Lucas system until they have mastered it?—Yes, and knitting.

3780. At what age do you begin to teach them?—Eight.

3781. Do you think they ought to begin learning something before that time?—Yes, I think so.

3782. Do not you think they ought to begin at the same time as sighted children?—Yes, we do not admit them until they are eight years of age, because we require that they should be able to wash and dress themselves before they come in; we have not enough sighted help to enable us to wash and dress young children; that, I think, has been the only reason why they have not been admitted until they are eight years old.

3783. Do you think there is a want of some institution which would deal with the children of the indigent blind in their early years before they enter other institutions?—I think so. I think the sooner they can be dealt with the better.

3784. You could teach them to read and to write like other children?—Yes; but I think the great requirement in the case of young blind children is that bad physical habits should be corrected.

3785. Do you think it is advantageous that they should mix as far as possible with the sighted?—That is a matter in which I have really not had experience; I mean in regard to education.

3786. With regard to the correction of bad habits, do you mean that they ought to be under the constant supervision of the sighted?—Yes, I think so.

3787. And in an institution like yours you could not give that constant supervision at an early age?—Not at an early age without more assistance.

3788. When do you begin teaching them sewing?—I have really not done anything in the way of teaching sewing with a needle. I was the only seeing one in the schoolroom with 28 girls, and sewing requires rather individual attention.

3789. What blind assistance have you?—There are two monitors.

3790. Do you think for teaching that number of children you ought to have some sighted assistance?—Yes, to teach them efficiently.

3791. Have you had any experience of teaching the blind to work a sewing machine?—No.

3792. Have you seen any machines which you think could be worked by the blind?—That is a matter I have had no experience of.

3793. If there was a sewing machine the needle of which the blind could thread without sighted assistance, do you think it would be possible to teach them that?—I do not know; I am rather doubtful upon that point.

3794. Are you conversant yourself with the sewing machine?—No.

3795. How long do you find it take you to teach the girls to read in the system you teach them?—We teach Lucas and Braille; a girl of average capacity would learn to read fairly well in three months.

3796. Is that in either system?—Yes.

3797. Do any of those who have remained in your institution up to 21 years of age earn their own livelihood at all by any trade?—No, the girls have not been taught trades; that is one great difficulty with girls' education, to get hold of something that they can earn their livelihood by.

3798. Is there anything which they can be taught by which they can earn their own livelihood?—I do not know of anything; they can just earn a little, but not much more than mere pocket money, by knitting.

3799. Have you refused any applications for entrances into your institution during the last few years?—I cannot remember that we have, but that is a matter that would not come under my notice. I was in the schoolroom.

3800. Before the institution was reconstituted had it fallen into a state of inefficiency?—I think there was a great deal that wanted reorganization and re-modelling, and then the question of amalgamation was started, and after that things became very lax.

3801. From want of supervision?—Yes, and of course, though evils existed which wanted removing, it was not worth one's while to agitate about it.

3802. You think that the evils are now removed, and the institution has begun a course of usefulness?—Yes, I think they are being removed, but the new committee have been learning within the last three months what the old management has been, before they could strike out new lines for themselves.

3803. Under what supervision are the boys when they first come in?—The little boys are under the care of the wardrobe keeper out of school; they are, of course, under the supervision of the schoolmaster during school hours.

3804. You have no mixed classes of boys and girls?—No, they are kept quite apart.

Miss P. Hamilton.

11 Feb. 1886.

3805. Do you think that advantageous with regard to little boys under 10 years of age?—No, I do not myself, I think they might be worked together very satisfactorily; in fact I think it would be to the advantage of the boys.

3806. Do you think a lady very often has more influence over boys under 10 years of age than a man?—I think so; I think it is a matter that could be worked for the boys very satisfactorily.

3807. Have you paid any attention to the general teaching of the blind when they are young in connexion with the board schools?—I cannot say that I have; I have had no opportunity of getting any experience of the system of teaching blind children in board schools.

3808. Has your institution ever been visited by board school inspectors?—Yes, one board school inspector came; I only know of one instance.

3809. Can you tell us in what year that was?—I think it must have been 1876 or 1877.

3810. Do you think it desirable that all institutions for teaching children should be under Government inspection?—Yes, I think so.

3811. You are conversant with what is done in the national schools in that respect?—Yes, fairly well. I know they are inspected.

3812. Do you think it would be desirable that a similar inspection should take place of institutions where children are taught?—I think so decidedly, especially with charitable institutions, because it is so often the case that a schoolmaster or schoolmistress is appointed simply because the committee know someone for whom they want to make a niche; efficiency I do not think comes into the question often. I do not see anything but Government inspection that would remedy that.

3813. When you were appointed, were you appointed by advertisement or by the selection of a friend?—I suppose by the selection of one of the committee.

3814. When you were appointed as schoolmistress, was any question asked you as to your having received a certificate?—Yes, I was asked that question.

3815. Had you received a certificate?—No.

3816. You satisfied the committee that you had been brought up as a teacher, I suppose?—Yes. I had been brought up as a teacher, though I had not had the means of getting a certificate. At the same time I am strongly in favour of having certificated teachers both for boys and girls.

3817. Do you find the children generally easy to manage?—Yes, I have found them generally easy to manage, I think. The easiness or difficulty of managing them depends a great deal upon the internal rules of the institution.

3818. Do you think that blind children could be dealt with in the national schools if the masters were taught in what way to instruct them?—I have had no experience to enable me to answer that question, but I myself rather doubt it. I fancy the slow and the weak always go to the wall where there is a large number dealt with; the blind are slower than the sighted in many things; in everything mechanical they are slower, and I am therefore afraid that where there is a large number dealt with the weak will go to the wall.

3819. Have you observed any weakness of intellect among the blind as compared with the seeing?—No, I do not think so. The difficulty the blind would have in oral teaching or class work would be that they have so few books for preparation; and whereas the sighted children have the means of preparing their lessons beforehand the blind have not those means.

3820. Do you think it would be desirable that books for the use of blind children in national schools should be printed in one of the types used for the blind?—Yes, I think the sighted and the blind ought to be on an equality in that respect.

3821. Have you any preference for any type?—Yes, my own feeling is towards the Braille system.

3822. You think that the Braille system is the best for the blind?—I think the Braille system the best decidedly as a means of education and for the educated blind; in fact, I do not know what they would do without it; it is their right hand, you may say.

3823. (*Mr. Johnson.*) Do you think that Braille would be a sufficiently good type for the blind to the exclusion of all others?—I think I would reserve one of the others for the aged blind, for those who lose their sight late in life.

3824. Which type would you recommend for that?—I should lean towards Moon's for that.

3825. You would recommend Moon's for the aged and Braille's for the young?—Yes, I would recommend Braille's as a means of education of the young.

3826. Have you had any experience of any of the other systems?—I have had experience of the Lucas's.

3827. Have you had any experience of the ordinary Roman type?—Not as a reading system.

3828. Have you had any experience of it as a writing system?—No, I have just corresponded in it a little sometimes.

3829. You think the advantage in corresponding in the Roman type is that the sighted friends of the blind writers can read it?—That is the only advantage, as far as I can see.

3830. Have you found any disadvantage in corresponding in the Braille system on account of the friends of the writer not being able to read it?—I think that many will not take the trouble to acquire a knowledge of it, but I think the sighted ought to take the trouble for the sake of the blind. I do not think the blind ought to be sacrified to the sighted.

3831. Braille's is, in fact, an alphabet among the blind more especially?—Yes.

3832. But not as between the blind and the seeing?—No.

3833. If all the world were blind, the Braille would be the finest type for all, but do you think it a desirable thing that you should teach two systems, a system by which the blind should communicate between themselves, and another system by which the sighted should be able to read what the blind write?—It is an advantage to be able to communicate with the blind by some easy system; at the same time a knowledge of the more difficult system could be acquired in a week by any one who wished to acquire it.

3834. Do you teach both?—The girls have picked up the Roman type for themselves without any teaching.

3835. Then the Roman type is very easily learnt?—Yes, it is very easily learnt for writing, but not for reading. They do not attempt reading by it.

3836. Your institution was established originally for the purpose of printing and distributing books in the Lucas type?—For printing books in the Lucas type.*

3837. I believe a very large literature has been printed in the Lucas type?—Fairly large, not much outside the Bible.

3838. The whole of the Bible?—The whole of the Bible, and some few other books.

3839. Has the sale of those books increased or decreased within the last few years?—Decreased.

3840. Have you a large stock of those books on hand?—I believe there is a fairly good stock.

3841. Have you any means of knowing whether the demand for those books has gradually decreased throughout the country?—I believe it has.

3842. But the old committee, up to six months ago, still continued to print those books?—Yes, and the present committee continue to print them?—Yes.

3843. I suppose that is merely to finish the books they have begun?—Exactly.

3844. I understand that the present committee authorise you to teach the children both Braille and Lucas?—Yes.

3845. Have you any idea what the cost per head of the pupils is altogether, including board and education?—I think it is between 35*l.* and 40*l.*

3846. Of that 35*l.* or 40*l.* how much is contributed by the paying pupils?—Our scale of charges varies; if they can pay 20*l.* they do; they pay 25*l.* if they are a little better off; and those who wish to pay the full charge of 35*l.* do so.

3847. They are not regarded as charity cases?—No.

3848. Is there any extra charge for teaching music?—Yes, to those who learn music.

* In this answer I find that I confused the two terms "printing" and "teaching"; our rules require that we should *teach* Lucas's system, the printing followed as a matter of necessity.

Miss P. Hamilton.

11 Feb. 1886.

3849. How many learn music?—At present, roughly speaking, there are between 12 and 14 learning the pianoforte.

3850. Do they learn pianoforte tuning as well?—The boys do.

3851. Have they a professor to teach them music?—Yes, Mr. Barnes.

3852. Has he any sighted or blind assistants?—Yes, he has two blind assistants, one master for the boys and one monitor for the girls.

3853. Have you any experience of the success of blind musical pupils who have been taught in your institution?—I do not think I have; in some few cases they are doing well.

3854. Do you know how many?—Our great drawback is that we lose sight of our old pupils unless we look after them as a personal thing.

3855. You keep no record of them?—No.

3856. It is proposed to keep a record of them, is it not?—I believe so.

3857. In your opinion it is desirable to keep a record of them?—I think it is very desirable.

3858. Can you tell us anything more with regard to any former pupils who were taught music while they were in the institution?—From my own recollection, roughly speaking, I know about eight or nine who are doing fairly well at music, as organists and teachers.

3859. What do you suppose are the average earnings of a blind organist or teacher who has been tolerably well instructed in music at the institution?—Organists' appointments, as a rule, average between 50*l.* and 100*l.*

3860. Are there many who have become organists after leaving your institution?—I only know of five.

3861. Are you of opinion, judging by the performances at the concerts given at St. John's Wood, that music is very thoroughly taught there?—That I think is so much a matter of opinion; if you ask my own opinion I do not myself think that it is taught so well as it might be taught.

3862. But at all events it is sufficiently well taught to enable the institution to turn out pupils who afterwards get their 50*l.* or 100*l.* a year?—Yes; in most of those cases I think they had outside lessons.

3863. I suppose they gained the appointments from the fact of their being recommended by the committee of the school at that time?—Yes, exactly.

3864. At present you only teach girls knitting, and you are going to teach them sash-line making?—Yes; they have begun to learn sash-line making only within a fortnight.

3865. You are aware that sash-line making requires two people to work at it?—Yes.

3866. Therefore, I suppose, in your opinion, it would be better to let girls who wish to take to sash-line making work in a workshop rather than work at home?—Yes; I do not see how they could work at home.

3867. Does your committee propose to extend the workshop department?—Yes, I know they have that idea; that is one of the first things they wish to do.

3868. They also propose to build a gymnasium?—Yes.

3869. And you have already drill?—We have had drill for some few years now.

3870. (*Dr. Tindal Robertson.*) When the education of a pupil first commences, is it carried on in Lucas's system or in Braille's system?—Up to within the last six months it has been in Lucas's system, but on the girls' side matters were so unsatisfactory that I made an alteration and had them taught Braille's system first. I think it is so much better that they should be taught in that system first.

3871. Can you tell me the reasons which actuate the committee in still continuing the system of teaching by Lucas when it is generally acknowledged that it is not so good a system as the other?—I believe they would have to get an Act of Parliament before they gave up the printing of Lucas's, because the institution was founded for the purpose of printing Lucas's.

3872. Is it compulsory that the teaching as well as the printing should be by Lucas's system?—That I do not know.

3873. We have had it from the chairman that there is no endowment?—No.

3874. Then the rules may be made by the committee themselves?—I do not know how that is.

3875. With regard to learning writing by the Roman system and the Braille system, can you give us any idea of the comparative time that it would take in the first place to learn the two, and in the second place to write them?—In the first place the Roman system would be learned in one-third the time, and in the second place I think after once the Roman system is mastered it is a very slow process.

3876. Can you give me an idea of the comparative time it would take to write half a dozen lines on the two different types?—One is quite as quick again as the other; the Braille system is as quick again as the Roman system; at the very least, as quick again.

3877. Suppose you had to exclude all types but one, you said that you would take the Braille system?—Yes.

3878. In preference to any other?—Yes.

3879. Is your reason for preferring the Roman type as another system, that it enables the blind to communicate with sighted friends?—Yes.

3880. Have you any other reason than that for preferring that system?—No.

3881. Have you any experience of persons who have become blind late in life, and who are unable to learn the Braille system at all?—I only know of one instance, and I think there it was owing to a sort of sluggishness on the part of the blind person.

3882. You can imagine the case, persons who are old, who from want of touch and from having their fingers hard may be unable to learn the Braille system?—Yes.

3883. Do not you think that Moon's system, being the simplest next to Braille's, is much preferable for such persons as those?—Yes, I think so.

3884. Better than the Lucas system, and better than the Roman system?—Better than both.

3885. And better than any other system that you know of?—I think so. I would reserve Moon's for the aged blind and those whose hands have become hardened by labour, and Braille for the young and those whose touch is delicate.

3886. And who require it for educational purposes?—Yes.

3887. Can you give us any idea of the system on which music is taught; is it taught by the Braille system?—Yes; the pupils read from their embossed copies, and learn a piece of music just as sighted children do, and occasionally they have a piece read to them by a sighted teacher.

3888. Is the gentleman who teaches music acquainted with the Braille system?—I do not think thoroughly.

3889. Have you any musical knowledge yourself?—No.

3890. As to the question of health, do you think that the health of the children who have been under your care since you have been connected with the institution has been as good as that of sighted children generally?—Yes, certainly.

3891. Had you any experience in teaching sighted children before you went to St. John's Wood?—Yes.

3892. How do blind children compare with sighted children as to mental capacity, generally speaking?—As far as my own experience has gone I think there are more with dull intellects among the blind, but those who are fairly intelligent compare very favourably with the sighted.

3893. Do you think that if blind children were taught at an early age, especially if they were taught among sighted children, they might acquire a great deal of self-reliance and energy and spirit, and that they would compare not unfavourably with sighted children?—Yes, I think they would.

3894. As far as intellectual power is concerned?—I think so.

3895. (*Dr. Armitage.*) How long were you schoolmistress at St. John's Wood?—Ten years.

3896. Can you tell us what means there are of training the hands of young children?—We have no special means for teaching young children; we do not take children under eight years of age.

3897. You have no kindergarten?—No.

Miss P. Hamilton.

11 Feb. 1886.

3898. No straw-plaiting or modelling?—No, I want to introduce straw-plaiting.

3899. Do not you think it would be desirable to establish a kindergarten class among the younger children?—I do not think we have them young enough for that.

3900. They come to you at eight?—I understood that the kindergarten system was adapted for children between five and eight.

3901. You do not think that children over eight would profit by the training of the hand that straw plaiting, modelling, and so forth would give them?—Yes, I think they would.

3902. That is what I mean by kindergarten?—I think that might be desirable.

3903. Have you any personal experience of kindergarten teaching?—No.

3904. Neither among the seeing nor the blind?—No, no personal experience.

3905. You spoke of the desirability of providing school books for the blind; have you no school books in use?—We have school books, but the number is too limited; each child requires a copy of the book containing the lesson that he has to get up the next day.

3906. Why have not you a sufficient number of books for the children?—I think the expense has been the difficulty; we would like each child to have a Braille copy of its book, and then we thought they could reproduce it themselves; and the committee are contemplating carrying that out.

3907. Do you know at all what reading books are published in Braille?—Yes, several of Nelson's readers; there is the World's History, Ivanhoe, Philip the Second, from Motley's Dutch Republic, and several others.

3908. Are the science primers published by Macmillan in Braille's type in use at the school?—No.

3909. You were speaking of writing the Roman type; I suppose you mean the pin-point writing?—Yes.

3910. That is to say, the system of writing by raised pin points on little blocks of wood pressed down into the paper?—Yes, that was the system that I was speaking of.

3911. Can a blind child after writing in this way read her writing, or can other blind people read the writing which the child has written?—Yes, they can read it.

3912. As easily as they can Braille?—No, not to easily.

3913. Does that depend on the paper a good deal?—Yes, I think a good deal depends on the paper.

3914. Have you any knowledge of the system called stylography?—No.

3915. You told us, as far as you know, what has become of the musical pupils; can you tell us what becomes of those who have learnt trades?—No; our pupils have learnt trades, and we have lost sight of them entirely; I think it would be well if we had some means of keeping up a correspondence with the pupils after they leave us.

3916. Do you know anything about the system followed in many parts of Germany and in Paris of looking up the blind pupils after they leave?—I know it is done.

3917. Do you know what the system is which is followed?—I believe that an annual visit is made to each old pupil.

3918. Do you think that it would be desirable for your school to keep a register of all the pupils who leave, so as to be able to keep up a constant correspondence with them after leaving, and to assist them when they required assistance, by starting them in trades, or by giving them temporary assistance when they were in difficulties?—Yes, I think that that would be very desirable.

3919. (*Admiral Sir E. Sotheby.*) At what age do the boys leave your school?—17.

3920. As far as your experience goes, are they efficient in the trades that they have learnt when they leave?—I am afraid not.

3921. Has any suggestion been made to keep the boys longer at the school, so as to give them an opportunity of becoming more proficient?—No, I do not think so; within the last week it has been decided that one boy shall be kept on, but that is quite exceptional.

3922. There is no rule laid down by the Committee that they should be kept on till they are efficient?—No, I do no know that there is.

3923. Have you any experience with regard to the sale of what the blind make?—I have had only a small amount of experience with regard to the sale of the work of the blind, but I think if the work is properly done, it sells quite as well as sighted work.

3924. It can compete with sighted work?—It sells as well. I do not think the blind can produce an article as fast as a sighted person.

3925. You used to make a good many things at St. John's Wood, baskets and brushes, for instance?—Yes, we still make baskets. Brush making has been given up.

3926. What became of the brushes you did make?—They were sold.

3927. At market prices?—Yes, the brushes were always well made.

3928. Why was brush making discontinued?—The teacher left. He considered that he was not paid enough, and he gave it up.

3929. What was he paid?—I do not know.

3930. Did the committee take any steps to procure another teacher?—No, because it was given up just at the time of the proposed amalgamation.

3931. In what system do you read and write yourself?—I can read and write the Braille, and I can read the Lucas.

3932. (*Sir Henry Selwin Ibbetson.*) I understood you to say that within your knowledge there are eight or nine of the past pupils who are at present earning their livelihood, either as teachers of music or as organists?—Yes.

3933. Are they women or men?—Men. I believe there is one woman an organist. I only know of one, and she left many years ago.

3934. You do not think, that music is a thing which the girls can learn with profit as a means of future maintenance?—We have one old pupil who is doing very well as an organist.

3935. I was struck by one of your answers in which you said that the difficulty in dealing with blind girls was to find some labour for them which they could afterwards turn to profit; you do not think that music might be a useful means of earning a livelihood in the future?—I think it would be if they have sufficient talent.

3936. And the talent is not often developed?—No.

3937. Is there no other industrial work that blind girls can be taught in which they can compete with the blind males?—I do not know of any.

3938. What do you say as to chair caning?—In chair caning I think they can do just as well as the males.

3939. That is not taught at present?—No, it dropped.

3940. Do not you think it would be an advantage to teach them chair caning as a means of earning their livelihood?—I do, decidedly.

3941. From the fact of sash-line making requiring two to work at it, it is practically useless to them afterwards?—Unless they work in workshops; of course sash-line making is only an experiment with us.

3942. The chair caning they can do alone?—Yes.

3943. And you think the women can work at it as rapidly as the men?—Yes.

3944. (*Chairman.*) What religious instruction do you give in your school?—The pupils read the Bible every morning, and it is explained to them; there is a Bible class once a week, and there is a Sunday school held every Sunday afternoon; of course they go to church twice a day on Sunday.

3945. (*Admiral Sir E. Sotheby.*) You said that you kept the girls at reading only for some time; at what age do they commence writing?—If we can have Braille taught at once when they come into school they begin to write at the same time, otherwise if Lucas is taught first they have to wait three months before beginning to write.

3946. (*Chairman.*) Is there anything else you would like to mention to the Commission, or have you any further suggestion to make?—There is one thing I should like to speak about, and that is that when boys are learning trades the individual is very often sacrificed to benefit the institution. Take the case of a boy in the choir who has very little ear for music, or who has a very weak voice indeed, he will have to devote five or six hours in the week to singing in the choir, and as far as regards the boy it is a perfect waste of time; it seems to me that that is an evil which calls for a remedy.

3947. You think that there is a want of appreciation of the capabilities of the children, and that more attention ought to be directed to the advisability of instructing them in those subjects which they are most qualified to learn?—Yes, I do.

3948. Do you apply that remark to learning trades?—Yes, to learning trades more particularly.

3949. Do you think that they are kept at music when they should be put to something else, more particularly if they have no ear?—Where they have a taste for music I would teach them the pianoforte, but to keep a boy five or six hours a week at singing, when it will be no use to him in after life, I think is a waste of time. That is the great drawback in most institutions; at least it has been in ours.

3950. Do not you think that singing has a peculiar interest for the blind both as an exercise and as a recreation?—Yes, certainly; but I think myself it is a pity to take a boy away from basket making for five or six hours in the week to teach him singing if he has very little voice.

Miss P. Hamilton.

11 Feb. 1886.

3951. You speak from experience upon that?—Yes; the same remark applies to girls. I have known girls who have left the school when their time was up turn out very inefficient knitters, simply because they happened to have a fairly good voice and had to devote so many hours to singing; it is sacrificing the individual to the institution.

3952. Is that one of the points that you have thought it your duty to lay before the committee?—I am going to lay it before the committee on Friday when they meet.

The witness withdrew.

Mr. W. C. Lester examined.

Mr. W. C. Lester.

3953. (*Chairman.*) You are the secretary of the Indigent Blind Visiting Society?—I am.

3954. How many years have you been so?—Nearly 19 years.

3955. Will you tell us what are the operations of your society; in the first place what number of visitors have you?—Eleven.

3956. In how many districts?—In 11 districts.

3957. Is there one visitor to each district?—There is.

3958. Do your visitors visit individuals at their own homes, or do they gather them together from time to time in public halls or other places?—The visitation is home visitation.

3959. But do they give any lectures in public halls?—We may have prayer meetings or Bible meetings at the educational classes, but the visitation is strictly confined to the homes of the blind.

3960. Can you tell us what number you have on your list?—We have 875 on our list.

3961. Can you classify them in any why as to occupations?—Our society is a missionary society; but whilst we look after their spiritual welfare, we are also concerned about their temporal well being; and of the 875 about 125 have been trained in workshops or blind schools.

3962. Can you classify them as to those that have been trained, or those that have not been trained, or those that have been trained and have failed, and so forth?—Yes; 75 out of those 125 that have been trained in institutions are doing something at what they were taught.

3963. What becomes of the others?—The others are doing but little.

3964. From what causes?—The causes are various.

3965. We want to know what the failures arise from, whether from want of health and strength to carry on their occupation, or from inability to earn their livelihood in consequence of defective work, or from inability to find a sale for their work. Will you tell us, so far as you know, how far those different elements enter into the question of failure?—My opinion as to the failure is that it arises, first, from imperfect training, and, secondly, from the want of means of employment. In connexion with the last answer, I may mention that many on leaving schools or workshops, who have been tolerably well-trained, have not been able to obtain employment, and having given up all idea of doing anything at the occupation to which they have been trained, some have gone into the street selling articles, and some singing or playing musical instruments, and such like things. The great cause of failure is, first, the want of good training, and, secondly, the want of means of employment.

3966. Does that want of means of employment arise from want of co-operation between the various societies in London for the training and relief of the blind; or would greater co-operation and interest in those who have been trained after they have left the training institutions remedy that evil?—The cause of failure does not arise only with the London blind schools.

3967. I am speaking of London at the present time. Of course, some blind persons come up to London from the country?—A great many do. There is a distinctness between the institutions; there is no immediate co-operation between one institution and another.

3968. Do you think that that is an evil?—I do not know it is an evil. Co-operation might be beneficial in some cases.

3969. Do you think it is an evil or not?—I am not prepared to say that it is an evil.

3970. Is it a defect in those institutions?—I think that if there were in some instances co-operation, it would save a great deal of imposition and lead to better results.

3971. In other words, it is an evil or defect in those institutions to that extent, is it not?—I think so.

3972. Can you tell us about the lectures and religious meetings that are held, and how they are attended?—We have two Sunday Bible classes, attended by about 250 or 300 blind persons and guides; and we have educational classes in different parts of London attended by between 300 and 400 blind persons.

3973. What are the ages of those who form the educational classes?—From about 10 to 80.

3974. I gather then that there are a great many blind who are untrained, even at mature age?—Yes.

3975. Does that arise from defective training in the institutions, or from those blind persons never having been trained at all?—May I remark that most of the blind in London belong to the artizan and labouring classes, who get blind in after life, and who have no training in institutions at all.

3976. But they can hardly be on that account necessarily untrained in so far as education goes; they have had their training previously, have they not?—Not as blind.

3977. They are not uneducated, but they are not trained as blind. That, of course, would partly also arise from many people of mature years not having been educated properly in their youth; but that is not likely, or ought not, to occur again with regard to the rising generation?—No.

3978. But as a matter of fact out of the number who attend your classes you find a certain number who are not trained educationally?—Yes.

3979. Are any of them trained in reading the embossed types used by the blind?—All who attend the classes are taught to read the embossed type.

3980. Have you any preference for any one type beyond another?—In most of our classes we use the Braille and Moon types. We use Moon's for the very old and hard handed people.

3981. You think that there will always be a difference between those who have been taught as blind and those who have become blind when they are old, and that therefore there ought to be two types?—We find little difficulty in teaching Braille.

3982. For the old?—I may tell you that we have a man in one of our classes 80 years of age, who is just beginning to learn Braille. He has been blind for a little while, and he is just taking it up.

3983. The Moon system you think is more suitable for the old, but you do not think that any one system should be required to be universally adopted?—No.

3984. Can you tell us what are the causes of the imperfect training of which you spoke; is it the natural inability of the blind to profit by the training which is given them, or the neglect of those who have been

Mr. W. C. Lester.

11 Feb. 1886.

trained after they have left the training institutions?—One of the cases in my mind is that of a woman who was 11 years in the institution at Brighton in which she was only taught some knitting; she is only able to earn 1*s.* 6*d.* a week now.

3985. What age is she?—About 40.

3986. Have you known that case long?—I have known it some few years now.

3987. What are the trades that you think it most suitable that the blind should be taught?—For the working men, or for the young, in my opinion, basket making is about the most remunerative.

3988. Do you know anything about the making of sacks?—I have had to do a great deal with those.

3989. Does that answer?—Not well; they can earn about 7*s.*, 8*s.*, or 9*s.* a week if they have plenty of work.

3990. But are there not more sacks than baskets used in the country?—They would get about 1½*d.* or 2*d.* for making a sack.

3991. Can they compete with sighted labour in that point?—No.

3992. But that is work which is suitable to the blind, is it not?—Yes. Some few years since a workshop was started in Whitechapel by Mr. Kingscote, and the chief work done there was sack making.

3993. Has that failed?—That failed.

3994. Do you think it desirable that the blind should work together in workshops, or that they should take the work to their own homes?—I think it is better that they should work in workshops than at their own homes.

3995. Have you any experience with regard to the blind marrying blind women or sighted women?—I have had a great deal of experience of that.

3996. What is your opinion with regard to the advisability of intermarriage amongst blind persons?—That the practice is most disastrous to the blind.

3997. When the blind marry sighted women, do the women keep their husbands by their own earnings?—They usually do what they can in charing or any other work towards the support of the home.

3998. With regard to those blind men who marry blind women, you say that the practice is disastrous; you mean, I suppose, that they neither of them can earn their own livelihood?—They cannot; and another thing is that the children of such persons are neglected.

3999. The children of such persons, although they are generally seeing children, are not sent to school, and are not trained?—No, they are not properly cared for.

4000. With regard to your fund for relief, can you tell us what relief was given to the poor blind in the last year?—Yes, we gave last year from the Samaritan Fund between 1,100*l.* and 1,200*l.* I have put the reports on the table.

4001. Is this the last report which states the amount as being 1,165*l.* 18*s.* 3*d.*?—Yes, that was the last published report.

4002. That was from the Samaritan Fund, but the total relief was 2,720*l.* 15*s.* 1½*d.*?—Yes, it is summarised there.

4003. The relief consisted of money, bread, coals, tea, potatoes, blankets, and clothing?—Yes; in that is not included anything but what was actually given to the blind. That was solely relief. I may perhaps mention that between 1,500*l.* and 1,600*l.* were given from the General Fund, and the other from the Samaritan Fund. The Samaritan Fund was started by Dr. Armitage (who is present) some years ago, and he has endowed it to the extent of about 900*l.* a year. On this fund we have 97 pensioners, whose pensions come to about 720*l.* or 730*l.* a year. I have not gone back for the last year, I am taking what we have to-day.

4004. What is the maximum pension?—Each of these will receive from 2*s.* to 10*s.* weekly.

4005. Is each case examined into periodically?—It is examined by the visitor twice a month.

4006. I see that you have invested stock?—All the invested stock for the Samaritan Fund has been invested by Dr. Armitage. We have not any but what he has himself invested.

4007. But I see "dividends on invested stock" in your balance sheet. Is there any permanent endowment that you have?—Yes, we have a permanent endowment.

4008. Is that a dividend on the permanent endowment?—Yes.

4009. Can you touch the capital of that?—We cannot touch the greater part of it.

4010. The rest of your income is made up from donations and subscriptions, amounting, as far as I can see here, to 1,486*l.* 17*s.* 2½*d.* in donations, and 1,124*l.* 5*s.* 7*d.* in subscriptions?—Yes, the Samaritan Fund is quite distinct from the General Fund.

4011. I see that, according to your balance sheet for the Samaritan Fund, you have donations and subscriptions amounting to 416*l.* 4*s.*, and dividends amounting to 770*l.* 16*s.* 7*d.*; is that so?—Yes; that is from the fund that Dr. Armitage invested. Since then there have been further investments by Dr. Armitage.

4012. Are there separate trustees for the two funds?—No, the same trustees.

4013. The three who are mentioned in your report Lord Ebury, Dr. Armitage, and Mr. Denny?—Yes.

4014. What have you received from the Gardner Trust?—We have received two grants of 30*l.* each.

4015. That is for your circulating library?—Yes.

4016. Do any of those who receive pensions from you receive pensions from other institutions or societies?—They do.

4017. Can you give us any account of those?—I may explain that every case is minutely investigated. We know in every particular case that A. or B. is in receipt of 10*l.* from the Clothworkers' Company, or 10*l.* from the Painter Stainers' or from Hetherington's, and they have, say, 20*l.* altogether; that is not enough to enable them to live, and then our fund is made available, and in cases where we are satisfied the pension comes in.

4018. I suppose there will always be a certain number of blind persons who will never be able to earn their livelihood, but who will need charitable assistance from one source or another?—There are a certain number. We have started 67 persons in business from the Samaritan Fund, giving them stock for sale, mangles, sewing-machines, and so on; in fact, we lend them; that is the object of the other part of the Samaritan Fund, just to help them at the right time; and 67 are really doing very much for themselves aided by this fund. There are some, and indeed several, who are quite independent of our help, who have been started by us, and who are able fully to support themselves.

4019. Do you not think then that pensions should be rather supplementary to the earnings of those who can work?—That is precisely our line.

4020. But that is not a course which is universally pursued with regard to the pensions as a whole?—Not as a whole.

4021. Do you find any difficulty in selling the work of the blind, not yourselves but through those with whom you are connected?—There is great difficulty.

4022. What remedy do you propose for that difficulty?—The blind cannot compete with sighted labour.

4023. In nothing?—I do not think it is possible for them to compete in anything, excepting basket making. There are some that I know who have been well taught, and who are able to earn some 25*s.* a week or more; but they are quite the exception and not the rule.

4024. Do you think it advisable that blind workers should be always under the supervision of sighted people in order that they may earn as much as possible?—We are all more or less dependent upon the sighted. I am totally blind myself, and I have been blind for 28 years.

4025. Do you utilise the blind as teachers as far as you can in the institutions with which you are connected?—We do; all the 11 visitors are well qualified blind men.

4026. Do they require leaders?—They require guides; in our experience they make the best visitors; they enter into the wants of the blind more immediately, and they have more sympathy.

4027. How do you visit the blind in the workhouse?—They are visited in the various wards by our visitor, and he will read to them aloud.

4028. Do your visitors visit all the workhouses in London?—Only those who are on our list; we do not go in indiscriminately. Every case is nominated by a subscriber, and all those on our visiting list are attended to by the visitor in whose district they are.

Mr. W. C. Lester.

11 Feb. 1886.

4029. Can you tell us whether that is a course that is generally pursued throughout the workhouses in London; are they all of them visited by your own or other societies?—Mostly by the Home Teaching Society.

4030. Then you think that your society and the other societies pretty well cover the ground?—Yes, pretty well.

4031. But there might be some left out?—So far as we are concerned we only go to those whose names are given us, and who are recommended by our own subscribers. Each of the blind inmates in the workhouses will have 6*d.* a week allowed from us for the purpose of getting a little tea and sugar, and little extra privileges where the Home Teaching Society gives nothing.

4032. The allowance is not for books, or anything of that kind?—No.

4033. Do you look after the blind being taken to places of worship?—One shilling a month is paid for a guide, but we do not provide the guides; the blind person provides the guide, and there is an occasional certificate to be filled up by the minister or missionary, or person officiating at the place of worship that they are stated to attend.

4034. And you spent 635*l.* 9*s.* 3*d.* in the last year for that purpose?—Yes, and for guides to the classes.

4035. Do you think that the blind children should be compelled to attend the schools the same as sighted children?—I do.

4036. Do you think that they should attend the board schools with other children?—I do.

4037. Do not you think that there would be difficulty in finding qualified masters who would be able, and who would have time, to give them instruction?—The experience of the past year or two years during which it has been tried in the board schools, I believe, has been very favourable to the education of blind children in board schools.

4038. Of course in London they are able to get a sufficient number of blind children together in a board school to form a class, are they not?—I really cannot answer that question.

4039. But you think, so far as the blind themselves are concerned, that it would be very much to their advantage that they should attend the board schools or national schools?—I do.

4040. Do your visitors read to those who are not able to read for themselves?—They do; that is part of their work.

4041. How many blind persons are there in your districts who cannot read for themselves?—The majority of the poor blind cannot read.

4042. The majority of the poor blind, I suppose, either read imperfectly, or do not read at all?—Yes.

4043. Have you any difficulty in raising funds for the purposes of your institution?—I can assure you that it is a matter of very great difficulty. We are only restricted in our work by the want of more means.

4044. Have you any general observations to make with regard to the education and training of the blind in London or in the country?—I may say that from experience and from observation from visiting our classes, and from speaking to those who are taught, I am of opinion that the Braille system of reading has been proved to be unquestionably the best adapted for the blind. In our classes we have 40 blind persons engaged in writing books for the use of other blind persons. These books are revised and corrected by a blind man, and certified to be correct, and they are sent to the binders, and they are put into the libraries.

4045. Is that as cheap as stereotyping works?—No, it is not so cheap.

4046. But it provides employment for a certain number of blind persons?—It does. And then, supposing that your lordship wanted a copy made of any particular book it would not pay to have it stereotyped if you only wanted one or two copies and you could have it written.

4047. Do you think that the Bible printed in the Braille type is more likely to be circulated freely, from its diminished size, than in any other type?—It takes up less room, certainly, than some other systems. From the time that it has been in general use the Braille system has made very rapid progress everywhere. There is a great advantage connected with it in the writing, that one blind person can write a letter and it is sent to another, and it can be as easily read as a sighted person would read a letter which he or she may receive from a friend.

4048. Have you any acquaintance with what has been done for the blind either on the continent of Europe or in America?—I have not gone into that.

4049. Do you think that the funds which are now devoted to the blind in London could be better employed than they are at present? I am speaking of the whole system of pensions and of all the money that is now raised; could there be a better organization and a better re-arrangement of the funds so as to meet the wants of the blind?—I can hardly give an answer to that question.

4050. Do you think that there could be any improvement in the organization and inter-communication between the societies for the benefit of the blind?—I think that any inter-communication is very desirable, and it is carried out by Hetherington's Charity and the Painter Stainers' Company, so that it is not possible for a person applying for one or the other to have both.

4051. As I understand you also make inquiries very strictly before you give any of your grants?—We do.

4052. So that nobody receives pensions from one or more societies without your being aware of it, and thinking it necessary to supplement them?—Exactly.

4053. I ask you these questions rather with a view of ascertaining whether you think it desirable that either by voluntary means or by some inspection by the State perhaps, such a result should be attained?—I think that the question of pensions should be a secondary consideration brought in to supplement any deficiency. Persons who are permanently disabled are incapable of doing anything.

4054. Do you think that all the institutions for the education and training of the blind should be subject to Government inspection?—I do not very much like Government control. Our society have nothing to fear or to conceal, and I should be only too pleased for everybody to know what we are about, and then we should get more help.

4055. You do not object then to Government inspection?—Personally we should not object.

4056. There would be no means, I suppose, of making different societies join together in order that the whole of London might be covered and inter-communication between the different societies might be carried out unless by something like Government inspection?—I do not think that Government inspection could do much to benefit the blind.

4057. But do you think that the voluntary system is perfect now?—I do not.

4058. Then do you think that if there were conferences between the various institutions in London, that would be better than any Government interference?—I think so.

4059. (*Sir. Henry Selwin-Ibbetson.*) I understood you just now to say that the Hetherington Charity and the Painter Stainers' Charity considered these questions of pensions rather together, as you do with them, before granting pensions?—Yes.

4060. Might not that be applied with advantage to the general pensions for the benefit of the blind?—Certainly.

4061. What you and those two companies do might with advantage be extended generally to all endowments for the benefit of the blind, so as to avoid the possibility of a case, should there be one, of a blind person unworthily getting a number of pensions?—Yes.

4062. I understood you in your answers to the noble Lord to say that of the number of blind that your institution visits the greater part belong to the artizan class and have become blind in advanced years?—Yes.

4063. One of your suggestions from experience was that the Braille system of type was the best for teaching purposes; would you apply that to those who in advanced years have become blind who form a large number of those whom you visit?—I would, up to 60 years of age.

4064. The sense of touch is still sufficiently acute for them to learn the Braille system with facility, is it?—If they have ordinary capacity.

4065. And wherever the sense of touch was impaired the Moon system would be more easily taught?—Yes.

4066. I think I understood you to say at the beginning of your evidence that your 11 visitors visited 875 people;

Mr. W. C. Lester.

11 Feb. 1886.

of those, 125 I understood you to describe as having been trained in workshops or blind schools, and to say that of those only 75 are still doing something at the trades which they were taught, and that the others do but little?—Yes.

4067. Then I understood you to say that you attributed this failure in the first place to imperfect training, and secondly to the want of means for employment?—Yes.

4068. Could you suggest remedies for that?—One requirement is that there should be suitable and well regulated workshops generally in London.

4069. Then you would be of opinion that the welfare of the blind would be immensly advantaged by the establishment of such workshops on some uniform system?—Yes. I take the Leicester system, Mr. Harris's, as a model.

4070. By such a combination, do you think that you would not only improve the training in their industrial work, but that you would enable them to obtain a greater amount of that employment which you say is deficient?—Yes.

4071. Do you see any objection to the establishment, if it could be managed, of large workshops or wholesale depôts in our great centres where material could be kept and sold at cost price to the blind, and where the articles manufactured could be stored and distributed amongst the retail shops at the different institutions afterwards for sale?—No, I see no objection to that. The only thing is that the blind man must have his earnings supplemented.

4072. That has reference to the question of how you should employ the pension afterwards; but would it in your opinion be an advantage to have such a centre where the blind people would know that they had a sale for their articles, and where they could place them for sale, and which would, with a proper system of advertisement, afford an easy method of getting rid of the goods made at the different institutions?—Much would depend upon the management of such a place as that. In my experience some places have been opened for the sale of work for the blind, but bad management has soon caused the places to be closed again.

4073. Those would be retail shops for the retailing of goods?—Yes.

4074. What I wanted rather to get at was whether, if there was this difficulty about disposing of the goods made, it would not be of advantage to have some wholesale depôt from which retail shops could obtain the goods, the larger deposit of goods very often enabling them also to undertake contracts for particular articles?—I think it would.

4075. And it might remove the difficulty which at present exists in getting rid of the work done at blind institutions?—Yes. I may mention here that Mrs. Armitage employs 60 females.

4076. I see that in the report, and I see also that those 60 females are employed in work such as knitting, crochet, and netting, and that there is great difficulty in getting rid of the articles?—Mrs. Armitage loses about 200*l.* a year upon the sale of the articles.

4077. Is that because the place where those articles are retailed, if it is a shop, only deals with those goods?—No. Mrs. Armitage sends them to bazaars, and amongst friends.

4078. There is no actual place to which the public can go for those articles?—No.

4079. They are merely got rid of by Mrs. Armitage herself amongst friends?—Yes.

4080. That would not be a test then of how you might deal with work, but if retail shops answered partially, a system might perhaps be established by which, as in ordinary trade, a wholesale and retail business might be carried out in those goods, which would have the advantage of certainty of location, and therefore the public knowledge of those goods would be more general than it is at present?—A certain sort of work might probably be made to advantage and sold, but needlework cannot possibly be made useful.

4081. But basket making might be?—Yes.

4082. And chair caning?—Yes, that does not pay very well, but basket work might pay more.

4083. In such a case as happened not very long ago, when the Post Office required a large amount of basket work done suddenly at the time of the introduction of the Parcel Post, if there had been such a central depôt you might have got a good deal of employment for the blind in that way, might you not?—I believe the Berners Street workshop people turned out a lot of those baskets.

4084. Did they answer, or not?—I really do not know.

4085. (*Admiral Sir E. Sotheby*). Do you think it would be of advantage for a blind shop to sell things made by the sighted also; are you acquainted with the system of trade?—I am; I was formerly, before I went blind, in business for some years; and I think there may be an advantage in connecting the work done as a distinct department with a good wholesale firm or establishment.

4086. You say that you have 75 peolpe whom you can trace who have now employment; how much do they earn?—From 6*d.* a week to over 1*l.*

4087. What do you think is the average; would it be 10*s.*?—Not nearly 10*s.* Out of that number only about a dozen can be said to be supporting themselves earning from 12*s.* to a little over 1*l.* per week.

4088. Then how do that mass of people whom you cannot account for live?—Two hundred and twenty of our people are earning a little in the way of knitting, or writing, including those who are employed by Mrs. Armitage; they are earning 2*s.* or 3*s.* up to perhaps 5*s.* or 6*s.* weekly.

4089. Do you think that any of them are on the verge of starvation?—They would be if it were not for our society certainly; and then our Samaritan Fund comes in.

4090. You only visit a small number of blind people, I suppose?—We visit 875. It is a large number.

4091. Amongst those that you visit, do any of them belong to the workshops?—Yes.

4092. When do your men visit those if they are engaged all day?—In the evenings or mornings, before they go to their work.

4093. Are they ever visited on Sundays?—They never visit on Sundays. Many of them attend the Sunday Bible classes.

4094. Do you think that most of your people go to a place of worship?—They do, for the reason that I have told you, that we require about once a year, or once in two years, a certificate filled up by the minister of the place of worship, so that we know that the money which is given to pay a guide is used for that purpose.

4095. You do not show any preference for one place over another?—We do not.

4096. Do you know any of your blind people who support themselves by turning a mangle?—They could not earn much by turning a mangle, but they might make 5*s.* or 6*s.* or 8*s.* a week. In one case a man told me that he made 15*s.* a week, but that it took all the money for food, as it was hard work.

4097. Would it not be of advantage to have a general depôt to sell materials for the blind outside, or in certain districts, at cost price?—I think that the expense of managing such a depôt would perhaps be more than the advantage that the blind would gain.

4098. If they could buy the material at the present workshops, would not that be an advantage?—Yes. May I mention that it is a common occurrence that a blind man will come to me and say, "I can get employ-"ment, but I have no material; there is a job that I "can have, and I cannot take it." "Well," I say, "how much will start you?" and he tells me, and I inquire of the visitor to know whether it is all right. We never do anything indiscriminately, and we make very thorough examinations, and if we find it all right, we give what is necessary, 1*l.* or 30*s.* or 2*l.*, or in some cases more than that, perhaps.

4099. May I ask whether you are repaid?—Those are gifts. Whilst I am speaking about this I may mention that we are not a loan society, but Dr. Armitage is a loan society in himself. Where persons are likely to succeed and want more than we can give from the Samaritan Fund, Dr. Armitage will lend, perhaps, from 50*l.* or 60*l.* down to 5*l.*, or anything that on inquiry may be found to be necessary to establish a person whom we think qualified to carry out a certain undertaking.

4100. Do you think that Dr. Armitage is repaid?—In many cases he is not.

4101. Are you aware that there have been several blind agents in the country who have been provided with goods made at the workshops?—I have heard of agencies.

Mr. W. C. Lester.

11 Feb. 1886.

4102. Have they given a good account of the sale of the goods?—I believe not. I believe it is a general complaint that there is not sufficient sale for the products of the blind at remunerative prices.

4103. But have they got rid of the goods and not returned the money?—I have not heard.

4104 Do you read any books for the people in the workshops?—No, we do not.

4105. Why do you think that blind children would be better brought up in board schools with the sighted?—I think the more you can bring the blind into the company of the sighted the better.

4106. There is a large society called Christ's Hospital which gives large pensions, is there not?—It gives pensions of 10*l.*

4107. At present they can only be given to men who are 61 years old; would it not be a great advantage if that standard of age were lowered?—I think it is quite right as it is, considering that there are other societies. We have a great number who are qualified for a pension but cannot get it. I could supply them with any number.

4108. (*Dr. Armitage.*) You have been for about 20 years the secretary of the Indigent Blind Visiting Society, have you not?—I have been connected with the society for 21 years, and I have been secretary for nearly 19 years.

4109. What were you before you became secretary?—I was in business as an ironmonger.

4110. But you say that you have been connected with the society for 21 years, and you have been secretary for 19 years; what were you during the other two years?—A visitor.

4111. For what district?—For the East London district.

4112. Have you seen much of the blind in their own homes?—Very much.

4113. You have told us that out of the 125 who have been in institutions, 75 are doing something, and you told us that they earned from 6*d.* up to 1*l.* a week; can you tell us how many of those 75 are engaged in workshops?—About 21.

4114. Can you tell us what the average earnings of those 21 are?—The average earnings of those in workshops would be from 7*s.* to 12*s.* a week.

4115. Are those 75 men and women, or only men?—Men and women.

4116. Then, if we take off the 21 from the 75, that leaves 54; do you know any of those 54 who are maintaining themselves?—None.

4117. You know of none who maintain themselves at home?—None, excepting two or three.

4118. What are they working at?—Basket making.

4119. Is it two or three whom you know?—Three. There was one who was for two years and nine months in the Normal College, who was attending our classes at the East end, who is fully maintaining himself now as a tuner.

4120. You know of no other tuners?—I know none others; indeed, if they were able to support themselves, they would not be indigent and eligible for our society.

4121. So that your personal knowledge in connexion with the blind of London extends only to those who are in poor circumstances?—Only to the indigent blind.

4122. Only those who require help?—Only those who require help. I may say that before I became connected with the society, within about six or nine months after I went blind, I began to work amongst them. I had a Bible class at the Diocesan Schoolrooms in Nutford Place for some years, and I became acquainted with many there.

4123. Do you know of any mat makers who are maintaining themselves at home?—None

4124. Do you know of any sash-line makers who are maintaining themselves at home?—None.

4125. Would you say from your experience that mat making is a good trade for the blind to carry on at home?—It is a bad one, certainly.

4126. We have had in evidence that they receive large wages in one of the workshops; can you account for their failing to maintain themselves by working at home as mat makers?—The most that I know they are earning at home is 6*s.* a week.

4127. What is the reason of that?—They tell me that is all they are paid from the workshops. The fact is that prison labour is employed for mat making, and it is impossible for a blind man to compete with it; he cannot do anything at mat making to be remunerative.

4128. Then the blind mat maker has to compete with unpaid prison labour?—Exactly.

4129. Do you think that is the reason why he cannot maintain himself?—That is the chief reason.

4130. Would you recommend that institutions should go on to teach mat making under these circumstances?—Certainly not.

4131. Have you known any sash-line makers amongst the people whom you visit?—Yes, I forget their names, but there are two or three who really have been taught sash-line making, but who are not doing anything at it.

4132. Why not?—I suppose they could not get sufficient pay.

4133. Then you know of no person who, after having learnt sash-line making, carries on the trade at home?—I know of none.

4134. You would think, therefore, that sash-line making was not a good trade to be taught to the blind?—So far as my knowledge goes about those who have been taught it I should say that it is not.

4135. You were speaking of sack makers; have you known any blind sack makers employed at a shop with the seeing?—Yes, there were some employed in the City, either in Camomile Street or in that direction at a shop where seeing persons are employed.

4136. Do you know what wages they earned?—About 2*s.*, or 3*s.*, or 4*s.*, a week when they get work.

4137. But they do not get regular work?—No. As an instance many of them worked at Kingscote's, and so far as I know not one of those, although there were about a dozen or perhaps 20 employed in sack making, can obtain anything to do at it.

4138. You have spoken of various kinds of type for the blind; have you any personal knowledge of the types; can you read yourself?—Yes.

4139. By what type?—By Braille and by Moon, and by Frere.

4140. Can you read the Roman type?—No.

4141. You used to read it when you were seeing?—I did.

4142. Why did you not continue it when you were blind?—Because it is not adapted for the touch of a blind man.

4143. Because you could not feel it?—You cannot feel it.

4144. Is that a general complaint amongst the blind with regard to the Roman type?—Everywhere. In the case of those who say they can read it I have tried and found that they could not do so; you must have an arbitrary character.

4145. You say that you find that they cannot read it; do you know of any adult person who can read the Roman letters fluently?—I do not know of any person. I have tried, I suppose, a hundred, and not one of them has been able to do so.

4146. Is it a rule before taking persons on to ascertain what kind of type they can read?—It is.

4147. Are they tested?—They are tested. If they say that they can read the Roman character or any other type the visitor has specimens of that type when he is taking the particulars of their case, and he hears them read, if they can do so, by the system that they say they can read.

4148. Do you get those reports of the visitors?—Yes, monthly; in each particular instance we get all the particulars of the case. I have a form in my pocket which if you like I can put in evidence (*producing a form*). I put in the form for the applicant to fill up and the form for the visitor to fill up with his remarks on the case.

4149. Do you find from the visitors' reports that there are few, if any, amongst the adult blind who are able to read by the Roman system?—I have not heard of any. They can just spell out a little, but not to read.

4150. Have any of them been taught at school by the Roman system?—Several have been taught by the

Mr. W. C. Lester.

11 Feb. 1886.

Bristol system which is worse than the Roman system. They might read it in the school, but when they leave school their hands become hardened, and they are not sufficiently adapted for tactile reading.

4151. Then do I correctly understand that those who have learnt the Roman character at school leave it off when they leave school?—They do in most cases.

4152. Can you tell us what types are used in the reading classes?—The Braille and the Moon only.

4153. Not Frere's?—Not Frere's. I may mention that in one or two of the classes the old readers of Frere's are permitted to continue that reading, but they are only the exceptions and not the rule.

4154. Are many children taught in the society's classes?—Not many.

4155. Are there fewer than there used to be?—Much fewer, owing to the fact that they go to the School Board schools.

4156. (*Dr. Tindal Robertson.*) Are you perfect master of the Braille type?—I am.

4157. Do you conduct correspondence by it?—I do not, because the correspondence in my capacity as secretary is too great.

4158. I mean with friends or with any other persons; have you ever conducted any correspondence in it?—I have.

4159. Do you ever use it in your accounts for your private satisfaction, of course not for your public work?—Yes, I do use it for making memoranda.

4160. Is there any other system taken alone, by which you could have done the work in as satisfactory a way to yourself as you can by using the Braille type?—It is not possible, because there is no system by which you could write except by the old system of the Roman character, the capitals with dots, the pricking of paper.

4161. Do you know that there is a system of writing by Moon's type?—I do not, but I have used for writing one of Wedgwood's frames in which there is a little runner, and I can write with my finger on carbonised paper; I have used that a great deal.

4162. You said that you did not in your own institution give any pensions unless you were aware what were the pensions given by other societies; is that so?—We should want to know what was the entire income of the individual.

4163. Do you take it for granted, or do you get it by absolute inquiry from the associations themselves?—By reference; we inquire into it. Where there is the slightest doubt we apply to the companies.

4164. Do you not think that a uniform system of registration, which would enable all this information to be given at a glance, would be very valuable in the administration of pensions?—I think it would.

4165. (*Mr. Johnson.*) You say that there are 97 pensions from the Samaritan Fund, making up 730*l.* a year?—Yes.

4166. Those pensions vary, as I understand from you, from 2*s.* to 10*s.* weekly?—They do.

4167. Are they only weekly allowances, or are they annual pensions?—They are weekly allowances, but they are pensions continued so long as the pensioners are worthy of them and need them.

4168. But they are not given in the same way as other pension societies give them, for life?—No.

4169. Then in fact it is not absolutely a pension; it is an allowance of 10*s.* weekly or 2*s.* weekly?—It must be a pension if it is given.

4170. A pension is given for life; these are payments of 2*s.* and 10*s.* weekly during the pleasure of the committee, is it not so?—Yes. We have 30 pensioners on our general list.

4171. The 97 allowances arise from the munificence of the gentleman who founded the Samaritan Fund?—They do.

4172. On looking at the regular account, after what is given in bread, coals, or money, I see amounts paid to pensioners, 295*l.* a year. What persons are those pensions paid to?—Some of them are the quarterly pensioners.

4173. They are really pensioners?—They are really pensioners on the general fund.

4174. How many pensioners are there?—There are 30 now.

4175. What do they get?—From 5*l.* to 20*l.* a year.

4176. How many get 20*l.*?—Two.

4177. Will you fill up the list?—I am not prepared to give you the number, but the next will be 10*l.*; about half a dozen get 10*l.* a year.

4178. And the rest get 5*l.*?—5*l.* or 6*l.*

4179. Then those are regular pensions, like pensions from Hetherington's or any other charity. They are fixed pensions for life?—Yes; but you must understand that if Hetherington's committee know that a person was getting more than their rules would allow ——

4180. I do not wish you to enter into that. I only want to know the amount of the pure and simple pensions granted by this society?—Those are the pensions.

4181. There are 30 pensions, and the 97 what you call pensions, amounting to 730*l.* a year, in sums varying from 2*s.* to 10*s.* weekly, according to the pleasure of the committee?—Yes.

4182. I think I understood you to say that your society sometimes supplemented the resources of other people who held other pensions besides your own?—Yes.

4183. Can you tell me in how many cases that is done?—Many of the 97 pensions are weekly pensions, and those who have pensions from us from 5*l.* up to 20*l.* a year have pensions from other societies or parish allowances.

4184. You make no objection to give pensions or doles to people who are in receipt of parish relief?—I do not know about doles.

4185. I call the 2*s.* or 10*s.* weekly allowances doles. You would give those to people in receipt of parish relief?—So long as we know that the case is deserving, we give the amount to make up a sum sufficient for the blind person to live upon.

4186. What do you suppose that sufficient sum is?—That depends upon circumstances. In one case a person may be a very old and infirm person requiring some one to attend to him, and another person may be able to attend to himself. You cannot draw a line for a blind person.

4187. Your belief is that there is to a certain extent an understanding among the pension societies?—I only know of the understanding between the Painter Stainers' Company and Christ's Hospital.

4188. You do not know whether there is an understanding with regard to Day's charity, or any other of the large charities?—I do not.

4189. How many of your blind men are married to blind women?—There may be about 20 or 30 blind couples on our books; but I may mention that some few years ago the committee passed a rule by which all blind persons who, after that date, intermarried were disqualified from receiving the benefits of the society.

4190. You mentioned a case of a basket maker in Brighton who did not succeed; why did he not succeed?—It was not a basket maker. The person whom I referred to only learnt needlework, and that same person, named Antrim, who learnt needlework, was afterwards for five or six years in St. George's, and is only able to earn about 2*s.* a week now.

4191. Do you find any more difficulty in getting remunerative employment for the women than for the men?—Yes, because they are mostly employed in needlework.

4192. You discourage needlework then?—No, we encourage industry in every possible way.

4193. But you do not think that needlework pays?—It does not, but it is better to do a little than nothing at all.

4194. As I understand you you have 875 persons visited, of whom 125 persons are doing something; 75 are doing something to get their living, and 50 are doing but little; what are those 50 doing?—Included in that number you must count those who have been merely taught needlework. One person was in St. George's for nine years, I think, or 13 years, and is now earning 6*d.* a week at needlework.

4195. In that case was the person taught anything else at St. George's but needlework?—That person was taught needlework and something else, but the other occupation was not followed.

4196. She had no capacity, I suppose?—I do not know; I cannot say that.

Mr. W. C. Lester.

11 Feb. 1886.

4197. Then that leaves a residuum of 750 people; you say that 220 are earning perhaps 5*s.* or 6*s.* a week, and that 21 of the 75 are in workshops getting from 7*s.* to 12*s.* per week, and three are basket makers; what becomes of the other 500?—You did not, I think, quite take the reply which I intended to give; seven or eight of the others are earning on the average about 15*s.* a week.

4198. I have credited that. I say 21 of the 75 are in workshops; but taking it in round numbers there are 500 of the persons that you visit that you do not account for; how do they live?—By pensions or workhouse allowances, and by the assistance of friends.

4199. In fact they are not self-supporting?—No.

4200. And they do not earn anything at all towards their support?—Nothing at all.

4201. I believe you were engaged in teaching before you went to the Indigent Blind Visiting Society, were you not?—I was engaged only as the conductor of a Bible class.

4202. Was that under the Frere system?—That was quite distinct from the society; that was on my own account.

4203. You were connected, were you not, at one time with the Frere system with Mr. Goschen?—Never.

4204. Had you never anything to do with the Frere system?—Yes, I could read it, and read it fluently.

4205. What was your objection to that system?—It was not perfect.

4206. It was a phonetic system, was it not?—Yes.

4207. Then after that you learnt the Roman system?—No, I never learnt the Roman system.

4208. Then you cannot give much opinion about it?—Yes, I can.

4209. You do not read it yourself?—No, for the best of reasons, because I cannot.

4210. And you do not emboss in the Roman character?—No.

4211. You never used it for the purpose of correspondence?—No.

4212. Are the visitors of your society also teachers?—Some of them.

4213. Is it a *sine qua non* that the recipients of your charity shall learn the Braille system or the Moon system?—Not at all.

4214. You relieve people who do not read at all, and whom you do not teach at all?—Quite so.

4215. Then yours is really a missionary society?—It is.

4216. (*Chairman.*) Do you find that any of the blind who have no occupation lead immoral or vicious lives?—Unfortunately there are sometimes persons reported to me as being of such a character, and if they are on our books they are at once suspended, pending inquiry.

4217. Have you refused or suspended any in consequence of the result of the inquiries that you have made?—Several.

4218. (*Dr. Tindal Robertson.*) You stated that they taught the Braille system after the age of 60; are there not many cases in which much younger people would find it difficult, if not impossible, to learn Braille in consequence of the state of their hands, and to whom, therefore, it is necessary that Moon should be taught?—We are guided in all cases by the capacity and by the physical capability of the person.

4219. In such cases as I have mentioned, even in the case of a man 25 years old, the hands may be so hard that it is absolutely impossible for him to learn Braille, and is it your opinion that Moon would be then the best system to be taught?—Certainly. He would be one of the hard handed ones, that I mentioned.

The witness withdrew.

Mr. Alfred Willis examined.

Mr. A. Willis.

4220. (*Chairman.*) Are you a teacher or visitor of the Indigent Blind Visiting Society?—Both.

4221. How long have you been so?—Nearly 10 years.

4222. How many persons do you visit?—I have 87 in my district at the present time.

4223. How often are you able to visit them?—Once a fortnight in a regular way, and some oftener in case of sickness or some special reason.

4224. Are there many of them who cannot read for themselves?—Yes, many of the aged are not able to read for themselves, and there are some of the younger who are too far removed from the classes to attend the classes. If they are within three quarters of an hour, or in the case of some of them an hour they come to the classes to learn.

4225. Are you aware that there are many blind in London who have received no education to enable them to read the embossed characters which are used by the blind?—I should think that of my 87 not above half can read.

4226. Is that owing to their having been blind from early youth or from their having become blind in later years, and not having been taught any system of reading?—Generally the latter.

4227. Have you any special suggestion to make to the Commission with regard to the training or education of the blind?—I have my own personal experience, which I should be very pleased to lay before the Commission, if you will allow me. I have been blind now for 16 years, and the first four years of my experience in blindness were spent in the St. John's Wood School, where I was paid for as a pupil, and where I learnt music.

4228. Have you followed up your music?—No, I was never able to get employed after I had learnt it.

4229. What else did you learn there?—Nothing else but chair caning, which I learnt in my leisure hours.

4230. Did you earn enough to keep yourself after leaving that institution?—No, I was practically in the same position when I left St. John's Wood School as I was the day I went into it. My sister allowed me 7*s.* a week from her salary in service before I went in, and she contributed that much towards the 25*l.* that was paid for me while I was in the school, and she renewed it to me personally when I left the school, and continued it until the time when I was taken, I may say, in hand, by the Indigent Blind Visiting Society; and I ultimately became a visitor, and now I am thankful to say that my salary enables me to be quite independent of any assistance from here.

4231. Are you a paid teacher?—Yes, and a paid visitor.

4232. What is your salary?—70*l.* a year, and I am the conductor of classes as well in the South London district.

4233. In connexion with any other society?—No, not in connexion with any other society, but the pupils whom we teach to read the British and Foreign Blind Association employ as writers, so that it affords employment and work. I have, I think, at the present moment 10 who are employed thus as writers who are partially, and in one or two instances almost exclusively, supporting themselves by the writing.

4234. Do you think that some provision should be made for the blind after they leave these institutions by the institutions themselves, or by some organisation between the institutions?—If you will pardon me, I do not think that the blind would object where it was done or by whom it was done; but I know very positively that they would be very thankful that it should be done. I can say positively, speaking not only my own personal experience at the time I was at the St. John's Wood School, but from what many pupils that I have met with from various schools since then have told me, that the whole school experience is, as it were, overshadowed with a gloom as to the future, and that the constant thought was, "What shall I do when the time has "expired?" Pupils from different institutions visit me occasionally in the classes, old pupils who have belonged to my classes, and who have learnt to read and write there, some of whom have gone into different schools, and who come and see me during the holidays; and the question that I generally ask them is, "How "much longer have you to be there, and what do you "propose doing when you leave?" That is generally the great difficulty; I am positive about that.

4235. (*Admiral Sir E. Sotheby.*) Do any of the people that you visit receive out-door relief?—Oh, yes; in some cases we press it very strongly. The wish of the committee is communicated to us thus: that very often they consider such cases should either be inside the house or receive out-door relief.

Mr. A. Willis.

11 Feb. 1886.

4236. You visit about 87 people; how many of those people do you think are receiving relief from the guardians?—I could not tell you exactly, but I should say one-third if not more.

4237. Do not the guardians sometimes take away the money that they would naturally grant on account of your giving the blind persons so much?—I have never heard of a case of that sort, but I know of cases where I have seen the guardians, and they have in some instances continued out-door relief on the condition that we contributed as well. I have one case in my mind at the present time respecting which I saw the guardians.

4238. Do you think that there is much vice amongst the blind people?—If it is to be found I think it is in the institutions, and not among the outsiders. I do not know a drunkard amongst the blind.

4239. Do you visit any people who are employed at workshops in London?—Yes.

4240. What workshops?—St. George's workshops, the Peckham workshops, and the Greenwich workshops. I ought not to say that I personally know those at the Greenwich workshops, because I have now given up that immediate part of the district.

4241. You say that you learnt chair caning; why could you not get a livelihood at that?—Nobody could. I only know one man who could do three chairs a day.

4242. By doing three chairs a day what would you earn, about 1*s.* 9*d.*, I suppose?—Yes, about 7*d.* a chair, but I only know one man who can do three chairs a day; the average is two.

4243. And that would be about 10*s.* 6*d.* a week?—I only know one man who can do it, and he learnt it from infancy.

4244. How many could you do?—I would not undertake to do two.

4245. (*Dr. Armitage.*) Do you know any of your people who are earning their living, or nearly so, as basket makers at home outside the workshops?—I only know one case, and that is the case of Mark Little, who was taught basket making some years ago at Kingscote's workshops in Commercial Street, and he partly supports himself by getting work from the tramway company. That is the only instance that I know of.

4246. Do you know of any mat makers who are earning their living at home?—No, I know of none. I do not know of any mat maker who is working.

4247. Are there any in your district who have been trained as mat makers?—Several.

4248. And they have given it up?—No, they cannot get anything for what they do.

4249. Is that on account of the prison competition?—I cannot say what the cause of it is; it is generally attributed to that cause, but I could not say that it is so.

4250. Do you know any sash-line makers who are working at home?—No, not one.

4251. Do you know any wood choppers?—Yes; there are several engaged in wood chopping, some are doing better than others.

4252. Can you give us an idea of what a blind man can earn at wood chopping?—I could not give you very precise figures as to that, but there is a man named James Mills at Deptford who seems to be earning about 6*s.* or 7*s.* a week at wood chopping, that is at home. Then the men at the Peckham workshops earn somewhere about the same, I think.

4253. Are there any other trades that you know besides those that have been mentioned?—I think mattress making is one.

4254. I am speaking of what they can do at home; but they cannot do mattress making at home, can they?—No. I have 14 different persons who are getting their living in various ways, selling tea and other commodities.

4255. In your experience do you find that the adult blind are able to learn the Braille system?—If they are intelligent it does not matter what the age is; I have taught people up to the age of 60. I have a man at the present time who was in the St. George's School many years ago, and he has recently learnt the Braille system, and he reads it accurately, quite as fairly as I have ever heard a Lucas reader or an Alston reader. I dare say if I were to mention the man's name you would know him; his name is Clifford, and he is the man who makes the violins out of old cigar boxes.

4256. Do you know of any of your people who continue to read the Roman letter?—I do not know of anyone who reads it. I know some who know it, but I never heard one read it.

4257. You have tried them?—I have tried them.

4258. And they have failed to read fluently?—A young woman named Mary Jane Evans not very long ago told me that she could read the system, and I said, "Have you a book, I should like to hear you read?" Well, I should not like to call it reading; it was not reading, though I believe there are those who can read it.

4259. (*Dr. Tindal Robertson.*) There are some persons, I suppose, whose hands are too hard in the touch, and it is impossible that they could learn the Braille system?—Yes, I think so.

4260. What system do you recommend that they should be taught?—Moon, and I endeavour always to press them to learn it, and to tell the home teachers to visit them.

4261. Do you think that the combination of those two systems is really all that is required for a blind person?—I think so.

4262. Whether they are old or young, or whether their touch is good or indifferent?—I think it is absolutely all that is needed.

4263. (*Mr. Johnson.*) To the exclusion of the Roman character?—Quite.

4264. Can you read the Roman character yourself?—No, I have tried hard and could not succeed.

4265. You said just now that you had visited some one from the St. George's School, did you not?—I visited a man named James Beasley, but at the present time I do not visit him, because he is suspended from the society simply from the want of a subscriber.

4266. But you visited him while he was at the workshop?—Yes, and before he went to the workshop.

4267. Was he instructed so as to be able to read and write?—No, he never attended the class.

4268. But he is a good workman?—He is a good workman. He was taught privately, I believe.

4269. And he is earning a considerable amount of wages, is he not?—Yes, but he was not taught at St. George's.

4270. But he is employed there?—Yes, and White too whom I visit as well.

4271. You think that workshops would be a very good thing for the blind?—A splendid thing.

4272. Wherever they are taught?—It does not matter so long as they are taught properly.

4273. You think it would be a good thing to have workshops for the employment of the blind, and for the sale of material?—Yes.

4274. (*Chairman.*) You think that is preferable to their carrying on the work in their own homes?—Yes.

4275. Is it a disadvantage in the case of weaving and mat making, that they cannot carry on those occupations at their own homes?—Will you allow me to cite one case? A man of the name of Jackson came from Liverpool about 18 months ago. Through some interest (I do not know the particulars) he applied to the Gardiner Trust, and I believe he secured or he was granted 10*l.* for stock and frames. He started in business in Greenwich, under the auspices, I believe, of the Greenwich workshop. I received instructions to call upon him, and I found him working away at mats. They had laid out the whole of his 10*l.* in frames and fibre, or I think they call it material, and he was working away on an empty stomach (pardon me for speaking plain), for the man told me that he had not had anything to eat, and that he had made several mats on the first three days after he had had the materials, and he then started out to sell them, which he failed to do. The Greenwich workshop undertook to exhibit some of his mats in the shop and to hand over to him the money for the mats when they were sold. The man ultimately collapsed by first selling his material, and afterwards selling his frames. He is now living at Lewisham on his wife's needlework; he never sold a mat.

The witness withdrew.

Adjourned to to-morrow at 12 o'clock.

32, Abingdon Street, Westminster.

Friday, 12th February 1886.

PRESENT:

LORD EGERTON OF TATTON IN THE CHAIR.

ADMIRAL SIR E. SOTHEBY, K.C.B.
W. TINDAL ROBERTSON, ESQ., M.D.
T. R. ARMITAGE, ESQ., M.D.
E. C. JOHNSON, ESQ.

CHARLES E. D. BLACK, ESQ., *Secretary.*

HENRY J. WILSON, ESQ., examined.

H. J. Wilson, Esq.

12 Feb. 1886.

4276. (*Chairman.*) You are the secretary of the Gardner Trust?—Yes.

4277. Have you been so since its foundation?—Yes.

4278. Will you state briefly what are the objects of that trust and what its operations have been since you have been connected with it?—The trust was founded by a bequest of the late Mr. Henry Gardner, who left 300,000*l.* for the benefit of the blind in England and Wales. He appointed four trustees, who, together with the person who at the time of his decease should be Bishop of London, were to form the committee of management. The committee not being of one opinion as to which was the best method of carrying out the trust fund, a friendly suit was established in the Court of Chancery, in consequence of which a scheme was drawn up by the Court, dated the 20th of January 1882, and under that scheme the committee are now working.

4279. Is the trust now in full work?—Yes.

4280. Will you state what are the operations of the trust at the present time?—The scheme says that the money is to be divided, after deducting the necessary expenses for management, into ninths; two-ninths have to be given in instruction to the blind in trades, handicrafts, and professions, including the profession of music; two-ninths for instruction for the profession of music only, and two-ninths for instruction in trades, handicrafts, and professions other than the profession of music; and the remaining three-ninths are to be applied in providing pensions or grants, and generally in such other way as the committee may think best for the benefit of the blind. Those are the chief headings of the scheme.

4281. How many institutions are benefited by the trust?—At the beginning of last year I made a report to the committee, showing that 58 institutions and societies had been benefited directly from the trust.

4282. Is the whole of the money distributed every year?—There is a balance carried forward, but the yearly income is expended with this exception.

4283. What is the amount given in pensions?—The aggregate amount is 2,530*l.* a year in pensions to individuals.

4284. What are the principles upon which the committee of the trust distribute the funds among the 58 institutions?—The institutions make application for a certain amount; the applications are brought before the committee, and each application is dealt with separately, according to the needs of the institution. There are three chief considerations which weigh with the committee in the distribution of their funds; first, that all grants that they make should as far as possible be the means of eliciting assistance or aid from other societies or persons; secondly, with regard to individuals, the committee try as far as possible to give assistance which will supplement individual effort, so as to put the recipients in a position to maintain themselves. This naturally does not apply to persons who are past work.

4285. You give assistance to blind people other than in the way of pensions?—Yes.

4286. By way of assisting them in trade?—Yes.—And, thirdly, the committee try to prevent any application of their funds in cases where relief ought to be given from the parochial rates. Pensions are given in scales of 20*l.*, 15*l.*, and 10*l.*, paid quarterly in advance.

4287. Does the working of that principle which you have mentioned last prevent your giving assistance to the indigent poor who ought to be or might be in receipt of parochial relief?—Yes; those who are in receipt of parochial relief are, by one of the regulations drawn up for the guidance of the committee, ineligible for pensions.

4288. Therefore you only assist those who are in moderately good circumstances and who are partly able to assist themselves?—The applicants are not always able to assist themselves; they get assistance from relations or in some other way.

4289. You assist those who are partly assisted by their friends?—Yes.

4290. And with regard to institutions, do you make any condition of a certain sum being raised to meet your grants, like the Ecclesiastical Commissioners do, for instance?—Yes, in most cases the committee do; a certain sum is given on condition that a certain amount is raised within a prescribed period.

4291. Do you make those grants for buildings or workshops?—Yes.

4292. And to individuals do you give grants to set them up in business?—Small grants have been given in that way.

4293. In granting help to those institutions does your committee make it its business to examine fully into the working of the institutions to see whether they are deserving of your support?—Yes, as far as possible.

4294. Has it been your business then to investigate the conditions and working of all these institutions of which we have heard?—As far as possible.

4295. In giving your pensions do you take care that no other society is giving pensions to the same individual, or at least not without sufficient reason for such help being given?—Yes, always; but I may add that pensions have been given to persons receiving pensions from other societies, but not without inquiry and being aware of the fact.

4296. You do not give them without inquiring whether any other pensions have been given?—No, an inquiry is always made.

4297. Do you get at the information you require by making inquiry of the individual himself, or by communication with all those institutions which give pensions, or both?—First of all I generally get information from the applicant himself, and then I send a form of questions which has to be signed by the clergyman of the parish, or the minister of his chapel, and also by a householder. Then when the answers to those questions are returned to me I make further inquiries as far as possible. In London I investigate very nearly all the cases of the applicants through the Charity Organisation Society; but in the country it is more difficult.

4298. Do you put yourselves into communication with, and have a list of all, the different societies and their pensioners, so that no person could apply twice under the same name without your knowing it?—No, I have not a list of all the pensioners of the different charities.

4299. You have not any such list?—No, but there is a question on that point in the form of application which I issue, viz.: "Is the applicant in receipt of allowance from any societies or persons? if so, state amount and "names of such societies and persons. State total "income from all sources."

4300. Do you test the accuracy of the answer which you receive to that question?—I depend upon the information given me by the Charity Organisation Society in London, and upon the word of the clergymen in the

H. J. Wilson, Esq.

12 Feb. 1886.

country; he certifies from actual and personal knowledge of the applicant that all the questions are faithfully and truthfully answered.

4301. Do you think that it would be advisable that the various societies who give pensions should communicate to each other and to you the names of those to whom they give pensions and their circumstances?—Yes; I am in communication with some of the societies.

4302. Are you in communication with Hetherington's Charity?—I have been in communication with Hetherington's in several cases. They applied to me about twelve months ago about the case of an officer in the army, a very sad case indeed; they said they could not assist him because he was born out of England; he had come, through no fault of his own, to great penury, and they asked if the Gardner Trust could give him any assistance. I brought his case before the committee and he was placed on the list of pensioners at once as a vacancy had just occurred.

4303. Did they give him the largest sum that they were in the habit of giving?—Yes, 20*l.* a year. I am in communication with the Christian Blind Relief Society, the Poor Adult Annuity Society, and others; in fact, I have been in communication with almost all the societies, but not about each case.

4304. Then you think as a whole you are not likely to be deceived as to the nature of the application?—I think not.

4305. You take every precaution against being deceived by people making false statements?—Yes, if there is any doubt I write immediately and get further information from other sources.

4306. From your knowledge of the various institutions for the blind in London, do you think there is a want of intercommunication between them, and that therefore they have not that knowledge of the particular cases that come before them that they otherwise would have?—I think they do communicate with each other whenever any special information is required.

4307. Do you think there is room for improvement in the societies for the benefit of the blind in London with regard to the way in which they deal with the individuals whom they educate or train or assist?—I think as regards the blind generally more workshops are required; and also I think when young men and women leave school, that some assistance ought to be given to them; something ought to be done for them to enable them to start fairly in the world.

4308. If there were more combination between the various societies, could there not be workshops established to which those who had passed through the different institutions could be sent, and from which the work could be sent to be sold, either at a central depôt or at a variety of depôts throughout London. If there were more combined action among the various institutions, could they not start workshops, which you say are wanted?—That is a question I feel hardly competent to answer off-hand.

4309. How would you propose to establish workshops?—By charity, if State aid could not be obtained.

4310. By fresh charities or existing charities?—By fresh funds being raised.

4311. Looking at the number of blind societies existing in London, is it necessary or advisable, do you think, in order to provide workshops for the blind, to start a fresh society for the purpose of establishing workshops?—I do not mean that a separate society should be formed to which a workshop should be attached; but that funds would have to be raised for the support of new workshops other than the funds which are now being raised.

4312. Raised by the different societies, do you mean?—Yes.

4313. Would you have one workshop in London?—One or more.

4314. How many would you have in London?—I should say there was room for one or more large workshops still in London and for some in many of the provincial towns.

4315. Then you think, in addition to what has been done for the blind in London, fresh funds are required to create workshops?—Yes, if they are not self-supporting.

4316. Even if they were self-supporting some fund would be required to start them?—Yes, at first.

4317. Has it ever occurred to your trust to do that yourselves?—The committee have assisted existing workshops in London and the provinces.

4318. If you think it is desirable to create more workshops, and your society is for the benefit of the blind, does your society intend to start those workshops?—I do not think the subject has been brought before them exactly in that form, although aid has been given towards the starting of several workshops.

4319. If it was brought before them would they consider it?—I have no doubt they would consider it; they have, as far as possible, aided workshops and have given grants in aid to several so as to enlarge them; but, as far as practicable, they desire to utilize existing institutions rather than to start new ones.

4320. Your Trust does not propose to take the initiative in starting fresh workshops, but merely to support existing institutions?—Yes. Exactly so.

4321. Do you think that it would be desirable to divert some of the money now given in pensions to the assistance of those who could assist themselves, by starting workshops; that is to say, instead of giving a man 5*l.* a year, to give that sum to assist in founding a workshop where that man could be employed?—Yes, that would be desirable (if the funds could be so appropriated) in the cases where pensions are granted to those who could earn an equivalent or more by employment.

4322. That has not been considered by your committee?—No, but the committe do not grant pensions in lieu of wages.

4323. What are the conditions upon which you grant pensions?—There is no restriction as to religious opinion; the recipients must be of good moral character, and in real need of assistance from the trust; there is no limit as to age; they must not be in receipt of parochial relief.

4324. Have you refused any applications from those who you have found on inquiry have not been of good character?—Yes; and after the pensions are allotted each case is looked into evey year. Three pensioners have had their allowances withdrawn owing to misconduct.

4325. Are there more vicious men amongst the blind poor than in any other class?—No, I think not, from my experience.

4326. Of course there are black sheep in every class?—Yes, and those are the ones, I think, that show up in the streets.

4327. Is there not a tendency for people who are out of work to get into vicious habits?—I suppose there would be.

4328. Is not it therefore of great importance, in order to prevent the blind from falling into those habits, that they should be as far as possible employed?—Yes, undoubtedly.

4329. Your preventive is the multiplication of workshops?—Yes, or grants to individuals who can work at their own homes.

4330. Are you aware at all whether those who do work at their own homes are found to be successful?—Some get on very well at their own homes, and others can make no headway at all.

4331. Is it a question of ability, or perseverance and energy?—It depends a great deal on the district that they are in, whether they can get a sale for their stock; a very able man might be in a district where he could not get rid of his goods, and he does not like to leave that district.

4332. That rather points to another deficiency, which is a deficiency of means for the sale of work?—Yes.

4333. Has your society done anything in that direction, that is to say, in aiding the creation of depôts for the sale of work?—No, but a central aid scheme was brought prominently before them in March 1884, and they thoroughly entered into the subject then; and I sent a circular letter round to all the institutions, 33 in number, and judging from the answers received the feeling was rather against a central aid, so the matter was dropped. The idea was to start a large central depôt in London for the whole of the country to supply institutions with material at the cheapest wholesale rate, and to receive articles for sale from all institutions and from individuals; in fact, any manufacture by the blind and as far as possible to take Government contracts for work.

H. J. Wilson, Esq.

12 Feb. 1886.

4334. There might be objections to a central depôt for the whole country, but are you aware whether the institutions have any objections to a central depôt for London?—I have not heard of any except, judging from the answers to a question in the circular letter, most of the institutions sell nearly all the stock that they can make.

4335. We have had evidence that there is great difficulty in getting rid of some of the work of the blind, that if that difficulty is not felt by institutions, it is at all events felt by individuals?—It is felt by individuals, no doubt.

4336. You said just now that blind men did not succeed because they failed to sell their work in certain districts?—Yes, I think a central depôt certainly would be a great boon for those who have a difficulty in selling their work.

4337. Have you read the report of the Charity Organisation Society?—Yes.

4338. Have you any observations to make on that report?—It is some little time ago since I read it, so I can hardly remember any special point.

4339. Do you think that an Amendment of the Industrial Schools Acts would be desirable so as to enable industrial schools for the blind to be formed, assisted by the State?—Yes; or that existing blind schools should receive assistance from the State.

4340. Do you think it desirable to have inspection by the State of the education of the blind?—Yes, I should think that it would be most beneficial.

4341. You have visited most of the institutions in London for the education of the blind, I suppose?—Yes, I think almost all of them.

4342. Do you think that the education therein is generally satisfactory?—Yes, as far as I have seen, certainly.

4343. Have you visited any institution for the education of very young children, that is to say, children under eight?—Yes.

4344. Do you think it desirable that the education of blind children should begin as early as that of sighted children, say at the age of from three to five?—Yes, I think so.

4345. As a matter of fact there are very few institutions that take children at that early age?—Yes, as far as I know there are only four schools where they take very young children.

4346. Which are those four; would Miss Rye's be one?—Yes, and Miss Newbery's. The Primary School at Norwood, and St. George's.

4347. Do you consider the education in all those schools satisfactory?—Yes, I think so, as far as I can judge.

4348. Have you visited Miss Rye's school lately?—Yes, a few months ago.

4349. Has she received any grant from you?—Yes, one in 1882 and another in 1883.

4350. Has she applied again?—Yes.

4351. You have not refused to give any grant to Miss Rye's school?—She has applied again for a grant, and assistance has been offered for the support of two children; but not directly to the home.

4352. Are those children in fairly good circumstances, requiring assistance, but not of the pauper class?—Yes. The one that has gone there is. The other was rejected on account of ill health.

4353. What grant would you give in such a case; would you pay for the entire schooling?—Yes; if aid could not be obtained from other sources. For this girl who has been admitted the committee pay 12*l.* 10*s.* a year. That includes board and tuition.

4354. When do your elections take place?—When a vacancy occurs in the pension list, it is generally filled up at the next or following meeting.

4355. Do you give your pensions from year to year?—Yes; each year I look into every case, but the pensions are terminable at six months' notice. Each pension is given on that condition.

4356. Have you founded any scholarships at some of the blind institutions?—Yes.

4357. Will you state the character of those scholarships?—There are scholarships founded at Norwood College, which are musical scholarships.

4358. To what amount?—They vary. The highest amount is 60*l.* I struck the average the other day, and I found that it was 38*l.* 13*s.*

4359. What is the minimum?—As low as 20*l.*

4360. What other scholarships have you?—At the Preparatory School at Norwood there are 22 scholarships for general instruction, varying in amount from 20*l.* to 25*l.* There are also 16 scholarships at the Technical School at Norwood——

4361. What is the amount of those scholarships?—I think on an average a little under 40*l.*

4362. What is taught in the Technical School?—Tuning the pianoforte and its mechanism. The scholarships at the Technical School average about the same as at the college.

4363. Are they held for two or three years, or one year?—Each scholarship in the first instance is granted for one year only, but the scholar is eligible for re-appointment at the expiration of the first year. There is also the provision that they are taken on three months' probation, so that if they do not prove proper subjects for the scholarship, at the end of three months the committee have a right to withdraw them. At the end of the first year the scholars, if in every way satisfactory, are re-elected for a further period of one year, and so on, till the number of years is completed for which the scholarship is given; so that it is a year by year scholarship.

4364. Your trust has only been in operation four years; have you turned out many tuners in that time from those who have been recipients of your scholarships?—Some have gone out as tuners. I am not prepared to give the number that have received appointments; they could be but very few.

4365. Have there been any failures in those who have received scholarships to obtain employment?—Not that I know of, except a few from ill health and misconduct.

4366. You have some scholarships at Worcester College, have you not?—Yes, there are five scholarships at the Worcester College for the Blind Sons of Gentlemen, which were originally 50*l.* each; but the committee found that the sum of money required for the scholars could be partly met from other sources, so the amount was in some cases reduced to 20*l.* and 30*l.*, and there is at present a fund of 60*l.* which is not utilised.

4367. For how many years are those scholarships tenable?—The applicant must be over 9 and under 16 years of age, and the scholarships are tenable for seven years, subject to the condition that no scholarship shall be tenable after the scholar has entered his 21st year.

4368. Have any of those scholars gone to the universities?—No.

4369. What age are the scholars?—About 17 or 18 now.

4370. Is there a minimum and a maximum age for your scholarships?—Yes; the candidates for the Worcester scholarships have to be under 16 when they compete for them.

4371. They go by competition then?—Yes, when there are several applicants for one scholarship.

4372. Are they open to all England?—Yes; England and Wales.

4373. What class in life are those boys who enjoy these scholarships?—They are supposed to be sons of gentlemen; but the line is drawn very broadly.

4374. The sons of people of moderate means?—Yes.

4375. You inquire into the means of the parents, I suppose?—Yes, always.

4376. Do you give grants for the printing of books for the blind?—Yes.

4377. You give them to all institutions that print books for the blind?—I believe so, as far as I can remember.

4378. Do you give a preference to any one type over another?—No, but Braille's and Moon's have been most largely assisted.

4379. Have you any opinion yourself as to the best type for the blind to be used generally?—Yes; my personal opinion is that the Braille is the best; I mean for the education of the blind. Undoubtedly Moon's type is the best for those who go blind late in life.

H. J. Wilson, Esq.

12 Feb. 1886.

4380. Do you think it is desirable to perpetuate the other systems of printing?—No, personally I do not.

4381. Do your committee make any distinction as to the amounts which they give, or do they give equally to all?—It depends upon the necessities of the case. As regards Moon's Institution, only one grant has been made.

4382. Will you give us the grants in any one year to the different institutions who print books for the blind?—Only one grant has been made to Moon's Institution; it has not been repeated.

4383. What was the amount of that grant?—As far as I remember it was 2,000*l.*

4384. Have you made any grant for the printing of the Braille type?—The committee have made to the British and Foreign Blind Association two grants of the value of 150*l.* and 200*l.* respectively.

4385. Have you made any grant to any other institution?—Yes; to Worcester Cheap Literature Society one grant of 100*l.*, and another of 50*l.*; that is the Roman type.

4386. Will you go through the grants that you have made?—I think those are all.

4387. Are there any suggestions which you would like to make to the Commission for the improvement of the condition of the blind or their education and industrial training?—I have no suggestion to make except with regard to workshops and grants to individuals on leaving school to enable them to start in some trade or handicraft. The majority of them are very poor when they go to school, and naturally they are very poor when they leave, and they have no funds to buy material or tools; a great many of them have applied to the trust for assistance, and the committee have aided over 200 persons in this way, *i.e.*, by grants of 7*l.*, 8*l.*, 10*l.*, or 15*l.* on leaving school, and to others to carry on their trade; I find only nine have applied again, from which the inference may be drawn that they are getting on fairly well.

4388. You assume by their not applying again that they are getting on pretty well?—Yes.

4389. We have had it in evidence that sometimes they give up industrial occupation and find begging more profitable, you cannot say whether they have taken to that profession or not?—No; but I do not think any of those whom the committee have assisted have taken to begging.

4390. With regard to those 200 who received grants from you, were there any who had not passed through any industrial institution?—Yes, some were in trade, having small shops, or carrying on some profession, which they had not learnt at any institution.

4391. You are speaking of those who had become blind later in life?—Yes, the majority of those I am now referring to would have become blind late in life.

4392. Are there any trades which those who become blind late in life can follow with advantage or success besides those of basket making or chair caning?—I hardly think so, except those who go blind when they are in business. I always think they ought to be able to carry it on by the means of the wife or some relation.

4393. Do you know whether they do?—Yes. They do in several cases.

4394. Have you formed any opinion as to blind men marrying blind women?—In my opinion no actual harm comes out of it, but I should never recommend such a course.

4395. You have known many such cases?—Yes.

4396. Have you visited the homes of blind couples?—In some cases.

4397. Have you found the home where the wife is blind as well as the husband, as well kept as the homes of those who have married seeing wives?—In some cases, and in others I have not; in one cottage, which I visited last summer, there were four blind people, and I never went into a cleaner house in my life; that was near Salisbury.

4398. Were any of the children blind?—Those to whom I allude were four grown-up persons, two brothers and two sisters.

4399. Where both the parents are blind, are the children as well looked after as the children of seeing parents?—I have not had much experience of that.

4400. Do you know whether the parents in such cases send the children to school and see that they are kept as tidy as if they were the children of seeing parents?—I have hardly had sufficient experience to answer that question.

4401. But you can conceive it possible that they might not do so?—It is possible.

4402. (*Admiral Sir E. Sotheby.*) You say that you have assisted 58 institutions?—Yes.

4403. How many of those institutions are in London and how many are in the country?—I am afraid I could not tell you that without referring to my notes.

4404. I suppose London had the preponderance of grants?—I think not; without referring to my notes I could not say exactly.

4405. With regard to parochial relief, do you know of any instance in which after you have given assistance to a blind man, he has been refused help from the parish?—I do not know of any such instance.

4406. How many applicants are there on the list for pensions now?—About 3,300.

4407. They are given entirely according to the merits of the applicants for them?—Yes; 3,300 is the number of applications altogether; I do not say for pensions only, but for pensions and general assistance.

4408. You could not say how many there were for pensions alone?—No, but it would be by far the majority.

4409. You have given your opinion with regard to the establishment of workshops, have you visited many existing workshops, and if so, which?—I believe I have visited all the workshops in London; and I have visited Sheffield, York, Exeter, Devonport, Plymouth, Cardiff, Swansea, Nottingham, Bristol, Cheltenham, &c.

4410. Could you suggest any improvement on what you have seen in those institutions?—In some of the institutions I thought some improvement might be made.

4411. Perhaps you think Government inspection might be of advantage to them?—Yes, I think it would.

4412. You advise the establishment of more workshops?—Yes.

4413. Are you aware that that would be attended with additional expense?—Yes.

4414. There is a great difficulty already to support the present ones, is not there?—Yes.

4415. I think you give 9,000*l.* a year away for different purposes, do you not?—More than that.

4416. How much?—Roughly speaking, about 10,500*l.*

4417. Can you tell me in round figures what proportions you give for music, for trade, and for pensions?—In round figures a third for music, a third for trade, and a third for pensions and in such other way as the committee may think best.

4418. Do you give any money for music besides what you give towards the Normal College?—Yes, some has been given.

4419. What sum would that be?—100*l.* a year has been given hitherto to the Edgbaston Institution for Music, and a grant of 500*l.* was made to the St. George's School for the purchase of an organ.

4420. Independently of what you give to the Normal College, you have not given any money towards instruction in music except those two grants you have mentioned?—No, except in a few cases to individuals, as for instance, there are two at Henshaw's Asylum who are receiving assistance of 10*l.* a year for instruction in music, but no large grant is made except those mentioned.

4421. The great bulk goes to the Normal College?—Yes.

4422. I believe it was Mr. Richardson Gardner who proposed to have a central depôt?—Yes.

4423. You say that your committee thoroughly went into his scheme; do you know why his scheme was not adopted?—Because the feeling of the institutions was rather against a central depôt.

4424. That was the only reason, was it?—I drew out yesterday a few memoranda with regard to the central aid scheme. That scheme came before the committee in March 1884, and I sent out letters with regard to it to 33 institutions. With regard to question A, which was, "Whether you consider your institution is in need of any such depôt?" 15 out of the 33 institutions made no reply at all; 9 said "No," or "No need at present;" 4 said "Favourable to some such scheme;" and 5 answered "Yes." With regard to question B, which was, "Whether you would utilize it in any way?" 17 sent no reply; 4 said "Not likely;" 6 said something to this effect "If materials could be obtained as cheap "as in present market;" and 6 said "Probably, yes," or "yes." With regard to the surplus stock, I asked them to state, "The surplus stock on hand at the time of the "receipt of this circular or the general average of such "surplus." With regard to that there appeared to be no surplus stock except at two or three institutions, only the ordinary working stock. With regard to question 5, which was, "Have the sales diminished or increased of late years?" 22 said "Increased;" 3 "Diminished," and 1 "Stationary;" 2 were doubtful, and 5 gave no answer. With regard to Question 6, which was, "Are "the requisites for manufacture purchased wholesale, "and what is the expenditure yearly on this account?" 26 said "Yes," they purchased wholesale; 2 said "No," and 5 gave no answer.

H. J. Wilson, Esq.

12 Feb. 1886.

4425. Have you any knowledge of the begging system in London; I suppose you know that a great many blind people go about begging?—Yes.

4426. Do you know where they come from, have they been educated in music, for instance?—That I do not know.

4427. You do not know much about them?—No; except that I very often see them in the streets.

4428. Have any of them ever made application to you or relief?—Yes.

4429. Have they been given relief?—No, not actual beggars, nor, as a rule, itinerant musicians, as the committee do not look with favour on those men who earn their living in the streets either by singing or by music.

4430. (*Dr. Armitage.*) Supposing a central depôt was established in London for England and Wales, and it was largely used by the other institutions, it would involve a very large amount of buying of material, would it not?—Yes, certainly.

4431. Have you any personal experience of buying in large mercantile houses?—No, I cannot say that I have.

4432. Do you know that the buying of material is the most difficult problem to solve in a mercantile house, and that the firm has to depend largely upon the honesty and capability of the buyer?—No, I cannot say that I do.

4433. Have you ever turned your attention to the system in Germany of looking after the former pupils of blind institutions?—Yes, I thought the system was certainly a very good one.

4434. Do you think it is a system that could be followed with advantage in England?—I think so, undoubtedly. I think something of that sort ought to be done; that is to say, that the schools ought to keep touch with their old pupils who have learned a trade, at any rate for a certain number of years, and that a bonus should be given, if possible, by the schools to those who are starting on their own account and are really deserving and in need.

4435. Do you think it would be better that the responsibility of starting in life, and assisting, when necessary, all old pupils, should be thrown upon the school in which they were educated, or that it should be undertaken by an independent society?—I should think if there were an independent society which would undertake that responsibility, it would be almost better than throwing it upon the schools, but that is a matter I have not thoroughly thought over.

4436. Have you ever considered the subject of helping those who have left school?—Yes.

4437. Have you ever seen the system in action either in Germany or France of looking after the former pupils?—No, I have never seen the system.

4438. (*Dr. Tindal Robertson.*) Has any subsequent bequest been made since your trust was founded?—No.

4439. Has any addition been made to it in any other way?—A small donation has been made from the Charity Organisation Society, viz., 25*l.*, which were placed in their hands to be given away through some existing institution for the blind, and they handed it over to my committee.

4440. I presume your committee would be prepared to receive any bequests or donations if they were made?—Undoubtedly.

4441. Is it your plan generally to give a lump sum or to give annual grants to different institutions; which is the most in favour with your committee?—The grants are as a rule renewable annually, a fresh application is brought up each year before the committee, and they never make a grant for more than one year.

4442. You prefer that plan to giving a lump sum in order that you may, as I know you do, carefully investigate the circumstances each year of the different institutions and the way in which they are doing their work?—That is the reason the grants are made annually. I re-investigate the case of every institution when a fresh application comes up.

4443. With regard to education, do you give grants to schools as well as to individuals and for purposes of trade?—Yes, some grants are made to schools and some to individuals at the schools, for instance, at Miss Newbery's, I believe, there are eight children who are now receiving small assistance, say 4*l.*, 5*l.* or 6*l.* apiece, and their friends make up the rest.

4444. Is any preference given according to the way in which the children are educated in those schools?—No, so long as the instruction is, in the opinion of the committee, efficient.

4445. Have you any means by which you may test whether the education given in the schools to which you give grants is an efficient one or otherwise?—No, except by asking for information from those who are interested in the blind and by personal inspection. There is no regular examiner.

4446. Do you get reports from those schools?—Yes. The annual reports are sent from the schools.

4447. Do not you think it would be very much more advantageous to have a general inspection of those schools so that you might test the education given in them?—Yes.

4448. Would that assist you very much in coming to a determination as to the amount to be given to the different schools?—Certainly.

4449. With regard to pensions, do you think that a general registration by all the pension giving societies acting in combination, would be advantageous in enabling them to judge whether they overlapped each other in giving pensions to particular persons or not?—It would be hard to keep such a registration right up to date, because there are so many of the pensioners who are very old. With regard to Christ's Hospital, I should be afraid to say how many pensions lapse each year. If every case were thoroughly examined into there would be, I think, no necessity for such a registration.

4450. Is there any other scheme by which cases could be thoroughly examined, except the keeping of an annual register embracing the recipients of pensions from all the societies, and to which all the societies might have access?—I do not know that there is, unless each society did what I do with regard to the Gardner Trust, viz., investigate every case and get the full particulars and find out what assistance is given and from what charities.

4451. Do you know whether the different societies which give pensions to the blind make the same thorough and careful examination that you make?—I believe they send forms out in which similar questions are asked to those which appear on the trust's form of application.

4452. You were asked about a central depôt, and you said that a scheme for a central depôt had been before the institutions, did you mean that a scheme for a central depôt for the whole of the country had been put before them or that a scheme had been put before them of having one or more central depôts for London, and one in each of the large provincial centres?—The proposal was to have one central depôt in London for England and Wales.

4453. Do you think if a proposal to establish a central depôt, or more than one if necessary, for London, and central depôts for the large provincial centres had been before those institutions, that they would still have refused their adhesion to it?—No, I think they would not.

4454. I speak of depôts where the blind would be able to buy materials at wholesale price, and where they would be able to send their work for sale, whether they worked at workshops or at home, and where they would have their names registered so that they might be got

H. J. Wilson, Esq.

12 Feb. 1886.

at at any time if necessary?—The feeling of some of the institutions was that they would be very glad to see provincial depôts started.

4455. With regard to scholarships, have you any scholarships at the universities?—Two, at 60*l.* each, at Oxford.

4456. Would your committee be prepared, do you think, to increase the number of those scholarships, especially from Worcester College, if it was found that they would be very advantageous to the blind children of comparatively poor people who might be inclined to take advantage of them?—I think so, decidedly.

4457. Is it within your knowledge that at the present time there are blind clergymen and blind lawyers who have been educated at Worcester and afterwards at the university?—Yes.

4458. Do not you think it would be a very great advantage if such men as those who showed capability could be assisted from the funds of your trust?—Yes, I do. I may state that only four applications for scholarships at the universities have been received. Three were granted and one deemed ineligible. One scholarship was not accepted.

4459. (*Mr. Johnson.*) Two-ninths of your funds are granted, as I understand, to music only?—Yes.

4460. What portion of the two-ninths which goes to trades, handicrafts, and professions, including music, goes to music?—It varies.

4461. What do you suppose was the gross amount paid for music last year?—About a third of the income.

4462. With the exception, then, of 100*l.* paid to one nstitution and 500*l.* to another for an organ, that is 600*l.*, the balance of that third of the income has gone to one institution, the Normal College?—Yes.

4463. Could you tell the Commission what led your trustees to give it all to one institution instead of distributing it amongst other institutions in the country where music is equally well taught?—I do not know whether I can answer that question, because the scholarships to the Normal College were granted just before I was appointed secretary.

4464. At all events, one third of the income goes to that one particular institution?—Yes, about a third.

4465. That is to say, the whole of one two-ninths and a portion of the other two-ninths?—Yes.

4466. I think you said that the average amount of the scholarships at Norwood is 38*l.* 13*s.*, the highest being 60*l.* and the lowest being 20*l.*?—Yes. The highest can be 60*l.*, but at present is only 50*l.*

4467. What is the aggregate amount of money paid on those particular scholarships at Norwood?—The number of scholars at Norwood is 87, so it would be 87 multiplied by 38*l.*

4468. In the 87 do you include the 22 scholarships in the Preparatory School and the 16 in the Technical School?—No, the 87 are exclusive of them.

4469. Then the amount of the scholarships in the Preparatory School would be, how much?—500*l.*

4470. And those in the Technical School would be, how much?—600*l.*

4471. The 600*l.* and the 500*l.* would make 1,100*l.*, and the 87 scholarships would be a little over 3,000*l.*?—Yes.

4472. So that the Normal College get 4,100*l.* from your funds?—Yes, I believe so; about that amount, or rather more.

4473. Have you any idea what the total amount paid for instruction in handicrafts and trades, excluding music, was last year?—Last year 3,041*l.* 10*s.* was paid to 32 institutions and 511*l.* 7*s.* towards fees for instruction of individuals in addition to scholarship money to Worcester College, &c.

4474. From your experience do you think that music is a profitable occupation for the blind?—In many cases certainly it is.

4475. Not in all?—No.

4476. Have you any idea what would be the proportions of the successes and failures among the persons trained in music in this college, which you so largely subsidise?—I forget the exact number stated in the report.

4477. You receive a report from the Normal College; you have no report from any other institution because you do not subsidise any other in music?—Only from Edgbaston; they send their report.

4478. You give them 100*l.* a year; is that renewable every year?—Yes.

4479. Allusion has been made to a scheme which was proposed by Mr. Richardson Gardner, who, I believe, is not one of your trustees, which was brought before your trustees, with regard to the establishment of workshops; have you any objection to put in that scheme?—I do not suppose the trustees or Mr. Richardson Gardner would have any objection to its being placed at the disposal of the Commission.

4480. That scheme contained some very valuable hints, upon which your trustees took the opinion of all the existing institutions?—Yes.

4481. That scheme embraced the establishment not only of workshops, but of a central depôt?—A central depôt only.

4482. I understand you not to object to the establishment of one or more depôts for London and provincial depôts in different parts of the country?—I was not giving my own opinion, but that which I gathered from the various institutions; their opinion seemed to be against the establishment of a central depôt in London for England and Wales.

4483. Have you any difficulty in filling up all your scholarships both at Norwood and at Worcester?—Not at Norwood but at Worcester certainly there is a difficulty.

4484. In getting people to compete for the scholarships?—Yes.

4485. Where do they compete?—At the college.

4486. You have no control over the examination; you merely grant the money?—The examiners for the scholarships are appointed by the trust.

4487. Have you had any returns made to you showing the results of the instruction given in the Technical School at Norwood, to which you give 500*l.* a year, and in which pianoforte tuning and pinnoforte mechanism is taught?—It has only been started lately.

4488. How long?—I think about three years.

4489. You have only given three grants?—Three and part of the fourth year's.

4490. Your committee receive a periodical report with respect to all the scholarships, I suppose?—Yes, every ear.

4491. And they either withhold their grants for scholarships or continue them, as they see right?—Yes.

4492. You have a great deal of experience with regard to pensions; is there not a certain amount of association amongst all the managers of pension giving societies, and do not they communicate information one to the other?—Yes, they have always given me information very readily.

4493. Do the City companies who distribute pensions to the blind communicate with you?—Yes, some of them.

4494. And Christ's Hospital?—Yes. I have also corresponded with the Protestant Blind Pension Society.

4495. That is a voting society?—Yes.

4496. Voting charities and trusts follow the same plan of making all the inquiries they can?—Yes, I believe so.

4497. And you have received great assistance from many of those charities whom you have asked for information?—Yes.

4498. We may say that generally speaking those who grant pensions to the blind take the best means they can of procuring information with regard to the applicants for pensions before they grant pensions?—Yes.

4499. (*Chairman.*) You do not give any aid in those cases where the guardians assist?—No, not by way of pension, but sometimes parochial relief is supplemented to afford instruction.

4500. Are you aware whether the guardians assist all cases that they might reasonably be expected to assist?—No, I do not think they do, and they do not give sufficient assistance in many cases.

4501. Do they exercise their full power of sending blind children to institutions where they may be educated and trained in industrial work?—No, certainly not. I have had great difficulty in that matter. I try and get assistance from guardians, and I am not always successful. If the case is a deserving one and no assistance can be obtained from the guardians, the committee give assistance to enable the child to go to school.

4502. In fact your committee have relieved the rates to that extent?—Yes, where it has not been possible to get anything from the guardians, but only in a few instances.

4503. As I understand with regard to children, you do not draw the line very rigidly with regard to assisting cases which ought to be assisted by the guardians, but with regard to adults who ought to be assisted by the guardians, you do not give any assistance at all in those cases?—No, it has only been done in one special case, and that was by the unanimous vote of the committee.

H. J. Wilson, Esq.

12 Feb. 1886.

4504. Was that a case where the guardians ought to have assisted?—The guardians did assist, and the committee resolved to supplement their assistance; they only gave it on condition that the guardians would not withdraw the relief.

4505. Then the result of your experience is that the guardians are sufficiently alive to their duty with regard to adults but not with regard to children?—Yes.

The witness withdrew.

Mr. John Whitaker Hulke, F.R.S., F.G.S., examined.

4506. (*Chairman.*) You are connected with the Royal London Ophthalmic Hospital?—Yes.

4507. Are you connected with any other institutions for the blind in the metropolis?—I am not connected with any other special hospital; I am connected with the Middlesex Hospital, but that is a general hospital.

4508. Can you give us any information with regard to the preventible causes of blindness?—Yes, I think I can. For instance, the commonest cause of blindness in infancy and early life is the purulent ophthalmia of the new-born; there can be no doubt, I think, that that causes a very considerable per-centage of blindness, and that is a thoroughly remediable disease.

4509. What suggestions would you make with regard to precautionary measures to be taken to prevent the spread of that disease?—One would like to have all those who are occupied in attending women in labour, both the midwives who attend a very large proportion of the poor population and those in our own profession, better informed upon the subject.

4510. Is there ignorance in the medical profession with regard to the precautions that ought to be taken?—I should hardly like to say that there is ignorance; but, as I am informed, a large number of persons are attended in labour by a qualified practitioner, and they have no warning from him as to the possibilities that may eventuate; he does not see them again; ophthalmia occurs, and then the eye is neglected, and the opportunity is lost. But if some kind of regulation were made that there should always be a warning given by the poor law doctor to the nurse or to the mother of the child it seems to me that many cases would be prevented.

4511. Are most of the cases which are said to be cases of blindness from birth caused by that disease?—In the majority of cases I should say that that is so.

4512. Are there many cases of actual congenital blindness?—By "congenital blindness" do you mean where children are born blind?

4513. Yes?—There are some, but not such a very large proportion.

4514. Is it your opinion also that the midwives are not well acquainted with this disease?—That is so beyond any doubt.

4515. What steps could you take to ensure these precautions being taken, even amongst the midwives, by the poor law, or by circulation through the boards of guardians?—I should think so. I think that no midwife, unless certificated, should attend a woman in confinement, and that a certificated midwife ought to have stringent instructions on these heads.

4516. Are a large proportion of the midwives not certificated?—I cannot say; that is beyond my knowledge.

4517. But would a certificated midwife know what precautions to take?—I think they should know, but I doubt very much whether they do largely know.

4518. Are you aware of a great number of cases where blindness is owing to this disease?—Oh, yes.

4519. Are the precautions which you would recommend adopted in the cases of the birth of children in workhouses?—That is beyond my knowledge.

4520. Would you circulate through the machinery of the poor law some common remedy as a precaution against this purulent ophthalmia?—I think there could be no difficulty whatever in drawing up a short plan for the treatment and management of such cases which ought to be given to every person who has to deal with the children of the poorer classes.

Mr. J. W. Hulke, F.R.S., F.G.S.

4521. Dr. Brudenell Carter stated to us that the solution which he found to be most useful for application in cases of infantile ophthalmania was a weak solution of bi-chloride of mercury?—I believe that of late years that has been largely used; but we for the most part have used alum, which is a very common remedy, and one that is always at hand, and it is less dangerous if an accident should happen by anyone drinking it than corrosive sublimate.

4522. Is the blindness which arises from measles or scarlet fever preventible?—If it were efficiently treated, in a large number of instances the results would be very much less severe. That you could absolutely prevent the occurrence of inflammation of the eyes and ulceration of the eyes after these maladies, I doubt; but you render the results very much less severe by proper treatment.

4523. Are there any special occupations which tend to blindness in after life?—I cannot say that there are, except occupations where they are liable to accidents, for instance, in the case of boiler makers and occupations of that kind, and in the case of men who are engaged in grinding, where there are bits flying off the wheel, and so on.

4524. Do you ever find that any children become blind from over straining their eyes in youth?—That is a very difficult question to answer with a yes or no. I think one may say this: that if you have in childhood a strong tendency to shortness of sight, to myopia, then straining the eyes will greatly aggravate and intensify that; so that if they survive to middle life or old age their eyes very often break down.

4525. Do you think that the best corrective to that is healthy exercise?—Yes, and efficiently lighted rooms, and giving the children suitable glasses.

4526. Do you think that short-sightedness is on the increase in England?—I am not aware that we have had any thorough examination with reference to that. No doubt a larger number of cases come under observation because people are more alive to it; but as to whether there is an actual increase of it, I do not think we have figures before us which enable us to speak positively.

4527. But now that all children are obliged to attend school it is of course more likely that their short-sightedness will be found out?—It is found out, and their mistresses or masters send them to us for glasses; a large number of them are sent to the hospital for glasses. They cannot see the diagram board across the school room.

4528. Cases of that kind no doubt would be aggravated by constantly concentrating the sight on a book a short distance off?—No doubt, particularly in twilight and insufficient light.

Perhaps I might mention one malady which leads to a not small amount of blindness, and that is what is known as granular ophthalmia.

4529. What is that caused by?—It is a very infectious disease; it rapidly spreads; and you see it very largely in persons engaged in the slop-tailoring trade living in small, badly ventilated, and badly lighted rooms; for instance, among the Polish Jews, who make such a large amount of slop clothing at the east end of town.

4530. Is that produced by bad sanitary conditions?—It is greatly aggravated and possibly produced by them.

4531. Is it a disease which is imported from abroad?—Whether it was originally so one cannot say; there is

Mr. J. W. Hulke, F.R.S., F.G.S.

12 Feb. 1886.

no doubt that a number of persons come with it from abroad, but it equally, I think, breaks out here amongst children who have never been abroad, or who have never been much in association with those who have been abroad. I think we must allow that it will spring up endemically amongst us.

4532. Is it contagious?—I think there is no doubt about that; it will spread from child to child or from person to person. Unless you put a number of people into a room close together with no ventilation and so on, I do not think it would probably be so contagious through the atmosphere as it is by actual contact.

4533. Have you any experience or special views which you wish to offer to the Commission with regard to the general treatment of the blind in London, or with regard to their education or industrial training?—This is a matter upon which I unfortunately have scarcely formulated my views, because I received a request merely asking me if I would come here and give information, and I did not know on what points I should be asked for information, so that I am sitting here rather under a disadvantage in that respect. It is a matter that requires a good deal of reflection, and I should hardly like to speak upon those points; but if there is any particular subject that you would like any information about that I could give you, I will do so with pleasure.

4534. Are you acquainted generally with the societies for the relief of the blind in London?—I am acquainted with the Indigent Blind Visiting Society, but not with other societies.

4535. How many blind are treated year by year in the hospital with which you are connected?—A very considerable number, a number which would amount to thousands, but I should not like to say how many. If you will permit me, I will ask our secretary to send you our reports, and you will have all the information there, but I could not give you the figures. It is the largest and the oldest of the hospitals for the blind in London.

4536. Is there any way of preventing the blindness that comes on between the ages of 40 and 60, which appears to be the period of life at which it comes on most frequently in England?—A certain and not inconsiderable per-centage of that is due to glaucoma and glaucomatous affections; and unfortunately they are still very largely unrecognised. Again and again patients come to the hospital in a hopeless condition: perhaps they had been under observation, but the disease has not been recognised; and yet that is a malady for which in a large number of instances much can be done if you only get them early enough. Very often glaucoma in its earlier forms is taken for an acute bilious attack; there is great headache and vomiting, and so forth: but the vomiting is simply symptomatic of the affection of the eyeball.

4537. Is glaucoma an affection of the nerves of the eye?—No, it is an affection of the eyeball, the leading characteristic of which is undue hardness of the eyeball, due to over tension of the eyeball. If the eyeball becomes unduly distended, you get pressure of the nerve, and then you get wasting of the nerve and blindness.

4538. What are the predisposing causes to glaucoma?—They are very imperfectly known, though there are a great many theories about them. In a certain not inconsiderable number of instances there is a fairly distinct gouty history.

4539. (*Mr. Johnson.*) You think that purulent ophthalmia is the principal cause of blindness amongst children?—I think so.

4540. And in the case of children and persons of a later age you think that granular ophthalmia is the principal cause?—That is so with young adults, and in fact you may say any time of life.

4541. Have you any data to go upon which will enable you to state amongst what class of persons granular ophthalmia is most prevalent. You have said that it is prevalent amongst the Jews in the slopshops; do you think that it is prevalent amongst any other classes?—I think that wherever you find persons crowded together in unwholesome workshops, with flaring gas and bad ventilation, and where they are badly fed and dirty in their habits, there you get it.

4542. Then by taking proper precautions that is a disease which is equally preventible with the purulent ophthalmia of children?—By taking proper precautions I think it is preventible to a great extent.

4543. We understand that purulent ophthalmia in young children and granular ophthalmia in those of more advanced age, and glaucoma at a still more advanced age, are the principal causes of blindness amongst the population?—They are principal causes; I would not say that they are the only causes, but they are the chief causes.

4544. And the two first would be preventible by care and proper precautions?—They would be largely preventible, I think.

4545. Have you any experience of any other trades in which blindness occurs?—We have heard before the Commission something about shuttle-blindness; do you know anything about blindness dependent upon any particular trades?—No, I know nothing whatever about shuttle-blindness. It is said that a peculiar form of blindness is prevalent amongst miners who work a good deal under ground, and in constrained positions, but I have no experience of that whatever.

4546. Do you think that secondary syphilis is any very great cause of blindness in this country?—I would put inherited syphilis before the other.

4547. That would be secondary or tertiary syphilis, I suppose?—No, I am speaking of inherited syphilis.

4548. Is that a cause of blindness to a large extent?—I think it is so to a not inconsiderable extent.

4549. Have you any data on that subject at your hospital with which you could furnish the Commission?—I think that some statistics might be got out if the registrar were to go over the books and analyse the cases for a few years.

4550. It would be an interesting result if such a thing could be obtained?—Yes, and I think it could be obtained.

4551. Do you know of any other antiseptic except alum and bi-chloride of mercury that would be useful in the early stages of ophthalmia?—Almost any of the metallic salts, sulphate of zinc, for instance.

4552. But alum is the most innocuous?—Yes, and alum is always at hand.

4553. Do you know anything about the experiments of Dr. Crédé in France?—No.

4554. Have you had any experience of the epidemics in any of the parochial schools, such as the one at Hanwell?—None.

4555. Have you any experience with regard to Germany?—I know a great deal of German literature, but I have no experience with regard to the actual practice in Germany.

4556. Have you ever formed any opinion as to why blindness was more prevalent in Germany than it is in England?—No, I was not aware of the fact.

4557. In your experience, what is the proportion of children that are born blind?—I should think it is small, but I could not give you the actual figures.

4558. You have only to do with those who to a great extent become blind at a later period?—Children and persons of all ages are brought to the hospital.

4559. Is there any register of the periods at which they became blind?—No, there are merely the ages at the time of application. Every patient who applies has his or her name and age at the time entered; but an adult may apply who may have become blind in childhood, and the age at which the blindness occurred would not be mentioned.

4560. Do you think that the present system of education tends in anyway to increase blindness?—I think it does in this way, that under the high pressure there seems to be a notion that all children must be driven at the same rate, and sufficient allowance is not made for those whose machinery is weak, and they break down.

4561. Have you any experience of board schools?—No, I have merely the experience of patients who are brought to us at the hospital stating that they are attending board schools.

4562. Do you think that the present pressure in all schools tends to depreciate the ordinary sight?—It tends to break down those who are weakly; there is not sufficient allowance made for them. It is even the case with parents; they often want to urge on their children beyond their powers.

4563. (*Dr. Tindal Robertson.*) With regard to the ophthalmia of infants, about how long does it take to destroy the eye?—In an acute case it does not take very long, not many days. Children of a week or ten days old are frequently brought to the hospital whose eyes are destroyed.

Mr. J. W. Hulke, F.R.S., F.G.S.

12 Feb. 1886.

4564. So that any remedy to be of real use must be applied at once?—It should be applied at once.

4565. At the very first beginning of the disease?—Yes. It occurs, no doubt, from contagion in the act of birth; and if children are thoroughly well washed, and their eyes are thoroughly cleaned, and a little Condy's fluid, or any similar antiseptic is used, you will prevent it.

4566. I have been informed that in some parts of the midland counties there is a form in which alum has been distributed, either by the aid of the parish authorities, or in some other way, and that that has proved effective; do you think that if some plan of that kind were adopted it would be of great use?—I think that some measure of that kind would be very useful.

4567. Is the granular ophthalmia of which you spoke epidemic at times?—Where a large number of persons are crowded together it rapidly spreads, and so in that way becomes epidemic.

4568. And there is no special mode of treatment, I presume, which would apply to that, or anything which would prevent it, except what you have told us of in the way of care as to sanitary appliances?—There again each case must be treated on its own merits. You cannot lay down any hard and fast line of treatment, except the general rule that astringents for the most part seem to be more useful than other remedies. But there are different stages of the disease, and you require to modify your treatment accordingly.

4569. With regard to the prevalence of myopia amongst young children, do you think that a periodic inspection of schools, say an annual inspection, or something of that kind conducted by an experienced person would be useful in detecting it at an early stage, and possibly in preventing its getting worse?—I think it would be very useful, and not merely in detecting myopia but in detecting the opposite condition of hypermetopia it would be exceedingly useful. Again and again children are scolded and bullied because they will not do their work when they simply cannot see and want glasses.

4570. You spoke of the bad effect of insufficiency of light; do you think that gas for instance has a tendency to do harm by having too much light?—No; if the gas is steady, if it is so arranged that the light given by the burners is thrown down upon the work, but not blazing in the childrens' eyes, I see no objection to gas with proper ventilation.

4571. You think that it depends upon the position in which the light is put?—I think largely so. You ought always to have abundance of light thrown upon the work, but not any blaze upon the eyes.

4572. Would it not be an advantage in schools that rules should be laid down by which people should know how light ought to fall; is not the light now often thrown directly into the faces of the children?—I have no direct personal knowledge of schools, but I have no doubt that it is so.

4573. Setting aside altogether the question of the transmission of syphilis, do you think that blindness is in any other way hereditary?—Yes, I think you see cases where it runs in families.

4574. Have you any experience of blind intermarriages?—I have only a general experience of it; I have no particular experience of it. When I first joined the Indigent Blind Visiting Society there were several instances in which blind men married blind women and it was found to be bad in every way for the children. How could the parents bring them up carefully and properly, or see that they were clean?

4575. Have you any reason to think that there are any other results to the children of blind parents, whether any of them have ever become blind or been born blind?—I have myself no knowledge of instances where blind parents have begotten blind children.

4576. What is your opinion of the influence of smoking upon blindness?—That is a very broad question. I think there can be no doubt whatever that there are some persons to whom tobacco is poison, and that a relatively small amount of smoking is injurious to them; but there are a very large number who can smoke without taking harm from it.

4577. Could you give us any approximate idea as to the per-centage of cases of blindness which might be caused by over-smoking?—No, I could not. My impression is that it does exist, but that the per-centage is not very large.

4578. (*Dr. Armitage.*) You say that the ophthalmia of new-born children is easily preventible; is it easily curable?—I think it is both easily preventible and easily curable. If you see a child with infantile purulent ophthalmia early enough it ought very seldom indeed to lose an eye from that. Of course if the child is some miserable, puny starveling in a wretchedly ill-nourished condition, perhaps nothing will save the eye; but speaking broadly one may say that you ought seldom, if ever, to lose an eye if you see it early enough.

4579. Is the cure generally rapid?—I think fairly so.

4580. Within two or three weeks or so it ought to be well?—Oh, yes.

4581. Would you say the same with regard to glaucoma?—No, that is a very lingering and intractable thing; it is a difficult thing to cure.

4582. Easy to prevent, but difficult to cure?—I think so.

4583. Have you any experience with regard to intermarriages of cousins which are within the limits of consanguinity allowed by the English law, as to their effect upon the children born of such marriages?—I have seen several instances of blindness in children the offspring of first cousins; but I have seen a great number of instances of intermarriage where no such ill resulted.

4584. Are you of opinion that intermarriage of first cousins is a cause of blindness?—Taking the particular condition which is known as *retinitis pigmentosa* the technical name for the condition which leads to blindness, and which is an inflammation of the retina and choroid accompanied by the formation of pigment, I do not think you would find such a large proportion of instances of blindness to occur in the offspring of first cousins as to make it desirable to throw difficulties in the way of such marriages.

4585. Do you know of cases in which several children in one family have been blind?—I know instances where several children in one family have had very considerable imperfections of sight, but I could not at the moment speak of cases where many children in one family have been actually blind; for instance, you often see several members of the family with congenital cataract.

4586-7. Do you look upon such diseases as congenital cataract as being hereditary? I mean where the parent has the disease. If a person has congenital cataract is he from that reason more likely to have children with congenital cataract?—That is a matter upon which I have no positive knowledge; I have no data to go upon. I do not at the moment remember instances where the parents have had it and where the children have had it.

4588. Are there any diseases of the eye in which you would say that the disease is hereditary, passing from parent to child?—I cannot say at the moment that there certainly are; but, as I have already stated, you often see disorders running in families where, for instance, there is atrophy of the optic nerve, where parents have gradually drifted into blindness, and the children with advancing years have done so also from a defect of the optic nerve.

4589. Could you make any suggestions as to the professional education necessary for dealing with these diseases; do you think it would be desirable to give more prominence to a knowledge of opthalmic surgery?—There is no doubt that it would be very desirable to do that. The difficulty is that already the whole curriculum of medical education is crowded into so short a space of time that it is absolutely impossible to demand more unless we could extend the time of education.

4590. Is a knowledge of ophthalmic surgery essential at the College of Surgeons, for instance?—Yes, candidates are liable to be asked questions, and are very constantly asked questions as to eye diseases and the treatment of eye diseases.

4591. But it is not necessarily so; they are only liable to it?—They are liable to it, and being liable to it I think they for the most part prepare themselves in some degree.

Mr. J. W. Hulke, F.R.S., F.G.S.

12 Feb. 1886.

4592. Is an attendance on some course of ophthalmic surgery or practice in an ophthalmic hospital essential?—I am not aware that that is actually required by the schedule.

4593. Can you tell us how that is with regard to Germany?—No, that I could not say. I think it is not essential in Germany, but I would not speak positively on that point.

4594. (*Admiral Sir E. Sotheby.*) Would it not be highly desirable for general instruction to be given at the lying-in hospitals and workhouses respecting the treatment of the infants' eyes when they are born?—Very desirable.

4595. And such instructions are not so given now, are they?—I have no distinct knowledge of that point, but I think they are not.

4596. You have told us that blindness is sometimes caused from hereditary syphilis?—Very often.

4597. Do you not consider, then, that the abolition of the Contagious Diseases Acts would tend much to the increase of blindness?—By increasing the spread of syphilis; in that way it would.

4598. Then that would increase blindness, I presume?—Yes.

4599. Do you consider that blindness amongst the children of the poor is sometimes caused by their being turned out in the open air too soon after measles, and scarlet fever, and so on?—I do not think it arises from that cause; I think it is from bad nutrition.

4600. And not from catching cold in the eyes after suffering from these complaints?—If they catch cold it is because they are badly fed and badly clothed.

4601. You say that blindness may be also caused by over-pressure and overwork in the schools?—Yes.

4602. That is, I presume, rather against the present competitive system?—I think that a large number of persons break down under that in their eyes as in other parts of their bodies.

The witness withdrew.

32, Abingdon Street, Westminster.

Wednesday, 17th February 1886.

PRESENT:

LORD EGERTON OF TATTON IN THE CHAIR.

THE RIGHT HON. SIR HENRY SELWIN IBBETSON, BART., M.P.
ADMIRAL SIR E. SOTHEBY, K.C.B.

W. TINDAL ROBERTSON, ESQ., M.D.
W. AUCHINCLOSS ARROL, ESQ.
E. C. JOHNSON, ESQ.

CHARLES E. D. BLACK, ESQ., *Secretary.*

MR. PINDER SIMPSON examined.

Mr. P. Simpson.

17 Feb. 1886.

4603. (*Chairman.*) You are clerk and treasurer of Day's Charity?—Yes.

4604. What is the amount of the capital, the interest on which is at the disposal of the trust?—We have in consols the sum of 55,350*l.* 18*s.* 9*d.*, and a further sum of 7,287*l.* 14*s.* 4*d.* consols. I may state that the sum of 7,287*l.* arose from accumulated interest between 1836 and 1842, when the charity was floated, the will having been disputed by Mr. Day's representatives in the meantime. Then in reduced we have the sum of 55,350*l.* 18*s.* 9*d.*, and a further sum of 7,286*l.* 3*s.* 4*d.* accumulated interest.

4605. In the whole, how much does that amount to?—125,275*l.* 15*s.* 2*d.* The sum originally left by Mr. Day was 100,000*l.* to found The Blind Man's Friend Charity.

4606. What are the expenses of management?—They were about 372*l.* last year, we may say 360*l.*, or something like that, per annum upon an average.

4607. What is the amount distributed per year?—The amount that was distributed for the four quarters ending October 1885 was 3,391*l.*, that sum was distributed amongst about 230 annuitants, the annuities varying from 20*l.* to 16*l.* and 12*l.* per annum.

4608. The interest upon the 125,000*l.* odd is how much?—The interest at 3 per cent. on 125,275*l.* is 3,758*l.* When you add the 372*l.* for expenses to the amount distributed, which was 3,391*l.* in 1885, you get very nearly to the 3,758*l.*

4609. Will you tell us in how many annuities that 3,391*l.* is distributed?—It was distributed amongst 46 annuitants at 20*l.* a year, 58 at 16*l.* a year, and 124 at 12*l.*; that is rather below the average, we are about four or five short at the present time.

4610. Are those pensions given annually and paid quarterly?—They are paid quarterly in advance, they are not fresh grants every year; the pension may be considered as an annuity for life, provided the annuitant conducts himself or herself properly.

4611. That is the only condition?—Yes, unless there is a flagrant breach of the rules of the charity.

4612. Will you tell the Commission what means you take to test the needs or the qualifications of the applicants?—In the first instance a petition is sent in, which must be on the books 12 months before an applicant becomes eligible; at the expiration of that time the trustees consider the case, and provided all the requirements are fulfilled and the case is well backed up by persons who know the case to be a thoroughly deserving one, the applicant is considered by the trustees to be a fit object for an annuity.

4613. What are the qualifications; is one of them that the applicant must be over 21 years of age?—He or she must be over 21 years of age, and not in receipt of parish relief at the time the application is made.

4614. Do you make it a qualification that the applicants shall endeavour to gain their livelihood as far as they can by some trade?—No, that is not one of our qualifications. It is generally stated in the petition whether they follow any trade or profession.

4615. Do you give the pensions mainly to those who do not or cannot earn anything for themselves?—No.

4616. You give them to those who help themselves?—We give them to those who help themselves; it was Mr. Day's wish that the money should be given to those who endeavoured to support themselves.

4617. But you do not make it a qualification?—No, not an absolute qualification.

4618. What means do you take to verify the correctness of what the individual has stated in the paper filled up?—The qualification paper after the case has been nominated by the trustees is sent either to the individual or to some friend, or the clergyman of the parish, who fills up the qualification paper; then it is returned to the trustees, and it must be signed by the clergyman of the parish, or by a magistrate to whom the applicant is personally known.

4619. Do you keep a list of the applicants?—Yes.

4620. And of the annuitants?—Yes.

Mr. P. Simpson.

17 Feb. 1886.

4621. What number of applicants have you now on your list who are not in receipt of pensions?—I made out this list yesterday; in round figures, as near as I can arrive at it, is 4,735: of course, a vast number of those applicants one would never hear of, because they have never received an annuity, they may be dead; and some of them, if alive, would be 120 years of age; how many might be written off as dead I cannot tell you. The deaths of our annuitants average about 10 per annum.

4622. And you have that number of vacancies?—We have about that number of vacancies per annum.

4623. How many of those 4,735 have been 10 years on your list?—I could not tell you; the number of cases I am giving now is from the commencement of the charity.

4624. You have about 230 pensioners?—Yes.

4625. And you elect 10 a year?—Yes.

4626. Therefore, it would take nearly a quarter of a century to put the entire number of pensioners upon the list?—Yes.

4627. How many of those 4,735 have been applicants for 25 years; you say some of them would be 120 years old if they were alive; what number of bonâ fide applicants are you unable to give pensions to?—We have 2,000 cases on the books which the Trustees are unable to relieve.

4628. Do you communicate with any of the other societies or companies who give pensions, in order that you may ascertain whether two or three pensions are given to the same person?—Whenever those different charities make application to me for information I furnish it.

4629. But you have no interchange of lists with other pension-giving societies?—No; but in my experience upon two or three occasions I have had applications from the Hetherington's Charity for a list of our annuitants.

4630. You do not know therefore whether a great number of those applicants on your list are not now in receipt of pensions from other charities?—They have to state their income from every source at the time the qualification paper is returned; by which I arrive at the fact as to whether they have an annuity from any other charity.

4631. How many applicants have you each year for the 10 vacancies?—I ascertained that a few years ago, and in one year I found there were 80 new applicants; in the second there were 90, and in the third year there were 100; but I do not think there have been so many during the last few years; we might take the average at 70.

4632. Is that diminution in the number in consequence of other charities or pension-giving societies existing now which did not exist formerly?—Possibly.

4633. The Gardner Trust, for instance?—Yes. Now and then I have had tremendous rushes; upon one occasion I was induced to test the cause of those and I found that some one had put an advertisement, I think in the "Mirror," about Day's Charity, stating that if they applied at 34, Savile Row, they would get an annuity of 12*l.*, 16*l.*, or 20*l.*, and briefly stating the routine they ought to follow and so forth. Immediately after that advertisement I was inundated with petitions, then again they fall away.

4634. Are your applicants generally living in London or are they scattered over the country?—They are scattered all over the country.

4635. Do you think the effect of those pensions being given in London brings up the blind to live permanently in London?—No, I think not; I might say that I have more applicants from Cornwall than from any other county.

4636. Do you find that many of those applicants have been miners?—Nearly all of them.

4637. Since you have been clerk to the trust how many annuitants have lost their pensions through misconduct?—Not half a dozen.

4638. Do you have reports from time to time of the condition of your pensioners?—No, unless they are asked for; if we have any idea there is anything not quite right I send a qualification paper to the clergyman or to someone of position in the parish.

4639. Have they to report themselves from time to time so that you may know that they are alive?—Those who reside in London are expected to come to the offices for their annuities, those who live in the country are paid through bankers; the certificate of the clergyman of the parish attached to the quarterly receipt paper is assumed to be a sufficient guarantee that the recipient of the annuity is alive.

4640. I suppose you are not aware whether the nature of your trust could be varied in any way without much difficulty with the consent of the trustees?—No, I should not like to express an opinion upon that point.

4641. Have you any special recommendations to make to the Commission with regard to the treatment and training of the blind?—No.

4642. (*Sir Henry Selwin-Ibbetson.*) I understood you to say that an applicant for a pension has to state his income from every source?—Yes.

4643. And by that means you arrive at a knowledge whether he is in receipt of pensions from other sources?—Yes.

4644. Suppose he is in receipt of other pensions, would Day's Charity refuse him a pension in consequence?—It would depend upon circumstances. If he had a number of pensions and he was pretty well off in other respects, the trustees in all probability would say they had more worthy objects.

4645. You have no regulation which prevents a man from being in the receipt of other pensions than your own?—No.

4646. Would not the benefits of your charity and of other pension-giving societies be more widely extended to the general blind if there was some combination between the different pension-giving charities which would prevent an accumulation of pensions in one individual?—Yes, I think it would have the object of diffusing charity over a larger field.

4647. And therefore would be a benefit to the general body of the blind?—Yes.

4648. Whereas at present from the system which is in operation, under which there does not seem to be any intercommunication between the different pension-giving societies, one man may be in possession of five or even six pensions?—Yes.

4649. Which is clearly to the prejudice of many others who might be really deserving objects of charity?—Yes.

4650. Is it your opinion that some system ought to be established by which there should be intercommunication as a matter of course between the different charities for the purpose of avoiding that?—I think it would be a very good plan.

4651. (*Admiral Sir E. Sotheby.*) Do you think it would be desirable to make it a qualification on the part of a person seeking a pension that he had been endeavouring to get employment and could not obtain it?—Yes, I think it could.

4652. Do you give any preference to industrious persons and those who cannot work any longer at their trade?—It depends entirely upon circumstances.

4653. Will you state the exact wording of Mr. Day's will?—Those persons whom the trustees consider worthy objects of relief, it is left to their discretion.

4654. (*Chairman.*) Have you the will before you?—No, I have not.

4655. (*Admiral Sir E. Sotheby.*) There is nothing in the will with reference to giving pensions to people who are at work?—No, the trustees have an absolute discretion.

4656. Would not it be an advantage if pensions were given as a supplement to the earnings of the blind?—Yes.

4657. That would give encouragement to blind people to work, would it not?—Yes.

4658. They would in that case not entirely depend upon pensions?—Yes, that would be a good plan in my opinion.

4659. (*Mr. Arrol.*) You stated that if any applicant was in receipt of parochial relief he would be disqualified?—Yes.

4660. If you found that a pensioner was obtaining parochial relief would you disqualify him?—He would be suspended immediately.

4661. Is the clergyman who gives a certificate when you pay a pensioner supposed to examine into the con-

Mr. P. Simpson.

17 Feb. 1886.

dition of the pensioner?—Yes, it is presumed that he does so; he has to state in the certificate that the pensioner is not in receipt of parochial relief, and those words are inserted in red so that they should not be overlooked.

4662. During your term of office you have only disqualified six. They were not disqualified because they received parochial relief, they lost their pensions from misconduct.

4663. Do the benefits of your charity extend to Ireland and Scotland?—Yes; we have one annuitant only in Ireland, we have some in Scotland.

4664. (*Dr. Tindal Robertson.*) You said that your pensions were of different amounts?—Yes, 12*l*., 16*l*., and 20*l*.

4665. What are the principles which guide the trustees in determining the amounts to be paid to a particular applicant?—They deal with each individual case upon its merits; it is entirely in the discretion of the trustees.

4666. There is no particular rule that they go by; they decide upon each individual case?—Yes.

4667. Can you tell us whether in giving the pensions there is any preference given to those who assist themselves, or do you give them equally to those who assist themselves and to those who are unable to get anything for themselves?—Each case is dealt with according to its merits.

4668. Your trustees have not laid down any broad principle, either that they will assist most those who assist themselves, or that they will assist most those who are unable to assist themselves?—It depends upon circumstances entirely.

4669. Will you tell me what those circumstances are?—For instance, if a young lady who had been a governess was suddenly cast upon the world blind, in all probability she would have 20*l*. at the first vacancy.

4670. You say that you have a good many applications from Cornwall. Have you any particular class of applications from any other county. Take the case of a county like Nottingham, where the people work at lace?—Now you mention it I fancy I have noticed that there have been a good many applications from Nottinghamshire.

4671. Have you any data at all, should you be able to collect any, which would give information as to the causes of blindness in different districts in England?—The majority of cases are from amaurosis.

4672. What would be about the average age of your applicants?—About mid life.

4673. Have you many of the age of 21?—We have a good many applicants who have been blind from birth

4674. Do you take them on in that case when they get to the age of 21?—No, they are not registered until they are 21.

4675. You have been asked about the advantage of intercommunication between the different pension-giving societies; do you think it would be an advantage that there should be a kind of register kept of the different persons who receive pensions throughout the country, and that that register should be inspected by the different societies before they granted pensions?—Yes, I think it would be a very good plan indeed.

4676. (*Mr. Johnson.*) As one of your trustees, I will ask you a few questions. I think it would be desirable for the Commission to know the form in which the application is made, and also the mode in which the cases are considered by the trustees. Is it necessary that six householders should certify?—Yes.

4677. The petitions, as I understand, are sent up to your office?—Yes.

4678. They are then registered?—Yes.

4679. And each one is numbered?—Yes.

4680. The petitions are then submitted to the trustees when they meet at their quarterly meeting?—Yes.

4681. The trustees are privately written to by a great number of persons interested in the applicants to take certain cases into consideration?—Yes.

4682. Then when the trustees meet, what is the mode of proceeding?—After a case has been registered 12 months, the trustees look over the correspondence in reference to the case during the last quarter, and then he petition is called for and examined by them.

4683. The trustees have no power of visiting the cases, on account of their being distributed throughout the length and breadth of England, Wales, and Scotland?—That is so.

4684. Therefore they are obliged to take the statements of the friends of the applicants and of the applicants themselves, and whatever information they can get otherwise?—Yes.

4685. Is it within your knowledge that the trustees very often make use of other societies for the purpose of obtaining information?—Yes.

4686. Has it in some cases been found that persons have been in the receipt of a plurality of pensions?—Yes.

4687. You probably remember a case in which Christ's Hospital petitioned your trustees to give a pension to a governess to raise her income up to 40*l*. a year?—Yes.

4688. And the trustees were unable to give a larger pension because it would have exceeded the 50*l*. a year which she could hold?—Yes.

4689. That was a specially deserving case?—Yes.

4690. Have you any knowledge of the trustees having suspended their standing orders so as to admit a very good case under a very short application?—Yes.

4691. You no doubt remember the case of the butler who went out to post a letter in Belgrave Square, when a boy threw a stone and cut his eye; he was taken to St. George's Hospital and had one of his eyes removed, then the other one sympathised, and he lost the second eye. In the interim his mistress died, and there was nothing but the parish before him. I believe your trustees gave him 20*l*. a year, and asked other societies also to aid?—Yes.

4692. I ask these questions to illustrate the mode in which your trustees distribute the money. The 4,000 or 5,000 applicants you say have been accumulating since the charity was founded on its present basis?—Yes.

4693. There are no expenses whatever allowed out of the trust for making inquiries, no travelling expenses or anything of that kind in going to see cases?—No.

4694. Therefore your trustees, when they meet four times a year, are only able to decide upon the cases from the evidence which they have before them in writing?—That is so.

4695. When Mr. Day established this charity, do you know for what class of persons he established it?—"For people reduced in circumstances by reason of "their affliction." Those are the words to the best of my recollection.

4696. Take the case of a man striving to get his living, for instance a basket maker in the country, able to earn two or three shillings a week, the giving of a pension to whom might be the means of keeping him from the workhouse; do not you think your trustees would give due consideration to a case like that?—Yes.

4697. Their desire being to help those who are trying to help themselves?—Yes

4698. The pension is paid quarterly?—Yes, in advance.

4699. How are the funds held?—They are held by the Accountant-General, and the dividends are received by the Bank of England under a power of attorney.

4700. Then the warrants are paid at the Bank of England as cheques?—The receipt is presented at the office, and my signature is attached to it; it amounts to a warrant.

4701. That warrant is a receipt?—Yes.

4702. And that is presented at the bank, and when it is paid it becomes the receipt of the recipient?—Yes.

4703. The trustees would have no power to administer the trust in any way that would be inconsistent with the scheme laid down by the Court of Chancery?—No.

4704. I suppose the trustees could apply to the Court of Chancery if they pleased to alter the scheme?—I see no reason why they should not.

4705. Do you think the trustees would be inclined to apply to the Court of Chancery to alter the scheme?—No, I think not.

4706. Will you explain to the Commission what are the expenses of carrying on the trust; what is your own salary?—By the terms of Mr. Day's will the first clerk and treasurer was to receive 120*l*. a year, and 200*l*. a year for office rent, assistant clerk's salary, and expenses, which makes up the 320*l*.

4707. The trustees have altered that arrangement, have they not?—Yes.

4708. How does it stand now?—The clerk and treasurer receives 200*l*. a year, and the 120*l*. goes for rent; it comes out of the secretary's pocket; merely reversing the figures.

4709. The balance of the 370*l*. is for postages and sundry expenses?—Receipt stamps is one item; every receipt that goes out costs 2*d*.

4710. There are certain incidental expenses that go to make up the 370*l*., such as receipt stamps, postage, and the railway fares of any of the trustees if they live at a distance?—Yes.

4711. Are you aware that the trustees are bound under the will or scheme to act together; that all three have to be present when any appointment is made?—I think two are sufficient to form a quorum.

4712. But I believe a medical certificate is required if one is absent?—Yes.

4713. Is it lawful for the trustees to make such further rules and orders as in their judgment they see fit, for the proper management of the Charity?—Yes.

4714. That is in the trust deed?—I believe so.

4715. You said just now that there were 228 pensioners at the present moment?—That was the number last quarter.

4716. Is the average greater or less than that?—About 230 would be the average.

4717. It has been as many as 240, has it not?—Nominally it was; there were certain blanks left to be filled up if we had sufficient funds.

4718. It was five years ago 240, was it not?—No, I do not think it ever reached that number.

4719. The amount paid to the blind last year was 3,391*l*.?—That was the amount paid last year.

4720. And the expenses of management were 372*l*?—Yes.

4721. So that 3,763*l*. was spent last year?—Yes, nearly.

4722. (*Chairman.*) Can you tell the Commission what work any of your annuitants do?—Principally basket making and brush making.

4723. Are any of your annuitants tuners?—Very few.

4724. What do they earn by tuning?—I could not tell you.

4725. Were they when you elected them getting a livelihood by tuning, and to what extent?—I could not put my finger upon any particular case, and say that such a person gained his livelihood wholly or partially by tuning. I know we have had one or two annuitants who were pianoforte tuners.

4726. I should like to know whether or not you inquired whether the tuners earned their livelihood by tuning. Suppose a man were to earn 50*l*. a year by tuning, would your trustees still continue the pension?—That would depend on circumstances.

Mr. P. Simpson.

17 Feb. 1886.

4727. You say you do not know how much they earn, therefore it is possible under your system that a man might be earning 50*l*. a year by tuning and still be in the receipt of a pension of 20*l*. a year?—Yes.

4728. Do you vary your pension after you have once given them; do the 12*l*. pensioners ever get 20*l*., or the 20*l*. pensioners ever come down to 12*l*.?—They are constantly promoted.

4729. Then you do from time to time inquire as to the condition of the pensioners?—Yes.

4730. Then ought not you to be able to know whether a tuner is able to earn his own livelihood or not?—I do not think we have a tuner at the present moment.

4731. You said that you had had tuners?—Some time back.

4732. I am speaking generally?—I could not answer that question now; I recollect there were some a good many years ago.

4733. Can you tell the Commission whether any of those who received pensions earn sufficient to keep themselves independently of the pension?—I should think none of them do.

4734. None?—There might be some.

4735. What does the butler, whose case was mentioned, do?—I am not aware that he has anything besides the pension.

4736. Does he receive any other pension than yours?—I could not tell you without looking up the case.

4737. I gather from what you say that each case is taken on its own merits, not in priority of application?—No, only on its own merits.

4738. Do the trustees allow canvassing for any particular case?—No, there cannot be canvassing in our charity; a person may interest himself in a case, can write letters and so forth, the applicants are all upon the same footing. So far as that goes there are letters coming in daily relating to various cases upon the books.

4739. Of course if each case was taken according to priority of application, that would be one principle, but that is not the principle upon which you select cases?—No, we go upon the merits of the case.

4740. There are three trustees, as I understand; as a matter of fact how many of the three act constantly?—All three are at the meetings unless they are unable to attend on account of ill health.

4741. How is a new trustee appointed on resignation or death?—The surviving trustees appoint a successor.

4742. With the consent of the Court of Chancery?—Yes.

The witness then withdrew.

Mr. William Elliott Terry examined.

Mr. W. E. Terry

4743. (*Chairman.*) You are secretary to the Blind Pension Society of the United Kingdom?—Yes; it was formerly known as the Protestant Blind Pension Society.

4744. Will you state to the Commission the object of your society?—To pay pensions to deserving blind people.

4745. How long has your society been founded?—Since 1863.

4746. At what age do your pensions commence?—21.

4747. Will you state the amount of your pensions?—Up to the age of 70 we pay 6*l*. a year; from 70 to 80, 9*l*.; from 80 to 85, 12*l*.; and over 85, 15*l*.

4748. How many pensioners have you now of different ages?—We have six over 85, 20 over 80, 80 over 70, and 384 under 70.

4749. Have you any vested funds?—Under 6,000*l*.

4750. Are those from accumulations or from legacies From legacies principally; it is a rule with us, an unwritten rule, to invest legacies. I see the amount of invested funds is 5,855*l*. 16*s*. 9*d*.

4751. What is the amount that you pay in pensions annually?—Last year we paid 3,036*l*. I should say that means our last financial year, ending the 31st March 1885.

4752. Are your subscribers large subscribers, generally speaking, or have you a great number of small subscribers?—They average from 10*s*. 6*d*. to 1*l*. 1*s*. I do not think you could take the average at 1*l*. 1*s*. I have not made any calculation as to that.

4753. Are the candidates selected by the votes of the subscribers?—Yes; and we have a rule in addition to the ordinary election rule, whereby at every election the two who have been longest on the list are taken on; we have two elections a year, so we take on four every year by rotation.

4754. Do you examine the cases very fully before you grant pensions?—Our usual course is to consider the application made in the form which we issue, at the committee meeting, then it is referred, if in London, to one of the committee, or some other party that we have every confidence in, to visit the applicant, and inquire into the case, and report at the next committee meeting; but if the applicant is resident in the country we have

Mr. W. E. Terry

17 Feb. 1886.

not those facilities, and we are obliged to accept, to some extent, written evidence; we are not able to make any personal inquiries.

4755. Did I rightly understand you to say that you begin giving pensions at the age of 21?—Yes.

4756. Are not there a great number of blind who leave training institutions before they attain the age of 21?—Possibly; but they do not come before us, because our rules are contained in a book which we usually send out, and the rule which says that no one is eligible under 21 years of age, would stop any one under the age of 21 from making an application. I may add that the age of 21 was originally fixed, because that was the age at which pupils usually left the schools of instruction, but many for want of orders were unable to earn their living.

4757. Do not you think it would be an advantage that assistance should be given, not so much in the way of pensions as in the way of enabling them to procure tools and materials for work after they leave the various institutions in which they have been trained?—Possibly it might be an advantage, but we have never laid ourselves out to do anything of the kind; we have no funds other than for paying pensions.

4758. I suppose that the larger number of your pensions are given to those who are unable to earn a livelihood for themselves?—That is the general principle upon which they are given; although in many cases we give the pensions to supplement their earnings to some extent.

4759. Do you make it a condition that the pension is to supplement earnings?—It is not a *sine quâ non*.

4760. Would not it be a stimulus to the blind to earn their livelihood by work, if it was made a condition that the pension should only be given to supplement earnings in all cases where the applicants were physically able to do such work?—The evidence that comes before us shows that many of the applicants are quite unable to earn anything at all; they have become blind late in life. A case has just come before us of a young man between 20 and 30, recently married, who has been a shorthand writer and reported the Belt trial; from the strain on his nerves and constitution he became totally blind in a few weeks, and he is now applying to us. He is not able to continue to practice as a shorthand writer, and he has no resources at all, he is entirely dependent upon any little help his wife is able to give by dressmaking. Cases of this character come frequently before us.

4761. You give a preference to those who have become blind in mature years through some accident, rather than to those who have been trained in institutions and who have been blind from early years?—Certainly, but it is rarely we are called on to exercise any preferences, all are eligible who come within the rules.

4762. Is your institution conducted entirely by unpaid officers?—I am the only paid officer, and it is only within the last twelve months that I have been appointed, at least permanently. I had assisted in the work for three or four years in the evening, for which I received a nominal salary of 1*l.* a week in addition to what I got at my occupation in the day. Now I give my whole time to it, and I receive 150*l.* a year.

4763. Who finds your office?—The office is at the business premises of Messrs. Pocock Brothers, wholesale boot manufacturers and leather merchants. The grandfather of the present honorary secretary, Mr. Thomas Pocock, founded the society, and it has always been a labour of love with the family.

4764. Do you give pensions to applicants in all parts of the United Kingdom?—Yes.

4765. Do you find that many of the pensioners come up to London to receive the benefits of your institution, and stay there, or send up?—There is no occasion for their doing that, their application by post is always sufficient; we do not find that they come up to London on purpose.

4766. I understand you do not give grants to enable them to find tools?—No, nothing outside pensions; occasionally we have a donation given to us to distribute as a separate fund, but that is quite outside our ordinary work.

4767. Do you give any books to the blind?—We keep a small library of raised type books, given to us from time to time, which we lend when they are applied for.

4768. Do you make it a condition of your pensions that any of your pensioners should read books in raised type?—No.

4769. Do you speak with much knowledge of the blind as a class?—No, any experience that I have of them is only derived from my connexion with the Blind Pension Society.

4770. What is the board of management of your society?—There is a chairman, a treasurer, honorary secretaries, and a general committee of ladies and gentlemen. There are three trustees, but they do not act as a committee in any form; they are simply trustees for the invested funds.

4771. Are the cases taken on their merits?—Candidates are elected by the votes of the subscribers, but before a candidate can be voted for by the subscribers he has to be approved by the committee. If all the circumstances of the case accord with the conditions laid down in our rules the name of the candidate is put in the approved list.

4772. Do you give priority in any special cases?—Only in the way I have mentioned by taking on at each election the two candidates who have been longest on the list. Then I may mention that we have a rule prescribing the limit of income which applicants must have; if they are single they must not be receiving more than 20*l.* a year, and if they are married they must not be receiving more than 30*l.* a year.

4773. Have you discontinued any of the pensions in consequence of the immoral character of the recipients?—I have a recollection of one case only within the last four years; we have had one under consideration the last month or two, but it has not been finally dealt with.

4774. Do you give the benefits of the society without regard to creed?—Yes.

4775. Do you give any relief to those who are assisted by the rates?—Yes; the fact of the candidate receiving parochial relief is no bar to his receiving assistance from us.

4776. I believe you do not relieve those who live by begging?—Our rule specifies that they shall not be mendicants or musicians playing in streets or in alehouses; that is the only condition that we have of that character.

4777. Is that rule always acted on?—The exceptions are of a very trifling character. I think in one or two such cases that I have in my mind respectable people have attested that the recipients of the pensions are well conducted people.

4778. They might be blind fiddlers but of good character?—Yes, our principal objection is to their frequenting public houses.

4779. (*Admiral Sir E. Sotheby.*) In your opinion would not it be an advantage to have a general administration of pensions in London if it could be brought about?—It would certainly, or, I would suggest that it be compulsory with all societies to publish a list of their beneficiaries as we do.

4780. And would not it be an advantage to give pensions to old blind people who have been industrious when they were able to work, and who can no longer work?—We do that ourselves.

4781. You give your pensions entirely by election?—With the one exception I have mentioned; that is taking on at each election the two who have been longest on the list.

4782. With regard to your subscribers, do you think that they inquire whether the candidates are people who were industrious when they were able to work, or not?—No doubt personal influence goes for a good deal in canvassing, but the merits of the case are stated on the canvassing card, and that no doubt has influence with them.

4783. The people who get the pensions are those who have most interest?—Those who have most interest. Generally speaking the most deserving cases get the most friends to assist them.

4784. Is there a committee to approve of the applicants?—Yes, the general committee of management.

4785. And the name of every applicant and his condition are brought before the committee?—Yes, everyone, twice.

Mr. W. E. Terry.

17 Feb. 1886.

4786. Does your society discountenance inter-marriage amongst the blind?—That does not enter into our consideration.

4787. If they become beggars you do not strike them off the list, do you?—The circumstances are considered on their merits.

4788. (*Mr. Arrol.*) You have stated that if a single man is earning over 20*l.* a year, if a married man is earning over 30*l.* a year, he is disqualified; supposing one of your pensioners after he was placed on your roll earned more than 30*l.* a year, being a married man, would you then disqualify him?—A good deal of latitude is allowed in applying that rule. To a certain extent I may say it would be a disqualification, but it is very rarely indeed that we do strike anyone off for that reason, we do not strike anyone off entirely; our rule is to suspend them until such time as they come within the rule again. That obviates their going through the form of election again.

4789. As I suppose you get nine-tenths of your funds from general subscriptions has it ever happened in the course of the existence of your society that you have not had sufficient money in the year to pay your pensioners?—That has not happened.

4790. Is the object of your funding the money to meet such a contingency?—Yes, as a business precaution.

4791. (*Dr. Tindal Robertson.*) How do you procure your subscriptions, do you canvass for them?—We canvass for them and advertise, and we send out an appeal every Christmas; we obtain a good many subscriptions in that way, but originally the subscriptions were got by the personal influence of the committee.

4792. Could you give us any rough idea as to the number of your subscribers?—2,200.

4793. Do they reside in all parts of the country?—In all parts of the country.

4794. How is your committee selected?—Speaking from what has been done since I have been connected with the society, one or two members have been elected by the committee themselves and their election has been confirmed by the annual general meeting.

4795. Do you know the different parts of the country from which your pensioners come?—We have a table showing where our pensioners are to some extent.

4796. Have you any communication with them from time to time?—We require a certificate by some responsible person as to their income each year.

4797. Can you tell what proportion of your applicants come from any one part of the country as compared with another?—Without going particularly into it, our experience is that most of our pensioners apart from London and the home counties come from the West of England, from Cornwall, Gloucestershire, Devonshire, and Somersetshire.

4798. Can you give us any reason why they should come from that part of the country?—I do not know; in Cornwall, I think, from what I have seen of the papers, it arises from the large mining community that there is there.

4799. Have you any from the midland counties, where the fine lace manufacture is carried on?—Very few.

4800. Or from Sheffield, where grinding is carried on?—No, we have very few from the north at all. I think, perhaps, that is accounted for by the many good institutions there are in Leicester, and Nottingham, and Sheffield.

4801. (*Mr. Johnson.*) What endowments have you got?—The only endowment that we have got is that fund of 5,000*l.* or 6,000*l.* that we hold as invested legacies.

4802. Does the 5,000*l.* or 6,000*l.* constitute the whole of your funded property?—Yes.

4803. And that, I understand you, is placed in the names of trustees?—Yes.

4804. Do the trustees hold it in perpetuity or could the votes of the subscribers at the general meeting dispose of that sum?—The committee themselves could sell it out or any part of it, and appropriate it to the purposes of the society, the trustees assenting. The committee have dealt with it by investing it in that way, and I presume the committee could sell it out again.

4805. It is not a trust held in perpetuity, it is merely money held in trust till it is wanted?—That is all.

4806. You grant 490 pensions, I understand?—We have that number on the books now.

4807. I think you said that you had six pensioners aged 85 or upwards; you have not so many as that now, have you?—I took the names from this book; looking over them, I find that one of them has died since its publication, a woman of the name of Blake.

4808. Substantially you have 490 annuitants, and you distribute 3,375*l.* a year?—Yes.

4809. Is it still one of your rules that those playing on musical instruments in the streets or in alehouses are disqualified?—It is one of our rules, but such cases are dealt with very liberally.

4810. Still, it is one of your rules?—Yes.

4811. (*Chairman.*) But it is not strictly acted on?—There are certain exceptions. I will mention a case, to give you some idea of what the exception may be. A lady applied to us to know whether a pensioner could be given an accordion or harmonicon to play in the streets, and knowing the character of the lady, who is a warm supporter of the society, the committee agreed to her doing so, and we have made that no bar to his being a pensioner.

4812. (*Mr. Johnson.*) That is an exceptional case; in fact, you have no hard and fast rule that the committee cannot modify?—That is true, all alterations of the rules are confirmed by a general meeting.

4813. Suggested by the committee, and then submitted for approval to the general meeting?—Yes.

4814. Fresh members of the committee are appointed, as I understand, by the committee, and then their names are submitted to the general meeting for approval?—Yes.

4815. Do the committee change every year?—No, there is no rotation.

4816. Can anybody apply to your society for a pension without the recommendation of a subscriber?—No, we do not entertain any application unless it is nominated by a subscriber.

4817. Supposing a blind person applies for relief in your society, what is the form he has to go through?—The usual course we take is to send them a printed form of application asking certain questions, and that has to be certified by a minister, by a surgeon who certifies that the applicant is blind, and by a subscriber or someone willing to become a subscriber, nominating the applicant. Then with the form of application we usually send a subscription list, so as to give the applicant an opportunity to canvass any subscriber and to get the nomination made. It then goes before the committee. When the application paper comes before me in the first place I see to some extent that it is in form, but not more than that; I do not deal with the merits of the case.

4818. Then the committee, having all this information, determine whether the applicant shall be put upon the list of candidates or not?—Not the first time: if it is in London or anywhere where we can get any visitor to see the applicant, we get a report made on a printed form, and then he is put on the list of candidates if approved at the next meeting of the Committee.

4819. Then he is subjected to the votes of the subscribers?—Yes.

4820. No one is elected except by the votes of the subscribers, except the two unsuccessful candidates who have been longest on the list?—That is so. There is one other rule which I ought to mention, that a donor of 20 guineas in one payment has the privilege of nominating a candidate for an immediate pension provided he is upwards of 75 years of age, and otherwise eligible according to the rules.

4821. (*Chairman.*) How many applicants have you on your books at the present time?—About 200.

4822. At what rate do you admit them yearly?—Lately they have averaged about 50 plus the four that we have taken on by the rule I have mentioned, that is 54; it would not be less than that, the year before last we took more.

4823. Then those 200 applicants that you now have on your books have the chance of being admitted in the course of the next four years?—Supposing we have no more applicants.

Mr. W. E. Terry.
17 Feb. 1886.

4824. Do you communicate with other societies as to the granting of pensions, so as to know whether your pensioners are in the receipt of any other pensions?—Not unless the necessity arise. We ask that question in our application form, whether the applicant is receiving anything from other societies, and in our annual returns which we get from all our pensioners that question is asked again, and in that manner we ascertain whether they are getting relief from other sources.

4825. Can you altogether trust to that?—No, we are not altogether satisfied with the information we get in that way.

4826. In your opinion would not it be desirable that these blind pension societies should communicate with each other as to the pensions they give, in order that they should not overlap one another?—It would be a large work to undertake, but the registration that was suggested by one of the Commissioners would facilitate the matter very much.

The witness withdrew.

Mr. HENRY DEVEREUX PRITCHARD examined.

Mr. H. D. Pritchard.

4827. (*Chairman.*) You are clerk of the Painter Stainers' Company?—Yes

4828. What is the nature of your trust for the blind?—We have six charities, under which we give 174 blind people pensions of 10*l.* every year. Under the will of Mr. John Stock we give 138 pensions.

4829. What capital sum have you under Mr. John Stock's will?—We hold 55,000*l.* Reduced 3*l.* Stock for the blind and for other charities under Mr. John Stock's will, out of which we pay 138 blind pensions.

4830. Then there are other pensions which your company distribute?—There are six blind charities altogether. There is Mr. John Stock's Charity, out of which we pay 138 pensioners; then there is Mrs. Jane Shank's Charity, out of which we pay 28 pensions; then there is Mrs. Mary Grainger's, out of which we pay three pensioners; then out of Mrs. Dorothy Smith's and Mrs. Frances Yates Charities we pay two pensioners; and out of Mrs. Anne Rhodes Syddall's, three; making 174 altogether. I should say that there is a little charity besides, Mr. John Gregory Grace's Charity, which gives 5*l.* in addition to one of the pensioners.

4831. What are the qualifications for the recipients of those charities?—The qualifications are rather stiff, they must be 61 years of age complete, they must have been totally blind for three years, they must be unable to maintain themselves and in distressed circumstances, they must have been born in England, not in Wales or Scotland, they must have lived three years in their present parish or place of residence, they must have no income for life above 10*l.* a year or any benefaction to that amount, they must never have received alms from any parish or place as a pauper, they must never have been common beggars, and must be of sober life and conversation.

4832. Would they forfeit their pension if they became beggars in the streets?—Yes, if they came under any one of those disqualifications except residence they would forfeit their pensions; they are allowed to change their residence.

4833. What means do you take to ascertain that they do not receive a pension from any other institution?—Christ's Hospital kindly give us their list, and if we find that there are any of our pensioners on that charity we strike them off ours; and we also make the minister and churchwardens certify to the fact that the pensioner is not receiving any other pension, as well as to all the other qualifications except that of residence.

4834. Do you continue the pensions till death unless the recipients misconduct themselves?—Yes, we continue them till death, unless they misconduct themselves.

4835. About what number of vacancies have you annually?—I should say from 15 to 32 or 35.

4836. Have you to refuse a certain number every year?—Sometimes a good many and sometimes very few; when there were 35 we should not have to refuse any, we generally have about 30 or 40 applications.

4837. Do they go on from year to year?—No, we elect in December, and we take the unsuccessful candidates in December and select from them for the vacancies in May. The annual election is in December, and we make a list of the candidates for that election, then we take that same list in May and fill up from the list of the disappointed candidates in December, the vacancies that have occurred between December and May.

4838. Do you make inquiries as to the condition of the pensioners from time to time yearly, or at any fixed time?—Before a candidate can be elected he has to forward us a petition accompanied by a certificate of birth, a certificate of marriage if married, a certificate of blindness, and a certificate by the minister and churchwardens of the parish with regard to residence and other particulars. We pay our pensions annually, and when we pay them we have the certificates of the minister and churchwardens that all the qualifications except that of residence for three years still exist.

4839. Are the cases of the applicants inquired into by a committee of the company, or by the whole body?—By the whole court of the company; I take all the petitions, and I put them into an abstract; I print that abstract, and then I put it before the court. They look through it, and they say, "About so and so, is there anything more than you have put in"; and I sometimes read the petition and any letters that may accompany it at full length.

4840. Do you take each case on its merits, or according to priority of application?—On its merits; each case is selected from the list.

4841. In the first instance do you weed out those who you think are ineligible?—I weed out those who are ineligible, and put them in a list at the bottom, but those who are eligible I put all together, arranging them alphabetically, and then there is a discussion at the court.

4842. One of the qualifications of the applicants is that they must be unable to maintain themselves; does that mean physically unable, or would it include people unwilling to maintain themselves?—It means people who have not the means of supporting themselves. We take the certificate of the rector and churchwardens to that effect.

4843. Are you aware whether any of them earn anything by basket making or any other trade?—That is stated in the petition and certified to be correct by the rector and churchwardens.

4844. Supposing that an applicant earned less than 10*l.* a year at basket making or any other work, would you give him a preference over others not earning a livelihood by any trade?—We give no preference; that is to say not as a matter of course.

4845. You would give no preference to a poor old blind person who earned something over those who earned nothing?—It would be a matter for the consideration of the court when the election came on.

4846. At the age you elect them you assume that they are unable to earn anything for themselves?—We assume that they are mostly unable to earn anything for themselves.

4847. Do you think it would be desirable that the various companies and institutions for the relief of the blind should have communication with each other in order to see whether they do not relieve the same cases?—I suppose it would; it very rarely happens that we find out anybody breaking our rules and receiving more than the income specified in the rules.

4848. You have not been obliged to discontinue pensions to any great extent in consequence of an infraction of your rules?—Every now and then we do; every now and then we find that a person has been elected at Christ's Hospital.

4849. Have you ever had a case of begging?—I have had occasionally.

4850. That is to say soliciting alms in the street?—Yes, that would disqualify.

4851. Or singing?—Yes, or selling matches or things of that sort; we have occasionally found out such cases from the certificates of the minister and churchwardens.

4852. Do you think your funds are administered in the most suitable manner for the blind?—I think they are, and I think we get the most deserving people.

Mr. H. D. Pritchard.
17 Feb. 1886.

4853. I suppose you cannot speak at all of the desirability of pensions being given rather to supplement the earnings of the blind at an earlier period, after they have left the different institutions where they are trained?—No, we are tied by our rules.

4854. You do not wish to make any relaxation of those rules?—Except, I may say, that Mr. Stock's Charity was founded 100 years ago, and the purchasing power of a sovereign has very much decreased in that 100 years; therefore we find a great number of people disqualified, who perhaps ought not to be, and I do not know whether some day we shall not be obliged to modify our scheme by increasing the amount of the pensions and diminishing the number, that may be necessary.

4855. I suppose by applying to the Court of Chancery you could get the scheme altered?—I suppose it would be the Charity Commissioners to whom we should have to apply.

4856. (*Admiral Sir E. Sotheby.*) You could not change your rules without applying to the Charity Commissioners?—No, because we are tied by our various wills.

4857. (*Mr. Arrol.*) Referring to Stock's Trust, I think you said the capital sum was 55,000*l.*, could you tell me the amount of revenue derived from that annually?—The 55,000*l.* produces 1,650*l.* during the year, that is without deducting the tax, which we ultimately get returned to us. The Reduced 3*l.* per cent. stock held by the company is a larger sum, including other charities.

4858. (*Mr. Johnson.*) I understand that your capital under Mr. John Stock's will is 55,000*l.*, and 1,650*l.* is the income which you derived from it?—Yes.

4859. And you give 138 pensions from that 1,650*l.*?—Yes.

4860. What is Mrs. Dorothy Smith's capital?—Mrs. Dorothy Smith's capital is 377*l.* 5*s.* 1*d.* Consols, and that produces 11*l.* 6*s.* 4*d.* gross.

4861. And out of that, together with Mrs. Anne Yeates' Charity, two pensions are paid?—Yes.

4862. What is Mrs. Anne Yeates' capital?—Mrs. Anne Yeates' capital is not sufficient to pay a pension.

4863. Some years ago your company gave me the amount as 250*l.*, has it increased?—No, we mix Smith's and Yeates' together, and make up two pensions from the two charities.

4864. Then there comes Anne Rhodes Syddall's capital, which is 1,000*l.*; that produces three pensions?—That is really 993*l.* 10*s.* 7*d.* actual Consols.

4865. That produces not quite 30*l.* a year?—That produces not quite 30*l.* a year; there is a small sum which we draw out of an old balance.

4866. Then, altogether, your company gives 1,740*l.* in pensions?—Yes.

4867. From those funds?—Yes, besides Mr. Grace's 5*l.*

4868. Mrs. Jane Shanks's bequest is for women only, I believe?—For women only.

4869. What is the number of women that get that pension?—The number of women that get that pension is 28.

4870. Your applications are made at a certain time of the year?—Yes, from the 25th of October to the 1st of December is the time for sending in applications.

4871. And at no other time?—At no other time.

4872. You never displace an annuitant except for bad conduct?—Except for disqualification.

4873. Therefore the rest of the applicants have to wait until there is a vacancy?—They wait until there are vacancies.

4874. The qualifications prescribed by the benefactors and donors of the charities cannot be departed from?—They cannot be departed from.

The witness withdrew.

Adjourned to to-morrow at half past 12 o'clock.

32, Abingdon Street, Westminster.

Thursday, 18th February 1886.

PRESENT:

LORD EGERTON OF TATTON IN THE CHAIR.

W. TINDAL ROBERTSON, ESQ., M.D.
T. R. ARMITAGE, ESQ., M.D.
W. AUCHINCLOSS ARROL, ESQ.
EDMUND C. JOHNSON, ESQ.
CHARLES E. D. BLACK, ESQ., *Secretary.*

Mr. ALFRED WILLIS further examined.

Mr. A. Willis.
18 Feb. 1886.

4875. (*Chairman.*) In continuation of the evidence which you have already given, can you tell us the causes which, in your opinion, tend to produce imperfect workmen in the occupations of the blind?—I think my experience would teach me that the length of time given to their training is insufficient. I do not think that there is sufficient time devoted to the particular work that may be desired to be taught to the blind. My experience in school was that a good deal of the time was spent in school and not in the workshop.

4876. Do you think that the teaching of some trade should begin earlier, together with the ordinary education at the special blind institutions?—I do not think it should commence earlier unless it extended longer.

4877. Up to what age do you consider that those who are in these institutions ought to be kept there?—I could not say precisely up to what age I would have them there, because my opinion is that as a rule they go in when they are not fit to go in. I think that a good deal might be done either by the parents or by some other means before they are admitted into institutions.

4878. You think that the children who are born blind or who have become blind in early years ought to have some education before they enter the institutions?—My experience is that those who go into institutions, having been previously taught, turn out generally much brighter workmen.

4879. You said in your former evidence that you thought that workshops were good things; do you think that there should be workshops attached to all these institutions in which the training which they had previously received might be continued, and which would provide work for the blind after they had left their several institutions?—I think it would be a most excellent thing if workshops were established, either in connexion with institutions, or separate from them, so long as the pupil was provided with some means by which he could continue the trade that he had been previously taught.

4880. But have you any opinion as to whether those workshops should be general or attached to some particular institution?—I should prefer that they should be general, so that they might be free to other persons besides the pupils of the institution.

Mr. A. Willis.

18 Feb. 1886.

4881. You think that the want of success in earning their livelihood on the part of the blind is due partly to insufficient training; is it not also partly due to the difficulty of selling a thing when they have made it?—Yes. But my impression is that many who call themselves by some particular trade which they may have learnt have no right to do so. I think that the experience in trades, and in the case of all things that are taught to the blind at the present time, is very similar to what it has been in the past, relative to music for example. There is a prejudice amongst sighted persons against almost anything that the blind can do, and I believe that prejudice is not without some ground. They see a blind person professing to be able to do a certain thing when he is not able to do it. I can speak positively with regard to basket making, for I am acquainted with a large family of basket makers, father and sons, who have been basket makers all their lives; and whenever I speak to them about work made by the blind, they say, "There is no shape or make about it; it is so imperfect." I think that prejudice arises from the article not speaking for itself. As I said just now, I think that with regard to every trade and everything that a blind person does, a prejudice has arisen, because of the incompetency of those who have professed to be able to do it; and if it could be proved that blind persons could do it equally as well as sighted persons, that prejudice must disappear; it is going fast in some directions, and I do not see why it should not do so in others. I am not competent to say, and I would not wish to say, that the teaching is imperfect, for I believe, so far as my experience goes, that what persons are taught, they are taught in precisely the right way, but they are not sufficiently taught. Perhaps I may be allowed to instance a case. A man that I knew left an institution and he started in business in one of the suburbs within 12 miles of London. The first order that he received, singularly enough, was for a hen-coop.

4882. You mean a basket hen-coop, I suppose?—A basket hen-coop. He had never made one, and he had never seen one made at the institution that he was brought up in. He instantly went for instruction, and it was not to be given, and he could not get it; I would not say that they could not give it, but it was not convenient for him to get the instruction that he required. The consequence was that he went to Covent Garden and purchased a hen-coop. I do not think that the teaching is imperfect, but I think that it is insufficient.

4883. Does not that also show rather a want of foresight and resource amongst the blind which might be got over?—I can speak for one institution, I know what they make there, and what they teach to be made there is what they can sell at the society's bazaar, such as key-baskets and little fancy baskets, and little things that will be saleable; and I repeat the words of a blind man when I say that they were taught to make only what they would never be required to make when they left the institution.

4884. Have you ever known in these institutions the teaching of the making of rough baskets to protect the acid jars which are sent all over the country?—Yes, bottle casings. My conviction is that they are the only things that a blind workman can make as perfectly and as competently as a sighted man. I have felt them and they have been close up in every respect.

4885. Does not that arise from the fact that they have a form to work on?—I think that is the secret of it.

4886. Why should they not have the same form for making a hen-basket or any other basket?—A little exercise of common sense and ingenuity might easily plan a form for all sorts of baskets?—I think it arises from the fact that as it was, so it is, and so it ever will be; that is to say, as we used to make, and what we used to make, we go on making.

4887. Then is there not a want of ingenuity and resource among the institutions which are devoted to the instruction of the blind in finding out new trades and in finding out those that are most suitable to the blind?—Yes, it may be want of means that prevents them from extending further.

4888. Is it not likely also to be the case that where you have a set of people who are bolstered up by pensions and by private charity they are not forced to earn their livelihood in the same way as sighted people do from the fact of their not being assisted and being obliged to work?—With regard to casual help I am not prepared to say, but I do not know of anything except the Blind Man's Friend Charity that will reach men who are competent or of an age to work. Pensions are all for aged persons. Speaking for myself, I find that there are two classes of persons amongst the blind, those who are very anxious to help themselves, and the sweetest shilling that they ever had in their hand is the one that they earn; and the others, those who would rather receive it as a gift than work for it.

4889. The question that I asked was rather, whether it was not a fact that the helplessness of the blind to work, and the willingness of people to assist them induces them not to take so much trouble to earn their livelihood as an ordinary poor sighted man would be obliged to do?—I really think that it is for the want of means and opportunity, and not for the want of desire. The want of some opening by means of which the blind could help themselves drives them back upon the necessity of being helped.

4890. Then you think that it is rather the fault of the institutions which profess to teach the blind than of the blind themselves that there should not be in those institutions anything in the shape of workshops and in the shape of a place of sale for the goods which are made, and also for the purchase of material at wholesale prices?—One of the greatest difficulties is to get material, or to get it at wholesale price. The blind as a rule work from hand to mouth and they have the greatest difficulty to keep a shilling by them; and in consequence when their stock money is gone they have a difficulty in finding sufficient money to buy ever such a little stock; and I believe that if they could go and purchase materials anywhere at wholesale prices it would be a great advantage. A wood-chopper, for instance, cannot go and purchase wood cheaper than another man can hand over bundles already chopped and tied. I bought 100 bundles last week of a man who started recently, in order to give him help. I paid him 4*s.* for 112 bundles, and I can go round the corner to the oilman's and buy them at precisely the same rate, seven bundles for 3*d.*; and I know that that man can go to any wood-chopper's and purchase them for 3*s.* 6*d.* a hundred; and you cannot go down to the wood-yard and buy the wood in its raw condition at less than 3*s.* 6*d* a hundred.

4891. If you buy in a small quantity?—Exactly so, and that is one of the greatest difficulties. It is the same with rods and the same with fibre. A blind man who had dealt in that kind of thing yesterday told me that he had to pay 15*s.* 9*d.* (I think that was the figure) for what he could go and buy wholesale for 8*s.* 6*d.*

4892. Then you think that the institutions would do well also to assist the blind by finding them materials at cost price, and also giving them assistance when they are reduced to straits so as to prevent them from selling their stock-in-trade?—The greatest difficulty is for a poor man when some trouble overtakes him, or in case of a week's sickness, to keep his few shillings of stock money; it is bound to go. We have a fund in connexion with the Indigent Blind Visiting Society which has rendered invaluable help in this matter. I could sit here and tell you of dozens of cases of men who have been nearly on their beam ends, as it is termed, just because they have had to part with their stock money and they could not go on. We have come forward with a few shillings which have been perhaps really of more benefit to that man than if you had given him a pound, because it has just enabled him to buy a bit of stock.

4893. Then do I correctly gather from you that assistance of that kind when it is given where it is wanted, and to those who are trying to assist themselves, would be far better than a fixed pension?—I think so. I do with all my heart believe that it is a far better principle. Of course I am speaking with regard to those who are able to work and assist themselves; I would not say that it would apply to persons who are advanced in years, or infirm, or bedridden, because it is a source of great relief to such persons to know that they have 5*s.* a week coming in and they have no anxiety about the rent. We have many of those persons who are allowed constant pensions, and who do not receive casual help at all.

4894. I excepted from my question those who are too infirm or too old to work; for those, of course, pensions must be always necessary?—You want a stimulant to work. I visit a man and I find that since I was last there he has been ill, and he is just unable to go on; I give him 5*s.* and I say, "Now go and buy a bolt of "rods, or a couple of pounds of cane, or some wood."; and that man rolls up his sleeves and sets to work. He has an object in view; he has to turn that 5*s.* To my mind it is the grandest thing imaginable, because it produces profit on the very money that is given; it enables the man to convert his 5*s.* into 10*s.*, or 10*s.* into 1*l.*

4895. Do any of those institutions visit the poor blind at their homes from time to time to see whether they are engaged in work?—I do not know of one.

4896. There seems to be a difficulty after they leave the institutions in knowing what becomes of them; do you think it would be possible that institutions should follow up the assistance they have given by visiting those who have been trained there from time to time, and seeing whether they are able to work and whether they are getting work?—I think that would be a splendid thing, just the very thing.

4897. (*Mr. Johnson.*) Were you educated in any institution in London?—I was at St. John's Wood School for four years.

4898. Were you at no other institution?—No.

4899. I suppose you had not much experience at St. John's Wood of the tradal manufactures of the blind?—Yes, I had, because we were always together.

4900. Perhaps you did not quite understand my question. You say that you were at St. John's Wood for four years; had you during that time much experience of the trades carried on there by the blind?—Yes, I had a perfect acquaintance with it.

4901. How many trades were carried on there?—Only basket making and chair caning.

4902. Over what proportion of South London do your visits connected with the society of which you are now visitor extend?—From Lambeth Bridge to St. James' Road, Bermondsey, or I will say from Lambeth Bridge to Rotherhithe; and then south to Peckham.

4903. Have you any experience about the workshops and institutions of London themselves, and as to the way in which the work is conducted there?—My district up to last year used to extend to Greenwich, and I used to visit the Greenwich workshop. We had there some six of the men who are employed on the society, and I used to visit the Greenwich workshop every fortnight; and I now visit the Peckham workshop every fortnight.

4904. Have you ever visited St. George's Fields?—I have been there twice.

4905. Merely to go through the place?—No, I did not know that it was allowed. I have been there as a visitor twice, but not to examine the place.

4906. Does your society aid anybody by any grants in the workshops at Peckham, or at Greenwich?—Yes, at both of them, and at St. George's workshops too.

4907. Whom do you relieve at St. George's workshops?—George Simmons, Emily Boxall, and a man named White; I do not know whether I ought to mention him.

4908. Do you give them subsidies now?—Yes.

4909. What amount of subsidies do you give them?—They do not have Samaritan help, except in the case of sickness.

4910. What do they get now?—About 2*l.* 10*s.* a year, I should think.

4911. In what way?—In bread tickets and coal, money, and Christmas gifts.

4912. Those are people who are earning wages varying from 10*s.* to 15*s.* and 20*s.* a week in an institution, and yet you relieve them with some more money?—Yes.

4913. Upon what principle do you do that?—That they do not earn sufficient.

4914. What do you suppose the earnings of those people are that you relieve?—From 10*s.* to 15*s.* a week. George Simmons was at home last week when I called, and he said that there was no work for him to do, so that he cannot always be earning the same amount.

4915. Then your duty is simply a visiting society's duty?—It is a missionary society, a helping society.

4916. Your society does not undertake any work?—We do not undertake any work, but we do our utmost to start people in work.

4917. But you have no workshops of your own?—No, only educational classes.

4918. Have you much experience yourself, personally, with regard to the trades of the blind; I do not mean as visiting other people, but have you personally ever worked at a trade yourself?—I have not, but I have always taken the deepest interest in this matter.

Mr. A. Willis.

18 Feb. 1886.

4919. You have no experience in the actual work yourself?—No.

4920. You say that you have had no experience about trades, and at the same time you say that you consider that covering bottles is one of the best trades; where have you had experience of that?—Personally, I may not be able to do that, but I can enter fully into the experience of a man who can.

4921. But where have you had experience of it?—I have repeatedly examined them at the Greenwich workshop.

4922. Do you know what amount of bottles they cover at Greenwich?—I could not give you an estimate.

4923. How many men are employed in covering bottles?—I can tell you how many basket makers there are there, but I could not tell you about the bottles; they do them by orders.

4924. Are you aware that there is a large trade done in covering bottles for spirit merchants?—I knew that they did it at Greenwich, but I do not know whether they do it anywhere else.

4925. You do not know that amongst the blind there is a large trade done in covering bottles?—No, I did not know that.

4926. Have you any knowledge of people carrying on the trade of wood-chopping to a great extent in their own homes?—Not to a great extent, but in a little way.

4927. How many wood choppers do you know of?—I know four at the present time.

4928. Do they get their living by wood chopping?—They live by it; they get on as best they can.

4929. You have told us about the difficulty that they have in getting material, and in competing with the trade; have you any idea about what the average earnings of those four men would be for wood chopping?—I could not tell you. What they earn in some weeks is very different from what they earn in others, and in some seasons they earn very much more than in others. I could not give you the average of it.

4930. Then your society would augment or decrease the allowance according to the amount of wages that the person whom you visit earns?—According to the circumstances of the case.

4931. (*Dr. Armitage.*) You say that it is very desirable that the blind should have the opportunity of buying the raw material at wholesale price; have they any chance of doing so at present?—I do not know any place where they can do so. Perhaps I ought to answer the question in this way?—I have heard that they can do so at St. George's School, but I have never heard of a blind person doing it, so that I do not know whether they can or cannot do so.

4932. I am speaking of their being able to get materials at wholesale prices?—I have never heard of that anywhere; but most of our people in the south buy at two sighted warehouses.

4933. Do you think it would be desirable to establish a central depôt where the blind could buy at wholesale prices?—I think so, for this reason. Sighted firms cannot, I suppose, on their principle sell a small quantity of material at the price at which they could supply a large quantity, because their profits, I suppose, are regulated by the quantity they sell. An institution or depôt that would be established for the express purpose of supplying the blind with material would not be actuated by the same motives. If their object is to supply the blind with material at cost price, they would not want to sell a small quantity for a greater price than they would sell a larger quantity at. That is why I think it would be a good thing to have a depôt where the blind could procure the material they require in small quantities at really wholesale prices which they cannot now do.

4934. Do you see any objection to the present workshops selling the material in small quantities to the blind at wholesale prices?—I only wish they did it. I see no difficulty about it; I am not perfectly acquainted with the difficulties of the institution, but I say it would be a grand thing if they did that.

Mr. A. Willis.

18 Feb. 1886.

4935. Would that meet the case, so far as the blind are concerned?—Yes, I think so with regard to those who are employed or who want material. I was asked just now to give my personal experience, and I give my own personal experience at this moment with regard to this matter of supplying the blind with material. We desire to help the blind as much as possible, and I have undertaken in six different instances to procure matting and mats for persons who required them. I have got two lengths of matting for a hall (I forget the measurement), and I have got mats for other places, and I have got coconnut matting for two private persons. Now, I bought these articles at professedly wholesale prices at a reduction on the right price, so that it was said that I could have a profit; but I did not require a profit, and I sold those things at precisely the same money that I paid for them, and I was informed for my trouble that the buyers could have gone to any warehouse and have got them at precisely the same price. That is my own personal experience.

4936. Where did you buy those things?—At St. George's School. Of course I am not able to say whether the material would not have been better; I simply give you the reply that was made to me after I had done the persons a kindness in getting it cheaper, and I thought that I should at the same time be helping the blind who were the makers. I do not know why the St. George's School or any other warehouse, or workshop, cannot compete with the market, but it is evident to me that they cannot, or they do not.

4937. (*Mr. Arrol.*) Would you be good enough to favour the Commission with your views as to educating the young blind at sighted schools?—I am very strongly in favour of it. If I had a blind child I should send him directly to be educated at a Board School; he should not go into an institution until he was about 12 or 14 years of age; and then I should hope that he could be taught some profitable trade at which he might be able to earn his living.

4938. I think you have rather spoken adversely to pensions; have you any pensions?—I have one.

4939. From what charity?—I get a pension of 12*l.* a year from Day's Charity, No. 34, Savile Row.

4940. What other source of income have you, may I ask?—I am much obliged to you for asking me that question. I stated the last time I was here that I was in receipt of 70*l.* as a salary from the Indigent Blind Visiting Society. Reviewing the matter over afterwards in my mind I did not know whether I did at the time make this qualification; my correct salary is 71*l.* per annum; but that is subject to a deduction of about 14*l.*, the cost of my guide and other little incidental expenses.

4941. So that your salary is 57*l.* a year?—Yes.

4942. Are you disposed to recommend, if it could be arranged, that subsidies should be given to those who are learning trades during the time that they cannot earn anything for their own livelihood?—That is the great difficulty that we have to contend with. With regard to the Greenwich workshop particularly, I believe I am correct in saying that the charge to any blind person to learn a trade there is 6*s.* a week, whoever may be the kind friend who pays it. At Greenwich and also at Peckham they teach blind men who are too old for admission into institutions, men who have lost their sight say at the age of 25. There is a large class of persons that have not, as it seems to me, come under your notice, who lose their sight when they are too old to enter institutions, perhaps by only a month or two, or a year or two; ranging from the age of 25 to 40; and there is nowhere that I know where they can learn a trade, or where they can learn any means of getting a livelihood. I am thankful to say that I have been able to put the means of helping them in the way of many. Now there are above 40 employed as writers in the Braille system of manuscript books which are either ordered or required to be multiplied; and that affords a very profitable means of living, because there is no outlay attached to it. But if a man wants to learn a trade I know of no institution that will teach him, and even if a blind man finds a friend who is willing to pay the 6*s.* a week that is required to teach them a trade he has to live during that time. I will instance the case of a young man, a railway porter at New Cross Station who lost his sight through an accident. He was about 27 years of age, and he had a wife and one child. The Railway Company I believe could not help him; he was not in the sick fund, or there was some difficulty of that kind, and he was in very destitute circumstances. You generally find that people can, when they lose their sight, struggle through the first year by means of friendly help, and many living upon the little which perhaps they may have stored up, or living upon their homes; but in about a year they get into a destitute condition. In the case of which I am speaking some one kindly came forward and undertook to pay for this young man to learn basket-making at the Greenwich workshop. But then the difficulty arose what was he and wife to live upon? She went out washing and charing, and they struggled on with the help that we were able to give them at the time, but it was a terrible struggle for them. That young man is now employed as a workman at Greenwich; he did not learn basket-making, but he learnt fender-making, and he is in constant work there still. That is but one case out of many. Perhaps you will allow me to mention the case of another young man. He was a bookbinder by trade. As he was passing along the street there was an explosion of a boiler, and a brick struck him in the head, and the result of it was that he not only almost entirely lost his sight but he has now altogether lost his hearing, and is perfectly deaf. I visited him, and I am thankful to say that I have been able to teach him to read and write, and he is now a constant writer in the Braille system, and, with the exception of a small pension, he is entirely supporting himself. I mention that case, because it occurred to my mind, and I have dotted it down here. I could mention several other cases where men were too old for institutions, or were otherwise ineligible. In the case I last mentioned, the man's deafness would have prevented him from getting admission anywhere; but now he is able to help himself, and there are many other similar cases that I could mention. I wish you would look at this book; it contains a few names of men and females too who are now helping themselves in the employment of writing. I know more persons helping themselves through writing the Braille system than in any other way.

4943. If there was a national system of insurance against blindness, allowing every person who became blind to have a grant of 5*l.* or 10*l.* per annum, would you approve of that?—I do not know a blind person who would not be very thankful for 5*l.* more than he has.

4944. Do you think that it is a hardship on the blind to compel them to go into the workhouse if they require parochial relief?—There are circumstances in which I recommend persons to go into the infirmary, and I find that those who are in the infirmary are far more comfortable, and far better off than they would have been outside; but I do not think it is a good thing to divide a man from his wife or from his home. As a rule I should say that a blind person ought no more than a sighted person to be inside an infirmary or a workhouse. I do not think that for the want of a little help outside he ought to be compelled to go in.

4945. (*Chairman.*) You have told us that you get a pension, did you get that pension before you took your present post?—No.

4946. Then you got it afterwards?—Yes.

4947. When you applied for your pension did you state what your income was?—Yes, you are obliged to do so. My income was not then what it is now.

4948. What was your income then?—I could not tell you at the moment exactly what my income might have been at that particular time.

4949. You say that you got a pension when you were receiving other wages, and you have told us that you had some other post which brought you in a certain income when you applied for that pension?—I applied for the pension about four years before I had my present position, but I got the pension since.

4950. Would you let us know what was your income when you filled up the paper applying for the pension?—I could not tell you now, I was not employed by the society when I made the application for the pension, but I was a visitor employed by the society when I got it some four years afterwards.

4951. You have told us that you cannot tell what your income was when you applied for the pension, or when you received it?—No, I could not tell you that now. It was not so much as it is now, because I had my salary raised when I was married, and my work has increased. Perhaps I may be allowed to say that I am not trying in any possible way to evade the question; I desire to be most truthful, but my work has grown upon me. I was first a teacher in the classes.

4952. We do not want to enter into any question of that kind. It is simply a question of fact.

Mr. A. Willis

18 Feb. 1886.

4953. (*Mr. Johnson.*) When your pension was granted what return did you make to the society of the amount of income that you were then receiving otherwise than from the society that granted you the pension?—I do not think that I understand the question. I have no recollection of being asked to make such a return.

The witness withdrew.

Mr. Matthias Sidney Smith Dipnall examined.

Mr. M. S. S. Dipnall.

4954. (*Chairman.*) You are clerk to Christ's Hospital?—Yes.

4955. Can you tell the Commission what is the nature of the charity to the blind which you administer?—I can.

4956. Will you state the details?—I should be happy to do so. The Reverend Mr. Hetherington was a governor of Christ's Hospital, and in the year 1774, that is to say in his lifetime, he confided to the governors an endowment of 20,000*l.* Old South Sea Stock. Of the dividend on that South Sea Stock, as it was at that time, he wished to devote to the hospital one sixth, so that the hospital should always receive 100*l.* a year from this fund, be the dividend more or less than the 600*l.* which it then produced; in other words he gave the governors one sixth, not specifically as one sixth, but distinctly as 100*l.* a year; and he expressed the hope that other benevolent persons might follow in his steps and enlarge that charity. He then directed that the other 500*l.* a year available for the blind should be distributed in annuities of 10*l.* each to fifty blind persons. Those annuities were to be distributed to persons who should be blind and destitute of sight, who had never been paupers, who had been born and were resident in England proper, that is to say in the 40 counties of England, and who had no annuity, salary, pension, estate, or income for life of the value of 20*l.*; and he left the entire management of this charity to the Committee of Almoners of Christ's Hospital, with this direction, that it was not competent to the committee to make any change in the fundamental provisions of the deed without the sanction of the General Court of Governors; but he reserved to himself the right in his lifetime to make alterations. At the first meeting of the committee in 1774 for the choice of the 50 annuitants, there were no less than 711 applicants of ages ranging from infancy to old age, and after having gone through 640 petitions the committee found themselves rather out of their depth and adjourned to another day. They then proceeded, having in the meantime made a rule for their own guidance that they would elect none under 51 years of age, or with a less period of blindness than one whole year. But it was still found that the number of applicants was inconveniently large; and Mr. Hetherington himself then fixed 61 years as the maximum age for applicants, and required three years total destitution of sight. In other particulars the conditions remained the same, but he expressed the wish that regard should be had to age in the selection of the annuitants, and also that preference should be given to persons who had been in a better position in life socially, persons who had seen better days, and who might become a burden or had become a burden on their children and relatives, and so on, they themselves being people not in affluent circumstances. Soon after the foundation of Hetherington's Charity, additions began to be made to it, and those additions have been so considerable, by gift in the lifetime of the donor and by will, and here and there by an allocation from an estate left for distribution by executors, that instead of paying only 50 annuitants as arranged by Mr. Hetherington, we have on our list for 1885 717 annuitants. With regard to the administration of the charity, I may mention that in the earlier days of the charity several donors required their gifts to be distributed in their entirety to the blind, and gave the hospital nothing to pay the expenses. The Governors soon found out that that would not do, and they therefore laid down a rule that they would only accept future donations and legacies as additions to Hetherington's charity, upon the general terms of Hetherington's charity, namely, that one sixth should go for the use and benefit of the hospital; and many of the donors, I may remark, were themselves governors of Christ's Hospital. But in the course of time the effect of that rule was that the one sixth so taken over by the hospital amounted to a considerable sum. Just about that time, that is to say 1863, there was a Charity Commission inquiry into the hospital's charities and funds, held by Mr. Hare; and in the course of the inquiry he intimated that it appeared to him that the Governors were taking an unnecessary large sum from the Hetherington Charity. That was considered by our committee, and it was felt that the Governors could, with every consideration for the blind on the one hand, and for the hospital on the other, reduce those allowances. The terms of the different benefactions were gone over very carefully and sorted out into categories, and at last the amount arrived at as the amount which the hospital should receive was about 600*l.* a year, it is now just a few pounds over 600*l.* a year, and the administration of the charity is vested in the Committee of Almoners.

4957. Is any class specially excluded from the benefits of your charity?—The Governors interpreted Mr. Hetherington's meaning at one time by specifying certain classes that were considered to be below the mark.

4958. Do you go by any such classification now?—We do to some extent. If a man had never been better, socially, than a labourer, and his father had never been better than a labourer, he would be considered below the mark for us. We take a kindly view of these things, and if the people are aged we say, You had better apply to the Painter Stainers' Company; and they go there and often get their annuity, for the company do not observe the little social distinction that we do; so that many of those who are not qualified for Hetherington's can go and get the Painter Stainers' pension.

4959. Do your applications come from all over England?—From the whole of the 40 counties of England. At the beginning of October or the end of September we advertise in various country papers, thereby spreading a knowledge of Hetherington's Charity practically over the whole of the 40 counties of England.

4960. You advertise in the country papers?—Yes, at a cost of about 50*l.* We freely give out petitions in response to letters, or to persons calling personally; if a blind person calls, we generally ask the age and just see that the individual has the necessary qualifications, in order to save trouble to those who do not possess the necessary qualifications.

4961. Do the elections take place in order of application, or by merit?—By merit and by age. Petitions come in during the whole of October, and they are classified according to age, the oldest being put at the top; we classify them in decades; for instance, in October last a person of 93 applied; including him with all above 80 we have 17 annuitants who have turned 80; we place them in the book in decades of age. The petitions are abstracted and printed for the information of the committee in the way shown in this blue book, which I shall be very happy to leave on the table, and which shows those who have been elected. This book is sent round to the Committee of Almoners of Ghrist's Hospital something like a week before the election; then, when the election day arrives, supposing there are 60 vacancies, the committee at one vote usually take the 30 oldest in the book, but if by taking 31 they would cover a person of perhaps the age of 76 or 75 they put in the odd one. Then nominations or suggestions are made by Governors round the table, who have selected a case on its merits, or who know something of it, and recommendations of other Governors receive some consideration.

4962. Are those of the age you just mentioned, that is to say, those between 80 and 90 and over, applying for the first time?—Mostly for the first time.

4963. That looks as if a knowledge of Hetherington's Charity had not reached them?—Very aged persons have perhaps only been blind three or four or five years; it is in the lower part of our book that we chiefly find long periods of blindness. If this first selection which I have mentioned does not exhaust the 60, the committee then take some more, perhaps, of 75 years

Mr. M. S. S. Dipnall.

18 Feb. 1886.

of age, and also some of the most deserving cases, though less aged.

4964. Do you find after all you can do, after letting in the extremely old cases, there are always from year to year a certain number of those between 60 and 70 whom you are unable to let in?—Yes.

4965. Therefore, your charity meets to a certain extent a want which exists, but you are not entirely able to meet that want?—Not entirely. I might say that when we have elected our 60 and filled up our list of annuitants, we issue the annuity letters to the clergymen of the parishes in which the blind people live, and we then get perhaps 40 of those letters in the course of the next week or ten days returned to us, showing that the people are dead, though we had not previously been apprised of their deaths, so that we have further vacancies. The annuities are all due on the 10th of December, and between that and the end of December we probably pay 600 annuitants; there would then be some few who had not presented their papers through the bankers. We then make inquiries to see if there are any further vacancies. We then notify to the committee to elect to those vacancies, and something like the same process goes on, but with this qualification; in the second election in February special care is usually taken to look to cases of affliction superadded to blindness, to cases of considerable length of time and blindness, and also to cases where the circumstances are very special; so that the result of our two elections meets Hetherington's wishes with regard to age, and with regard to his other requisitions.

4966. What means do you take to find out that the annuitants are not in receipt of other pensions?—It is not a disqualification at our charity that they should be in receipt of other pensions, if those pensions do not total to 20*l.* a year, with the exception that there is a bye-rule that we do not elect a painter stainers' annuitant, because if we did the company would take him off their list, because their limit is 10*l.*, ours being 20*l.*

4967. Are you in constant communication with the Painter Stainer's Company?—There is communication enough at the period of the election. If a person has an annuity of 20*l.* we at once put him down as ineligible for our charity, but he might have 12*l.* from Day's and 4*l.* from the Goldsmiths', and so on, so long as the total did not reach 20*l.*; but in this very last election, finding that a number of the applicants had 16*l.* or 18*l.* or 19*l.* a year, we have rather avoided electing them, taking cases of affliction in preference to them. With regard to the administration of the charity it is administered in the counting-house of Christ's Hospital in common with the general business of Christ's Hospital. About the time of the elections a great deal of time is necessarily occupied, and we have throughout the year a large correspondence with the clergy and people connected with blind persons with regard to the charity.

4968. I suppose it would be possible for the Court of Governors to alter the character of the trust if they thought it desirable?—If there is a paucity of applicants the course taken has usually been to depress the age of qualification; the age was depressed to 50 at one period, then raised to 55, and later on 61 was reverted to.

4969. You have never contemplated altering the character of the trust?—No.

4970. Could the Governors by application to the Charity Commissioners or to the Court of Chancery alter the trust?—I presume they could.

4971. The minor alterations were made of your own accord?—Yes; Mr. Hetherington empowered the governors to make such alterations and regulations from time to time as they might consider to the advantage of the charity, but almost the only change that the governors have made has been that with regard to age.

4972. (*Mr Arrol.*) May the Commission conclude that from 90 to 100 new applicants are admitted every year?—We have about 100 new annuitants admitted each year.

4973. May I take it that 15 per cent. of those on your books die?—Our experience is that one seventh of the entire number of our pensioners go off our list each year, that one seventh would include perhaps five or six who vacate through having parish relief and going into the workhouse for one thing, or getting a better pension or property from elsewhere, and then here and there a person who may be reported to be of immoral conduct is displaced from the list.

4974. You give each pensioner 10*l.*?—Yes, none more and none less.

4975. (*Dr. Armitage.*) Do you take any other means of ascertaining what the income of the applicants is except the statement in the form?—We communicate very freely with the clergy, the charity was founded by a clergyman and it is clergymen principally with whom we communicate (I am speaking rather of country parishes) unless the case is taken up by some other person who communicates with us freely, but the clergyman is the eye through which we see in the matter. We cannot call these poor blind people up from Yorkshire or Cornwall to London, therefore we trust to the local surgeon as regards blindness and to the local clergyman as to the veracity of the statements in the petition; and we require the statements in the petition to be read over to the blind person, and we ask the clergyman and churchwardens to certify that the statements in the petition are true. I will leave you one of our forms of petition and one of the prospectuses of the charity; and I will leave also one of the forms of annuity warrant which we issue; and I have also brought with me a list of the committee who are the present distributors of the charity (*handing them in*).

4976. Do you communicate with other pension societies to ascertain whether the returns that you get are correct?—We do not unless something should occur to suggest it; we should communicate with Day's, for instance, if anything occurred to suggest our doing so.

4977. After a pensioner is elected do you appoint any person to keep Christ's Hospital informed from time to time as to his conduct?—We look to the clergyman; and in the letter which is annexed to the annuity warrant we particularly ask the clergyman to inform us if the annuitant is a person of immoral conduct, because that is not the sort of person the committee wish to have an annuity. Mr. Hetherington particularly lays it down that the Governors are to have the right of displacing any annuitant who should be found to be of immoral life and conversation.

4978. If a person were to take to street begging would he be disqualified?—Yes.

4979. Have such cases happened?—I was just thinking whether I could quote a case; I am not sure that I could; in a case of street begging we should probably caution the man and not act very harshly towards him; if we found that a man was selling boot laces or doing a little hawking we might take no notice of it; we have had cases occasionally where it was difficult to draw the line between ostensible selling and mendicancy, but those are rare cases.

4980. Do you have a regular annual report from the clergyman or from your correspondent in the place where the blind person resides, respecting the condition and circumstances of the blind person?—In the form of certificate on the annuity paper we require information on these particulars, that the person elected resides in the parish and has lived in the same so many years; that he is wholly destitute of sight; that he is of so many years of age; that he is of sober life and conversation; that to the best of the clergyman's knowledge and belief the blind person never did receive any alms or allowance as a pauper; that he had never been a common beggar; nor possessed nor was entitled to any state annuity, salary, pension, or income for life to the amount of 20*l.* a year over and above the annuity that we give. That accompanies the form of receipt for the money, and we make a special request that the clergyman will witness the mark of the blind annuitant. That is our evidence of the person being alive, in most country parishes these blind persons being well known to the clergyman. Amongst our 700 annuitants it will happen from time to time that there is a shifty person into whose conduct we have to make some inquiry upon various points, and then we make inquiry and perhaps we have to offer an admonition to the annuitant.

4981. (*Dr. Tindal Robertson.*) Has any alteration been made since the donor's death in the rules of the charity, with the exception of the one with reference to age, which you have described?—I might say no such alteration has been made. I might say, perhaps, that an interpretation has been given to some particular point. We used not to require a surgeon's certificate of blindness, for instance, but we were sometimes so puzzled by its being said that the person applying had a slight glimmering of light, or was practically blind, or was blind to all intents and purposes, that some years ago, the governors directed that we should require a surgeon's certificate stating that the person is blind and destitute of sight, following the words of Hetherington's deed. Then I may mention another thing. It used to be considered that a person was required to have been resident for three years in the parish previously to the time of petitioning; and if the person moved between the first time of applying and the second, that person was disqualified. That was felt to be hard, and that requirement was relaxed by the committee, and they made it a rule that if a person had once applied and was deemed to be qualified, a mere removal to another parish should not be a disqualification. So there have been interpretations of Mr. Hetherington's requisitions rather than new rules, save the one with regard to age.

Mr. M. S. S. Dipnall.

18 Feb. 1886.

4982. Then I may take it that the intentions of the founder are almost absolutely adhered to?—Yes; the governors laid down rules with regard to the classes of people that they considered below the mark 80 or 90 years ago, those have been gradually relaxed somewhat to meet the feeling of the times; still we adhere to the qualifications that the person must be totally blind; that he is not in receipt of parish relief, that he has resided in the parish three years, and that he has no other assured income up to 20*l.* a year. I use the word "assured," because if a blind person was in a little business and getting 10 or 12 shillings a week out of it, it would not disqualify, because it is not an income for life, it is not an annuity.

4983. Has there been any desire at any time on the part of the governors to vary the amount of the pension, to put it on a sliding scale; or is it the general desire to keep it at 10*l.*?—I think the governors have found it so convenient to pay 10*l.* all round that they would not be disposed to alter it; we should be glad to see the 10*l.* larger, but as it goes in aid rather than as a total maintenance, I may say it works so very conveniently in our accounts and in other ways that I do not think the governors would themselves initiate an alteration.

4984. I was going to ask you, if the governors had that wish, would they have the power to do it according to the present deed?—I do not think they would for this reason; there is no lack of candidates, there are plenty of people to take the pensions, if we had a smaller field of applications the governors might say they would give 15*l.* instead of 10*l.* in order to spend the money, and I think the governors could under those circumstances increase the amount of the pension; but Mr. Hetherington says that his money is to be divided amongst 50 persons, so that there is something in the essence of the charity that seems to suggest 10*l.* to each.

4985. In your selection of the recipients of the charity, do you give any preference to persons who are themselves earning anything, I mean after you have selected the persons whom you believe to be qualified by age and so on, do you then give any preference to those who are able to earn anything for themselves?—We do not; we do not regard that as an essential matter.

4986. Is it at all a point which has been considered?—I can hardly say that it is. We sometimes see an interesting case where a man is still making some efforts for himself, and we take notice of that as one special feature of the case, but it is not an essential point with us. We are dealing with people upwards of 61 years of age, and many of them 70 or 80.

4987. Is there any particular county from which you get a larger number of applicants compared with the size of the county than others?—Cornwall, perhaps, gives us the larger number of applicants, and Yorkshire from its great size also gives us a great number of applications.

4988. Would Cornwall, taking its size into account, in proportion to Yorkshire for instance, give you more applications than Yorkshire?—I should think it would. I have not very closely examined that particular point; we do get a good many from the mining districts, and a good many from the manufacturing districts of Yorkshire.

4989. From looking at the surgeon's certificate are you able to assign any cause for the greater number of applications from those districts?—There is no mention of the cause of blindness in the surgeon's certificate; the surgeon merely certifies the fact of the person being totally blind; it is only here and there that we get the cause of the blindness stated.

4990. Have you any experience as to the prevalence of blindness in such a county as Nottinghamshire for instance, where the fine lace manufacture is carried on?—We get applications from Nottinghamshire. I have not noticed specially that we have a larger number from Nottinghamshire than other counties.

4991. Have you noticed whether you have a large number of applicants from the iron districts who have become blind from the fact of small particles of iron affecting their eyes?—No, I cannot say that I have. I have some views upon that matter which I have arrived at from having made certain inquiries as to whether blindness had increased in this country from certain causes, or whether, owing to other causes, it had diminished. A gentleman of great wealth in London, who is now dead, and who contemplated making a large addition to the endowments for the blind, got me many years ago to give him some views upon the subject, and I made certain inquiries which led me to the conclusion, that blindness has not increased in England, certainly not in my judgment beyond the ratio of the population, and that is due to vaccination and also to the very great improvement in optical instruments, the greater knowledge of ophthalmic science, and greater care taken in factories and other places. I considered that whilst on the one hand there was probably an increase of blindness among iron puddlers, glass blowers, and railway engine drivers, and people of that sort, on the other hand there was a diminution of blindness or a shortening of the period of blindness due to the progress of ophthalmic science and greater care in other respects. In some trades the workers, from the nature of their work the saw grinders of Sheffield, for example, commonly do not live to the age of 61 which is our limit of age; I do not suppose we should find a saw grinder in our list of applicants if I looked through the books for ten years. Then there are other trades in which the workers are cut off often times in early life comparatively, in the third or fourth decades of their life.

4992. Have you noticed whether watchmakers are peculiarly liable to become blind?—No.

4993. With regard to the administration of pensions generally, is it your opinion that if a general register could be kept in which the names of all persons applying to the different societies for pensions could be registered and to which access could be readily had by the different societies, there would be a possibility of preventing what we have been told is the case, namely, that pensions very often greatly overlap each other?—I am hardly prepared to give an opinion upon that at this moment; we have ourselves a great deal of confidence in the clergy, we communicate very freely with them and they with us, and we fancy we are fairly well informed with regard to our pensioners.

4994. You seem to take extra care, but we have it in evidence that there is such a thing as plurality of pensions; speaking from your general experience would you think it advisable that such a register which could be easily inspected should be kept?—I hardly know. Our charity is so large we fancy we can run alone; at the same time we freely avail ourselves of other sources of information. The fact that a person is having 12*l.* from Day's, and 5*l.* from the Clothworker's, does not disqualify him from receiving a pension from our charity.

4995. I am not now speaking with reference to your particular charity, but I am putting to you whether you do not think it advisable that such a register should be kept to which all the societies who give pensions to the blind could have access?—I should almost prefer not to give any decided opinion upon that point. I might make this remark with regard to Hetherington's Charity; that it deals with a class of persons who have suffered adversity and there is a certain tenderness towards their feelings, and we should not be inclined to bring before the eye of everybody the peculiar circumstances of every annuitant.

4996. (*Mr. Johnson.*) I believe it is one of your principles to give your pensions to people who have been in a better situation of life?—Yes.

4997. Have you any knowledge of any other charity or pension society which gives pensions to that class of persons?—I do not think I have. I do not know what the considerations are which guide the trustees of Day's Charity in selecting their pensioners.

4998. I know as a trustee of Day's Charity that you have communication with Day's Charity, as Day's Charity very often profits by the information which Christ's Hospital can give them. Do you think that there is any large number of people who get pensions

Mr. M. S. S. Dipnall.

18 Feb. 1886.

who are unworthy recipients?—I do not, judging from our own experience.

4999. I see that these directions are appended to your warrants, "The above certificate and receipt should be "signed as soon as conveniently may be, and the "minister and churchwardens are requested to be par- "ticularly attentive" (I see those words are printed in italics; "to the several circumstances which are to be "ascertained, and not to sign it as a matter of mere "form;" do you find that clergymen do take that trouble?—I think they do, especially newly appointed clergymen. We find that they make sufficient inquiries about the charity and about individual cases to justify us in saying that clergymen do take care to inquire into the cases. In country parishes these aged blind are known to the clergymen personally, and we invite the clergymen to witness the mark of the person to the annuity receipt, as the best proof of the person being alive.

5000. Do the same disqualifications which apply to Hetherington's Charity extend to the whole of your 717 pensioners?—With the exception of six in the special gift of the Reverend Mr. Watkins. The Reverend Mr. Watkins' father founded endowments for six additional annuitants, with the condition that during his son's lifetime his son, the Reverend Mr. Watkins, should have the right of appointing the annuitants without being restricted by considerations of age and other things as in the case of Hetherington's Charity; therefore we have amongst the 717 we will say six blind persons who are not necessarily amenable to all the rules of Hetherington's Charity. They must be blind.

5001. I understand that common soldiers and sailors are excluded?—Yes; but in practice there has been a gradual relaxation of that restriction during many years past. We are not very strict in insisting upon it, it was not an exclusion which Mr. Hetherington specified, but was rather an interpretation that was put upon Mr. Hetherington's views.

5002. Then I see journeymen in any handicraft trade are excluded, does that restriction still exist?—Yes, but that is a disqualification that we do not insist on with great strictness, a man who is a journeyman now may have been a small master years ago, or his father may have been a master; we do not exclude a man if he has been in a respectable position though he may have been only a journeyman.

5003. Journeymen in handicrafts, persons living by turning a mangle or a polisher's wheel, or other like employment, or those who have begged or received parochial alms, do I rightly understand that you give a broad interpretation to those disqualifications?—The receiving of parochial relief and begging we read in a very strict way, but if a person has been thrifty and saved a little money, and he wants something to be added to it, we give him the credit of that piece of respectability, so to speak. With regard to the exclusion of soldiers they used commonly to have 18*l.* 5*s.* a year army pension, and if they picked up a little pension somewhere else they soon got outside our limit of 20*l.* a year.

5004. You say you get information from Day's Charity; do you get information from any other societies or charities?—From the Painter Stainers.

5005. From the Charity Organisation Society?—We do not get information from them, we get it where we can. Where the cases are London cases we, perhaps, send one of our own messengers to take stock of the blind person, and make inquiries of the local clergymen and so on.

5006. If any one wrote to your court and told you that one of your pensioners was a person of immoral conduct, or was in receipt of a plurality of pensions, that would be enough to lead you to enquire *de novo* into the case?—Yes, certainly.

The witness withdrew.

Mr. HENRY SMITH examined.

Mr. H. Smith.

5007. (*Chairman.*) Are you the trade manager of the Kensington workshop?—Yes.

5008. How long have you been so?—About nine months.

5009. What number of inmates have you in the institute?—Nine.

5010. Are those all employed in the workshop?—Yes.

5011. Are they male and female?—No, male only.

5012. You do not take in any women?—No, we employ women outside.

5013. Who preceded you as trade manager?—It was a lady that was in the place before me.

5014. Are you able to give instruction in the different trades, or do you only superintend them?—I only superintend, I do not give instruction to the blind people.

5015. Who does give instruction to them?—We have a blind foreman in one department; that is the brush department.

5016. Have you no sighted superintendent or teacher?—Yes, we have a sighted foreman in the basket department, and a blind foreman in the brush department.

5017. What is your principal trade, brushes or baskets?—Baskets.

5018. Do you give any educational instruction as well as industrial?—No.

5019. How long do you keep the inmates; as long as they can work?—Yes, just as long as they are able to work; they come in the morning at a certain time, and leave at a certain time in the evening; and as long as they are able to work they are employed in the institution.

5020. Supposing you are unable to sell their work, do you keep on employing them?—Yes, we have done so since I have gone there, though the stock has been accumulating very largely; it is such a difficult thing for us to compete with the east end people, and more especially in the brush department, we seem to fail in that line of business.

5021. Have you any shop for the sale of your goods?—We have a shop in the institution.

5022. That is your only shop?—Yes.

5023. And you find a difficulty in getting rid of your goods?—Yes, of the brushes at any rate.

5024. Shall you be able to go on employing the workmen now in your institution if you cannot sell the goods they produce?—To make up for the loss on the goods that they make, we get a profit on goods that we buy, we try to make a balance as best we can, and then instead of keeping too large a stock of brushes that they make, we sell them at a reduction.

5025. The goods that you cannot sell you sell at reduced price?—Yes.

5026. Have you any chair caning?—Yes, but it is not done on the premises, we give the chair caning out.

5027. To women?—We have one blind woman employed at chair caning, and we also have one blind person, one man, employed outside in chair caning, and we sometimes give to one of our men employed in the brush department, chair caning for his wife to do at home.

5028. How many do you employ altogether outside your shop?—Three.

5029. What was the amount of the goods sold out of the workshop last year?—897*l.*

5030. Has the amount of the sales increased since you have been there?—Since last year there has been a increase of 110*l.*

5031. How is the institution supported?—By subscriptions.

5032. You have no endowments?—No.

5033. What is the cost of the institution?—Since I have gone there, we have had to move from one of the places that we were originally in; the rent of one of those places cost us 85*l.* We do not keep our brush makers and basket makers all under one roof, we cannot get the necessary accommodation for the two branches of business in one place, and we have two different places of business; we have the basket makers in one street, and the brushmakers in another.

5034. You have two small houses?—Yes; the rent was 112*l.* in Young Street and Church Street. We have now gone a little out of the way; we do not think it has been any benefit to us at all, but we could not get a place of business in a principal thoroughfare, and we have now gone to a place called Ball Street.

5035. Is that out of the way?—It is out of the way, and the rent we pay in Ball Street is 65*l.*

5036. Have you plenty of room for your workshop?—We have plenty of accomodation. We have only been there now since the 15th of January, but the chance sales seem to be much less than they were in Young Street.

5037. Do you advertise?—Our committee do not seem to believe much in advertising.

5038. Retail tradesmen seem to think differently?—I know myself that I would advertise.

5039. Have you had a commercial training?—Yes, I was in the blind institution at Aberdeen.

5040. Can you tell us anything of that institution; is it self supporting?—Yes; they have subscriptions.

5041. Has it been long established?—Yes, since 1843.

5042. Have they a ready sale for their goods?—Yes.

5043. They have not the competition of the East end of London which you spoke of?—No, they have a good many departments; it is a much larger institution than ours, they have between 50 and 60 hands.

5044. Do you think that fresh branches of trade should be opened out to the blind?—Yes.

5045. You think that they are capable of learning more than they have hitherto been taught in the institutions?—Yes, I would always teach them basket making, basket making is a very good paying department.

5046. What kind of baskets do you make?—Grocers baskets, candle baskets, and linen hampers.

5047. Baskets for wines and spirits?—Yes, we can do any kind of basket work, suppose an order was sent in, we would take it for any kind of basket.

5048. Do your basket makers make the baskets on forms?—Yes, they put the willow in between a piece of wood placed on to a large flat board; they put the willow in and weave it in the ordinary way.

5049. Are your baskets turned out as well as any in the trade?—Yes, I could guarantee that our blind people can manufacture baskets as well as any seeing person.

5050. The reason your goods do not sell so well as you could wish is not because they are of inferior workmanship?—No, I could safely say that our goods are of a superior make; we pay a good price for our material, and therefore, we think we ought to get a better price than we do get.

5051. Do you get your materials cheap, in large quantities?—We are not able to afford to buy it in large quantities.

5052. That is a disadvantage in a small institution?—Yes.

5053. I believe you have received grants from Gardener's Trust from time to time?—Yes, for three years back.

5054. On what grounds do you receive a grant from the trustees of the Camden Charity?—This is a grant for institutions in Kensington.

5055. (*Mr. Johnson.*) How many workpeople have you altogether?—Twelve.

5056. Nine men inside and one man and two women outside?—Yes.

5057. I see by the accounts that 338*l.* is paid for wages; how are the workmen paid, by piece work or by weekly wages?—By piece work.

5058. They are only paid for what they produce?—That is so.

5059. Are their earnings supplemented in any way?—No.

5060. Taking the 338*l.* 17*s.* 5*d.* for wages in the year and dividing that amongst the 12, it would give them 28*l.* a year each; which gets the largest amount of wages the basket makers or the brush makers?—There are more brush makers than there are basket makers, but the basket makers get more wages.

Mr. H. Smith.

18 Feb. 1886.

5061. What are the average wages that a basket maker gets?—Between 18*s.* and 19*s.*

5062. What are the average wages of the brush makers?—Between 16*s.* and 17*s.*

5063. I see the salaries are 145*l.* a year; that includes your salary; does it include any other?—We have a sighted porter, and the 145*l.* of course includes the salary of the basket foreman.

5064. What is your salary?—The salary I have at present is 70*l.*

5065. (*Chairman.*) Is that including board?—No.

5066. (*Mr. Johnson.*) You say that you have gone to Ball Street, and you now pay 65*l.* a year rent; does anybody live in the house?—Nobody lives in our premises, but above our premises there is a Young Man's Friendly Association.

5067. I mean does anybody connected with the institution live there?—No.

5068. You all live at your homes?—Yes.

5069. Do you know the reason why you moved from Young Street?—There is a firm called John Barker and Company up that way, and they are going to take down the houses that we were in. We rented our houses from them.

5070. I see that the amount of your stock and materials is 240*l.* I suppose that is stock that you cannot get rid of?—It is not just that; I generally take stock at the end of the year, and that is the stock we have in hand. I expect we shall get rid of it.

5071. You expect you will get rid of it at a very reduced price?—Yes. We reduce the price of it, and try and get a profit on some of the goods that we buy.

5072. Have you any difficulty in getting rid of your stock?—Sometimes we have to reduce it to a very low figure indeed; for instance, in our brush department, the scrubbing brushes cost us to make, taking wages and material and one thing and another, about 7*s.* a dozen, and to get them sold we must sell them at 5*s.* a dozen, that is to say, if we compete with wholesale people.

5073. Then in fact as far as your experience goes the workshop does not pay at present?—Not the brush department.

5074. But the baskets you think do pay?—The baskets pay.

5075. Does the chair-caning pay?—The chair-caning pays.

5076. What do your workmen get per week at chair-caning?—The foreman in the basket department sees the size of the chair, and we count how many holes there are in the front of the chair, and how many holes there are in the back; it depends on the size of the chair; for a common size chair, a bedroom chair, our workmen would get 1*s.* 3*d.*, and they would supply the cane.

5077. They are paid 1*s.* 3*d.* for the chair; how much of that is profit to them; what does the material cost, and what is their profit?—I should say that they have about 9*d.* out of that chair.

5078. How many chairs could they do in a day if they had plenty of work?—They would be able to do two.

5079. That is 1*s.* 6*d.* a day profit?—Yes.

5080. They could earn that every day if you could give them the work?—Yes.

5081. In your opinion is chair-caning a very good occupation for them to pursue at home?—Yes.

5082. You do not make mats?—No.

5083. Nor mattrasses?—No.

5084. Nor sash line?—No.

5085. You only make baskets and brushes?—That is all.

5086. Where do you get your workers from; are they from institutions or do you teach them?—Since I have gone there we have taken in a little boy, that is the only learner we have had; that is in the basket department. I understand our committee in future are not going to employ or take in any more brush makers.

5087. The people who work at your workshop are people who have been instructed at other institutions?—Yes.

Mr. H. Smith

18 Feb. 1886.

5088. Can you tell me where they have been instructed?—They have been instructed at different institutions, I know some of them have been at Bradford; I do not know what other institutions they have been connected with.

5089. You would not take them in unless they were first-class workmen?—We take them in to learn the basket department.

5090. I am referring to the people who are working for journeymen's wages, they are people who come from other institutions; would you take in anybody who was not a good workman?—No.

5091. You select your workmen?—Quite so.

5092. (*Dr. Tindal Robertson.*) As a rule do you find that your people are good workmen when they come to you?—We have to look over any little faults in their work for some time. We cannot say at first that they are really good workmen, they may be good workmen, but they may not to be able to show what they are capable of just at first.

5093. Do you know whether or not those who are with you have been educated before they come to you?—No.

5094. What office did you hold in the Blind Institution at Aberdeen?—I was clerk there.

5095. Had you anything to do with the purchasing of materials there?—No.

5096. Who purchases the materials at your workshop?—This blind foreman.

5097. Where does he get them from?—From wholesale places in the City.

5098. Have you more people applying for work than you can give work to?—Yes.

5099. Do you not think if a large central depôt or more than one large depôt were established in London, where materials could be got by the blind at cost price even in small quantities, and where things made by the blind could be sold, you and similar institutions to your own would not accumulate your stock so much, and do not you think that such a depôt or depôts would be of advantage generally to the blind poor?—Yes; I should think myself if a large institution were established in London where we could take our accumulated stock, and where they could buy material in large quantities and hand it out in small quantities to the smaller institutions, it would be a very great advantage.

5100. (*Dr. Armitage.*) What is the number of your present shop in Ball Street?—No. 19.

5101. (*Mr. Arrol.*) You say that you do not subsidize your workers; do you give them a dinner free?—No.

5102. Do you pay them on the sighted piece work scale?—They get more than sighted persons do.

5103. You stated that the basket makers earn 19*s.* and the brush makers 17*s.* a week, the average aggregate shows 12*s.* 6*d.* a week?—I meant to say that the average would be between 16*s.* and 17*s.* for the brush makers, and between 18*s.* and 19*s.* for the basket makers.

5104. But 338*l.* is the amount expended in wages, so the average wages of all the workers would be 12*s.* 6*d.* a week?—I do know anything about what the amount was last year; I have not been able to get up a report for this last year yet, because I do not know what happened when I was not there.

5105. You have made reference to the Institution at Aberdeen, and you have said that it was self-supporting, can you say what wages the Aberdeen men get?—I cannot say.

5106. Are you aware that the Aberdeen Institution is not self-supporting, that it is always in deficit, every year?—I know they have subscriptions as other institutions have.

The witness withdrew.

Mr. George Barnes examined.

Mr. G. Barnes.

5107. (*Chairman.*) You are a basket maker by rade?—Yes.

5108. Where did you learn that trade?—At Kingscote's workshops, Commercial Street, Spitalfields.

5109. How many years were you there?—Three and a half years, and then it ceased.

5110. When you left did you set up on your own account?—No.

5111. Did you work for any insitutions?—Not then.

5112. What did you do?—I went to work at a place where they employ sighted men.

5113. And you worked with sighted men?—Yes.

5114. What wages were you able to earn there?—From 10*s.* to 18*s.* a week.

5115. Will you tell us what you did when you left that place?—Then I went to Berners Street Institution, it was in the Euston Road at that time.

5116. What wages did you get there?—I should think about the same, about 10*s.* to 18*s.*; it all depended on what class of work I was on.

5117. Then did you do work on your own account?—No, I went to the Notting Hill Institution then, it is Kensington now, it was Notting Hill then.

5118. What made you go from one to the other?—Because I wanted to improve myself.

5119. They did not teach you enough at Berners Street then?—They did not undertake to teach me there; I went there as a competent workman.

5120. What did you learn at Notting Hill?—I was a teacher there.

5121. How long were you a teacher there?—I think I was there about three years; I was there until the Notting Hill Institution ceased and then I went to Kensington.

5122. In the same capacity?—No, I went as a journeyman to Kensington.

5123. Are you married?—Yes.

5124. Have you been married long?—Yes.

5125. To a sighted wife?—No.

5126. Does your wife help you in your basket making?—No, it is rather too heavy work for her.

5127. Is she able to do anything?—She has enough to do in doing the housework.

5128. Is she able to do that without any other assistance?—Yes.

5129. Have you any children?—No; I keep a little orphan nephew.

5130. Does he take you about?—No, a lad that is outside takes me about.

5131. How do you get orders for your baskets?—I go about for them with this lad.

5132. To different shops?—To warehouses and contractors.

5133. When you married did you begin to work for yourself?—No, I still stopped at Kensington, till the work fell off, and we were put out of work for three months; then I left there and went to the Peckham Institution, and they fell slack; and from there I went to St. George's to work in the journeymen's shop, and when I left there I became master for myself; I could see they were all falling slack now and then, and I thought it was best for me to try and see whether I could not get the profit of my own work.

5134. Have you been able to earn more on your own account than you were when you were working for an institution?—Yes, I can earn from 1*l.* to 30*s.* a week.

5135. Do you get a sighted person to assist you?—When I am busy.

5136. Is it your experience that a good blind workman can earn his own livelihood by basket making?—Yes.

5137. In your opinion is the reason why many fail to earn their livelihood because they are not good workmen, or because they are not industrious enough to work?—They have not been taught enough; that is where the failure is.

5138. Do you think they leave the institutions imperfectly taught?—Yes.

5139. They leave them too soon?—Not too soon; they are in there quite enough time to learn a trade, but they are not sufficiently taught.

5140. In your opinion is that the fault of the institution or the fault of the person taught?—I put it down to the management of the institution.

5141. You have had some experience of them?—I have been to all the institutions there are except Greenwich.

5142. Have you found any difficulty in teaching the blind to work?—No; I have one now that I am teaching.

5143. Are any of your pupils earning their livelihood?—Yes.

5144. You say a great deal depends on the style of teaching; have you been successful with all your pupils?—Yes.

5145. You have had no failure?—None at all.

5146. And you attribute that to theirbeing properly taught by you?—Yes.

5147. How do you buy your materials?—At the warehouse; I pay my bills once a month.

5148. Do they sell you material at the wholesale price?—Yes.

5149. Then all the blind can get materiels at wholesale prices if they choose?—Yes, anybody can do that.

5150. When you say the warehouse, do you mean a warehouse where you sell your work?—No, I do not sell my work to any basket warehouse at all; I sell my work to private customers.

5151. What is the warehouse that you were speaking of?—Where they sell the raw material, the cane warehouse or the rod warehouse in Spitalfields; there are warehouses in different parts of London.

5152. We have been told that the great difficulty of the blind is to get the raw material at wholesale prices, that they have to pay more than the wholesale prices, and that they cannot make a profit out of their work?—They can get the stuff at wholesale prices just the same as you might get it, there is no difficulty in that, but the great difficulty is in disposing of the articles produced.

5153. How do you get to your customers?—I have to travel a good many miles. I keep a pony and a cart to carry me about to different places.

5154. (*Mr. Johnson.*) Do you hawk?—No; I travel for my orders first, and as soon as I get them I execute them and take the work home, then I go on to another place. The other week I was at Paddington for six days repairing baskets. I went there every day with my pony, and directly the work was done they paid me for it; the greatest difficulty is to find work; if we could get places to work for we could gain our livelihood.

5155. The desideratum is to get a place where the work of the blind could be sold?—Yes.

5156. That of course could be done by arrangement among the different institutions if they combined?—Yes; that is what they ought to try to carry out, what is wanted is a depôt for the blind to bring their work to.

5157. At present the different institutions do not combine for that purpose?—No.

5158. Do you think the blind ought to be taught at a school as early as possible?—No.

5159. I am speaking of education in the first instance, not of industrial training: were you blind from a child?—Ever since I was 11 years of age.

5160. Do you think blind children ought to commence their general education as early as sighted children?—Yes, I do, and after they have received a proper education the same as the sighted children it is time for them to begin to learn any trade, but I do not think their general education ought to be in the same hours as the work is on.

5161. You mean that their ordinary education and their industrial training ought not to be going on at the same time?—I think so.

5162. Do you think industrial occupation ought to begin at 12 years of age?—That would be too early, because when children are at that age they have not the sense to think of their future life.

5163. What are they to do between 12 and the time when industrial occupation should begin?—A child is kept at school until he is 14 before he is put out to work, they will not take an apprentice under 14 years of age in ordinary occupations.

Mr. G. Barnes.

18 Feb. 1886.

5164. You think 14 is the time at which they should begin to learn their trade?—Yes.

5165. How many years would you give them to learn their trade?—Of course, brush making is very easily learnt, that would take two or three years, and at the end of that time they ought to be capable of earning their own living at brush making; but at basket making they ought to have no less than 5 years.

5166. (*Mr. Arrol.*) What may have been the reason for your leaving the sighted workshop where you were employed?—I wanted to see if I could make myself a better workman. The Peckham institution advertised that they wanted 50 hands, and I and another blind man who was very quick went there, and we were only there three months before they told us we did too much work for them and we had to be put on half-time. From there I went to work at St. Georges, and I did better at St. Georges than I had done at any of the other places.

5167. (*Dr. Tindal Robertson.*) Being a blind man yourself, if you had a blind child in what way would you have him educated, would you send him to a school board school?—Yes.

5168. Do you think it would be a great advantage that a blind child should be educated with sighted children?—Yes, certainly.

5169. For what reason?—Because he learns their ways and he becomes almost the same as a sighted person; my wife was the same, she never went to any blind institution.

5170. Where was your wife educated?—She went to a school board school, and from there she went to classes.

5171. You say that your wife does the housework, does she light the fires?—Yes, she does all the household work.

5172. Without assistance?—Yes.

5173. You said that anyone would be able to get material at wholesale prices, do you mean even if he went with a small order?—That would be a difficulty, no doubt.

5174. Do not you think that if such a depôt as was suggested by the Chairman, for the sale of work done by the blind, could be established, and where the blind in any part of the district might be able to purchase even small quantities of material at wholesale prices, that would be a great advantage?—Decidedly, that would be an advantage.

5175. (*Mr. Johnson.*) You say you learnt your trade of basket making at Commercial Street, Spitalfields.

5176. That workshop was only open for a few years?—Altogether it was open about 5 years, it is 20 years ago.

5177. What was the reason that that institution collapsed?—Through mismanagement.

5178. Did it collapse at all from their not being able to find a sufficient market for their produce?—Not at all.

5179. It was simply through bad management?—Quite so.

5180. When you were there, were you able to earn from 10*s.* to 18*s.* a week?—Not there.

5181. Where did you first earn from 10*s.* to 18*s.* a week?—At the sighted place, at the place where sighted men were employed.

5182. At Berners Street did you get from 10*s.* to 18*s.* a week?—Yes.

5183. How long were you at Berners Street?—I should think about 18 months.

5184. At Berners Street did you work at piece work or regular wages?—At piece work.

5185. Were your earnings supplemented at all?—No.

5186. You merely took the actual earnings that would have been paid to a sighted workman?—Yes.

5187. Did you find when you worked by the side of sighted workmen that it was any disadvantage to you to be associated with them?—Not a bit.

5188. Do you think it would be a desirable thing if persons who employ sighted workmen were to associate blind workmen with them?—No.

Mr. G. Barnes.

18 Feb. 1886.

5189. You think it is better that blind people should work by themselves?—Yes.

5190. What objection would you have to work with sighted people?—The objection is that they ridicule you and make all sorts of sneers at you.

5191. Perhaps they work a little quicker than you?—Yes.

5192. But they do not earn much more wages than you do, do they?—Yes, ours would not come up to much more than half theirs.

5193. If you were earning 10*s.*, a sighted man next to you might be earning 20*s.*?—Yes.

5194. If a pension or some assistance were given to a blind man who was earning his livelihood in that way, so as to raise him up to the level of the sighted workman, you think it would be a good thing?—That is just the thing that wants to be done. I have had a very great struggle myself in managing to get through the world as I have got through it, with my own earnings, because I had nothing to help me at all besides my own earnings.

5195. You have no pension?—I have a small pension now, a Clothworker's pension of 5*l.* a year.

5196. That is an assistance to you in aiding you in your work?—Yes.

5197. Possibly it gives you the opportunity of going and purchasing a little material?—That is just what it does; when I receive it I go and purchase my material with it.

5198. Do you not think that pensions therefore, given to deserving workpeople, would be of very great advantage?—That I do.

5199. You have told us that you worked for sometime at St. George's, and you got on pretty well there; what did you do at St. George's?—All sorts of work.

5200. I believe you earned 15*s.* or 16*s.* a week there?—The last week I was there I made 1*l.* 7*s.* 9*d.*

5201. In the outworking department?—Yes.

5202. Is that outworking department supervised by sighted people?—No.

5203. Is not there a sighted foreman?—He does not look after the basket makers.

5204. There is a sighted foreman?—Yes.

5205. What is your opinion of the instruction given at the institutions; take three or four of the great institutions, St. George's, Berners Street, and St. John's Wood, and the smaller institutions; do you think the inmates of those institutions are taught sufficiently well?—Of course I cannot say much about the Berners Street teaching now, but there was no foreman there when I was there, nobody at all. I do not think the blind ought to be compelled to find a friend to pay 6*s.* a week for their teaching when subscriptions are coming in.

5206. Nothing was paid at St. George's?—No.

5207. Could you point out anything which you think ought to be altered there, or is it fairly well conducted?—I have no fault to find with it myself, that is to say, not with the journeymen's shop. I do not know anything about the other department.

5208. As to the disposal of the work of the blind, what is the reason of the difficulty in disposing of the work?—The consumer will not place confidence in blind people's work.

5209. Do you think it is a difficult thing for medium workers—men who are not very expert at their work—to get employment?—Not if they are capable workmen.

5210. I say medium workmen; do you think there is work for medium workmen in coarser stuff?—Yes.

The witness withdrew.

Adjourned to to-morrow at 12 o'clock.

32, Abingdon Street, Westminster.

Friday, 19th February 1886.

PRESENT:

LORD EGERTON OF TATTON IN THE CHAIR.

SIR HENRY SELWIN IBBETSON, BART., M.P.
ADMIRAL SIR E. SOTHEBY, K.C.B.
W. TINDAL ROBERTSON, ESQ., M.D.
W. AUCHINCLOSS ARROL, ESQ.
E. C. JOHNSON, ESQ.

CHARLES E. D. BLACK, ESQ., *Secretary.*

OWEN ROBERTS, Esq., M.A., F.S.A., (Barrister-at-Law,) examined.

O. Roberts, Esq., M.A., F.S.A.

19 Feb. 1886.

5211. (*Chairman.*) You are clerk to the Clothworkers' Company?—I am.

5212. Will you state what you can tell us about the pensions distributed by that company?—The Clothworkers' Company are trustees of blind pensions, mainly consisting of 5*l.* pensions under the will of Mr. and Mrs. West; and also they are trustees of other blind pensions of 10*l.* per annum each. The aggregate amount of the fund available for those pensions at the present time is 5,210*l.* 6*s.* 11*d.* But the company have augmented one of those charities, namely, Thwaytes's, by a sum of about 300*l.* a year, providing 30 blind pensions or thereabouts. Thwaytes's fund was left by a member of the company in 1835; it was a sum of 20,000*l.*, and the produce of it was to be spent in giving poor blind folk pensions of 10*l.* each.

5213. Are there any limitations to that?—The recipients are to be poor and blind. Then the company had left them by the same member of the court, William Thwaytes, another fund of 20,000*l.*, with which, in the words of the testator's will, "the said society may make "themselves comfortable." Part of the produce of that sum is given to augment the blind charity, that is to say, something over 700*l.*, the produce of the first 20,000*l.*, is spent in 10*l.* blind pensions, and that is augmented by something under 300*l.* from the produce of the surplus of the 20,000*l.* left to make the company comfortable, making 100 pensions altogether. The total pension fund of the Clothworkers' Company is now as nearly as possible 5,500*l.*

5214. The 5,210*l.* odd and 300*l.* in addition?—Yes, or rather 280*l.* odd, making altogether 5,491*l.* 16*s.* 11*d.* Then with regard to the way in which these funds have come to the company, in almost every case, as in the case of all money belonging to the Clothworkers' Company, they are the gift of persons who have been members of the governing bodies of companies, who, being interested in the administration of similar charities have been impelled to give bequests from time to time, and these gifts have resulted in this total fund. Acton's trust, 42*l.*; Cornell's trust, 79*l.*: Newnam's trust, 382*l.* 10*s.*; Thwaytes's trust, 718*l.* 10*s.*: and there are seven trusts under Mr. and Mrs. West's charities. Mr. West being a member of the Clothworkers' Company. There is a clause in Mr. West's will, that any surplus remaining after the pensions of 5*l.* have been dealt with, shall be given for general purposes of charity; and the company have under that clause occasionally made grants to ophthalmic hospitals and aids incidental to the blind, it being the opinion of the Clothworkers' Company that that is *cy pres* to a pension fund. Fifteen years ago we approached the Charity Commissioners with a view of getting some of these trusts relaxed, so as to give a greater elasticity to the governing body of the company in dealing with them; but it was found impossible to proceed under the Charitable Trusts Acts except by means of a parliamentary scheme, which was a mode of proceeding which the Charity Commissioners are loth to adopt, they having found that the system of a parliamentary scheme did not work well; and they would not incur the risks and annoyance attending that mode of procedure. There is a provision in one of the earlier Charitable Trusts Acts, that if any scheme is found to be in excess of the ordinary powers conferred by those Acts the Charity Commissioners have power to certify a scheme agreed on mutually between the parties to Parliament, and then it is subject to the ordinary incidents of the passage of a Bill; but the Charity Commissioners, I believe, found in the earlier history of the administration of the charitable trusts that local opposition and expensive proceedings arose.

5215. Do any of these trusts limit the recipients of the pensions to certain localities?—Some of them. There are certain localities favoured by Mr. and Mrs. West by reason of their connexion with the places, such for instance, as Reading. As I have already said, Mr. West was a member of the Clothworkers' Company, and he had a large clothier's factory at Newbury, or in the neighbourhood; and therefore, having been interested in that locality for business reasons, he gave a preference to persons resident at Newbury and Reading; he also gave a preference to persons residing in Twickenham, Isleworth, and Richmond, I believe for some reason connected with his wife's family. Such reasons operate with testators as you may naturally suppose.

5216. Did you wish to get Mr. West's trust altered in that respect?—No, we have not found that provision work prejudicially; the pension under Mr. West's will is only 5*l.*, and therefore it does not lead to an unnatural immigration of blind into those localities.

5217. Do you always find a sufficient number of deserving blind requiring assistance?—Under Mr. West's will, when there is not a sufficient number of blind persons from those localities we have the power to give the benefits of the trust to poor blind residents wheresoever they might be. Therefore that was not a provision that we desired to relax. The company desired to give larger pensions, 10*l.* instead of 5*l.*, and also, though I do not know that I have the right to say so, I think they would have been glad to have been able to give donations to local societies formed for the assistance of the blind folk. The company have done so out of their own corporate funds; feeling a sympathy with the blind with whom they are brought into contact by acting as trustees of these blind charities they have out of their corporate funds several times, and more frequently lately than before, given small grants to start organised funds in different localities for the assistance of blind folk.

5218. If it were found desirable to recommend the expenditure of a certain sum of money either for the establishment of workshops or to assist existing institutions for the education of the blind and training them in industrial pursuits, your company would have no objection to divert some of its funds for that purpose?—I think if power were given them to do so they would be very glad to be able to do so. I could not say that the company would like to be compelled to do so, but it would be in accord with the sympathies of the company to act in that way; but they would like their discretion unimpaired.

5219. Have you always a full number of applicants for your charities?—We have. I have reason to believe that the number of blind folk in the metropolitan radius is about 3,000; and we find that it is almost impossible to keep up with the number of applications which keep pouring in, so much so that from time to time the committee, of which Mr. Bazley White is chairman, have been so sorry at having to postpone the claims of good and deserving applicants, that they have voted out of their corporate funds sums temporarily till there was an increase in the charitable funds, in order to absorb a large number of redundant cases. Hope deferred maketh the heart sick.

O. Roberts, Esq., M.A., F.S.A.

19 Feb. 1886.

5220. I see one of your rules is that if a petitioner is unsuccessful the application must be renewed at the end of three years; is that acted on always?—Not always; we relax it continually; I am directed every half year to go through these cases and sift them; the chairman of the committee attends at the hall, and we go through the cases; the cases which appear to him to be deserving of investigation are investigated, by myself occasionally, but more ordinarily by the beadle of our company, who is a man by his training and so forth well qualified for the duty. He visits them at their own homes, and if he finds that an application has been lying in our office it may be seven or eight years, or even more, and that the circumstances of the case, though the application has not been formally renewed, still hold good, or that additional circumstances have arisen to make the case more deserving, then the inclination of the company is to appoint those persons.

5221. Can you tell us at all what proportion of your applicants come from country districts and how many you relieve in London?—The largest trust under West's will is primarily for the poor of the city of London; we have endeavoured to get out of that limitation as much as possible; the Company found it very prejudicial to have these poor people living in houses at unnaturally high rents in the city of London. They found sometimes, I am speaking of years ago, that almost all the advantage that the recipients derived from the pension was absorbed by the extra rent that they had to pay by living in an expensive locality; therefore, without getting a formal scheme from the Court of Chancery we have, as a matter of fact, relaxed that rule, and we have considered ourselves justified in so doing. First we relaxed it by taking London as defined by one of the charters of Edward VI., which brought in Southwark as "liberties of London," and which we believe to be technically sound in law; and, secondly, the committee relaxed the definition of the city to a radius of four miles from the Guildhall; and more lately still they have considered the city to embrace the metropolitan area.

5222. You were able to do that without application to the Charity Commissioners or to the Court of Chancery?—I am bound to say that I do not think technically we could so extend our limits, but we justify ourselves by reference to the common sense of the position. I do not think we should be impeached by anybody for so doing; we have always given a pension to every poor person resident in the city who has made application, therefore nobody is damnified by the extension.

5223. Your limitation of age is over 50 years?—Fifty years, except in the case of those persons who are qualified by residence in the favoured localities. The pensions were to be given, according to West's will, to poor blind persons resident in those localities without limit of age; we construe the word person as meaning a person of 21 years of age at least.

5224. Are most of those annuitants who are over 50 years of age persons who have become blind late in life?—I will hand in for the information of the Commission the form we use. It is required that the applicants should have been blind for three years, that is in order to protect the charity, so as to give it to *bonâ fide* blind people. Blindness comes on very gradually, and sometimes we have found that applications have been made where the people are not actually blind; they are practically blind, it is true, but still at the same time the committee do not think it right to appoint persons practically blind when there are others actually blind and equally deserving; but they make an exception in favour of those who have been blinded by sudden accidents, such as accidents in mines, and catastrophes of that sort.

5225. Who would otherwise be excluded by your limit of the period of blindness?—Yes, if a man or a woman has been blinded by a sudden calamity the committee almost invariably appoint him or her; those poor blind people are helpless, and therefore the committee generally appoint persons incapacitated by blindness from accident on the first vacancy, provided they seemed otherwise deserving.

5226. You carefully investigate all these cases to see whether the applicants are of good character, whether they have been in receipt of parish relief, and also whether they are in receipt of any other pension?—All those things are carefully investigated.

5227. And if your questions on those points are not satisfactorily answered they would be disqualified, I presume?—Yes; we rely upon the best evidence we

O. Roberts, Esq., M.A., F.S.A.

19 Feb. 1886.

can get in that respect; in the case of persons resident within the metropolitan area, visits are made to the individual by the beadle of the company, whose duty it is to make those visits; but in cases at a distance we rely on the best evidence we can get, namely, that of the ministers of religion, a clergymen preferentially; Roman Catholic priests in districts where that form of religion is more prevalent; and Nonconformist ministers in other cases; in some cases we get information from persons brought into contact with the blind. We also rely more and more upon the local societies which are being established through the country, and any representation received from those societies is always very respectfully considered by the committee.

5228. Are you in communication with other institutions and companies in London who give pensions?—We always have from Christ's Hospital annually a return of their blind pensioners. Through their courtesy on several occasions I have obtained an augmentation of the pension of some of our more respectable blind folk; we have drawn their attention to cases of that sort, and we are in friendly communication upon the subject.

5229. If your pensioners receive any other pensions, are they disqualified from receiving yours?—No; we allow them to have a pension not exceeding 20*l.* The words of Mr. West's will are that pensions of 20*l.* per annum shall disqualify; we interpret that "not exceeding 20*l.*" We consider, in fact, that the penny stamp, and the expenses, and so forth, bring it below the 20*l.*; and in the cases of some of the most deserving of our pensioners it would be very hard indeed to make 20*l.* exclude our pension; our pension would only make their total pension 25*l.* or 30*l.*, as the case may be, and in some cases it would be cruel to exclude them.

5230. Twenty pounds at the date of the trust was worth more than it is now?—Yes; we have gone to the very verge of straining the provisions of the will to meet those cases, but we have not gone further than we considered ourselves justified in going.

5231. Are you in communication with the Charity Organisation Society in case your pensioners should be found begging in the streets?—Yes; the Charity Organisation Society we have found most useful.

5232. Have you had to dismiss any of your pensioners in consequence of begging?—Yes, two or three times in the course of the last 10 years; and the intervention of the Charity Organisation Society has been most useful. There was one notorious case of a woman living near Grosvenor Square; she was a most cunning impostor, and by means of the Charity Organisation Society we were enabled to track her, and she was brought up before the committee and her pension was ordered to be stopped.

5233. Can you tell us whether your pensioners, though they are 50 years of age, do anything for themselves in the way of industrial occupation?—Yes.

5234. How do they eke out their livelihood?—My information upon that point is not very specific; but a good number of the blind to my knowledge are making baskets and things of that sort, having been trained at the Berners Street Institution, or elsewhere. Whenever I go into the country I generally pay a visit to the blind school or workshop in the locality, and I almost invariably find one or two of our pensioners at work there at very scanty wages.

5235. Have you heard any general opinion expressed amongst the blind that it would be desirable to have some depôt where the work of the blind could be sold?—Yes, I have had conversations with some of them upon the subject; I think I have heard them say that it would be better if their work was sold in the open market, and not as blind work; if it is called blind work there is a disposition to suppose unjustly that the work is inferior, and they think that it would be far better to rely on the ordinary distributing agencies of commerce than to depend on the charitable public in that respect. I have had conversations with one or two blind people in which they have expressed that opinion.

5236. They find it very difficult to compete on equal terms in most trades with sighted persons, do they not, except perhaps in basket making; in mat making, for instance, is not it almost impossible for them to compete with sighted workers?—It is for that reason that we consider we are doing a good work in supplementing what they get at their occupations by these pensions; they are at a great disadvantage undoubtedly, though nature does give them some compensations.

5237. Your object in giving pensions is, as far as possible to supplement the earnings of the most deserving?—Yes; I think Mr. Tait and some other gentlemen stated in their evidence before this Commission that we disqualify persons who are in receipt of parish relief, that used to be so in our company, but we have relaxed that, to some extent we consider it a disqualification, and we prefer that persons should not be in receipt of parish relief, but we do not consider it an absolute disqualification. If the guardians stop the relief then we stop the pension.

5238. You act to a certain extent with the guardians?—We always communicate with the people in receipt of the pensions; and if their relief is in any way interfered with or curtailed we stop the pension at once.

5239. Has your company, independently of its pensions, ever given any assistance in the shape of providing stock in trade to start blind men in any business?—We have occasionally given a mangle to a poor woman, &c. We have not given such assistance to any great extent. The company gave grants to the Normal College at Norwood years ago, when it was in difficulties. I think we gave them 1,500*l.* out of our corporate funds; and also, some years ago, we established, under rather a misimpression, some scholarships at the Worcester College for the Blind Sons of Gentlemen. We gave some scholarships there supplementary to a trust fund which has been established in connexion with the college; but we did so under the impression that it was a public institution. When we found that it was carried on as a private adventure we discontinued the scholarships, but we promised that on the college being placed on a public basis we would give 500*l.* to the building fund, and also reconsider the question of giving scholarships; but we did not think it right indirectly, though we cast no imputations upon the gentlemen connected with the college to subvent private adventure.

5240. Have you any special recommendations to make to the Commission with regard to the education or training of the blind?—I am not an expert in the matter. There is an admirable report issued by the Charity Organisation Society, and there are also some books of Mr. Johnson's that I am familiar with. I do not think I could add anything to what I see there. I may mention this as regards administration. The Clothworkers' Company charge nothing for the administration of their blind charities. Every penny received goes to the blind; there is not a penny postage stamp, or any expense of office, or clerk, or solicitor, that comes out of the blind funds. Anybody who makes us trustees of blind charities may know that every penny goes to the blind unsweated for expenses of any sort or kind. Some years ago when Gardner's trust was founded we put ourselves in communication with one of the trustees under Gardner's will and offered to administer the Gardner's charity free from all expense of any sort if the Gardner's trustees would care to avail themselves of our administration, and we suggested that a certain number of gentlemen connected with Gardner's trust should associate themselves with a certain number of gentlemen in the position of Mr. Bazley White at Clothworkers' Hall in the administration of the fund. I believe it is the feeling that any gift which may be left to us for administration will be administered without expense, that has induced members of our court and will induce, I believe, other members of our court from time to time to make the Clothworkers' Company trustees of funds for the benefit of the blind and for other objects.

5241. Did you receive anything from Gardner's trustees in consequence of the suggestion to which you have just referred?—Gardner's bequest seemed such a munificent one, and having an organisation fit for the purpose, we thought we might be doing a public service if we offered to administer the trust, not excluding Gardner's trustees under the will. If that suggestion made through Mr. C. Mills Roche, their solicitor, had been carried out, and the trust had been administered in connexion with the Clothworkers' Company, their staff would have been placed at the disposal of the trust and it would have been administered gratuitously.

5242. What is the number of your governing body or committee?—There is a committee of management of nine members, of which Mr. Bazley White is chairman; but for practical purposes there is a small sub-committee, viz., the master and Mr. Bazley White, which manages matters of detail, *i.e.* sifts the lists of applicants along with me.

5243. (*Mr. Johnson.*) The whole 5,500*l.* arising from the charities which you have mentioned goes to the blind?—Yes.

5244. And your company is generous enough to administer those charities without charging any expenses?—Yes, we administer them free of any expense.

5245. You have told us that you have some sort of communication with other pension societies, such as Christ's Hospital?—Yes, and the Painter Stainers.

5246. Have you any communication with Day's Charity?—Yes, occasionally.

5247. I take it that you are from time to time in communication with all the large pension societies or charities, and if any doubt arose in the minds of your committee in any particular case, you would get what information you could from those societies or charities?—Certainly. From time to time I (or one of my deputies) call at the offices of those societies or charities for that purpose.

5248. Do you think there would be any objection to the publication of the names of all the recipients of pensions in all the different pension societies or charities. Do you think that would be any guidance to the trustees of the different charities in distributing their pensions?—I do not know to what extent it would be a guidance. I think it would be an assistance. I am sure of this that we, as the largest distributors of blind pensions in London, next to Christ's Hospital, would be very pleased to establish any registration with the assistance and co-operation of other institutions.

5249. Such a registration would tend to prevent blind persons getting a plurality of pensions. If there was a registration of everybody who received a pension, you would be able to spot whether a man had two or three pensions?—Yes; for our own purposes we have such registration so far as practicable. We do not withhold our pensions from people who are in receipt of pensions of a small amount, but they must not in the aggregate exceed 20*l.*

5250. The liberality of your company and the generosity with which you treat the blind are well known, and you would no doubt be perfectly ready to do anything for the benefit of the blind in the direction which I have indicated?—Certainly. I think I might say that my company would be very pleased to act gratuitously as the medium of such a registration for London.

5251. The question of the Worcester College will of course come before the Commission bye-and-by, but will you tell us whether any effort was made to put that Worcester College upon a public foundation instead of a private one?—Consequent upon a communication I made by the direction of the court to Mr. Foster, that we would, on the college being placed on a public foundation, give 500*l.*, he has intimated to me that he has another 1,000*l.*, I think, from Gardner's trustees, and the Bishop of Worcester was to convene a public meeting, appealing to persons in the neighbourhood, and generally to establish a fund of 6,000*l.*, which is the amount necessary to place it on a public footing.

5252. Have you any idea what the allowances of the guardians are to those pensioners who receive parish relief?—I find it varies a good deal. In Cornwall I think the allowance is 2*s.* 6*d.* a week, or a loaf a day. I have known it to be as much as 4*s.* or 5*s.* a week.

5253. Have you found that there are more applicants for blind pensions from Cornwall than any of the other districts of England?—It has struck me so, that would be, I suppose, from accidents in the mines.

5254. Have you found that there are any special causes of blindness in particular trades which are carried on in particular districts?—We are the Clothworkers' Company, and we take an interest in the cloth trade. Any one applying from Yorkshire or Stroud, or anywhere where the cloth trade is carried on, who had got blind in his trade, would immediately, if he had not a pension out of the funds of our blind charities, find great sympathy at the hands of the governing body.

5255. Do you find a great number of applications come from Yorkshire?—A good number, but not anything like the number from Cornwall.

5256. (*Dr. Tindal Robertson.*) With regard to the surgeon's certificate as to the causes of blindness, is it simply a certificate that the person is blind, or does it give any information as to the causes of blindness?—"I "hereby certify that I have examined the eyes of the "petitioner and find him," or "her, to be blind and "destitute of sight." That is the whole of the medical certificate.

O. Roberts, Esq., M.A., F.S.A.

19 Feb. 1886.

5257. Have you any information as to the causes of the blindness of the people who have come under your cognisance?—I am afraid I could not give any useful answer to that question.

5258. You have been asked with regard to the number of applicants that you have from different counties; you say that from Cornwall you have the largest number of applications; would Yorkshire come next in proportion to the size of the county, I mean?—I should imagine so, though I rather suspect that applications from Yorkshire are often made to our company, because we are the Clothworkers' Company. I rather attribute it to the fact of our being the Clothworkers' Company that persons from Yorkshire apply to us rather than to other charities.

5259. Have you any applications from Nottinghamshire?—Yes; I observe that there have been applications from Nottinghamshire.

5260. Have you any reason to think that blindness is caused in Nottinghamshire from the fact that the fine lace manufacture is carried on there?—I would naturally conclude so, but I only draw the inference from seeing that we have applications from Nottinghamshire, and from knowing that they make fine lace in that county.

5261. Have you noticed whether watchmakers in London who use a strong light are peculiarly liable to become blind?—I know that is a very common form of blindness. I believe that some of the trusts of the Goldsmiths' Company refer to the tendency of goldsmiths in very early days to become blind by reason of their work.

5262. With regard to persons holding a number of pensions, are you aware that there are cases in which one person holds a large number of pensions over four or five?—I know several cases in which blind persons hold pensions up to 20*l.* a year, but those cases would be jealously watched by us; we would consider the circumstances very strictly.

5263. Do you think there would be any objection to such a scheme as Mr. Johnson has suggested, of a register which might include the names of all the persons receiving pensions from different societies, and which register might be available for inspection by all the different societies before they gave their pensions?—I think it would be a most useful thing, but I should prefer that it should be done by the voluntary effort of the companies and societies.

5264. You think it would be better done by your own company and other societies in a voluntary manner, by associating together and contributing a small sum towards the expense of such a scheme, than if done by State aid?—I am sure if this Commission, constituted as it is, made such a recommendation the good sense of trustees of those societies would immediately fall in with any suggestion of that sort.

5265. You referred to what you have done with regard to scholarships at Worcester College; were those scholarships simply tenable for the time when the boys were at the college or were they tenable afterwards when they proceeded to the university?—They were tenable at the college, but as a matter of fact I think two of the young men who went to Oxford obtained scholarships by reason of their blindness mainly from the funds of the company, which were devoted to the aid of poor and deserving students. In the case of the young gentleman at Lincoln College, who made an application to the company for a grant to enable him to get special tuition suited to an unsighted person, a special grant was made to help him to do so.

5266. Are you aware that Dr. Ranger, who is a D.C.L. of Oxford, and other blind gentlemen, clergymen, and others, have proceeded to the universities from Worcester College and from private tuition?—Yes, I have known two or three instances; Dr. Ranger I know by reason of this fact: it was in connexion with him that we worked in the matter of the scholarships at Worcester College. We made him as it were the assessor of the committee in appointing to those blind scholarships.

5267. Do you not think, in future, if this scheme for making Worcester College a public institution should take root, it would be a very great advantage that either your company, or your company in connexion with others, should provide some scholarships which

O. Roberts, Esq., M.A., F.S.A.

19 Feb. 1886.

should be tenable at the universities? — I think it would.

5268. But you think your Committee would probably entertain such a scheme as that favourably if it was put before them?—A person in my position ought to be chary in answering such a question as that, but it would no doubt receive due consideration. There are many calls at present upon the Clothworkers' Company, and I can only suppose from their past action that any such application of their funds would meet with sympathy. I doubt exceedingly whether the present position of our finances would admit of any large appropriation of the funds for any purpose, however desirable, outside our present objects, but I am confident it would appear to them desirable, for the very fact of our instituting scholarships at Worcester showed the desire of the company to help the sons of gentlemen as well as of craftsmen in getting higher education, and I think I should be justified in saying that the committee would view with great sympathy any such proposal.

5269. Have you any experience as to the education, speaking broadly, which the people who apply for pensions have received, whether it is good, bad, or moderate?—Naturally I have not much knowledge on that subject.

5270. You have taken a great deal of interest in blind work; do you think it an advantage that blind children should be educated with sighted children, or would you prefer that they should be brought up in separate places?—The evidence upon that subject would lead me to suppose that blind children should, if possible, be educated with sighted children; that it would be a great advantage to the blind children in any case, and it might be an advantage to the others.

5271. (*Mr. Arrol.*) Can you say how many pensioners you have at 5*l.* and how many at 10*l.*?—We have, roughly speaking, 150 at 10*l.* and 400 at 5*l.*; at present the full amount of the income is not appropriated by reason of this fact: there was a fund derived from the sale of premises opposite the Mansion House, which have been rebuilt there, which the company reinvested in ground rents at Hackney; the money derived from the sale of the Mansion House premises was not enough by 2,000*l.* or 3,000*l.* for the purchase of the ground rents at Hackney, and therefore the company have advanced to the charity free of interest the necessary sum in augmentation, reserving to themselves the right during the next three or four years of applying the surplus income derived from the investment in redemption of this loan; therefore the full application of the 5,500*l.* is postponed for two or three years in consequence of that measure.

5272. You have been good enough to state the amount under the West trusts; can you mention the total amount you have invested of all the trusts, what is the capital sum?—I could not say what the capital sum was, because they are freehold properties in almost every case.

5273. Would your powers allow you to benefit those coming from all parts of England and Wales, Ireland, and Scotland?—Yes, I am Welsh myself, and the company the other day made a grant to the Home Teaching Society established at Bangor. I am not sure whether they charge that to the trust fund, or whether they made the grant out of the corporate funds. I think it came out of the corporate funds.

5274. You are speaking of a grant to a society; what course do you pursue with regard to individuals?—We should not give them our pension unless they were connected with the cloth trade, or unless there was something very special in the case. The locality qualified applicants are very few, but the applications of persons over 50 years of age are so numerous that we should not feel justified in going below that age, which is the age stated in the wills, unless for some very special reasons.

5275. (*Sir Henry Selwin Ibbetson.*) Did I understand you rightly to say that that there were 150 pensioners in receipt of 10*l.*?—Yes.

5276. And 600 in receipt of 5*l.*?—Yes, and upwards.

5277. What is the gross number of your pensioners?—At present they are 750. They will be many more when we have arrived at the full usufruct of our income.

5278. I understood you to say that the amount which your pensioners receive altogether cannot exceed either 30*l.* or 25*l.*, because you are bound under your trusts not to give a pension to anybody in receipt of more than 20*l.* of pensions?—Yes.

5279. You said that your company would like to be able to give larger pensions in extension of their powers?—In certain exceptional cases.

5280. That is to say that you would wish to give more than the 30*l.* in some particular cases?—Yes; if we had had the power to do so we should have exercised it occasionally, no doubt.

5281. I understood you also to say that you preferred supplementary earnings to giving a pension to a person who is not earning anything?—Yes.

5282. The question arises whether a larger amount of benefit to the general blind by a greater distribution of pensions could be arrived at. Several instances have been put before us of men in receipt of five, and sometimes six, and sometimes seven pensions, monopolising therefore pensions that might be useful for other people, supposing the amount is in excess of what they could live on?—Anyone in the receipt of two or more pensions stands a comparatively poor chance of being successful in our company. Directly we find that the applicant is in receipt of 5*l.* or 10*l.* the general tenour of the petition is very closely scanned, and an applicant with those advantages would stand a much poorer chance of appointment, *cæteris paribus*, than other persons with no pension at all.

5283. Still you would wish to be able to give larger pensions in several instances?—Of course the term poor is relative to the condition of life that the people are born in; it is to that we have reference rather than anything else.

5284. The system of registration which has been suggested would assist materially in preventing a great number of pensions being given to one person?—Yes, any registration of that sort open to the public would be very desirable, but I deprecate compulsion in the matter.

5285. (*Chairman.*) I gather from your evidence that the Clothworkers' Company have shown a disposition to assist the blind even beyond the granting of pensions; would the Clothworkers' Company have the leisure and disposition to devote itself still further to assist the blind if it were shown that it is desirable that the blind should be assisted in earning their own livelihood, by grants to provide them with stock in trade or to provide central depôts for the sale of work?—As I said the corporate funds of the Company are unfortunately entirely preoccupied. The work which we are engaged in in technical education as connected with the clothworking industry in Yorkshire and the general scheme of technical education carried on by the City and Guilds of London Institute which the Company have assisted materially, and of which I am honorary secretary, have taken our funds up so entirely that I fear it would be almost impossible that the Company could go into any new adventure, except to this extent, that if there was anything that the administrative staff of the Clothworkers' Company could be usefully employed in, which did not involve much extra expense, I think I may say that the company would be inclined to make it available.

The witness withdrew.

Mr. Henry Jackson examined.

Mr. H. Jackson.

5286. (*Chairman.*) You are clerk of the Cordwainers' Company?—I am.

5287. Will you state what you know of the pensions which are distributed by that company to blind persons, and the sums which are annually given, and describe the mode of distribution?—The charity is administered under the will of Mr. John Came, who was a member of the company, and who more than 100 years ago resided and carried on business, I believe, in Cheapside. His will (of which I have a copy before me) is dated the 12th of August 1782, just 103 years ago; and by that will he bequeathed all the stock standing in his name at the Bank of England, after giving certain annuities and legacies to the Cordwainers' Company, upon trust to distribute the dividends of that stock as I will describe. The stock altogether at that time (and it has not changed much) amounted to about 36,000*l.*, 18,000*l.* in reduced and 18,000*l.* in consols. The dividends he directed to be divided into three portions. As regards the blind, 100 blind persons were to receive an annuity of 5*l.* each; 40 deaf and dumb persons the same amount, an annuity of 5*l.* each; and 40 clergymens' widows also 5*l.* each.

5288. Were they also to be blind?—He sets out specially in his will the qualifications of all the parties. So far as regards the blind I take it that that is the only matter in which the Commissioners are interested.

5289. We should like to hear what were the terms of the bequest for the benefit of the deaf and dumb because we are equally interested in the deaf and dumb?—After certain bequests the will proceeds in this way: The widow must be a widow of a clergyman of the Established Church of England; her last deceased husband a clergyman, who at the time of his death had a settled duty as a clergyman in London, or within 20 miles; a widow having no children must be not less than 40 years of age; a widow having children unprovided for must be not less than 30 years of age; their ages must be proved by certificates; they must have a character that they are living a sober and godly life; and their petition must set forth all the above particulars, and be signed by not less than six of the principal inhabitants of the parish where the deceased clergyman did duty at the time of his death. Those are the qualifications for the clergymen's widows, and we have never had any great difficulty in finding widows answering to those descriptions. Occasionally there has been a difficulty, because of the bequest being restricted to London, or within 20 miles. We have a vast number of applications from persons, especially from Wales and other places.

5290. Have you ever diverted any of the funds to other charities?—Never. We have increased the annuities to the blind and to the deaf and dumb; and indeed there is a clause in the will which states there is to be no increase made to the number of clergymen's widows. Then in the case of a blind man or woman the man must be not less than 45 years of age; a married woman must be not less than 40 years of age; and a widow or spinster must be not less than 30 years of age, the age being proved by certificate; they must never have had any allowance or in any way received any support from any parish; they must never have begged in the streets; and they must live in London, or within 100 miles; the petition must set forth what they have to support themselves upon, or by whom, or by what they are supported; they must have a character that they are living a sober and godly life; their petition must set forth all the above qualifications, and be signed by not less than six of the principal inhabitants of the parish where they reside at the time of the presentation of the petition. That is all that there is about the blind. With regard to the blind we have never had any difficulty whatever in finding far more applicants than we have funds to provide for; we have always a very large number applying in excess of the 100.

5291. What do you do with those who are rejected year by year?—We keep a list of those who are applying year by year. In the first place they send in their petitions, and when they are found to be proper objects their names are kept in a petition book, and are every year brought forward as vacancies occur, in order that out of the number so applying the number of vacancies may be filled up.

5292. Do you take them in rotation as far as you can?—No, they are elected entirely by the votes of the court of assistants.

5293. You take them by merit, I suppose?—It is supposed to be by merit, I think I may say, because one of the rules of the company is not to allow any person to be nominated upon that list unless the person nominating that particular blind person has himself personally inquired into the case, and ascertained that the blind person is a proper object; and if he does not get that information himself he must get it from someone who has gone and seen the blind person.

5294. Do you give a preference to those who are in London itself?—No, we give a preference, if at all, to the most aged. The preference is given generally, if any preference is given, to those who have been longest applying without being elected, or to those who are the oldest.

Mr. H. Jackson.

19 Feb. 1886.

5295. Can you tell us how many of these annuitants are resident in the country and not in London?—I do not think that I have that information with me. I may say that I have sent to your secretary a list of the pensioners, and that would give you their addresses. I should think that about half are in London and half in the country, of course living within the hundred miles.

5296. Have you had any additional gifts to this Came's Fund?—Yes, we have had two additional gifts; one from two ladies of the name of Woolnough, formerly pensioners, and who, having become possessed of property, left 100*l.* to the company to distribute the dividends in the same way. That fund produces rather more than 3*l.* a year, and the way in which the company dealt with that was to add that 3*l.* to the pension of one of the oldest pensioners of Came's charity, so as to increase it to 8*l.* and some shillings; and that continues down to the present day. In another case we had a sum of something like 200*l.*, Love's gift; that consists of 265*l.* consols. It reverted to the company upon the death of some life tenant, a lady to whom the property was left for life with ultimate remainder of that particular sum to the company; and it is left to the company to deal with in the same way for the benefit of the blind. The way in which they dealt with it was to give the whole of the dividends, amounting to something like 7*l.* or 8*l.* a year, to the oldest pensioner of Came's charity, that is to say, one who had been on the list for 30 or 40 years. He takes it all in lieu of the 5*l.* which he would receive from Came's charity. Then the 5*l.* so set at liberty is given to another pensioner, who is elected in his stead. The company have since added five more pensions; those five pensions by which they have increased the number come, in fact, out of the company's own funds. Three other pensions were given to the deaf and dumb. The company for nearly 100 years used to pay the cost of carrying on this charity; and, of course, there was a good deal of work and labour involved, and it was found to be almost necessary to keep a clerk to attend to the duties, and the company used to pay that out of the funds with the approbation of the Charity Commissioners. The company thought a few years ago that there was no necessity to do that any longer, and therefore they took the total cost of the management out of their own funds, and appropriated the amount which they used formerly to pay for the performance of these duties to those donations instead, and that gave 25*l.* a year to the blind, 5*l.* each to five persons, and it gave 15*l.* to the deaf and dumb, 5*l.* each to three persons. With regard to the recipients of these charities, I think it is an open question whether this mode of dealing with the money is really the best in the world. The way in which the money is distributed is this: In November every year these annuitants are called upon either to attend personally at the Hall to receive the 5*l.*, or to forward a certificate that they are alive, and a certificate from a guardian of the parish in which they live that they have not begged in the streets or received parish relief. Of course, being blind, each one of those persons that comes to receive the money is accompanied by somebody else who in point of fact takes the money, I suppose; they come together, and we know no more about it. Now, it is quite possible that 5*l.* spent in that way may do more harm than good; at all events it may not do all the good it might do. At the same time there is a difficulty in dealing it out for the benefit of the blind person otherwise than by giving it so much at a time, and that we could scarcely do; we cannot give them so much a week. One of the difficulties that we find is that a man, having no means of subsistence excepting this 5*l.*, and being restricted from applying to the parish or from begging in the streets, when the time arrives for the payment of the 5*l.*, say in the month of October, they being paid upon the 10th of November would by every possible effort, although he was in the depth of poverty, avoid applying to the parish for relief, because if he did so he would forfeit his pension; and we have had two cases of persons being in such destitute circumstances that they were starved to death rather than apply to the parish, in order that they might continue proper recipients of these funds. Those circumstances were, of course unknown to us at the time, but we heard afterwards of the death of those two persons, and on inquiring into the circumstances we found that those persons were literally starved to death. At all events that was the verdict of the jury at the inquest; they were a man and his wife, both of them annuitants, who had 10*l.* to receive; and sooner than apply to the parish as they ought to have done (because they had no means of living), they starved.

Mr. H. Jackson.

19 Feb. 1886.

5297. Have you relaxed that rule at all since that time?—No, there is no means of relaxing it.

5298. Have you applied to the Charity Commissioners to relax it? — No, I afterwards endeavoured to get a better class of persons to apply. In the instructions that are given to persons who apply for particulars of the charity, and for leave to petition, I had at the foot this note printed: "Note.—The applicant must "have some means of support in addition to the pen- "sion." That forms no part of the directions of the will; but I have found that of great use; for since this note was appended to the instructions we have got rid of a number of applicants who would really not be proper persons in my opinion certainly, and possibly in the opinion of our court to receive those pensions. A man says: "I make mats, or I do something or other." I say, "If you have got 5*l.* from another charity of this "class, then I think you would be a better object for "this charity than you would be without it. I think "that this fund is very useful to supplement your in- "come if you have an income, but if you have no income "at all, I think this will be of no use to you whatever. "The probablity is that you will take that 5*l.* in the "month of November, and it will be of very little use "to you when you have got it, and you will be depriv- "ing some one else of it to whom it might be of "service."

5299. Have you ever found that the result of giving the 5*l.* in one sum has been that the money has been spent rather recklessly after it has been received?—I have no positive evidence of that, but I have a strong suspicion that that would happen in many cases from looking at the pensioners when they come, and the parties that they bring with them. A blind man comes, and another more active person comes with him, who seems to take the entire control; he signs his name, or he makes his mark in our book acknowledging the receipt of the money, and they depart together. It is quite possible that they may go to the first public house and spend half the money, and so far as I can see there are no means which we could devise by which we could control the money afterwards. That does not apply to the deaf and dumb, or to clergymen's widows; they are a better class of people altogether. The deaf and dumb who come are an exceedingly respectable class of persons, and they are as a rule tolerably well educated, and they manage somehow or other to get through the duties of life with much less difficulty than a blind man. A blind man seems more lost to everything, and especially the blind men that we have, because they are mostly aged persons who have not been brought up and taught, as blind persons have been of late years, various modes of gaining their livelihood, but they have been taught nothing whatever.

5300. Have most of them been blind from early years?—I should say that the greater number of them have; I think I have specified in some of the applications how long they have been blind. In the year 1881 we had 39 applicants for five vacancies. Of those 39 one who lived at Pimlico was 46 years of age, and had been blind for seven years. Another who lived in Great Coram Street was 52 years of age, and had been blind for 42 years. Another one who lived in Wiltshire was 47 years of age, and had been blind for three years. Another one who lived in the Kent Road, was 50 years of age and had been blind for three years. Another one who lived at Hackney was 47 years of age, and had been blind from birth; he was organist at the City of London Union Workhouse at Holloway. Another one who lived at Edmonton was 64 years of age, and had been blind for 32 years. Another who lived in Tottenham Court Road was 48 years of age, and had been blind for 40 years. Another who lived in Rotherhithe was 55 years old, and had been blind for 27 years. Another was 51 years old, and had been blind for 30 years. Another who lived in Harrow Road was 46 years of age, and had been blind for 42 years. Another who lived in London was 56 years of age, and had been blind for 42 years. Another who lived in London was 55 years of age, and had been blind for 42 years. Another who lived in London was 55 years of age, and had been blind for 28 years. Another who lived in London (these are nearly all persons who live in London) was 47 years of age, and had been blind for 12 years.

5301. Do you examine into the particulars each year?—Every three years a party presents a petition, and if he is not elected within three years he is required to renew his application with a new statement if there is anything to add to it.

5302. But are those who are on the list of pensions viewed from time to time?—Those who are on the list of pensions are only seen once a year when they apply for the pensions; and if any circumstances come to our knowledge, or if anything occurs that requires any inquiry at all, we then inquire into it. We have struck persons off on the very day that they came to receive their pensions in consequence of information that we have received.

5303. Do you make any inquiries from their neighbours or fellow parishioners?—We do not make any inquiry actually unless it comes in some manner altogether outside and beyond our inquiry. We summon the people to attend, and if they do not answer we go and look after them and see what has become of them. If we have any information given us that they are not fit objects we send to make inquiry on the spot.

5304. How do you know that they do not beg from year to year?—We get a certificate from the guardians.

5305. Do you also communicate with the Charity Organisation Society?—Very little. We have done that occasionally, but we have never found much use resulting from that.

5306. You have always satisfied yourselves that a man has not been begging or in receipt of parochial relief from year to year?—Yes, that is a *sine quâ non* before we pay the money.

5307. Will you now proceed with what you were going to tell us about the deaf and dumb?—In the case of the deaf and dumb the arrangements are very similar as to their fitness for the pensions.

5308. Are the arrangements entirely similar? —The ages are a little different. They must be both deaf and dumb, and not dumb only, the men being not less than 40 years of age, and the women not less than 25 years of age, that is our rule. The ages are proved by certificate; they must never have had any allowance, or in any way received any support from any parish; they must live in London, or within 100 miles, and they must not beg in the streets. It is just the same arrangement, in point of fact, as in the case of the blind. They must have the signature of six of the principal inhabitants of the parish where they reside. The terms of the will are very strict; the words are: "My will and desire is that no per- "son may ever receive any part of these benefits that are "in any way wanting in any one of these qualifications;" so that we have no power to depart from those terms. The number of clergymen's widows is not to exceed 40. As Mr. Came did not know what the dividends would be, the number of blind recipients and the number of deaf and dumb recipients must depend upon the sum of money which will remain unprovided for after all the before-mentioned legacies are paid.

5309. What are the numbers at the present time?—It used to be 40 deaf and dumb and 100 blind; we have now made it 115 blind, and 48 deaf and dumb, considering that the blind were more in want than the deaf and dumb. It would be rather a difficult thing to carry out an annual visitation of all these people, so far as our company is concerned, having regard to the fact that some of them live a long way from London; and we endeavour to get the information, so far as we can, by sending them a written notice when the money is payable, requiring them to get the minister of the parish to certify that they are living, and the guardians of the parish to certify that they have not received parish relief. That being so it is open to the clergyman to make any observation that he chooses to make, and if he thinks that the party is not a fit object it would be his duty to say so.

5310. Do you get information as to their moral character?—Not when once they have been elected, unless we get information that leads us to make inquiry, in which case we do make inquiry of the parties themselves. The master and four wardens attend to distribute these pensions on a given day, and each person, if he is well enough, is expected to attend; if not he sends someone who brings a certificate that he is alive, and that he has not begged in the streets, and that he has not received parish relief; and we then inquire of the parties from time to time when they come up what they are about, and how they live, and so on.

5311. Can you tell us from those inquiries how many of them are able to earn anything by any trade?—I should say not one-third of them. The greater part of our annuitants are elderly people, and I should think that they get very little from any trade. Some of them get something from their friends; I do not think that they earn much themselves; but many of them are also recipients of pensions from some of the other city companies, and from other sources of donation for the blind. I think the parties that we get (the annuities being small) are generally of the worst class and not of the best class.

5312. Do you lay down any limit at all as to the amount of pensions that they may receive in addition to yours?—No, we do not, but some of the companies do; several of the companies, I think, limit it to 20*l.* When a party applies in that way I say, "Well, have you any "other annuity? If you get our annuity, and it will "bring up the amount that you receive to over 20*l.* "you will lose the Clothworkers' pension;" but I fancy notwithstanding that that the parties do not always communicate to the other companies that they have that amount.

5313. Do you think that there is a want of communication between the various companies and institutions in order that they may be certain that a person does not receive more than is necessary for him?—Yes, I think that the parties who come themselves when they apply conceal the facts as far as possible: they do not tell you truly what they have got. But since I have put this note at the foot of the instructions, we do get some information as to what they have got, because a blind man applying fancies that the worse he makes out his case to be the more likely he is to succeed, wherens I endeavour to make him understand that it is just the reverse. If a man has nothing whatever to live upon I consider that he is not a fit object for our charity, and I should object to his being a petitioner at all.

5314. You encourage them to earn their own livelihood as far as you can?—Yes, by some certain means, not merely haphazard.

5315. Do you ever give money specially for the purchase of materials for work or stock-in-trade?—No, we have never done that.

5316. You do not interfere with the application of the money?—We feel a difficulty in doing that, because we are bound by the will to give the pension to the party who is elected. No doubt a great deal of good would be done if you could follow out the result of the pension, and see that it was applied in some way. That would require a reconstruction of the whole charity.

5317. Does your company devote itself principally to this object, or have you other objects which take up a good deal of your time?—This is a very small part of the work that I have to do for the company. It takes up a certain amount of time.

5318. Would your company be willing to co-operate with the other companies in order that a better system of registration of the blind and of those who receive pensions as blind should be carried out?—I see no reason why they should not. Of course I could only put that before the governing body, and ask them to consider any proposition of that kind that was made to them. So far as my judgment goes I see no possible objection to it, and I think it would be really desirable that there should be such co-operation.

5319. From your experience have you any views as to the best way of getting sale for the work of the blind?—No, I think not; that does not come within my province to consider. Possibly these charities, so far as they go, might be made more widely known. There are possibly very proper objects scattered over the country who never hear of them at all.

5320. Do you advertise?—We do not, because we have so many applications; but a few years ago a case of that kind occurred within my own knowledge. I was at a village in Warwickshire, and I saw a very nice, clean-looking cottage, and a woman very tidy, and cleanly dressed sitting at the door. I was struck by the cleanly appearance of the place, and of the woman; she was a woman over 60 years of age; and I spoke to her, and to my astonishment she told me that she was quite blind. I said, "How do you live?" "Well," she said, "my children have grown up and gone away." I asked her how long she had been blind, and I think she said she had been blind for 30 or 40 years. I said, "How have you been supported all this time?," and she said by some of my children who have gone away and "married, and now only by one who lives with me still "and supports me." I said, "What are you going to "do if he leaves you? She said, "Oh, dear me, that "would be a very sad day for me; he may marry and "go away, and I shall have nothing." I said, "Are "you aware that there are charities in London which "are specially suitable to your case?," and she said No, she had never heard of them. I said, "Is there a "rector or clergyman of this parish?" She said "Yes." I said, "Did he never mention anything of the kind to "you?," and she said that she had never heard of anything of the kind. I said, "Would you like to have "an annuity? Give me all the particulars." I made inquiries, and I found that it was one of the most deserving cases I ever met with. This was about two months before our election came on. In consequence of meeting this woman casually in this way I put her name down, and she sent down a petition, and it was sent in, and she succeeded in getting this 5*l.* a year; but at the same time feeling as I did that that would not support her unless she could get something more, I made an application to the Painter Stainers' Company, and I found that there were several vacancies, and that there were pensions of 10*l.* vacant; and I succeeded in getting her a 10*l.* pension as well, and now she has 15*l.* a year for life. The woman is extremely grateful for it; it is the salvation of he position as regards her future maintenance. This woman was in every possible way within the meaning of every one of the blind charities; but she had never heard of them. Any means of making them more widely known would be a very good thing. That was one instance that occurred to me as a total stranger passing through the village, and being attracted by the poor woman's appearance.

Mr. H. Jackson.

19 Feb. 1886.

5321. Are there any counties from which your annuitants come specially?—No, I think not; I think that if you take the radius of 100 miles there is no particular part of England which they come from more or less. I think what your Lordship suggested would be a good thing if the companies were more in communication with one another. I have thought that for a long time, because it is quite possible that the applicant may go from one to another and get a pension from each without our knowing anything about it.

5322. (*Admiral Sir E. Sotheby.*) Does your corporation give grants to blind people independently of the blind trust which they administer?—They do not. They give away a good deal of money in one way or another, but not specially to blind people. They subscribe to some of the blind charities, such as the Indigent Blind Visiting Society, and the Protestant Blind Society, but they do not take any interest otherwise in it.

5323. Can you say how much you give away to blind charities in the year out of your common funds?—Not a vast deal, perhaps 20 or 25 guineas.

5324. Do you give to any particular institution or blind charity?—I know that we have given to the Protestant Blind Pension Society; I do not recollect another one.

5325. But that is merely as a grant?—That is merely as a grant. Petitions come to us by basketfuls every week; we have all sorts of applications.

5326. You have only given to the Protestant Blind Pension Society and to the Indigent Blind Visiting Society?—I do not remember any other one.

5327. You give your pensions only annually, I think you said?—Only annually, in the month of November.

5328. Would it not be an advantage to the blind if you paid them monthly?—Possibly it might, but I do not know that we could do that, because they are entitled to the whole 5*l.*

5329. But if they got the 5*l.* within the year it would come to the same thing, whether they received it all at once or whether they received it in instalments, would it not?—They might never get it. Supposing that the payment became due in November, and the man got 1*l.* then, and he died in December, he would lose the other 4*l.*

5330. Then it might go towards his burial?—Amongst our own pensioners, of whom we have a very large number, we have persons who have been old freemen of the company who have become blind. In one case, which I remember, a man not only receives a blind pension, but we give him 10*l.* a year besides.

5331. You pay them all annually?—Yes.

5332. The reason why I ask that question is, that I know one institution which pays monthly, and it is of the greatest benefit to the blind people in the way of helping them to clear off their rent, or something of that sort?—I quite agree that anything that would tend to make the money more certain to be usefully employed would be an advantage.

Mr. H. Jackson.

19 Feb. 1886.

5333. As you say, now one half of it very likely goes to the grog shop?—Yes, I have always seen that difficulty, but I do not see how consistently with the will one could remedy that, it would require a large staff. In fact under the directions of this will we should be bound to give the money to the party elected all at once. With regard to one question that his Lordship asked, whether we ever did anything to enable a man to earn his living, I think in one case we did give a grant to a man to buy a mangle.

5334. Do you think that it is a good thing to give these pensions as a supplement to a blind man's wages?—I do not put it in that way exactly. If a man is not able to work at all I do not think that one of these pensions would do him any good; but if a man is able to work and get some wages, I do not see any harm in his having 5*l.* additional, although you may say that he is not absolutely in need of it. In the case, for instance, of a blind organist (which is a very common thing) who has 30*l.* a year, 5*l.* a year is a very great assistance; to that person it would make the difference between very slender means, and possibly, some few superfluities.

5335. Have you any knowledge how much blind people earn by being organists?—I think that 20*l.* a year would be the least that an organist would get; some would get 30*l.* and some 40*l.*

5336. What do you think would be the maximum?—I should think that 40*l.* would be the maximum. It would be only in small parishes that they would have a blind organist; they would not have a blind organist in a place like Westminster Abbey or any cathedral church.

5337. (*Mr. Arrol.*) I think you have stated that the certificate that you get every year in the case of your recipients, is given by the clergyman of the parish, and it states that they have not received parochial relief, and are not beggars?—Yes, it is certified not only by the clergyman of the parish, but by one of the guardians of the poor for the district.

5338. That being so, do you think that your court could not accept that as sufficient guarantee for the man being alive, and wanting to get his pension through a banker in the place where he resides, or through the post office?—He does get it through a banker in that way if he sends his certificate. If he wants to get the money through a banker, he would go to the clergyman and get him to certify that he was alive, and then he would go to the guardians, or to the churchwardens, and get them to certify, not only that he was alive, but that he was a fit object, and that he did not receive parish relief. I am sorry to say that clergymen certify almost anything. I have said to one of the parties: "How came the clergyman to sign this? He certifies "that he has seen you and knows all this; did he see "you?" And the answer has been: "No, I sent it to "his house, and he signed it." Then I said, "He has "signed what is not true; he has signed that he knows "you are an inhabitant of the parish;" and the man to my knowledge had not been in the parish a month. I said, "Did he know you personally?" "No," he said; "but he made no objection to signing it." "Well!" I said, "That clergyman, I think, has not done his "duty." But we are subject to that difficulty, especially where the party resides in the country. In that way, we might be imposed upon. I may say that I do not know of a case where a party has ever been certified to be alive when he was dead.

5339. I thought you had expressed the opinion that it was necessary for the recipient to apply personally?—He has to apply personally unless he lives beyond a certain distance from London. Of course, to bring a blind man 50 miles to London to receive 5*l.* would be taxing him very heavily. We prefer their attending if they can do so, but a man may be bedridden and unable to come up; and then we ask the blind person to sign a request appointing somebody by name to receive his pension; and we require the clergyman to attest the mark of the blind man to that person being appointed, so that there may be no mistake that the blind man has nominated some person to receive his pension for him. Then the difficulty is that the clergyman unfortunately does not always see the blind man sign this; so that somebody takes the paper and fills in his own name and takes the money, and the blind man may never get a shilling of it. That is one difficulty, but otherwise it seems as a rule to act pretty correctly and properly. Then there is another thing that I ought to mention. We strike a blind person off the list if she marries. If a blind woman marries, we require the case to be investigated afresh, because she may marry a person who is in a position to maintain her.

5340-5341. (*Dr. Tindal Robertson.*) Do you require medical certificate as to the blindness?—We have a medical certificate in every case that it is total blindness.

5342. But in the case of every application made to you, do you require a medical certificate as to whether the person applying is blind or partially blind?—Undoubtedly. Applicants would not be placed upon the list for election unless they furnished a certificate from a surgeon that they are totally blind. We have had applications from persons who were nearly blind, who could only see a little. There is a medical certificate in every case before a person is allowed to petition: "I certify that I have examined the petitioner, and that "he is totally blind."

5343. Is there any statement as to the causes or the character of the blindness?—No, the surgeon does not state anything except the fact of the petitioner being blind, but the petitioner himself sometimes states the cause of his blindness. It may have been suddenly produced; we had one case of blindness caused by an explosion on board a steamboat.

5344. From your large experience in these cases, have you formed any opinion as to the effects of certain trades upon the causation of blindness?—No, I have not; that is not a matter which I have gone into at all.

5345. You stated in answer to one of the Commissioners that you wished the blind persons to have a certain sum before you would recommend that they should have a pension from your charity; do I correctly understand that if you had two cases, in the one case that of a person earning his living as far as he could by himself, and in the other case that of a person who was receiving a pension from some other society, you would rather give the preference to the man who received the pension and who therefore had a certain means of living than to the person who was trying to get a living but about whom it was uncertain whether he might get it or not?—That is the view that I take as to the better course to be adopted. If I had a large number of applicants I should give the preference to those who had some certain means or income.

5346. That is to say, you would prefer a man who had a pension to a man who was trying to earn his living, and doing so to a certain extent?—Yes, as a rule, but there might be exceptions. The other day we had the case of a costermonger who earns his living with a barrow about the streets; that man was elected, and he had no certain means of living. But as a rule I would give the preference to a man who has got 5*l.* from another charity as a certainty, or who has a little annuity of his own, or has some person to support him.

5347. Is that the opinion of your court, and do they act upon it as a rule?—I think they do, but it hardly comes before the court, because I stop the petition if the applicant is not a proper object. When a person applies, I say, "Have you anything to live upon." Perhaps he says, "Nothing at all." I say, "How do you live"? He answers, "A friend gives me a shilling or two." I say to that person, "You have no regular "means of support, and ought to go to the parish."

5348. Supposing he was to tell you that he earned 5*s.* or 6*s.* a week what would you do?—If he showed me that he was earning 5*s.* or 6*s.* a week, and that that was likely to continue, then I should not object to him. We had a man in that very position, a man in the employment of one of the stained glass works; that man was earning 17*s.* or 18*s.* a week, and as long as he was able to earn that he came within the requirements. The objection that I have is to a person who has no certain means of living at all. A man who goes about the streets with a barrow may or may not earn something; it is very doubtful to me whether he would.

5349. You said that you thought that it would be a good thing if there was a register for the whole of these pension societies; but if there was such a register, especially if it was established as a permanent thing, and at the voluntary cost of certain people, or at the cost of the societies themselves, might not they also with great advantage undertake the publication of all these matters to the general outside public, many of whom, as you say, are of the very poorest, have no cognizance at all of these pensions, and how they may be obtained?—There would be no harm in that. The objection that would possibly be made to it would be that it is not necessary, inasmuch as the applicants are always largely in excess of the pensions.

Mr. H. Jackson.

19 Feb. 1886.

5350. Does that meet the case of those who are the most necessitous? You may have applicants in excess of the pensions, and yet those applicants may be better off than a great many who do not know anything at all about these blind pensions?—I think that anything that would tend to make the thing more completely known would be advantageous.

5351. Do you no think that such a registration as I have suggested would accomplish that end?—It would help it. There is one thing that I should like to mention here. I thought that one of the observations made by the Chairman went in the direction of suggesting that it was desirable that the various companies and bodies who have these pensions to give away should furnish each other with a list of the names of the pensioners; that I think would be a very good thing.

5352. That is the Chairman's point with regard to this matter; but in addition to that might there not with great advantage be some registration society which would make the information with regard to the pension more widely known, especially amongst the very poorest?—I do not see any objection to it, but the difficulty that I see about it is how you would propose to do it.

5353. (*Mr. Johnson.*) Do you think that your company would have any objection to publish a list of the pensioners, in the same way as the Gardner Trust had published the names of the persons who receive pensions from them?—I should think they would not have the least objection.

5354. It would cost something, but they would not mind that?—They would not mind that.

5355. Do you not think that if all these city companies and pension societies were to print a list of their annuitants every year, it would render co-operation much more easy amongst the societies?—Yes, I think it would.

5356. Do you think that if such a plan was initiated your company would fall into it?—I believe they would readily do so.

5357. Do you pay your annuities by warrants, or must the annuitants apply in person?—We pay them in person, as far as possible, in money, handing over five sovereigns at a time.

5358. But do you not pay the money by warrants to those who live in the country?—No, certainly not. Our intention is to pay them all in person. The master and wardens attend, and the 500*l.* is upon the table, and they either pay the money to the actual pensioner himself in person, or to his nominee. There are a few instances in which some one that we may possibly know requests that the money may be sent to a particular party in the country, or through a bank. In that case on the following day I send the 5*l.* in a registered letter to the person, and I get his acknowledgment.

5359. You stated just now that there were several organists that applied for pensions; can you give us any idea of the per-centage of organists?—I should say that so far as the organists go their number is very small indeed. We have had applications from organists.

5360. Are there many of those who are following the profession of music?—I only know of one on our list.

The witness withdrew.

Mr. W. P. Sawyer examined.

Mr. W. P. Sawyer.

5361. (*Chairman.*) You are clerk of the Drapers' Company?—Yes.

5362. Will you state what pensions you give away to the blind, and what sums are at your disposal for that purpose?—The Drapers' Company administer one charity for the blind, Jonathan Granger's charity. The capital sum held by the company is 4,674*l.* 10*s.* 6*d.* consols, standing in the name of the Paymaster-General of the Court of Chancery. The income is 140*l.* 4*s.* 8*d.* That is distributed every alternate year amongst 14 blind persons, one of whom receives 10*l.* 4*s.* 8*d.*, and the other 13 receive 10*l.* each.

5363. What do you do the next year?—The next year the income goes to an apprenticeship charity.

5364. That we need not inquire into?—The application of the money is regulated by an Order in Chancery made a good many years ago.

5365. What are the qualifications which you require?—The primary qualification is the total blindness of the recipient; but we make inquiries into their character and desert.

5366. Do they continue to receive the pension through life if their characters are good?—They do.

5367. Is the receipt of parochial relief a disqualification?—By the terms of the trust it is not a disqualification; but it has not been the custom to grant a pension to persons who are in receipt of parochial relief. The question is always asked of candidates whether they are or are not in receipt of parochial relief.

5368. Do you give pensions to those who are in receipt of other pensions?—Yes; we do not decline to give pensions to candidates who are in receipt of other pensions. We inquire exactly what their income is, from what sources it is derived, and what relatives they have in a position to assist them.

5369. Do you have any communication with the other companies who give pensions?—No, it has not been our practice to communicate with the trustees of other pension charities.

5370. Do you think it would be desirable that all the pension charities should communicate with each other for the purpose of knowing exactly to what extent pensions might possibly overlap?—I think it would be a very good plan if the trustees of the different blind charities were to exchange lists of pensioners.

5371. It might easily be done, might it not?—I should say that it might be done very easily.

5372. And you would have no objection on the part of your company to do it?—Not the least.

5373. (*Mr. Johnson.*) The 4,674*l.* consols is no part of Mr. Jonathan Granger's will, is it?—It arises from the fund left by Mr. Jonathan Granger.

5374. But he left 1,000*l.*, did he not, specially?—Yes, I believe he did. His will is rather complicated in terms. He originally left a life interest in the funds to his relatives, and then he left sundry bequests, and then there was a residue which was to be applied partly for the blind and partly for apprentices.

5375. Then the blind pensions of 10*l.* a year that you get from this 4,674*l.* are not given every year?—Every other year.

5376. Then it is only a grant for the one year?—It is a grant for the one year in which it is given.

5377. Then it lapses the next year, and it is taken up again the year after?—Yes.

5378. Therefore, it is not a continuous pension; it is an alternate continuous pension?—Yes.

5379. (*Dr. Tindal Robertson.*) You have 14 pensions to give away every second year; what is the average number of the applicants for those pensions?—We had a distribution this month. There were 83 applicants, and, strange to say, there was not a single vacancy; it is the first time that such a state of things has occurred in my experience. The whole of the 14 pensioners who were appointed in the year 1884 were living and in need of the charity in 1886.

5380. No death having occurred?—No death having occurred at all.

5381. What means do you take to make the existence of your pensions known?—The existence of the charity is very widely known, and it has not been found necessary to take any means such as advertising to make it known. For instance, as I say, we had 83 applications last month.

5382. Do they come from London or from the country?—From London and the provinces.

5383. Do you know in what way the existence of this charity becomes known?—I am under the impression that the particulars of the charity are published in some of the charity record books. There are two or three books widely circulated which give the general particulars of most of the charities.

5384. In what way do you judge of the merits of the candidates; do you take them upon their merits in giving these pensions?—Entirely.

5385. Do you give any preference to those who try to help themselves by working at some kind of trade?—The general circumstances and necessities of the appli-

Mr. W. P. Sawyer.

19 Feb. 1886.

cants are taken into consideration; and if they can show that they have been prudent and have tried to help themselves, that certainly would be considered a point in their favour.

5386. Would the fact that a man is doing some kind of work for himself, and that he is to a certain extent self-dependent and self-reliant, influence your committee in giving him a pension in preference to a man who was not making those efforts, and who was simply leading a life of absolute idleness?—It would, provided of course that the first man was not earning sufficient to support himself.

5387. (*Mr. Arrol.*) Would you object to a pensioner having a pension from another society?—No, we should not. It has occasionally happened that we have given these pensions to persons who have been in receipt of pensions from other societies.

5388. Would there be any objection to the pensioners selling articles or playing musical instruments in the streets?—I think that we should more closely scrutinise the case of a man who confessed that he was a street seller, or that he gained his living in that sort of way. We should be inclined, perhaps, to look upon him with some suspicion. We always ask the question whether a man begs or sells in the streets.

5389. Do the benefits of your society extend now beyond England?—They extend to England, Wales, Ireland, and Scotland certainly, but not beyond the limits of the United Kingdom.

5390. (*Admiral Sir E. Sotheby.*) Does your corporation give grants independently of this blind trust to blind people?—They have helped and do help some of the public charities for the blind.

5391. Can you say to what amount annually?—No, I am not prepared with that information now, but I could let the Commission know afterwards.

5392. (*Chairman.*) Does the amount vary from year to year?—It does, the company grant annual subscriptions to one or two charities for the blind, and they grant occasional donations to other charities.

5393. (*Admiral Sir E. Sotheby.*) Are your pensions paid annually or monthly?—The pensions are paid every second January.

5394. In a lump sum?—In a lump sum.

5395. Do you find that the best plan?—It is the plan that we are directed to adopt by the will of the founder.

5396. (*Chairman.*) How many vacancies have you generally?—We had none last month. In 1884 there were four vacancies.

5397. You did not mention the ages at which the pensioners are generally elected?—A preference is given to people of advanced age, but there is no particular qualification laid down in point of age.

5398. Three or four vacancies, I suppose, is about the average?—Yes.

5399. Were all those 83 cases inquired into?—They all had to fill up forms, which had to be signed by the minister and churchwardens of their parish, and in nearly all cases they have, in addition to those forms, forwarded testimonial letters from persons who are prepared to testify to their circumstances.

5400. Then those people would not apply again for another two years?—They would not apply again for another two years.

5401. Supposing that a man dies within the prescribed period, do you have an intermediate election?—No, we should have no authority to distribute anything.

The witness withdrew.

Mr. Walter Sherburne Prideaux examined.

Mr. W. S. Prideaux.

5402. (*Chairman.*) You are clerk of the Goldsmiths' Company?—I am.

5403. Your company distributes pensions to the blind, does it not?—It does.

5404. Will you state their number and amount?—Yes. Perhaps I ought to separate those pensions of which the company are trustees from those which they give away voluntarily out of their general corporate property. There are only two blind charities of which the company are actually trustees. One of them is under the will of Rachel Farmer, who died in the year 1817, and who left 1,000*l.* 4 per cent. consols to the Company, upon trust, to pay the same to 10 poor blind men, or women, as often and in such sums as they should think proper. Until the year 1875 the interest of that sum was paid away to 10 people in sums of 4*l.* per annum each; but in the year 1875, when the Goldsmith's Company first established the voluntary pensions, which I shall mention presently, it occurred to them to reconstitute in some measure this charity; and with the assent of the Charity Commissioners they altered the 10 pensions of 4*l.* per annum each to two of 20*l.* per annum each, and those two pensions will be so paid in the future. It is not very material, perhaps, but I may mention that at the present time only one of those pensions of 20*l.* is paid, because we wish to allow the five persons who were holding pensions of 4*l.* per annum to die off; and at the present time there are five persons each receiving 4*l.* per annum, and one receiving 20*l.* per annum under that charity.

5405. Are the other charities solely given by the company?—No, there is one other charity of which they are trustees. Under a deed and the will of Mr. Harry Osborne Cureton there is what is known as Cureton's charity. In the first instance by deed dated the 9th February 1838, Mr. Cureton transferred 3,000*l.* three and a half new per cents., subject to his life interest, to the company, upon trust out of the dividends to pay to five poor blind persons 20*l.* a year by half yearly payments; and he constituted the company the trustees under the deed. Mr. Cureton subsequently by his will, dated the 19th July 1848, and which was proved in 1858, bequeathed to the Goldsmiths' Company a further sum of 2,000*l.* consols, which was reduced by the payment of legacy duty to 1,800*l.* consols; and he stated in his will that he did that because the original sum of 3,000*l.* would not be sufficient to pay the five pensions of 20*l.* a year each mentioned in the deed; and he directed that out of the dividends of the 1,800*l.* consols the company should make up those five pensions to the full sum of 20*l.* a year each; he gave certain small fees to the wardens and clerk, for the trouble involved in administering the trusts, and he gave the surplus to the Goldsmiths' Company for their own use. The company have never accepted the surplus, but they distribute the whole of the funds amongst the pensioners; and at the present time, instead of the original number of five pensioners we have seven, and they exhaust the fund. Perhaps I might mention also that Cureton's charity was subsequently remodelled in the year 1868 by an Order of the Charity Commissioners. The material parts of the order are these: in the first place the income of the charity is to be received by the Goldsmiths' Company and applied by them towards the support and assistance of poor blind persons residing in the county of Middlesex, including the cities of London and Westminster. It is limited to the county of Middlesex. Then in selecting the recipients the Goldsmiths' Company are to have regard to their qualifications, and to give the preference in this order: (firstly) to freemen of the Goldsmiths' Company who are of the craft of goldsmiths or silversmiths, (secondly) to other freemen of the Goldsmiths' Company and their widows, (thirdly) to freemen of the city of London and their widows; and lastly to other poor blind persons residing in the county of Middlesex. That is the scheme under which Cureton's charity is now managed. There are other provisions with regard to discontinuing the pensions in case of misconduct on the part of the recipients.

5406. Are the other pensions on the same lines?—The pensions which the Goldsmiths' Company have voluntarily established are also very much upon the same lines, except that in the case of those pensions we take in the five home counties, and we do not confine them to Middlesex. Prior to the year 1875 the Goldsmiths' Company had been for many years in the habit of appropriating 50*l.* per annum in small sums to indigent blind persons. The company had also sometime previously established during the pleasure of the court 10 pensions of 20*l.* each. In that year they reconsidered the question generally, and they reconstituted Rachel Farmer's charity, as I have mentioned, and established voluntarily 18 more pensions of 20*l.* per annum each. Those 18 pensions were subsequently again increased by 10 more; so that at the present time the Goldsmiths' Company administer, in addition to Cureton's charity, 40 blind pensions of 20*l.* per annum each, 38 of which are voluntarily given out of their corporate funds, and are given during the pleasure of the court.

5407. Will you state whether there is any limit as to age or qualifications?—There is no limit of age in regard to those pensions.

5408. Have any of these pensions been given to blind persons who are able to work and who require assistance to enable them to supplement their earnings?—Yes, that is one of the objects that the company had in view. They felt that there were some cases in which although the blind may have been able to achieve a certain amount of success in a trade or craft, still they must be always under some disadvantage, and that these pensions might just help them to overcome that disadvantage.

5409. You make no limitations where you give a pension as to the application of it?—No, we do not.

5410. Whether it is for the purchase of materials or anything of that kind?—Not necessarily; in certain cases if we found that it was desirable we should do it; and I have frequently myself undertaken personally the application of the fund, and spent it in that way; but that would be only in special cases.

5411. In your experience do not the blind after they have left the institutions in which they have been trained very often require assistance to start them in life before they can earn their own livelihood and get a living by selling the goods that they make?—Quite so.

5412. Have you ever given any of these pensions for a limited number of years on that ground?—No, I think not, because in such cases as those where we have seen that it was merely likely to be a temporary want, we have given a donation; and these pensions we usually give to people whom we consider likely to be permanently in want.

5413. Those persons would be generally either suffering from old age, or from infirmities which would prevent them from working at all?—Yes.

5414. Besides these donations can you tell us what amount you have given in pensions during the last 10 years?—I am afraid I cannot do so now, but I could easily supply that information to the secretary afterwards. Of course we have also given considerable donations from time to time to blind institutions; it has been more in that way than in any other.

5415. Have you assisted in any of the efforts that have been made to start a central depôt for the sale of work, or for starting workshops in which the blind could be employed together?—Yes, we have contributed to those. We have assisted also the Royal Normal College at Norwood, and many other institutions of that kind.

5416. In fact the object of your company is not merely to give pensions, but to assist the blind in whatever way you think best?—Certainly.

5417. From your experience of the charities for the blind in London, do you think that they work together as much as they should, that is to say, have they intercommunication of information with regard to the blind and those assisted by them?—Perhaps not. I think it might be better if there were more intercommunication in that way.

5418. Would you be willing to communicate with other institutions and companies the names of your annuitants?—Certainly, I should see no objection to it at all. After we have once given a pension of this kind it is quite competent for the pensioner to go elsewhere and get other pensions, and then perhaps get relief from five or six different blind charities, and we should not necessarily know anything about it.

5419. And you have no check upon that?—We have not. Of course if it came to our knowledge that a pensioner had three pensions we might discontinue our pension, and it has only been in rare instances, I am happy to say, that we have discontinued them in case of misconduct.

5420. Do you make inquiries year by year as to the condition and position of your annuitants?—Not every year; I review them from time to time.

5421. Have you anyone who acts as your almoner in that way, or do you yourself enter into the question so far as you are able; I act as almoner, that is to say, the payments are made through me, and every detail comes before me, but we have a special officer whose duty it is to make personal investigation both into the circumstances of blind applicants and also into the circumstances of other applicants.

Mr. W. S. Prideaux.

19 Feb. 1886.

5422. Then that officer would visit all applicants within the radius of London, or Middlesex, I suppose?—Yes, or even further, if necessary.

5423. And in other counties you, I suppose, get the best information you can from the minister or clergyman, or from the guardians, is that the case?—That is so; but when a pensioner is first put on the pension list, that is to say, when he first applies, his case is never gone into until our officer has made personal investigations, even if it envolves a railway journey we send him down to make personal investigations. I have here the form of application which we require them to make, and which has to be vouched for by the minister and by householders.

5424. And I presume that a medical man also states the nature of the blindness and the state of the patient?—Yes, there is a medical certificate attached. The applicant must be totally blind.

5425. (*Mr. Johnson.*) What is the total number of pensioners?—There are seven under Cureton's charity, and there are 40 others.

5426. Forty-seven altogether?—Forty-seven altogether, all of 20*l.* per annum.

5427. Then the Farmer Charity is included in the 40?—Yes.

5428. As I understand, the company give 38 pensions, and the other two are made up from what was left by Rachel Farmer?—Quite so.

5429. Have you many other applicants except freemen?—Oh, yes. The number of freemen is only one or two, I think.

5430. Of course, they have the priority?—Yes, but it so happens that we have only one or two freemen.

5431. Can you relieve any other case except in the counties of Kent, Surrey, Essex, Hertfordshire, and Middlesex?—No.

5432. Your pensions are confined to those five counties?—At present they are, and we find that we have quite enough to do in those counties. In point of fact I may say that at the present time we have a list of 70 applicants waiting for the first vacancy, and we have been obliged to decline to entertain any more applications at the present time.

5433. Those pensions are granted, I suppose, entirely at the pleasure of the court?—Entirely.

5434. Have you any experience of people having more than one pension?—Yes, I know that it is so in some cases.

5435. Is that any bar to your giving them a pension?—No. When they come to us they may, perhaps, have 5*l.* a year, but it does not generally amount to much; but I have in my mind a case which I have been investigating in the last four or five days of a person who has been a pensioner of ours for some few years, and who I found since he obtained our pension has obtained three other pensions from other societies, so that he has got something like 50*l.* a year out of blind charities, including the 20*l.* which he receives from us.

5436. I suppose that if you had a concert amongst all the blind pension societies, such a possibility as a man getting three or four pensions could not occur?—It would be, of course, reduced very much.

5437. Do you think that your Company would aid in an association of that kind?—I think so, certainly. Perhaps I may take this opportunity of mentioning that my company have it under their consideration now to grant some more pensions, but they are disposed to wait for the result of the deliberation of this Commission before taking any further steps. They thought that the evidence that was given now might be valuable in enabling them to come to a conclusion upon that point.

5438. With regard to the age, have you any limit?—No.

5439. Are the pensioners mostly old?—They are mostly old, but we have one or two cases in which they are young, for instance I have in my mind the case of two sisters who have been blind from birth. They were both living together, and it was felt that in their case their age ought not to be made a bar to the applicants, so we elected one of them.

Mr. W. S. Prideaux.

19 Feb. 1886.

5440. Were they outside people or were they connected with the company?—They were not connected with the company at all; you may take it from me that, with one exception, or two at the outside, our blind pensioners are not connected in any way with the company.

5441. (*Dr. Tindal Robertson.*) Does the medical certificate in the petition simply state the fact of the person being blind, or does it enter into any statement as to the causes of the blindness?—It does not necessarily state the causes of the blindness. All we require is to have a certificate that the person is absolutely blind. There are a few lines left for the circumstances of the case which the petitioner fills in himself, or gets filled in, and as a rule they state the cause of the blindness, but the medical certificate does not necessarily state it.

5442. With regard to the special trades which are represented by the Goldsmiths' Company, do you find that there is any special tendency to blindness on the part of people who work at watch making, or gold beating?—I do not think we find that there is a tendency to absolute blindness from working at those trades, but we find that the sight is very much tried, and perhaps in some few cases it may result in blindness. I do not know whether we have any experience that it results in total blindness as a rule, but the sight often fails, and of course in certain branches of the trade good sight is essential.

5443. Your court has considerable powers under the trust, I suppose; they are not bound down to a very hard and fast line?—No. Perhaps I might mention this fact, that as a rule we have other charities for our own freemen, so that supposing that a freeman were blind we should be able to relieve him otherwise than by a blind pension. We should be bound under the scheme to give a freeman the preference, but we have other ways of dealing with freemen.

5445. And you could dispose of your funds in other ways than by simply giving pensions?—Yes.

5445*a*. Have you ever had an application made to you by the Worcester College?—Yes.

5446. Have you ever given them any donations or subscriptions?—Yes, we gave them something, and it was with the view of sending a gentleman who was studying for the church to Cambridge or Oxford; and I have heard since that he has taken his degree, and is now in the church. I mention that merely as a matter of interest. I happened to hear afterwards that it had been very successful, and that the gentleman for whom it had been applied was able to gain his living in the church.

5447. Are you aware that there is a scheme for making the Worcester College, which is at present a private institution, into a public institution?—I am aware of that.

5448. Has any application been made to your company with that object?—Yes, but it was not successful.

5449. Do you think that if that college were made into a public institution there is any probability of your committee favourably considering the establishment in support of scholarships in the university in connexion with that institution, in the same way as you have already done in the case of this one gentleman whom you have mentioned?—I think it would be quite likely. Last summer when the last application from the Worcester College came before us it did not come before us in a very tangible shape; and although we considered it on one or two occasions, the company considered on the whole that it was somewhat premature to make any grant.

5450. My question was rather directed to whether you thought that your company would favourably consider the very important question of how best to raise the condition and help the upper classes of blind people who still might do work to get sufficient education to put themselves into professions?—We have already had one case of that kind in the university which was very successful. We allotted an exhibition to a blind gentleman.

5451. Apart from the Worcester College?—Apart from the Worcester College.

5452. Do you think that the Goldsmiths' Company would be willing to do that in other cases?—So far as I am competent to bind the company in any way I should judge from that that they would be most willing to do so.

5453. (*Admiral Sir E. Sotheby.*) What is the amount of the grants which you voluntarily give away in the shape of pensions to institutions and to assist blind people?—I am not prepared with figures, but I should think that they would amount to something like 1,100*l.* per annum altogether.

5454. Independently of that you give grants to freemen, I think you said?—Yes, we have certain charities specifically for poor members of the company; it does not matter whether they are blind or not so long as they are necessitous. Almost all our charities are primarily for poor members of the company.

5455. Do the blind have any preference?—No, not under those charities.

5456. Did you strike off your list this person who had 50*l.* a year?—His is a very peculiar case, and is under consideration now. It is a case in which a man has six or eight children whom he is bringing up like heathens, and the children at any rate would be better in the workhouse.

5457. Do you pay your pensioners annually?—No, quarterly.

5458. Do you find that that is much better than paying them annually?—Much better.

5459. If they were paid annually, do you think that the money would be squandered away?—In many cases I have no doubt it would.

5460. And a large amount of it would very likely go into the public-houses?—And not only that, I think that these blind people would be apt to be preyed upon by other people. In all ordinary cases we require personal attendance to receive payments.

5461. Do you think that your pensions when they are paid could ever go astray into other hands than those of the proper recipients?—No, I think not; we take precautions to prevent that. If they cannot attend personally, we require evidence that they are living, and so on.

The witness withdrew.

Adjourned to Thursday next at 12 o'clock.

32, Abingdon Street, Westminster.

Thursday, 25th February 1886.

PRESENT:

LORD EGERTON OF TATTON IN THE CHAIR.

W. TINDAL ROBERTSON, ESQ., M.D. | T. R. ARMITAGE, ESQ., M.D.
ROBERT MCDONNELL, ESQ., M.D., F.R.S.
CHARLES E. D. BLACK, ESQ., *Secretary.*

MR. THOMAS CLARKE examined.

Mr. T. Clarke.

25 Feb. 1886.

5462. (*Chairman.*) You are the honorary secretary of the "Christian" Blind Relief Society?—I am.

5463. How long has that society been in operation?—Under the present organisation 30 years in April, it was originally commenced in 1843.

5464. Have the objects of the society been confined to the pecuniary relief of the blind?—Not entirely. The primary object of the society is to grant pensions; but we conduce to the social comfort of the blind by endeavouring to make them self-helpful, by visiting them as far as we can at their homes, and entering into their pecuniary circumstances and difficulties; by that means alleviating a large amount of suffering.

5465. Is your pecuniary assistance given entirely in the shape of pensions, or do you give weekly doles or relief?—Pensions.

5466. It is given in the shape of yearly pensions?—Yes. We have pensioners who have been on our society for about 28 years.

5467. I see in your report the heading of one class of your pensioners is, "Pensioners receiving 2*s.* 6*d.* a week," do they receive 2*s.* 6*d.* weekly or a lump sum amounting to 2*s.* 6*d.* a week?—Some are paid weekly and some monthly; we find that that is better than giving it in a lump sum, because if they receive it in a lump sum they are apt to spend it. If it is given periodically it goes further, and it is better for them.

5468. What is the mode of procedure adopted in the selection of pensioners?—Every person subscribing a guinea a year has the privilege of nominating a blind person, whose name, when nominated, is added to the list of candidates; the person so nominated is taken in rotation, and inquiries are made about him, and if eligible he is made a recipient of the funds of the society.

5469. Do the committee give priority to those most deserving, or do they take them in rotation?—Every one is taken in his turn as he is nominated by a subscriber, but the case must be a deserving one. The relief is given independently of any religious qualification whatever.

5470. Are there any pecuniary disqualifications; is the receipt of relief from the guardians a disqualification?—The receipt of parochial relief is not a bar to the receipt of one of our pensions, but with regard to income, if a person is single, whether a man or woman, his or her income must not exceed 20*l.*, or, if married, it must not exceed 30*l.* per annum; we do not draw a hard and fast line in that matter, but that is the rule by which we are guided.

5471. Have you any funded property?—We have 1,400*l.* at present.

5472. From savings or from legacies?—From legacies. We received 1,018*l.* last year from the late John Harrison's estate.

5473. Do you get any annual contributions from any of the city companies?—We have received one or two donations, among others, from the Merchant Taylors and the Clothworkers.

5474. What is the actual amount distributed?—Last year we distributed about 600*l.*, while our income from subscriptions and donations was 450*l.*, that was 150*l.* above the amount received from subscriptions and donations.

5475. You also receive grants from the trustees of Gardner's Fund, do you not?—We do, annually. They very much appreciate our work, and they do what they can to further it.

5476. Are any of your officers paid?—No; there are no officers paid out of the funds of the society.

5477. Not the assistant secretary?—He is not paid by us, he is paid by Sir Charles and Lady Lowther.

5478. The society is Sir Charles and Lady Lowther's society, more or less?—Yes, to a very great extent.

5479. They supply the funds for the salary of the clerk?—Yes; and they subscribe 20*l.* to the society. I was about to observe that during last year the trustees of Gardner's Fund, in consideration of the work and my decay of sight have thought it well to subscribe 50*l.* towards the working expenses of the society; extra grant made by them.

5480. Do you give any assistance in the way of providing books for the blind?—Yes, we have given a great many books away. Sir Charles and Lady Lowther always keep us fully supplied in the way of books, and we have given a great many away.

5481. Do you employ any blind in copying books with raised types?—No, we do not interfere with the work of any other society in that respect.

5482. Do you prefer any particular sort of type for your books?—No; up till very recently Moon's type has almost universally been used; I have found in my experience that it is the most acceptable, and that it is much easier learned by the adult blind than any other. I am aware that the system of Braille is coming more into use, but it is very few, I think, that are able to accomplish it, particularly the adult blind; I found a difficulty in it myself. I have learnt the alphabet, but I cannot get on very well with the feel of it.

5483. Is is only lately that your sight has become impaired?—My sight has gradually decayed within the last two or three years. I have not been able to carry on the correspondence of the society, and hence the kindness of Sir Charles and Lady Lowther in providing an assistant secretary.

5484. You give your services entirely gratuitously?—Yes, and have done so ever since the commencement of the work.

5485. What is the area of the operations of your society?—The United Kingdom. We have 160 pensioners, and they are distributed in all parts of the kingdom.

5486. Have you any visitors in London?—The committee visit some of our blind, we have no paid visitors.

5487. I see in your report you give the causes of blindness of your pensioners; they seem to have become blind from a great variety of causes?—Yes.

5488. Should you say that generally they have become blind when they were adults?—Yes, the large majority of the blind lose their sight after the age of 20.

5489. Therefore you have not gone into the question of the education of the blind at all?—No, we have not, because we thought if we did that it would occupy too much of our time, and we should be trespassing on the work of other institutions.

5490. Can you tell me how many of those who are your pensioners, who have become blind as adults, are able to read Moon's type?—I could tell you the country cases, but nearly the whole of our London pensioners, with very few exceptions, can read Moon's type.

Mr. T. Clarke.

25 Feb. 1886.

5491. Do you supply those in the country with books as well as those who live in London?—Where they are required, small books.

5492. Do you find that many blind come up to London from the country in order to receive the benefits of the charitable institutions for the blind in London?—No, I think not; I do not think there is sufficient inducement for them to come up.

5493. You think that the pensions are not more than sufficient for the number of blind in London requiring them?—It would be no use their coming up to London to obtain a pension, because they would have to wait such a long time before they could obtain a pension, while the grass was growing the steed would be starving; and if they came up to London with a view of getting work it would be a failure altogether, because there is not employment for those who are able and willing to work in London.

5494. Do you think it is a desideratum that there should be some better organisation to enable the blind to obtain employment and sell their work?—Yes, I think that something might be done in that direction. I do not see myself from my own experience that those institutions that are in operation at the present time are equal to the circumstances, because the blind persons who are in the workshops at the present time, and have been there for a long period, are only in a position when they have earned what they can at those workshops to come to other societies and ask for further aid to help them. It is not possible for a young woman or a young man, for instance, to live upon, say, 6*s.* a week, paying for the rent of a room, without further help. I mentioned that some years ago to Mr. Levy; I felt that while they were doing all they could, yet they were assisting the blind to such a small extent that they were compelled to come to a pension society and ask them for a grant in aid.

5495. Do you think that there should be intercommunication between the different pension societies and charities, so that they should be able to ascertain whether the same persons were in receipt of relief from different societies or charities?—I think it would be a step in the right direction if this Commission could gain from all the various institutions throughout the country their income, how much the blind receive from those institutions, whether they were industrial institutions, schools, or pension societies, and the kind of work they were doing, and how they were doing it; for upon a rough guess I may venture to say that if all the money which is subscribed for the benefit of the blind in this country found its way to the blind, something like 10*s.* a week might be given to each of those in need.

5496. Do you think that there is either a waste of money or a want of organisation between the different societies in the distribution of their funds?—I think it is simply that in many institutions there is a great number of sighted persons employed who are not necessary. Some years ago Mr. Kingscote started an institution in the east of London, which institution was open for two years, and just prior to its close Mr. Kingscote asked me if I would go and see what could be done, Dr. Armitage was there also; we asked several questions of the manager, and we found that 3,000*l.* had been expended in that institution in the two years, and it appeared that the blind had not received any of it, that is to say, not in the way of assistance, they had what they earned, but no more.

5497. That institution, I understand, failed?—Yes.

5498. They taught the blind to make up sacks, did they not?—Sacks, baskets, and bags; and they introduced the sewing machine there, which was quite a failure.

5499. Do you make inquiries as to the moral character of your pensioners?—Always.

5500. If they forfeit their good characters do you withhold the pensions?—Yes.

5501. Do you allow them to beg in the streets or earn their living by singing in the streets?—No; if any blind persons are found to be begging or singing in the streets they are taken off our list if they are already on it, and such persons, if candidates, are disqualified from receiving our pensions.

5502. Have you any suggestions to make to the Commission with regard to the training of the blind in industrial occupations from your experience of the blind that you have come in contact with?—In my opinion, with regard to the blind, they ought to be divided into three classes; there are the young blind, then there are the middle-aged, that is up to about 30 years of age, the strong and healthy willing to work, and then there are the aged and infirm blind, who must be looked after. Professor Faweett at one of our meetings said that every provincial town ought to support its own blind, and he said, Suppose in a provincial town there were 40 blind, and out of that 40 there were 25 who were very young blind, that would only leave 15 adult blind for the town to maintain and support, which he thought might be very easily done. I do not know from whence he got that information, that there would be that proportion of 25 out of 40 young blind, which is certainly an erroneous idea, because we find that the number of young blind persons is very small.

5503. You think that the aged will always require pensions to enable them to live?—They must necessarily. For instance, a large number of blind are distributed in little out-of-the-way places, small villages and so on. You would not bring them into a provincial town or provide a building in which they could be trained to work. I know a man at the present time, a strong able-bodied man, who was employed at cutting wood with a machine, and by a blow he lost his sight. Since he has lost his sight he has turned his attention to chaff cutting, at which he is very clever. He says he has no fear whatever; I believe he can sharpen his own knife and feed his own box, and go through the whole operation without assistance, yet no one will employ him. He says if he could get employment he should be able to earn his own living, or nearly so.

5504. Does not that rather point to the necessity of some depôt being established where those who wish to work could have work found for them?—Yes; but this man, for instance, had been at a sawing machine till he became blind; what other trade could he be put to?

5505. The evidence we have shows that there are very few trades which the blind are at present taught, and the question arises whether that number could not be enlarged?—It would be a great advantage if it could be.

5506. You mentioned chaff cutting; that does not seem to be an occupation carried on at any of the blind workshops?—No. There is another case to which I might refer. I know a blind man who is an excellent basket maker; he can make baskets so well that even the dock companies, the West India Docks among others, give him contracts, and a little while ago I advanced him a few pounds as a loan to enable him to execute a contract. He executed the order, and did it to the satisfaction of the dock company; he got his money, and came and paid me back what I had advanced. If that man had not been assisted in that way he could not have done the work, but having the opportunity of making his baskets, and finding a market for them, he is able to keep himself and family without depending on any institution.

5507. Do you think it would be a good thing that these institutions for the blind should, as far as possible, assist the blind by loans to enable them to get materials with which to work, rather than give pensions without any stipulation that they are to do any work at all?—I should not advocate loans myself. We have sometimes found that the fact of blindness does not alter a man's character, and if he got a loan with the view of purchasing a barrow or a pony or a cart, he might be induced to sell it after he had purchased it, and spend the money, and he would not be able to return the loan. A shoemaker whom we visited on Monday said that he would be glad to do anything that he possibly could; he said he could not get employment at anything, he said he could turn a wheel, turn a coffee mill, or anything for a few shillings a week if he could get it to do. One of our pensioners used to go over to the institution at Peckham for employment; he used to go there on the Monday morning and return on the Saturday night, and his wife had actually to find 3*s.* or 4*s.* a week towards his expenses, because he could not earn sufficient to meet the requirements, and she was in very delicate health.

5508. (*Dr. Tindal Robertson.*) What is the average number of people you relieve in the year?—We have 160 at the present time.

5509. What is the total expenditure connected with the work for the year, including the pensions and everything?—The amount paid to the blind last year was just about 600*l.*, and the working expenses were 61*l.*; but the expenses were greater last year than in any previous year, in consequence of the meeting of 1884 being held at the Mansion House, as we had to send out special tickets and notices, so that extra expense was incurred.

Mr. T. Clarke.

25 Feb. 1886.

5510. What amount of contribution do you get from Gardner's Trust?—Fifty guineas a year.

5511. Is that in the shape of a renewable grant; do you have to make application from time to time in order to get it renewed?—No; it has been granted annually for some years. In the list of pensioners you will see that there are 17 raised from 5*s.* a month to 10*s.* a month by their grant.

5512. What I wanted to ascertain was this, whether the Gardner grant is a grant in perpetuity, or whether you have to make an annual application for it?—No, we do not make an annual application for it.

5513. Do they ask you to give any return as to what you do with the money?—They send us the cheque and they see our report; we send them a list of the names of those pensioners whose pensions have been raised, and submit it to them for their approval.

5514. During the time you have been connected with this institution have you looked into the list of cases you have relieved to see whether you could form any general idea as to what the causes of blindness were?—They have always been so numerous that one could hardly say that the blindness of our pensioners has been brought about by one cause more than another.

5515. You have not formed any opinion as to particular trades causing loss of sight?—No.

5516. Have you taken notice whether you have more applicants from one county than another in proportion to the size of the county?—No; I think where there is a larger proportion of blind in any particular district it is in consequence of there being in that district an institution or institutions where the blind are assisted. I do not think there is any particular cause for it other than that.

5517. Certain counties, for instance, Cornwall, some parts of Yorkshire, Lancashire, and Nottinghamshire, we have heard, supply rather a larger number of cases than other counties; have you any experience that they have done so in your charity?—No; I think in Cornwall a great number lose their sight from blasting processes.

5518. You were asked a question about the establishing of a central depôt; have you formed any theory at all as to what would be the best way of dealing with children when they leave schools or when they leave workshops in order to enable them to get their living?—There are a number of ways of dealing with them which might be suggested.

5519. Do you think it would be an advantage if in different centres in London and in provincial towns depôts could be established where, in the first place, material could be supplied at cost price to the blind who wish to receive it; where, in the second place, the work after it was completed could be exposed for sale; and where, in the third place, a register of names of blind workers could be kept, so that application might be made to them to execute work for institutions or firms or individuals?—If they could be conducted sufficiently economically, so that the blind would derive a proper proportion of benefit from them; but you would require so many, the blind are so scattered throughout the country.

5520. I am suggesting that every provincial town should have its depôt?—If every provincial town were to have its own depôt, would not that involve a very large amount of expenditure? I think the expense of establishing an institution in every provincial town would be very great.

5521. I am not asking you as to the expense; I am asking you whether, in your opinion, taking for granted that it could be done at a moderate expense, it would be an advantage or otherwise?—Yes, I think it might be done.

5522. If it could be done, do you think it would be an advantage to the blind generally?—Yes, to many; but not in proportion, I fancy, to the large amount of expenditure. There are about 23,000 needy blind in our country. We have to look to the large number of blind who are scattered.

5523. One question with regard to pensions; is it your experience that a great many who receive pensions from you receive pensions from other sources?—Some do.

5524. Have you any means of ascertaining whether that is the case or not?—Yes, all our forms are filled up, and we could furnish any information with regard to that.

5525. Is it any bar to applicants receiving a pension from your society that they are in receipt of pensions from other societies?—Not if their income is below the amount specified.

5526. Then, with regard to intercommunication between pension societies, which the Chairman has alluded to, do you think it would be an advantage if a register of names could be kept of persons in receipt of pensions from all sources, to which register the different societies would have access?—Yes, I think it would prevent a great deal of imposition on the part of the blind; because we find some are able to get many pensions while others are not able to get any at all.

5527. Have you any particular instance in your mind of one person receiving a number of pensions?—I know of two; one particularly occurs to my mind at the moment. I believe the man to whom I refer is on Gardner's; he is on the Goldsmith's Company, or his wife is; he is on the Clothworkers; in fact, he is on several institutions, I know; he is an able-bodied man, he goes about selling tea, and he and his wife also have a very good business in connection with a mangle. I think they receive in pensions nearly 50*l.* a year.

5528. Then you agree with the evidence which has been given to us, that there are many persons who are receiving too many pensions, and many persons who are not receiving any at all?—Yes.

5529. (*Dr. Armitage.*) You say you send out forms to be filled in with respect to the income of applicants for your pensions?—Yes.

5530. Do you take any means to ascertain that the information given by the applicants in the filled-up forms is correct?—Certainly.

5531. Do you communicate with the different pension-giving societies and charities?—We have asked for reports to be sent to us, but I generally find that they are very indifferent about sending them.

5532. For instance, A. represents himself as not being in the receipt of any pension; would you apply to the different pension societies and charities to ascertain whether A.'s name was on their books or not, or would you simply take his statement?—If we were to write to some of the city companies in a case of that kind they would not tell us whether the applicant was in receipt of their pension or not, at least they have not done so up to the present time.

5533. As a matter of fact you take it on the statement of the person who applies for the pension?—We make inquiries with regard to the truthfulness of the statements of the candidates, and as to their respectability.

5534. But as I understand you, with regard to the special question whether the person is already in receipt of a pension or not, you take his statement; you do not apply to the different pension societies to ascertain whether he is on their books or not?—Not always, because we are so well acquainted with some of the cases that we know all their circumstances. We have reports from such societies as the Blind Pension Society of the United Kingdom, which was formerly known by the name of the Protestant Blind Pension Society, which is a sister society to ours, and originated from ours.

5535. In the case of a person who applies for a pension from you, and who states that he has no pension from any other society or charity, do you apply to the different pension societies and charities to ascertain whether his name is on their books or not?—Not always, we do sometimes. We cannot get information from Day's Charity or the other charities, nor can we get information from some of the societies.

5536. There being that difficulty in obtaining information, do not you think that it would be very desirable that a register should be kept, accessible to all institutions for the benefit of the blind, in which the names of persons receiving pensions should be entered, so that you would have nothing to do but to go to the register in any individual case and see whether a person applying for a pension was already receiving a pension from any other society or not?—That is what I suggested many years ago when we met at Buckingham Street.

5537. What is your limit of age?—We do not give pensions to persons under 18 years of age.

Mr. T. Clarke.
25 Feb. 1886.

5538. Are there many of your pensioners who are capable of doing work if they had it to do?—Yes, I think so; I know several in London who are capable of work if they could get it to do.

5539. Are there many of your pensioners who have been educated at institutions for the blind?—Several.

5540. Do you think that if employment could be found for all those who have been trained in institutions and are of an age to be capable of work, your society and the other pension societies would be sufficient to meet the ranks of those who are infirm, and who are so old as to be incapacitated for work?—I think if the able bodied blind were fully employed (not partially), and able to earn a maintenance, it would enable the existing pension societies to alleviate the sufferings of the infirm and aged.

5541. Do you know anything about the system adopted in Germany and in Paris with regard to looking after the blind after they leave the institutions in which they have been educated or trained?—No, I do not know anything about that system.

5542. (*Mr. McDonnell.*) Did I rightly understand you to say, in answer to a question by the Chairman, that if all the money which at present goes to the blind through charitable institutions like your own, in the form of pensions, were gathered together and economically distributed, it would give 10*s.* a week to every blind person in the United Kingdom?—I should think so.

5543. Have you any data upon which you arrive at that conclusion?—A meeting took place at Buckingham Street some years back in connexion with the Charity Organization Society, and I went into the figures at that time with regard to the number of the blind that were able to maintain themselves either wholly or partially; and it was from those figures that I arrived at that conclusion.

5544. You think that a great deal of the money which is at present subscribed or given for the relief of the blind is expended in establishment charges, in paying secretaries and so forth, and that with a more uniform system, a great deal might be done towards giving a great deal more to the blind themselves?—I think so.

The witness withdrew.

Mr. Thomas Hardwick Smithson examined.

Mr. T. H. Smithson.

5545. (*Chairman.*) In what way are you connected with Humston's charity for the blind?—I am clerk to to Mr. Glynes, the vestry clerk of St. Botolph Without Aldgate, who is clerk to the trustees of the charity.

5546. Have you been acquainted with the working of the charity for a number of years?—About 20 years.

5547. When was the charity founded?—The will of Hugh Humston, the founder of the charity, is dated the 18th of February 1777; he died in the same year. The estate of the testator was not sufficient to carry out his intentions. Proceedings in Chancery were taken, and it was referred to one of the Masters to approve a scheme for carrying out the charitable purposes contained in the will. The Master, by his report dated 24th May, certified that he had selected five blind persons who were fit to partake of the annuities at the rate of 10*l.* to each blind person. By an order of the Court dated 29th May 1827, the Master's report was confirmed, and it was referred back to the Master to settle a deed of trust. A deed poll was accordingly executed on the 1st September 1827, under which the dividends on 1,967*l.* 8*s.* 3*d.* consols became payable to five blind persons.

5548. Who administer the charity?—Trustees appointed under the scheme. There were four trustees originally, of whom Mr. Henry White and Mr. John Sparks are the two survivors.

5549. How does it come about that the clerk to the vestry of St. Botolph Without Aldgate has anything to do with the administration of this charity?—The will directs that whenever the number of trustees shall be reduced to two the stock shall be transferred into the names of the survivors and of the minister and churchwardens of the parish of St. Botolph Without Aldgate.

5550. Are the present trustees churchwardens of that parish?—They were at the date of their appointment.

5551. Is all the office work done by the clerk of the vestry?—Yes.

5552. Under the trust or voluntarily?—Voluntarily; that is to say, it is taken as one of the duties of the vestry clerk.

5553. How often are the pensioners appointed?—Whenever a vacancy occurs by the death of a pensioner notice is given to the several parishes interested, that is to say the parish of St. Botolph, Aldgate, St. Botolph in the county of Middlesex, St. John, Wapping, and St. Paul, Shadwell.

5554. Is any preference given to any class?—Yes, the will directs the dividends to be paid "to blind persons "not receiving alms of the respective parishes to which "they belong, and who should be parishioners of the "parishes of St. Botolph Within and Without Aldgate, "and the parishes of St. John, Wapping, and St. Paul, "Shadwell, in the county of Middlesex, or any of them, "or whose parents did belong to any of the said "parishes, whether such blind persons be men, women, "or children, the said persons to be chosen and appointed by the executors or the survivors or survivor "of them and the said minister and churchwardens of "the parish of St. Botolph Without Aldgate aforesaid "for the time being or the major part of them," and the will further directs "that in choosing such blind persons, "lightermen, or watermen, their widows and children, "parishoners of some or one of the parishes aforesaid, "or whose parents were such parishioners should be "preferred in such choice, and if not enough of them "to fill the charity then those of the parish of St. "Botolph Without Aldgate, and if not enough of them "then, those of the parish of St. Botolph Within "Aldgate, and if not enough of them then those of the "parish of St. John, Wapping, and if not enough of "them then those of the parish of St. Paul, Shadwell."

5555. Has there always been a sufficient number of the lightermen and watermen class to absorb the pensions?—We have not always been able to find lightermen or watermen, or their widows or children.

5556. Are the pensions in that case given to any applicants in the four parishes who are properly qualified?—Yes.

5557. Is there any qualification with regard to the receipt of parochial relief?—The words of the trust which I read, namely, "blind persons not receiving "alms of the respective parishes to which they belong" are held to disqualify persons receiving parish relief.

5558. Can you give us the ages of the present recipients of the pensions?—Robert Campbell, 68, elected 1869; Margaret Goodman, 70, elected 1874; Philip Butcher, 54, elected 1878; George Baker, 74, elected 1882; and Alfred Kreamer, 22, elected 1884.

5559. When was the last vacancy?—The last vacancy occured in July 1884.

5560. What was the age of the person who was elected on that occasion?—20.

5561. You give a preference to old persons?—Yes; this young man is the only young person I have known to be elected.

5562. His case, I suppose, is a very deserving one?—Yes, he is at the Normal College, Norwood, now, where he has been learning the trade of a pianoforte tuner; I believe his course is about finished at the college.

5563. Is he in receipt of any pension other than yours?—I am not aware that he is.

5564. Can you say that he is not?—I believe the only benefit that he receives is his education at the college; he will leave the college shortly.

5565. Do you make inquiry before you give a pension whether the applicant is in receipt of a pension from any other institution?—No, I am not aware that such an inquiry has been made.

5566. For all you know, those to whom you give pensions may be in receipt of pensions from other institutions?—I do not think it is likely they are; I do not know whether they are in receipt of such pensions or not.

5567. Do you think that it would be desirable before giving a pension that you should inquire whether the applicant is already in receipt of pensions from other institutions which give pensions?—Certainly; inquiry may have been made in each case, but I am not able to answer whether it has or not; the inquiry would be made by the trustees.

5568. You are acting as clerk to the vestry clerk; would not the applications come through your office?—We should know the applicants; the applicants attend personally before the trustees and they are questioned by them; I am not always present.

5569. Then, as I understand, the trustees make the inquiries personally before they give a pension, but they do not communicate with the other institutions so far as you are aware?—They do not; petitions are received and notices given to the applicants to attend the trustees at the meeting.

5570. Have you a form of application?—No; I have some of the applications here. We do not supply any form.

5571. (*Dr. M'Donnell.*) How many altogether have you on your list?—Five.

5572 (*Dr. Tindal Robertson.*) What was the total income of the trust last year?—59*l.* 0*s.* 4*d.*

5573. How much of that was given to pensioners?—The whole of it; each pensioner received 11*l.* 16*s.* 1*d.*

5574. You give your pensioners more than the 10*l.* allotted by the Court of Chancery?—Yes; the dividends on the consols are divided between the five persons.

5575. Have there been any additions to the funds made by private persons since the trust was founded or since the scheme was framed?—No such additions have been made.

5576. On what principle do the trustees go in selecting pensioners. You explained that a particular class, namely, lightermen and watermen, are entitled in preference, but excluding those, upon what principles do the trustees proceed?—Applications are invited and considered; the petitions of unsuccessful candidates are retained, and when a vacancy occurs we communicate with them if we can find them. Sometimes we find they have removed. We give notice to applicants who have been unsuccessful when previous vacancies have occurred.

Mr. T. H. Smithson.
25 Feb. 1886.

5577. Do you select them according to priority of application, or have you any other principle upon which you elect pensioners?—I cannot answer that; I believe they are taken on their merits and not according to any priority of application.

5578. Suppose, for instance, you had a pension to give away and you had the names of the former applicants and the names of one or two fresh applicants, would you take as a matter of course the former applicants?—Judging from recent elections, I should say that the trustees would give the preference to a fresh applicant if his case was more deserving.

5579. Then they would be selected according to merits?—Yes.

5580. Do you think it would be a good plan to communicate with other societies which give pensions, to see whether they gave pensions to persons who are applying for your pension?—It would be advisable.

5581. (*Chairman.*) What means do you take to give publicity to this gift to the blind?—We put this notice on the doors of the churches of the parishes mentioned (*handing it in*). Mr. Glynes is vestry clerk of Wapping as well as of Aldgate, and he writes to the vestry clerk of Shadwell informing him when a vacancy occurs and requesting him to publish that notice.

5582. No expense is charged to the gift?—None; the whole of the income is given to the blind persons.

The witness withdrew.

Mr. Henry Wilkinson examined.

Mr. H. Wilkinson.

5583. (*Chairman.*) Are you a basket maker by trade?—Yes.

5584. How long is it since you became blind?—I have been blind since the autumn of 1809.

5585. Where did you learn basket making?—At the Bristol Asylum.

5586. Have you been able to earn your livelihood all your life since you left the asylum?—Not exactly at basket making. When I came to town in 1823 I depended upon my father. Then I got a journeyman's situation at a basket maker's at the west end of Marylebone, and I worked for him for three years, and I obtained a very great insight into the London trade. One town differs from another. If I had been able only to ply the trade that I learnt in Bristol I should have been very awkward in London; but I got this situation as a journeyman at the west end of Marylebone. This basket maker took me on as a jobbing hand, and put me on to all sorts of work, so that I got a great insight into the trade that I did not know when I left Bristol.

5587. You were taught nothing but basket making then at the Bristol Asylum?—I was taught nothing but basket making there. But after that, when I was about 30 years of age I took and taught myself chair caning; I was not taught it, but knowing one trade it gave me an insight into the other, and so I undertook to do caning; and now that I am grown so old I do more chair caning than basket making, for I am not strong enough to work at basket making at the present time. I am in my 83rd year.

5588. Have you been able to earn sufficient to keep you?—I have been making a very respectable livelihood in Marylebone for the last 62 years, but I did not depend upon my trade. I married a wife who had a mangle, and I earned more money by assisting my wife at the mangle than I did at my trade; but one week with another I have made a tolerably respectable living.

5589. Do you think that the chances of a blind man obtaining work are as good, or better now, than they were when you first came up to London?—I do not know. It depends upon the talent of a man altogether whether he will be able to earn his living or not. There is a talent and there is a will. If a man has not got the will to work you cannot make much of him; but if he has the will he will persevere in the work. When I came up to town in 1823 I had a will to work. I married a respectable woman, and between her trade of mangling and what I earned we got on.

Mr. H. Wilkinson.

5590. Have you any suggestions to make as to what is the best way of obtaining work for the blind after they have left the training institution in which they have been educated?—Not altogether.

5591. It depends upon individual exertion, does it?—It wants a deal of exertion and likewise talent on the part of an individual after he leaves an institution. If I had not had a very good talent when I left the Bristol Asylum I should not have got on so well. I was discharged after being there seven years and three months as the brightest pupil that ever was discharged from that institution. But I certainly had a great difficulty to get into the art of the London basket making, because it was different altogether from what I was taught at Bristol; it was like learning a new trade, and by working three years as a journeyman I got into the art of the London work.

5592. Do you know many of the blind in London, personally?—No, I have made hardly any acquaintance with the blind.

5593. You have never been in any institution, or worked for any institution in London?—No, I have always worked independently. I have worked a great deal in the wholesale trade, such as serving turners' shops and supplying them with all kinds of baskets.

5594. Do you make brushes?—No, I do not understand the brush trade; basket making and chair caning is all that I understand.

5595. Can you read any of the types for the blind?—Yes, three; I read Frere's, Lucas' and Moon's; but I prefer Frere's system to read out in public. Frere's system is the elementary sounds of the language. That was the first system that I learnt, and I learnt it from Mr. Frere himself.

5596. Do you know anything about the Braille system?—No, I do not understand that at all. I learnt Lucas' system at Lucas' school, which is now up in the Avenue Road.

5597. Then you attended school in London after you came up to London?—Yes; I went to Lucas' school

Mr. H. Wilkinson.

25 Feb. 1886.

when it was in Queen's Square, that is where I learnt Lucas' system. Moon's system has been brought to me by what are called the home teachers, a few hours in the week until I had learnt to read Lucas's system.

5598. Have you received any assistance in the way of pensions from any institutions?—I have got 12*l.* a year from Day's Charity, and I have got 12*l.* from what they used to call the Protestant Society; they allow me 1*l.* a month. To make my reply as to the date of my pensions clearer I must explain that I was elected to the Protestant Blind when I was 67 years of age, and received only 6*l.* a year, and when I was 70 years of age it was increased to 9*l.* a year, and when I became 80 years of age it was increased to 12*l.* To Clothworker s at the age of 63 years; to Day's Charity at the age of 63 years; to Cordwainers' at the age of 67 years. I sold my mangle in the year of 1851, when I was 48 years of age.

5599. So that besides your mangle and the baskets you get 24*l.* a year in the shape of pensions?—Yes, but that is only since I have been 60 years of age. Before I was 60 I depended entirely upon my trade and the mangle; but since I have been 60 years of age I have got two pensions of 12*l.*, and I likewise have two pensions of 5*l.* each from the Clothworkers' Company and the Cordwainers' Company.

5600. When you applied for each of those pensions did you state that you were in receipt of other pensions?—I always applied in my profession as a basket maker.

5601. Without telling them what you were receiving?—I had to state how I got my living when making an application to these places, and I always put down that I got my living at basket making and chair caning.

5602. You got a pension after you were 60 years of age?—After I was 60.

5603. When you applied for the next pension did you state that you had that pension?—Yes, I got the Clothworkers' pension first. Then I stated that I had the Clothworkers' pension when I got the pension from Mr. Day's Charity.

5604. That made 17*l.*; did you state that you had 17*l.* when you got the other two pensions of 12*l.* and 5*l.*?—I have got 34*l.* altogether.

5605. After you had got the 17*l.* did you state that you had 17*l.* a year from pensions when you applied for the other pensions?—Yes. I did not get the 34*l.* until I was turned 62 or 63 years of age. I had a great trouble to get the Cordwainer's pension.

5606. Do you think there is any difficulty in the blind obtaining tools and material for work; is there any necessity in many cases for them to get loans for that purpose?—When they are sent out of the asylums or schools they have tools given them. If a man is a basket maker he has his basket making tools given him.

5607. Is that so in all cases when they leave an institution?—Yes, I believe it is. I had some tools from the Bristol Asylum, but it was a very small supply, and I had not quite enough to go on with until I bought more.

5608. You saved up your money until you were able to buy some more?—Yes; but at the present time I have got no supply for tools; if I want any I supply them again out of my own private pocket.

5609. Do you think it would be an advantage that any of these pensions should be given in the shape of material or tools?—You see the blind in general want money to help support them, and they perhaps may borrow or buy tools second hand in a cheaper way. But if they have got a set of tools given them, some of them do not know how to work them, and I have known cases where they will sell their tools to perhaps a sighted basket maker.

5610. You think then that the great difficulty with regard to the blind is that they are many of them not skilled workmen, and that some of them have not the willingness to work?—That is what I believe. Some of them are not skilled enough; they have not got the talent to go through the branch of the trade to take in any job. They might be able to work upon just a few baskets that they have been taught to make at the asylum; but they have not a talent to enter into the trade to take any order of a stranger quality.

5611. Have you ever made basket chairs?—Yes.

5612. Are they taught to make basket chairs at these industrial institutions?—They were not while I was there.

5613. Do you think that they ought to be taught, not only to make baskets, but to cane chairs and to do every variety of basket work which you have taught yourself?—I think they ought, because since I have been in business for myself I took and taught myself to make cane garden chairs for gentlemen to sit in gardens. I mean chairs made all of cane.

5614. Do you mean high chairs so as to cover over the head?—Yes, or back all round; I taught myself to make them.

5615. Did you work from a model or from a form of any kind in making those chairs?—No. The first chair that I felt of that description was at the exhibition in 1851 in Hyde Park.

5616. Was that chair made by a sighted person?—I suppose it was made by a sighted person. I went in and felt the nature of the chair.

5617. And you felt that you could do it?—I went home and I imitated it as closely as I possibly could, and from that time I have made a great quantity of them.

5618. Then you think that the blind, if they are clever, can turn their hands to many more things than they generally do at present?—Yes, if they have got a talent for it they may turn their hands to a great many things.

5619. Then you think that it is only the clever ones and the industrious ones who succeed in earning their livelihood?—Yes, they must have a talent and a working mind.

5620. (*Dr. Armitage.*) Do you remember what age you were when you left the Bristol Asylum?—I was just upon 20 years of age. I was put in the Bristol Asylum at the age of 12 years and 8 months on the 28th of February 1816, just about this time of the year. I left the asylum on the 7th of June 1823. I was then just under the age of 20 years. My birthday is on the 30th of June; I was born on the 30th of June 1803.

5621. Are you of opinion that it is desirable or easy for blind persons leaving institutions to commence work before they are 20 years of age; do you think that a man leaving an institution at the age of 17 or 18 has a chance of succeeding outside?—No, I do not think he has, because he is what you may call a youth. The first place that I went to when I left the Bristol Asylum was Cheltenham, and I found that the Cheltenham work was not fit for me. Then I came up to town, and I got a journeyman's situation in Spring Street, Marylebone. I worked there for three years, and my master found that my talent was pretty good, and he put me on all sorts of jobbing work. If he had a strange basket to make and different things like that he put me on it.

5622. From your experience at what age should you say that pupils who have learnt basket making should be dismissed from institutions?—I was dismissed just upon 20 years of age, and then a great many of the committee thought that I ought to have remained two years longer, although I had been there seven years and three months; but it depends upon the talent and the will of the man.

5623. I am speaking not so much of acquirements as a basket maker, but of the character of the man. What I wanted to know from you was whether from your experience amongst other blind persons there is any limit of age that you would fix as a minimum for their leaving institutions?—I think it depends upon what sort of friends they have to go to. It would do but very little good for a young man to be sent out of an asylum and to be sent back to the parish where he came from if he has not a parent or relation that would work with him to assist him.

5624. Do you think that you would have succeeded in life as you have done if you had not had that intermediate training in the basket shop?—I do not think I should have done so well only that I had a father who was a very good tradesman, a tailor, who lived in Shouldham Street, and he got me this place of work in Spring Street, and I worked there as a jobbing journeyman.

5625. From your experience do you think that it would be desirable, after a blind basket maker leaves the school where he has been taught, to interpose a few years in a workshop before he sets to work on his own account?—It might be a great advantage to him, because I worked for three years as a journeyman myself before I set up on my own account, and that gave me a great light in these three years to set out upon my own footing.

5626. Then you think that it would be desirable for the blind who have been trained in institutions to pass through some workshop before setting up on their own account?—I think it would; I think a man would learn more in an out-shop than he does in an asylum, for he is just put upon one sort of work in these blind schools, and he might be reckoned a very clever hand just upon a few sorts of work, but if he got into another workshop where he would have various sorts of work it would give him a greater insight into the trade, and he would be more able to launch out upon his own footing.

5627. Do you know whether there is any practical difficulty in the way of a blind man's getting admission into a sighted workshop?—There is a difficulty because very few sighted basket makers would care to take a blind man.

5628. Why?—Because a blind man's work would not in general be so good as a sighted man's work. Of course we cannot expect a pupil to come out of an asylum and his work to be equal to that of a sighted journeyman.

5629. Is it that the work would not be so good, or that the blind man would not work so fast?—The work is not so good; it is not so shapeable. A blind man cannot make such a beautiful shaped basket as a sighted man. I know that I could not myself, and at times even now at some of the work I cannot say that I could come up to a sighted man's work in shape and form.

5630. Have you ever thought whether on that account it would be desirable for the blind to work upon shapes or moulds of wood?—No, I do not think so. I never worked upon a mould myself, though I have heard talk of blind men working upon a mould, but I know so far as this, that if you had a mould to work upon it would incline the work to run to the left, to screw round to the left as you work to the right. I have cased a great many jars and bottles, and I found that it was like working on a mould to put basket work round a stone jar. In doing that, if a man is not very careful the work will run all round to the left.

5631. Do you think that the care which is required to prevent that fault is as great as the care which is required to keep a form without a mould?—It is according to the man's judgment. When we are at work we do it in this way. Here is my stick, call that a stake; then as we work and are turning round, this stake is liable to go to the left with the hand; and if we bear too much to the right, that is liable to pull it round to the right. It all depends upon the judgment of the man in doing this work, but I never found that a mould was of much use. Some blind basket makers have a sort of hoop to keep the work out to the proper size, but I never liked it myself; I always like to go on just as a sighted man would work, by judgment; and if I found that my work ran in by putting my measure to it, I would keep it out more.

5632. Do you know whether seeing men use moulds?—No, I never knew a seeing man use a mould.

Mr. H. Wilkinson

25 Feb. 1886.

5633. You have been married several times, have you not?—Yes, I have got my sixth wife now.

5634. Have all your wives kept mangles?—No, only the first.

5635. When did your first wife die?—She died in the 24th year after I married her; we were married just upon 24 years.

5636. Since that time have you been able to keep yourself by your work without the mangle?—Yes, I sold the mangle after I buried my first wife.

5637. Then since that time have you been able to keep yourself by your work?—I do not say that I have kept myself wholly, because I have been trying to get some of these gifts.

5638. But you have just told us that you received none of them till you were 60 years old?—I did not get any until I was turned 60.

5639. In the interval between the death of your first wife and the time when you were 60, did you maintain yourself?—I did after a way. You knew me partly when I was in Nottingham Street.

5640. Can you give us an idea of your average weekly earnings during that time?—I put the wages and profits together. Perhaps the wages, according to the trade, might be 10*s.* or 12*s.* a week; then the profit that I got upon this work would sometimes mount it up to 16*s.* or 18*s.*, and I tried to do as well as I possibly could upon that money that I earned.

5641. Do you think that the profit which you derived from your work during those years averaged 16*s.* a week?—Well, I daresay it did; I could not have paid my way if it had not; but I did not take any particular notice of what it was exactly. While I lived in Nottingham Street I supported myself in an honest, respectable way by the art of basket making and chair caning.

5642. Where did you purchase your raw material?—I got my materials and made it off myself.

5643. But where did you buy the oziers and the cane?—I used to buy it generally at a man's named Applegate in Rathbone Place.

5644. Were you able to buy them at wholesale price?—I used to have to find a guide to take me down and lead me home, and I used to carry the material home myself, and I used to buy it at the least rate I possibly could. Sometimes I would buy a bundle, sometimes I would buy two, and sometimes I would have as many as three bundles of rods. We ought to have about three sorts of rods to go through the basket work. I used to like to have three different sorts, large, middle and small, and if I kept up that quantity I used to do pretty tidily.

The witness withdrew.

Mr. Henry H. Hyams examined.

Mr. H. H. Hyams.

5645. You are secretary of the Jewish Blind Institution?—Yes.

5646. How long have you been secretary of that institution?—Ten years.

5647. What is the number of blind on your books?—Fifty-four.

5648. Do you give pensions weekly or yearly?—We give pensions of 8*s.* per week, 20*l.* 16*s.* a year. We pay the majority of them weekly. The exceptions being a few who live at a distance.

5649. You find it better to give the pension weekly, rather than in one sum once a year?—Yes, the pensioners are people who, as a rule, live from hand to mouth, and if they had 20*l.* 16*s.* at once, it would probably not last the year out. There are a few who live in the country or at long distances, and those we pay monthly, or quarterly, at their convenience.

5650. Is the institution managed by a committee?—Yes.

5651. How many vacancies are there generally yearly?—We do not declare a fixed number of vacancies. It has been the custom now for a great many years to admit every deserving applicant who can conform to the rules of the society, that is to say, every deserving applicant who is a Jew is admitted.

5652. And funds are never wanting?—Funds are constantly wanting, but we do not wait for funds. At the present moment there is a deficit.

5653. But the wealthy and liberal-minded Jews always make up the deficit?—They have done so hitherto. We are very hard up for funds at the present moment, and it is not a very good time to make an appeal, but as a rule we find what we want. It had been the custom till about eight years ago to have a ball once in three years, the proceeds of which were given to the society. We had an ordinary deficit of about 250*l.* to 300*l.* a year, and at the ball about 900*l.* was raised and so made up the amount. Since the last ball I have succeeded in getting every year a few donations, and with what was left as the result of that appeal staved off the difficulty; but I found myself at the end of the year 1885 with the balance at the bank of 23*l.*, and some other step will have to be taken this year, or else we shall be quite out of funds. In fact at the present moment we have not sufficient to pay this week's pensioners. There was a deficit on the working last year of 154*l.*; we commenced the year with 177*l.*, and at the end of the year we had 23*l.*

5654. Have you any endowments?—Yes; if it was not for endowments we should be in a sorry plight. We have 18,646*l.* New Threes and a trust fund of 1,200*l.* Consols. We have not possession of the fund, but the

Mr. H. H. Hyams.

25 Feb. 1886.

interest is paid to us as it becomes due. The dividends for last year were nearly 600*l.*

5655. Do you ever pay the pensioners less than 8*s.* per week?—No, that is a fixed pension.

5656. Do you before you grant the pensions inquire into the circumstances of the applicants as to their moral character, and as to whether they are in receipt of relief from the poor rates, or from any other source?—Yes, we only help those that we consider want relief. I do not mean to say we should refuse those who have some other income, because a blind person cannot always live upon 8*s.* a week; if we consider that an applicant is poor we still give him the pension, although he may have some other income.

5657. Is your society the only one for the relief of Jews in London?—It is the only institution that specially relieves the Jewish blind. There are other institutions for general relief which do not refuse to relieve applicants because they are blind. The Jewish Board of Guardians, I have no doubt, relieves some of the blind people occasionally when they are ill, or under special circumstances.

5658. You do not relieve any but Jews?—No, none but Jews; in fact we could not. Our funds have been left by will to this institution for that purpose, and of course we could not divert them. The invested funds that we have are almost entirely the result of accumulated legacies, there has been no special endowment. We invest all our legacies.

5659. Do you get a certificate from a surgeon as to the blindness; must the blindness be total?—Yes, it must be total and incurable, so far as medical science can say it is. It has happened, I think, once that a pensioner was cured after some years, but the certificate must be that the candidate is incurably blind.

5660. Do you relieve foreign Jews?—Yes; they must have resided in England for five years.

5661. You act strictly upon that rule?—Yes.

5662. Are there any foreign Jews whom you have been obliged to refuse to assist in consequence of their not having completed the requisite term of years in England?—Yes.

5663. Do you communicate with the other institutions in order to ascertain that those whom you are giving pensions to are not in receipt of pensions from other societies?—There is no Jewish institution that allows other pensions to the blind.

5664. But some of the other institutions might give pensions to Jews?—We never have communicated with any institution for that purpose, except the Jewish institutions that allow pensions irrespective of blindness.

5665. But do you know as a matter of fact that any other institutions do give pensions to Jews?—I do not know that they do; I do not think it is likely that they would without consulting me first. There are other institutions that give pensions to Jews, but not specially to blind people, and these do communicate with me; in fact one of those institutions pays its pensions at my office. I lend them the office gratuitously for that purpose, and I know the whole of the circumstances.

5666. (*Dr. Tindal Robertson.*) What is the cost of the administration of your funds?—I have the proof of the balance sheet for the year 1885 before me now. The whole of the expenses were about 100*l.*; that includes the secretary's salary, commission on collection of subscriptions, advertisements, printing, and stationery. The advertisements and printing come to 43*l.* That amount was spent almost entirely in an appeal, the result of which was that the annual subscriptions were increased, and in addition we obtained some donations.

5667. You spoke of your office just now; is that a special office for the institution, or is it an office of your own which you use for that purpose?—It is my own office. I am secretary of several institutions, and I keep my own office.

5668. Then do you charge the society for the use of your office?—No.

5669. Is that included in the expenditure?—No, it is not included here at all?—The society pays me a fixed salary and it is understood that I am to pay the pensioners. I might have paid them at my own private house if I liked; I have no doubt that I could make arrangements to pay them in any way I liked; but the committee knew that I had an office at the time I was appointed, and they may have taken that into consideration.

5670. Do these people apply to you at your office once a week?—Not necessarily. Some of them come themselves and some of them do not; but an application has to be made every Thursday morning at my office unless it is not convenient, and then by arrangement I pay them monthly or quarterly, and in some cases I send cheques by post.

5671. Then the cost of administration last year was about 100*l.*; what was the total amount expended?—The amount paid to pensioners was 1,160*l.* 16*s.*

5672. (*Dr. Armitage.*) How many pensioners have you on your books?—Fifty-four at present. There are five or six applications now which will probably be considered next month.

5673. Have you any limit of age?—No.

5674. Would you take children as pensioners?—We have granted a pension within the last few years to a child nine years old. It is a case in which there is a great deal of illness and special nourishment is required; and after investigation the committee found that the mother was put to additional expense in consequence of the child being blind, and we thought it a fair case for assistance. Of course the child could not get a living at this age, even if it had not been blind, still it was considered that the mother was put to a great deal of expense in consequence of the child being blind, and I believe I saw a certificate at the time from Dr. Mackenzie, that the child wanted a large amount of nourishment; and the committee on that ground granted the pension.

5675. Would you consider it part of your society's work to assist blind children with their education, or are you merely a pension society?—We are merely a pension society; but I have no doubt that in any case in which money was required to assist a blind child with its education the society would grant the usual pension for that purpose.

5676. (*Dr. McDonnell.*) Do you give your pensions independently of the earnings of the individual?—Supposing that a person is able to earn 6*s.* or 7*s.* a week, do you still give him a pension?—It would depend upon circumstances. If a person could earn that amount and had no one dependent upon him probably we should not give him a pension. But in many cases there is a family, and even if the person is able to earn a few shillings a week it is not enough.

5677. As a matter of fact, I suppose you find that every blind person is sufficiently poor to come within the terms of your pension?—Most of them.

5678. Do you know what are the employment of these persons?—As a rule they do nothing now, but they have been at various businesses.

5679. Do you think that the giving of the pension prevents them from doing anything for themselves?—I do not think so, because it is a sum that a poor person cannot possibly live on unless he is living alone.

5680. Supposing that a person was able to earn 7*s.* or 8*s.* a week, would you still give him the pension, so that he may have his earnings in addition to the pension?—If it was a case in which there was anyone depending upon the blind person, a wife or children, we should most likely give a pension; but if a single man was blind, and earning 8*s.* a week, the committee would probably refuse to give him a pension, unless it was shown that his income was insufficient to maintain him.

5681. So that if I was blind and was able to earn 8*s.* a week, and was a single man, you would say: "As "you are able with your work to maintain yourself I "will not give you anything"?—We should not give a pension in any case in which we thought the applicant could earn sufficient to keep himself and his family. Of course if there was no family 8*s.* or 10*s.* a week would be a fair income for a poor person living alone.

5682. If I did nothing, and became very indigent, partly from idleness, should I come within the terms necessary for getting your pension?—That is a hypothetical case, and it is very difficult for me to say offhand what the committee would do in a case like that; it would require a great deal of consideration.

5683. I want to see whether you give your pensions in such a way as to encourage men to be industrious or to be idle?—So far as we can we encourage them to be industrious; but it would be very difficult for us in such a case as you put to ascertain whether it was the man's own fault that he was in need.

Mr. H. H. Hyams.

25 Feb. 1886.

5684. Do you take any pains to ascertain whether a man is able to support himself?—Yes.

5685. If you found that a man was taking any pains to support himself, would you refuse him a pension?—Not unless he earned sufficient. I do not remember any case in which we have refused a pension for such a reason. If a man had a wife or young children dependent upon him, we should take that into consideration.

5686. Supposing that you had an industrious man who was able to make, say 4*s.* a week, if you gave him anything from your pension fund, it would be 8*s.* a week?—Yes.

The witness withdrew.

Mrs. Starey examined.

Mrs. Starey.

5687. (*Chairman.*) You are the secretary of the Somers Town Blind Aid Society?—Yes.

5688. That society was founded in the year 1864, was it not?—Yes.

5689. Is it managed by a committee?—It is.

5690. You take the most active part in the management, do you not?—Yes.

5691. Have you a number of unpaid visitors?—We have. We have no paid officials whatever, except the man who takes care of the room, who has 1*s.* a week; with that exception it is all voluntary work.

5692. Have you a room for the benefit of the blind?—A room in a board school lent to us rent free on Thursday evenings.

5693. Is that for recreation?—Yes.

5694. Do you give lectures, or what recreation do you provide for the blind?—It is chiefly music. We have concerts, and lectures, and readings, and all sorts of things. There is something every week all the year round.

5695. Do you also have religious services?—Yes, occasionally.

5696. You receive subscriptions from the trustees of the Gardner Fund, do you not?—We have for the last three years.

5697. Are they annual grants, or only donations?—It is an annual grant.

5698. Do the Clothworkers' Company also give you an annual grant?—We have had only one donation from them.

5699. Do you give medical advice, and aid generally to the blind?—Yes, to all our members who wish it, and who are within reasonable distance of where our physician lives.

5700. Do you mean those who subscribe to your society?—No, I mean the members of the Blind Society. We have 160 members.

5701. Do you not go outside that number?—No.

5702. Are you able to send the blind to convalescent homes?—We have done so for the last four or five years to a certain extent.

5703. Do you assist them in getting work or materials to earn their own livelihoods?—Yes, as much as we can.

5704. Do you give them assistance in the shape of loans or of small grants?—We do both, but generally in the shape of grants.

5705. You find, I suppose, that the loans are not always repaid?—It is a tax upon them. We prefer giving them less as a grant, as a rule.

5706. Do you give your pensions generally to the aged blind, or do you sometimes give them even to those who are younger, if they are unable to work?—It is not according to age; it is according to their real necessities. The pensions as yet are not established pensions, that is to say, that they cannot count upon them for life.

5707. They are only grants from time to time?—We sometimes give them for so many years until the people are able to obtain other pensions, and so on. We have not sufficient funds to establish a real system of life pensions.

5708. You have no endowment?—No, none whatever.

5709. Do your lady visitors take it in turn to visit the homes of the blind?—No, they take charge of one or two or three generally. They go to them regularly.

5710. Do they read to them?—They read to them.

5711. Or do they teach them to read?—They generally read to them.

5712. Are they able to teach them to read?—One or two of the ladies can do so, and have helped the blind men, but they do not do so as a rule.

5713. Do you find that most of the blind cannot read for themselves?—A great many of our members are very aged, and have not been able yet to learn.

5714. They have become blind late in life and, therefore, they have not been able to learn?—Yes.

5715. Do you teach any particular type?—No. You see teaching is really not our specialty.

5716. Can you speak much with regard to those who have been educated or trained in any of the industrial or educational institutions for the blind in London?—We have a good many who have been in St. George's-in-the-Field, and St. John's Wood, and so on.

5717. Amongst those whom you know who have been so trained, what number are able to earn their livelihood, or partially to earn their livelihood after they leave?—I should say that hardly any of them can earn their livelihood entirely. A few earn it partially, but it is only perhaps by going to Berners Street, or to some of those places.

5718. Unless they can get regular work you think that the blind do not generally succeed when they set up for themselves?—From my experience of our people I think it is very seldom that they do succeed.

5719. Do you think that there is any want of some depôt or institution which would give work and provide a sale for the work of the blind after they leave these institutions?—I think there is a decided want. With the exception of course of the work that many have at Red Lion Square and at Berners Street, there is very little opportunity for them; and we find that if they set up on their own account it is almost always a failure.

5720. What is the actual area of your society; is it confined to Somers Town?—No, it was only because we met there that it was called the Somers Town Society.

5721. What is the area?—It is principally the North of London. The bulk of our people are in St. Pancras and thereabouts; but we have them from all parts; we have some from Westminster and some from Islington, and so on.

5722. They come of course to your services and to your recreation parties?—Yes.

5723. Before they become members do you make inquiries as to their moral character?—Yes, so far as we can.

5724. Do you take any that are begging in the streets?—Yes, we have some. We try to prevent it if it is possible in any way; but there are some who must do it unless we give them a sufficient pension to keep them; there seems to be no other course open to them.

5725. Do you find that those who do beg in the streets or who play instruments in the streets get a good livelihood from it?—No, not very, I think. Some few do who seem cleverer than others; but I do not think that many really get a livelihood, as a rule.

5726. You have never known them get as much as 18*s.* a week?—They have never told me that they have, I have not known them to do so. I know one person who sings only on Saturday evenings, and she frequently gets 15*s.* and 16*s.* in the one evening. I know that as a matter of fact. But some of the others (and I have tested their cases very well) make very little.

5727. But I suppose that after all, however trained a blind man or a blind woman is, they have an up-hill game to play, and it is only the cleverest and most persevering who succeed; is that your experience?—Yes, it is indeed.

5728. Do you think that the majority of the blind, even if they were taught some trade, would probably

Mrs. Starey.

25 Feb. 1886.

not be able to earn their livelihood by it?—I do; that is my experience, most decidedly.

5729. But do you admit that there can be an improvement in the teaching of the blind the various trades which they might pursue?—It has often struck me that other trades might be opened up for them, only it wants time and ingenuity of course, and great resources too to work out a plan. But I think that if that could be done, even if they only earned a very little, the employment would be very beneficial to them. We find that it is very demoralising to them to have to go from society to society and get a little here and a little there, just to make up a livelihood.

5730. And of course there must always be a temptation where pensions are to be got to resort to them rather than to industry for their livelihood?—Of course, we have not at present any person in our society who was born blind; they have mostly lost their sight in adult life through accident, or illness, or weakness, and so on; a good many from sheer weakness, I think. In the case of these people, not only is their eyesight deficient but very often their hearing, and in many cases their mental powers also to a certain extent. All the nerves of the head are affected, I suppose, by what has destroyed the eyesight. We have a good many people of that kind who are really quite incapable of maintaining themselves anyhow; but still if they can do even a little towards it it is far better for them than having it all given.

5731. Do you think that there is a want of co-operation or inter-communication between the different societies for the assistance of the blind in London, and that more might be made of the funds which are now distributed, by interchange of ideas and interchange of knowledge about the recipients of these pensions?—I think more might be done in that way, decidedly. I think, for instance, that it would be very much better for a blind person to receive say 30*l.* from one society, than to be receiving 10*l.* each from three societies; and that it would be better for one society to entirely provide for a smaller number than to give partially to a larger number. It is less demoralising in every way to the blind themselves, I think, if it could be done.

5732. Do you think it is advisable to give the pensions weekly, or monthly, rather than in a lump sum once a year?—We find with our people that it is very much better to give them weekly.

5733. You think then that their receiving these large sums in bulk really may tend to demoralise the blind and expose them to temptation?—I think it does so in many cases. The poor blind are not always fitted to take care of their own money; and if it is given weekly you ensure a more steady life and regular comfort for them.

5734. Have you ever known cases of money being squandered away, which has been given in comparatively large sums, in the way of pension?—I have known cases in which people get into debt, counting upon 5*l.* or 10*l.* which comes in at a certain time; then when the money comes in, of course, it all goes in the payment of debts, and in one way the blind person is as badly off as he was before. I think it is a very bad system to give the pension all in one sum.

5735. Of course the tradesmen naturally give them credit if they know that they have a pension?—Yes; I think that with people so poor as ours are, and in their circumstances, it is decidedly better that the payments should be weekly.

5736. Do you know at all what assistance the guardians give in your part of London to the blind poor?—They give very little outdoor help at all to the blind. Of course, there are some cases in which they receive it, but they are very rare.

5737. Do you ever supplement what the guardians give to the blind?—Yes.

5738. It is not a bar at all with you?—No, not at all; it is the reverse, because people who are receiving parish help are cut off from a good many other societies.

5739. A good many other societies make the receipt of parish relief an absolute bar to the grant of pensions?—Yes.

5740. So that the class that receives relief from the guardians is rather left out in the cold?—Quite so.

5741. There are a few societies, I suppose, like yours, but not many, which do give relief to such persons?—There are not many, I think; in fact, we generally consider that our society fills up little gaps between the other societies. For instance, many societies give their pensions to blind persons when they become 61 years of age; we help them on till that time frequently. Those are the things that we try to do. We have not really any very stringent rules. Our society began in a very small way; it has worked up from year to year, and we have done what we could according to circumstances.

5742. Have you any prospect of extending the operations of your institution?—We hope to do so; the income each year has increased steadily.

5743. And you get a larger number of these blind people together for your meetings?—Not a larger number of members. Our work is very personal; we like to know them all as much as we can personally, and we think it better to limit the number. Our room for one thing would not hold many more, and we could not supervise them personally so well; so that as yet we have limited the number to the 160.

5744. Is the membership sought for?—Very much indeed. We always have a long list of applicants waiting, and they attend our meetings extremely regularly; we generally have crowded meetings.

5745. When do your elections of members to fill the vacancies take place?—We have a committee meeting about three times in the year and elect members.

5746. Do you employ your own medical man?—We have an honorary physician.

5747. Does he give his assistance gratuitously?—Yes.

5748. Do you send any of the poor blind to any of the London hospitals?—It is not part of our system to do so; but if we find that they need such assistance we help them as much as we can with letters, and so on.

5749. Do you work in co-operation with the Charity Organization Society at all?—They have investigated our society, and they are very friendly towards us; but we have no other communication with them whatever. Two or three of our members receive help through them.

5750. Do they contribute any money to your funds from time to time?—I receive money for two people through them. They pay the money to me; it goes into our funds, and we supplement that, and give it in weekly pensions.

5751. Supposing that blind persons apply to individuals for charity, and the individuals referred them to the Charity Organization Society, would the Charity Organization Society apply to you for information if they were members of your society?—Yes, if they were members. Once or twice we have had to write about members of our society, but not frequently.

5752. Are there any suggestions which you would like to make with regard to the general management of the education, the training of the blind in London?—We have not many very definite suggestions; of course I am always so busy about the small practical work that I have not time for that; but I think it would be a very excellent thing if a little more combined effort could be made for them. Of course it has been done very much more of late years than it was a few years ago. I have a very great objection to asylums and places of that kind; and I find that our blind, without exception, object to them very much.

5753. They like to be assisted in their own homes?—Yes.

5754. Can you speak from knowledge as to whether it is desirable that the blind should be educated together with seeing children?—We have not very many blind children, but as a rule I think that it retards the seeing children.

5755. That is because more time is taken up with the blind children, and therefore less time can be given to the seeing children?—Yes We have centres of course in the board schools for blind children.

5756. Do you know the board school classes for the blind?—Yes; at Aldenham Street I think there are five blind children at present, and I sent another little boy the other day.

5757. That is purely for the blind?—Yes, a "blind" teacher comes so many times a week, and then at other times the blind children are with the sighted, and that seems to work very well.

5758. After the blind children have had a certain amount of special training they are taught with the sighted children, and benefit by the same instruction as far as possible?—Yes, they are doing so in Aldenham Street.

Mrs. Starey.

25 Feb. 1886

5759. Have you thought at all whether it is desirable that institutions like yours should be extended all over London to meet the cases which you say are not met by other institutions?—I think it would be a very excellent thing if that could be done, so that we might each keep to our own district. The blind would be less likely to be overlooked then, and it would meet a great want, I think.

5760. What means have the blind of getting information as to the various institutions which exist in London for their relief and assistance?—I do not think they have any very definite means of getting information at all.

5761. There are a variety of institutions to which they can apply, but there is no definite information circulated in any way?—No, not that I know of. In the case of some of them of course when blindness first comes upon them they are extremely ignorant about all these things. Several men I know have applied to the parish as the only resource, and that has injured them very much in after years.

5762. Does the relieving officer furnish them with all the requisite information as to any institutions before giving them any assistance?—No, I have not known that that has ever been done. I do not know, of course, whether the relieving officers know that giving them parish help would disqualify them for pensions.

5763. I am asking you these questions rather with a view of ascertaining whether those upon whom blindness comes suddenly have any ready means of getting information as to the best way of obtaining relief without applying to the guardians?—I do not know of any special means for that.

5764. For instance, do you think it would be a good thing if the relieving officer were able to furnish them with that information?—It would be a very good thing, I think, if the relieving officer could furnish them with any information, but I do not know that it is done at all.

5765. Do you know whether similar institutions to yours are started in any of the country towns; have you been in communication with any institutions of a similar character in any other part of England?—No. I have been over a good many asylums and so forth, but I do not know of a society like ours.

5766. Who was the founder of your institution?—It was founded by Mr. Wark; he supplied the means, and a blind man, Mr. Ireland, who is still our leader, took the charge of it. It was started in a very small way in the year 1864 with very few members. At that time Mr. Ireland was blind, and in a very depressed state, and it was thought that if he had something to do for other blind people it would help him; and Mr. Wark said that he would supply the means, and for many years it was a very small affair; there were no lady visitors, no pensions, and no relief given.

5767. Does Mr. Ireland conduct the prayer meetings that are held?—We have called him the conductor. He pays the guide money, and he is the head blind man. He does nothing else specially now.

5768. Have you a clergyman at the head, so far as conducting the services goes?—We generally invite one.

5769. But there is no one specially appointed?—No, our president, Dr. Dykes is a minister, but he is very seldom there, and we very often invite a clergyman (it is not always a clergyman) or some well known Christian friend, to take special meetings. Mr. Ireland and one or two of the other blind persons very often take part in the meetings, but Mr. Ireland does not conduct the meetings.

5770. You endeavour to teach them singing at these entertainments in the evening?—We always do sing, but not in actual classes, and we sometimes practise singing a little.

5771. Have you any acquaintance with the teaching of music to the blind?—Not with our people.

5772. You have no tuners?—No, none who have been trained. There were one or two whom we thought of trying to have trained, but they were too old and it was of no use. They are chiefly uneducated people of course, though some of them are very intelligent.

5773. (*Dr. Tindal Robertson.*) Can you tell us what the total income of your society was last year?—The subscriptions and donations amounted to 408*l.* and the whole of the receipts amounting to 648*l.*, and the balance at the end of the year was 137*l.*

5774. Your income is made up of subscriptions, donations, and the grants from the Gardner Fund; have you any grant from any other company or society?—With the exception of the grant from the Cloth-workers' Company we have had no other.

5775. And your expenses, I think I understand you to say, were absolutely nothing, except this 52*s.* a year that you pay to the man for looking after the room?—With that and the printing of the report and postage I think the expenses came to 14*l.* last year.

5776. And beyond that you have no other expense?—No other expense whatever.

5777. Almost the whole of the work therefore is what you may call voluntary?—Yes, it is quite so.

5778. The objects of the society are, I suppose, in the first place to give assistance where it is required for the comfort of the blind people; and secondly to entertain them, and give them some kind of recreation?—Yes, those are the chief objects. The objects are set out in the report. We consider the benefits of our society to be fully as much moral and religious as monetary.

5779. What is the average number of attendants at your recreation evenings?—I could hardly tell you the exact average, but I should think that it would be from 130 to 140.

5780. That is the average attendance out of the 160 members?—Yes, there are very few absentees, except those who are ill. They enjoy the evenings so much.

5781. Could you tell us what they particularly like, what is their favourite amusement; is it music, or reading, or any particular kind of recreation?—I think the generality like music best. Some of the men enjoy lectures extremely.

5782. Do you have music at all the evening entertainments?—Not at all of them. We sometimes have the entire evening taken up by a lecture.

5783. You have about 160 blind persons in your society; do you think that there would be many more applications if you could take them in?—Yes, a great many more.

5784. When you are arranging the number to be admitted do you find that your applications are in excess of what you can arrange to take?—Yes, we always have a long list. We have just now I think about 17 who are quite approved, and who are just waiting their turn.

5785. With regard to education, I think you said that you had yourself sent a child to one of the board schools in your neighbourhood?—Yes, last week.

5786. I suppose I may understand from that, that you approve of the system of education of the blind children which is pursued in the board schools?—So far as I know about it, I do.

5787. And you think from what you know of the blind children that after they have been taught by teachers for the blind the subsequent communication with sighted children is more likely to make them self-reliant, and vigorous, and strong, than they would be if they were left alone, or brought up in a blind school by themselves?—Yes, I think very decidedly so.

5788. With regard to industrial occupations, do you think that any of these poor people that you have spoken of as getting their living in the streets by begging or playing musical instruments, or anything of that kind, would, if the opportunity was presented to them, change places with those who got their living by manual work?—I do not say that all would, but I am quite sure some would. We have some people who detest the street life, and yet there is no way open for them but playing on an instrument or something of that kind. Of course some get demoralised, and they like that sort of free and easy life, and those, perhaps, would never settle down to a trade; but we have some, I am sure, who would do so if they had the chance.

5789. I am anxious to know that, because my own experience teaches me that when once these people do that sort of thing they get to like it?—Yes, some do no doubt; but still we have some now who would gladly leave that sort of life if they had any other chance.

5790. Can you give us an idea about how many out of your 160 members are making their living in some in-

Mrs. Starey.

25 Feb. 1886.

dustrial occupation apart from begging or anything of that kind?—Certainly, upwards of 20 work at Berners Street, and a good many work for Dr. Armitage.

5791. Do any of them work at their own homes and take their work elsewhere?—Some of the girls for instance do fancy work, and we have several basket makers, and chair-caners, who work at their own homes, and several have mangles.

5792. Do you find from them, or from the ladies who visit them, that they have much difficulty in getting rid of the products of their work?—As a rule they have great difficulty in doing so.

5793. Judging from your experience, do you think it would be an advantage that there should be some central places where work could be sold, or exposed for sale, and where materials could be bought at a cheap rate?—I should say that it would be a very great advantage, an extreme advantage to them.

5794. Would you not be able to furnish to such an establishment as that a register of persons whom your visitors would be able to look up, and ascertain from them whether they would avail themselves of such means?—Yes, we could easily get statistics of that kind if it was necessary. One of our men went to the institution at Notting Hill, but he found it a failure; he could not support himself and his children by it, and he left again. We thought that he was in a comfortable position for life, but he was not there many months. He is a very excellent workman.

5795. (*Dr. Armitage.*) With reference to the difficulty of persons who have just become blind knowing what to do, have you seen a fly leaf that was widely circulated by the British and Foreign Blind Association some years ago called "Advice to people who have just become blind"?—No, I have not seen it, and I never heard of it.

5796. You do not know that it was widely circulated through the ophthalmic hospitals?—No, I did not know that.

5797. Do the blind from the workhouses attend your meetings?—We have seven, I think. It is now only from St. Pancras.

5798. They are allowed to come?—Yes.

5799. It is a great pleasure to them, I suppose?—Yes, a great pleasure, they are allowed to stay out until the end of our meetings if we have anything special. They are very kind to them.

5800. Do they come pretty regularly?—Yes, quite regularly.

5801. Do you think it would be a desirable thing to have social meetings occasionally near the principal workhouses, at which the blind inmates could attend?—I think it would be a very great pleasure for them.

5802. Would you see any objection to it?—None whatever, if they were allowed to come out for it. I think it would be a very great benefit to them.

5803. Are many of your people married to blind persons?—We have 11 blind couples.

5804. Do you think that it is a good thing for the blind to intermarry?—We never approve of it, or like it; but at the same time we cannot help it, and we think those who are married couples are shut out in the cold very much, and we never object to help them.

5805. Do you think that such intermarriages have occurred in consequence of the blind of both sexes coming together at your meetings?—I should think it is quite possible, but I do not at this moment remember any case of it.

5806. If it happened that a blind man and woman attending your meetings were to get married, would they cease to be members of your society?—Oh, no, they would not cease to be members. In one or two instances when a blind person has been married we have taken the husband or wife on to our society.

5807. Then what steps do you take to prevent these intermarriages?—Simply by giving private advice about it. The men and women are separate at our meetings; they have different sides of the room as far as possible.

5808. But they come at the same time?—They come at the same time and they go at the same time.

5809. What specific objections do you think there are to blind people intermarrying?—I think that the difficulty which arise afterwards are very great sometimes.

5810. The difficulty in earning a living?—Yes, for one thing; and then of course taking charge of the children soon afterwards very often entails great difficulties. I have spoken privately to many girls about it, girls that I thought perhaps intended to be married, and they have always said: "Oh, you do not look at it from our "point of view; there is nobody in the world that needs "sympathy as we do, and nobody can give it to us but "another blind person; and one rent will do for both, "and if we are going to starve we had rather starve "together than alone." One or two have said that to me. Of course that is their point of view. We have just those 11 couples. I counted them lately, and we do not find that they get on any worse than the others. They do manage somehow to pull through, and to take care of their homes.

5811. But still, supposing that a blind man is earning 12*s.* a week, and that the woman whom he marries is earning say 6*s.* a week, that will make an united income of 18*s.*; but if they had a family the woman would very often not be able to earn her 6*s.* a week, so that their income would be reduced, and they would have more mouths to feed?—Yes, that is very true, and that is why we object so much to the blind intermarrying, because these difficulties come afterwards, and of course then they are helpless to prevent them.

5812. From your experience of those blind people whom you know who have intermarried, do you think that the wives are able to look after the children properly?—They seem to do so. Their homes as a rule are just as tidy as the homes of the sighted people. Of course I am only speaking of the few that I know.

5813. Do you think that the children are as well trained as if the mother was seeing?—They are in some cases quite as well trained, I think; but of course very much depends upon the individual character of the mother and father.

5814. As with seeing persons?—Yes, just so.

5815. Your principal objection to it then is the financial difficulty?—Yes.

5816. (*Dr. McDonnell.*) I think you said that very few of those people who attend your meetings receive parochial outdoor relief?—Not many.

5817. But it would not cut them off from you if they did?—No, as I was saying, if we found that they had as much as would enable them with a little help to live in a little home of their own we should be more ready to help them.

5818. Do you know of any who receive parochial outdoor relief?—Yes, I know of some, but I have not the statistics.

5819. Can you give us any idea upon what ground they receive it; is it given on any special ground? Why should one blind person receive outdoor relief and another not? Blindness, one would think, would be a tolerably good ground for giving outdoor relief?—Yes, one would think so. In St. Pancras I think there is a great tendency now to take people into the workhouse as much as possible rather than to give outdoor relief; and some of our own people have from time to time had their outdoor relief stopped: but it would have been the same, I think, if they had had sight.

5820. But blindness is a distinct and very simple test; it is a thing that cannot be feigned; and it is a thing that does not depend upon dissolute or drunken habits in a great degree; is it not applied as a test upon which outdoor relief may be given? Do they object to give outdoor relief to blind people as much as to sighted people?—Yes, I think so.

5821. But you are not able to tell us the grounds of exemption in the case that you speak of now?—No, I have not thought of that.

The witness withdrew.

Adjourned to to-morrow at 12 o'clock.

32, Abingdon Street, Westminster.

Friday, 26th February 1886.

PRESENT:

LORD EGERTON OF TATTON IN THE CHAIR.

THE RIGHT HON. ANTHONY JOHN MUNDELLA, M.P.
W. TINDAL ROBERTSON, ESQ. M.D.
E. C. JOHNSON, ESQ.
ROBERT MCDONNELL, ESQ., M.D., F.R.S.
CHARLES E. D. BLACK, ESQ., *Secretary.*

MATHIAS ROTH, Esq., M.D., examined.

M. Roth, Esq., M.D.

26 Feb. 1886.

5822. (*Chairman.*) You are honorary treasurer and secretary of the Society for the Prevention of Blindness and the Improvement of the Physique of the Blind?—Yes.

5823. You have had considerable experience in ophthalmology, and have written upon the subject?—I am not an oculist, I am a physician; but I have taken a great interest in the subject of the causes and prevention of blindness, and with the aid of a few friends I established, about six years ago, the Society for the Prevention of Blindness and the Improvement of the Physique of the Blind.

5824. Have you any suggestions to make to the Commission with regard to the best means of spreading knowledge as to the preventible causes of blindness?—If you will permit me for a moment I will refer to this table on the wall, which shows the causes of blindness in 2,598 cases. The first columns, coloured black, are cases of congenital blindness. People say you can do nothing for congenital blindness, but we know that this congenital blindness is caused in many cases by the intermarriage of blind persons.

5825. Is that a proved fact?—We know that congenital blindness is due to that cause in many instances.

5826. We have had it in evidence that the children of two blind persons are not invariably, nor to any large extent, blind; have you any evidence to the contrary?—I have before me one of the books published by the Society for the Prevention of Blindness, in which more or less evidence is given to show that congenital blindness is caused by the intermarriage of blind persons; but I wish you to understand that I do not mean that every marriage between blind persons has necessarily the effect of producing blind children, but we know that as a consequence of intermarriages between the blind there occur eye diseases or blindness. A second cause of this congenital blindness is intermarriage between near relations; we find in those cases a certain number, not many, where congenital blindness is produced.

5827. That does not apply to blindness only, the intermarriage of near relations tends to produce a weaker offspring than in cases where there is no such relationship?—Yes. Then there is another cause of blindness, where mothers, while pregnant, have been exposed to some fright or have experienced some mental shock.

5828. Short-sightedness is hereditary?—Yes.

5829. Would you go so far as to say that blindness is hereditary?—Some congenital blindness is hereditary.

5830. Supposing two blind persons married who were not congenitally blind, but who had become blind by accident, you would not say that they would be likely to produce blind children?—They would not be likely to do so; but sometimes they do.

5831. Is there any case known where two people who have both become blind from accident in mature years have had blind children?—I am not able to give you a definite answer upon that question. With respect to the first group of cases of blindness in this table, namely, cases of congenital blindness, I believe that those three causes that I have named contribute to produce such congenital blindness; therefore, the first suggestion which I would make is that it is desirable to make known to blind people that it is not good for them to marry other blind people. The second point, with regard to consanguinity, has been already taken up very much by the public and also by the profession, and near relations are advised not to intermarry, particularly if there is some tendency to disease in the family. With regard to the third cause of this congenital blindness, it is rather difficult to prevent it. We can only warn women who are about to become mothers, to try to avoid anything which would be likely to give them a mental shock. Then in the second group of cases, coloured red on the diagram, there are high and low columns according to the per-centage of each cause. The highest column represents the per-centage of cases about which you have probably had evidence from my medical friends, namely, cases due to inflammation of the eyes of the new born. Then the next column which shows a high per-centage represents cases of trachoma and blennorrhœa in the adult; these are eye diseases which produce blindness. You have no doubt heard that the blindness produced by inflammation of the eyes of the new born can be perfectly prevented; every such case can be prevented, and if unhappily some cases occur they can be perfectly cured.

5832. We have already had evidence upon that point; but have you any suggestions to make with regard to diffusing a knowledge of the means of prevention of diseases of the eyes in the new born, especially in country districts?—Our society has issued this leaflet, "Advice to mothers who do not wish their children to be blind" (*handing in the same*). I may mention that in Ireland the authorities have been taking steps towards making the registrars of births, deaths, and marriages the means of diffusing this information in that country, but unhappily the Local Government Board of England and Scotland have not taken any steps in the matter.

5833. Something of the kind has been done in Germany, I believe. Instructions have been issued in that country to midwives and nurses with regard to precautions to be taken in the case of newly born children suffering from purulent ophthalmia?—Yes, this is a leaflet published by the Saxon Minister of the Interior, which has been translated for our society, (*handing in the same*).

5834. Have you anything further to say with regard to the class of cases of which you have just been speaking?—I wish to say a number of these diseases can be cured, but they are not cured, for several reasons; first, through neglect of the patients themselves, and, secondly, I am sorry to say, through ignorance of medical men; and that leads me to make this suggestion, that this Royal Commission would be kind enough to suggest to the Council of Medical Education that no medical man should be permitted to obtain a degree without having studied eye diseases and having passed an examination in them. In Ireland this is already done, and as it is done in Ireland I see no reason why it should not be done in England and Scotland.

5835. Will you now proceed to the next class of causes?—These columns coloured brown in the diagram represent cases of accidents and unsuccessful operations. People say you cannot prevent accidents, but I beg their pardon; I have a leaflet here which is issued by the society, containing "Hints for the prevention of the most common accidents causing blindness," (*handing it in*). To give you an instance: very often you will find in a school playground that one child will have a pencil in his hand, and another will have a pen, a hair pin, or penknife, with which they wound the eyes of their fellow scholars. These are accidents which can be prevented; the teacher has the means of prevention in his own hands. Then there are many other accidents which are preventible; for instance, those which arise in the uncorking of soda and aerated

M. Roth, Esq., M.D.

26 Feb. 1886.

waters; and there are a number of other trades in which accidents occur which can be prevented. You only want to give people the necessary instruction to prevent those accidents. Then very often an accident will arise by a person trying to undo a knot with the aid of a pin, fork, or a hairpin; the moment the knot is undone the tape or string suddenly gives way, and the pin or fork strikes the eye. No doubt oculists have more to do with such accidents than I have, but I have no hesitation in saying that a large number of those accidents, which are the causes of more than 10 per cent. of blindness, could be prevented if instruction were given with regard to their prevention; and therefore I suggest that it would be desirable to give instruction in training colleges to school teachers; not only in general hygiene, but in ocular hygiene, because, apart from those accidents, shortsightedness is produced to an immense extent in schools by bad positions, by bad light, and by many other influences. I have another paper here which has been issued by our society, entitled "Ocular Hygiene, or instructions for preserving a good eyesight" (*handing in the same*).

5836. Do you think that all teachers in our schools should be furnished with instructions of this kind?—Yes; Dr. Jansen, at the head of the Bureau d'Hygiene at Brussels, has written a little pamphlet in which instruction is given to schoolmasters not only with regard to ocular hygiene, but with regard to every infectious disease. A certain amount of elementary knowledge is desirable for every teacher, and this can only be given through the training colleges. If such a suggestion came from this Royal Commission I think it would have great effect, whereas a suggestion of that character coming from a private individual meets with no attention.

5837. We have had it in evidence that a knowledge of ophthalmic surgery is required to a certain extent at the College of Surgeons?—There are 14 medical schools where no instruction is given in ophthalmology, while in other schools such instruction is given, but the students are not obliged to attend the course.

5838. Will you now go to the next class of causes?—These columns coloured green on the diagram show the comparative number of cases of blindness caused by various diseases of the human body. The per-centages are very small except those caused by atrophy of the optic nerve by disease of the brain, the per-centage of those cases being 6·96. Then comes atrophy of the optic nerve by disease of the spinal marrow, 2·33 per cent.; and then we have blindness caused by various eruptive diseases, among others small-pox, the per-centage of blindness from small-pox being 2·21. That is a cause of blindness which it is desirable to bring prominently before you, because it is a disease which is to a great extent preventible by vaccination. In France, the number of people who became blind through small-pox, before vaccination was introduced, was 35 in 100, now the number is 5 to 6. As we have so much anti-vaccination agitation now-a-days, I refer to those figures to show how desirable it is to impress upon parents, schoolmasters, and others, the importance of vaccination as a preventive of blindness. Then we have another class of cases, namely, cases arising from injuries in certain trades. In certain trades the eyes of working men are liable to be injured through pieces of metal or stone getting into them, or through the great heat which is required to be kept up at certain works. In many cases the men do not adopt the precautions which they ought to adopt. When I was in Birmingham some time ago, I visited a manufactory where from the nature of the work the men's eyes were liable to be injured by chips of metal flying into them. I saw a pair of goggles near one man, and I said to him, why do you not put them on? He said, Oh! it does not matter. I found out afterwards the reason why men are so careless; in every trade where the men are exposed to some danger the wages are much higher. This is the reason why they do not like to do what is requisite for preventing such accidents. Wishing to study the causes of blindness in particular trades, I, with the help of Mr. Shipton, the Secretary of the United Trades Societies in London, sent a circular to 100 different trades, in which I asked these questions: Have you any eye disease or cases of blindness amongst your members, if so, what has been the cause of such eye disease or blindness, and have you any suggestion to make with a view of preventing such eye disease or blindness; I am sorry to say that to those 100 circulars I had only three answers. I give you that as a proof that efforts by a private individual for the welfare of the working class may not result in the success which he anticipates; but if such questions came from this Royal Commission you would probably obtain a great amount of information about the causes of blindness in a large number of trades, and then you would be able to suggest a means of counteracting them.

5839. Which were the trades from which you got answer?—My aim was to call your attention to the difficulty of getting at the causes of blindness, and I thought with the help of the Royal Commission this information might be obtained. The London Consolidated Society of Bookbinders, The London Operative Gas Meter Makers Society, and a third trade society, the name of which I do not remember, are the only three which have answered.

5840. Apart from a limited number of trades in which accidents which may cause blindness are obviously liable to happen, are there various trades in which the workmen are liable to become blind?—Yes, all those trades, for instance, in which lime is used; lime is extremely dangerous to the eyes, and then there are other trades where the eye is liable to be injured by chips of metal coming in contact with it. Those accidents can be prevented by wearing goggles. In my opinion, of every three people at present blind, two are blind from ignorance and neglect.

5841. Have you known cases of workmen in glass works becoming blind from the great heat?—No; but the subject was brought before the Society d'Hygiene in Paris, of which I am a member. A gentleman connected with some large looking-glass works, wrote a paper to show that the idea of the eye-sight of working men being injured in the manufacture of looking-glasses was not well founded; they use a kind of coloured glass to look at the fire when it is very intense, and, according to the statement of this gentleman, they do not suffer. As to ordinary glass works I have no information.

5842. Did you see in the Inventions Exhibition last year a machine for preventing accidents from charging bottles with aërated water?—No.

5843. That would be a step in the direction in which you wish action to be taken?—Yes.

5844. Have you any remarks to make with regard to the physical education of the blind?—In the physical education of the blind we have to a certain extent to follow the same rules that we go by in the physical education of those who are not blind; but in the physical education of the blind there are some difficulties which we do not encounter in the case of other people. It is difficult to make them do certain movements, because they cannot see. About 24 years ago I had a French artist living with me, and I got him to make 36 models from nature to show various bodily exercises adapted for the blind; these models and these sketches (*producing them*) show the a b c or elementary movements of the human body. These exercises can be gone through without the aid of any machine or apparatus. It is not necessary for the development of the human body to have any gymnastic apparatus, and, just as we can express anything we have to say, or write with the 24 letters of the alphabet, and also a great deal of nonsense, so with a gymnastic apparatus a good deal of what is done is useless. If you wish to develop a man as a gymnast, or an athlete, a soldier, or fireman there is no objection to the use of gymnastic apparatus, but if you want to develop harmoniously the human body for ordinary purposes nothing else is necessary than the free exercises of the Swedish system, invented by Ling, which I have tried to get introduced in the schools of the London School Board for the physical education of all pupils including the blind. Then it is desirable that teachers in schools should be instructed to do all they can to prevent short sight, which is produced by bad positions, by wrongly constructed chairs or benches, and by bad light. The paper which I now hand in (*producing the same*) gives instructions for preventing short sight in young people, by directing them to keep their eyes a certain distance from their books, and by giving each child a comfortable seat with a support for the lower part of his back; then it is suggested that he should work at a sloping desk, and that he should be placed so that the light should fall from the left and from above, and that there should be plenty of light and so on. The lower part of the backs of chairs generally, like those in this room, are made concave, which is very objectionable. At my suggestion, at Norwood they have changed the shape of the backs of the chairs and made them convex. When the back of a chair is made convex it gives a better support to the sitter than when it is made concave. Dr. Armitage has taken up the idea, and at Norwood Dr. Campbell, who is an eminent educationist, says that the whole education of the blind is based on their physical education; he considers that the physique of the blind should be the basis of their education in order to make them independent. As regards the physique of the blind, I will hand in this paper the Physical Education of the Blind, which our society have issued (*handing in the same*). First, it is necessary to prevent what interferes with the natural growth of the body, and secondly, to develop the body by proper exercises. The food at some institutions is very bad, they give them food to fill the stomach, but it is not good food. Then with regard to dresses, they are too tight. At St. George's I saw that the girls were uncomfortably dressed. I am sorry to say that in all the English institutions, except Norwood, the physical education is very much neglected.

M. Roth, Esq., M.D.

26 Feb. 1886.

5845. Does not that apply quite as much to the seeing as to those who are blind. Of course your argument goes so far as this, that the blind ought to be taken quite as much care of, in fact rather more care of, than those who see, because the difference of blindness makes them averse to any physical exercise, because they do not see where they are going to; your proposal is that in schools and institutions for the education and training of the blind they should have all these exercises rather forced upon them to make up for the natural exercise which seeing children take?—Yes, in fact to develop them. I paid a visit to a blind institution in Edinburgh, and there the women were sitting knitting all day, moving their bodies monotonously forward and backward, which movement must be injurious to a person suffering from asthma or cough or catarrh; blindness is quite sufficient affliction for anyone to suffer from without the aggravation of other ailments. In blind institutions more attention should be paid to the improvement of the physique than in institutions for seeing people; it is much more necessary for the blind.

5846. Have you inspected any schools for the blind in London?—Yes.

5847. Do your remarks apply to them?—I am sorry to say that they do. On the establishment of the society with which I am connected I went to all the schools to see for myself how they were conducted, and I sent out circulars to other institutions which I did not visit. I went, for instance, to St. George's-in-the-Fields, then there is one near the Swiss Cottage which I visited; then there is a little school at Kilburn, Miss Nowbury's School, which I also visited, at which school there was a teacher paid by our society in order to introduce the free exercises.

5848. Have you visited Miss Rye's School in East London?—Yes; there were no backs to the benches at that school, and I procured from my society a little money to provide backs for the benches; the children were taught in a subterranean room, not at all under healthy conditions. Miss Rye seems to be a very kind good lady, she is the daughter of a surgeon, is almost blind herself, and takes much interest in the work, but she has not the means of doing things properly.

5849. Are you of opinion that it is desirable to educate the blind as far as possible with seeing children?—I think in some respects it is useful to do so.

5850. Do you think it would be necessary to give them some special instructions in classes by themselves before they mix with other children?—Yes, that is absolutely necessary, that is what is done by the London School Board. I went to a school in Bayswater where there were some blind children.

5851. Do you approve of the mode of teaching the blind adopted by the London School Board?—No, I have accused the London School Board of neglecting the physical education of blind children.

5852. Have they remedied those neglects which have been pointed out by you?—I do not think so; I think they have done nothing. I went, for instance, into a room which was scarcely a fourth of the size of this room, and there I saw six or eight children; the teacher was a blind person herself, and these children were being taught there once or twice a week separately by themselves, but the rest of the time they were with the other children.

5853. When they were with the other children the rooms in which they were taught was very much better than when they were taught by themselves?—Yes; this little room that I refer to struck me as being very objectionable.

5854. Is not there a great difficulty in teaching a small number of blind children by themselves?—There is no difficulty if you have a teacher who is trained to teach them.

5855. If you gathered together the blind children from all parts of London you would have a large number of children in one place; if on the other hand you taught them in different districts you would require to have a great number of small classes, which would be a more difficult system, of course, to carry out, because you would have to go to more expense in providing teachers, than if the instruction were carried out on a large scale. How do you think it should be carried out?—It would be difficult to have classes in each district, because in every district there are only a small number of blind.

5856. And the number varies from time to time?—It varies from time to time. The School Board officials have to use their best influence to induce the parents to send their blind children to school.

5857. Do you think blind children ought to be compelled to go to school?—Certainly.

5858. At present they are not compelled, at least it is easy for the parents of blind children to get a certificate excusing them from attendance?—Yes, I understand so. I was told by the lady superintendent of the blind under the London School Board that she had to go to the parents of the blind children and try and persuade them to send their children, otherwise they would not send them.

5859. You have paid great attention to blindness; could you suggest any means by which the societies which are now devoting themselves to the assistance of the blind in London could be induced to act with greater harmony and in greater co-operation with each other than at present they appear to do?—I have no suggestions to make with regard to inducing greater unity of action among the various institutions, but I have taken the trouble to go to several members of the committees of the different institutions for the purpose of calling their attention to the importance of physical education in those institutions.

5860. I suppose that the objection to the adoption of your system which you met with was the expense, was it not?—No, indifference and ignorance. For instance, the oldest institution in London, St. George's, have plenty of means, but they spend too much upon other things, they produce a certain number of workmen, everyone of whom costs an immense sum; but I think they are now beginning to do something.

5861. I understand you to say that at Norwood they have to a certain extent adopted your system?—You must not call it my system. I am advocating it.

5862. They have adopted your recommendation?—Yes.

5863. Do you think your system of exercises for the blind would make the blind more fit for various industrial occupations than they are at present?—I not only believe so, but I am convinced of it, and I will give my reasons. By going through a simple system of free exercises which must be gone through by the young every day, just like every other lesson, you improve by degrees the general physique; you give a better circulation, a better chest, and greater power, and there is another important thing to bear in mind, viz., the influence of the mind on the body by these exercises, you bring out a certain power which it is desirable to bring out in persons whom you wish to train to industrial work. In all industrial work, if you are to do it properly, you must feel in your head what you do with your body, that is more important for a blind person than for a sighted person; therefore, I believe it is of the greatest importance to give the maximum of health, the maximum of power, and the maximum of strength to every blind child, in order to enable him to learn some industry.

5864. Has you system been adopted on the continent to any great extent?—It has been adopted in Copenhagen; almost everywhere on the continent they have begun to adopt the system, but in Copenhagen, I myself had an opportunity of seeing a very great development of these ideas.

5865. With what result as regards industrial training?—In Denmark, everyone that is blind is brought up to some industrial occupation.

5866. You are speaking about this from your own personal knowledge?—Yes, I have been at Copenhagen, Christiania, and Stockholm.

M. Roth, Esq., M.D.

26 Feb. 1886.

5867. In what industrial occupations are the blind engaged in those places?—Mat-making, rope-making, chair-making, shoe-making (I saw shoe-making only in Christiania), basket-making, and cabinet-making.

5868. Did you find them working with the assistance of seeing people, or were they working in workshops by themselves?—They were working with the assistance of seeing people.

5869. Do you think it necessary that the blind in order to get the most out of their labour should work together in workshops under sighted superintendents or can they get on very well by themselves?—As far as I saw, in those institutions they work in workshops, but in Denmark the director told me that many of those who have been taught some trade go home and their friends provide them with the necessary materials, and the work they do, if they cannot sell it in the country, is sent back to Copenhagen, where they have a central depôt, in which such work is sold. They have done more there in the way of making the blind independent than they have anywhere else; they keep an eye upon them after they leave the institution, and then in the town wherever they are they invite a few people to look after them, and, as far as they can, help them. In some cases they earn all they want and do not want any extra support, in other cases they do not earn enough and their earnings have to be supplemented.

5870. Are their earnings supplemented by State aid or by pensions from funds provided by voluntary subscriptions or donations of charitable people?—I believe in Denmark the institution is called the Royal Institution, so it is probably supported by the State.

5871. You do not speak with personal knowledge of Germany?—I have not seen the German institutions at work. In France they are beginning now to have workshops.

5872. (*Mr. Johnson.*) Have you had any communication with the school board authorities?—Yes, it is through me that they have introduced this system of free exercises. I had a communication with the board at the time that Sir Charles Reed was chairman of the board. I could not succeed in getting my suggestion adopted at first; two years later I brought the matter before the board again, when I recommended that they should appoint a Swedish lady, who had come to me with a letter of introduction, and who had been trained in the Royal Central Institution at Stockholm, and with the help of Mrs. Westlake this Swedish lady was appointed as the first superintendent of physical education at the London School Board. She continued here for three years, and after she left a very clever person was appointed in her stead, who has continued the instruction began by that Swedish lady. My suggestion to the London School Board was that they ought to train teachers in these exercises, so that they might teach the children the exercises in school.

5873. Then as I understand you, you suggested to the school board the system of calisthenics, which they have adopted?—We do not call these exercises calisthenics, we very much object to that word being applied to them, we call it physical education.

5874. This physical education was adopted at your suggestion?—Yes.

5875. That is to say, it has been adopted throughout the whole of the board schools in London?—Yes.

5876. In one of your answers you said that there were a great many things in which the school board were neglectful; but they seem to have adopted your suggestion with regard to these exercises?—When I was speaking of their being neglectful I was speaking of the blind, when I speak of their adopting my suggestion with regard to physical exercises I speak of children generally.

5877. Then for the sighted children in school board schools the board have adopted your suggestions, but for the blind they have not adopted your suggestions?—That is so.

5878. Are you aware that the blind are educated with the sighted in the board schools, except for an hour or two when they get special education?—Yes.

5879. Do not the blind then take part with the seeing in this physical education?—I am not able to answer that.

5880. If they did take part you would be satisfied?—You could not put the blind children with the seeing children to do these exercises, you must have only the blind.

5881. You do not think it is necessary to have any form of appliance; you do not think a gymnasium would be of any use?—No. If you wish to produce harmony in the body by physical education no instrument is required.

5882. Have you any personal experience of the trade productions of the blind, except from what you saw casually in visiting various blind institutions?—Only from what I saw; I was more interested in the physical education.

5883. You propose that in the training colleges this system should be introduced, so as to produce teachers capable of teaching these exercises?—Yes.

5884. (*Dr. Tindal Robertson.*) With regard to the system in Saxony, do you know what means are taken to distribute the information which they give with regard to the prevention and causes of blindness?—I only know of one paper of instructions which has been issued in Saxony, and that is the instructions to midwives and monthly nurses concerning the special care to be taken in cases of eye inflammation in new-born children; they have not done anything else as far as I know.

5885. Do you know what means have been taken to make that widely known?—I believe it is circulated in the different districts by the different authorities.

5886. What authorities?—The Government authorities, that is to say, the political authorities, I believe by what is called the Gerichtshauptmann, the judge in the district. I am not able to give you a definite answer as to the particular authority. I know it is done under the Home Ministry.

5887. You have told us that in Ireland the information is distributed by means of the Local Government Board?—Yes.

5888. What suggestions would you make with regard to England and Scotland; in the first place, do you think that the method of distribution is a good one which they at present adopt in Ireland?—I do not know how the information is distributed. I only know that it has been recommended to be done; how it is done I am not able to say.

5889. Have you any suggestions to make with regard to the best means of diffusing such information in this country?—I have made a suggestion that the Royal Commission should recommend that the Registrar-General should give an order that every registrar of births, deaths, and marriages should, on the registration of a marriage or birth, give a card with directions how to prevent this unhappy inflammation of the eye in infancy, which is a cause of blindness which in fact should not exist.

5890. With regard to intermarriages between blind people, have you ever known or heard of a single case where two blind people have begotten a blind child?—I have here a book to which the society's prize has been awarded, written by Dr. Fuchs, Professor of Ophthalmology at the University of Liége, in which he brings forward statistics on the subject.

5891. Have you yourself heard of any cases of that kind?—I have heard of such cases, but I have no personal knowledge of such cases.

5892. You have spoken about the depôts in Denmark and other places?—In Denmark more especially.

5893. Do you know whether there is a central depôt in the capital, and other depôts in other parts of the country, or is there only one central depôt at Copenhagen?—I only know of a central depôt at Copenhagen. I did not hear of any provincial depôts.

5894. From the experience that you have had with regard to blind people, do you think there would be an advantage in having a central depôt, or more than one depôt in London, and other depôts in the large cities of the country where the blind people could get their material, where they could send their goods for sale, and where a register of the names of all the blind workers in the district could be kept, which might afford a means of communication between firms or individuals or public bodies who wanted work to be done and the blind workers who could do the work?—I am not a commercial man, and therefore I cannot speak to the commercial part of the question, but I believe it would be useful to have such a thing. The question is whether the blind can produce manufactured articles to sell at the same price as articles manufactured by seeing people.

5895. At the depôt at Copenhagen of which you spoke, are they able to sell things produced by the blind as cheaply as articles produced by seeing people?—I do not know; I did not go into the question of trade.

5896. With regard to the examinations that you have spoken of by the Council of Medical Education, are you aware that it is absolutely in the discretion of the examiners to examine on points connected with diseases of the eye, in the same way as it is in all other matters?—It is in their discretion.

5897. Are you also aware that in the event of a student coming up for examination and being unable to answer questions which might be put to him on diseases of the eye, there is a great probability, almost a certainty, that he would be sent back again?—I believe he would be sent back again.

5898. Therefore is it not fair to presume that most of those medical pupils who go up to those examinations do acquire a fair knowledge with regard to diseases of the eye before they present themselves for examination?—A short time ago I met a medical man, a Fellow of the Royal College of Surgeons, who, after six or seven years' diligent study, had obtained his diploma; to my inquiry whether he knew something about eye diseases, he said, "No, I know very little of eye diseases; I shall "now study the subject. I have hitherto only studied "those subjects which I was obliged to study." He did not consider that he was obliged to go into the study of eye diseases.

5899. That is to say, he had gone up for examination for the Fellowship of the Royal College of Surgeons absolutely unprepared in those subjects, though he ran the chance of being examined in them?—I only know that he said to me, "I studied those things which were "absolutely necessary; now I shall go into the study "of eye diseases." That was after he had passed his examination.

5900. You are aware, I suppose, that it is a six day's examination for the Fellowship of the College of Surgeons?—I do not know that.

5901. And it embraces almost every possible thing that can be taken in a surgeon's examination?—I only tell you what I was told by the gentleman to whom I have referred.

M. Roth, Esq., M.D

26 Feb. 1886.

5902. (*Dr. McDonnell.*) You are aware, as you said, that in Ireland it is not left to chance whether a person is examined in ophthalmology, he must produce certificates that he has been educated in the subject, and there is a special examination in that subject?—Yes.

5903. In all the colleges the students must pass a special examination in midwifery?—Yes.

5904. And you think the same course should be followed with regard to ophthalmology?—Yes, that is to say, it should be obligatory as it is in Dublin; the student must bring a certificate that he has attended the course of theoretical education as well as the practical course, and then he has to pass an examination in the subject.

5905. You think that so very important a subject as ophthalmology should form departments by itself in which medical students should be examined, and you would require that the person coming up for examination should produce proof that he had attended a course of education in the particular subject, so as to give proof of a knowledge of the subject?—Yes.

5906. Are you aware what is done now at the London College of Surgeons in that respect?—When they examine candidates for the membership they sometimes put questions on ophthalmic subjects.

5907. Are you able to tell the Commission whether there is an examiner in ophthalmology at the London College of Surgeons' Board?—As far as I know there is not.

5908. Are you able to give us positive information upon that point?—No.

5909. You stated that in Dublin there is a special examiner in this subject which I know to be the fact?—I was not aware that there was a special examiner, but I was aware that the students must pass an examination in the special subject.

5910. If I understand you rightly, you think the Commission might do good service by endeavouring to induce the Medical Council to require that there should not only be an education in, but a special examination in, so important a branch of surgery as ophthalmology is?—Yes.

5911. And by doing so you think we would aid very much in the prevention of blindness throughout the United Kingdom?—Yes.

The witness withdrew.

Rev. Henry Bright examined.

Rev. H. Bright.

5912. (*Chairman.*) You are superintendent of the Home for Aged Christian Blind Women?—Yes.

5913. What is the number of blind that you take into the home?—The number at present is 30, we could take in 32.

5914. You have a home; have you any other special branches?—We have also a self-supporting branch, the object of which is to meet the necessities of ladies of limited means, and are able to pay from 12*s.* 6*d.* to one guinea weekly according to the accommodation that may be required.

5915. How long has that branch been in operation?—This is now the third quarter.

5916. How long has the parent institution been founded?—Six years the 22nd of April next.

5917. What are the qualifications of your candidates for the home?—They must be 50 years of age, their blindness must amount to entire incapacity, they must be members of some evangelical section of the Church, or must give some reliable evidence of a christian life.

5918. May they be in receipt of parochial relief?—Yes, they may have parochial relief; and in that case the guardians are requested, and as a rule they consent, to transfer the amount of outdoor relief to the home funds.

5919. How many of such cases have you in the home?—Ten.

5920. What is the area of the district from which you select candidates?—The United Kingdom.

5921. Do you give no preference to those in London?—No preference at all; if the candidates are eligible they are admitted from all parts of the United Kingdom.

5922. Who are the committee who decide upon their admission?—The names of the committee are in the report.

5923. How often do you elect candidates?—Monthly.

5924. When they are once admitted into the home, do they remain there permanently, or is their stay only for a certain time?—Only inconsistency of character or disqualification would prevent their remaining in the home permanently. If they became insane we should not keep them.

5925. They must be over 50 years of age you say?—They must be over 50 years of age; but the committee reserve to themselves the right of dealing with special cases even if under that age.

5926. What are the funds at the disposal of the institution; have you any vested funds?—No.

5927. I see by your accounts that the to all receipts are 782*l.*?—Yes, for the last year.

5928. The cost of house-keeping and maintenance of the inmates is 465*l.*?—Yes.

5929. The other expenses are rent, rates and taxes, and servants' wages?—Yes.

5930. Are the superintendents paid any salary?—All that service is honorary; there are no salaries to the superintendents.

5931. I see on the expenditure side you pay the superintendents in lieu of rent 101*l.* 5*s.*?—The superintendents pay that to the committee in lieu of rent; it is not what the superintendents receive; it is what the superintendents pay.

5932. It is on the expense side?—The committee pay to the honorary superintendents who conduct the work the sum of 10*s.* weekly for each inmate, including the cost of maintenance and so on, and the superintendents

Rev. H. Bright.

26 Feb. 1886.

give to the committee at the close of the year 100*l.* which goes towards the defraying of the expense in connexion with the building.

5933. But in your balance sheet you have got in the expenditure column 101*l.* 5*s.* according to that it would appear that the superintendents receive no salary, but in lieu of rent they receive 101*l.* 5*s.* ?—The money is paid by the superintendents.

5934. This account has been audited and found correct by professional accountants?—Your lordship's view of the case was not taken by the auditor according to the explanation given him.

5935. But your explanation does not clear it up to my mind. The expenditure is this: Balance brought on from last audit, 4*l.* 14*s.* 11*d.*; housekeeping and maintenance of inmates from June 1884 to May 1885, 465*l.* 7*s.*; taxes, poor-rate, property-tax, water-rate, gas, coals, servants' wages, and superintendents in lieu of rent (101*l.* 5*s.*), making all together 231*l.* 14*s.* Do you contend that you do not get 101*l.* 5*s.* in lieu of rent?—We pay everything from the 10*s.* a head that is given, servants' wages, taxes, board and residence, and everything else.

5936. But you have all those items here in addition to the 101*l.* 5*s.* ?—Yes, that is so.

5937. I do not understand why you contest the accuracy of this report. You stated previously that you, as superintendent, received nothing?—Neither do we; we give our time.

5938. I assume from this balance sheet that you give your time for nothing?—Yes

5939. It is stated here that in lieu of rent the superintendent gets 101*l.* 5*s.* ?—That is a mistake.

5940. This balance sheet has been audited, and it professes to be the report of a year ago. It is not desirable that an account of this institution should be circulated in which a material item, amounting to one-seventh of the whole expenditure, is inaccurate?—Perhaps your lordship will allow me to explain that the home from its beginning has been conducted by us as the founders and honorary superintendents. We receive 10*s.* a week for each inmate, and that 10*s.* a week includes servants' wages, rates, taxes, board, residence, and rent. If we really did receive anything at all we should only receive that amount of 101*l.* 5*s.*; but instead of receiving it we give it to the committee in lieu of rent on the present building on which there is a debt of 750*l.*; and we are paying the committee that 101*l.* 5*s.* yearly out of the 10*s.* a head which they give, until the building shall be absolutely free.

5941. But then you lay before this Commission an account of your receipts and expenditure, and the remarks which you have just made entirely differ from your published account, and the explanation that you have given does not entirely clear up that discrepancy so far as I can gather?—Will you be good enough to refer to page 34.

5942. That is headed "Purchase Fund." You appear also to have an account which I suppose is intended to clear off the debt on the purchase of the building?—Yes.

5943. But that does not at all effect the accuracy or inaccuracy of the general fund account. The treasurer's account appears to be as follows: receipts 913*l.*, including a loan from the bank of 200*l.*; and the expenditure is 1,095*l.* 16*s.* 9*d.*, including 50*l.* in part repayment of the loan, and a balance in hand of 54*l.* 3*s.* 2*d.*; and there appears to a balance due to the City Bank on the security of the building of 850*l.* Has any more of that been paid off since May 1885?—100*l.*

5944. Therefore the debt is 750*l.* ?—750*l.*

5945. Had you had any experience previous to starting this home in any work of charity for the blind, or what nduced you to start it?—I was formerly one of the enrolled visitors of the Indigent Blind Visiting Society of which Dr. Armitage is the leading member.

5946. And without any funds of your own started this home?—Yes, without any funds at all.

5947. From the subscription's which are raised you got paid as I understand so much for each inmate?—Yes.

5948. And you have to pay all the other expenses out of it?—Yes, rates, rent, and taxes.

5949. This balance sheet is evidently not strictly accurate; are you losing or are you making money by it?—Neither, I suppose it simply amounts to this; that if we did not give back to the Committee the 100*l.* in lieu of rent to clear off the building debt, we positively should be that amount to the gain, so to speak, on the conduct of the whole, but not for us. Instead of receiving a farthing ourselves the proceeds would be perhaps 100*l.* a year, which is given back in lieu of rent to the Committee, so that we virtually receive not one fraction for our conducting the work. That is the simple point, I think. It was never our intention to receive any payment.

5950. The 101*l.* then goes to pay off the debt on the capital account?—Yes, the debt on the building.

5951. And has the capital account been reduced by so much each year?—The present building has only been purchased two years. In that time on the purchase of the whole property and the additions and reconstructions and so on which have been made, something like 1,850*l.* have been raised, leaving us still a balance (which I hope will before long be raised) of 750*l.* to clear the entire freehold. You will see by reference to the balance sheet what was paid on the purchase fund in 1884, for example.

5952. I see that in the purchase fund the 101*l.* 5*s.* comes in as a receipt?—Yes, that is what we drew your attention to on page 34.

5953. As a visitor have you had great experience amongst the blind of London?—I think something like 500 cases or nearly so.

5954. Have you had much experience with regard to the poorest class of blind, especially those begging in the streets, and those who earn their livelihood in the streets, either by playing or singing?—I have not had very much experience of that class.

5955. Has the class that you have had to do with been those who have been earning their livelihood?—Yes, feebly earning it. By that I mean simply this: during my visitation, I took from the Indigent Blind Visiting society forms of investigation to get as nearly as we possibly could at the circumstances of each person in the district, and having passed through three districts numbering in all rather over 300 cases, I think the average income of those 300 cases would not be over 6*s.* a week.

5956. How many of those were earning absolutely nothing?—When you speak of earnings scarcely any of them were earning anything really in the shape of employment. They were simply depending upon charity, on receiving casual help, which might have reached on the whole a sum of not more than 6*s.* a week.

5957. Were none of them earning anything at all?—Scarcely anything.

5958. Do you think that under a better system they might have earned something for themselves?—Some of them might, but we have, I think, to make a distinction between those persons who have been blind any length of time and those who lose their sight when their work is practically done, even supposing that they had their sight.

5959. Were most of those that you speak of aged blind?—A goodly number of them were.

5960. And they were receiving pensions or assistance?—They were receiving pensions or assistance from their friends, or from the parish, or something of the kind which reached, according to my judgment, not more than 6*s.* a week.

5961. Have any of those who are now in your home pensions?—Yes, several of them have pensions.

5962. Do they give up those pensions when they come to live in your home?—No.

5963. Do they contribute anything towards the expenses of the establishment?—Yes, you will find that they contributed last year 258*l.* 14*s.* 6*d.* Report, page 26. Mrs. Leonard has pensions to the extent of 27*l.* a year. From that 27*l.* a year she contributes to the home funds 21*l.*

5964. Does that represent the cost of her maintenance in the establishment?—No, it does not.

5965. Then why does she not give up the whole of her pension?—She has to find herself in clothing, and some little pocket money which we like them to have.

5966. How many persons that have pensions are there in your institution?—Seven altogether, I think, receive pensions.

5967. The pensions, I suppose, vary in amount from 30*l.* down to 5*l.* ?—Mrs. Leonard has the highest, and that is 27*l.*

5968. Are there many who are in receipt of more than one pension?—Miss Evans has 15*l.* from the Gardiner Trust, and Miss College has 10*l.* from Hethrington's Charity and 12*l.* from the Poor Man's Friend, Day's Charity; she has two pensions, that is her whole income.

5969. Do you elect into this institution those who are able to pay for themselves in preference to the indigent poor who have no pensions at all?—If a person possessed a great deal of money she would not be admitted, provided that she could not give credible evidence of christian character. On the other hand, if the person could furnish such evidence of christian life, she would be elected; emergency and merit certainly would give weight to the case, and in that sense we should give the preference.

5970. Then you are guided rather by their characters than by their actual wants?—In that sense we are as to their christian character.

5971. Have you daily services in your home?—We have two services each day, that is to say, morning and evening devotions; and we have public service on Thursday, and one on Sunday evenings in addition. We have two public services.

5972. Who conducts the services?—I conduct them myself, as a rule, and other ministers and other friends conduct the public services.

5973. Do you mean ministers of various denominations or ministers of the Church of England?—Ministers of various denominations. The work is absolutely undenominational in its character.

5974. Can you offer any suggestions as to the improvement of the condition of the blind, either in the way of industrial training or in providing work for the blind after they have left industrial institutions?—It is a complicated not to say a complex question. Of course, I fully believe in self-help and employment for the blind so far as that employment can be obtained. How we are to get over the difficulty, however, that a great number of the blind who leave our institutions have neither home or capital I really do not know; I hope that is a point which the Royal Commission will tell us something about by-and-by; but I find a good number of persons who have been taught in institutions in more indigent circumstances, I rather think, than they were before those persons went to the institutions at all.

5975. Do you mean that they have not learnt any trade sufficiently to be able to earn their livelihood by it?—Not exactly so, but a person is generally sent to an institution by the sympathy of a number of friends, and when that person is supposed to have learnt his trade, whether he has or has not, these friends naturally feel that they have done what they could. The consequence is that that blind person is minus some of the friendship and interest when he leaves the institution, because his friends believe that they have placed him by their influence and sympathy upon the basis of self-help, and so he comes out minus some of the friends that he might have had before he went in, and yet he has neither home in which nor capital with which to pursue his duties.

5976. And you think that these institutions ought to go a step further and follow up the blind persons after they leave the institution, and endeavour to find work for them, and provide for the sale of their work?—It strikes me that something of that description will have to be done before the condition of the blind will be raised, as I am sure you desire that it should be.

5977. Were you brought up in an institution of that kind and then turned adrift?—I was trained in an institution in the Euston Road. I spent two years there, and for some years I received work or pension to the amount of 5*s.* per week. Entering the ministry, however, nearly 20 years ago, I, of course, did not have the pension after that, and from the ministry, and not from my business, am I able to support myself. I wish to make that remark now that I have the opportunity of doing so. It might have occurred to your Lordship as well as to the other Commissioners present how it is that we are able to give voluntary free service to the home. My answer to that is, simply from a pretty full list of ministerial engagements.

Rev. H. Bright.

26 Feb. 1886.

5978. During the week?—During the week and on Sabbaths as well.

5979. Are you employed to conduct blind services?—No; services in connexion with the various sections of the church of an evangelistic character.

5980. Are you in the employment of various societies?—No, I make my own engagements.

5981. But you make your engagements, I suppose, with certain individuals or societies?—Yes. Supposing that a Baptist church wished for a course of meetings, if their pastor wrote to me I should settle the date so far as I had room in the diary; but I am under the care of no society to find engagements, but I conduct my own.

5982. That has been the case for the last 20 years, as I understand?—It has, except during the time that I was connected with the Indigent Blind Visiting Society; then, of course, I received a salary for that for nearly two years, and for four years I presided over a Baptist church in the county of Essex.

5983. Were you sole minister there?—Yes.

5984. Do you think blind children ought to be educated by themselves or in company with sighted children, as far as may be?—I should think that if they were brought in contact with sighted persons it would be better.

5985. I suppose they might require some special training before they are fit to take their part in the school with sighted children?—Yes, I think so.

5986. But with that exception you think they ought to be taught as far as possible with other children, and be under the same compulsory law also that other children are under?—Yes, I do not see why not. Of course, in reference to our people in the home, nearly all our cases are cases of persons who have lost their sight late in life, and who, prior to their becoming blind, had held fair social positions, such as upper servants, and that kind of person. The loss of sight has of course made a difference in their circumstances; in some cases it has utterly exhausted their resources, and in other cases it has severely taxed them.

5987. (*Dr. Tindal Robertson.*) Where were you educated yourself?—In the Euston Road.

5988. At what age did you go there?—I should think when I was about 13.

5989. What did you learn there?—A branch of brush-making.

5990. Were you educated there?—Yes, in reading and writing.

5991. On what system?—I learned two systems while I was there; I learned Moon's and Frere's.

5992. When you left there where did you go?—I returned then to my own village in Somersetshire for some years.

5993. Did you carry on your education or business at all in your village when you returned there from school?—No, I did not.

5993*a*. You would be about 15 then?—I was about 15.

5994. What kind of life did you go on with then?—I received a pension for some time from the society, and I did their work in the village, and in that sense I carried on a trade.

5995. What pension was it that you got?—The school for the blind either gives work or money to the extent of 5*s.* a week.

5996. Which school is that?—The Berners Street Society. When I left the school I had 5*s.* a week allowed me either in pension or work from that society.

5997. Is the Berners Street Society the same as the Euston Road Society?—Yes.

5998. Then it migrated from Euston Road?—It did.

5999. And then you went on in the receipt of a certain sum after you left the school?—After I left them I did their work for some time in my own home; and then on entering fully on the ministry of course I did not do work.

6000. Did you pursue your education when you gave up the trade?—Yes, so far as the reading and writing went.

Rev. H. Bright.

26 Feb. 1886.

6001. What system did you go on with then?—With both of them, Moon's and Frere's.

6002. How did you manage to write?—I wrote in the Alston type, the Roman type.

6003. Could you write in any other?—No.

6004. Have you made yourself acquainted since with any other system?—With Braille.

6005. Are you perfectly conversant with Braille now?—I can hardly say that I am perfectly conversant with it.

6006. Do you know it to a sufficient extent to enable you to utilise it in your work?—Yes.

6007. Can you write it?—Yes.

6008. Do you find it of great advantage to be able to do so?—Only just for correspondence, just a few manuscripts or anything like that.

6009. Are you in the habit of addressing people publicly?—Yes.

6010. Do you take notes?—No.

6011. Do you prepare yourself before doing so?—Yes.

6012. Do you not take notes of what you prepare?—No, not in the Braille system.

6013. In what system?—As a rule I may have the outline written from my own dictation, and so preserve it.

6014. And have it read over to you?—I have it read over to me if there is a necessity for it.

6015. In what way do you utilise your power of writing?—Only for manuscripts, if I have time, or for corresponding with Mrs. Bright, for example, when I am on my evangelistic tours.

6016. Is there any other system than the Braille and Moon's which would enable you to write in that way?—No, I think not.

6017. Supposing that you were away from home and with strangers, and you wanted to communicate with home, what system would you use?—I should use Braille's, certainly.

6018. May I ask whether your wife is conversant with it also?—Yes, she reads it and writes it.

6019. So that it becomes very easy for you to correspond when you are at a distance from each other?—Very easy.

6020. Have you any experience of the school board system of educating the blind?—But very little.

6021. Have you seen it at all in operation?—No, I have not.

6022. What you know of it is only from hearsay?—Only from hearsay. I happen to know Miss Butler who is one of the teachers.

6023. His Lordship has mentioned the question of the education of the blind in company with sighted children, and I think you said that you would be in favour of that plan?—Yes, I have always heard its advantages set forth by Miss Butler, and by one or two other teachers.

6024. As an educated blind person yourself, supposing that you had a blind child to educate what plan would you pursue?—I certainly should place it with seeing children. Whether I should bind the child to the Braille type I do not know, because it has one very important disadvantage about it, namely, that you can only correspond with those who may known the system.

6025. Is there any other suggestion that you can make in regard to a plan by which you might provide for the education of the blind?—I think not.

6026. Are any of the inmates of your institution able to read Braille?—In the home proper there are none; in the self-supporting branch there are three.

6027. Have they been taught it since they entered, or did they know it before?—Two of them knew it before they came, and Mrs. Taylor has been taught since she came.

6028. Do they read by any other system?—Yes, Moon's and Frere's, and Lucas's are read by some of them.

6029. Is any system taught to them after they come into your establishment?—There is a visitor from the Home Teaching Society who teaches Moon's.

6030. What system do you think is the best for those persons who become blind late in life, and whose touch has become so deficient that they are unable to read by the Braille type?—I do not think there can be two opinions upon it that Moon's is the best.

6031. You think that Moon's is the best system altogether for those who become blind late in life?—I have not a moment's hesitation upon that.

6032. I will not ask you about the trades, because I think from the answers that you have given to the chairman you have not had much experience about them?—No, I have not.

6033. Having given up, I suppose, the business altogether since you had entered the ministry, you have no suggestions to offer upon that question?—No, I have not.

6034. (*Mr. Johnson.*) How many people do you receive 10*s.* a week for who are now in your institution?—Thirty, but they do not pay it themselves, of course.

6035. (*Chairman.*) There are only 30 in the institution altogether?—That is so.

6036. (*Mr. Johnson.*) You receive 10*s.* a week paid by your committee for each person who is in your establishment?—Yes.

6037. How many people have you in your establishment now that you receive 10*s.* a week for from the committee?—For the 30, of course.

6038. And that is about 750*l.* a year?—Yes.

6039. Then out of that 750*l.* a year you pay back 100*l.* a year to the committee, and of course you pay all the rates and taxes, and servants' wages, and so on?—Yes.

6040. Then you live in the house rent free yourself?—Yes.

6041. You say that you learned brush making in the Euston Road?—Yes.

6042. With Mr. Levy, I suppose?—Yes.

6043. You were only in the Euston Road for two years?—Yes.

6044. That is entirely an industrial establishment, is it not?—Yes, I think so.

6045. There was no school connected with it?—A teacher came twice in the week for teaching reading, and so on.

6046. One of the Home Teaching Society's teachers?—No, Mr. Galpin. I think he came twice in the morning and twice in the afternoon, for both sexes.

6047. Was it there that you learned the system of reading?—There I learned Moon's; Frere's was not taught principally in the institution; I learned that with Mr. Welch at the Nutford Place class.

6048. When that class was carried on by Mr. Goschen?—No, by Mr. Welch.

6049. When did you learn the Alston system?—I learned to write it at the institution.

6050. And that was, I suppose, at the institution the usual mode of correspondence?—I think it was, that and the pencil.

6051. Have you any experience of writing in pencil?—I have not, for the simple reason that I never saw and therefore never formed letters.

6052. But are you aware that blind people do write with pencil?—Yes.

6053. You had a pension yourself you say, when you were at the Euston Road Institution; had you any other pension then?—No.

6054. Did you ever receive any other pension from any pension society?—No, the pension from the Euston Road was simply given in this way; it was supposed to be 5*s.* a week allowed for work. After a time they had a sufficient number of hands to supply the work, and instead of their giving me the 5*s.* in work, they simply sent the 5*s.* in pension.

6055. Then it was only an allowance for the time?—That was all.

6056. You have never had any pension from any pension society?—No, none at all.

6057. There are seven people in your institution, you say, who have pensions?—Yes.

6058. Do you know about what they average; how many have got three or four pensions? Miss College, you tell us, has two pensions, 10*l.* and 12*l.*, and Mrs. Leonard has three pensions, amounting in all to 27*l.* a year, are those the only ones?—Then there is Miss Warren; she has only one small pension, 5*l.*

6059. Where does she get it from?—From the Protestant Blind Society.

6060. Do you think it is an advisable thing that people should have two or three pensions?—Yes, I think so

6061. You do not think that the pension system is at all abused by two or three pensions being given to one person?—I think not.

Rev. H. Bright.

26 Feb. 1886.

6062. Do you take any initiative with the boards of guardians in getting an allowance?—Yes.

6063. What is the average amount that the boards of guardians allow you?—I suppose you may put down the average at 3*s.* 6*d.* a week.

The witness withdrew.

Mr. JOHN THOMAS EDMONDS examined.

Mr. J. T. Edmonds.

6064. (*Chairman.*) You are the honorary secretary of the South London Association for assisting the blind?—I am.

6065. The object of your charity is principally to teach the blind to read, is it not?—We have a variety of objects. The general object of our association is to improve the social and religious condition of the indigent blind, principally those living in the south of London, and to assist them as their necessities may require. We have classes where the blind are taught to read in embossed type; Dr. Moon's type is used principally at our classes. We have also devotional meetings held amongst the blind. We have classes also at which entertaining and instructive readings are given to the blind by ladies and gentlemen, members of the Committee, and friends. We also visit and relieve such as are sick, so far as our funds allow. We also grant loans in cases of special distress to help them to redeem pledges at times, to prevent landlords distraining upon their little stock of goods, and to enable them to purchase stock to go about and sell things. We enable them also to purchase materials that they can make up for work. We also grant twenty pensions amongst the oldest of our members, and those whose circumstances are worse than others. Those pensions are very small unfortunately, because we have made it a rule never to let our expenditure exceed our receipts. We have no salaried officers whatever, nor have we any office rent to pay.

6066. Have you any funded income?—We have a small funded income now, I am pleased to state, which has arisen in this way. We had a bazaar some few years ago which was opened by the late Earl of Shaftesbury, and which brought in a fund of 230*l.* or 240*l.* This we invested in Cape of Good Hope 4 per cent. inscribed stock. That was increased by a lady making a donation to us of 30*l.* Then we had a legacy of 50*l.*, and then we succeeded in getting a grant, as you will see from the balance sheet, of 500*l.* odd from the Court of Chancery under the estate of Mr. Harrison. That was also invested, and we have now, as your Lordship will observe in a note by the auditor (who is also honorary), 1,000*l.* 4 per cent. Cape of Good Hope stock, and the income from that gives us this pension fund.

6067. You follow up those who have left other institutions; you do not teach them anything yourselves so far as industrial occupations are concerned?—We are only able to assist those who are our own members. We have 129 members (the last Report states 123) and until a few weeks ago we had 130. One poor young woman died of bronchitis this hard winter. The form of application for membership has to be filled up and signed by a subscriber.

6068. But are those members of the class that I have mentioned, namely, those who have gone through institutions, and been trained, and who want work?—I cannot say that all our members are or have been members of existing institutions. There are some of our members who are employed by the Surrey Association for the General Welfare of the Blind, in the Peckham Road. Your Lordship will observe that we are a South London Association. Some of our members are also employed at the School for the Indigent Blind, and so forth, and they would come to us either to learn to read or to join our recreation class. Then we have several members who are not members of any other association at all. For example, many of our poor people are those who become blind in mature years. We have an old man now nearly 80 years of age who went blind some years ago; he is much too old to learn a trade, or to do anything, poor old man! and there are several instances of that kind.

6069. In electing your members do you give the preference to the aged blind, and to those who cannot work?—Yes, we do; we give the preference to those whose circumstances in point of fact seem to entitle them to relief.

6070. But you also assist those who are younger, and who are willing to work, and who want materials and aid to start them in their business?—Certainly. I have with me a form of application for a loan (*handing it in*).

6071. Have you had much experience as to the repayment of these loans?—I have had a great deal of experience. I have been the honorary secretary of this association, with slight intermission, for the last 14 years.

6072. What is your opinion with regard to the repayment of these loans?—I am very pleased to be able to state that these loans are, as a rule, regularly repaid. The principle that we adopt is this: One of these forms is sent to me; the purpose for which the loan is required is stated, and the date of the last loan; and if it is more than 1*l.* a surety is required. Our rule is that a 1*l.* loan is to be repaid by weekly instalments of a shilling; a loan of 10*s.* by instalments of sixpence; a loan of 2*l.* by instalments of 2*s.*; a loan of 3*l.* by instalments of 3*s.* a week, and so on. As a rule those loans are regularly repaid; we have a few black sheep amongst our flock I am sorry to observe. We have three or four who do not pay out of 70 or 80 loans that we have running; but I do not suppose that out of the whole of our loans, which for last year have certainly exceeded 100*l.*, we shall lose more than about 2*l.* per cent. The money comes back with very satisfactory regularity.

6073. Do you find also that the fact of your giving them these loans enables them to set to work and earn a livelihood for themselves, which they otherwise would not be able to do?—In many cases that is so. For instance, we have a poor old man of the name of Aldritt, who came to me only three or four weeks ago, and following some remarks which I had made at our annual festival, as we call our Christmas treat, he said he was determined to make a start for himself if he could. He determined that he would buy some tea, and hawk this tea about, and get a living if he could. He stated the circumstances of his case, and we made him a grant of 10*s.*, and we let him have a loan of 1*l.*, and with that 30*s.*, in his hand he was able to go and get some tea at Dakin's in St. Paul's Churchyard, and he took this round to different houses. We bought some ourselves, and he got a profit on it which helped him forward.

6074. Are you able to give these pensions by small sums weekly, or do you give them in large sums?—We pay them quarterly on the 4th of February, the 4th of May, the 4th of August, and the 4th of November, in sums of 10*s.* each.

6075. You do not exceed that amount?—Unfortunately we do not.

6076. Would you, on principle, think it undesirable to give pensions as they are given by other societies in lump sums, which may very often be squandered, instead of giving them by instalments, either quarterly, or monthly, or weekly?—I should say that it would be desirable to give them weekly.

6077. That involves, of course, a great deal of trouble?—It does. With regard to the grant of our own pensions that is a branch of the work taken up by my friend, Mr. Sopper, a gentleman who has retired from business, and who lives in Kennington Oval, and who does our visiting amongst our poor blind. He would have been here to-day, but I am sorry to say that he is unfortunately laid up with rheumatism and is confined to his bed.

Mr. J. T. Edmonds.

26 Feb. 1886.

6078. What number of visitors have you?—Some of our ladies go and visit: Miss Straker, for example, occasionally visits, and my wife occasionally visits, but the visiting is principally done by Mr. Sopper. In cases of sickness I also get Mr. Charlton (a city missionary living in Kennington, who is connected with the church of St. Philip's, the Rev. A. T. Edwards' church) to go occasionally.

6079. Is there anything that you would wish to lay before the Commission with regard to the education or training of the blind?—We ourselves think that it is most desirable that all blind people whenever they become blind should be taught to read. We find that that relieves, to a very large extent, the weariness and monotony of their lives. I visited, not long ago, a poor christian old lady living in a little room in a basement in the neighbourhood of Kennington Park. She had been confined to this room for two or three months at least by illness, and the only relief that she had was the reading of portions of the Scriptures and other books in embossed type which she had got, and which formed quite a companionship and solace to her. There are some blind people, of course, who cannot even learn to read; their sense of touch is deadened, but as a rule we think that it is a most important thing that the blind should learn to read. Then we think, very strongly, that blind people should, if possible, be taught to earn their livelihood, whether by trades or by selling articles in the streets depends very much upon the ability which each blind person displays. There are some who have taste and capacity for music, but in our experience of the blind people we find that those who can develop it to advantage are few.

6080. Have you any experience of blind tuners?—We have a few. We have one lad named Hayball who, I believe, is a very good tuner, but I do not think he earns a very satisfactory livelihood.

6081. Do you know what he earns a week?—I do not. We do not teach tuning. I should say that we should ourselves have established classes for teaching men to work, but that involves such a very large cost in the payment of sighted labour to oversee these things, that we found it was impossible with the limited funds at our disposal to do that. As your Lordship will see, one of our principal rules, I think it is the last rule, is that, as far as possible, all our officers are honorary.

6082. I see one of your rules is as to orders for brushes and brooms of every description to be made by a blind member, or for knitted hose and fancy articles; do you find that there is any difficulty about the sale of those articles when they are made by the blind?—We have not of late had very much experience in the actual sale of those articles by the blind. Our work has been restricted, so far as this branch of it has been concerned, to teaching blind girls and women. Some of our female members for example, make Cardigan jackets, gloves, socks, babies' frocks, babies' jackets, and things of that kind; and these have been taken by members of our own committee and sold, and the proceeds paid over to the blind makers.

6083. Do you think it is advisable to have anything like a public depôt or depôts in London for the sale of the work of the blind, and that that is better than having it sold in ordinary shops; or do you think that the present system, if it could be so extended, is the more practically useful?—I think it is very much better that they should go into ordinary shops. I may instance our own experience in this matter. When I was invited to join this committee, some 14 or 15 years ago, we had a depôt in the Brixton Road for the sale of the work made by the blind. At that time unfortunately we were very much in debt, some 40*l.* or 50*l.* at least in debt, and we had to pay 50*l.* a year for the use of the window where these articles were exposed, and that at once exhausted our income. Undoubtedly the principle was a very good principle if it had been fairly and honestly carried but. The principle was this, that the blind persons made the brushes and garments, and so forth, at home, and brought them to the depôt, and that the depôt (the depôt being the home of the association) bought them at a small discount, say, three halfpence in the shilling, and then they were sold for the shilling, the three halfpence being the profit made by the association. But alas, we found that very few blind persons availed themselves of the privilege, and it was found that sighted person's work had been bought at the depôt as well as blind persons' work, and therefore it was of no value to the blind people as a whole at all. We therefore determined to close the depôt, which we did, and to confine our operations to charitable relief amongst our own poor people entirely free of expense.

6084. Is there any prejudice against the work of the blind in the retail shops, or is there only an unwillingness to receive inferior goods, supposing the goods of the blind to be inferior to those made by the sighted?—I should think that there is only an unwillingness to receive inferior goods. I am bound to say that I have always found people willing and anxious to assist the blind, and I have found great kindness on the part of everybody that I have asked in connexion with our blind friends.

6085. Do you think that these industrial institutions where they profess to teach the blind fail to a very large extent in turning out good workmen, and that consequently the work being bad is not readily saleable?—I think there is a great deal of truth in that, and I think that one reason why they fail is because the expenses of sighted labour are so very heavy in comparison with the advantage to the blind people themselves. I am afraid that it is a necessary incident to them, and I do know from experience, gathered from other institutions, that there is a large amount of what I may call dead work by the blind people in learning their trades, and spoiling work, and so forth.

6086. I suppose you find that the blind feel the pressure now of scantiness of work and low prices?—Yes, I am afraid they do.

6087. And they feel the pressure of competition of every kind in every branch of work that they can do?—No doubt that is so, and the few things that they can make thoroughly well, of course other people can make, and when you put things into the open market a blind man can get no more for his goods than a sighted man, and they take a blind man very much longer to make.

6088. Do you think that there should be more communication amongst the societies for the blind in London, in order that they may, as far as possible, work into each other's hands and assist each other?—I think that is very desirable. In fact some three or four years ago I myself had an idea of coalescing our association with the Surrey Association for the general welfare of the blind. We had a meeting with that view, and my friend, Mr. Sheppard, a solicitor, a member of the firm of Roscoe, Hinks, and Sheppard, (he unfortunately died), and I, went down and saw over the Surrey Institution, but on looking into their accounts we found that they were practically in an insolvent condition, and we were solvent, because the work was done at my house in the Brixton Road, and we had no paid officers. Therefore we came to the conclusion that we would not risk our own little income for the benefit of comparatively few members; there were only about twenty employed by the Surrey Association when we had a hundred whom we could benefit in a variety of ways. So we abandoned the idea.

6089. Do you think that the pension system as it is administered now by the different institutions and trusts could be improved in any way so as to assist the blind to earn their livelihood in the first instance, the pensions not being given to those who are aged or unable to work?—I should scarcely like to answer your Lordship's question. I think that pensions are a very useful form of relief to the blind, and I think it is very desirable that some further aid to teach blind people to earn their own livelihood should be afforded.

6090. I ask you the question, because your practice of giving grants and loans seems rather to point to a different system as being better than the system of pensions only?—The circumstances of blind people in the same way as the circumstances of ordinary men vary with each particular person to some extent. We have found in some cases that it is not desirable to grant a pension, but to give special relief in case of special emergency. We have found in other instances that it was necessary to grant a pension.

6091. But you are aware as a matter of fact there are a great many more pension societies than there are loan societies?—Yes, I am aware that that is so.

6092. The question I asked was whether the two systems would not work better side by side than one system, that is to say, the pension system only?—I should think that the two systems would work very well side by side.

6093. As yours does in fact?—Yes.

Mr. J. T. Edmonds.

26 Feb. 1886.

6094. (*Mr. Johnson.*) Your pensions are very small, are they not?—They are, I am sorry to say.

6095. They do not amount to much more than 40*l.* a year altogether, do they?—That is so.

6096. Then your society is really an aid society and not a pension society?—That is so; it is an assistance society.

6097. If I understand you rightly, no person can be assisted from your society unless he is recommended by a subscriber?—No person can be relieved by our society unless he becomes a member of the association.

6098. For that has he to pay a subscription?—Our rule is that the form of application for membership has to be signed by a subscriber. We have a register of subscribers, and we see at once whether a subscriber has nominated a person, and if all our subscribers have nominated then the blind person has to get a subscriber of at least half-a-guinea a year.

6099. Then when a case comes before you through a subscriber's letter, or otherwise, you make special inquiries?—We do.

6100. Do you give any instruction at all in Moon's type?—Certainly.

6101. Only in Moon's type?—Only in Moon's type, except at the request of a blind person; some of them like Frere's. We have a few books in Frere; and some like the Braille system.

6102. Have you formed any opinion yourself about the best system of embossing for the blind?—I have not formed any deliberate opinion myself. Unfortunately my time is very much occupied, and I am not able to go and see so much of the blind people reading as I should like; but I am told by teachers amongst our blind friends that the Braille system, which is a little difficult to learn to begin with, gives them great satisfaction, and when once they have got hold of it they can read so much better and quicker than they can with other systems; but I have no practical experience myself.

6103. And your society takes up Moon's system specially?—We do.

6104. You have no agents, I suppose, for the propagation of Moon's system?—No.

6105. Do you employ agents from the Home Visiting Society?—We do not employ them.

6106. You permit them to visit your people?—Yes certainly.

6107. And you give them a list of people who require to be visited?—If they ask it, certainly.

6108. Does any other visiting society visit some of your people?—Yes, the Indigent Blind Visiting Society have done so; but I may say at once that we do not approve of their system of visiting in many respects, because they have blind visitors, and my experience has taught me that blind visitors, as a rule, are not good ones. It is a kind of beggar on horseback, if you will pardon the vulgarism; the blind are often jealous of one another, and are often unkind to one another, and I think the blind are much more kindly and more effectively relieved by sighted persons.

6109. Then you think that the education and assistance of the blind is better effected through sighted agents than through blind ones?—I do, certainly.

6110. Have you any experience of a market for the blind produce?—I have not much experience of that. The only experience that I had of it was our depôt that I have mentioned. The Surrey Association, the School for the Indigent Blind, and other kindred institutions have a very fair trade, I think, but we ourselves have never tried to develop the actual trade of our men; we found that to do it would involve so much expense that we really could not undertake it.

6111. Of the number that pass under your observation do you think that there is a large proportion who could earn their own living?—No.

6112. Not even if a proper market were supplied?—Amongst our own members there are few who could earn their own living, even if a proper market were supplied.

6113. To what do you attribute that?—I attribute that to the blindness with which we have particularly to deal coming upon men and women in mature years.

6114. (*Dr. Tindal Robertson.*) What was the total amount of your income last year?—Our report is made up to the 31st January 1885, and taking the figures from that, the total amount was 1,059*l.* 12*s.* 5*d.*; but that includes this sum of 509*l.* 2*s.* 3*d.* that we received from the Paymaster-General. I should say that the amount received up to the 31st of January 1886 is between 600*l.* and 700*l.*, so that our fund, I might say, is in a healthy state, in fact our subscribers have increased.

6115. Do you include in that the amount that you receive from your invested income?—Yes.

6116. Then, with the exception of that, from what other sources do you derive this amount?—From subscriptions and donations loan repayments and general receipts.

6117. What should you say would be the average annual expense of conducting the association?—Not more than 30*l.* or 40*l.* a year, the expenses are simply for printing, advertising, the payment of a man to arrange our classes, &c.

6118. Then in fact your society does almost what you call a voluntary work?—It does entirely voluntary work. I claim for our association that it is entirely a voluntary work.

6119. You have no paid officers?—No, with the exception of a small commission which goes to the collector, and you will see from our cash account that that amounted last year to only 2*l.* odd.

6120. And you have no payment for offices?—No, certainly not.

The witness withdrew.

Miss DANVERS examined.

Miss Danvers.

6121. (*Chairman.*) You are the secretary of the Blind Female Annuity Society, in Fairfax Road, South Hampstead?—Yes. I am honorary secretary, and I live at 25, Fairfax Road. There is no office connected with the society.

6122. What number of blind persons have you on your register?—About 70.

6123. How many do you give annuities to?—To 20 now; we elected four additional candidates last month.

6124. Besides those on your books you have applicants, I suppose?—Yes, but some have been rejected as ineligible; a few will be brought before the committee at the next meeting. I believe there are between 30 and 40 still waiting to be elected who have been accepted as candidates.

6125. What is the qualification of the candidates with regard to age or means?—They must be 21; that is the earliest age at which we receive them. As to their means I do not think we lay down any particular rules, but we require that whatever we give them shall, with what they already have, be sufficient to supply them with at least the necessaries of life; what we give them is intended to supplement what they already have, because our pension, the highest being 10*l.*, would of course be inadequate of itself.

6126. You give your pensions very often then to those who have pensions already?—Yes, very often to those who have pensions or something else to help them, not necessarily pensions.

6127. Do you give the doles or allowances from week to week?—No, by the quarter.

6128. Do you pay the pension of 10*l.* in one lump sum, or by the quarter too?—We give that by the quarter too.

6129. Your endowment is not large, is it?—No; it is now nearly 1,100*l.*

6130. Is that created by funding legacies and donations?—Yes. It began with a bequest of 200*l.*, and we have since had one of 300*l.*, the rest has been made up by donations, and by a third part of what we receive annually according to the present rules.

6131. What are your annual subscriptions, and what is your annual income?—I think I may say that we have about 130*l.* a year that we can depend upon; but that does not include the donations, which of course vary from year to year.

Miss Danvers.
26 Feb. 1886.

6132. How many vacancies have you annually?—That all depends upon circumstances, upon the state of our funds, and also upon the deaths that may occur.

6133. This institution was founded about 10 years ago, was it not?—Yes.

6134. Is it confined to London?—Certainly not; there is no limit to its extension that I am aware of. We have had applications from all parts of England, and some from Wales.

6135. Do you give the preference to the aged?—I think we do if they are very aged, but at the same time as we profess to be one of the few societies that help the very young, beginning at the age of 21, we do not overlook that fact.

6136. I suppose that there are very few occupations at which blind women can earn their livelihood?—Comparatively few. Some are very clever and independent, while others are less capable.

6137. Do you know any who do earn their own livelihood when they are young and have been well taught?—I know a great many who help towards it; I do not know any who do exclusively, most of those I know do a good deal of needlework and knitting, but their earnings are very small, seldom more than 1*s.* a week.

6138. Are they able to work with a machine?—Yes, some of them are, but comparatively few, I think.

6139. There is a particular sewing machine, is there not, for the blind?—I am not sure that I have heard of a sewing machine, but there is a woman who lives close by us who has a knitting machine; she is one of the very clever ones, and she knits stockings and various other things.

6140. When you spoke of their doing needle work, did you mean that they did it by a machine?—Some of them do real needle work as we do it, and most of them knit without machine. Many of them are very clever.

6141. Do you find that most of them are able to read?—Yes, certainly.

6142. Have most of those who are on your books been taught after they became blind, or had they become blind in mature years, or have the majority become blind in early youth?—I cannot say. Many of them, of course, I do not know, personally. When their case is put before us it is not always stated when they became blind. They are obliged to have a certificate from a surgeon to say that they are blind, but it does not necessarily state how long they have been so.

6143. Is there anything that you would like to tell the Commission with regard to your experience as to the education of blind girls?—There is one thing that they themselves feel very acutely, and that is that they should be treated, as far as possible, as if they saw. They do not at all like to be sympathised with as if they were very much wanting in advantages; that they really resent. I remember on one occasion at an institution near us, the Blind School at St. John's Wood, after one of their quarterly meetings they told me that they liked the chairman on that occasion (Dr. Boyd Carpenter, present Bishop of Ripon) better than the one they had before, because he talked to them as if they were beings like himself. They said they quite dreaded the speeches that were made in public, because they always expressed so much pity for them.

6144. Then you think that blind children should, as far as possible, be always educated with sighted children?—Yes, I think that is a very great advantage.

6145. From your knowledge of the blind in London, do you think it advisable that the education of the blind should be compulsory, as in the case of sighted children?—I think so. In many cases blind children are even quicker than sighted children, because they are very often able to concentrate their attention better.

6146. (*Dr. McDonnell.*) Have you been in any of the school board schools where blind children are brought up along with sighted children?—No I have not.

6147. You have not visited any of those schools in London where there are some eight or ten blind children trained along with the sighted children?—No, I have not been in any of the board schools in London.

6148. Do you give a fixed sum of 10*l.* a year to all your pensioners?—No, it must not exceed 10*l.*; but we are at liberty to give any sum that we please. It is generally 5*l.* or 10*l.*, but in one or two cases it is 6*l.*

6149. What are the principal circumstances that you take into account in giving the larger pension?—The means and requirements of the applicant. If she is very necessitous, and if 10*l.* was requisite to supply really the necessaries of life, we should try to give that amount, because, as I have already said, our principle is not to give such a small sum that it would be really of little avail, but to give them sufficient to prevent them from being paupers.

6150. Still, if you could give every person 10*l.*, if they were industrious they could earn 10*l.* additional?—They might, but I do not think it necessarily follows. In some cases 5*l.* in addition to their income would be ample.

6151. If we found that they were already able to support themselves then we should not grant a pension. As a rule a great many of those who apply are perfectly unable to support themselves. I think that persons who are industrious would in any case do their very best to earn all they could.

6151*a*. (*Dr. Tindal Robertson.*) I think you said that we might take the total income of your institution at about 130*l.* a year?—Yes.

6152. May I ask what would be the cost of administration?—We have no expenses; the officers are all honorary.

6153. I wanted to know whether there was anything in the way of printing, or anything of that sort, which would be a charge upon that 130*l.*?—There is the cost of printing the report, and the stationery which comes to about 5*l.* altogether. That of course will vary year by year

6154. But so far as I can understand you your institution is almost entirely voluntary?—Yes, entirely; there are no paid officers whatever.

6155. And you have no office rent to pay, or anything of that kind?—No.

6156. Can you give us any idea of what has been generally the position in life occupied by the persons who receive your pensions?—It varies very much. Most of them belong to the working class, some have been domestic servants, and in one case the applicant had worked as a missionary abroad. I know a woman now living in Holborn who earned her livelihood by colour painting; she lost her sight in doing so; and is quite unable to do anything at all, having some other terrible disease. Her sister now helps to support her, and of course the assistance that she gets from us is a very great addition.

6156*a*. Have you any governesses or persons who have been governesses on your list?—I think not.

6157. Is the rule with you to assist people who are poor, or persons who have been in better circumstances?—I think that our pensions are more for the poor of the working classes, however, we are not limited at all. The object of the society is to assist respectable blind women.

6158. In considering the question of pensions, what reasons mainly influence you in giving them to one or the other?—They must be widows or spinsters, of good character, necessitous, and their health and surrounding circumstances are taken into account.

6159. Then in fact you take the whole circumstances of the case into account?—Yes.

6160. Do you judge upon each individual case, or have you any kind of rules that you have laid down for your guidance?—In the event of the applicant being of great age I think we should give the preference to her, also to those who have been longest on the list; and when we can we employ the Charity Organisation Society to assist us in investigating the cases.

6161. Would it be competent under your rules to give loans to persons?—The committee, I believe, at any time could make any byelaws; but I do not think that power exists now.

6162. Then under present circumstances it would not be possible to do that?—No.

6163. Do you think that there are cases in which persons might be very advantageously assisted by the granting of loans?—Decidedly.

6164. Do you think that if that suggestion was offered to your committee they would be inclined to adopt it?—I doubt very much if they would, because it was the original intention of the founder to give pensions; unless we had a very large surplus indeed, we should not, I think, feel at liberty to give relief in any other form.

Miss Danvers.
26 Feb. 1886

6165. (*Mr. Johnson.*) I believe that you only distribute twelve pensions of your own, and I see that there are three pensions from the Gardner Trust?—Yes, there are three pensions from the Gardner Trust, but we receive the grant from them. I took that into account when I said that our annual income might be 130*l.*

6166. That grant from the Gardner Trust of 21*l.* a year, is made to your committee, and they distribute it as they think proper?—Yes, they add it to the general fund.

6167. Yours is specially an annuity society then?—Yes.

6168. Do you know whether any of your annuitants receive annuities from other societies?—Yes, a great many of them do. Several of them have pensions from the Gardner Trust, and others from different societies.

6169. Do they receive annuities from the Gardner Trust, other than the 21*l.* which you receive?—Yes.

6170. Do any of them receive any pensions from any other charities or from any of the city companies?—Yes.

6171. Do they receive any from Day's Charity?—I do not remember, but it is very possible.

6172. Then you make no rule with regard to your pensions that people receiving pensions from other societies should become ineligible?—No, not any; on the contrary, sometimes it is rather a recommendation, because they must have what we deem to be sufficient to keep them respectably.

6173. What is your idea of the amount that would keep them respectably?—That very much depends upon circumstances; it depends upon their surroundings with whom they live, and what they are able to earn. Sometimes, perhaps, our pensions might seem a little unequal, for to one who had more than another we might see that it was right to give the 10*l.* from one circumstance or another.

6174. You only give five 10*l.* annuities and seven 5*l.* annuities?—We have elected four additional ones this year.

6175. The Bokenham annuity you have no control over, I believe?—No, that is a sum of money that is invested for the endowment of one annuity. The committee have the power to elect the annuitant.

6176. Have you any knowledge of how these people get their living?—Yes, I have it all down on the register, and on the forms of application. Each one, before she is elected, has to fill up a form of application, which is then carefully considered by the committee, and when possible the Charity Organisation Society investigate it also to see that it is all correct.

6177. Do you think there is greater difficulty amongst the female blind in getting employment than amongst the male blind?—I do not know, I have had so little to do with the male blind that I am hardly in a position to say.

The witness withdrew.

NOTE.—I should like to remark, in addition to the above statements, that I find, on referring to the register, that by far the majority of applicants are represented as incapable of earning anything; some few get 1*s.* a week, others less, and the four who contribute substantially towards their own support earn severally 15*l.* 12*s.*, 11*l.* 14*s.*, 7*l.* 16*s.* and 3*l.* 18*s.* per annum.

I believe that where a blind person is trained from childhood to works of industry she may be as competent to support herself as a sighted person, but probably the majority of applicants to this society have not had this advantage, and are consequently more or less dependent upon others. It should also be borne in mind that blindness is very often produced by bad health and disease, which frequently incapacitates the sufferer for employment; but I cannot too strongly advocate the necessity and advantage of educating the blind from their earliest years to habits of industry and self-reliance with a view to supporting themselves in the future.—C. D., Hon. Sec.

Mr. Robert Storey examined.

Mr. R. Storey.

6178. (*Chairman.*) Are you the foreman of basket making at the Kent workshop?—Yes.

6179. How many years experience have you had in basket making?—Since I was 12 years old; that will be something like 42 years.

6180. Where did you learn basket making?—At St. George's.

6181. How many years were you in the institution?—Six and a half years.

6182. When you left that institution were you an accomplished worker?—Well, they considered me so, but I really was not.

6183. And then you had to teach yourself, I suppose?—Yes.

6184. How did you get your livelihood after you left the St. George's Institution?—I started in a little business for myself in Bakewell, in Derbyshire.

6185. Did you fail, or did you succeed?—I did very well for perhaps a year or thereabouts at basket making. Then I took to following the fairs and markets round, and I did very well for a time.

6186. Were you blind from birth?—No, I lost my sight when I was six years old. Then I had to leave off going to the fairs and markets on account of the expense. I could not afford to buy a horse and cart of my own, and it cost so much that I could not follow it, and I had to leave it off. Then I got a job anywhere I could, travelling from town to town, picking up a job wherever anyone would give me one.

6187. Did you marry?—No, not then; I had four years in the country.

6188. What age were you when you came back to London?—About 22.

6189. Did you find that you could get on in London?—Mr. Levy's establishment had just started in Cromer Street; that is where it started first, but it is carried on in Berner's Street now; and I went to work for them directly I got to London, and I continued to work for them for six years as outside journeyman; and I had a business of my own in Hampstead Road, and I did very well at that time.

6190. What was the most that you earned in a week at that time?—I can scarcely tell you. Sometimes I earned as much as 2*l.* and 2*l.* 5*s.* a week in the way that we were paid then. We had a certain basket given us out to make, and we took it in, and what it realised we received. We had the profit and the principal all for ourselves from the institution, so that in that way, of course, it gave us good wages. Then I was sent for by Miss Harrison to go to Sheffield to start an institution there.

6191. Did you go there as a teacher?—Yes, and there the basket making was very unsuccessful, and they had to drop it. They simply kept me on for a time just to keep the shop going.

6192. What did they take to after that?—Brush making is their chief trade.

6193. Did you learn that too?—No.

6194. Then did you come back to London?—I went to Southsea first from Sheffield, and I was 11 years in Southsea teaching there.

6195. You have been the round of these institutions then?—Yes.

6196. Do you think that they were successful in turning out good workmen?—Some of them are successful and some are not.

6197. Did you find much difficulty in teaching the blind?—A youth you can get on with very well, but when a man gets to 25 or 30 years of age he had better not touch basket-making at all, it is a complete failure. That I have specimens of with me now at work. I have one young fellow, a clever lad, about 20 years old now; I have had him with me about three years, and he can make things almost as well as I can myself. Another man has been there five or six years and he can scarcely do anything well, and he began as a man.

6198. How soon do you think that they ought to begin to learn an industrial occupation, supposing that they are born blind, or become blind when they are young?—Let them start work at about 14, that is plenty soon enough.

6199. In about how many years ought they be to learn basket-making or any other trade?—I think that basket-making should take five years, but that depends a great deal upon the men that they have to put them forward. It wants a thoroughly experienced man to teach a blind person, and the man must have wonderful patience.

6200. What do you think should be done to assist the blind after they leave these institutions to enable them

Mr. R. Storey.
26 Feb. 1886.

to get work?—Supposing that we had in a small town of perhaps 25,000 or 30,000 inhabitants three men, one a good man (and we are badly off for good hands, there are not many of us about) and two indifferent hands in a little shop, and if that shop were watched by gentlemen like yourself, a committee to overrule the whole of them, I think that would be a good plan.

6201. You think that a blind workshop should be started in each provincial town under the supervision of a committee?—Yes, I think that would relieve us wonderfully.

6202. And that you should get at least one skilled hand, and, of course, as all hands are not skilful two or three inferior men would get on with a good man at the side of them?—Yes.

6203. I suppose you would not advocate sighted labour, because it is too expensive?—It is rather expensive.

6204. And you think that these workshops would pay their way?—I feel confident that they would.

6205. You have seen it tried, have you?—Yes, there are two persons now trying it in Birmingham, Dale and Crowder.

6206. Are they working together as partners?—They are.

6207. Are they married?—One is married, but I really do not know about the other.

6208. Who is to keep house for them?—Out of three most likely one would be married.

6209. In London how would you multiply institutions of that kind?—As to London that is a question that I hardly know how to deal with. We have so many blind in London in different parts in little businesses for themselves that it would be a difficult matter to plant shops in London.

6210. Is there much competition amongst the blind themselves?—No, I do not think that they try to injure each other in any way, or run each other down in the trade. I do not think that there is anything of that sort.

6211. Is one of the reasons why the blind find it difficult to sell their work that their work is not so good as that of sighted people?—It is not quite so shapeable.

6212–13. Of course there are some blind people who can make as good work as sighted people?—Quite equal to it.

6214. But those men succeed and the others fail who cannot do their work as well as sighted people?—They are sure to fail; that is why they want a good man with them, two or three together.

6215. And you think that if some of these institutions were to spend their money in setting up small workshops of that kind over London and in provincial towns that would be one of the best ways of finding work for the blind?—It would relieve a great many who are now in want, poor fellows, I know.

6216. Do you follow up those whom you have taught in the institution where you are working now?—Yes, there are two now in Southampton doing very well for themselves; and another one that I taught when he was a boy at Southsea I have with me as a journeyman; he is the best hand in the shop where I am now.

6217. You have not a large number of men under you now, have you?—There are seven under me now.

6218. Could you look over more than that?—Yes.

6219. Is not the workshop rather larger than the workmen require; do you not require more workpeople in order to make it profitable?—We do not require any extension.

6220. You say that you could superintend a larger number of workpeople, and therefore, of course, to that extent your labour is less profitable than it would otherwise be?—Yes. I have no doubt that I could manage 12 or 14, and teach them well.

6221. (*Mr. Johnson.*) Without much more expense?—It would be no more expense.

6222. You have room where you are to take in people to the number of 14?—I dare say we could manage 14.

6223. Is there any difficulty in disposing of the work that is made by the blind now?—Where I am at present we scarcely have any difficulty. We do not keep much stock. We have some very good customers who take a quantity of our work.

6224. Your experience is principally in basket-making, is it not?—Yes.

6225. At the institution where you are now working they make ship fenders very much, do they not?—Yes.

6226. Is there equal profit upon making ship fenders as there is upon making baskets?—I do not think so. At that place there are only two blind men at work making ship fenders, and there is one sighted man to superintend them, and of course he would be able to teach 12 or 14 at the same expense if he had them.

6227. What is your opinion about sighted supervision over blind workmen; do you think it is a good thing or not?—So far as I am concerned I do not think that sighted men are, as a rule, capable of turning out good blind men, or very few of them.

6228. Then your idea, as I understand it, is that blind teachers are better teachers for the blind than sighted ones?—Yes, I feel confident of it.

6229. Where did you pick up that experience?—By being side by side with those who can see, in the same shop.

6230. I suppose you yourself were taught by a sighted person?—Yes, there were no blind teachers in the days when I was taught.

6231. How many years ago is it that you were taught?—I went to school in the year 1844, at St. George's. I left there in the year 1850, and since that time they have found it expedient to employ a blind teacher. They always were against it before, they never would have one; but they found it quite necessary to get one.

6232. Where did you pick up that experience?—I visit that school frequently, and I know the man who is teaching there.

6233. Who is the man who is teaching there?—Hussey, I think his name is. I do not know the man, only by seeing him in the workshop. He was a pupil in the school, but he was not a pupil in my day.

6234. He is kept as a monitor, I suppose?—He is kept as a teacher.

6235. I suppose in many of the institutions that you have been to they keep their best workers as monitors, or teachers, if possible?—If possible, they do.

6236. So as to employ the blind?—Yes.

6237. But in other institutions which you have visited they have all sighted supervision?—It is all sighted supervision in most of them.

6238. Have you any experience of people having pensions?—No, I do not know anything at all about pensions.

6239. Have you one yourself?—I have a small one from Red Lion Square; that is the only one that I have.

6240. From the Indigent Blind Visiting Society?—Yes.

6241. What pension do you get from them?—I dare say in amounts to 2*l.* 5*s.* or 2*l.* 6*s.* a year.

6242. Have you had that all the time you have been at work?—I have had it for about five years.

6243. Do you think that it is a good thing to give pensions to persons who are carrying on a trade?—Yes, because not one out of 10 can earn sufficient to live upon.

6244. Amongst the people that you know who work, do pensions help those who are successful very much?—Oh, yes.

6245. Do you know many who have got pensions who are engaged in manufactures?—Yes, I dare say I know 40 or 50.

6246. Do you think that the pensions are distributed in a proper way, or would you suggest any alteration of the way in which they are distributed?—That is rather a difficult thing for me to say anything about. Of course I do know some instances. In Mr. Day's gift there are three sums, and I know some men that get 20*l.* a year that should have 12*l.*, and others get 12*l.* a year that should have 20*l.* I know that much; according to their position in life I mean.

6247. What leads you to think that there is that inequality of distribution?—It is simply, I suppose, that fortune favours the one and misfortune follows the other.

6248. Why do you think that a man who gets 12*l.* a year should have 20*l.*, and that a man who gets 20*l.* should have 12*l.*?—Because the one has no children and the other has four or five children; that is the only reason, and I know that it happens so in several cases.

Mr. R. Storey.
26 Feb. 1886.

6249. Do you know many that have two or three pensions?—Yes, I know several.

6250. Do you think that all of those who have got two or three pensions deserve it?—Yes, I really think they do. There is one old gentleman who lives with us in Greenwich. I think that man has three pensions to my knowledge, and he is 70 years of age, I dare say, or rather more, and he was never able to work, so that if he had not had that assistance he must have been in the union.

6251. What is the amount of the pensions that he gets altogether?—I could not tell, I never made bold enough to ask the man.

6252. But of your own knowledge you know that there are a good many people employed in trade who have one or two pensions, and perhaps more?—Yes.

6253. In your experience what are the average wages of basket makers?—Really not more than 9*s.* or 10*s.* a week on an average taking them altogether as a body. There are a few that will earn a pound or a guinea a week; others will not earn more than perhaps five or six or seven shillings a week.

6254. In your extensive experience of teaching do you find that there are great varieties of excellence in work, and that some men are able to learn very easily, and produce very good work, and some produce very bad work?—Yes, and you may bestow all the pains you can on one man and you cannot put it into his head, and cannot teach him; he cannot remember it.

6255. What would you suggest for those people that you cannot teach anything to?—I hardly know. There is only one thing that is on foot now that is of any use to these sort of men, and that is wood chopping.

6256. Have you any experience of what they gain by wood chopping?—They only earn something like 12*s.* or 14*s.* a week.

6257. At institutions, or at their own homes?—Scarcely any of them do it at their own homes; it requires so much room.

6258. And a certain amount of apparatus I suppose?—Yes, and in order to carry it on with any effect it wants a little capital, and that is what many blind men have not got.

6259. (*Dr. Tindal Robertson.*) I noticed that in speaking about Sheffield you said that basket-making was unsuccessful there; can you give us the reason?—I do not know why it should have been unsuccessful, but the only reason that I can assign for it is this: the man that superintended there then was a brush-maker, and he seemed to study his own branch of the business and let the others go to the winds.

6260. Are you married now?—Yes.

6261. Have you any children?—Yes, I have a son here now with me.

6262. Are they sighted children?—Oh, yes.

6263. Supposing you had a blind child, it what way would you have that educated?—I should send it to school with my other children, undoubtedly.

6264. Have you any experience as to the way in which they teach the blind in board schools?—I have never come across any that have been taught at those places; I do not know how they manage with them, I am sure. The board schools round about where I live have not a blind child in them. Now, in Bermondsey, they have blind children in the board schools, but I do not happen to reach that far.

6265. Can you give me your reason for saying that if you had a blind child you would send it to a school with sighted children?—I do not know particularly why it makes their knowledge better; they acquire more knowledge and a truer knowledge of things by being mixed up with children that can see, whereas, if they were all mixed up together, as we were at St. George's, they get one strain of thought and one strain of action, and when they come out into the world they are almost afraid to move and afraid to speak, and are almost like dumb people. But children going to school with little people who can see acquire the same actions and the same thoughts, and everything as they have.

6266. Your reason is mainly that if your blind children were educated together with sighted children it would make your children more self-reliant and more independent, and better fitted to go into the battle of life than if they were educated in a blind school with blind children?—Blind schools are what I call exile institutions, that is my idea.

The witness withdrew.

Adjourned to Thursday next at 12 o'clock.

32, Abingdon Street, Westminster.

Thursday, 4th March 1886.

PRESENT:

THE RIGHT HON. THE LORD EGERTON OF TATTON IN THE CHAIR.

W. TINDAL ROBERTSON, ESQ., M.D.
B. ST. JOHN ACKERS, ESQ.
T. R. ARMITAGE, ESQ., M.D.
W. AUCHINCLOSS ARROL, ESQ.
E. C. JOHNSON, ESQ.
C. E. D. BLACK, ESQ., *Secretary.*

Mrs. ALICE WESTLAKE further examined.

Mrs. A. Westlake.
4 Mar. 1886.

6267. (*Chairman.*) You have already given evidence before this Commission as to the blind. You are a member of the committee of the London School Board that specially looks after both the deaf and dumb, and the blind?—Yes, it is the same committee.

6268. How long has that committee been in operation?—I think for 10 years; I have been a member of it for nine years.

6269. What steps have they taken to deal with the education of the deaf and dumb children?—The first step was taken in 1874, before I was a member of the committee. The Rev. Mr. Stainer was then appointed superintendent of the instruction of the deaf and dumb.

6270. What is the present state of the education of the deaf and dumb?—Perhaps I had better give the history. In 1874 Mr. Stainer was appointed, and he taught the deaf and dumb on a system which I believe was entirely his own, a sort of united system of signs and oral instruction. I do not think it was adopted by anyone else. I think it was his own system. I became a member of the board in 1876, and I think about a year after, in 1877, my attention was drawn to the subject of the instruction of the deaf and dumb by Mr. St. John Ackers, and I went carefully into it with him. We visited classes under the school board, and came to the conclusion that the results of its teaching were not satisfactory at that time. That the children were not fitted for their work in life; that the fact of partly using signs unfitted them for the hard work of learning the oral system; that they therefore acquired very little lip speaking; and that the sign system cut

Mrs. A. Westlake.

4 Mar. 1886.

them off from their kind, very few people of course knowing the manual alphabet; so that the results were really very unsatisfactory. We had a great many discussions at the school board; Mr. St. John Ackers kindly came and gave us his evidence and advice, and the subject was discussed for two or three years. Mr. Stainer was very much opposed to the introduction of the oral system; he thought that it was very unsuited to the children in London board schools, and he opposed it in every possible way. In 1879 the board determined, regardless of Mr. Stainer, to start a class on the oral system under a separate teacher. This teacher was procured from the Fitzroy College, and she was put into a school in Bermondsey, and left there under the superintendence of Mr. Van Praagh of the Fitzroy College. Her work has gone on continuously up to the present time, and she has now been incorporated in the general system which has been adopted by the school board. In 1880 Mr. Stainer went to a conference at Milan of teachers and others interested in the education of the deaf and dumb; and he then found that the oral system was the one adopted universally throughout Europe and America by all good teachers, and he came home converted, it was a very sudden conversion, and he was ready to adopt the oral system. Then the question arose with the board whether Mr. Stainer could himself, without special training, introduce this system into its schools. I for one felt that he was hardly the person to do it; but on the other hand it was pointed out to us that nearly all the teachers of the deaf and dumb had been originally manual sign teachers, and that they had adopted the oral system, and trained themselves, and become teachers of the new system, and that we might carry out that course with Mr. Stainer. I believe that he then went to Ealing and had some training, and he told us that he had had a good deal of previous training in the oral system, I do not know where it was, but the oral system was then introduced into all our classes. We got some teachers from Ealing, and some from the Fitzroy College, and we adopted a system of training pupil-teachers who were to give part of their time to the teaching in our classes, and part of their time to training themselves, either at Ealing, or at Fitzroy Square, for the special work of teaching the deaf and dumb. We have at the present time 13 of these pupil-teachers, three ex-pupil-teachers who have been trained on the same system, and 13 assistants, 7 of whom were trained at Ealing, two at Fitzroy Square, and as to four I am not aware in what place they were trained. Some of them were old teachers of ours, who had gradually, I suppose, learnt the system as best they could. Now we have nine centres in different parts of London under this large body of teachers, superintended by Mr. Stainer, and in order to carry out the system more perfectly, in two centres we have had special class rooms built.

6271. Then the deaf and dumb are collected together in certain centres in London?—Yes.

6272. Of course the number of them varies in different districts?—Yes.

6273. And you have, I suppose, to take them out of their districts and collect them together in one centre?—Yes, that is the great difficulty.

6274. You have never attempted to teach the deaf and dumb, of course, with the ordinary children?—No, I think it would be quite impossible to do so. They are under a very great disadvantage as compared with the blind, because the blind can be taught partly with the seeing children, but the deaf and dumb cannot be taught with the hearing children. In the same way we cannot use itinerant teachers for the deaf and dumb. With our blind classes our teachers go round to various schools, and where perhaps there are one or two children who may happen to be isolated, they take them for a morning, or for an afternoon, or for a certain time; and then the blind children can join the ordinary children for the rest of their time. But we cannot do that with the deaf and dumb.

6275. Do you teach the deaf and dumb children entirely on the oral system, and do you, as far as possible, prevent them from using any signs?—I think Mr. Stainer uses what he calls a modification of the oral system.

6276. You have a mixed system then?—It is supposed to be the oral system, but Mr. Stainer says that the oral system, pure and simple, is not adapted to these children. I do not feel that I have sufficient technical knowledge to be able to answer that point myself.

6277. Has the school board satisfied itself that all the deaf and dumb children are brought to school that ought to come to school?—I am afraid not, for this reason, that they live in such remote districts. It would be too expensive to have a teacher for one or two children, and therefore the isolated remote children are necessarily left out of instruction. I was asking Mr. Stainer about that, and I think we have perhaps more than half of the deaf and dumb children under instruction; but it is rather difficult to get the exact figures. The superintendents of visitors report to the superintendent of the deaf and dumb any deaf and dumb children that their visitors come across; but the visitors are not very skilful on the subject, and they report a good many imbecile children who are dumb because they are imbecile, and are really hardly suited for any training that we can give them. So that it is rather difficult to pick out exactly the deaf and dumb children alone who are still out of instruction. But I have been suggesting to our committee that we ought to have a far better system of individual visiting than we have. In the case of the blind the superintendent visits every individual child in London who is reported to her; but Mr. Stainer does not do that, nor do any of his teachers; they leave it entirely to the school board visitors; and that I think is not sufficient, because these parents are very ignorant, and require a great deal of persuasion to send their children to special classes.

6278. Then how would you propose that these isolated cases, which are difficult to get into classes together, should be dealt with?—It is entirely a question of expense.

6279. Has the school board made grants to any existing institutions for training the deaf and dumb?—No, we have no power to do that.

6280. You have no power by the existing law?—No.

6281. Are you aware that the Manchester School Board have passed a resolution to this effect: "That "the Education Department might with propriety "make grants to institutions for the education of the "deaf and dumb, &c., and that such grants might be "made either towards maintenance, as in the case of "certified industrial schools, or upon examination as in "the Public Elementary Schools"?—Yes, I know they have done that, but nothing has come of it so far.

6282. The London School Board, having this before them, have taken no steps to pass a similar resolution?—No.

6283. In your opinion would that be the only way of getting at the isolated cases?—I do not think that would meet them; I do not think the Education Department would ever make grants sufficiently large to pay a competent teacher for one or two children.

6284. But my point was whether they would allow the school board to make grants to such institutions as would train these isolated cases?—I very much doubt it. I think they would leave it to the guardians; I do not think they would give us the power.

6285. The guardians at the present time have the power of doing it?—That is so.

6286. Have the guardians been moved to do that in London?—No, not by the school board.

6287. But is it not the business of the school board to see that, as far as possible, all children should come to school, and to take all legal steps towards making them come to school?—Yes, it is no doubt; but we should never get any support from the magistrates for instance in cases of that kind, if we compelled these children to attend any kind of class to the inconvenience of their parents.

6288. That is assuming that the magistrates are of opinion that the deaf and dumb children cannot be educated?—No, I think they would consider it an afflicted class, and not one to be pressed in any way. We certainly find that in the case of blind children we do not get much support from the magistrates, if we want to summon the parent of a blind child for bad attendance.

6289. Do you think that it would be impossible to make the education of the deaf and dumb compulsory?—I suppose it is theoretically compulsory at present.

6290. But you say that at present the law is not put in force?—It is not. Theoretically the compulsion is incumbent upon all children, but the magistrates do not thoroughly support the London School Board.

6291. But if the law does not require to be altered, and if, from the evidence brought before this Commission, public opinion were satisfied that the deaf and dumb could be trained and educated in such a way as to enable them to gain their livelihood in after life, would there not be sufficient public opinion in favour of carrying out the law as it stands now?—I am afraid that the magistrates are not very amenable to public opinion, and a great deal of pressure would have to be brought to bear. I should think that you are better judges of that than I am.

6291*a*. What is your individual opinion?—I do not think that public opinion would support the school board in using any harsh measures. The public are very apt to consider the school board very harsh, because it does carry out its duty of insisting upon attendance at school.

6292. Then the fact remains that isolated cases are left out of education altogether by the School Board of London?—Yes.

6293. But in cases where the deaf and dumb children can be conveniently brought together the school board has classes for that object?—It is very much a question no doubt of the health of the children. If they are tolerably healthy, strong children, they can walk a good distance to a class; but if they are weakly, as so many of the children are, they cannot be made to go any considerable distance.

6294. Of course in those cases it would be impossible to compel them to come to school, because they would be physically unable to do so?—Yes.

6295. Will you tell us where the centres are in London?—At Winchester Street, Finsbury; at Summerford Street and Turin Street, Bethnal Green; at Farrance Street, Tower Hamlets; at Bell Street and Campbell Street, Marylebone; at Boundary Lane, in Lambeth; at Farnecombe Street, in Southwark; and at Surrey Lane, in Battersea.

6296. Is there any part of London where the deaf and dumb are more prevalent than anywhere else?—The largest attendance is in Bethnal Green; it is a very crowded district.

6297. Are the deaf and dumb found generally among the poorest classes?—Yes. Occasionally a better to do family will have some deaf and dumb children, but ours are mostly amongst the poor.

6298. Have you followed in after life those who have been educated by the London School Board?—I am afraid not; I am afraid that there has been very little of that. I have tried to get some facts, and I have been able to follow a few children; but I do not think Mr. Stainer himself knows much about them.

6299. Have they when they have been turned out of the schools been able to conduct a conversation?—The results are only fairly good, I think. There are a great many difficulties to contend with. First of all the attendance of these children is very irregular; then they come in at all times and at all ages; and they are in our classes in all the different stages of progress, and it is extremely difficult for one teacher to do justice by a number of children in that state.

6300. In fact I suppose that if these children could be collected together into one centre and put into different classes according to their ages and requirements the work would be much more satisfactorily and better carried on?—Yes, very much.

* 6301. That would be the case if they were sent to some institution, would it not, the school board having the power to subsidise such an institution rather than have classes for themselves?—It would no doubt. A large number of those children I believe are gathered into homes which Mr. Stainer has started, but those do not come under the cognisance of the school board at all, we have nothing to do with the management of them.

6302. Those are places where the children are maintained, I suppose?—I believe they live in these homes to a great extent from the Monday to the Friday, and then return to their own homes after the school week; but we know nothing about that, officially.

* The children in Mr. Stainer's home are taught by the school board at its centres; in fact, they are collected in the homes for the sake of their more convenient attendance at the classes. It is only their domestic management which does not come under the board's cognizance.—A. W.

6303. That is done entirely by voluntary support?—Yes, and by the payments for the children, which I believe are in some cases rather considerable in these homes.

Mrs. A. Westlake.

4 Mar. 1886.

6304. What is the age at which the deaf and dumb leave your schools; do they leave at the same age as the other children?—We do not turn them out, but as a matter of fact they do leave at about the age of 13. No doubt it would be better if they remained longer, but there are difficulties. For instance, in the Bethnal Green centre we had some bigger boys in the class who have had to be expelled; we had great difficulty with them.

6305. They were too big to manage, I suppose?—They were expelled for bad behaviour. We have now started a class for bigger boys under a master because of the difficulties of management. Another difficulty about the training of these children is, that those who return to their homes return to very poor homes with very illiterate parents who do nothing to carry on their education, and who probably would check it. I do not think that the education of the deaf and dumb is half as satisfactory as the education of the blind under the London School Board.

6306. I suppose that to train them in the oral system requires a longer time than to get the same amount of education into the blind?—Yes, and no doubt they are very much more isolated than blind children; very much more cut off from their kind. Blind children can mix with the ordinary sighted children in many ways and work with them. I would mention that the deaf and dumb children are not examined by Her Majesty's inspectors as the blind are. The instruction, as far as possible, is made to follow the standards of the Education Code; but there is no passing of the standards, and very little estimate really of what the attainments of the children are. I think that we ought to have a great deal more inspection than we have. I have pressed that very much upon our committee, but they would not face the expense.

6307. We have a report before us with regard to Manchester, but we have not yet a report with regard to London?—You have an almost contemptuous report from Mr. Sharp; in fact, no report at all. He did not take the trouble to make any enquiries of the school board, or to visit a single centre; he simply dismisses the whole subject, saying that the board is doing it very inefficiently. Mr. Sharp has not applied to the London School Board for any information, or for the names of the classes; he has not visited anything. He mentions that in a school in the division which he usually inspects he found three deaf and dumb children who were not receiving special instruction; but that is all, I believe.

6308. He only mentions that in one school he found three deaf and dumb children who were not in receipt of any special instruction; was that an oversight?—No, it was not an oversight. We have asked Mr. Stainer about that. There is no centre near to which those children can go; we are just trying to arrange one now if possible; but those are the only children in the district that we know of who are not in a class. But Mr. Sharp happens to be the inspector of the Westminster district, so he came across these children in his official capacity, and thought that that was sufficient information to supply the Education Department with about the deaf and dumb.

6309. Can you state what the actual number of the deaf and dumb are in London?—We have 313 on our books, but the average attendance is very bad; it is only 67 per cent.

6310. What is the total number of the deaf and dumb so far as your knowledge goes?—That I cannot tell you.

6311. Of course there are more than the school board educate?—Yes.

6312. But you cannot say exactly how many there are?—No, I have tried to get that information from Mr. Stainer, but even he cannot tell me. I am sorry to say that we only get an average attendance of 67 per cent. of the 313 that we have on the books, and that is very low.

6313. Is there any other particular that you would like to draw the attention of the Commission to with regard to the deaf and dumb in relation to the London School Board?—I think not. I shall be very happy to answer any questions that may be put to me.

Mrs. A. Westlake.

4 Mar. 1886.

6314. Is that an official report of the London School Board which you have before you?—This is the same report which you have; but I have had it filled up with the salaries of all the teachers, including the teachers trained at Ealing and Fitzroy Square, and I can hand this in.

6315. (*Admiral Sir E. Sotheby.*) I believe there are certain persons who are instructed to see that the children are sent to school; is it not in their power to report all the deaf and dumb children who do not attend the schools?—The school board visitors are supposed to report to Mr. Stainer every deaf and dumb child that they come across in their scheduling; but of those children it is found that a good many are imbeciles and incapable of receiving any instruction by the school board, and I do not think that Mr. Stainer has separated the two classes of children sufficiently. He does not visit them personally.

6316. Then who is it that sees that these children are sent to school?—The school board visitor; but then he has no special knowledge of the difference between an imbecile and a deaf and dumb child.

6317. Then he is a very inefficient visitor, I should think?—It requires a good deal of special knowledge, I should imagine, to distinguish.

6318. Do you consider the oral teaching far superior to the sign system?—I do.

6319. Do you know whether the deaf and dumb can get employment as a rule?—I said, in answer to Lord Egerton, that I have only been able to trace a few cases of these children, but in several cases they are working at trades with their parents.

6320. Then you have no knowledge of the deaf and dumb adults?—No.

6321. (*Mr. St. John Ackers.*) I think you stated that the average age of a deaf and dumb child when it leaves school is about 13; can you say what age the child is, as a rule, when it joins?—That varies very much indeed. In some of the classes there are quite babies in attendance. They join at all ages; it depends very much upon the formation of a new class in a district. Children are gathered in from the neighbourhood, and they are usually of various ages.

6322. Do they have an average attendance of five years at school?—They can get more than that.

6323. I am aware of that; but do you think that the children have as a rule five years at school?—The class that we have to deal with is a very migratory class, and the parents are continually moving from place to place and changing their school, and it is very difficult to get the children for a continuous course of instruction; but I should think that they would get on an average five years off and on.

6324. Will your experience of those who have been at school five years warrant you in saying that those children can carry on conversation?—Fairly.

6325. Sufficiently to understand quite easily any one that may speak to them?—Not quite easily, moderately easily.

6326. Do you think that the oral system, after taking into consideration all the amount of labour involved in learning it, is practically of use to an ordinary working man's child?—It is of very great use. It is the only way in which he can communicate with his kind.

6327. Do you not think at the same time that the French or manual system ought to be taught?—No, I believe that if you teach the manual system the child will never sufficiently apply himself to the great labour of learning the oral system. It is so easy to make signs and to be understood by signs that he will not take the mental or physical trouble necessary to acquire the oral system.

6328. You have stated that the deaf and dumb are very much isolated; if a deaf and dumb child has learnt to speak and he finds another similarly afflicted, how can they carry on a conversation if the one has been only taught the manual system and the other the oral system?—It would be difficult, no doubt. We hope that in time they will all be taught the oral system.

6329. Would your information lead you to say that very few only of those who have passed through the board schools can speak?—I think that a considerable number can speak fairly.

6330. Would you say that 10 per cent. of them can speak?—More than that I should say.

6331. Twenty per cent.?—I should say that 50 per cent. can speak fairly. It is rather difficult to be quite accurate on such a subject. You would best judge of that by visiting the classes and seeing them in operation.

6332. You have mentioned that on the continent and in America the oral system is the prevailing system?—Yes, I believe so.

6333. I suppose you are aware that those who are conversant with the subject in America have rather shown that they are not disposed to recommend that the oral system should be solely taught?—I really can pronounce no opinion about that; I am not sufficiently conversant with the subject. I mentioned the conference at Milan, where teachers and experienced persons in connexion with the education of the deaf and dumb gathered together and came to an almost unanimous resolution that the oral system was the best.

6334. You say that you have 313 on the books, and only 67 per cent. in average attendance, and that 50 per cent. (I take it that that means 50 per cent. of the whole and not of the 67 per cent.) of those who have been turned out from your schools are able to converse by speech to a moderate extent?—That is rather a guess, and you must not take it as perfectly accurate. I said that they could speak moderately fairly, not well.

6335. Do you consider that the amount of education which they have hitherto received at board schools is sufficient?—No, I do not think it is.

6336. Are you not aware that the Education Acts allow eight years for a hearing child unless it passes an examination sooner?—Yes.

6337. Do you consider that a deaf child requires less time for its education than a hearing child?—Certainly not.

6338. Then you would not think eight years an unfair period to fix for the teaching of a deaf child?—Certainly not.

6339. Have any of your deaf and dumb children received eight years' full instruction?—Not on the oral system; we only introduced it in 1880.

6340. Then in fact, allowing that your system is the purely oral system, and that it is carried out to the best of your ability, you have not yet had a fair chance of testing what it can do in the school board classes?—That is so.

6341. Have you enough teachers, as many as you wish for?—No.

6342. Then you have more pupils to a teacher than you consider desirable?—I think so; but that of course is a question of expense.

6343. The question of expense, I suppose, comes up at every turn with regard to these children?—Yes.

6344. I think you said that the teachers are all female teachers?—Yes, with the exception of one.

6345. Why are they all female teachers?—I do not know that any others are available.

6346. (*Chairman.*) Are they cheaper?—They are cheaper, no doubt; and I think, perhaps, they are more patient.

6347. (*Mr. St. John Ackers.*) But could you obtain male teachers who have had any training?—I must say that we have not tried until just lately, when we had this unruly class, and then we asked Mr. Stainer to look about for a male teacher.

6348. Has that male teacher had any special training?—I believe he has, at Manchester and under Mr. Stainer.

6349. You said I think that the children are mostly the children of poor parents; are not many of those parents themselves unable to spell easily and accurately?—Yes.

6350. Therefore, if these children were not taught by speech, but were taught upon a system of finger talking, would it not be very difficult for them to converse with their parents when they went home?—No doubt, and it would be more difficult still for them to converse with others.*

6351. Do you keep any statistics with regard to the causes of deafness?—I am sorry to say we do not. I have been pressing upon Mr. Stainer the necessity of doing this, but he says that his time is not sufficient for the purpose, and that he must get an assistant if we require that; but I think it is most important that we should have such statistics. The school board does not at present insist upon it from Mr. Stainer, but I think it ought to do so. I believe that a year or two ago we did suggest to Mr. Stainer that he should do this, and he tells me that he drew up certain heads of questions which he wished the parents to answer; but it seems to me that that is quite inadequate for our purpose. These parents are very uneducated people and it is very difficult for them to fill up forms with information of that kind, and I want to press upon our committee the necessity of getting Mr. Stainer himself, personally, to visit the homes and to get all the information he can from the parents orally.

* Because conversing with their parents would confirm them in their bad spelling, and so increase the difficulty of their conversing with those who spell correctly.

6352. You consider that it would be advisable to have perfect statistics upon this question?—Very advisable. I must say that the assistants as a rule make inquiries of the parents, and they can tolerably accurately tell the cause of deafness, whether the child was born deaf at any rate, or whether the deafness was caused by some illness, or other reasons.

6353. But that does not go, I suppose, to the more minute particulars which are generally given in these statistics with regard to the deaf and dumb?—No.

6354. I understand that you advocate compulsory teaching for the deaf and dumb?—Compulsory attendance at school.

6355. You think that the deaf and dumb children, with those exceptions of course which there must be in all classes, should be compelled just as every hearing child is compelled to attend school?—Yes.

6356. (*Chairman.*) I think you rather shrank from going so far as to say that it should be made compulsory?—I said that I did not think that we should be supported by the legal authorities in carrying it out with any vigour; but I think it is very necessary if we could do it.

6357. (*Mr. St. John Ackers.*) But do you yourself personally, as a member of the London School Board of many years' standing, now consider that it is desirable that there should be compulsory attendance of the deaf and dumb?—Certainly.

6358. Do you further advocate the compulsory training of the teachers, or of some of the teachers, as in the case of the teachers of hearing children?—I do not understand what you mean by compulsory training.

6359. In this way, that I believe no grant is allowed for hearing children unless a certain number of teachers are certificated teachers. Do you consider that some such training and some such certificate should be required on the part of those who teach the deaf and dumb?—I think it is very desirable.

6360. Do you also consider that Government inspection should be as universal for these classes as for the hearing?—I think it would be also very desirable to have a special examiner, not an ordinary Government inspector.

6361. What alterations do you, as an experienced member of the school board, suggest should be made in the present laws relating to the elementary education of the deaf and dumb?—That is rather a wide question, and one upon which I am not prepared to make any suggestions.

6362. (*Dr. Armitage.*) Could you tell us what Mr. Stainer's special duties are?—He is general superintendent of the classes; he engages the teachers, sees that their agreement with the board is carried out, that they get proper training, and that their work is efficiently done.

6363. Does he himself teach?—I believe he gives lessons occasionally.

6364. Does he report to you upon the state of the different classes?—He does not give us any formal report as to the efficiency of the classes, only a general report that the work is going on well.

6365. Do you not think it is desirable that you should have a regular report as to each class?—I do not think that he would be the person to do it. I should like to get that from an outsider who was not interested in the classes. I think perhaps Mr. Stainer would not be so impartial as we should desire for a thoroughly searching report.

6366. I think you said that the deaf and dumb are taught in special centres?—Yes.

Mrs. A. Westlake.

4 Mar. 1886.

6367. Do you mean by that that they are taught entirely by themselves, or do they sometimes join the ordinary classes as the blind children do?—They are taught entirely by themselves; they never join the others.

6368. (*Chairman.*) Are they in different buildings?—Wherever we can find a class room to spare we put them in the ordinary schools; but in several of the new schools we have built special rooms for these children apart from the ordinary class rooms.

6369. (*Dr. Armitage.*) Do you think that there are any special advantages in training the deaf and dumb in day schools as compared with institutions?—No, I should have thought that there were disadvantages, but we have to put up with the inevitable; we cannot board the children. I think their return to their homes at night is very undesirable. The teaching is very much checked by their being with their illiterate parents, who cannot help them in any way in carrying on their training, and who rather check it.

6370. Your opinion, then, is that these children who are attending the day schools would be better off if they were collected in a special institution?—I think so, and under continuous instruction.

6371. Is that educationally, merely, or in other respects?—Educationally, I think. I am not at all desirous of breaking the connexion between the parents and the children if it can be avoided: that is of course the drawback of institutions: but educationally I feel sure that they would get on much more rapidly under constant tuition.

6372. Do you know that in America very grave difficulties have arisen in consequence of the deaf and dumb being congregated in special institutions, and that intermarriages are very frequent amongst them?—I do not know anything about that. I think that perhaps the best system, if it could be worked out, would be to board them with families in which they would have their special education carried on, and not to collect them in large numbers in an institution for the whole of the time. If they could be collected together for tuition, and boarded in special families where the people would take some trouble to carry on the instruction given in school hours, that would be very desirable no doubt.

6373. Have you any experience, whether when those children leave who have learnt the oral system, they continue it, or whether they adopt the sign system?—The few cases that I know of have continued the oral system, because it has been more convenient in their contact with the world; but I cannot say that I have much knowledge, or that Mr. Stainer has much knowledge of what becomes of these children.

6374. Can you tell us what is the public opinion amongst the children themselves who have been for a considerable time at school, as to the oral system as compared with the manual system?—I could best tell you the opinion of their parents, which would perhaps be more to the point. I think that the parents are very much pleased with the instruction. I think the children are happy enough. I should perhaps mention that we have not had this system very long in operation, and therefore a very large number of the children have not been turned out into the world from our classes; it is a comparatively small number who have gone through the training.

6375. (*Dr. Tindal Robertson.*) Will you kindly state the reasons which induced the London School Board to adopt the oral system for the education of the deaf and dumb?—I think we were very much influenced by the public opinion of those best acquainted with the subject. The resolution which was passed at the Milan Conference, for instance, very much affected the opinion of the members of the school board. The fact that those who were most experienced in the training of the deaf and dumb had almost unanimously come to the conclusion that the oral system was the best was sufficient for the school board.

6376. Was any evidence taken at all with respect to the adoption of the two systems?—Yes, Mr. St. John Ackers gave us a great deal of evidence, and Mr. Stainer brought a great deal of evidence himself on the other side. I think that we thoroughly threshed out the subject.

6377. Was it after Mr. Stainer had been converted, or before, that he gave that evidence?—Before.

Mrs. A. Westlake.

4 Mar. 1886.

6378. There are different classes of the deaf and dumb, those who may be called deaf mutes, who have been deaf and dumb from infancy, and those who have become deaf from diseases of childhood at the age of from three to five years; do you find any difference between those two classes as to the facility with which they receive instruction?—Yes, the class which has become deaf after a certain number of years is more easily trained than those who are born deaf.

6379. Do you find that those who are born deaf, deaf mutes, are liable to take up the oral system, and that they ever attain to anything like perfection with regard to it?—We have had no pupils, as I said before, who have attained perfection; but they have done fairly well.

6380. Even the deaf mutes themselves?—Yes, as far as I can ascertain from inquiry, I believe that the majority of the children in our classes are children who have been born deaf.

6381. I think you said that you had a report as to the amount which the different teachers have; can you tell us what is the aggregate amount of the cost of teaching the deaf and dumb under the London School Board?—Yes, 1,625*l.* is the cost of the salaries; it comes to 5*l.* 3*s.* 10*d.* per head of the children. Besides that there has been the cost of the special buildings, special furniture, and special appliances. For instance, we have gone to a good deal of expense in re-printing picture books for the children. I cannot give you the whole expense of the appliances and of the building, but the cost of the building I could ascertain if you desire it.

6382. I should like to know if you could give me an approximate idea as to what the total cost per child is including all the capital expenditure, the amount that you expend by the year, and the cost of the different appliances of which you have spoken?—I can send to the Commission an approximate amount for that.

6383. You have said that it is difficult to get these children together from different parts of the town; do you think that it is possible to have either one or two large training institutions in different parts of London, where, as you say, these children could be boarded somewhere in the neighbourhood, and, if that were done, would it not then be much more easy to establish a system of classes?—No doubt.

6384. So that you might have, say, 150 children in a large institution, and then you might have different teachers all in that institution, and you might have then small classes which would make it much easier both to the teacher and to the taught?—No doubt that would be so; but the expense would be very great, and the ratepayers would be very indignant in consequence I fear.

6385. In what way would the expense be so very much greater than under the present system?—The expense of building these large institutions, and the board of these children and the attendance required, would be very great indeed.

6386. Do you think that it would not be possible that the Government would sanction a grant for such a purpose as that, if it was shown to them that it would be largely desirable in other respects?—I do not think that the Government would give a grant sufficient to cover anything like the cost and expense, when you consider the difficulty of the Education Department in getting money from the Treasury at present, for grants alone. They are cutting down the grants all over the kingdom considerably, because the Treasury is crying out so much at the increase of the education rate.

6387. My reason for asking the question was that, so far as I have been able to glean from the evidence which you have been kind enough to give us, at present the whole thing is very imperfectly done, whereas by a somewhat increased expense it might be well done?—I hope I have not given too unfavourable a picture of the work at present; I think it is being fairly done, and not very imperfectly.

6388. (*Mr. Johnson.*) Could you tell us on what you yourself personally have formed your opinion as regards the relative advantages of the two systems, the oral or the sign system?—I formed my opinion from the numerous discussions that we have had upon the subject with people interested on both sides, and from the effect upon the orally trained children.

6389. How many, in your experience, have been turned out as perfect specimens of the oral system since you have had the management of this department of education?—I should say none; it has only been in operation five years altogether.

6390. On the other hand I should like to ask you whether you have any experience with regard to the sign system, whether after five years' training on such a system as that they are more perfect than those trained on the oral system would be?—We had six years' experience of the sign system. It was started in 1874 and went on to 1880, and the results were certainly unsatisfactory. I think that the results of the oral system are much more satisfactory during the five years that it has been at work.

6391. Have you any idea of the number who have been turned out that follow the oral system fairly?—No, it is rather difficult. I do not think Mr. Stainer keeps any statistics of the kind.

6392. You have no means of looking after the children when they once pass from your school?—No, no official means of doing so. There is some little voluntary work of the kind.

6393. I think I understood you to say that Mr. Stainer engaged the teachers?—Yes.

6394. I understood that they must be special teachers for teaching the deaf and dumb; from what class of persons does Mr. Stainer select his teachers?—He has got seven from the College at Ealing, and two from Fitzroy Square, and the others were old teachers who had been in the service of the board for many years, and who had picked up their training.

6395. As sign teachers?—They began as sign teachers.

6396. And they have become converted to the oral system?—Yes.

6397. What is the difference between the salaries of deaf and dumb teachers, and the salaries of blind teachers?—We have one salary for a deaf teacher which is very much higher, that is Mrs. Dancey, who was the first teacher appointed under the oral system; she came from Fitzroy Square in 1879, and she receives 150*l.* The others receive from 70*l.* to 85*l.*, which is about the same as the blind teachers get.

6398. What does Mr. Stainer receive?—300*l.* a year now; he began at 120*l.* with a small number of children.

6399. Is it your opinion that ordinary school board teachers could ever be sufficiently instructed so as to become teachers of the deaf and dumb?—No doubt if they gave the time to it they could; but they get much better salaries as ordinary teachers.

6400. You think that it would be a desirable thing that there should be colleges for the instruction of persons who are to become teachers of the deaf and dumb, just as there are training colleges to supply ordinary schoolmasters and schoolmistresses?—Yes, I think so. Our system of training assistant teachers is to engage them as pupil teachers; they come into our service without any knowledge of a system, and they are apprenticed for four years to us; and they give half their time to teaching, and half their time to training themselves at one of the two colleges at Ealing and Fitzroy Square.

6401. You think that it would be a desirable thing for training colleges for this special education to give certificates to teachers?—I think it would. We should be very glad to have any certificate of competency from a recognised authority.

6402. I only ask these questions, because it does not appear to me that the teachers who are at present engaged have been regularly trained teachers, with the exception of those two or three whom you mentioned?—I do not think that our teachers are really sufficiently trained. In the first place we do not give them salary enough, and they do not come from a very exalted class, they come from the lower middle class.

6403. What is the largest number that you educate in one centre?—I think the largest number on the roll would be at Boundary Lane, where there are 54 on the register, and the average attendance there is 39.

6404. How many teachers have you for that particular class?—I really do not know. That is a new class. We try to give ten children only to a teacher, if possible; but that I consider to be too many, having regard to the fact that our children are in all stages of progress, from almost babies to big boys and girls.

6405. I quite understood you to say that you are opposed to the present system of what is called the oral system and the sign system being combined?— Yes, I am quite opposed to it.

6406. And that system is still carried on at the board schools under the supervision of Mr. Stainer, is it not?—No, he does not adopt the sign system; I think he has adopted what he calls a modified oral system, that is to say, he does not teach the children so many sounds as they are taught on the pure oral system, but he does not encourage signs at all.

6407. (*Chairman.*) Have you visited all the London Institutions for the training of the deaf and dumb?—I only know the Ealing and Fitzroy Square Institutions.

6408. Have you visited any in the provinces?—No.

6409. You kindly promised to furnish us with the cost per head of each child taught; is it not the fact that the school board are enabled to teach many of these children with the assistance which they get from voluntary contributions in providing the children with these Homes?—No doubt the children could not attend the classes unless they were brought together in spots from which the attendance would be tolerably easy.

Mrs. A. Westlake

4 Mar. 1886

6410. And, therefore, to that extent they are subsidised by private funds?—Yes, by collecting them in these Homes they can be brought from much greater distances than they could be if they attended at the centres every day from their homes. They go home from the Friday till the Monday.

The witness withdrew.

The Revd. W. Stainer examined.

Rev. W. Stainer.

6411. (*Chairman.*) You are superintendent under the London School Board of the education of the deaf and dumb?—Yes.

6412. How long have you held that position?—Since September 1874.

6413. Will you state what you did at the commencement of your duties with regard to the education of the deaf and dumb in London?—My first step was to ascertain in what locality the largest number of these children resided, and I found that in the densely populated part of Bethnal Green, there were a considerable number of them. I applied for the use of a room in a permanent board school in that neighbourhood; a class room was allotted for the purpose, and the parents of the children were requested to bring them at a fixed time. From those so brought together I selected the children whom I considered eligible for instruction, five in number; and the school was, immediately after that, opened under my sole teaching.

6414. Of what ages were the children?—The ages of those five children varied from 7 or 8 to 12 or 13. We have a greater range of age at the present time.

6415. Upon what principle did you begin to teach them?—upon the sign principle?—No, I began to take those children individually, try their voices, and endeavour to the best of my ability to teach them to speak. That was my first effort.

6416. Did you use no signs?—I used no signs at first.

6417. You began with five children; did the school increase in number?—Children were brought in at the beginning of each week.

6418. Were they brought voluntarily by their parents?—They were sent in by the school board visitors, who found them in the neighbourhood. I taught them the sounds and syllables, and simple words. I continued that for a few months, but when the numbers increased, it was beyond my power to give them that kind of instruction. Children can only be taught to speak and read the lips where there are few in number under one teacher. The increase of the number made it essential that I should have assistance. I sought for such assistance; I advertised on my own account, but I had no replies; in fact, I found that it was impossible to get an assistant to aid me in carrying out the oral instruction.

6419. Were there no deaf and dumb institutions in London at that time which pursued that system?—Yes, there was the institution in Fitzroy Square.

6420. Why could you not get assistance from there?—The Fitzroy Square Institution at that time held aloof from the work; it is not for me to assign motives; no doubt they had a motive, but I could not get any assistance from them at that time.

6421. Did you train your teachers yourself?—In the first instance I had to show them what to do, but you cannot call that a systematic training. They carried out my instructions. I got one or two to help me, but I ought to tell you that the oral teaching soon came to a standstill for want of assistance. I had a pupil teacher under me, but she was not competent to carry on the work, for want of propertraining In answer to my wish for help, I had applications from deaf teachers, and I fell back upon them as the only means of help at the time. I engaged for this first centre that was established a deaf teacher, who was competent as such.

6422. Did that teacher teach on the oral system?—No, a deaf teacher cannot teach on the oral system. The oral instruction was as far as possible carried out by myself, and in my absence of course the sign system was adopted.

6423. Then you had both systems?—It was a combined system at that time.

6424. Were you satisfied then as to the advantage of the oral system?—I have been always convinced of the oral system being the best. The question has only been how far the oral system was practicable in the case of a number of children in schools.

6425. I suppose the instruction takes much longer by the oral system than by signs?—That is a matter of opinion on which it is rather difficult to decide at the moment.

6426. But as a matter of practice is it not so?—In the first stages the oral system is certainly the slower process; but when it can be proceeded with to a sufficient extent to carry the pupil over the early difficulties so as to enable him to acquire speech and written language, then it is certainly quite equal in rapidity and in facility of teaching to the manual system.

6427. You say that the oral system is more difficult in the earlier stages; after how long does it overtake the other system?—It might overtake it in three or four years, but certainly not in less.

6428. Then how long would it take to enable the deaf and dumb to speak like other people, if they ever do so?—That is never attained during the school period. Of course I repeat your words "speak like other people." If you mean simply as regards the pronunciation of the word or words, many pupils may be taught to speak like other people; but if you wish to express by "speaking "like other people," using speech as readily as other people, or as a general means of communication, like other people, I assert that that is never attained during the school period.

6429. How many years do you call the school period?—The period as it ought to be or as it is?

6430. I want to know what the practice of the school board is. I suppose you are speaking of the period of education under the school board?—There is no fixed period under the school board.

6431. Between what ages then do you take deaf and dumb children?—Children are admissible to these classes as soon as they can learn anything. I am not restricted; I could take, and have taken, children at four years of age.

6432. How long can you keep them?—So long as their parents will send them, or so long as their parents reside in the neighbourhood, and can be compelled to send them.

6433. In the cases where you have had them for the longest period, you have never been able to turn them out speaking perfectly?—Certainly not.

6434. Would it be possible to turn them out speaking perfectly, supposing you had longer time?—"Perfectly" is a relative term, and I scarcely like to use it.

6435. I gather then from your statement that after you have done all that you can, it is impossible to teach deaf and dumb people to speak exactly like other people in the intonation of the voice?—Certainly; the speech of the deaf is never like the speech of the hearing.

Rev. W. Stainer.
4 Mar. 1886.

6436. I am not speaking only of the speech, but I am speaking so far as their deafness goes, and so far as their ability to gather the meaning of other people from watching the motions of the mouth goes?—Their power of gathering from the lips of others is within very narrow limits, during the school period.

6437. How many are able to gain a complete facility for gathering the meaning of others by watching the movements of the lips of others?—That is rather a difficult question to answer offhand.

6438. After leaving school how far are they able to go out into life and to hear (if I may use the word), by watching the movements of the lips of others, what other people say to them, so as to be capable of taking a position in life?—I can only give you my own experience upon that point. I know what assertions are made, but without wishing to contradict those assertions and statements, I must say that I consider that only very few are capable of taking their position in life as if they were not deaf, hearing with their eyes. The difficulty of teaching deaf children to speak, and of giving them a knowledge of the English language through speech, when they are collected together in numbers in a school, I consider so great that it is only fully attained by a small minority. I will qualify that by saying, in the present stage of oral instruction in this country.

6439. Do you attribute that inability to the want of training on the part of the teachers, or to the want of intelligence on the part of those who are taught? do you mean that they are more stupid than they are in other countries, or that they are less well taught?—More has been done in the direction of teaching orally in other countries than in England.

6440. Then we are behind other countries in oral teaching?—I think so. America was considered an exception, but in a recent visit to the United States I have seen results which I think, considering the time that the system has been in operation in the schools that I have visited, will compare favourably with anything that I have seen on the Continent. In Italy astonishing results were shown to us at the Milan Congress in the year 1880, results which, if they could be attained under all circumstances, and in all countries, and in all schools, certainly ought to be our aim. But I can only speak so far as my knowledge, goes of other countries. I would not wish to express myself too positively with regard to the system as pursued in Germany, because the statements differ as regards that system.

6441. You mean that there is difference of opinion?—There is difference of opinion as to the extent of the results that are attained. It is called the German system, and we look to Germany to show us the best examples and the best results of the system; but so far as I have been able to see and judge, Italy has, up to the present time, certainly produced the best results.

6442. With regard to the number of pupils under one teacher,—what number is there generally in Italy, which you say is ahead of other countries?—The institution which was looked upon by us as a model, and cited as a model, is the one at Milan, where they have eight children under one teacher and eight classes, making the total number about 64; and the period for which they are supposed to continue under instruction is eight years.

6443. You began, I suppose, with a larger number than eight under instruction by one teacher?—I began with five under the London School Board in 1874.

6444. That was not on the oral system, you told us, that is to say, you had signs as well. I will not go through all the stages at present; but I am speaking of the present time. Now that you have introduced the oral system, what number of children have you under one teacher, assuming the oral system to be taught?—I am obliged in some instances to put as many as 14 in one class, and even more than that, until recently.

6445. Because I suppose the question of expense entered into the consideration?—Yes, and the difficulty of obtaining qualified teachers.

6446. Then it is on that ground that we are inferior to other countries, that we have too many pupils to each teacher; and the two causes of that are what you stated, namely, the expense, and the difficulty of obtaining qualified teachers?—Yes.

6447. We have been told that you have nine centres of instruction in London?—We have nine schools; there are seven centres; two of the centres are double.

6448. Had the buildings to be specially constructed and the furniture specially made for the purpose?—Special buildings are required in order to secure success.

6449. Will you state why you require special buildings and special furniture, and the nature of the special furniture which you have?—The teaching of the deaf requires a great deal of individual attention, and that individual attention should be given by a teacher whose mind is not diverted or interrupted by what is going on around; so that separate class rooms are essential.

6450. For each eight children?—For each class, whether eight or more. Such class rooms should be well lighted; that is a very essential point when children have to take from the teacher all that they learn by watching the slight alterations, positions, and intricate motions of the vocal organs.

6451. Can the teacher then only be accurately watched by a limited number of children at the same time; and must the teacher also be in a certain position in relation to the children in order to be seen by all at once?—It is better in the earlier stages that the teacher should face or nearly face the children, and that the children should not only have a good view of the teacher's mouth, but that they should also be able to see each other; and for that purpose a circular desk is found highly beneficial, so that they should sit in a circle. It is not really a circular desk, for that would describe the individual desk; but the children should be placed in a circle, sitting at desks. That is the chief specialty of the class room. The apparatus that is used is the same as is used in other class rooms, to a certain extent. We have, of course, special lessons; but as regards apparatus the black board and other things are used in these class rooms, the same as in the hearing schools.

6452. Have you had much difficulty on account of irregularity of attendance, from the first?—Very great difficulty.

6453. I suppose that unless they attend regularly the children lose ground?—Yes, and it neutralises to a very great extent the teaching of deaf children on the oral system. In the earlier stages they have no means of communicating except by natural signs, and the teachers (although we do it as little as possible), are compelled to fall back, in the earlier stages, upon such natural signs and gestures as will enable the children to understand the directions they have to carry out. The children not having any knowledge of language, being in the early stages of instruction acquiring simple sounds and combinations of sounds, go from the class rooms to their own homes. The parents, as a rule, know nothing whatever about what they have been taught, and they have simply no means whatever of communicating on that same principle, and almost invariably resort to the use of signs. I should like to explain here that I am speaking of the school board work, and of the class of children that attend the board schools. If you go to children of a higher class, children of educated parents, children of parents who will take the trouble to carry on their school instruction, whose anxiety is for the welfare and advancement of their children, of course they will make every effort, and their efforts in that direction are even of more importance than those of the teachers, in the earlier stages.

6454. But you have been, as a rule, unable to enlist the interest of the parents of those poor children in the work that you have been doing?—I am speaking now of the difficulty of the oral system in the case of children who attend a day school under the school board, for five hours, five days a week, all the other time being outside and beyond the influence of the school room or of the teachers.

6455. Did this difficulty induce you to start homes for these children, in order to keep them as far as possible under supervision and training?—That was one of my objects.

6456. Was also the distance that they have to travel from their homes another reason?—That is the great reason. The irregularity of attendance arose in the majority of cases from the distances at which they resided from the centres, which in the first instance were few. Now the number is increased, and the difficulty in that respect is somewhat lessened; but it is not entirely overcome, nor would it be overcome if we had double the number of centres. We should require on a rough estimation 40 centres of instruction in London, so that each centre could be easily accessible to children from all parts; and even then I doubt whether we should get them all into the schools. Some difficulties would be found; the parents would not always bring them, and I doubt very much whether the compulsory laws of the Education Act could be applied to them so as to bring every child into the schools.

Rev. W. Stainer.
4 Mar. 1886.

6457. We have heard that, although a large per centage of the children go to these centres, yet there are some who do not attend any school at all, in consequence of there being only a small number living in distant or isolated districts?—That is perfectly true.

6458. Do you think that the only way of carrying out that compulsory system which is carried out by law with regard to other children who can hear would be by having some central institution in London in which all these children could be brought together, and trained and maintained, as well as taught?—A central institution is not essential.

6459. But there might be one or more such institutions?—There might, and that is the principle upon which the homes are being conducted at the present time where about 40 or 50 children are brought together and attend the principal centres of instruction, those centres being provided with specially constructed class rooms, four in number in each building. The majority of the children attending these principal centres are boarded in these homes which I have provided for them.

6460. Have the parents provided the means, or have you obtained them from charitable friends?—I have a considerable number of cases in these homes paid for by the boards of guardians; others are paid for by charitable individuals.

6461. May I ask whether the boards of guardians pay for the maintenance, or only for the education of the children?—They pay for their maintenance. I have about 50 such cases.

6462. How much do the guardians give per week?—The present rate is 4*l.* a quarter; 16*l.* a year.

6463. Does that cover the expense of their maintenance?—It has not done so up to the present time; I am in hopes that after a time it may meet these cases. But, in addition to the permanent boarders, who require a home at all times, who are sent to me from the guardians, on account of their being orphans or paupers, the homes contain a certain number of children who come from Monday to Friday, whom I call weekly boarders; and I may say that my intention in the first instance was to establish homes for weekly boarders only, where they could come on Monday, returning to their own homes on Friday. The fact that they are now no longer temporary weekly homes, but permanent homes, containing a majority of children who live there altogether, has arisen out of the necessity of the case.

6464. Do you think that that system is the most economical one, or that it would be better to group the children in larger numbers together, so that you might have a more perfect classification of ages, under different teachers? We have heard from the last witness that, owing to the necessities of the case, children coming in at various ages, there is great difficulty in properly classifying the children in the different centres; would you suggest any alteration in the present system on the ground either of economy or of efficiency?—Each system has its advantages. In larger numbers you get better classification; you may have greater economy in working, though that does not always follow; and you get better discipline, on the whole. But you get less individual attention, and you have less means of developing the individual character. I may say that I have had a wide experience in connexion with large institutions in this country, and therefore I am not speaking without knowledge on these points. My own feeling in the matter is that a moderate sized home, or a small institution containing from 40 to 50 children, would be far preferable to an institution containing a greater number. A smaller number might be fixed, but it would be more expensive, and there would be less means of classification, which is a very important point.

6465. How would you meet the case of those isolated children of whom we spoke just now, who do not at present attend any of these centres?—These cases are being met at the present time by the boards of guardians, when they are applied to in a proper manner, finding the necessary funds for the maintenance of children in the homes. It is only within the last year or two that the guardians seem to have been roused to their duty in this respect. There is great improvement in that direction. I had, in the earlier stages, much difficulty, but I have now a considerable number of applications before me, and the applications are continuing to increase. The Poor Law Act provides a means by which every deaf and dumb child in the country requiring education can be educated. I have carefully read the Act, and not being a lawyer, I say it with diffidence, but it is my impression that the Poor Law Act gives power to the guardians to provide maintenance and education for every deaf and dumb child in the country.

6466. Either by themselves, or through institutions?—Quite so. At present of course they can only do it by sending the children to institutions in the various towns where they exist; but I believe I am right in saying that they have power to form centres, that is to say, a certain number of unions might combine and form themselves into a district, and bring together the few deaf mutes who are scattered amongst the population in sufficient numbers to form an institution, and that they have power to erect such an institution, and to appoint the necessary officers. That is my impression from my reading of the Act.

6467. Do you think, then, that it would be desirable that the compulsory education of the deaf and dumb should be carried out strictly by the school boards, either by themselves, or through the guardians, as the law at present provides?—Yes, carrying on the same idea that the guardians have now effective power in one direction, and the Education Act gives power in another direction, I consider that the difficulty arises at the present time from the want of money; or, perhaps, to put it in other words, from not knowing from what source the money shall come. The guardians have the power to pay, but I suppose within limits. It has been stated that one shilling per day is as much as they could be expected to pay, although in some instances, I know they do pay more and have paid me more. The Poor Law Act seems to me to form one side of the arch, so to speak, and the Education Act the other side; but the keystone is wanting. The keystone is the money, or where the money shall come from, and I wish to state it as my opinion, that if a capitation grant were given by the Government of 10*l.* per head, the entire difficulty would be overcome. That would be the keystone which would bring into proper operation the Poor Law Act on the one side and the Education Act on the other.

6468. You are speaking, of course, of those Acts under which the guardians act, only as permissive and not as compulsory, at the present time?—Only as permissive.

6469. Are you prepared to say that they ought to be compulsory?—Not as regards the guardians, unless arrangements could be made that the Education Act should be brought into connexion with them. What I mean is this, that if you do not discriminate at all where these poor law guardians should send their children to, they might, and probably would, send them to inefficient places; but the Education Act would come in there, and say that these children shall not be sent to any but efficient elementary schools.

6470. And that they shall be there examined?—That they shall be examined there under Government inspection.

6471. And that upon that Government inspection they should receive the grant that you mention of 10*l.* a year?—Yes, certainly. The 10*l.* a year in that case, I presume, would be given as an education grant, and not for maintenance.

6472. Have you read the report of Mr. Oakeley on the Manchester district?—I have.

6473. Do you agree generally with his conclusions?—Generally; I do not agree with the report as a whole. Mr. Sharpe's report I do not agree with at all.

6474. Do you agree with Mr. Oakeley that it is quite useless to send a deaf and dumb child to a school where there is no special teacher?—Certainly.

6475. Do you agree with him that the school authority of the district should be empowered to send deaf and dumb children to some institution under inspection?—It would be very desirable.

6476. And that, if it might be said, that there is not room at present in these institutions for all the children who might be sent there; if this grant of 10*l.* were allowed, these institutions would be extended, or new ones would start up which would meet the requirements?—In all probability it would be so; if not, the

Rev. W. Stainer.

4 Mar. 1886.

guardians could exercise the power which I believe they possess of building schools.

6477. Mr. Oakeley states also that there is no difficulty in obtaining employment for the deaf and dumb children educated at the Manchester school; do you find the same thing in London?—That is a statement which I am afraid is open to criticism. Probably the party who gave the information believed that it was so, but I am afraid that it requires qualification.

6478. How far is it accurate with regard to London; how many of those who have passed through your schools have been engaged, or are now engaged, in trades earning their own livelihood?—It is impossible for me to answer that question.

6479. You have no means, of course, of following their occupation?—As superintendent of the instruction I have nothing whatever to do with the children after they leave school.

6480. I am not assuming that you have; I am only asking you whether you have personal information on the subject?—I have not sufficient data to give you a decided answer to the question. I am afraid it would not be a very satisfactory answer if I were to give it.

6481. As to Manchester, you say, then, that you do not think this is accurate, but you do not speak from more than general knowledge?—I speak from actual knowledge of Manchester as it was about 20 years ago. There may be a great change since then.

6482. Were you resident there?—I was resident there for 12 years, and I had charge of the adult deaf mute population of the town. After that I had charge of a large district in London as chaplain and missionary to the deaf and dumb. Therefore my experience as regards the adults is almost equal to my experience as regards children; and I prepared to say that a statement that pupils educated in their school readily get employed and satisfactorily engaged requires some qualification.

6483. But what becomes of them; do they return home to their families, and are they supported by their families, or are many of them taken into institutions?—There are no institutions for deaf and dumb adults. There are one or two schools where they take them at an advanced age, but not to teach them trades effectually as adults, or to receive them as permanent inmates.

6484. Have they ever attempted in any of these deaf and dumb schools to give them any industrial training?—In England it has not been done for many years. In the earlier years of the existence of the institutions attempts in that direction were made, but they were made in a very imperfect manner, on a system which could scarcely succeed. We do not keep them in the schools at present sufficiently long to justify any large portion of time being devoted to manual occupation. Five years is about the average, or I might say nearer the limit, of the period for which our institutions take them. If that period were extended to eight years, or, as it might be, to 10 years, I consider that it would be highly advantageous to give all the pupils some insight into a manual occupation. I prefer not to use the word "trades," because teaching a trade can only be effectually done where trades are actually carried on. I have no doubt that the results as regards the blind are very satisfactory, because they teach trades and have trades carried on in their institutions; but none of the deaf and dumb institutions have ever attempted to be profitable in that way by having trades carried on so as to make them a means of support; and, therefore, the manufacture of articles in such a manner as to meet the general market of course was never attained to. Teaching the children the use of tools is quite another matter.

6485. Then you think it would be desirable to continue the course of instruction so as to include that?—Certainly. Perhaps I may be allowed to describe a new departure which I have just commenced. I have found the bigger boys under my direction get very troublesome and very naughty after a certain age, and I think it chiefly arises from the fact that they want something to do. After their school hours are over they do not care to sit down at a table, although you may sometimes amuse them with drawing, and in various other ways. There is nothing so good as some manual occupation to occupy the head and the hands. For that reason I have just opened a new home in Pentonville Road, a large house of 24 rooms, some of which are of considerable size. One room, when completed, will be fitted up with every appliance for wood work. I have benches, turning lathes, carvers' benches, fretwork benches, and so on. In doing this I may state, most distinctly, that I am not undertaking to teach trades, but simply the use of tools, as an initiatory step to the pupils entering upon a trade after they leave school at the age of 15 or 16 years.

6486. Will you explain to us with regard to those who are not absolutely deaf and dumb, or those who are deaf and not dumb, what course you pursue?—At present there is no special provision made for these. The system as at present carried out is not very varied, not so much as it ought to be, it is too rigid. Children who are called deaf and dumb are often found to have a considerable amount of hearing, and many of them have intelligible speech, that is to say they are deaf but not dumb, he deafness in such cases having occurred after the child has learnt to speak, and at such an age that the power of speech has not afterwards been lost. The children who are dumb, but not deaf are as a rule weak in intellect, their dumbness arising from a want of power of imitation, and of memory. A child learns to speak ordinarily by imitating the sounds it hears, and it retains those sounds, and the combination of those sounds into words, and associates those words with objects, and as language is extended the child understands the meaning of sentences. A deaf child has no means of doing that in the ordinary way, and therefore remains dumb unless special means are taken to give it the power of speech through the remaining senses, sight and touch. The child who can hear and does not speak, we conclude, as a rule, has some abnormal weakness: and we find ourselves generally correct. There are some few cases of what is called idiopathic dumbness, that is to say, perfect hearing and inability to speak without our being able to assign any cause, but those cases are very rare.

6487. With regard to those cases of which you speak, which rather come under the head of idiot cases, are they at once drafted from your classes, and sent to some institution for the reception of idiots, many of whom are dumb?—Those cases give me the greatest anxiety at the present time.

6488. What is the practice with regard to them; are you able to send them away at once, or is it your practice to keep them?—I often take them unwillingly, on probation, feeling almost certain that they will prove unsuitable; but I do that for the satisfaction of the parents and friends, and in some cases perhaps for my own satisfaction; but from large experience one is able to diagnose a case, and, from one or two interviews to ascertain whether the child would benefit by the instruction as afforded. Finding that such children cannot benefit by it, I have no resource but to refer them to the parish, if a parish case, or to the secretary of an institution where they could be elected, if they could get sufficient votes.

6489. Is there no public institution to which you can send them without their being elected?—There is the institution at Earleswood, but the difficulty of getting admission there is so great that very few cases really succeed in getting in.

6490. You mean that the institution is so full that they cannot take the cases that ought to be taken there on public grounds?—That may be so. I think I have succeeded in a few instances in having them sent by the guardians to Darenth, but I am afraid that the Earleswood Institution has not been within my sphere of operations. I have not been able to send any to Earleswood.

6491. On account of the difficulties which you have mentioned in getting admission for them?—I think it is very much owing to the difficulty which arises from the voting system.

6492. Since what time have you given up what is called the dual system of signs and oral teaching, and adopted the oral system, pure and simple, as far as possible?—Since the strong convictions that I received at the International Congress, at Milan, in the year 1880.

6493. Where do you get your present teachers from? Do you get them from the colleges?—Occasionally I have applications from the colleges, and the board have engaged a considerable number of those who have been trained at Ealing, and some who have been trained at Fitzroy Square. My most reliable source at the present time is the result of the principle which has been adopted by the board of engaging pupil teachers on specified conditions; and those pupil teachers attend college to be trained, alternating between assisting in

school and receiving their training at one of the colleges. That is at present the chief source (and I expect it will continue so), from which I hope to derive my teachers. I have teachers who come to me from the colleges, but I am sorry to say that the scale of salaries at present fixed by the board is not such as to induce them in all cases to remain. In fact they use the board school as a stepping stone to something better, and they are always on the look out for appointments in private families, where they can have a superior class of work, and be better paid.

6494. We have been told that the average rate of pay for teachers is between 75*l.* and 85*l.*, is that so?—A qualified teacher commences now at 70*l.*, and rises by increments of 5*l.* to 90*l.*

6495. Can you tell us anything about any machinery for the assistance, or the testing of, deafness, or for the assistance of hearing; can you tell us what are the instruments known as the audiphone, and the audiometer?—The audiphone was tried in the school board classes for some little time by the inventor, and produced some results.

6496. What did it profess to do?—It professed to be able to make the deaf hear through the sense of touch. I am describing it scientifically. The inventor would probably say that it was done by the audiphone conveying the sound through the teeth, but that is not the principle of it; and inasmuch as there is no real connexion between hearing and touch, however analogous and similar they may be, it has proved a failure. The audiphone certainly in some instances seemed to be very useful, and I can quite believe statements which are made by deaf people who use it.

6497. Can they hear music?—As to the amount of hearing I should be sorry to make any statement. The instrument does not convey sound, in my opinion, to the sensorium simply as sound; it conveys vibration, which affects the sense of touch, and not the sense of hearing as in the sense of sound conveyed through the organs of hearing. Those who use these instruments find them a help, and I have no doubt that they are so. A person who is partially deaf is sitting in a quiescent state, you speak to him, and he will pay no attention. The probability is that if he had an audiphone in his mouth, his attention would immediately be aroused; but that would not prove to me that he had heard me or anyone else speak, but simply that the concussion of the sound on the audiphone had conveyed a sensation which had aroused his attention.

6498. In fact it stimulates the intelligence?—It stimulates the intelligence, and partial hearing is very often assisted in that way. There are those who can hear in a railway carriage or an omnibus much better than they can in a still room, the stimulation of the nerves increasing their power of hearing; but as regards the audiphone as an instrument of instruction, I may say that it is of very little use. To render it of any use at all it would require a selection of cases, and a special method of treating those cases, which I was not prepared to recommend to the board, and, therefore, it has not been adopted.

6499. What is the audiometer?—Professor Hughes' audiometer is the one that I have experimented with. It is an instrument in which loud and soft sounds are graduated. This instrument begins at zero, where there is absolutely no sound, and it rises up to 200 degrees, where a loud ticking is produced, on a similar principle to the microphone; in fact, it is a combination of the microphone and the telephone; and the sounds produced enable us to ascertain whether the sense of hearing is capable of discriminating between those different degrees. It is a measure of sound, so to speak, up to a certain point, but not beyond that.

6500. It is useful, I suppose, to assist you in diagnosing a case?—It is of very little use as regards the children.

6501. But it helps you to test the amount of hearing that they have, if they have any?—It has failed in my hands to attain that, and the reasons are obvious. A deaf child, especially one who is uninstructed, cannot at first know exactly what you mean; and so when I have been using it and have patted a child on its back, and as far as I could make it understand that it was to intimate to me whether the sound was heard or not, I have found in a large number of cases when it was at zero the child has said that it heard a beautiful sound, but that when it was at its highest degree the child has said that it heard nothing. Its use is within very narrow limits. It is a test instrument for those who are hard of hearing, but it is of very little use practically to those who have to deal with the totally deaf, or with such states of hearing as we generally meet with. In America they have other instruments which I have not experimented with.

Rev. W. Stainer.

4 Mar. 1886.

6502. What are the hours of instruction in the school board schools?—The children have to be under instruction for five hours each day.

6503. I suppose they have nothing to prepare?—Very little has been required of them in that respect. When they attain a sufficient knowledge of language to be able to commit lessons to memory, they are of course capable of performing home lessons; but all exercises of articulation can only be pursued under the immediate direction of the teacher to be of any real advantage.

6504. What are the fees which you charge?—The same fee as is charged in the case of ordinary children, 2*d.* per week in all cases.

6505. Do you teach them very much by pictures?—Pictures are found very helpful, but we ought not to resort to pictures in the earlier stages if we can avoid it.

6506. Why not?—It is much better to use real objects and real actions than to present a picture of an object or to produce a picture attempting to represent a motion which it does not represent. But when the teacher has to divide his time amongst a large number of children it is found that the small amount of individual attention that a child can possibly have during the short hours of instruction makes it absolutely necessary that the child shall be provided with some occupation in school, when it is not under the immediate instruction of the teacher. Such occupation is best provided by having pictures which the child can recognise. They should be and are in many instances good illustrations; for their utility depends very much upon their quality. If the child can distinguish the object in the picture it is allowed to write the name of the object, and something about the object, probably even before it has the knowledge of language acquired through speech. That is the practice. I do not put it forward as being the best way of teaching, because it would be far better if it were practicable, that the child should be taught speech by speech, that is to say, that it should be taught to speak every word before or as soon as it can write it, and that the compiling of sentences should be attained by the same means. But to carry that out effectually would require one teacher to one pupil. One teacher to one pupil is perfection, and is the only means in my opinion of exactly fulfilling the conditions and producing the results that have been stated as being possible to be attained by the deaf and dumb. The only means by which the pure oral system can be perfectly carried out is by having one teacher to one pupil; and my reason for making that assertion is strengthened by the fact that if you have two deaf and dumb children together they will use signs in preference to speech.

6507. Were you present at the New York Convention of 1884?—I was.

6508. Will you tell us anything that was discussed there that it would be interesting to the Commission to know?—It was a special convention of articulation teachers. Other teachers who pursue the combined system attended and were very friendly. Various points connected with instruction in articulation were discussed in a very friendly manner. Professor Bell, who was president, gave us some very good ideas as the result of his extended knowledge and experience, and also the result of some of his recent experiments. The use of visible speech was discussed. I will explain what visible speech is, if you wish. It is a system of representing sounds. The system is said to be founded on characters which represent the positions or the actions of the organs of speech; and from my knowledge of the system it seems to me to be certainly the most perfect system of recording sound in all its varieties, in writing, that has ever been invented. But it is far too intricate to be of any practical use in the instruction of deaf and dumb children. Professor Bell is not unaware of that fact, and he is experimenting and endeavouring to find out a simpler method than the original visible speech, and he has done so in a system which he calls "line-writing." That may be described as a simple system of phonetics. For my own part I have discarded all these things. I suppose I am like David when he went out to meet Goliath; I have tried the armour on and found it unsuitable, and I have thrown it off. Visible speech was

Rev. W Stainer.
4 Mar. 1886.

tried in this country to a certain extent, in the north, but not with satisfactory results, and I think the English teachers are generally agreed that it is not desirable. It is building up scaffolding larger than the building itself, which you have afterwards to pull down. The simplest and the best method is to use ordinary writing as a means of expressing sounds, and as a medium of instruction. That I think is the generally received opinion in this country. The one novelty that struck me most at the New York Convention was the attempt that is being made by Professor Gillespie in what he calls the aural method as applied to children who have a certain amount of hearing. My recent experience amongst a large number of deaf children leads me to believe, with Professor Gillespie, that great benefit would follow systematic instruction which would develop the latent hearing power in a number of these children. It could scarcely be done side by side with the instruction as now provided; it would require, like the use of the audiphone, a selection of cases and special means to be adopted. But as I said with respect to the audiphone, I am not prepared to recommend my Board to adopt it at the present time, although I do look forward hopefully to something being done in the direction of developing a large amount of hearing, which is latent in a great many of our so-called deaf and dumb children. I do not consider it necessary to enter into any comparison of the systems of teaching articulation as discussed. There seem to be very great differences amongst teachers as to the best way of teaching the elements of sound and combinations. In fact almost every teacher has some method, or modification of a method, which he finds more suitable to his special class of pupils. In America they have tried, and seem still to be trying, a variety of systems which are very widely different. For instance, the established principles upon which most English teachers are trained is that we should begin with the elements of sound, and elementary sounds, and so build up words and sentences. But my friend, Dr. Greenberger, the principal oral teacher in New York, is carrying on a system in an opposite direction. Instead of beginning with elements, he begins with words, such words of course as little children can utter, and I believe I am right in saying that he grounds it upon the fact that hearing children do not learn the elements, but that they really begin by saying "papa," "mamma," "fish," "tata," and so on, and the results which I saw in his baby class were very striking, though I am not prepared to say that they were sufficiently so to cause me to adopt his method.

6509. Do you consider, then, that the oral system is to a certain extent in its infancy, and that it may be improved and extended?—Certainly.

6510. It is not so far advanced that you could say that that system is the best and the only one?—I speak of the oral system as being the method by which deaf children are taught to speak. If you arrive at the ultimatum required, that deaf children are taught to speak, that is all that is necessary; but whether they shall begin at that point, or at this point, or whether they shall go through this series of exercises, or that series of exercises, it seems to me is not of vital importance. If you lay down that the only means of getting to the top of that building is by means of that ladder I should say at once, "Well, I think I have found an easier way "by going up the staircase."

6511. What is your staircase?—It is simply another way of getting to the top. Probably there is a staircase inside, and if I seek for it I find it. It may be a spiral one, and I may have a long way to go round to get up to the top, but I get there eventually.

6512. So far as I understand, you mean to convey that the oral system is the most satisfactory; but that there are various methods of carrying out the oral system, and that none of them is so much in advance of the others that you could say that it is absolutely the best, or not capable of some improvement?—The best under some circumstances would not be the best under all circumstances. If you will excuse my using an illustration, an examiner or inspector does not question how a child is taught to read if the child can take a book and read it. We all know the variety of ways in which children are taught to read; and so there are various ways in which we can teach a deaf child to speak. Many parents and many good people who have scarcely heard of the oral system, who have not had a lesson on the method of teaching deaf children in their lives, have undertaken the work as they did at the commencement of the instruction of the deaf, and have taken individual children, and in an unmistakeable manner made them speak plainly and distinctly. In fact the oral system is the oldest system of all. It being the natural desire of the early teachers of the deaf to give them the power of speech they applied themselves to the task, and many of them succeeded to a considerable extent. But it is one thing for a private individual with unlimited means and unlimited time to undertake the instruction of one child, and it is quite another thing to take a class of children in a school and say, "I will teach all these children by the oral "system, so that they shall be in a certain time able to "speak." There, of course, we must have methods, and the methods by which a deaf child can be taught to speak are very varied. Many of them would ensure success in the end; some would probably be longer than others; but they would all come under the head of the oral system.

6513. You said that the oral system at the best does not enable those who have been taught by it to speak in the same way as ordinary people;- but you think that it is for all practical purposes superior to the sign system even in the case of a person who can speak fluently by the sign system?—I am afraid that I cannot follow you in that, because it is not a just comparison. They mean two different things.

6514. What I mean is that they can attain greater proficiency in the sign system than they can in the oral system, but you say that, although they cannot attain absolute proficiency in expressing themselves and in conversing with those who can use the oral system, still it is better than the sign system however well and successfully that may be carried out?—That depends entirely upon circumstances. I think that I might give you an idea in this form. If sufficient proficiency is acquired in speech and a knowledge of language, and that speech is sufficiently intelligible to hearing people, so that it can become a general means of communication, and if in combination with that power there is the power of reading the lips so far as that can be extended, the person so educated and so taught would be in a far better position than one who was taught the sign language. But to reduce a thing to practice, it becomes a question of how far these results can be attained. What is possible is not always practicable.

6515. Then I still gather that it is not practicable always to carry out the oral system?—I do not venture to say that. You must understand (and I know Mr. Ackers will dwell very much upon that point) that the oral instruction in this country is only of recent introduction. As to whether, at the present stage, the results so far justify the conclusions which you have been drawing, I hesitate to give a decided answer; in fact I may say that, at the present time, I consider, as regards my own work (and I may look to some others who have only recently commenced), it is still in an experimental stage.

6516. (*Mr. Johnson.*) Are you of opinion that the two systems, the oral system and the sign system, should be kept perfectly separate?—I speak from experience on that point. The noble chairman asked me a question which I did not fully answer at the moment, as to the dual system. I scarcely think it necessary to go into a full explanation. It was an experiment on my part to endeavour to provide, as best I could, for different children under different circumstances. But my experience led me to the decision that you cannot carry on a combined system successfully, side by side with what is called a pure oral system. The word "pure" of course is comparative; and if intended to mean the entire and absolute absence of any sort of motion or sign, then I say that it is an idea, and not a reality. But there is no reason why we should not endeavour to make our system as pure as we can, and for that reason as few signs as possible should be used in the elementary stages, and the children should, as far as possible, be kept away from those who use signs, so that they may not imitate them. Therefore I may give you a decided answer and say that I do consider it an absolute necessity that the oral instruction should be carried on separate and apart from any sign system.

6517. Have you any idea of the number of people in this country who now talk by the sign system, and those who employ the oral system?—I am afraid that it would be difficult to get at anything like the number. You can prove anything by numbers, and I am afraid that if I stated my impression, somebody else might say, "You have over-rated it," or "You have under-rated it."

6518. I suppose that a very large majority of the deaf and dumb people communicate by signs?—Certainly, at the present time.

6519. Could you tell us the number of people that have passed through your hands under this oral system who are what you may call satisfactory pupils, and give satisfactory results?—I can answer the question, but I should like to qualify my answer after I have done so. My answer would be that they are very few; but I can give reasons for it. The difficulties of the method, the numerous obstacles, and the impossibility under existing circumstances of getting the system continued after the children leave, render that number so small as it is.

6520. To what do you attribute the difficulty of getting the system continued when the children pass from you?—The difficulty is this: that they are unable to express themselves intelligibly, and unable to read the lips of others so as to make that a preferable means of communication. That is what we aim at, but we are far from having attained it at present; and the short period during which the system has been in operation must be taken into account.

6521. And the short period I suppose during which you have had those people under instruction?—Certainly.

6522. Do you believe that if you had the children that you have already had under instruction for a longer period the oral system would then have had a greater advantage over any other?—I must add something to the length of the period. The length of the period would do a great deal, but that is not the only thing that is required. If you ask me whether, if I could make conditions for the oral system, I could in all cases produce satisfactory results, I answer yes. But we have to deal with the varying circumstances and conditions which at present exist in day schools (of which I am now speaking only and separately); and the difficulties and obstacles which have to be overcome seem to be so numerous that we must go on applying double the effort that we have hitherto applied, and we shall require greater resources.

6523. You mean double the expense?—I would not say double the expense but double the opportunities and means, and time than we have at present to render the thing a perfect success. The children, as I have explained, leave the schoolroom where they have had their lessons, and lessons in speech alone will never make a child talk. Children, in order to learn to talk, must talk. We know that an ordinary child does not acquire speech without an immense amount of daily practice, surrounded by those who can converse with it, and who use every effort to make the child talk; and even then it is a slow process; and if you were to sum up the whole time I suppose you would find that it is a very long period that is required for a even a hearing child to learn to speak. The hearing child learns in the natural way by means of hearing; but the deaf child has to learn by artificial means quite separate and distinct from the ordinary course; the deaf child has lessons in speech during school hours, but throws speech aside as soon as it leaves the school room, and our work under the school board is limited to the school premises. The child, in the early stages, has no encouragement to proceed with the efforts which it has been putting forth in the school room.

6524. Unless it is an inmate of one of your homes?—I would rather not bring that in, if you please. This child goes outside, and it cannot speak, it cannot talk, it is only beginning to learn. I am speaking of the initiatory stages, and I am speaking of a class of children who have not educated parents, and no nice nursery to go into where there is a nurse ready to receive them and assist them in carrying out the instructions they have had in the schoolroom. They go to their parents, and in many cases in London they are turned out into the streets, as we know, and there is no opportunity whatever for them to continue to practice what they have learnt in the schoolroom. Therefore, even with the greatest efforts of the teachers in the day schools, including the lengthening of the period for which the children are at school, unless supplemented by some other means, I am very doubtful (though I am determined that the best shall be done so far as I can do it) whether results will accrue on the whole, and to the majority, which will give satisfaction. That such results will hereafter reach (as they do not at the present time) the very high standard which has been put forth as possible in all cases of deaf children, I venture to doubt.

Rev. W. Stainer.
4 Mar 1886.

6525. The results that you saw in Italy were arrived at from 64 children, were they not?—Yes.

6526. Is that the same system as is pursued in Germany?—It is the oral system. We call it the oral system; the Italians object to the word "German."

6527. But is the German system a different system from that used in Italy?—The systems or the methods by which a child may be taught to speak, as I have already said, are very various, not so various, perhaps, as the methods known to us by which a child may be taught to read, but they are various, the final results being the same. I should describe the system as pursued in Italy as being the pure oral system in a more strict sense of that word than the system as generally carried out in Germany.

6528. You approve then, as I understand, of the system pursued in Italy; you were converted in Italy?—I only give my opinion according to my means of observation, and the results that I have seen. I have visited schools in Germany and elsewhere, and, with one or two exceptions, I do not think the results could be compared with what I saw in Italy.

6529. You say that you train your teachers yourselves from pupil teachers?—The pupil teachers are engaged under certain rules laid down by the board.

6530. They are ordinary pupil teachers, are they not?—They come to me at 16 or 17 years of age, and they bind themselves to the board for a period of four years. During the first two years they are required to attend a training college, devoting half their time to the school room, and half to their college course. At the end of two years the board has the whole of the pupil teacher's time. At the end of the four years they continue at an advanced rate of salary as ex-pupil teachers, and they ultimately become teachers on the full scale.

6531. Do they pass an examination and become certificated?—Yes.

6532. By a Government inspector?—The Government has nothing to do with it.

6533. Then it is by an inspection of your own, that is to say, a board school inspection?—No, the pupil teachers have to get their certificates from the college. If they did not succeed at the end of two years I do not know what would happen; I have not had a case, but they are expected to get their certificate at the end of two years, and in all cases up to the present time they have done so. It is the certificate of a private college.

6534. And that is received by the school board as a qualification for a teacher?—It is accepted by the school board.

6535. With regard to the employment of adult deaf and dumb people when they leave you, why is it that you think that they do not succeed?—I know that they do not succeed.

6536. But could you give us any reason for their not succeeding?—Imperfect education is one reason.

6537. You do not mean imperfect manual education, I suppose?—I will go into it if you like. I will say that it is from imperfect education generally, because it is a fact that deaf persons who have been taught on the silent system without speech have succeeded in life, and in America they have done so exceedingly well on the whole. In this country the education generally is far behind what it is in America, according to my observation. In speaking of general education of course I do not include speech as a necessity; it may be considered as a necessity; it may be considered so important a branch of the education of the deaf that none would be considered educated without it; and I hope the time will come when that will be recognised. But as regards general education, I suppose I am right in saying that it is not a matter of speech so much as it is a matter of language. Speech is one thing, language is another. If you ask anyone, "Can you speak French?" and he says "Yes, I can speak French," you may enter into conversation with that person, and you may go away delighted and say that he speaks French very fluently. But if you give that person a French book to read he may be able to gather very little from such book. If you ask such a person to write something in the French language he may be quite unable to write anything. It is language that makes the difference between the deaf mute and the brute creation; it is language that elevates the mind of the deaf. Speech is more a social matter;

Rev. W. Stainer.

4 Mar. 1886.

it is the power of communicating in a way which is pleasant, and in a way which is supposed to be easy, with their fellows who are not suffering from their deprivation. But language is the thing which elevates the deaf mute and brings him up, more to an equality with ourselves. Many statements have been made as to the absolute necessity of teaching a child speech, and representing that it has no knowledge of language, and can only acquire language through speech. That is not stated in so many words, but it is put in such a form as to leave that impression upon the majority of the minds of those who read such statements. The idea is that no deaf child can be educated without speech. To give you an illustration of it, a letter in the "Times" the other day by a noble lord stated a most glaring untruth; it stated that the time spent upon the education of a deaf child on the silent system was to all intents and purposes thrown away, "wasted" I think was the expression. Such is really not the case. If so, every deaf child who has not been taught to speak, and we know that at present they are the large majority, would not have been educated at all. We have men holding positions in life as barristers, as teachers, as eminent artists, and so on, who have never spoken a word, and to whom speech does not seem in any way a necessity. Therefore I would ask you to separate in your minds speech and language.

6538. Do you think that the deaf and dumb people succeed in trades, and that there is a fair opportunity of their getting employment?—There are great difficulties in their way, and I consider that the education of the deaf will not be complete as it ought to be until something has been done. If you ask me what that something ought to be I say, "What I am doing."

6539. (*Dr. Tindal Robertson.*) How long ago is it since you undertook the superintendence of the education of the deaf and dumb in the board schools?—Since the year 1874.

6540. What was your previous training?—There were no colleges where I could receive any training in my earlier time. For the college training that I have received I am indebted to my friend, Mr. Ackers. He gave me the opportunity when the Ealing College was opened of receiving a series of private lectures from the principal of that college who had had opportunities of travel, and opportunities of observation, which were not existent in my early days. I desired to benefit by what he had attained in that direction, and on communication with Mr. Ackers he kindly consented to my receiving such assistance as I could from the principal, of which I availed myself. That, so far, may be called training that it enables me to go into every question connected with the systems which are now carried out in the board classes by my assistants, who have been trained at the Ealing College.

6541. Where did you gain your previous knowledge before you acquired any knowledge of the oral system?—I have been a teacher all my life.

6542. Of the deaf and dumb?—Yes, of the deaf and dumb.

6543. At different institutions?—In connexion with the charitable institutions of this country.

6544. Will you kindly give us the specific reasons which induced you to recommend to the School Board of London the oral system in preference to any other?—My conviction that it was the best.

6545. But I want to know, if you please, upon what ground you founded that conviction?—To start with, I think it would be generally accepted that if a dumb child can be taught to speak it ought to be taught to speak. But on the other hand (though I have already, perhaps, gone rather too far in distinguishing between speech and language), I should hesitate to say that speech is an essential part of the education of the deaf, and the only means by which language can be taught, and that it should stand in the most prominent position. But the reason why I recommended it to the board was this: that there is certainly a considerable number of children who may be taught to speak by great effort, and who may make speech a means of communication, and to whom speech may be of very great advantage in life; and for the sake of those I certainly think that we ought to aim at teaching it by every means in our power. For the sake of those who can be taught to speak I say that the system should be adopted.

6546. Do you think that the children would be more able to get employment, or to fulfil their employment more efficiently afterwards, if they were taught on this system than if they were taught on the silent system?—Decidedly, it must be so. If a child can speak even to a limited extent, and can understand only to a limited extent, that child is in a different position with regard to the outside world from a child that is totally deaf and dumb.

6547. Do you make any distinction in teaching between those who are deaf mutes (which I think is the term for those who are born deaf and dumb) and those who have become deaf later in life?—We are unable to do so. Classification is most important, but it is also one of the most difficult things to carry out, especially in the classes which I have to organise, consisting as they do of a few children, from half a dozen to a dozen in some cases, children from the age of 4 to 14, boys, girls, and infants. We might classify them in a dozen different ways. You might graduate them from those who have a small amount of hearing, to those who have a large amount of hearing. We might draw a most important distinction between the so-called deaf and dumb and the so-called semi-mute (semi-mute being the term applied to those who are deaf, but not dumb). Those children, having acquired speech and a knowledge of language through speech, have no right whatever to be classed or put together with, or taught on the same form as, congenital deaf children.

6548. I understand from your answer that you recommend that, if possible, a distinction should be drawn in the mode of teaching between those two classes?—A distinction is absolutely necessary; they cannot be taught on the same system precisely.

6549. Do you know anything about the causes of deafness?—Yes, I have had a large experience from the cases which have come before me.

6550. Can you give us any indication as to what your opinion is upon that point?—The common question asked is whether it arises from consanguinity, and I have no doubt we might put down some cases to consanguineous marriages.

6551. I am putting aside the question of deafness, which arises from scarlet fever and such diseases?—You have named the prolific causes.

6552. But putting those aside, have you arrived at any conclusion with regard to the causes of congenital deafness?—There is no doubt that that is an hereditary taint.

6553. Have you any instances in your own knowledge in which deaf and dumb people have intermarried and had deaf and dumb children?—Numbers of cases.

6554. Is it an ordinary thing, or is it rather an extraordinary thing?—I should say that in the cases of intermarriages amongst the deaf and dumb, a large portion of the children are not deaf and dumb. In speaking of these intermarriages, I mean a deaf and dumb man marrying a deaf and dumb woman. But there is no doubt that there will be a tendency produced which will show itself, if not in the second, even in the third or fourth generation.

6555. Are there any statistics in any book which you have had access to which tend to prove that point?—There are some statistics, but none of them I am afraid very satisfactory, for statistics to be satisfactory require to be collated from a very large number of cases.

6556. Then you base your assertion on that point more upon your general ideas on the subject than upon anything absolutely certain that you have ascertained?—No, I think I may say that the statistics which have been collected and published show that the intermarriages of the deaf and dumb are a source of the increase of deafness, especially as it has been shown that where one parent only is deaf there have been fewer cases in the family through hereditary taint than where both parents have been deaf.

6557. As this is a very important point, could you furnish us hereafter with any statistics which have any bearing upon that, or which go to prove that these conclusions are correct?—The only thing that I have in my mind at the present moment is a pamphlet that was published some years ago by Dr. Buxton, who was then the principal of the Liverpool institution, on the subject of intermarriages of the deaf.

6558. Have you any copy of that?—I have one in my library for the teachers, I think, which I could lend to any one wishing to peruse it. It was published some years ago, and I am afraid that we have not any recent statistics sufficiently numerous for the deduction of general principles.

Rev. W. Stainer.

4 Mar. 1886.

6559. Is there any scientist or any living author who has made any special study of this point?—Yes, Professor Bell. I was speaking of this country when I answered your question. Professor Bell has written a treatise in which he seems to show, and I may say almost proves, that it is possible hereafter that there may be a race of deaf and dumb in consequence of the frequent intermarriages in America and elsewhere.

6560. Have you taken any special notice with regard to the comparative intelligence of the deaf and dumb children as compared with those who are not so?—Yes, a deaf child and a hearing child start from the same basis. The brain of a deaf child in its earliest stages, I suppose, would bear comparison with the brain of a hearing child; but I doubt very much whether it would bear comparison after the lapse of a few years: I do not mean to say that the microscopist could discover any difference in the atoms of the brain; but my firm conviction is, that a brain developed through sound, is of a different formation altogether from a brain developed without sound. There is a different conformation, I believe. The development of the children's intellect of course is what we have to look to; and if the proper means were applied sufficiently early and every opportunity afforded to a deaf child, that child could be made, so far as I can see, nearly equal to one who had the power of hearing. So that we might assert, what is sometimes asserted at the present time, though to my mind not yet realised, that the only difference between these two, is that the one is deaf and the other is hot.

6561. You are speaking of what might be: I wish to know rather what your opinion is as to what really is the comparative condition of the two as to intelligence?—I think you cannot compare them. A hearing child has greatly the advantage.

6562. Do you not think that those cases of idiopathic dumbness, of which you spoke, are cases in which the brain itself is principally affected?—Yes, certainly.

6563. With regard to the point which you raised about the Poor Law and the Education Department, I suppose all the rates come out equally from the pockets of the people, whether they are paid by the one or by the other?—Certainly.

6564. In that case would it not be possible that any poor law guardians, if it was thought advisable that there should be a separate institution established for the education of these people, might for themselves, either on their own ground or in some place contiguous to their own ground, have some establishment of the kind in which they could educate the whole of the children who might be within their particular area?—I believe they have the power to do so, but they have wisdom enough not to carry it out for their own district, because the numbers are so few that it would be a very small place, and very imperfect, and very incomplete. If a number of boards of guardians united together and, as has been suggested, formed districts, they would probably be able to bring together 40 or 50 children, a sufficient number to form what I consider a complete and perfect institution.

6565. I was going to suggest whether in the event of one parish being too small an area, a number of parishes could not be combined, and whether it would not be better to divide the responsibility between the poor law guardians and the education board?—I believe it is suggested in the Act that they should form themselves into districts for the purpose. The school boards have the power of compulsion, and they have the power of inspection, which I consider it would be desirable to unite with the action of the poor law guardians in this matter; and that would naturally follow if a capitation grant were given as an educational grant, subject to the conditions of inspection, and so on, which are laid down in the Education Act.

6566. Is there any superior school in this country for the education of the deaf and dumb, sons of persons in the higher classes, somewhat similar to the blind school which you may perhaps be aware exists at Worcester, which is a school for the blind sons of gentlemen?—Yes, there are private institutions, but there are no public institutions in this country that I know of where the higher education is carried out.

6567. Is there any of superior importance to the others, so as to make it a sort of *quasi* public institution, or is there one which is infinitely superior to any of the others?—Not that I am aware of.

6568. Therefore you cannot tell me under those circumstances what system is now pursued by these higher schools, if one may so call them?—There are no higher schools, unless you mean private schools, and they go very much on the lines of the public elementary schools, carrying their pupils to a more advanced state, probably through having more funds to employ better and more numerous helpers, and retaining their pupils for a longer period.

6569. Do you know what is the system of teaching which is generally pursued in these higher private schools?—It is now becoming almost universally the oral system.

6570. I think I understood you to say that there was a great deal of difficulty in those deaf and dumb persons getting employment after they leave school; is it within your knowledge that there is a difficulty in these people getting employment after they leave these institutions?—There is great difficulty; and I say it with some reserve, but I believe that the system adopted of apprenticeship in the case of deaf and dumb children on their leaving school, breaks down in the majority of cases.

6571. Then that being so, and there being this great difficulty, do you think it would be advantageous that there should be some kind of workshops, or something of that sort analogous to those which are instituted for blind workmen after they leave the schools, where deaf and dumb people could find employment if necessary?—I should be sorry to recommend it.

6572. Could you tell me why?—The bringing together of deaf and dumb adult people is certainly undesirable. The more we can separate them and mix them up with the hearing the better.

6573. I am not speaking of the two sexes?—Nor am I, though I may imply it; I do not mean that alone. In the first place, if you put them together in workshops, or for any purpose after their school education, you entirely neutralize the greater part of the benefit that they have derived from oral instruction. Their natural tendency is to communicate their ideas by signs, and I should certainly strongly deprecate their being assembled together for any purpose. That which seems above all most excusable, would be their being assembled for religious purposes and for religious instruction, and I am not prepared to give a definite opinion upon that point, because the deaf must have the ministrations of religion by some means, and I think if we did make an exception it would be in that direction, but I should certainly strongly advocate the not assembling workmen of the deaf mute class together.

6574. Do I understand you aright, that if it was plainly proved to you that those people could find employment more easily, and that their earnings in after life might be made much greater by such means as you have just mentioned, the objections which you have just stated would induce you to say that these workshops should not be established?—I think that the undesirability of associating the deaf and dumb together would override any other benefits that might accrue.

6575. You think it would override the economical considerations?—Yes.

The witness withdrew.

Adjourned to to-morrow at 12 o'clock.

32, Abingdon Street, Westminster.

Friday, 5th March 1886.

PRESENT:

LORD EGERTON OF TATTON IN THE CHAIR.

THE RIGHT HON. SIR HENRY SELWIN IBBETSON, BART., M.P.
ADMIRAL SIR E. SOTHEBY, K.C.B.
W. TINDAL ROBERTSON, ESQ., M.D.
B. ST. JOHN ACKERS, ESQ.
W. AUCHINCLOSS ARROL, ESQ.
F. J. CAMPBELL, ESQ., LL.D.
E. C. JOHNSON, ESQ.
CHARLES E. D. BLACK, ESQ., *Secretary*.

The REV. W. STAINER further examined.

Rev. W. Stainer. 5 Mar. 1886.

6576. (*Mr. St. John Ackers.*) Will you explain to the Commission a little more fully what the Aural system is?—"Aural instruction" is a term used by Dr. Gillespie of the United States to signify a mode of instruction given to children who have partial hearing. Dr. Gillespie uses instruments, including the audiphone and ear trumpets; and his experience as related at the convention of teachers in New York in 1884, was that about 15 per cent. of the ordinary pupils of his institution had a sufficient amount of hearing to derive benefit from this special means of training.

6577. Does he attempt, after having developed the hearing as far as possible by these means, to teach the child apart from the rest of the deaf?—I have no information upon that subject.

6578. Considering how much there is to be learnt with regard to the degree of deafness and other matters, would not it be very desirable to have accurate statistics recorded with respect to all those matters by those who have to do with classes and schools for the deaf in this country?—Very desirable.

6579. That is done, is it not, in America more than in this country?—I believe so.

6580. Do you keep such statistics with reference to the school board classes?—The school board keep no statistics relating to the differences and peculiarities of the deaf.

6581. Is it your intention to start the collection of such statistics as shortly as possible?—I think I may venture to say that that matter is before the committee of the board but it has not been carried out, and therefore it may be taken as being still under consideration with the probability of such statistics being recorded.

6582. Is this form one of which you would approve as a means of procuring such statistics (*handing to the witness the "Form to be filled up by parents or "guardians of a child applying for admission as a day "pupil. 1872. Association for Oral instruction of the "Deaf and Dumb, Fitzroy Square"*)?—Not in its present form. I may be allowed to add that I submitted a form compiled from that, and from the forms in a number of other institutions in different parts of the country, to the board at the time that this question of the collection of statistics was brought up, but it was not carried out. I suppose because it would mean some addition to the work of the statistical department.

6583. Have you yourself asked for several things under the school board, which have either not been given or have been postponed on account of want of funds, such as a larger number of teachers, a greater number of centres, and so forth?—I cannot say that I have distinctly understood that that was the reason given.

6584. Will you kindly say whether the following are points which you would consider it desirable to include in the statistics—the date of deafness, the degree of deafness, the relationship of the parents, deaf ancestry, lineal or collateral, occupation of parents, cause of deafness, and defective eyesight?—All those points, and some others, were included in the form which I submitted to the board.

6585. You mentioned that you began in the year 1874, and you said that you then tried to get teachers on the oral system?—I did.

6586. And you were unable to do so though you say you applied to the Association for Oral Instruction of the Deaf and Dumb in Fitzroy Square?—The Fitzroy Square institution was applied to.

6587. You stated yesterday that you could not give the reason why teachers were not supplied, but you said that as a fact they were not; are you aware that the association was only started in 1872, and therefore it would be hardly possible to have got teachers trained in two years?—I was thinking of the Jews' Home; I believe that teachers might have been supplied, or a teacher at all events, might have been supplied from the Fitzroy Square institution, but I believe also that the difficulty was a matter of salary. I am stating that on my own responsibility.

6588. You said yesterday that if the results could be as they were at Milan they would be very satisfactory?—The results at Milan have been most satisfactory.

6589. Why is it that we cannot obtain the same results in this country as are obtained at Milan?—That is a large question.

6590. I will confine my question by asking you why he same results are not obtained under the school board?—The conditions under which the school board attempt to educate deaf children are entirely different to the conditions under which the children are educated in the institutions at Milan. I have already stated that at Milan the number of children is eight under one teacher, that teacher being a male teacher, and that a child goes through eight successive classes in eight years, during which time the child is entirely under the control of the officers of the institution. The children can be trained in school or out of school, which they are, more efficiently than in any other institution I have ever visited. I wish to place stress upon the fact that they are trained efficiently out of school hours, because the gymnastic exercises, which are wrought up to a high degree of perfection, bring the children into a state of discipline, which I consider renders their school education doubly or quadruply as effective as where that training is not carried out. The school board education of the deaf is limited to the attendance of the children in the day classes, being exactly the same as that for hearing children, five hours per day for five days a week. Beyond those hours the school board takes no cognizance whatever of the children, and there is no previous training of the children. They enter school at once, at all times, whenever they present themselves at the school doors with their fee in their hands. They may remain in the class one week or many, a considerable number only remain a very short time by reason of the nature of the occupations of their parents; the humbler classes, especially in London, have frequently to change their residences, and of course they take their children with them. Then as regards the average attendance of those children, I speak from the statistics which I have gathered from one class, but I believe my remarks would apply to all; though I have not had an opportunity of gathering the same statistics in all the classes. In one class which has been established six or seven years I added up the attendances of the children who had left school, and I found, on dividing the number of attendances by the number of children, that the average of the time those children had been in attendance was under three years.

6591. You have mentioned also amongst other things that there are male teachers in the male department of the institution at Milan. Why have not you had male teachers in your male department in the schools of the

London School Board?—I have just succeeded in persuading the board to allow me to have a male teacher for the bigger boys, and therefore the rule of female teachers is now broken through.

6592. Is he a trained teacher, trained specially for the teaching of the deaf?—He has no certificate from either of the training colleges, but he intends to offer himself for examination in June next at the College of Teachers, which has been recently established as a private college for giving certificates to those whom the examiners consider entitled to them. When he has obtained that certificate I shall present him to the Board as a teacher having a private certificate, in the same way that I present the teachers who have other certificates of a similar kind.

6593. When was that College of Teachers of which you speak established?—Last year.

6594. Is there any residence required at the college?—No.

6595. Is it, in fact, a board of examination?—Yes.

6596. Are the examiners persons who have special knowledge of the teaching of the deaf?—At present.

6597. Have you one of the syllabuses of the examinations?—I have not; I could supply one.

6598. What are the subjects dealt with in the examinations?—The usual subjects of examination at other colleges.

6599. We know that the syllabuses in colleges for teachers of the deaf vary very greatly. Are the subjects confined in fact to the teaching of the deaf, or do they embrace anatomy and the physiology of the vocal organs?—They embrace the anatomy and the physiology of the vocal organs.

6600. Are the papers written upon these subjects examined by medical gentlemen?—Is it necessary that I should go into all the details of a college recently founded? I am one of the examining body, but the syllabus for the next examination is not fully decided on. We have gone on the same lines as the college at Ealing and the college in Fitzroy Square. We of course have not followed precisely the syllabus put forth by either of those colleges, but we have compiled one of our own which we think will meet the requirements, and which will justify us in giving certificates. It includes the subjects which Mr. Ackers has named.

6601. Is it the case that the the papers written upon these two subjects of anatomy and the physiology of the vocal organs are looked over and marked by teachers of the deaf, and not by a medical man?—We have only had one examination at this college, and we have not yet decided whether we shall at the second examination have a medical man as examiner in those subjects.

6602. I am referring to what happened at the first examination?—At the first examination we decided not to call in a medical man to examine the papers on anatomy and the physiology of the vocal organs, though one was named for the purpose. It partly arose from the shortness of time, but it is in our minds to have the assistance of a medical man or a man acquainted by reason of his profession with the subjects of anatomy and physiology. Hitherto we have conducted the examination in those subjects ourselves.

6603. Who are eligible for examination?—Those who are recommended by their principals as having been occupied in the work for a number of years, and who can be recommended for their moral conduct and their discipline, and other points. This college was established on account of there being in the country a large number of teachers who had done good service in the cause, many of them for a period of more than 10 years, who had no professional status, and who had no opportunity whatever of getting their services recognised. To those who have been teachers for 10 years, and who have given satisfactory evidence of having performed good work, the college has given honorary diplomas; others come in by examination, and after satisfactory evidence we give them a certificate or acknowledgment of their ability to perform the duties which they are required in their respective institutions to perform. The colleges that existed previously to the establishment of this examining board had up to that time refused to admit them as candidates for certificates.

6604. Has the School Board for London employed any of those who passed the examination last year at this college?—Yes, two.

6605. Do they obtain the same salaries as those that have passed the examinations at the other two colleges?—This certificate has no effect whatever upon their salaries any more than the certificate of any other college.

Rev. W. Stainer. 5 Mar. 1886.

6606. In your evidence yesterday before the Commission, did you not say that those who had been trained at colleges made the school board a stepping-stone to something better?—They have done so in several instances.

6607. Then there is a demand for those who have got a certificate?—A considerable demand, especially amongst private families.

6608. And you consider, as an old teacher of the deaf, that it is only right that teachers of the deaf should have certificates of proficiency the same as teachers of hearing children?—Certainly, every teacher should have a certificate.

6609. Can you tell us the number of deaf children in the school board district that you fail to get into school at the present time?—It would be only possible to tell the number approximately.

6610. Have you more than half in school?—I consider that there are more than half at present under instruction.

6611. Much more than half, do you think you have got nine-tenths in?—I can only give the number approximately, because it is difficult for us to arrive at the exact number of children of school age, but approximately I find there are about 500 deaf children in the metropolis of whom we have 300.

6612. So that, in fact, you have not got anything like the whole number of deaf children of school age yet gathered together in the school board classes?—Three-fifths.

6613. You made a suggestion yesterday with regard to a capitation grant of 10*l*; have you not found that there is an increasing dislike on the part of ratepayers and others to the whole of the money for the education of deaf children which, of course, is larger proportionately than for hearing children, coming from the rates?—I should prefer you to refer to the clerk of the board for an answer to that question.

6614. Do you suggest that this capitation grant of 10*l*. should come out of the rates?—No, as the education grant from the Imperial revenues.

6615. Do you find that persons understand and recognise the fact that a deaf child on first coming to school has no language at all. Is not it the fact that deaf children on first coming to school have absolutely no knowledge of language?—No; in some instances they have a knowledge of language.

6616. Will you explain to the Commission how they have a knowledge of language?—Children who have lost their hearing——

6617. I am not speaking of semi-mutes?—I am speaking of pupils that come to the school board; I must answer the question in a general way if I answer it at all.

6618. I will ask it in another way. With regard to the congenitally totally deaf children, children born totally deaf, or who have lost their hearing before they have been able to speak, have they any knowledge of language before they come to school?—They cannot have.

6619. Is that fully appreciated?—Not by uneducated unintelligent people.

6620. May that not be the reason why hitherto so short a time has been considered necessary to teach the deaf?—I scarcely think so.

6621. How is it that the very short time of four years, which is about the average throughout the country, has been hitherto considered sufficient for teaching the deaf, whereas, as you stated in your evidence, they gave eight years at Milan, and you yourself preferred 10 years for reasons which you gave?—The period of four years is the average. I am not aware that that time is considered sufficient by any person qualified to judge.

6622. Are parents, as a rule, willing to let their children remain after they have been at school four years?—It depends on the age at which they enter; some of them, of course, would be very anxious to take them away, if they were poor people, when they were 13 or 14, so that they might derive some benefit from their being occupied.

Rev. W. Stainer.

5 Mar. 1886.

6623. Is it within your knowledge that a less portion of time is given as a matter of fact to the education of deaf children in this country than in Italy or America?—Certainly, a much less period. The present practice in this country is for them to remain under education a much shorter period than pupils on the continent or in America. That short period is caused by a variety of circumstances. A good many children do not enter upon their education till they are advanced beyond the age at which they could be admitted.

6624. (*Chairman.*) Is it not the fact that the reason why they do not remain longer at school is that they are sent in so late?—That is one reason, but if they enter at the proper time, the institutions limit the period in most cases to five or six years; that of course is a matter which the institutions themselves are responsible for and could explain. Probably it arises from want of means.

6625. (*Mr. St. John Ackers.*) Yesterday you stated that in your opinion deaf children should have eight years for general education and two years for technical education, 10 in all, do you mean that the two years of industrial training, training in the use of tools and so forth, should come in the last two years, or should be spread over several years?—It should be given in the last two years of the eight; it might be continued a year longer as circumstances required. I have undertaken to give the pupils, in the homes which I have established, an opportunity of learning the use of tools, but that is a work entirely independent of the school board, the children out of school hours are beyond the control or influence of the school board entirely, they happen to be under my care through their residing in the homes, and I propose taking every opportunity of giving them training in various ways, privately, and not in any way in connexion with the school board.

6626. That training you consider to be very useful?—I consider it essential.

6627. And you do not think that the fact of their having received that training will in any way prevent their being employed, when they go out afterwards, as having been partially taught by charity?—I cannot conceive that any objection could possibly be raised to their employment on that account.

6628. (*Mr. Arrol.*) Is it your opinion that the deaf and dumb are physically weaker than other classes?—Certainly.

6629. Do you suppose that oral teaching tends to develop the chest?—I do.

6630. On that account you would be disposed to recommend oral teaching?—I consider it the best system, and I think it ought to be universally adopted.

6631. I think you have discontinued the manual system in favour of the oral system since 1880 at the school board. Have you any deaf pupils who have been with you for the last five years?—We have one or two in some of the classes who were on the former system.

6632. Still under your tuition?—Still under my tuition, but they are not allowed to use the manual system or gestures during the time they are under instruction.

6633. Can those few who are still with you speak fairly well?—As a rule those who have been trained on the manual system do not speak so well as those who have been taught exclusively on the oral system; and therefore, answering the question generally, those children can scarcely be expected to do so well as those who have been taught from the commencement on the oral system.

6634. Have you any who have been taught from the commencement on the oral system?—Yes.

6635. Do they speak fairly well?—Their progress is much more satisfactory than when the system was in a transition state and signs were permitted on sufferance, and which are now done away with.

6636. Would you be disposed to say that 50 per cent. of those who have passed through the school board speak fairly well?—I certainly should not.

6637. Twenty per cent.?—The system has been so short a time comparatively in operation, that the number of deaf children who have gone out is comparatively small; if 100 children had passed out I could give you the per-centage, but where only 20 or 30 have passed out it is difficult to give a proportion that would lead to a proper conclusion. I think the Chairman asked me yesterday whether the children who left us were perfect in the system; of course I could not say that they were perfect, but I endeavoured to convey the idea that during the school period we could only really lay a foundation for an education, the development of which mainly depended on circumstances beyond our control after the children left.

6638. At the age of 13 you do not consider that deaf children have sufficiently acquired a knowledge of speech to allow them to leave school, I suppose, with the expectation that they would continue to improve?—It would be very difficult to get them up to a point, I should say almost impossible, at which we could say that they were sufficiently started at the age of 13; they would have to come when they were very young to complete the period I have named, eight years; they would have to begin at the age of five, when they are almost babies, and at that age they are scarcely capable of receiving the teaching on the oral system in its elementary form as at present adopted. I mentioned the system that has been adopted in America by my friend, Dr. Greenberger, under which children are taught in early years to utter a few words, the object being to enable them to make greater progress during those early years, and if we had a sufficient number of children at that early age and adopted the oral system, I dare say we might increase their progress, but eight years, that is to say, beginning at five and ending at 13, I should think would scarcely be considered sufficient to complete their education. I should far prefer taking them at the age of seven or eight and then keeping them the eight years. I do not mean to say that it is undesirable to receive them at five years of age; on the contrary I am a strong advocate for receiving them at an early age and keeping them as long as we can; if we had them ten years it would not be too long a period to teach them what they require to give them a fair start.

6639. You gave want of education as one of the reasons why many deaf persons do not find employment; I suppose that is general education, not technical education?—I spoke of general education, more especially a knowledge of language, that is, to be able to express themselves in words. If they could write words with intelligence I believe that that in many cases would be almost equal to their power of speaking words, because we cannot teach the deaf to speak in the same natural way as hearing children, their speech is often of a kind that is only intelligible to intelligent persons who can give the necessary attention to the peculiarities of such speech; but the speech of the deaf not being as a rule like that of the hearing, and workmen being generally impatient, I believe that a fair knowledge of language, with the power of expressing their ideas in writing with a piece of chalk, we will say, would carry many of our children through workshops and enable them to learn a trade which for the want of that general education they are often unsuccessful in learning.

6640. Are we to infer that the deaf and dumb have not been taught in the institutions to write?—They are taught to write, which implies of course a knowledge of language, but the knowledge of language is only acquired by deaf children who have passed through a very long period of exercises and instructions under proper training.

6641. You have recommended a capitation grant of 10*l.*, would you not be inclined to recommend that that grant should be continued to the deaf and dumb when they leave school, seeing that they are handicapped in the commercial world?—I should be most ready and willing to support such a recommendation to the extent of my influence.

6642. With reference to the deaf and dumb going to religious service on the oral system, how does that succeed?—There are no religious services, properly so called, conducted in such a manner that children who had been taught orally could derive any benefit from them. An experiment is going on in connexion with the Oral Institution, where one of the teachers has a Sunday class, and she gives religious instruction to orally taught pupils; I believe she has called in some friends to help her and they have found it possible to make some communications with those children in respect of religious instruction, but I am not prepared to say whether that experiment is a success or not, speaking generally I should say it would be exceedingly difficult to have special services conducted orally for the orally taught pupils; and I am not quite sure that I should do right in recommending such a provision to be made, because the theory is that children taught orally should as far as possible be kept apart from other deaf children and mixed with hearing people as much as possible, and in all cases where it it practicable I should prefer to recommend their parents or relations to take them with them to their special places of worship. That they could not derive directly and immediately from the ministers of those places of worship direct instruction is possible, but we may say the same of hearing children who accompany their parents to a church or a chapel, it would lead them to see and to know what religious worship is through the sense that remains to them of sight, and it would be in the power of their parents or friends to give them any additional explanations they might require at their own homes.

Rev. W. Stainer.

5 Mar. 1886.

6643. (*Admiral Sir E. Sotheby.*) You say that at present service is performed on the manual system at churches which are attended by the deaf and dumb?—There are services performed on the sign and manual system all over the country.

6644. Do you see any reason why hereafter the oral system should not be adopted in churches when the rising generation are more fully instructed in the oral system. I believe there is a church now for the deaf and dumb in Oxford Street?—Yes, I was chaplain there for seven years.

6645. Hereafter do you see any reason why service should not be performed there on the oral system?—I have already explained that I think it undesirable that deaf persons should be brought together after they have been taught effectively on the oral system, that we should aim at keeping them as much amongst hearing people as possible, bringing them together as little as possible. I think I said yesterday that if an exception might be made to the general rule of not bringing them together as adults, religious instruction would be that exception, but I am not prepared to recommend that an exception should be made even in that case.

6646. Where you have special services for the deaf, would you recommend that they should be conducted on the manual system?—Certainly not, I am an advocate of the oral system exclusively. If you were to ask me whether I would officiate at the present moment in the deaf and dumb church in Oxford Street, where formerly I took part in the services conducted on the manual system, I would say most certainly I would do so, because before the introduction of the oral system that was the only way of reaching their minds, and I should certainly say as the manual services at present exist, let them alone; do not abolish them, but let them die out, as I hope they will in time when the oral system has been further developed.

6647. With regard to the two-fifths of the deaf and dumb children who do not go to school, what means have been adopted to induce their friends to send them to school?—The non-attendance of the approximate number that I have stated, two-fifths, arises from the difficulties of providing the means of education, it does not imply any unwillingness on the part of their friends to send them to school.

6648. Then there is not sufficient school room for the two-fifths?—The school board has not been able to cover the whole of the metropolis as regards providing for the education of deaf and dumb children; we are progressing as rapidly as we can; we have many difficulties to overcome, but at present two-fifths are not in attendance.

6649. Then there is something wrong in the present organisation for teaching the deaf and dumb?—There is no reflection on the organisation, difficulties have arisen which are insuperable.

6650. Why?—In the first place oral teaching requires teachers qualified to teach on the oral system. Previous to the founding of the college at Ealing, teachers on the oral system could not be obtained, as I have already stated; there was an oral institution in Fitzroy Square, from which association I received some inadequate assistance, but till the college with which Mr. Ackers is connected was established trained teachers were not to be had, and it was impossible to get those children properly taught. We might have continued the manual system and so have brought them all in, but that was not our object.

6651. If there were sufficient teachers and sufficient centres you would be able to embrace the whole of the deaf and dumb?—That is all that would be required, sufficient teachers and sufficient accommodation. There has been some difficulty as regards accommodation as well as with regard to teachers. The difficulty with the statistical department of the board, of course I only speak as far as my knowledge goes, arises from the fact that schools are built to accommodate a fixed number of children. Upon my application for accommodation in such and such a school, objections are raised that we shall be interfering with the arrangements sanctioned by the department, and deprive the school of a part of the accommodation which has been provided for the neighbourhood. For that reason the board have undertaken to erect separate and special class-rooms, and that is going on at the present time. Class-rooms are being built in the west similar to those in the east and south of London; and I may express the hope that the present economical principles adopted by the board will not cause them to halt or withdraw from their action in this direction.

6652. From your knowledge of the schools of the school board, do you not think there is sufficient room for a separate class-room almost in every school in London?—No. As far as I have been able to ascertain, and I have inspected a good many schools in London for the special purpose, all the schools in the thickly populated parts of the metropolis, where it would be desirable to establish a centre for the deaf and dumb are full; schools in the suburbs and the less densely populated parts, have some vacant spaces, but I have refused to accept such accommodation as being unsuitable to the deaf mute portion of the population.

6653. Are you satisfied with your present teachers?—I think I may say they are as good as we could expect considering the short time that this movement has been in operation on a large scale in this country. There is no doubt that the teachers will improve. I have every reason to be satisfied with the teachers who have been trained at Ealing, as the theory that is there inculcated is of a very valuable character; but a teacher can only become a practical teacher by practice, and the practice of years: theoretical knowledge, as in the case of a medical student in early life, is most important; he should have as much as he possibly can obtain, but his success as a surgeon depends on his subsequent practice. It is the same with teachers.

6654. Is the reason why you cannot obtain good teachers the question of salary?—No, at the present time I think not. I think I ought to qualify that, because on second thoughts it has occurred to me that I should not have lost some of my teachers who have left me, if I could have increased their salaries.

6655. At the centres for the education of the deaf and dumb are their gymnasium and outdoor amusements for the children, the same as for hearing children?—The deaf children use the playground attached to the schools: at present the class rooms that have been erected are situated in the girls' and infants' playgrounds.

6656. From your experience abroad, do you consider that the Government of the United States, and Continental Governments give greater support to the education of the deaf and dumb than we do?—In America every deaf child is entitled to free education.

6657. In America every child must be admitted who presents himself or herself?—I believe that is so.

6658. What system do they adopt to gather in the children?—It is sufficiently well known to those who have deaf children that they have only to apply to certain centres to have their children's education provided for.

6659. Have you known any deaf person in a superior rank of life who was able to speak in a foreign language on the oral system?—I have never come across a case of any deaf person, even in the higher ranks of society, who has acquired a sufficient knowledge of a foreign language orally to be able to converse in such language.

6660. I suppose you have frequently met people in the higher classes able to converse in foreign languages on the manual system?—They would scarcely use the manual system, they would use writing.

6661. Do you know many deaf and dumb people who gain their livelihood by any trade or employment?—A large number; I have acquaintance with the greater part of the deaf mute population in London, not personally, of course, but more or less, directly or indirectly.

6662. (*Chairman.*) You did not tell us yesterday the proportion between boys and girls in your schools?—Of 313 children last reported, 164 are boys and 149 girls, as stated in the Table of Institutions published in the Proceedings of the Conference of 1885.

Rev. W. Stainer.

5 Mar. 1886.

6663. (*Admiral Sir E. Sotheby.*) You said yesterday that in England there are many deaf and dumb who cannot get employment?—A large number in London at the present time are unemployed.

6664. How do they live?—I think they get assistance sometimes from charities, there are charities for the deaf and dumb as well as for the blind.

6665. In some cases they are obliged, I suppose, to fall back on the parish?—I do not think many of the deaf become chargeable to the parish, because I think they live upon their affliction to a certain extent. I will not say they are all beggars, but their affliction to a certain extent excites sympathy, and they get sufficient assistance to provide themselves with the necessaries of life.

6666. Do you consider that the deaf and dumb can get employment as easily as the blind?—Much more readily than the blind: blindness is a physical affliction which renders the person suffering from it almost helpless in the way of general occupation. If I were to take a deaf and dumb man in one hand and a blind man in the other hand to a workshop and ask the manager: Will you kindly employ one of these two men? He would say, what can they do? I would answer, they can do so and so; which will you have? I think he would say, I will take the deaf and dumb man, because he can see.

6667. What trades can the deaf and dumb be employed in?—Almost every trade. I consider that the blind are much more heavily handicapped in the race of life than the deaf and dumb.

6668. (*Dr. Campbell.*) You were speaking of the desirability of not bringing the adult deaf and dumb together; I wish to know if the intermarriage of the deaf and dumb has anything to do with that opinion?—It is one of the reasons.

6669. Is it your opinion that when there is intermarriage between deaf and dumb persons there is a growing deaf and dumb population?—Yes, certainly.

6670. I have been requested to ask this question: whether you find it advantageous to have blind people and deaf and dumb people brought together, either for education or working purposes?—Inasmuch as there is no sympathy whatever between the deaf and dumb and the blind, and the deprivations are so entirely separate and distinct, I should think it most undesirable that the deaf and dumb and the blind should be brought together, whether for general education or for industrial training. From a sentimental point of view we, perhaps, might rouse sympathy between them, as in the case of the deaf, dumb, and blind Laura Bridgman. I think in such cases we might make an exception, and say it would be desirable, but under ordinary circumstances I consider that the deaf and dumb and the blind should be kept totally apart, and I may venture to add that I think it unfortunate that it should be found necessary in documents to put them together.

6671. With regard to the employment of the adult deaf and dumb, do you think that the difficulty of getting employment for them is increased from the fact that in their education they have been helped by charity?—It is impossible for me to put myself in the position of an employer, and to judge what his motives would be in employing, or refusing to employ, an afflicted person, but I cannot conceive that state of mind which should make him less willing to employ a competent workman simply because he had been educated by charity.

The witness withdrew.

Sir WILLIAM BARTLETT DALBY, B.A., M.B., examined.

Sir W. B. Dalby, B.A., M.B.

5 Mar. 1886.

6672. (*Chairman.*) You are aural surgeon to St. George's Hospital?—Yes.

6673. Will you state to the Commission the causes which produce deaf mutism generally?—I should divide such cases into two classes; first, children who are born with congenital deformities arising from arrested development in the internal ear; and, secondly, children whose deafness arises from disease acquired in early life, and where the hearing has been lost completely before language has been acquired. I should say those are the two principal classes. In the first class the deafness is due to arrested development before birth, which is quite unpreventible; and in the second class of cases, those in which disease takes place, causing complete deafness before speech is acquired, the deafness is due chiefly to scarlet fever and other exanthematous fevers, and it arises in the middle ear from catarrh. I divide that second division into two classes; those in which loss of hearing is absolute, and those in which it is partial; by partial I mean sufficiently to prevent the acquirement of language.

6674. Are there any means of testing the comparative power of hearing possessed by such persons who are partially deaf?—Any child, unless he can hear an ordinary voice at a distance, say, of a foot or two or three feet from the ear, is unable to acquire language in the ordinary method.

6675. You would class that child as a deaf mute?—Yes.

6676. Though the ear is not absolutely impervious to all sound?—No, a child may be absolutely dumb and yet possess a considerable amount of hearing.

6677. How far is the oral system applicable to those cases?—I should say it was applicable to them all; but so far as my experience would enable me to judge the instruction would be modified in the case of those who have a considerable amount of hearing but not sufficient to acquire language in the ordinary way. What remained of the hearing would assist in the modulation of the voice, and also would assist in the more rapid acquirement of language than where the child was absolutely deaf; so that the period necessary for technical instruction would be considerably lessened in the case of this child who had a considerable amount of hearing.

6678. Do you think the classification in institutions where these children are taught is a satisfactory one; that is to say, are not those who are absolutely deaf often classed with the partially deaf to the disadvantage of the partially deaf?—I should say the partially deaf are often classed as absolutely deaf.

6679. To their disadvantage in learning?—I should question that very much. I should say to their disadvantage in this respect, if they were instructed in the oral system, a more accurate estimation of their hearing would be useful; if they were not instructed in the oral system, I should think it would not be of so much importance that care should be taken in the classification.

6680. Then a distinction between the absolutely deaf and the partially deaf is of more importance in the oral system than it is in the sign system?—I should say very much more.

6681. Can you speak to the physical advantages of the oral system in respect to its effect on the general health; has it a beneficial effect on the organs of respiration for instance as compared with the other system?—In the oral system the very fact of the children being taught to speak in an articulate manner has distinctly a beneficial effect upon their respiratory organs, there can be very little doubt upon that. There is very little doubt that deaf mute children used to be very subject to diseases of the respiratory organs, consumption for example, much more than they are now.

6682. Do you find that deaf mutes are also deficient in intellect?—Not more frequently than in the case of other children I should think.

6683. Are there not a number of deaf mutes in idiot asylums?—I have no experience of idiot asylums, so that I could not say. There is a very great liability to mix up the two classes of deaf mutes and idiots, but I cannot speak from absolute experience of any idiot asylum. I can simply say that a certain number of cases come before my notice in the course of the year in which a child is supposed to have defective intelligence, but where the truth of the matter is that there is no want of intelligence, but the hearing is defective. There is, as I have said, a liability to mix the two classes, but in what way or to what extent they are absolutely mixed I cannot say, because I have no experience of idiot asylums.

6684. We have evidence that there are cases of children brought before the school board supposed to be only deaf mutes, but who when they try to teach them prove to be idiots?—I should think that is also possible.

6685. Do you think the combination of the two is common?—I do not think so. I do not know that you find more idiocy in combination with deaf mutism than you find in the case of other children.

6686. Do you find that deaf mutism runs in families, that is to say, deaf mutism arising from congenital deformity?—There can be no doubt that it does.

6687. Are there cases where several children of the same family are affected in the same way?—Yes, I know one where there are four out of seven children with arrested development which left them without any hearing, the other three children being born with good hearing.

6688. Without any defective intelligence?—Without any defective intelligence.

6689. With regard to intermarriage of deaf mutes, do you find that the children of deaf and dumb couples are in any large number of cases deaf and dumb?—With regard to intermarriage of deaf mutes, or of the children of deaf mutes who intermarry with one another, it is not sufficiently common to afford experience which would enable me to have an opinion upon it; but with regard to marriage of blood relatives, although I should be sorry to say anything that would appear to be dogmatic, it is impossible for me to divest my mind of this fact, that marriages with blood relatives have an influence in causing arrested development of the inner ear. I am led to say that, because it has become a habit with me during the last few years, when a deaf and dumb child has been brought before me, to make inquiry whether there was any blood relationship between the father and the mother; the answer so frequently being in the affirmative has led me to a conviction which amounts to a certainty (though it is impossible to prove it without enormous statistics) that marriages between blood relations have a tendency to cause arrested development of the inner ear. I would go further and say that this conviction has been confirmed, if confirmation were necessary, by the fact of so many children of the Jewish persuasion being born congenitally deaf, and we know that Jews intermarry very much indeed.

6690. Are you acquainted with the working of the system of teaching deaf mutes adopted by the London School Board, and can you point to anything in which you think it ought to be supplemented?—I will say that I should like to see some help in the way of education provided for children who come to the hospitals. It seems almost impossible to obtain instruction for children who come up from the country to a metropolitan hospital like St. George's. The parents do not know where to send their children.

6691. The children come up to the hospital for medical assistance?—Yes, and I do not know what to advise them to do; I say, why do not you send your children to a board school; and they reply, there is no instruction in the board school in our district for the deaf and dumb, then they begin to consider whether they should not remove to London for the purpose of educating their children; but in the case of the very poor, when they find they have a deaf and dumb child they are extremely anxious to get rid of it, not only to obtain education but to obtain maintenance, that of course is but natural.

6692. Do you speak with much practical knowledge of the success of the oral system?—I speak with considerable practical knowledge on the subject. I have been on the Committee of the Association for Oral Instruction of the Deaf and Dumb since its formation, and I have watched the development of the system with deep interest: it has been a matter of interest to me not only medically but physiologically.

6693. Do you think the oral system is gaining ground, enlisting the support of persons interested in the welfare of the deaf and dumb?—I have not the smallest doubt about it, and I say so from the following reasons. When a child is brought to me, and I have stated to the parents of the child that it must be educated as a deaf and dumb child, in order that I might make up my mind as to how far a knowledge of this system has gained ground, I have never in a single instance recommended any system of education at once. I have said to the parents, you must go yourselves and see the results of the two systems; and I can say with very great confidence (and I am speaking of a very large number of cases during the last 15 years) in every case where the parents have made themselves acquainted with the working of the two systems, they have of their own free will and without any persuasion on my part selected the oral system; when they have made a selection then I have expressed my opinion as to the relative advantages of the two, but I have been very careful to satisfy my mind as to what is the general impression with regard to the comparative merits of the two systems. I am now speaking not of very poor people; if I went on to very poor people, hospital patients, I should say when they get a chance they select the oral system also.

Sir W. B Dalby, B.A., M.B.

5 Mar. 1886.

6694. The oral system seems to demand more absolute separation in order to carry it out fully?—Yes, there is no doubt of that.

6695. Do you think that that involves separate maintenance, rather than a system of day schools with children going home to their parents on the supposition that those parents do not carry out the system of oral instruction which is practised in the school by day?—It is very much better that children who are undergoing the process of education upon the oral system should mix with speaking persons; whereas if they are placed in asylums or institutions which are confined to the deaf they mingle with the deaf.

6696. But given that desirability, do you think that when the children of poor parents go home the parents communicate with the children by signs, or do they attempt to speak to them as they would to anybody else?—I could not say what they do.

6697. If it is desirable to exclude the use of signs by the children who go home to their parents, and if the signs are generally used by poor parents who have been accustomed to use signs before they sent their children to those oral schools, would that tend to make it more difficult for the children to acquire the oral system?—I think it might tend to make it more difficult; but it must be remembered that parents of the labouring classes will make the children understand in the best way they can with the least trouble; and therefore no doubt till their education has proceeded to a considerable extent they will make signs. But those are not signs which belong to a system; they are the signs which would occur to any gentleman in this room if he wished a child to perform a certain act.

6698. You mean pointing, and so forth?—Pointing is one way of making a sign; but that is hardly the kind of sign which I should say would interfere with their education. The kind of signs that would interfere with their education would be an organised system of signs. If a child can make its wants known by speaking upon the fingers, that it to say, if it has been educated by speaking upon the fingers, it will not exercise the necessary perseverance to educate the muscular sense which is possessed by the palate and the lips, to enable it to imitate with absolute accuracy the movements which are being made by its instructors. That is the physiological explanation, in my opinion, as to why it is quite useless to attempt to educate a child upon the oral method where it has been with moderate completeness educated upon the sign system; but although that may be absolutely true it does not at all follow that the ordinary signs which occur to any poor parents when they are brought in contact with their children, in order to make them go and ring the bell or open the door, will have the same inhibitory effect upon the children's education that an organised system would have.

6699. And of course you think that the advantage of the children seeing their parents speak would be more likely to induce them to imitate their parents when they have had some instruction on the oral system, and therefore that it is better that they should go home?—Yes, that is my opinion, but I would go further and say that the fact of a child being brought in absolute contact with its mother or with its grown up sister, or with any female relation, is of great advantage, and for this reason, we constantly see that children are taught lip-reading without any special instruction by the mother. Thus we will take for example a child who is deaf to a considerable extent, who can speak a little, but whose enunciation is so imperfect, that the child cannot make itself understood. That child will go home and live in the country with its educated and intelligent mother. When that mother has been told by me, or by anyone else, that it is possible to improve the enunciation of the child, when she has learnt that it is possible that the child may read with facility from the lips, she will devote her attention to the child as no one but a mother, or a near relative, or one who is devoted to the child will do, with the effect that twelve months afterwards the child will speak quite clearly, and will read from the

Sir W. B. Dalby, B.A., M.B.

5 Mar. 1886.

lips in a way that quite astonishes me. It is these circumstances which make me think that it is of great advantage for children to live at home with their parents if possible.

6700. A good many of the children lose their hearing at an early age, before they have completed the absolute learning of speech, do they not?—They do.

6701. Is it of great importance that they should be taught the oral system in order that they may retain what little they have learnt, and may perfect themselves in what they are deficient in?—Yes, they should be taught at once, and not only they, but children who can speak perfectly well. Take for example a child between six and seven years of age, who loses its hearing in the course of a few hours, as they do with scarlet fever, or in a few weeks as they do from inherited syphilis. Let alone, it becomes dumb; taken in hand at once and taught lip-reading, and taught upon the oral system it retains language. In that way the method of instruction which it has to undergo occupies a very few years instead of seven or eight years, about eight years I think it is.

6702. (*Sir Henry Selwin-Ibbetson.*) I understood you to say that there were a large number of children for whom nothing could be done, because they were born imperfectly formed, but that there were a large number who lost their hearing very early, from scarlet fever or from other diseases of that kind, before they had acquired the power of speech?—Yes.

6703. Is there any treatment, either of a surgical nature or of a protective nature, when a child was suffering from scarlet fever say, by which the number of cases of deafness could be diminished. I ask the question because, when we were enquiring as to the blind, we heard a good deal of evidence, very much of the same character as you are giving, and it was suggested that by treatment of the children when born and immediately afterwards you might prevent blindness; could you prevent deafness under these circumstances?—In a certain number of cases there is no doubt that early surgical treatment will prevent the children from becoming completely deaf, but there are also a very large proportion that no treatment will affect.

6704. Of those who suffer from scarlet fever?—From acquired disease. In short, a child will be hearing quite well during the time that it has scarlet fever, and within 48 hours it will have irretrievably lost its hearing altogether, and no treatment of any sort or kind could have had the least effect. There are a great number of such cases.

6705. (*Mr. Arrol.*) Is it any one particular part of the ear that scarlet fever affects?—The cavity of the tympanum, and sometimes the labyrinth.

6706. Of course that is beyond man's power to touch?—Yes.

6707. Would your experience warrant you in supposing that it is quite possible for a deaf child who has been taught under the oral system, to hold a conversation with any casual individual, or must it speak as a rule to the one to whom it has been accustomed to speak?—If the child has been perfectly educated upon the oral system the mass of persons with whom it is brought in contact make it understand very well indeed, that is to say, in a conversational manner. If you ask me whether I think that all the children who are educated upon the oral system could go into a church, or into a public room, or into a theatre, and understand every word that is said, I do not think they can; I think that some can, but I do not think that the mass of them can. Great distinction is to be drawn on the one hand between a deaf mute's understanding the person speaking when that person is conversing with a deaf mute, and on the other hand a deaf mute's understanding what a person says at a considerable distance.

6708. I meant an individual speaking directly to the deaf and dumb child?—In most cases I think a deaf and dumb child perfectly educated in the oral system would understand what was said to it.

6709. Do you think that it is a disadvantage to teach the manual system as well as the oral system?—I think it is impossible. If you attempt to combine the two I believe that the one neutralises the other. If you teach a child upon the manual system, as I said before, I am quite sure that you cannot teach him upon the oral system as well.

6710. (*Mr. St. John Ackers.*) Is there any physical connexion between congenital deafness and dumbness?—The dumbness, the loss of speech, is the result of the deafness, because the absolutely deaf child is unable to acquire language in the ordinary way; but there is no physiological connexion between the two. The one is the result of the other.

6711. Will you state what is the common cause of dumbness as apart from deafness?—There is no cause of dumbness. It is the result of the inability to acquire language because of deafness.

6712. That is as to those who are deaf; but I am speaking of those who are dumb but not deaf?—Those who are dumb but not deaf are mentally deficient. A hearing child who is dumb is imbecile; there is no doubt about that.

6713. But is there not very often a confusion made between the two, and are not such children sent very frequently as deaf children?—Yes no doubt.

6714. You said that you yourself asked the parents with regard to the relationship; do you as one connected with the Oral Association and others, consider that it would be advisable for all societies and school boards and so forth connected with the deaf to keep accurate statistics, as far as possible, with regard to the relationship of the parents and other causes of deafness?—Such statistics would be very useful indeed.

6715. You spoke with regard to the Jewish persuasion having the greatest number of deaf mutes, possibly on account of the intermarriage of relations; have you carried your inquiries further and traced it with regard to other religious bodies?—No.

6716. Is it not a fact that deafness is often not discovered in the first two, or even sometimes two and a half, years of the lives of little deaf children even by their mothers?—Yes, and later than that.

6717. Will not this account in a great measure for the accepted opinion that the census returns do not give the full number of the deaf children of this country?—The census returns are absolutely unreliable, for this reason, it requires a considerable amount of knowledge, and takes a great deal of pains to accurately estimate in the case of very young children what amount of hearing they have. The truth of the matter is that it is very difficult to persuade any mother (I am now speaking of the educated and most intelligent classes) that her child has no hearing; and the reason of that is that they do not appreciate the fact that the child is so susceptible of vibrations in contradistinction to sonorous vibrations.

6718. (*Dr. Tindal Robertson.*) Following that question of Mr. Ackers, are there not cases of what is called idiopathic dumbness?—The very term "idiopathic dumbness" shows that whoever makes use of it does not appreciate the accurate meanings of terms.

6719. I think I understood you to say that those cases in which dumbness exists where deafness does not exist are cases generally in which there is some deficiency in the brain power or some disease in the brain?—Yes, they are imbeciles.

6720. With regard to the question of hereditary deafness and dumbness, you told us that those conditions are transmitted in certain ways; are they produced more by the intermarriage of blood relations or by the intermarriage of the deaf and dumb?—So far as my experience is concerned it results from the intermarriage of blood relations, because it must be understood that I have not a very large experience, and I do not suppose that anyone else has a very large experience of the intermarriages of deaf mutes.

6721. Do you know any cases in which deaf and dumb children have been born as the result of intermarriage between deaf and dumb people?—I do not. I could not recall to my mind any one case that I could absolutely specify.

6722. We have had evidence of the intelligence of blind children brought under our consideration; do you think that the general intelligence of deaf and dumb children, among the poorer classes especially, is equal to that of other children?—Quite. I would go further than that, and say that their powers of observation are more accurate; it is quite remarkable what powers of observation these children have.

6723. What is the general state of the physical health of deaf and dumb children?—They are born just as well and healthy as anybody else.

Sir W. B. Dalby, B.A., M.B.

5 Mar. 1886.

6724. During their early career are they more liable to disease than other children?—I have not observed that they are more liable to any disease which is likely to shorten life or to impair health than anybody else, except one thing that I have mentioned to his Lordship, and that is that where the children are educated without speaking, certainly from what I have understood in past years, they are more liable to pulmonary diseases from not using their voice.

6725. Would you recommend that for that cause alone, if not for others, means should be taken to make their physical exercises, and games and things of that kind as much as possible like those of ordinary children?—Certainly.

6726. Are there any special kind of physical exercises which you would recommend for these deaf and dumb children?—I should recommend them to take the same sort of amusements and exercises as hearing children; I would bring them as near hearing children as possible.

6727. With regard to the question of the treatment of the diseases of deaf and dumb children, do you think there is any possibility of improving the treatment generally of the cases which occur in early childhood, by giving information possibly to the public, or in any other way?—There is no doubt that a large number of children who are partially deaf can, by surgical treatment, have their hearing improved, I would say indefinitely; and it is quite within my knowledge that children who were very nearly dumb, having been placed under the treatment which would be provided by ordinary surgeons for the malady from which they suffer, have been able to get a great deal better hearing, and so to acquire language.

6728. We have been told with regard to the condition of the blind children that ophthalmia of the new born child is the main cause of so many children being blind; is there anything analagous with regard to the prevention of disease in the deaf and dumb to that which may be pursued in the blind?—I could give a general answer to that. I should say that catarrhal inflammatory affections of the middle ear demand immediate treatment and very seldom obtain it.

6729. Would there be any means of educating the public to the understanding of that point, and would it be an advantage if the knowledge of that point could be made more general?—It would be an advantage to the children no doubt.

6730. Could you suggest any plan by which that could be done either by means of printed information disseminated throughout the country, or in any other way, because that is the system that has been suggested to us with regard to the treatment of infantile purulent ophthalmia?—I should simply say that, wherever children are observed by their parents to be suffering with their ears, they should be taken to their doctor at once. I would not like to say more. I think that is very important.

6731. Of course, we must be aware that that is most important, if anything is to be done for them in the future, in the way of prevention; but my question was more as to any suggestion that may have occurred to you as to the best way in which this information might be given to the people generally, so that the importance of arresting this malady in its very earliest stages might be brought home to them more thoroughly than it is at present?—The means of doing that do not occur to me at present. If upon consideration any idea occurs to me, I will, if I may be permitted to do so, take the liberty of writing to the secretary, if you wish it, but it is a question that requires some consideration.

6732. (*Chairman.*) We have had evidence that the medical officers of the unions should have certain general instructions in cases of that kind to call the attention of the poorer classes to the importance of doing such and such things under such and such circumstances; the question is whether any instructions of that kind could be given in the cases that you mention?—There is no doubt that a large number of the poor, in consequence of not obtaining treatment in the early stages of inflammatory affections of the ear, are permitted to lapse into a condition which does induce deafness.

6733. (*Dr. Tindal Robertson.*) May I ask what is your view with regard to the age at which the education of these children should begin?—I should think not much before the age of seven, so far as I can say; but I think that is a question which could be better answered by someone engaged in teaching; it comes hardly within my province. What I have given you is merely my impression, and I should not like to say anything very definite about that.

6734. You stated it as your opinion that it is, at any rate as far as you can see, for the physical welfare as well as the intelligent condition of deaf and dumb children that they should be brought up as much as possible not by themselves but amongst hearing people?—That is so.

6735. It has been put before us in evidence that it is very difficult for some of these people to get employment after they leave the schools?—There is no doubt that it is.

6736. Can you give us any reason for that?—I will tell you why. I was personally acquainted with the late Mr. Fawcett, who was Postmaster-General, and I have talked to him upon this subject. He was extremely anxious at one time to give employment to the deaf and dumb, and there were a certain number of persons employed at the post office who were deaf and dumb. In all those instances the deaf and dumb people had been educated upon the sign and manual system, and Mr. Fawcett was anxious at one time to try some of those who were educated upon the oral system. We have not many opportunities of sending them, and one of the provisions which was made there was that some one should accompany these deaf and dumb employés and remain with them for a certain time, in order to save trouble to the other officials; but the thing rather fell through, because it was found that there were other employments they could obtain which did not entail a second person going and spending his time for a few weeks accompanying the deaf and dumb.

6737. We have heard about some instruments which have been tried in America, one of which is called the audiphone; have you any knowledge of that?—Yes.

6738. Will you kindly tell us what is your experience of it, and whether it is useful?—A certain number of persons who are very deaf from particular reasons obtain aid from the audiphone. If it is supposed for one moment that the audiphone is likely to be of the smallest service to children who are so deaf as to be unable to acquire language it is incorrect. I should say that its only use would be to those who sold the audiphone.

6739. Have you any experience of the system of treatment which we have been informed goes on under the name of the aural system of Dr. Gillespie, an American?—I have heard of it; I hear of a good many things; but there are certain of these things that do not demand very serious consideration.

6740. (*Mr. Johnson.*) As we are on the aural method I should like to ask you whether you think that this aural method developes in any way the latent aural power?—Oh, no.

6741. In what way do they profess that this aural method acts?—Professions do not count for very much.

6742. You have no experience of this method, I suppose?—No.

6743. And you think it of no great value?—Not sufficient to occupy very much of my time.

6744. Are the children who come under your care at the hospital principally from London?—They come from all round the country.

6745. Could you tell us about the number of people who apply to you as deaf mutes?—I should think that not less than 50 come in a year; I should think that 50 pass through my hands at St. George's Hospital in a year.

6746. In the case of the majority of the persons who pass under your hands to what may you attribute their want of hearing?—I could give nothing more than a general impression. My general impression is that one cause is very nearly as frequent as the other, viz., inherited or acquired deafness (complete)

6747. Your impression is that there is as much congenital deafness as there is deafness resulting from disease?—No, I do not say that. When you speak of deafness you are speaking of absolute deafness, of course. I should think that absolute deafness results about as much from one cause as the other; but I must say that that is only an impression.

6748. You have no statistics that would lead you to suppose that that was so?—I have looked at a very great number of statistics, but I do not rely very much upon statistics, because it depends so much upon who makes the observation, and it is so difficult sometimes to find out who had made the observation. They make

Sir W. B. Dalby, B.A., M.B.

5 Mar. 1886.

statistics more readily than they make accurate observations.

6749. Have you any experience at all in the sign system, reading on the fingers?—No more than generally; I have no practical experience of it, though I have, of course, constantly seen people talking in that way.

6750. You believe, then, that the two systems could not possibly go hand in hand?—I feel confident about that, for the physiological reason that I gave his Lordship just now. I believe that just as well as I believe that the oral method cannot be taught to a certain number of persons; it is inapplicable, for instance, to those who have a cleft palate, and it is inapplicable to those who have imperfect vision; when I speak of imperfect vision I do not mean a little imperfect, but if the vision is not pretty good the oral system is not applicable.

6751. Then a portion of the oral system is carried out by visual observation?—Yes, the whole of it.

6752. From the experience that you have obtained with regard to deafness arising after scarlet fever, is it very prevalent?—Very prevalent.

6753. Does it almost amount to half the cases that come under observation?—No, not quite as much as that in the cases of acquired permanent deafness, but it amounts to an immense proportion. I should class it first.

6754. Would you put it before congenital deafness?—I should certainly class it before deafness arising from congenital syphilis.

6755. Do you find that the number of cases of deafness arising from congenital syphilis are very large?—Very large indeed; not so large as the number of cases of imperfect vision arising from interstitial deposit in the cornea; but they go together.

6756. In your experience in the case of any of these children who come to you with almost complete deafness, have they any affection of the eyes as well, from inherited syphilis?—Generally a child who is perfectly deaf from inherited syphilis has either opacity of the cornea, or has at some previous period of his life had opacity of the cornea from which he has recovered; they are almost always found together; more frequently than affections of the teeth.

6757. Do you think that those children whose sight is affected are equally capable of being instructed on the oral system?—No, I say that those whose sight is affected are unable to be instructed on the oral system.

6758. Do you know how many were employed at the Post Office on the oral system?—I could not answer that question. Besides, these were private conversations and private letters between myself and Mr. Fawcett, so that I should not care to say very much about it.

6759. (*Chairman.*) Do you consider that knowledge of the oral system has so far advanced that the teaching of deaf and dumb children in board schools on the oral system should be made compulsory?—I should think it would be for the advantage of the children, provided that they could be instructed for a sufficiently long period. I am now speaking of the labouring classes. The labouring classes must be instructed from the time when they are about seven until they are very nearly 15. If you were to say; "Here are two children, and "I am going to educate them, giving them only four "year's instruction," I would not like to say that I should recommend their being instructed on the oral system.

6760. (*Mr. Johnson.*) They would not make much of it in four years?—I do not think they would.

6761. (*Mr. St. John Ackers.*) Ordinary short-sightedness would not, with the help of glasses, prevent their being taught on the oral system, would it?—Not if by the aid of glasses the vision became perfect.

The witness withdrew.

Mr. Richard Elliott examined.

Mr. R. Elliott.

5 Mar. 1886.

6762. (*Chairman.*) You are head master of the Asylum for the Deaf and Dumb at Old Kent Road, and at Margate?—Yes.

6763. You were first assistant master in the Old Kent Road, were you not?—Yes.

6764. For how many years did you fill that position?—For about 18 years.

6765. Since then you have been appointed head master?—Yes.

6766. And you have been in that position for 10 years?—About 10 years.

6767. What number of children have you under your charge?—318 at the present time.

6768. How many boys and how many girls are there?—169 boys and 149 girls.

6769. Is there a matron to look after the girls?—There is a matron to look after the domestic department. The whole of the educational department is under my supervision.

6770. Of how many does your teaching staff consist?—The teaching staff consists altogether of 26 teachers; 12 male teachers, 10 female teachers, 2 female pupil-teachers, and 2 male pupil-teachers.

6771. Where have those teachers been educated or trained?—They have mostly been educated in the asylum. Several of them have been previously in provincial institutions.

6772. Have they come back to you, or had they been trained in provincial institutions before they came to you at all?—They have been trained in provincial institutions.

6773. Are they all hearing persons?—With one exception.

6774. Have you ever had a case of a pupil-teacher, or a teacher brought up in the school who is able to teach the deaf and dumb?—That is the case with one girl.

6775. Was she absolutely deaf, or only partially deaf?—She was absolutely deaf. She lost her hearing at an early age, but never lost her speech, and her speech has been extended and improved under tuition.

6776. Do you use the oral system exclusively?—Not exclusively.

6777. To what extent do you not use it?—We are rather peculiarly situated in regard to that. The committee have come to the conclusion that the oral system is the system which should be adopted in the case of as many as can be best taught by it; but that conclusion was only arrived at about six months ago. Consequently the majority of the children are and have been up to the present time under the combined system. We have 90 children who have been for more than five years past exclusively under oral teaching. That was an experiment which the committee made in order to judge of the results of the teaching by that system.

6778. Have you had any cases of children who have been physically incapable of acquiring the oral system, either from their having defective palates, or from defective vision?—During the course of the experiment all those children of whom there was any doubt of ultimate success were sent from the oral instruction to the sign instruction.

6779. Then you had some as to whom there was doubt, from various causes, such as defective or perhaps slower intelligence?—Yes, exactly so.

6780. Does the oral system require more intelligence than the sign system?—I should say it does; but at the same time I think it develops intelligence to a higher degree.

6781. But it takes a longer time to learn than the other system?—I can hardly say that, looking upon it as a means of instruction. As such the oral system takes more time to bring into use than the sign system, because with the sign system, when we commence we have something to go upon; the children have already signs, whereas by the oral system there is no means of instruction until we have made it; that is to say, until there is a way of communication established between the teacher and the pupil.

6782. At what age do you receive the children into the asylum?—Between the ages of 7 and 10.

6783. Are they elected by the subscribers?—By the votes of the subscribers.

6784. Are they all from the poorest class?—From the very poorest classes.

6785. They are boarded, lodged, clothed, and educated free of cost to the parents?—Yes, with these exceptions, that a few are taken on a pay list, and also a few are taken from boards of guardians who may choose to send them.

6786. What do the boards of guardians pay you per annum?—They pay us 25*l.* a year.

6787. Does that represent the cost of the children to the institution?—No.

6788. What are the boys taught besides reading?—They are taught to articulate, to read the lips, ordinary written and colloquial language, geography, grammar, arithmetic, the elements of religious instruction, and general information on everyday matters.

6789. Are they examined in any way by any public officer?—Not by a public officer.

6790. How are they examined?—They are examined by myself, and also by an independent examiner, a diocesan inspector. He does not examine as diocesan examiner, but is employed by the committee to do so.

6791. Do you do anything for the Science and Art Department?—Yes, drawing. The whole of the boys are taught drawing, and they are examined in it.

6792. Are they successful?—Very successful; quite as successful as ordinary children in ordinary elementary schools, probably a little more so.

6793. Have any of them when they have left turned their attention to designing as a means of livelihood?—Several of them have done so. The better class go to the trades which require designing.

6794. In those cases where the children have remained the full time, have they generally been able to compete with the outside world when they leave the institution?—Generally.

6795. Have they been able to compete sufficiently to enable them to get on even if they could not be considered quite perfect?—They seem to have no difficulty, as far as I know, in making themselves understood.

6796. And in understanding what people say?—And in understanding what people say.

6797. Have you at all watched their progress in after life in any trade?—That does not come under my department, but I have done so, as a matter of fact.

6798. Do they write to you?—Yes, they frequently write to me, and they seem by those letters to be doing well in life.

6799. What trades do they take up generally?—I think they take up mostly shoemaking and tailoring; but the secretary of the asylum will be better able to tell you about that, as that comes exclusively under his department in London.

6800. What do you teach the girls?—We teach them, besides ordinary education, the different branches of sewing as in ordinary elementary schools.

6801. Do you teach them house-work?—Yes, they do part of the house-work, and assist in the washing.

6802. Have you a steam laundry?—It is not a steam laundry, but we have a laundry where there is mechanical apparatus.

6803. And they use that by hand?—Yes.

6804. Have the committee any funds with which to apprentice the boys when they leave?—Yes; they have not special funds, but they devote part of the funds of the charity to that purpose, and they have always done so. Perhaps I might be allowed to say that there is an officer whom the committee have appointed to supervise those children who have been apprenticed with the moneys of the charity in the metropolis, and he goes from time to time to see how those boys and girls are getting on, and to smooth any difficulties which possibly may arise in the course of their training.

6805. Does he go only to those who are apprentices?—Only to those who are apprentices. It is part of his function to enquire as to the desirability of a master, or a mistress, who may be proposed as the master or mistress to teach a certain trade. I may perhaps say that I was employed myself in that capacity for six or seven years before I was appointed to the head mastership.

6806. Did you find any difficulty in dealing between the masters and the apprentices?—I had very little difficulty indeed during that time.

Mr. R. Elliott.

5 Mar. 1886.

6807. And you find that the apprentices were able to make themselves useful as well as other people?—They were able to make themselves quite useful where the trade did not require a very large amount of verbal direction, if it was merely an imitative trade.

6808. Do any of them go into pottery works, and do painting, as at Doulton's works?—I have never known a boy employed in Doulton's works; but I know two or three who went into the glass painting, and who did very well at it.

6809. Do you think that the education of the deaf and dumb should be supported by a grant in the education estimates, proportionate of course to the difficulty of training them, but on the same lines and on the same grounds as the grants for the education of other children?—Speaking privately, I do.

6810. You wrote a letter to the conference at Manchester to that effect; do you wish to speak in that direction at all now?—No, I think I had rather not.

6811. You do not wish to express an opinion before the Commission upon the subject?—As a private opinion I believe that there is no other way of meeting the difficulty of making a full provision for deaf mute education; but speaking as an official connected with the asylum we do not want State aid ourselves.

6812. And you think that children should attend the schools for not less than seven years?—Decidedly.

6813. Do you think that deaf and dumb children should be allowed to continue longer at school than other children, so that if the other children leave school at the age of 12 the deaf and dumb should be allowed to continue until the age of 15?—Decidedly.

6814. Do you think that the education of the deaf and dumb should be made compulsory the same as the education of other classes of children?—I think so.

6815. What is the difference between your two institutions, the one in the Old Kent Road and the one at Margate; are they both on exactly the same lines?—We are rather in a transition state at the present time; we are in process of rebuilding. The former place is being pulled down, and probably reconstruction will take place.

6816. What you have been describing, then, is what goes on at Margate?—Yes, and at Ramsgate. We had a school formerly at the Old Kent Road, and it was transferred temporarily to St. Lawrence, close to Ramsgate, about four miles from Margate.

6817. (*Mr. Johnson.*) I understood you to say that when the pupils leave the institution you have found that they make themselves very well understood; by what system do they make themselves understood, by the sign system or by the oral system?—That would be by signs, because we have not as yet sent out any children who are going through their course of industrial training and have been fully trained by the oral system. We have sent out a few, but they could hardly be said to be fully qualified, because they have not had the full time that they will have in the future.

6818. I suppose that your society recognise the desirability of keeping the two systems distinctly apart. As I understand you have a school at Margate?—Yes.

6819. You do not mix those who are learning the oral system with those who are learning the sign system?—No.

6820. Then they are in two separate establishments?—They are.

6821. Do the pupils of the one class ever mix with the pupils of the other class?—Not generally, nor in school; that is to say they are entirely a part and separate I could not say but what when they are away from school they might probably come together, but they do not come together in school or in playtime.

6822. While they are under the superintendence of your school authorities they do not mix?—They do not.

6823. Do your pupils come from any particular district more than another?—The majority, of course, come from London.

6824. There is no particular district in the country from which a large number of your pupils come?—Except London. We have them from various parts of the country, even as far north as Lancashire and Yorkshire.

6825. You say that you have the largest number from London; I suppose people come from the country and locate themselves in London with the hope of getting into a London institution?—I do not think so.

Mr. R. Elliott.

5 Mar. 1886.

6826. You mean that they are Londoners?—They are Londoners.

6827. Is the old form of lessons in articulation and lip-reading still pursued in your principal school?—Yes.

6828. Do you still teach them any articulation at the same time as you teach them by signs?—We do.

6829. Then you have a mixed system at one place, and a separate system at the other?—Exactly.

6830. You have an oral system isolated entirely, and a mixed system of signs and oral?—Yes.

6831. What is the proportion of pupils that you have instructed in the mixed system, and those that you have instructed in the oral system?—We have 90 children under oral instruction, and 228 under the mixed system.

6832. How many of the 26 teachers are appointed to the oral side, and how many to the mixed side?—Ten belong to the oral side, and the remaining 16 to the mixed system side.

6833. Do you believe that it requires more teachers to teach the oral system than it does to teach the other system?—I think so; especially, I should add, in the elementary lessons.

6834. Has that been recognised by your committee?—Yes.

6835. You have had some experience with regard to the trades which those deaf and dumb children carry on when they leave school; have you many who are joiners or cabinet makers, or what is the majority of the trades?—I can only speak from 10 years ago. The secretary would give you more recent information, but I will answer the question, if you like, as far as I can. I should think that the trades which the pupils go to are probably determined rather by the locality in which the childrens' friends reside than by the suitability of the trades. For instance, if a child comes from the country, there is evidently hardly any means of putting him to a skilled trade, such as there might be in London; so that the majority of the children in the country become tailors and shoemakers. You find in every village a tailor and shoemaker. Apprenticing the children is mainly a matter of arrangement with their parents.

6836. Then your society apprentices these children and supervises them to a certain extent after they are in apprenticeship?—Yes.

6837. Is there any fixed sum which they pay for the apprenticeship?—There is no fixed sum; it is at the discretion of the committee, but there is a sum which is usual.

6838. Do you find any difficulty in getting people to accept deaf and dumb children as apprentices?—In some cases there is a considerable amount of difficulty, but in others there seems to be very little.

6839. Is there any particular difficulty in any particular trade?—I never found it to be so.

6840. What is the number in the year that are apprenticed from your school?—I can hardly say positively. The secretary will be able to give you that.

6841. The school is examined, is it not?—Yes.

6842. Do you think that it would be advisable to have it examined by a Government inspector?—In our case I should say not.

6843. Would it be the wish of your committee that there should be such inspection?—It would not be the wish of my committee.

6844. Nor would it be the wish of your committee, I suppose, to have any Government help?—No.

6845. They are rich enough without?—I will not say that they are rich enough without, but I will say that they do not desire it.

6846. What is the proportion of pupils who pay in the school?—We have a very small proportion now who pay; I think at the present time there are four or five out of the whole number, including the poor law cases perhaps seven or eight at the outside who pay.

6847. What is the payment on what you call the pay list, exclusive of the boards of guardians' payments?—The payments by the parents is subject to the will of the committee. Each case, I believe, is taken on its own merits.

6848. But the guardians' payments are fixed at 25*l.* a year?—They are.

6849. Does that include clothing?—Yes.

6850. Do the pupils go away for holidays from your asylum?—Yes, twice a year.

6851. For what time?—They may go from about the middle of June to the latter end of July, for about five weeks in the summer; and they go away at Christmas for four weeks.

6852. Do you find that that materially interferes with their educational course?—I think not.

6853. They do not come back having acquired any sign-habits or things that you would not wish them to acquire?—All the children will sign.

6854. Even the oral children?—Even the oral children.

6855. Is the sign which the oral children make use of a natural sign, or an educated sign?—When they are at home, they pick up some of those conventional signs, and in some instances they make conventional signs of their own. It is almost impossible to keep them entirely apart, when they are at home, from all association with the sign-taught deaf and dumb. Consequently, their modes of expression and the conventional signs that they make by such means come to them.

6856. But those conventional signs, I suppose, are not regulated signs; they are conventional signs that they or their parents create for themselves; they do not learn any regular system of signs?—They are mostly the same conventional signs that are used by the ordinary deaf and dumb.

6857. And they apply them with without any special education in those signs?—Yes.

6858. They pick them up from the hearing?—Some they do. In natural signs there are certain of them which any deaf and dumb children, if they are put together, would speedily make conventional; and then, if they have a little bit of help from those who have carried on this system of intercourse for so many years, it puts them as it were in the same groove which experience has long followed in making them.

6859. I am going to ask a question which I do not know whether you will care to answer. Will you give us your opinion as to the system which you think the better for universal adoption, the oral system or the sign-system?—I should think the oral system is the better system as a means of education for the children. I have come deliberately to that conviction.

6860. To the exclusion of the sign system?—No, not to the exclusion of the sign system.

6861. You say for the purposes of education, will you explain that a little more fully?—There are some children of very low intelligence and whose intelligence I think can only be enlarged through the agency of signs; and to those children I should give the benefit of the intelligence and the development that they could get by means of the signs.

6862. Then do I correctly gather that you are in favour of a mixed system?—No, I should use the oral system for the education of those who are the best qualified and the best fitted for it; and I should use the other system for children of lower intelligence, so that they may get all the enlightenment they can, not necessarily by the sign system, but by what I would rather call a silent system; that is to say, there are some who seem to have such very great difficulty in mastering the elements of sound, and such a very small amount of intelligence to grasp the conformations of the words as they are shown on the lips, that I think their intelligence would not be developed to any appreciable extent by that means.

6863. (*Dr. Tindal Robertson.*) Will you tell us what was your previous training before you became a master at the deaf and dumb asylum?—I was a teacher in an elementary school. I was second master of the Royal Asylum of St. Anne's Society.

6864. Where is that?—At the time when I was a master there it was at Streatham Hill.

6865. Are you certificated?—No.

6866. When did you yourself first get any acquaintance with the oral system?—I have been teaching articulation the whole of the time that I have been teaching the deaf and dumb at all. When I first went to the asylum in the Old Kent Road, the first employment that I had was to teach articulation to the children.

6867. And lip-reading?—We had no lip-reading at that time.

6868. When did you first become acquainted with lip-reading?—Perhaps about 14 or 15 years ago. I have become acquainted with it gradually. Of course I knew previously as one who had taken an interest in the work that there was a system of teaching by lip-reading which had been carried out in Germany; but at that time the knowledge that deaf and dumb teachers had of each other, whether in their own country or abroad, was very limited, and they had no means of getting any.

6869. Can you give me any idea as to how long it took you yourself to acquire a knowledge of it?—I have been learning it bit by bit for the whole of the time that I have been engaged in teaching, with the reservation that I have just made.

6870. How long do you think it would take a man of average intelligence to acquire a knowledge of it to such an extent as would enable him to teach deaf and dumb children the combination which I suppose makes the oral system, that is to say, the articulation and the lip-reading?—I should think under those conditions about two years, that is to say, if his attention and time were chiefly employed for the purpose, not so much of teaching, as of training.

6871. Where do you get your teachers at your school?—We are obliged to get them by open advertisement.

6872. Is there any particular place where they come from?—No, we advertise, and we take the best of those who come to us.

6873. Are they good altogether?—Do you mean is the material good?

6874. Are the people who apply to you so good as to satisfy you, or are you obliged to take them, although they may not be sufficiently good because you have not sufficient choice?—They develop into good teachers; I will not say but that if they had a special training they would become good in a shorter time than I can devote to the purpose of training them.

6875. Then there are some who come to you who are not absolutely trained up to the highest point before they come?—We have no trained teachers. I train them myself.

6876. Then, you take anybody that comes, whether they have been simply ordinary teachers, or otherwise?—It is an advantage, of course, to take them if they have been trained; and, supposing that one who had been trained and one who had not been trained presented themselves, I should take the one that had been trained.

6877. Do you get applications from any trained teachers?—Very rarely, indeed.

6878. What is the average daily time that you give to the education of the children, and what time do you give to their exercises or games?—They have about five hours' instruction per day.

6879. And how much time is devoted to amusements?—About two or three hours a day, I should think.

6880. Do you think that the health of the children, generally, is as good as that of other children?—I think so, as a rule. We have a small number of children who are physically delicate, but they are exceptional children Leaving those out of the question, I think the health of the normal deaf and dumb children is quite as good as the average health of ordinary children.

6881. When they first come to you, do you get any information as to the causes of their deafness?—The most common is in the phraseology that the mothers use, that it was through fright while they were "carrying," as they express themselves. We always have information as to whether the deafness is acquired or congenital.

6882. Could you give us any idea of the proportion of those who are deaf from birth, and those who have become deaf afterwards?—I cannot give you any definite statements, but I should think that at the present time about 30 per cent. are cases of acquired deafness. The cases of acquired deafness have very much decreased within my experience. The proportion about 20 years ago was 40 per cent.

6883. Could you tell us what you think is the reason of that?—I cannot say, unless it is through the advancement of medical science and skill. I cannot give any other reason.

Mr. R. Elliot

5 Mar. 1886.

6884. Do you think that people are still as ignorant, generally speaking, of the danger that there is to their children in letting cases of incipient deafness go on without applying for medical treatment?—I should think they are in rather a better position than they were formerly; and as a matter of fact in regard to the deaf and dumb children of London the information that I receive in my inquiries when I make them is, that the parents have done all they could for them, that they have taken them to this hospital and that hospital, and the result is that there is no hope for their hearing.

6885. Do you make any inquiries as to whether the parents have been deaf and dumb, or whether they have been related to each other?—Yes, we always make inquiries of that kind.

6886. What is the result of the inquiries, speaking generally?—Speaking generally there is a far greater probability of the offspring of deaf and dumb parents being deaf and dumb themselves than there is in the case of the offspring of other people. We have a large number of children in the school who are the offspring of consanguineous persons, and there are several instances in the school of families who are the offspring of first cousins, in which cases the whole of the family, or nearly the whole of the family, are abnormal in some point or other.

6887. Does any particular instance occur to your mind in which two deaf and dumb people have been married who have had deaf and dumb children?—Yes. I have now in the school the offspring of a father and mother who were both in the school and who have nine children; I think, speaking from recollection, that five are deaf and dumb, and four are hearing. In another case of children who are the offspring of deaf and dumb parents there are two in that family who are both deaf and dumb, both of them highly intelligent children. Then we have in the school at the present time two children, both of whose parents are deaf and dumb; and I believe in addition to those two there are two or three others in the same family who are also deaf. There is another case which I was going to mention, which is rather a remarkable one, of a boy whose father and mother were in the asylum and his grandmother also; I will not be certain about the grandfather. That boy has just left school.

6888. You have spoken of several persons who have married from the asylum; is it customary for the two sexes to be so brought together that they can form attachments there, subsequently getting married?—I do not think there is such a thing thought of in the school, and although children are in the same room together they only mix together during school hours, when they are under strict supervision, so that there is no facility whatever for making such attachments. They are not allowed to talk together except for class purposes, and as a matter of fact they never do.

6889. At what age do they leave the school?—About the age of 15.

6890. Do they go to the same church or chapel whilst they are in the school?—Yes.

6891. I suppose there must be a possibility of their becoming pretty well acquainted with each other, or else these attachments would not be formed afterwards?—Of course they know each other in the school, but I do not think they form the attachments there.

6892. They form the acquaintance there and the attachments afterwards?—Probably so; but I should say that the deaf and dumb are a very gregarious class, not so much perhaps in school as when they leave school; and where there is one deaf and dumb person another will be very likely strongly attracted towards that one.

6893. You would conclude, probably, from the statement of the cases made to us that it is very desirable indeed, as far as possible, to discourage this sort of acquaintance between deaf and dumb people of opposite sexes?—I think so.

6894. One more question as to the education. Do you think it is advisable that deaf and dumb children should be educated together in an asylum or institution, or that they should be mixed together with other children, as they are in the board schools?—I have had no experience of the board school education, but my own idea is that they are far better educated together and apart from ordinary children, in the way that we educate them.

Mr. R. Elliott.

5 Mar. 1886.

6895. Will you tell us the reason why you have formed that opinion?—Because everyone around them is able to treat them, as I may say, in an educated way. The whole of the teachers are teachers of the class, and can assist them in their difficulties. In addition to that, in a well regulated institution there are advantages in the way of physical education which the homes of the parents do not usually possess.

6896. We have been told by other witnesses that the system of oral education is very important, because it is intended to prevent, as far as possible, their keeping together, and to make them mix more with the world generally. How would you reconcile that with your impression that it is better to keep them together in institutions for the purpose of education?—It is a matter, I think, of theory and practice. Theoretically I should say that it would be better for the children to mix with the hearing and speaking world, even during the process of education; but up to a certain point even then I should hold that it would be better for them to be amongst educated people, that is to say, educated to their requirements, rather than amongst those who will not take the trouble to teach them those things that are necessary for them to know. It would require what I should call an educated person to do that; practically I should think that ordinary people will not take the trouble to give that instruction, and that aid and assistance which one might suppose they would give. They have not the time in fact to do it.

6897. (*Mr. St. John Ackers.*) With reference to the point which you have just mentioned as to the number of deaf children, the offspring of deaf parents or deaf grandparents, may not that be accounted for in a great measure by the fact that after leaving school, those who are deaf and dumb (which of course the majority of your old pupils are), meet together for religious purposes and also for lectures?—I think so.

6898. And if they have not already formed attachments they may very naturally be brought together, and so become united?—Yes.

6899. Have you in your institution statistics with which you could furnish the Commission as to the date of deafness, the degree of deafness, the relationships of the parents, the occupation of the parents, the deaf ancestry, and defective eyesight, and so on?—I cannot say that there are statistics; there is material for statistics, but it is not tabulated, except that as a matter of fact now and then, being interested in the question, perhaps I may look over one point or another; but it is not part of the work of anyone to do that.

6900. Do you consider that it would be an advantage if as accurate statistics as possible were kept in all the institutions?—I think it would be desirable if they were kept universally.

6901. You mentioned, in answer to a previous question, that your oral taught children, when they have gone for their holidays, pick up conventional signs; will you tell the Commission in what way they pick them up, that is to say, do they pick them up, from intercourse witn sign-taught pupils or elder persons?—From pupils who have been sign taught.

6902. They do not invent all these conventional signs themselves, but they generally pick them up from those who have been taught them in schools; is that so?—Yes; but I should qualify my answer by saying, that if you put a certain number of deaf and dumb children together they will make conventional signs if they have not already got them.

6903. You stated the number of pupils that you considered it desirable to teach on the oral system by one teacher; will you kindly tell the Commission what number of pupils should be taught by one teacher in order to get the best possible results, upon the combined system?—I should think the fewer the better; but at the same time where the instruction is collective and can be taken by the class from the teacher there is less necessity, I think, with the sign system to have a smaller number of pupils in a class than there is with the oral system, where the instruction at any rate for the first three or four years requires to be so very individual.

6904. In your experience do you consider that the number of teachers has been inadequate in most of the institutions in this country to obtain the best results?—Certainly I do.

6905. You have, of course, a great many applications for admission?—Yes.

6906. Will you tell the Commission how many you have refused during the last 12 months for want of room, or for other causes?—I think the secretary would be able to tell you that better than myself, if you will reserve that question for him. I am afraid that I could not give you a correct answer, though I might give you an approximate one.

6907. There are certain causes of refusal of admission which must come before you as head master; is not that so?—Yes.

6908. Do you examine each child before admission?—I generally examine all the London cases; but as a great number of our cases come from the provinces we are obliged to get the best testimony we can from the clergy and those who present the case for admission.

6909. And those that you do not personally examine are taken, I suppose, more or less on probation; that is to say, if you find them wholly unfit for education you are at liberty to report the case?—Before a child is finally admitted he has to pass a board of medical examiners, and I am always present on those occasions, so that if there is a case of decided idiocy, or such physical malformation as unfits the child for a public school, that child is refused admission.

6910. Is there no degree of want of intellect short of absolute imbecility which makes you refuse the children?—We always lean to the side of the children, and we would rather take a child on trial than absolutely refuse it, because the possibility is that he has already passed several medical and other examinations by those who present the child.

6911. But there are certain children, as I understand your answer, who eventually have to leave on account of want of intellect, stopping short of absolute imbecility?—There are a few.

6912. Have you had any cases of deaf and blind?—I have never met with one.

6913. You have met with them of course, but not asking for admission?—Quite so. I should say that a proportion of our pupils have very defective eyesight.

6914. You mentioned in answer to a previous question that none of your teachers had been trained?—I think I said that a few of them had been trained.

6915. Where were those trained that had been trained?—At provincial institutions, and in ordinary schools.

6916. They had been in a training college?—No.

6917. Had any of them passed through the ordinary training colleges of the country for hearing children?—No.

6918. Had you any reason for not taking trained teachers?—Not the slightest; we would rather have had them.

The witness withdrew.

Adjourned to Thursday next at 12 o'clock.

32, Abingdon Street, Westminster.

Thursday, 11th March 1886.

PRESENT:

LORD EGERTON OF TATTON IN THE CHAIR.

ADMIRAL SIR E. SOTHEBY, K.C.B.
W. TINDAL ROBERTSON, ESQ., M.D.
B. ST. JOHN ACKERS, ESQ.
E. C. JOHNSON, ESQ.
CHARLES FEW, ESQ.
C. E. D. BLACK, ESQ., *Secretary.*

Mr. RICHARD ELLIOTT examined.

Mr. R. Elliott.

11 Mar. 1886.

6919. (*Mr. St. John Ackers.*) I think in your previous examination you stated that you considered the oral system the best for the purposes of education?—Yes.

6920. That is to say, as contrasted with what?—As contrasted with the sign system, the system of instruction by signs. I think greater progress is made by teaching on the oral system than by teaching by signs, because after the initial instruction has been gained, the instruction is in the words of ordinary language, rather than in a language which is altogether different from the ordinary vernacular, and in addition to that I think that speech has a tendency to develop the ideas in a superior way to signs.

6921. As I understand you are in favour therefore of the oral system, to use your own expression, wherever it can be adopted?—Wherever it can be adopted.

6922. You give religious education in your school?—Yes.

6923. You give religious education to those orally taught as well as to those taught on the sign system?—Yes.

6924. Is that religious education given orally?—Quite orally.

6925. Then it is a mistake to imagine that it is impossible to give religious instruction to deaf children orally?—I think so. If I might qualify that answer I should say that religious instruction given to an orally taught child has to be delayed somewhat till a means of communication between the teacher and the child is established.

6926. Will you just explain in what that delay consists? What mode of teaching do you adopt during the first year before you begin to teach religion orally?—Generally speaking the first year is devoted to the acquirement of sounds and simple words. Then in the second and generally in the third year, or the greater part of the third year, the mother's teaching comes in, that is to say, the gaining of the ordinary elementary language for expression of thought. At the end of that time there is a means of communication and simple elementary instruction in religious instruction can be given. But I would not bind myself to say three years; in many cases the religious instruction might be commenced in two years.

6927. I think you said that after a certain time you find them get on faster in their education under the oral system than under the sign system?—Yes.

6928. Therefore your opinion is that though it is slower to commence with, it is in the end both more certain and better for the children?—For a normal child.

6929. Do you consider also that it is better for them in after life if they have been taught upon the oral system?—I think so.

6930. You have had great experience with regard to the deaf and dumb who have been taught upon the sign system as well as with regard to those who have been taught on the oral system. Is it your belief that when they are apprenticed those who have been taught on the oral system will do better than those sign taught?—That is my opinion.

6931. I think you promised that you would bring a table of statistics?—No. I only said we had materials from which tables of statistics might be prepared, but they have not been tabulated. I might perhaps make a little correction in the statement I made last time. I said my impression was that in the institution at the present time there are 30 per cent. of cases of acquired deafness, but upon examination I find that the proportions are 77 per cent. of children born deaf, 23 per cent. of cases of acquired deafness; that was the result of my examination into the cases of about 350 children. In my evidence on the last occasion I think I expressed the opinion that the cases of acquired deafness had very much decreased in my experience. I said from about 40 per cent. to 30 per cent.; in examining some notes I have at home I found that what I have stated is the exact number.

6932. Does that number include those who have lost their hearing so early as not to acquire speech before the loss of hearing?—Yes, it includes the cases of all those children who have been returned as having lost their hearing at any age however early.

6933. Is that in your opinion the normal per-centage?—I think so. As I have said the per-centages I have given were arrived at from an examination of 350 children. In the nomination paper, which has to be filled up when a child is admitted into the Asylum, one of the queries which is asked is whether the child was born deaf, or whether he lost his hearing, consequently we get answers from the parents, and I have examined these answers given, the result being what I have stated.

6934. Do you test the degree of hearing of a child when he first comes to you?—Yes.

6935. Do you test it at different intervals afterwards to see whether it has improved or become worse?—Not with that view, but at various times I have tested the hearing.

6936. Do you test the eyesight also?—I do not test the eyesight.

6937. Is the eyesight tested at your institution?—It is not, as a rule, though I should say that the medical officers of the institution in any case where spectacles would be of benefit, or where any other treatment is required, would order the case to be dealt with accordingly.

6938. (*Chairman.*) Have you had any case of a child who was blind, deaf, and dumb?—No. With regard to another point in my evidence on the last occasion I was not able to give the proportion of children who were the offspring of relations. I have gone over my notes at home, and I find that at the present time about eight per cent. are the offspring of blood relations.

6939. Eight per cent. out of 550?—Yes.

6940. (*Mr. St. John Ackers.*) What per-centage of the children are descendants of congenitally deaf parents or ancestors?—I cannot give you that.

6941. (*Mr. Few.*) When you say that you prefer that deaf children should be orally taught, I take it that that is dependent on the degree of capacity which the child manifests?—Certainly.

6942. And in respect, at all events, of many children, they would not be capable of grasping the instruction on the oral system?—No; that is what I said in my evidence on the last occasion.

6943. So that, in fact, each case must be judged on its own merits, and its own capacity of intellect, large or small?—Yes.

6944. (*Admiral Sir E. Sotheby.*) Have you any religious service in your institution?—Yes.

Mr. R. Elliott.

11 Mar. 1886.

6945. Is it conducted on the oral system or on the manual system?—I have two services. I have a service conducted by signs and the finger alphabet; that is, for those who are at the present time taught by signs, and a service conducted orally for those so taught.

6946. How many are there attending the signed service?—About 220 at the present time.

6947. Have not any of those been taught on the oral system?—Not on the oral system.

6948. Do not you propose to teach them on the oral system?—I think I explained last time that we have taken a certain number of children as an experiment, and the committee have come to the conclusion that the result of that experiment warrants the extension of the system, so that as soon as arrangements can be made the oral system will be extended as far as possible. At the same time, it is the wish of the committee that the whole of the children who are being taught on the sign system should continue on the same system to the end of their course.

6949. Would not it be to the advantage of those children to be taught by the oral system, too?—Those who, as far as possible by the system by which we have been teaching them, could be taught to speak have been taught to speak and to read the lips; but that teaching has not been carried out to the full extent of the oral system.

6950. How long do the children remain at the school?—The average time is 5½ years.

6951. Is not there sufficient time in that period to teach both systems?—No, it would be a reversal of all approved methods of teaching to attempt to do that, and it would probably end by the pupils learning by neither well.

6952. Have you a Sunday school?—Yes.

6953. How are the children taught in the Sunday school?—In the Sunday school for the children taught by signs, they are taught by signs. Then we have an oral school, and there the whole of the instruction is exclusively oral.

6954. (*Chairman.*) I will now ask you a few questions with regard to the education of the deaf and dumb generally. Do you think it desirable that the school boards should extend their system of education by grouping districts together, and erecting school buildings for the education of the deaf and dumb in those districts?—Yes; but I do not think that the education is so effectual in day schools as in boarding schools.

6955. You think that besides providing ordinary school buildings, boarding houses should be provided under special supervision for the deaf and dumb?—Yes, I think that would express my view.

6956. A committee of the school board would be managers of such institutions, instead of leaving such boarding houses to be provided, as they are now by Mr. Stainer, out of private funds?—Yes; otherwise I cannot see what guarantee there is for such boarding houses being provided; their continuance in London depends entirely on Mr. Stainer.

6957. You think it undesirable that a system which is found to work well should be dependent entirely on individuals?—You could not always find gentlemen like Mr. Stainer, with the requisite amount of knowledge and sympathy, and who would give the required amount of assistance to establish those boarding houses, which in my view, and I think his view, are necessary for the satisfactory working of day schools.

6958. Do you think that in cases where there are not a sufficient number of children to start such buildings and boarding houses the school boards should pay for the education and the board of deaf and dumb children at existing institutions?—I think so.

6959. Subject to the sanction of some public department?—Yes.

6960. And subject also to Government supervision?—Yes; I do not suppose the Government would give assistance without supervision. I look upon one as being the necessary consequence of the other.

6961. Independently of your relations with this institution of which we have been speaking, what is your opinion generally as to the class of teachers of the deaf and dumb; do you consider that they are satisfactorily trained at the present time?—I think not. Under existing circumstances they gain their training mainly by experience, but I do not think that it is best for institutions or for the instruction that it should be so.

6962. Has it been with the object of obtaining a better class of teachers for the deaf and dumb that you and others have attempted to found a College of Teachers for the Deaf and Dumb?—Yes, and for the purpose of raising as far as possible the status of the existing teachers who have qualified themselves by long experience.

6963. When was the first meeting of the college held?—On the 1st of last July.

6964. Was that after or contemporaneous with the conference?—After the conference. The examination took place two or three days before the conference, and the first meeting of the whole body which was then constituted took place the day after the conference.

6965. Will you state the constitution of this college of teachers. I suppose it has a president?—Yes, it has a president, vice-presidents, a registrar, and a committee; and at least three of that committee constitute the examining body.

6966. It is called the College of Teachers of the Deaf and Dumb. It has taken a definite name and existence since last year?—Yes, not the "College *for* Teachers" but the "College *of* Teachers."

6967. The examining body are all connected with existing institutions for the education of the deaf and dumb?—Yes.

6968. What is the course of examination or course of proceeding which is proposed to be carried out by the college?—There are various subjects of examination. I have not the syllabus with me, so that I am speaking from recollection. The subjects are, the history of instruction, the *modus operandi* of teaching, with especial reference to the intuitive method, a knowledge of making signs, ability in the manual alphabet (the latter two are optional subjects), the mechanism of speech, and the anatomy and physiology of the organs of voice. Then another subject is the practical instruction of a class.

6969. The college does not confine itself to examination on any one system, but examine both in the oral and the sign system?—Yes.

6970. Is it composed of members who favour both systems?—Yes.

6971. Do you consider it to be a thoroughly representative body of the existing institutions for the education of the deaf and dumb?—Yes.

6972. Has it any local habitation?—The office is at 13, Paddington Green.

6973. Is any payment made by those who come up for examination?—Yes, there is an examintion fee of one guinea, and also a fee of one guinea on the receiving of the diploma.

6974. That diploma is granted by the examiners to all who pass a successful examination?—Yes. The whole of the subjects in which they pass are registered on the certificate.

6975. Did any fail to receive a diploma who came up for examination last July?—Yes, one candidate failed.

6976. Has this college any connexion with any existing training college for the deaf and dumb in London?—No, except that some of the certified members of the Fitzroy Square and the Ealing Colleges have received a kind of *ad eundem* degree from ourselves, a certificate of incorporation.

6977. (*Mr. Johnson.*) What class of children come to your institution?—The very poorest.

6978. Are they in fairly good health?—Generally speaking their health would be about the same as that of the class from which they come, but there are a few who are below par.

6979. Has there ever been any epidemic or any mortality amongst your children?—Very rarely, there have been some deaths now and then, but the per-centage of mortality is very small.

6980. Would the deaths be two or three in a term?—They would hardly amount to two or three in the year.

6981. How long do the children remain in the institution?—The average time is five and a half years.

6982. Does the committee extend that time under any circumstances, is it a hard and fast rule that the term of

a child's stay in the school shall be five and a half years, or do they extend the time occasionally?—It is not a hard and fast rule. I make a report to the committee as to particular children whom in my judgment it would be wise to send out into the world, and the committee take into consideration the circumstances of each case and also the fact that the object is to treat children so that they will afterwards be capable of supporting themselves. If we kept them at the institution too long a time it might probably prejudice their chance of being apprenticed and so of earning their livelihood. That is a point that has to be taken into consideration.

6983. Does the school apprentice their pupils?—A considerable number of them; the secretary would be able to tell you the exact number when he is examined.

6984. They remain five and a half years and then the committee exercise their discretion as to whether they will keep them any longer?—Yes.

6985. Do you ever make monitors or pupil-teachers of your old pupils?—Some of them become monitors and we have pupil-teachers from outside.

6986. You do not take the pupil-teachers from your own pupils?—Not as a rule.

6987. Where do you get your pupil-teachers?—We advertise for them generally.

6988. Are they trained partially in the system of teaching the deaf and dumb?—Yes.

6989. Where do you get them from generally, from other institutions?—From ordinary life.

6990. From ordinary schools?—Yes.

6991. Then they require a certain amount of training when they come to you?—When you are speaking of pupil-teachers probably you mean junior teachers.

6992. I mean assistant teachers?—We have pupil-teachers who are of the age of 15 when we start with them, junior teachers generally come to us who have been teachers in ordinary elementary schools as ex-pupil-teachers.

6993. You train them in your institution for your particular requirements?—Yes.

6994. (*Dr. Tindal Robertson.*) As to the College of Teachers, how many examiners are there?—The minimum number is three; on the last occasion we had the whole of the committee, five.

6995. Can you tell us how many of those were advocates of the oral system, and how many of the other system?—I can tell you the names of the five examiners; Mr. Stainer, Mr. Howard, Mr. Schöntheil, Mr. Sleight, and myself. Mr. Schöntheil has been an oral teacher all his life, Mr. Stainer, as you know, favours the oral system, and Mr. Howard also; Mr. Sleight is a strong advocate of the sign system.

6996. And you?—I advocate the oral system.

6997. So that there are four advocates of the oral system on this examining board?—I might almost say that I am half and half.

6998. That would leave three and one half to one and one and a half to the other?—Yes, if you like to put it so.

6999. Is there any standard required to be reached by the examination?—We recommend a number of works, but unfortunately in this country there are very few works on the subjects of examination.

7000. I am not speaking of the works in which they are examined. Is there any standard which the examinees must reach, or is it an optional question with the examiners whether they shall be passed or not?—At the last examination in July the whole of the papers were taken and examined; one gentleman was told off to examine on a certain subject and another on another; and then any points which, in his opinion, required the judgment of the whole body were put before the whole body who sat in committee.

7001. That does not answer my question. I will put it this way: are there a certain number of marks required?—Yes.

7002. Is it possible for any one who does not reach the minimum number of marks to pass the examination?—There was a certain minimum number of marks laid down before the examination, but in a particular subject possibly some of those who were examined might have come a little below the minimum, but in others they might have plus marks given them.

7003. So that they get a certain aggregate number of marks?—Yes.

7004. Then there is a standard?—Yes.

Mr. R. Elliott.

11 Mar. 1886.

7005. (*Mr. St. John Ackers.*) You say that it is a college of teachers, and that it is not a training college for teachers?—Yes, that is the difference; we endeavoured to make it plain that we did not desire to interfere in any way with the work of any existing college.

7006. You are prepared to give certificates to any persons who come, whether they have been teachers in a school without having had special training, or whether they have been specially trained without having been teachers?—Yes.

7007. Then, in fact, the expression that you used that it was more for the purpose of registering the qualifications of teachers, would properly describe the functions of the institution?—Yes.

7008. Will you tell the Commission what the object of starting it was?—Because there was no such college in existence, that is to say, no examining body that would take into account such qualifications as we knew existed.

7009. Your object was, in fact, to raise the status of competent teachers?—Yes.

7010. You remember the passing of the Education Act of 1870?—Yes.

7011. And you remember that at that time it was found impossible to get a sufficient number of trained teachers all at once to fill the places in the new schools?—Yes.

7012. The Government then allowed, did they not, that a teacher who had been a certain number of years in a school or schools should, on passing an examination, be deemed equal to a certificated teacher?—I cannot say that I know that; I have no doubt that that was so.

7013. Your object is, till a sufficient number of trained teachers can be got to supply vacancies which must take place in old schools, and also to supply teachers for new schools, to recognise that there were in this country a certain number of competent teachers, though not trained?—We recognise teachers with suitable qualifications who have been in ordinary deaf and dumb schools a sufficient time as having been trained by experience, and therefore we thought that training had as much right to recognition as training for a certain short time previous to the time at which they were engaged as teachers.

7014. Do you wish then to continue this sort of dual system of trained teachers in colleges and those who have gained experience in schools?—I think probably the training is more effectual in a college, where everything is directed to that end; but the training gained in the actual teaching of children in deaf and dumb institutions is effective, though perhaps not so short a process as in an ordinary training college.

7015. Had any of the teachers from existing institutions who came up for examination at your collge passed through a course of anatomy and physiology such as was down in your syllabus?—Yes.

7016. Had they obtained their knowledge in those subjects as teachers in different institutions?—No, they gained it by private study I believe, with one exception, that was in the case of the Manchester Institution.

7017. I believe the Manchester Institution has comparatively recently adopted the oral system for its new pupils?—Yes.

7018. And they had a trained teacher to give instruction to the rest of the teachers?—Yes.

7019. Who were the examiners in anatomy and physiology?—I think the whole of the committee; I cannot recall to mind who specially took those subjects, if any one or more of the committee did.

7020. You did not have a medical expert to examine?—No; it will probably be done in future.

7021. It was not done as a matter of fact at the last examination in July?—No.

7022. Did I rightly understand you to say that the oral system is optional in the examination?—No; two subjects are optional; those subjects being the ability to read spelling on the fingers, and also the making and understanding of natural signs, those are the only two optional subjects of examination.

7023. With regard to the practical instruction of a class, how was that managed?—The examination in that subject was conducted in the way which our experience as teachers dictated.

Mr. R. Elliott.

11 Mar. 1886.

7024. Had you a class there?—Yes, we had an oral class, and a class of pupils who had been taught by signs.

7025. Where did the oral class come from?—From Mr. Stainer's Homes.

7026. Was it a class consisting of children of a certain age, or of children who had gone through different stages of instruction from the beginning up to the highest point that Mr. Stainer takes them?—Mr. Stainer selected them; it was left in his hands. I know there were some young children and I know there were some old children. It is a difficult matter in London to get a complete class, and I apprehend it would be in any place unless you went to an institution.

7027. You did not go to any institution?—No.

7028. How did you manage with regard to those taught on the sign system, seeing that there is no school for sign taught children in London at the present time?—I provided the children myself; I got some of the children of my own institution who were away from school for their holidays; we gave them a sum of money for their services, and paid their railway fare, and brought them there to be practised on by the candidates who chose to be examined in the signs and the spelling on the fingers.

7029. Were they children in different stages of instruction?—Yes.

7030. (*Mr. Fen.*) About what number of children did you examine in that way altogether?—I should think we had about 23 or 24 altogether.

7031. Did you classify them in one, two, or three classes for examination?—I should say that Mr. Sleight, who is perhaps the best exponent in this country of the sign system, had that part under his charge, and Mr. Howard, Mr. Stainer, and Mr. Schöntheil took the oral classes in that examination and examined the candidates.

7032. What would be about the age of the children?—The eldest was about 15 and the youngest about eight or nine years of age.

7033. Was the classification arranged and approved by the examiners?—Yes.

7034. Do you propose to continue that sort of examination?—Yes.

7035. Were you pleased with the result?—I was very pleased indeed with the result of the examination.

7036. It came quite up to your idea of good work?—Yes.

7037. (*Admiral Sir E. Sotheby.*) Are there more candidates for admission to the college than vacancies?—It is not a question of vacancies. Our idea was to follow the analogy as far as possible of the Royal College of Surgeons as an examining body; however they were trained or wherever they were trained, if they chose to come up to us we would examine them.

7038. Are you under Government inspection?—No.

7039. Would it be an advantage if your institution were under Government inspection?—I think not to ourselves.

7040. Why not?—In the first place we do not want Government aid.

7041. But you are supported by voluntary subscriptions, are you not?—Yes.

7042. Do you not think that your subscribers would be more pleased if there were a Government inspection of the institution?—That is a question for the committee, I think I am hardly qualified to give an answer to that.

7043. You could not speak as to the feelings of the subscribers?—I could not.

7044. Has that ever been mooted at all at your committee?—I think not; I am not aware that it has.

7045. I suppose you are aware that most schools are under Government inspection now?—Yes.

7046. Are you aware that many schools believe it to be a great advantage to be under Government inspection?—Yes, a monetary advantage, but that is not the case at present in regard to deaf and dumb schools.

The witness withdrew.

Mr. William Howorth Warwick examined.

Mr. W. H. Warwick.

7047. (*Chairman.*) You are secretary of the Asylum for the Deaf and Dumb in the Old Kent Road and at Margate, are you not?—Yes.

7048. And you have been there for 15 years?—I have.

7049. It is one of the oldest of the asylums, is it not?—Yes, it is the oldest.

7050. It was founded in 1792, I think?—Yes.

7051. And it was incorporated in 1862 by Act of Parliament, with a further Act in 1883?—Yes.

7052. What was that further Act obtained for?—To enable the corporation to obtain the fee simple of the Old Kent Road estate.

7053. Have you any funded property, or are you entirely dependent upon voluntary contributions?—We have funded property.

7054. What is the amount of your funded property?—You may put it down at about 159,000*l.* as we stand to-day.

7055. Do you fund all the legacies that you receive?—We do.

7056. What is your average annual income?—Between 10,000*l.* and 12,000*l.* a year.

7057. What number of children have you at the present time in the Asylum?—318.

7058. And the number of children who have been admitted since the foundation is between 4,000 and 5,000, is it not?—4,741 to this day.

7059. After they leave the institution are they all, or mostly all, apprenticed to some trade?—We apprentice those children for whom we receive applications for assistance.

7060. What number have you apprenticed up to the present time?—Down to the end of 1885 we have apprenticed 1,848 children.

7061. What has been the cost to the charity?—17,200*l.*

7062. What is the cost of apprenticing them generally?—The average for a boy is 10*l.*, and for a girl 5*l.*, but it is sometimes more.

7063. What number of boys and girls have you apprenticed at the present time?—87 boys and 29 girls.

7064. Can you state to what trades they are apprenticed?—Yes, to bakers, bookbinders, bootmakers, cabinetmakers, carpenters, carvers and engravers, coach painters, clothiers and tailors, compositors, coopers, curriers, engravers, writers on glass, harness makers, saddlers, horsecollar makers, law stationers, leather case makers, letterpress printers, lithographic writers, cane chair makers, picture frame makers, printers, furniture manufacturers, stone masons, vellum binders, wheelwrights, zinc workers. Those are the trades to which the boys are apprenticed.

7065. What training do you give them to qualify them for those trades?—None whatever.

7066. Do you teach them drawing specially?—To the boys we do.

7067. Is not that a qualification for some of the trades which you have mentioned?—Yes, it is useful in some of those trades. The girls are not taught drawing.

7068. Do you teach them no handiwork at all?—None whatever; their time is taken up educationally.

7069. Do you use the black board extensively in teaching?—Our drawing lessons are conducted under the regulations of the Science and Art Department, South Kensington.

7070. Do you teach them freehand drawing, or geometrical drawing?—We teach both.

7071. What number of paying cases are received in the institution at the present time, and what is your average?—At the present time I do not think we have above five or six. We have had, since 1862, 84 private cases, and 15 pauper children.

7072. Those were sent by the guardians, I suppose?—The latter were. The guardians have the power of sending them to us under an Act.

7073. Do you get any grant from the Science and Art Department for your drawing?—Yes.

7074. Are you obliged to refuse many applicants each year?—In the year 1885, 48 boys and 19 girls were not elected, but they went forward again to this year's elections.

7075. The mode of election, I presume, is entirely by the votes of the subscribers?—Just so.

7076. Have you extended the institution gradually, and taken more children in from time to time?—Yes, twice in my time.

7077. And there appears to be still a demand for a further increase?—Quite so.

7078. You are only limited, I suppose, by want of funds?—To a certain extent, and by want of accommodation.

7079. Could the institution be extended with advantage?—Yes.

7080. I suppose the committee of the institution manage it?—Yes.

7081. And they meet at stated times?—My committee meet, including all their sub-committees, as many as 60 and 70 times per annum.

7082. What is the age at which you admit the children?—Seven.

7083. What is the age at which they are disqualified?—Over 10.

7084. How many out of the number that have been candidates in the last 10 or 12 years failed altogether to obtain admission?—During the last 12 years 31 children failed out of 850 candidates.

7085. Your institution does not wish to obtain a Government grant, does it?—No.

7086. Does it object to Government interference?—It does.

7087. You have not taken part in any conferences having State aid for their object?—No.

7088. Does not your committee think that there is room for further education of the deaf and dumb?—My committee, I may say, are anxious to do their best for, in round numbers, 320 children. More than that we cannot do.

7089. That does not answer my question. Does not your committee think that there is room for further education of the deaf and dumb children in London?—I am not prepared to answer for them in that respect.

7090. As you have stated that you could take more children in, and that you have from time to time enlarged your institution, I want to know whether your committee think that the time has now come to stop, and that it is not desirable to increase?—As regards our own institution we cannot take any more in than about 320.

7091. Your committee then does not think it desirable to educate any larger number of children in the institution?—No.

7092. But I suppose if you were able to get some State aid, say a certain sum per child, you would be able to educate a larger number?—We should not have room for them.

7093. But with the subsidy which you would receive from the State you would be able to afford to take in more children, would you not?—If a subsidy from the State was forced upon us, and we had more room, of course we could do more. We should be blocked for want of room.

7094. It is only for want of room then. Have you made yourself acquainted at all with what has been done in other parts of London for the education of deaf and dumb children by school boards and various institutions?—Yes, with my committee I have visited various schools in London and in the provinces.

7095. Are you aware that there are deaf and dumb children in London still receiving no education at all?—I believe that is so.

7096. Upon what grounds do you think that your committee would be unwilling to extend the benefits of your institution to other children who require education?—We find that we have as many children as we can take in by the votes of the subscribers

Mr. W. H. Warwick.

11 Mar. 1886.

7097. What are the qualifications of your children as regards poverty; must they not have received parochial relief?—That does not stand in their way as to eligibility They are extremely poor; they are quite of the indigent class, such as farm labourers, we will say, with large families and 12*s.* a week, and charwomen's children.

7098. You are remodelling your institution now, are you not?—We are.

7099. Shall you be able to take in a large number at Margate permanently, or is it intended to make the London Institution the chief and sole institution?—The Margate Institution will contain the maximum number of children.

7100. Are you building at Margate?—We are about to build at Margate additional accommodation.

7101. You are about to add to the number then?—Not to the number of children, but we want more room.

7102. Is that in order to carry out the two systems, the oral and the sign systems?—Yes.

7103. I suppose that it adds very much to the cost of an institution where you have those two systems carried on side by side?—No doubt. Hitherto we have been separated.

7104. In fact you might with the same funds educate a larger number of children if you had not a dual system going on?—Possibly.

7105. Is the religious instruction which you give to the children given by the head master?—It is given by the head master and his teachers.

7106. What household work do you teach the female pupils besides the ordinary education?—The matron trains a certain number of girls in domestic work.

7107. You did not tell me what work the girls who are apprenticed undertake?—They are dressmakers and milliners principally.

7108. Do any of them become household servants?—No, we do not send them into domestic service.

7109. You take the children from all parts of England, do you not?—We do.

7110. Do you give a preference to London and the home counties?—No preference at all.

7111. We see in the balance sheet a lump sum for salaries of 3,491*l.*; what are the salaries of the secretary and of the different teachers?—The salaries of the teachers amounted to 1,857*l.* 2*s.* 8*d.* in the year 1884.

7112. (*Mr. Johnson.*) What is the salary of the head master?—It is 550*l.* now. We have just advanced his salary.

7113. Is that with board and lodging?—No, he lives out of the house. We have 26 on the educational staff, including 12 male teachers, 10 female teachers and four pupil-teachers.

7114. Then you have a matron, have you not?—We have two matrons, one of whom I think gets 80*l.*, and the other 60*l.* a year.

7115. (*Chairman.*) What is the average salary of the teachers?—I think the first teacher gets 190*l.*, and the next 150*l.*, and so on downwards.

7116. Does the salary begin at 120*l.* and go on to 190*l.*?—No, it begins according to their age. They may come in very young, and their salaries may start at 25*l.* or 30*l.* or 40*l.* a year; and then they advance.

7117. The salary goes from 25*l.* up to 190*l.* a year?—About that.

7118. The officers do not all live inside the building then?—The matron and some of the teachers live in the house, some of the teachers are married, and live out of the house.

7119. Do the girls do the household work in the house itself?—A portion of it. We have servants.

7120. Do you teach the girls cooking?—Some few are told off into the kitchen to be taught.

7121. (*Mr. Johnson.*) I suppose the admission by election is one of the fundamental principles of your school?—Just so.

7122. Then any great alteration that you might make would be subject to the opinion of your subscribers in court assembled?—Yes.

7123. Would it be considered by your committee a necessary thing, if State supervision was proposed, that

Mr. W. H. Warwick.

11 Mar. 1886.

that should be submitted to your court before you could give your approval?—Undoubtedly.

7124. The present committee are, as I understand, entirely averse from State supervision?—Yes.

7125. That I suppose is because they think that the education given to the deaf and dumb children is as high and as efficient as it can be?—We believe that we are giving them as efficient an education as possible at the present time.

7126. And you do not wish to alter your plans?—No.

7127. If you had more funds given you, you would be able to increase your accommodation for the children—Yes.

7128. You are secretary; you have nothing to do with the education, I suppose?—No.

7129. You come in contact, I suppose, with the subscribers more than anybody else?—Yes.

7130. Have you ever heard any opinion expressed by your subscribers with regard to the advantages of the oral system over the old sign system?—Yes.

7131. What do you gather to be the opinion of the public who support you upon that question?—Some are in favour of it and some are not.

7132. What should you say was the opinion of the majority?—One is a new system; I do not think I can say that the majority are in favour of that at present.

7133. Because it has not, I suppose, been carried on sufficiently long?—It has not.

7134. Do you think if there is any alteration in the system of election, that is to say depriving the subscribers of votes, you would lose subscriptions?—I think so.

7135. Have you had much opportunity of taking the opinion of your subscribers upon that point?—I have never put it to them.

7136. But you never find people subscribing any money who do not ask for their votes?—They always like their *quid pro quo*.

7137. Have you any experience with regard to the mortality in your school?—Yes, I have some experience.

7138 Are the children supposed to be very healthy, as healthy as ordinary children?—We have had 68 deaths during the last quarter of a century.

7139. And those were deaths not from any special cause but from the ordinary mortal diseases?—Yes, I think so.

7140. Do you find that the children are much stronger and more able to learn at Margate than they are in London?—Yes, Margate air suits them.

7141. Your committee seem to approve of moving the school to a certain extent into the country?—Yes, they did, and it has been most beneficial to the children.

7142. Have you ever found any objection on the part of hearing people to take deaf and dumb apprentices to work with hearing people?—There has been no great difficulty in that respect.

7143. But there is a difficulty, I suppose?—At times we experience a difficulty.

7144. The pupils that leave your establishment then go quite untrained in everything except educational matters?—Yes.

7145. What is the average cost per child in your institution?—In the year 1885, the average cost was nearly 34*l.*

7146. Is there a regular hard and fast rule with regard to the price paid for apprenticeship?—No.

7147. We were told by Mr. Elliott that a general sum was given; I suppose it is within the province of the committee to enlarge it or not, as they think proper?—It is within the province of the committee to enlarge it.

7148. Have the committee entire control over the whole of the funds?—Yes.

7149. There is no trust deed whatever?—None whatever.

7149*a*. We have no endowment fund, the accumulations are from former donations and legacies.

7150. And your endowment fund is from the accumulations of your committee?—Just so, and from legacies.

7151. I understood you to say that you invest all your legacies?—We do.

7152. And when you require extra funds you draw upon your investments?—When there is any deficit we have to sell out. It is a standing rule to show that our legacies have been invested. The amount received must appear in the balance sheet as invested.

7153. (*Dr. Tindal Robertson.*) How is the total amount of your annual income made up?—I have before me the printed balance sheet for 1884, which puts the amount down at 11,600*l.* It is made up in this way:—Annual subscriptions and subscriptions for votes, 1,565*l.*; life subscriptions, 464*l.*; donations, 239*l.*; dividends, 5,000*l.*; rents, 1,700*l.* Then there are collections after sermons in churches and other places of worship; we have two annuities; payments from paying children; a grant from the Science and Art Department; return of property tax, and a few sundry receipts.

7154. So the largest amount of your income is derived from your capital?—Just so.

7155. And the subscribers who have the privilege of voting for the school are very small in number, comparatively, so far as the income is concerned, at any rate?—Yes.

7156. You said that the average cost of each child was about 34*l.*; could you give us any idea of what the average cost would be as between the two systems?—We have not sufficient experience of the new system to enable us to do that.

7157. Can you give the Commission any approximate idea of that?—I cannot.

7158. You have yourself formed no idea of it?—I have not. To carry out the oral system properly we shall require more teachers, because a less number of children must go under every teacher. Instead of putting, perhaps, 20 children under a teacher we may be only able to put 10 or 12.

7159. Do you keep any statistical account of the causes of the deafness of the children that come under your care?—Yes, I have some returns by me now. Since the year 1852 I find that 1,631 children that were born deaf were received into the school; 331 who became deaf from scarlet fever; 92 from teething; 87 from brain disease; 41 from measles; 12 from whooping cough; 126 from various diseases, such as falls, sunstrokes, burns, bronchitis, blows, colds, smallpox, and frights to the mothers before birth.

7160. Have you any experience or information with regard to the question of intermarriage between deaf persons?—No.

7161. Is anything of that kind a bar to election?—It is no bar.

7162. Do you get information upon it in your application forms?—Yes, we do now. I have a return of blood-relation cases since 1875.

7163. What is the result of that return?—There have been 47 children of first cousins; five of the children of second cousins; five the children of deaf and dumb parents; and one child had deaf and dumb grandparents.

7164. As well as deaf and dumb parents?—No, not deaf and dumb parents, but only deaf and dumb grandparents.

7165. (*Mr. St. John Ackers.*) You say that no trades are taught now in your institution; were trades ever taught?—I think so, many years ago.

7166. Can you give us the reason why they were discontinued?—I believe that the committee considered that the time of the children should be devoted to educational work, and that the system of apprenticing them to trades should be adopted. When they were taught trades in the school they were not apprenticed by us.

7167. Have you any special form of apprenticeship?—Yes.

7168. Have you that with you?—I have not.

7169. There is some one, is there not, to look after the apprentices?—Yes.

7170. Do you not find that a very valuable provision?—Very valuable indeed.

7171. You think that they would not do nearly so well unless there were somebody who understood them to look after them from time to time?—It is an incentive to the children to be looked after, and they like it.

7172. Will you explain to the Commission in what way they are looked after?—Yes, the London cases are visited regularly by the apprentice officer; he reports upon the cases monthly, and we have every month some of the apprentices, their masters and mistresses and parents before us.

7173. Do you mean before your committees?—Before the general purposes committee.

7174. So that in fact during the apprenticeship you thoroughly look after the apprentices?—We do, and we keep written reports.

7175. Do you look after them when they have served their apprenticeship?—Not to any great extent; we correspond with them.

7176. You are not aware in fact what the majority of your old pupils are doing at the present time?—Not the majority.

7177. Do many of them become artists?—Very few.

7178. Are those who have been taught under this apprenticeship able to get as good wages afterwards in their trades as ordinary persons?—Yes.

7179. Do you consider that there is any disadvantage in a large school so large as yours?—No.

7180. You are in favour in fact of large boarding schools as against day schools?—Yes.

7181. It has been given in evidence that your committee are against Government inspection; has that anything to do with the fear that if you had Government inspection you might lose your control over the teaching of your children? Take for instance the religious instruction which you are now able to give and other matters; in fact, is it because you wish to keep the control in your own hands that you do not want Government inspection?—Yes.

7182. Have you an application form with you?—I have not.

7183. Will you send an application form to the Secretary of the Commission?—Yes, and I will also send an indenture form.

7184. You have a school now at Margate for sign taught pupils, and you have one at Ramsgate for the oral pupils; you have no school, I think, in London at the present time?—No.

7185. Will you state what it is intended to do with regard to those three places?—We hope to have a small establishment shortly, in London, for the reception of the newly elected children, say for six or twelve months. Then they will be sent to the Margate Asylum.

7186. Are all the new ones to be taught on the sign system then?—No.

7187. But at the Margate Institution they are taught on the sign system, are they not?—At present.

7188. Then it is intended in Margate to have a sign branch?—At Margate we shall undoubtedly have the two systems, the sign system and the oral system.

7189. Kept entirely separate?—As separate as possible. We are now building separate schoolrooms, and making separate provision for the oral children.

7190. Do you think it possible without entire separation to carry on the oral system successfully?—As I am not a practical instructor I cannot express an opinion upon that point.

7191. Is it intended to take all the children to this dame or infants' school first who are going to be taught by signs or orally?—Yes.

7192. Then they will be all mixed up at that time, and there will be no separation of the two classes?—No.

7193. What system do you intend to teach at the dame school?—To the utmost extent possible the oral system.

7194. But you will use some portion of the sign system with all of them?—I think that the head master will endeavour to arrange things so that those who can be taught orally shall be taught orally.

7195. But they will be separated?—As far as possible.

7196. (*Mr. Few.*) I believe that all the children at the Margate Asylum come from the poorest grades of society?—They do.

7197. And may I say that many of them would be classed almost as gutter children?—Yes.

7198. And that many come without a scrap of information to make them useful members of society?—They are totally ignorant.

Mr. W. H. Warwick.

11 Mar. 1886.

7199. Do you find that coming from these surroundings many of them are weak in fibre?—Yes.

7200. And many of them therefore you would not class as healthy children?—No.

7201. No trades I believe are taught at your school; is that because the committee considers that the whole of the children's time is wanted for educational purposes?—Yes.

7202. You have been asked as regards the large extension of the number of children; have you formed any opinion that the number might be too large to be managed by one principal if they were collected in one building? To put it in another way; supposing that the number of children were doubled, do you think that they would get the some personal supervision by one principal as they have now?—No.

7203. So that perhaps two altogether distinct schools with distinct staffs would be preferable to an overcrowded school?—Yes.

7204. Several of the children at your establishment are incapable of receiving oral instruction, are they not?—Yes.

7205. Is it your opinion that many of the poor children that come to your committee would be incapable of receiving oral instruction?—Yes, some.

7206. And that some, speaking generally, would always have to be taught on the sign system?—Certainly.

7207. As regards apprentices, the committee apprentice out those who are capable of deriving benefit from it, and whose parents apply for apprentice fees, do they not?—Yes.

7208. I believe your committee pay as much as 15*l.* for an apprentice fee?—In some instances.

7209. Do you, in those instances, pay the money all at once?—Never.

7210. What course do you adopt?—We pay the premiums in two instalments, the first when the child is bound, and the second at the end of the first 12 months, if everything at that time is perfectly satisfactory to all parties.

7211. How do you ascertain whether it is satisfactory?—First of all as regards London cases by the report of our own officer, the satisfaction of the parents and the master or mistress, and the satisfaction of the child brought before us. In regard to country cases we write to independent persons, such as the clergy, the magistracy, and others of similar standing, for reports upon the cases in hand.

7212. Do you find as a rule that those gentlemen are kind enough to take that trouble?—They are very willing to do it.

7213. As regards the finance; I do not think the evidence was quite clear as to the rents; I see by your cash account that the dividends represent 5,200*l.* per annum, and that the rental, after deducting repairs, rates, and taxes, and so forth, amounts to 1,749*l.*?—Yes.

7214. So that the two together represent 7,000*l.* per annum as a finance figure?—Yes.

7215. How often are your committee re-elected?—Once a year.

7216. By the subscribers?—Yes.

7217. How many are there altogether on the committee?—24.

7218. What is your course with regard to changing any number of them?—Six go out every year. Those who have attended the least number of times in the 12 months.

7219. Are they eligible for re-election after a gap of time?—Two only can come on if the committee think fit to re-elect them.

7220. But the others may be re-elected when a year has elapsed?—Yes.

7221. (*Admiral Sir E. Sotheby.*) Independently of the salary of the masters and teachers which is 1,800*l.*, how much do you consider to be the cost of each child?—About 34*l.*

Mr. W. H. Warwick.

11 Mar. 1886.

7222. But that is including everything, is it not?—Everything; 1,800*l.* is the cost of the educational staff.

7223. Does not that include the master's salary?—Yes.

7224. Is the cost of each child 34*l.* for education and feeding?—For everything, clothing, feeding, education, rents, rates and taxes, salaries, and so on.

7225. Could you give the cost of each child exclusive of the salaries?—It would take a little time to work that out.

7226. When the children are taught cooking and other domestic duties, is their education stopped?—No, they are on a rota to leave school at certain hours in the week to go in for domestic duties.

7227. Those are the elder children, I suppose?—Quite so.

7228. Have you a gymnasium or recreation ground?—We have large playgrounds, with a giant's stride, and the usual appliances.

7229. Are the children obliged to make use of those appliances, or is it voluntary?—It is quite voluntary to use the gymnasium and so forth.

7230. You have no swimming baths?—No.

7231. I suppose they bathe in the sea?—No, we purposely keep them out of the sea, being deaf and dumb. They would not be able to make themselves heard, or perhaps to arrest anybody's attention if any of them were seized with cramp and so forth.

7232. But with boats attending they might be taught swimming, which is a great advantage in these days?—We have never ventured to put our deaf and dumb children into the open water.

7233. They are never taught to swim?—No, not in the sea.

7234. I do not think you said what was the course of religious instruction?—The Scriptures and the Prayer Book.

7235. Then it is the Church of England?—Yes, entirely.

7236. Is the service and the education entirely performed on the manual system?—At Margate it is at present.

7237. You do not know how it is proposed to alter it?—We do propose to alter it very considerably.

7238. And the committee appreciate the oral system?—The committee appreciate it very much, and it will be applied to every child capable of being taught it.

7239. I suppose you have trustees?—We are incorporated; we are an incorporation.

7240. When you want to draw money out, who gives the sanction?—The committee have that power. We have no personal trustees. We are incorporated by Act of Parliament.

7241. How many of the managing committee of 24 are able to give an order to sell out any money?—The full quorum.

7242. How many is the quorum?—In a general committee five, but there are generally 12 or 15 present at every board. We have large attendances.

7243. Are they all gentlemen?—They are.

7244. Have you any difficulty in obtaining gentlemen to serve upon the committee?—Not at all.

7245. Do those who have left come on again after a certain time?—Sometimes.

7246. Can you give any reason why the committee are so strong against Government inspection?—My committee are, as a matter of course, subscribers to the institution, and they are very willing to conduct the institution on the same lines as they have hitherto done with great success, and without interference.

7247. Are you not, as secretary, aware that many large institutions, especially schools, have improved very much when they have adopted Government inspection, whereas before they were under their own private direction?—I have not had much experience of public schools except my own, and that was Christ's Hospital.

7248. When I said public schools I did not mean any schools like Christ's Hospital; but I mean schools for the education of poor people?—No, I have had no experence of them.

7249. (*Chairman*), Was your institution the first to commence the combined system of oral and sign teaching?—I think we were the first to commence it.

7250. Was the orgin of your school in the last century the fact that Mr. Braidwood founded a small school at Hackney?—The first school for the deaf and dumb was founded in Bermondsey.

7251. You said that yours was the oldest institution, did you not?—It is.

7252. Was yours founded upon the one in Bermondsey?—That is our institution; we were first at Bermondsey, and then we moved into the Old Kent Road.

7253. But was not there a man of the name of Thomas Braidwood who established a small school at Hackney in the year 1760?—I have heard of a small private school in Hackney.

The witness withdrew.

Mr. William Van Praagh examined.

Mr. W. Van Praagh.

7254. (*Chairman.*) You are Director of the Training College for Teachers, and of the School of the Association for the Oral Instruction of the Deaf and Dumb in Fitzroy Square, are you not?—Yes.

7255. For how long have you been in that position?—Since the foundation of the association, which is an outcome of my earlier work in London where I introduced the oral system in the year 1867.

7256. At that time what were you?—I was Director of the Jews' Deaf and Dumb Home, which was founded by the late Baroness Mayer de Rothschild. In 1870, after having introduced the system there, I joined the late Baroness and her friends, who founded the Association for the Oral Instruction of the Deaf and Dumb with the aim of naturalising or diffusing the oral system throughout the United Kingdom, to open a training college for teachers, male and female, and to have a school for deaf children of all ranks and creeds.

7257. Has your attention been directed exclusively to the teaching of the oral system?—Yes; I am unacquainted with the manual or finger alphabet. I came to England in 1867 with the sole purpose of introducing the pure oral system.

7258. May I ask what had been your previous position upon the continent?—I was at the Rotterdam Institution for the Deaf and Dumb, where I received my early training under Mr. D. Hirsch.

7259. Can you tell us when the oral system was first introduced upon the continent?—The oral system on the continent dates from the time of Heinicke, the contemporary of the Abbé de l'Épée. De l'Épée introduced his system in France when Heinicke opened a small school near Leipsic. Of course there had been individual efforts before the time of Heinicke, and before De l'Epée. We read of many priests in Spain who have taught deaf children to speak, Pedro de Ponce for example. but I am only speaking about the establishment of schools for the instruction of the masses of the people, and not of individual cases. We may say that De l'Épée founded the French system in France, while Heinicke did the same in Germany for the German system; and if it had not been that Heinicke kept his work so secret, whereas De l'Épée made his generally known, I think the oral system instead of only now getting to be the national system of every country of Europe, would then have become the universal system; but De l'Épée made his system so well known, so that the French system, that of manual signs, *dactylologie* as it has been called, got ahead of the German system, which afterwards became better known and has now been adopted, I may say, throughout every country in Europe. Even in France, the native land of the French system, all schools have adopted the pure oral system; and I shall be able to show you, as I have the documents here with me, that the Government of France has given every support and encouragement to the adoption of the oral system, which is now really the national system of France, much to the credit of the French teachers who have done this work in a very short space of time.

7260. Has the sign system been absolutely supplanted in France by the oral system?—It has been entirely supplanted in France; I have a report from the general inspector of the schools in France which proves that.

7261. Are all the schools in France state-aided and state-directed, or are they dependent on private enterprise as they are in England?—I am not prepared to give full evidence as regards France; but from the reports and the various papers that I receive, I think that France is exactly the same as every continental country. All schools for the deaf receive state aid; but they do not depend entirely upon it; they receive contributions from various other bodies; from local authorities, and do not exclude private charity. I may tell you that all schools for the deaf and dumb on the continent, particularly in Holland and Belgium, have always been established first by private benevolence. When the Government sees that a school is being carried on well, it steps in and gives as much aid and assistance as is required. For example, at the Rotterdam school, which I just quoted, they have a grant from the Government, a grant from the province, a grant from the local authorities, and further grants from communities from whom they receive children, and voluntary contributions.

7262. With your experience of the deaf and dumb in London, do you think that in order to cover the whole ground of the education of the deaf and dumb in London, it is necessary that either through the school boards or through various institutions they should receive some assistance, from the Education Department or in some other way, either for maintenance or for education?—I have watched the instruction of the deaf and dumb in our country (I mean the United Kingdom for the last 20 years), and I have found that our greatest struggle as teachers of the deaf, is caused by the want of state aid, and the sole dependence upon private benevolence. The greatest thing that is required for the proper furtherance of this work is state aid. How that is to be obtained, or ought to be obtained, I do not suppose it is my province to speak about. I do not think that the powers of the school board would be sufficient to enable them to grant enough money to cover the whole expense. Perhaps you will allow me to point out to you that the education of the deaf does not simply mean instruction; it means maintenance. Now I do not think that the school boards have the power to provide for the maintenance of the children. In my own institution the amount charged for the instruction of a deaf child is really within the means of every respectable man; but it is not only a question of education, it is a question of board and residence. Deaf children are spread about the country in small villages here and there, and everywhere, and how are we to pay for the board and residence of those children? I must confess that we have the utmost need of state aid for our work, not only for the children, but also for the teachers. If you consult the head masters of the various schools throughout the country, as I have had occasion to do, you will find that the general complaint is that it is impossible to get an efficient staff. If you will look over my list of the ladies and gentlemen whom I have trained, you will find that of those 45 teachers only three or four are men, simply because we cannot hold out any promise for the future. Men find that the profession really does not pay; consequently, they do not join. The result is that the big schools throughout the United Kingdom have no competent staff, I do not speak of principals, I speak of assistants. The great result obtained in the continental schools is really due to the amount that they pay the assistants. In some schools in Germany and Holland, in Cologne and in Rotterdam for example, I know men who have been assistant teachers for 30 years; they are married men, and hold good social positions. A permanent efficient staff is what we require for our schools; and unless we have state aid to enable us to give a sufficient amount of salary to our teachers, we shall never obtain it; and therefore the results will be unsatisfactory.

7263. Are the salaries which assistant teachers get in all deaf and dumb institutions much less than the ordinary salaries received by the schoolmasters under the Education Acts?—I am not prepared to answer that question in the affirmative, because I do not know; but I would like to point out that a teacher of the deaf ought to be paid better than an ordinary elementary teacher, simply for this reason; we must in the first instance have the services of men who as yet have not the love for the work which men have who are at the work. It is a very fascinating work, and when once one becomes a teacher of the deaf it is very difficult to give it up; but one cannot get people to love a thing they do not know; and the first bait I might almost say to get men to join our work is a superior salary, a better salary than is given to an elementary teacher. Otherwise they will naturally do the easier work, which does not require the training, or the devotion, or the knowledge that the teaching of deaf children demands.

Mr. W. Van Praagh.

11 Mar. 1886.

7264. You think that the advantages of the oral system are not only that it enables a deaf and dumb person to converse with every one whom he meets, but that it enables him to earn his livelihood better, and also developes the intelligence of the deaf?—Exactly. My opinion is that a deaf boy who has learnt to speak and who can understand the spoken words of his fellow creatures, who can go into an ordinary workshop and mix with his fellow workmen, and express his ideas in spoken language is far superior to one who is doomed to eternal silence, who is obliged to write, and who finds it very difficult indeed to make his ideas known. I have even found that children of inferior intelligence do better with the little spoken language they possess than those who speak on their fingers.

7265. But do you think that there is a residuum among the deaf and dumb who cannot learn the oral language, but who must have recourse to signs?—No.

7266. I mean children of more or less defective intelligence?—The only children who really cannot receive instruction on the oral system cannot receive instruction on the French system. I refer to cases of semi-idiotcy. Of course this is a class of children (as you will find out afterwards when you deal with the question of idiots) for whom we have no provision at all in England. I have daily brought under my notice children of all classes. The semi-idiots children are referred to schools for idiots, although they really are not idiots; they are simply what the French call *enfants arrières*, backward children. We have that very same class, and I am sorry to say in a large proportion, amongst the deaf. I have known those backward deaf children to do much better on the oral system than on the French system. Therefore, I would say, most unhesitatingly, that every deaf child can be taught on the pure oral system.

7267. Do you think that even an idiot child can be taught by that system?—In the case of an idiotic child we may do a great deal to promote his intelligence; but I cannot say that an idiotic deaf child can be taught to speak, because the causes which produce dumbness in an idiot are far different from those which produce dumbness in a deaf mute. A deaf child cannot speak because he has not heard a sound; an idiotic child fails in memory; and he cannot reproduce sounds simply because he does not retain them. Therefore you could not put the two children on an equality. As a rule deaf children are intelligent, and I find that in cases of congenital deafness, those born deaf are, as a rule, much brighter, and have more intelligence than children who suffer from acquired deafness. The causes of acquired deafness very often produce effects on the mental faculties; and it is not unusual that a child who has become deaf through a fall, or through a fever, gives much more trouble, and does not attain the same proficiency as the child suffering from congenital deafness.

7268. At what age should you say that a deaf and dumb child should be taught like other children?—A deaf and dumb child should be sent to school when he is six years old.

7269. I suppose you find that there is unwillingness on the part of parents to send their children to school if they are at all defective as the deaf and dumb are?—Some parents when there is a small amount of hearing are very reluctant to send their children to a school for the deaf. The leading aural surgeons, with whom I have had a great deal to do, Sir William Dalby, for example, whom you examined last week, say, the moment there is deafness, "Send the child to a school for the deaf." But unfortunately some doctors promise the parents that the hearing will come back. I have a girl of 16 years of age under treatment now who hears a little; but I am sure that the doctor who examined her when she was young must have known that she would never get her hearing sufficiently for the purposes of ordinary conversation. Then we have to deal with cases of neglected education. The parents themselves, when they are upheld in their opinion by medical men and friends, that their children will get their hearing back, do as a rule object to their children being sent to the school. That is one of the drawbacks that teachers of

Mr. W. Van Praagh.

11 Mar. 1886.

the deaf have to put up with. Even while the children are at school if the parents hear of any man who gives hearing back by electricity, or by any other means, they will take their children away just to try; but I always tell my friends and the doctors whom I know, that so long as they do not interfere with the children's education, and so long as the parents send the children to school they can do anything they like.

7270. How long do you think the oral system ought to take to be taught effectually?—I think that a deaf child ought to have at least the same advantages as a hearing child, that is to say, it ought to have about eight years' instruction. I have fixed the course of instruction at eight years.

7271. And you think that that ought to be reckoned from the time when they begin their instruction, that is to say, supposing they begin at the age of 10 they ought to go on till they are 18, and if they begin at six they ought to go on till they are 14?—They ought to be sent to school when they are six; but we have very often to use our discretion, and treat cases on their own merits. If a child is sent to school at the age of 10, and has received no previous instruction whatever, and that child belongs to parents who are very poor, it is impossible to keep him until it is 18; then we have only four years, and we must do the best we can. A deaf and dumb teacher must have sufficient tact and knowledge to treat his children individually.

7272. Do you attach great importance to a child being taken away from its home and boarded in an institution in order to train it successfully?—Yes. If a child can stay at home with its parents or friends it is the best thing that could happen; but if that is impossible, the deaf and dumb being spread all over the country, as I have already said, the best thing (and I can assure you that it answers very well, because I have practical experience) is to board the children out with families corresponding with their own station in life.

7273. In the provinces, where it is difficult to get a school in a district for a limited number of poor children, you would take them to some centre, and have a day school, and board them out among people of their own class?—Yes, if we could adopt a plan for the establishment of large schools, and divide our various districts, and make schools of 50, not exceeding 100 pupils, and take all the children from the district if they do not live in the place where the school is, and board them out in private families, that would be the best arrangement. In the country that would answer much better than in London, because it would be much cheaper. I find that I can get exceedingly good homes for children at 9*s.* a week; that is to say, putting a carpenter's boy with a carpenter, and a bricklayer's boy with a bricklayer, and so on; and I think that amount might be still further reduced in the country. But there is a qualification that I should wish to make. The houses to which the children are sent, and the persons who take charge of the children must be under special control; they must not be able to do what they like with these pupils. For example, you will find that in the rules that I have laid down in our printed prospectus of the school, we allow two children to be in one house, the children to be of the same sex, two boys in one home and two girls in another; the people to give references as regards respectability before they take children. Of course we place a child confessing a certain religion, with people confessing the same religion; they are bound to take the children on Sunday to places of worship, and they must agree to allow any qualified teachers to visit them whenever they like. I find that that answers extremely well; in fact I may tell you that I have more families who are anxious to take pupils than pupils. I do not say that we always pay 9*s.* a week; of course we pay more, sometimes we pay 15*s.*, 16*s.*, 18*s.* according to the class of pupils, and sometimes more than that.

7274. And you find that the people with whom the children board with take pains to try and speak to them in the way that they are taught, that is to say, by the oral system rather than make signs to them?—Comparing the parents themselves with the people who board the children, I assure you that there is no difference. I find that the people who board the children take great care of them. I have never had occasion yet to remove a child on account of want of kindness on the part of the people who took care of it.

7275. With regard to apprenticeship, which at present, of course, is only done by private benevolence, do you consider that it ought to be extensively carried out?—Yes. Some institutions allow the parents a certain amount of money for premium. I think that the question of apprenticeship is one of the most important questions for a deaf child, because if a deaf boy is not apprenticed to a trade which is permanent, that is, for which there is always demand, that boy becomes eventually a beggar, and is a burden on society. Therefore, to apprentice boys to very good trades, is one of the greatest necessities.

7276. That involves his being apprenticed at a comparatively early age, at the age of the 14 or 15, does it not?—I have adopted the following plan. In the later years of a boy at the institution, when he gets 14 or 15 years old, I very often try to apprentice him, and allow him to attend school from half-past 9 to half-past 12 in the morning.

7277. In fact to work half time?—Yes, and then you can apprentice him from the age of 14 or 15 until he is 21.

7278. Do you find that they are good workmen, and that they give satisfaction after they have gone through their apprenticeship?—My experience has chiefly been of young gentlemen belonging to the middle and higher classes of society, and I find that they are doing extremely well. I can state the same of those who have belonged to more humble classes of society who have come under my notice.

7279. Your college is solely for the training of teachers; it has no young men under tuition, has it?—Yes.

7280. You have two different institutions combined in one?—The Association for the Oral Instruction of the Deaf and Dumb has its headquarters in Fitzroy Square, where we have a large day school for deaf children, and our training college for teachers. The students who receive instruction in the theory and practice of the work are present both morning and afternoon to watch the instruction of the deaf children. We have at the present moment under tuition 13 students.

7281. Are those under qualified teachers?—Yes.

7282. What number have you in your school in addition to those whom you train as teachers?—We have six qualified teachers at the present moment.

7283. What number of children have you under instruction?—We have at the present moment in actual attendance 59 children, 22 girls and 37 boys.

7284. And you have six teachers for that number?—Yes.

7285. Then besides that number you have these students?—Yes, the 13 students. Perhaps you will permit me to explain to you that the students are not allowed to work at all with the children until they know how to do it. We have students who come to us for 12 months' or 18 months' training. I make it a rule that for the first six months the student is simply to look on and do nothing. For the next six months she or he is allowed to work under the supervision of a qualified teacher, or of myself.

7286. Then you have, to train those 58 children, six teachers and a certain proportion of your students; that amounts to one teacher for every four or five children, does it not?—No, I do not depend upon the students at all.

7287. But you have one teacher to about every 10 children, have you not?—Yes, which I think is the maximum for teachers in schools on the pure oral system.

7288. That necessarily must make the teaching of the deaf and dumb expensive?—I agree that the instruction of the deaf is necessarily much more expensive, and therefore I think that we ought to have state aid.

7289. What do you consider, independently of the maintenance of a deaf and dumb child, the state ought to pay for the education of a deaf and dumb child?—Simply for education I think a capitation fee of about 10*l.* would be sufficient.

7290. The Manchester School Board have carried a resolution "That the Education Department might "with propriety make grants to institutions for the "education of the deaf and dumb and the blind for such "children as, apart from their infirmities, would be "required by law to attend public elementary schools, "and that such grants might be made either towards "maintenance, as in the case of certified industrial "schools, or upon examination in the public elementary "schools"; do you think that would be a step in the right direction?—I do not know whether the Education Department would be empowered to grant a sufficient amount of money for every individual case as it has to cover maintenance.

Mr. W. Van Praagh

11 Mar. 1886.

7291. That is what they recommend should be granted. They quote the precedent of the certified industrial schools where children are boarded as well as educated?—It is a very difficult question to speak here about certified industrial schools. We are obliged to be very careful that we do not class deaf children as paupers. The parents are very sensitive on the subject. A man may be a middle class man with an income of 200*l.* a year, and still may not be able to spend 40*l.* on his deaf and dumb child; but that man would not call himself a pauper, and would perhaps be reluctant to apply to any boards of that description. I, myself, have given that question a great deal of careful attention; and I really think that we ought, if we wish to deal with the whole question thoroughly, to have special legislation upon the subject, and special grants for the education of the deaf to cover, in cases where it is required, instruction and maintenance.

7292. You say that the education costs about 10*l.* per child, and that the maintenance ought to cost about 9*s.* per week; do you think that a sum of that kind would be sufficient?—That would be sufficient. I think that taking it in a round sum we might say that a deaf and dumb child would cost the country, if board were included, perhaps 30*l.* a year, if all the expenses are to be covered, education, board and residence.

7293. (*Mr. St. John Ackers.*) Do you include clothing?—I have not included clothing simply because the parents might be made to contribute something towards the maintenance of the children.

7294. (*Chairman.*) You think that if the State contributed 30*l.* a year towards board and education, private means should supply the rest?—Yes, allowing about three months holiday in the year, the expenses for board at 9*s.* per week would amount to about 21*l.* a year; and the cost of education would bring it up to about 30*l.* This would simply apply to children who are to be sent to various centres in the country, and who are perfectly destitute, who want everything paid for them. But you will find that a good many parents are able to pay something towards the education of their children.

7295. That sum would be only in extreme cases; in the large majority of cases the parents would be able to find a considerable portion of the cost of the maintenance of the children?—I think that every parent who applies to any of the schools should be asked how much he can afford to pay towards the cost of instruction or maintenance of his children, and any deficit ought to be made up by the Government. In the case of the school over which I preside, whenever we receive an application we simply ask the parents; "How much "can you afford to pay for your child's tuition"? And I must say that I have always found that the people give a very true statement. Then the case is considered by the committee, and if we find that the statements of the applicants are true we admit them at their own fee.

7296. How are children admitted to your institution; is it by voting papers?—No, everybody is admitted who comes, subject to their agreement to obey the rules and regulations of our school, and to their possessing the necessary qualifications as regards respectability, and so on.

7297. Are you obliged to send away many from inability to take them in?—Yes, but since the classes under the School Board of London for deaf and dumb children have adopted the oral system, I make it a rule to send every poor child that applies to me to one of the classes presided over by Mr. Stainer; or in cases where parents want an asylum for their children I refer them to Mr. Elliott of the Old Kent Road. We do not admit any children free; every pupil has to pay; we have no free case whatever, but we charge a minimum amount. The minimum amount that we charge now for education to cover all expenses, books, stationery, &c., is 10*l.* per annum.

7298. What funds have you to supplement the payments made by the parents of the children?—We have our students' fees; I have sent you a printed paper containing the rules of our college.

7299. I was asking you about what funds you had to supplement what you receive from the parents of the children, and you state that you have the fees for the students?—Yes.

7300. Is that the whole?—That is all that we can depend upon in the way of fees. Our school and college fees amounted last year to 712*l.* 17*s.* 6*d.*, and our expenses exceeded 1,700*l.* For the balance we have to rely upon the goodwill and charity of our friends, which of course gives one a very precarious and unpleasant existence. That is the reason why I more and more wish that the day would come when we should have to look forward to the Government to aid us in this matter.

7301. The fee which you charge the students is 50*l.*, I see; does that cover board?—No; we charge our students 50*l.* for a course of 12 months, and 30*l.* for a course of 18 months; but, I am sorry to tell you, that again, as in the case of the pupils in the school, we very seldom get that fee. We receive the applications, and if the students are not able to afford to pay the fee rather than not train them as teachers we take what they can afford to pay. As a rule, I encourage the 18 months course for 30*l.* Your Lordship will notice that we charge less for 18 months than we do for 12 months. I may be allowed to explain that in the first instance I encourage a training of 18 months in preference to 12 months. Secondly, if I train a lady or gentleman for 12 months, we ourselves in the school get no benefit whatever from her or him; but if I train them for 18 months, I get the advantage of six month's work, for which I make due allowance.

7302. Then you conduct examinations twice a year, do you not?—At Midsummer and at Christmas. At your request I have sent the syllabus of the last examinations.

7303. And you examined those who have been trained elsewhere on payment of a fee of three guineas, do you not?—Yes; I have never had occasion to do so yet; I have had no applicants; but we would do so with pleasure if anybody applied, and you will notice that in 1881 we made it a rule to train any teachers sent to us by any other public institution free of charge. Of course our association saw that our work, and the work of other schools following in our footsteps, was getting on very favourably, and therefore we said: "Every institution "that is willing to adopt the pure oral system shall "have their students trained free of charge," and some of the institutions have availed themselves of that advantage.

7304. In fact the principle upon which you have worked has been, as far as possible, to develop the oral teaching of the deaf and dumb?—Exactly.

7305. Irrespective of any pecuniary gain?—Irrespective of any pecuniary gain; and to give every assistance to anybody who likes to adopt the system, both institutions and individuals, by training teachers free, and also by distributing broad-cast pamphlets and various information upon the subject.

7306. I see that you examined the students in the physiology of the deaf, and so-called dumb, the physiology of all the organs of hearing and speech?—Yes.

7307. Are those examined by professional surgeons or by trained persons?—Our examination is divided into three parts; oral, practical, and written. The oral examination is very often carried on by myself in the presence of my committee and the secretary of the college. The only examination that is always the same is the practical examination. Students before they leave the college have to show a capability of teaching classes of children in various stages of tuition. If they fail in this, however clever they may be in theory, they do not receive our certificate. In the written examination there are written questions which are looked over by independent examiners.

7308. But with regard to the examination in physiology, is it of a popular nature, or is it of a scientific nature conducted by surgeons?—No; the instruction in physiology is given by myself as principal of the college; it does not extend beyond Dr. Carpenter's Human Physiology.

7309. Is there any difficulty in obtaining employment for the deaf and dumb after they have left your school, and in apprenticing them, for instance?—I have experienced no difficulty, because the majority of the children who have been apprenticed by myself have been children of well-to-do parents. It is a question of premium; it is not difficult to get masters. If you have the money one is always able to find masters willing to take boys.

7310. We have heard of a variety of trades which the deaf and dumb applied themselves to; many of them seem to be connected with a knowledge and a love of drawing;

Mr. W. Van Praagh.

11 Mar. 1886.

have you found that in your experience?—Yes, it is natural, we find it throughout the world. I might almost say, that they in preference choose lithography and wood carving; and in fact I go so far as to encourage the love for drawing by having, as I had this morning, an examination carried on in drawing by one of the inspectors of South Kensington. I would make two suggestions to every deaf and dumb school, that drawing should be taught to the boys, and needlework to the girls.

7311. Compulsorily?—Compulsorily.

7312. Do you get any grant from the Science and Art Department?—The payment of our pupils exceeds ninepence per week, and therefore we cannot claim any money reward, but those who are examined and pass receive prizes.

7313. You do not receive in your institution any children who are sent to you by the guardians?—We have never had any applications. Of course if they were to pay the minimum fee, we should take the children, if the guardians looked after their board and residence.

7314. But I suppose they would not be willing to pay the fee?—I do not think so. I have had applications for advice, and I have simply referred them to the nearest deaf and dumb institution in their district.

7315. You take children irrespective of any religious creed, do you not?—Yes, that is one of our cardinal principles.

7316. Do you give them any definite religious instruction?—We do not give any dogmatical instruction.

7317. Do you read the Bible?—No, but you will allow me to explain that I told you just now that we take care that every deaf child is boarded out in a family professing the religion to which he himself belongs. We admit pupils and students of all creeds, but we take care that they have a very good religious training at home. We have in connection with the association, I must say that it was established by the free will of one of our lady teachers, a Sunday class for deaf children, which is carried on in exactly the same way as a Sunday class for hearing children; and what will interest you to hear is that this lady is assisted in her good work by lady friends of hers who are not teachers of the deaf, non-professional helpers.

7318. And they are able to make themselves understood by the children?—Perfectly. I need not tell your Lordship that the instruction in the school has a good moral tendency. Without receiving dogmatical instruction in religion, they receive a good sound moral education; and I have always found that when the parents are inclined to do so the children can be trained by their own clergyman at home, or in ordinary classes with the same ease as hearing children. In fact, I could refer you to gentlemen who have prepared some of our pupils for confirmation, and who have told me that they really did as well as their hearing candidates.

7319. Did you say that you boarded any children as well in your institution?—No. We board them out in private families. We go entirely on the day school system, because I am convinced that a deaf child should not be taken away from its own home, and sent to a large asylum.

7320. Then of course the religious difficulty to a certain extent is met by the boarding out system?—Yes, though I do not see how it would be affected the other way.

7321. There might be a prejudice against children being taken in and boarded without receiving any religious education at all?—I will not quote my own school now, but I will give you my experience of schools that I have seen abroad. I know a very big asylum in Groningen where Protestants, Catholics, and Jews are all mixed together; they simply come together at certain times of the day to receive religious instruction by their various pastors, and therefore really the religious question does not interfere with the work there at all. That is in Holland; I have seen the same thing carried on in Germany. You will find generally in looking over the Reports of various schools abroad, "The Rev. So-and-so for Protestants, the Rev. Father So-and-so for Roman Catholics, Mr. So-and-so for Jews, and Mr. So-and-so for some other religious body." They have those classes for religious instruction after school hours. The question of religion I see now still very often thrown up as an objection to the pure oral system. Only very recently I saw a remark made in one of our papers on the subject. Will you allow me to tell you that the pure oral system is better fitted for children to receive religious instruction than the system of signs. Of course we oralists are always met with this question: "Can your children go to church and read the sermon of the teacher?" My answer is decidedly, "No." I have known exceptional cases where deaf and dumb pupils could follow lectures, but I should be very sorry indeed to put down as the average ability of one whole class, what one individual can do. All our boys at school do not become senior wranglers. Sometimes some deaf boys can follow a lecture; but I say that you ought to give the same advantages to deaf children trained on the pure oral system as you give to those who are taught by signs, that is to say, let them have their special mission rooms and their special churches and meeting rooms; and if you put into one of those rooms 50 deaf mutes, taught on the pure oral system, all of average ability, with a man in front of them who opens his mouth when he speaks, and uses language within their reach, they would fully understand him. Nay more, I maintain that the pure oral system is far better fitted to reach every deaf child's mind as regards religion. The religious difficulty is always brought up against us, but it is a fallacy; it does not exist.

7322. Are there any congregations of the deaf and dumb under the oral system in London outside the institutions?—No, not beyond the Sunday class which I have quoted to you just now. I must not say that it is in connexion with us, because that would be rather against the rules of our association; the said class is carried on by one of my qualified teachers, Miss Marshall. I do not know of any congregations specially for deaf children, but I do hope that eventually we shall have Sunday classes throughout London and the provinces for deaf children, where non-professional people can go and explain the Bible and give instruction the same as they give to hearing children.

7323. Is there a great difficulty in a person who has not been taught to speak to deaf mutes on the oral system making himself understood?—None, whatever. There are some people who unfortunately do not open their mouths when they speak. You see as I get a little older my whiskers are not so prominent as they used to be 10 years ago; but I have always had a good deal of hair on my face, and I assure you that my pupils never have the slightest difficulty in understanding me. The secret is simply to articulate as I am doing now, not slowly, but deliberately, and to open the teeth. This is the most practical illustration that I can give you. There is no difficulty whatever. Of course when persons speak to a deaf child they must not make it as difficult as they possibly can, as I have seen some do. I have seen people stand in the corner of a room and turn their faces deliberately to the wall, and say, "How do you do?" Of course, the child not being able to see the face cannot read the mouth. Gesticulation ought to be avoided. I always find that the people who speak to deaf children are much more nervous than the deaf children themselves, and think that they ought to gesticulate; and that very gesticulation prevents the child from knowing what you say, because a child, if it is well taught, knows the normal position of the mouth and not the abnormal one. If there is the slightest difficulty, I have simply to say to the person, "Will you kindly open your mouth and "speak a little slower?" The sentence ought not to be pronounced word by word, because the context of the sentence assists the child in understanding the meaning of the whole. Some people think that when they speak to a deaf child they ought to say it word by word, and to make a full stop between every two words, for example, "Have . . . you . . . "seen . . . me . . . before?" It is two to one that a child who can think well does not understand that sentence; but if you say, "Have you seen me before?" The context of the sentence teaches the child the meaning of the sentence.

7324. Is there any other point which you wish to bring before the Commission?—I think I have mentioned the necessity for a higher standard of pay for teachers, both principals and assistants, and I think I have also mentioned a plan for the establishment of schools throughout the United Kingdom. Of course I am not wishing to interfere with existing establishments; but if the question were asked me; "How would you "provide for the efficient instruction of every deaf child "throughout the United Kingdom?" I would simply say that I would divide the whole country into sections,

collect statistics, and wherever I could bring 50 or 60 deaf children together I would open a school. I know there are some friends of ours, pure oralists, who profess that smaller schools ought to produce better results. I do not think so, and for this reason, Firstly, we must not increase the expense more than we can possibly help; secondly, the classification of deaf children is one of the greatest difficulties of a teacher of the deaf. If you get nine deaf children you sometimes get three classes; and therefore if you had 50 or 60 pupils you might classify them so as to get eight children, say, in one class. Then after having divided our country into sections and established schools, say at our chief towns in every county, I would make enquiries with regard to the position of the pupils and allow the well-to-do parents to pay for their children's education, and provide for the instruction and maintenance of the children of the poor in the neighbouring villages as I have explained to you before. The school that I have in my mind is of course the day school that I am carrying on at the present moment, our practising school belonging to our training college; and if you will recollect the various documents I have shown you you will find everything ready prepared for every occasion. If we had a set of schools like this throughout the United Kingdom, I think it would not be very long before our country would be on an equality with the continent. Secondly, we must of course have a high standard of pay for teachers, both principals and assistants, as naturally only a competent and permanent staff can ensure good results for our work. As regards the special support of training colleges, perhaps I ought not to mention them as I am personally interested in the matter; but I also think that training colleges ought to have special grants to enable the poorer students who are not able to pay for their training to join our ranks.

7325. (*Admiral Sir E. Sotheby.*) Have you any ladies or gentlemen in the upper classes who have had instruction in foreign languages?—Unfortunately the children do not stay with us sufficiently long, but I have some young men belonging to wealthy families who have been under my private tuition who have had instruction in languages.

7326. And they have been proficient in foreign languages?—Yes, it is perfectly immaterial if once a deaf mute can speak English, and has a knowledge of language, what language you teach him. We are so fond of only mentioning the word "speaking." Our work is divided into articulation and lip-reading, and then comes the great point, "knowledge of language." The French system used to have articulation in its curriculum, but we teach our children language in a different way from the French or manual system, and our children acquire language in a more natural way. You will not find so many deaf-mutisms in a letter written by a child educated on the pure oral system as you will in a letter written by one taught on the French system. When once a boy has acquired a good knowledge of language, you can teach him French or German, or any other language you like by the same process adopted for hearing children.

7327. Why ought the children not to be taken from their homes, because we have several institutions or asylums in this country where the children are entirely boarded?—I am perfectly aware of that; in fact I may say that I know them all. I do not say anything against those beautiful asylums and institutions, and I have a very great admiration for the benevolence and philanthrophy of our fellow countrymen who support them; but there are two or three points which I should like to mention. In the first instance you take the child of a very poor man, and you put that child in a house where he has the very best attention that any one might desire for his own child. You bring that child up under false pretences. You move him away afterwards from a home where he has had comparative luxury to his own home, and he becomes a discontented man.

7328. But that tells in all institutions, does it not?—Where a child is boarded out it sees life in the same phases as at his own home, and does not get discontented. Then one has more power to watch over the moral condition of pupils in day schools, than one has in very large asylums. I always admire, and I must say pity my colleagues, who have to preside over these very big asylums, because the surveillance that is required there is enormous.

7329. But surely they talk more in an asylum than when they are boarded out, and they come to a day school in the daytime?—I think not. Why should they? In an asylum they have their school hours the same as in a school. The difference is that after the school hours in an asylum are over the children go into the playground, or have lessons. Our children go home, and are taken out by the ladies and gentlemen, or by the men and women with whom they reside, and see all phases of social life. They have much more advantage and mix more with society than the children in an asylum.

Mr. W. Van Praagh.

11 Mar. 1886.

7330. You think that they ought to have recreation grounds and gymnasiums the same as hearing people?—Certainly, I think that our deaf children require very good physical education, and we give them as much gymnastics and drill as possible because naturally it will develop their bodies. Sir William Dalby I daresay has mentioned this; our deaf children who, by the mere result of speaking enjoy better health, as that exercises their vocal organs, have still a better appearance and enjoy better health if you give them gymnastics.

7331. Have you any knowledge of deaf and dumb children being able to swim like hearing people?—Yes. A deaf boy is really, physically, exactly like a hearing boy.

7332. There is no reason why the deaf and dumb should not be taught to swim the same as hearing people?—They can be taught just the same, and are excellent sportsmen, but a deaf man, I think, ought not to take horse exercise, because he necessarily could not hear a crying out from behind. I have had deaf friends, in fact I have them now, who hunt and enjoy themselves in every sport that man can indulge in. A deaf man is exactly like a hearing man, with the difference of the want of hearing.

7333. Have you supplied any institutions with the pupils that you have brought up at your college?—Yes, we have established only a few weeks ago a school board class at Dundee. I had this morning a letter from the lady whom we sent there; and according to the opinion of the press and the school board officials she is doing most excellent work there. We have trained the pupil teachers of the London School Board, at least the majority of them; we share that work with our colleagues at Ealing. We have trained a sister for the Smyllum Orphanage. Two of our students are at the London Asylum; though not fully trained by us they get on very well. A gentleman who has a school at Worcester, Cape Colony, has been with us to acquire a knowledge of teaching; he did not pay anything. We have had sisters from Boston Spa, and any amount of private governesses for private families. Some families object to have their children sent to institutions, and they can have a governess from our college, or they can have their own governess trained.

7334. Do you know what amount of salaries those governesses earn?—Yes, they generally consult me as to how much they ought to take. It depends a great deal upon the liberality of the people. Some of our governesses in private families have 80*l.* a year, some of them 90*l.*, and some of them 100*l.*, and everything found, whereas the governesses under the school board start, when fully certified, at 70*l.*, increasing to 90*l.* The association does not pay the teachers as much as I could wish, simply because it has not it.

7335. (*Mr. Few.*) I gather from your evidence that you would be against a large school being built, and deaf children being collected there as at an ordinary large school, or a public school, such as Wellington College, or Marlborough College, for the lower class of children; but that you would keep them in their own surroundings, and so to speak farm them out with people of their own station of life?—Exactly.

7336. Do you think that that is quite fair to a child if he has an opportunity of being lifted out of what may be very unpleasant surroundings, and put into a better sphere of work in a higher line of life?—I do not see that, to use your expression, farming him out would interfere with that plan of taking him away to a different sphere, because you would not necessarily put him in a home where he was not comfortable, or did not see a good moral life. Of course, we understand that the homes which these children are sent to ought to be thoroughly trustworthy.

7337. I assume that; but a child's parents may be extremely poor, and extremely ignorant, and may live in bad surroundings, because they really cannot help it?—No doubt.

Mr. W. Van Praagh.

11 Mar. 1886.

7338. Would not such children be better brought up by being drafted into a large school where there were masters and mistresses who could give them a superior education?—Yes, but I would take that child away from his bad surroundings and put him in a home where he would be surrounded by very good people who would give him a thoroughly good education, he would occasionally see his parents; yet would not be entirely taken out of their sphere. Supposing the case that you mention, which is a very likely one (I have seen such cases myself), if that boy is taken away from that low home he will afterwards return to his parents to that very same home, because he cannot disown his parents, and do you not think that that boy would be rather inclined to look with disdain upon them?

7339. That is a matter of opinion; I do not think he would; but that is your view?—Yes, that is my view.

7340. Your view, therefore, would be against a large building with 200 or 300 children collected together?—Most decidedly.

7341. Was I correct in understanding that you think that even a backward child can be better taught on the oral than on the sign system?—I said so.

7342. Do you not think that to some children, at all events, who are very backward, the power of using signs in after life would be on the whole of more service to enable those children to get their bread and cheese than an imperfect oral knowledge?—Perhaps you will allow me, before I answer this question, to ask what you understand by imperfect oral knowledge?

7343. I mean in the case of a child who is so feeble in intellect that he cannot during his six or seven years of teaching, gather sufficient oral knowledge to enable him to go out in the world and shift for himself?—I agree with you that that backward child would not be able to go out in the world and enter into a conversation on any subject as his more intelligent fellow sufferers would do; but I am sure that a child would have sufficient conversational language, as we call it in the profession, to make himself understood, and to make his wants understood. Do not forget, pray, that an uneducated mute has always at his command a natural sign language. I may tell you that in my own experience, which is a very long one now, I have had very backward children brought to me who had been brought up on the sign system exclusively, and I assure you that those children were unable to answer the most infantile questions; whereas I have seen similar cases of children who had been brought up on the oral system, and although you certainly could not enter into a conversation with them on any subject of high standing, they could answer you in a way which would meet all the necessities of their every day life.

7344. There was another opinion which you gave, that you think that a child is better if it is deaf at starting than if it becomes deaf three or four years afterwards; am I correct?—If I used the same words as you used just now I have certainly made a mistake. What I mean to say is this; I have said that the world at large thinks that better results can be obtained with semi-mutes than with congenital cases. I say that is not always true. We find in the schools that congenital cases are, as a rule, much better to deal with than cases of acquired deafness. Of course I do not speak now of children who are hard of hearing, and I maintain that children who are hard of hearing ought to be sent to schools for the deaf where the pure oral system is in vogue. But children who become deaf very often suffer slightly from mental incapacity. It depends upon the cause of the deafness. A child who has become deaf from a fall perhaps, or from brain fever, will not be so easy to teach as a child who was born deaf. I simply give that as the result of my practical experience. You will find very often in schools for the deaf, excellent speakers with very little brain power, and very bad speakers with very excellent brain power.

7345. Were you ever up at the deaf and dumb church in Oxford Street on a Sunday?—Yes, I have been there, but not lately. I have been there in the time of the late Mr. Samuel Smith, with whom I was very friendly privately, although I must say that we used to carry on a very big fight, and we had a great assault of arms as to the oral system. I could refer you to some correspondence in the "Times" on the subject. I have been there, many years ago, and I must confess that I was not edified by what I have seen.

7346. Taking any continental case that happens to come across your mind, how was the Sunday service conducted there?—Some of them were then conducted exactly like the services in the church in Oxford Street, viz., by signs, others on the oral system.

7347. Think of any one case that you like, and tell me how the service was conducted?—A service to deaf people, taught on the oral system, is conducted exactly as the service for hearing people, with the difference that the clergyman, or the head master, or any non-professional man stands so that the light falls full on his face, that the congregation who listens to him can see his mouth; and that he uses elementary language according to the class of people whom he addresses.

7348. And so far as you could see that was a success?—Oh, yes.

7349. (*Mr. St. John Ackers.*) In your experience of foreign as well as of English schools, are the children taken into oral schools of as low an intellectual power as the children taken into sign schools; do the oral schools insist upon a higher standard of intellectual power in the children they receive than the sign schools?—My experience is that the oral schools take all applicants without any difference, just the same as any other school. You mean to ask me whether the oral schools pick their children more than other schools?

7350. They acknowledge that they each refuse imbeciles?—Yes; beyond the rejection of idiots, oral schools take all cases that are sent there. That is the case not only in England, but throughout Europe.

7351. When was this system, I do not say publicly, introduced, because we know that it was publicly introduced by yourself, but when did the first pure oral teacher come to this country?—Mr. Van Asch came as a private tutor to a gentleman in Manchester named Mr. Solomonson, in 1859.

7352. Then in fact the pure oral system has only been introduced into this country, whether privately or publicly, for 20 years?—That is all.

7353. Do you happen to know what is the number of orally taught children at the present time in this country?—I have myself taught 149 since 1872; but I do not know what is the number in the schools at present. I am collecting statistics with a view of seeing what is the number of children thoughout the country.

7354. Then it would be of no use for me to give you a table, and ask you whether you believe it to be correct?—No, my table is not complete yet.

7355. You remember a banquet of your society over which His Royal Highness The Prince of Wales presided?—Yes, in the year 1877.

7356. At that time I think it was stated that your association had not been able to get persons willing to come in and pay the fees to be trained as teachers; and you still say that there is a great difficulty in that respect?—At that time there was really no field into which to send out the teachers. I trained the teachers, but after they were trained there was no employment for them. I have trained 45 teachers, out of which number I have rejected three as being unfit; so that I may say that I have trained 42 fully qualified teachers.

7357. We have it in evidence that, in 1874, the school board were unable to obtain trained teachers from the oral association; was that on account of the teachers that you had trained being otherwise engaged?—No, I do not know where you had that evidence from. I am not sure, but I think in the very same year we had a communication from the London School Board, and supplied all the teachers they asked for. The first class that was opened by the London School Board on the oral system, was opened under the superintendence of a lady teacher trained by myself, Miss Emma Denton. We had interviews with Mr. Thomas Smith, the head of the school management committee (unfortunately he died last year), and we offered to train as many teachers as they wanted; but for a long time the oral system was confined to the class carried on by Miss Denton only, until my friend, Mr. Stainer, altered his opinions about the systems, and became a friend of the oral system, and introduced it in his classes. Since then I have been training teachers for him; and following my advice Miss Denton has given up the entire superintendence of that class, and considers herself as one of Mr. Stainer's assistants, which she could not do before he adopted the system. I may say that Miss Denton's class was for a long time under the honorary supervision of myself.

7358. Now that so many more schools have adopted this system you have, I suppose, a greater number of applicants to become students?—Yes. Very few weeks pass without my getting applications for a private governess, or for governesses for classes.

Mr. W. Van Praagh.

11 Mar. 1886

7359. And this is increasing daily?—Certainly, I must say that the ladies I have trained are doing excellent work; but still, as we want this profession to be, like every other liberal profession, represented in the male as well as in the female sex, I regret that I am unable to train so many men for the profession as I should like to, particularly with the future prospect of sending out head masters to the various schools in the country; but I am sorry to say that the question of pounds, shillings, and pence prevents our doing so. Men of good ability will not come and be trained unless you can tell them that they can reckon for the future upon a good salary, and of course I cannot do so. The salaries which are offered at the present moment are really not inducive to that kind of thing.

7360. We have had it in evidence that a board of examiners, called the College of Teachers, was started last year, have you joined that association?—No, I have not.

7361. Have any of your trained teachers passed the examination of that board of examiners?—Referring to the report of the conference of head masters, of which I saw the proceedings, I noticed the names of three or four ladies who had been trained by myself, who have our association certificate; and who have received the additional diploma of the College of Teachers. I may tell you while we are upon the subject that I am so thoroughly and conscientiously anxious to get the oral system spread throughout the country, that I do everything in my power to unite every man, and particularly every head master, engaged in this work; but when the proposition was made to me whether I would join the College of Teachers, I was obliged to refuse, because as the principal of a training college for teachers I could not well join another examining body, particularly as my present students now can go there and be examined too; but to a certain extent we are in a transition state, and I am trying to bring about a friendly and happy feeling all round with a view to the general adoption of this system here as in France and elsewhere. I am obliged to refuse to take any part in this College of Teachers simply on account of my position.

7362. It has been stated that one reason for starting this board of examiners was that the existing training colleges refused to examine persons who had either been trained or were assistant teachers elsewhere, is that your experience?—Referring you to the printed rules of my college, it is stated there distinctly in Rule No. 8, that "Those who have been trained in the "system elsewhere may present themselves for exa- "mination and certification on payment of a fee of "three guineas."

7363. Is it your opinion that very poor children can be taught on the oral system?—Yes, the system is most eminently fitted for poor children.

7364. Do you consider that this system would be equally advantageous with, or more advantageous than, the sign system, to the very poor in after life?—I think I have anticipated this question already by saying that I believe the oral system to be suitable for all classes. The children of a wealthy man show a difference in their conversation from the children of a very poor man. You will find the same difference in deaf children; you would not expect a deaf child, the son of a labourer, to speak exactly as a deaf child, the son of a man who has been able to send his children to school for 14 or 15 years; in fact, I have known them to pick up (might I say it) the slang language of their friends with whom they mix.

7365. Have you in your experience abroad known any cases where the children of the poor are taught upon the sign system, and the children of those who are not so very poor are taught upon the oral system in the same town?—My continental knowledge now depends entirely upon what my foreign correspondents tell me; but I say conscientiously that there is no such thing at all throughout the continent. The Milan schools, which are presided over by the Abbé Tarra, are splendid schools, and exclusively for the children of the poor.

7366. With regard to the persons boarding and lodging your children, do you find persons willing to be under the control of your association, and yet willing to bear the expense themselves in some instances of the board and lodging of your children?—Parents who board their own children are exempt from home surveillance. The rule as to surveillance is only for people who are paid for boarding children. If they refuse our surveillance we simply do not accept their services.

7367. But do some of those persons take your children in free?—No.

7368. They are all paid?—Yes. I may modify this by saying that up to the present moment we have not adopted this system as completely as they have on the continent. On the continent the poor children, or children who are not residing near the school, are boarded out under the surveillance of the committee and the directors. Those children are entirely under the control of the school. The school finds the families in which the children are boarded out, and the school pays the money; and therefore it is really like having the children under one supervision. This plan is not adopted by our association. We allow the parents liberty in selecting their own families for the children to board in if they choose to do so, and of course in the case of parents who do not wish for our surveillance we dispense with it.

7369. In your school do you allow ministers of religion to come as they do at Rotterdam and Groningen and elsewhere, out of school hours, to teach the children of their respective religions?—We have not done so hitherto. Our object has been simply to avoid the question of religion altogether, as of course our fundamental principles are perfectly undenominational; but we give every encouragement to clergymen to give instruction in religion outside the school.

7370. Pupils taught on the sign system must obtain their religious instruction, must they not, from persons who are specially instructed in that system?—Yes, exactly.

7371. May not pupils taught on the oral system receive instruction from any minister of religion?—Not only from ministers of religion, but from their own parents. I can quote cases where children who attend the school have religious instruction, and read the Bible every night, just the same as children attending other schools.

7372. You have more boys than girls, have you not?—At the present moment we have 37 boys and 21 girls.

7373. Is it not your experience that there are more deaf boys than girls?—Yes, I think there are.

7374. With regard to the deaf and dumb do you not think that there is a great deal of misconception and error in this country on account of that word "dumb" being applied to all in this matter?—Yes, I perfectly agree with you; but still on the other hand the name "deaf and dumb" is retained in every European language. We have in French "*sourds muets*" in German, "*taubstumme*"; in Italian, "*sordo muti*"; and in Dutch "*doofstommen*." I should most willingly drop the word "dumb," were it not that the word "deaf" used by itself would create the same difficulty as the words "deaf and dumb" do now. You would not get a poor woman to send her deaf and dumb child to a school if our schools were called schools for the deaf; she would say, "Oh but my child is dumb too." That is the reason why, except in scientific writing when I address my colleagues, I always use the expression "deaf and dumb" or "deaf-mute."

7375. There is no more connexion between "deaf and dumb" than there is between a "blind and led" person?—No. I very often use this expression "deaf and so-called dumb people."

7376. (*Dr. Tindal Robertson.*) Your previous training, I think you said, before you came to this country, was at Rotterdam?—Yes, and afterwards I travelled through Europe to see almost every school.

7377. You had previous training in a school conducted on the oral system?—At the school in Rotterdam.

7378. Had you any experience there with regard to the other system?—No.

7379. Have you had any practical experience with regard to the other system since you came to this country?—No practical experience; I know the theory of the system. A man is not able to condemn a thing if he does not know the theory of it; I know the system in its theoretical aspect, and as regards practice, I have watched the various schools where the system is in vogue.

Mr. W. Van Praagh.

11 Mar. 1886.

7380. You have given his Lordship your reason for advocating the oral system; do I correctly understand that that applies equally to deaf mutes as to semi-mutes, and in fact to all the children who come under your consideration?—Yes. I divide the deaf and dumb into two classes; firstly, those who are congenitally deaf, and those who have become deaf after birth. Then we divide them again according to their degree of deficiency, and I may say that I even include those who are hard of hearing. Firstly, those who perceive the human voice when it is used close to the ear, without being able, however, to distinguish the separate sounds; then those who can distinguish the vowels when they are loudly pronounced in the ear; then those who understand, but with difficulty, some words that are known to them when these are clearly pronounced in the ear; then those who without effort understand all that is clearly pronounced in their ear; and finally those who can hear a raised voice. I may be allowed to quote the following words from my paper read at the International Health Exhibition: "Immediately it is clearly ascer- "tained that a child of sufficient age comes under "any one of these divisions, it ought to be sent to a "school for the deaf, for it is really astonishing how "quickly under such circumstances it will forget how "to speak, and how immense are the disadvantages "caused by but a few months delay." I have known a child to lose its hearing, say to-day, and in three months that child was almost dumb.

7381. You have stated in your evidence that you think it better that instead of aggregating the children in one establishment they should be brought up in separate establishments and boarded out; is one of your reasons for that opinion that you think it is very advantageous to deaf persons in after life to have associated a good deal with other persons during their childhood, and not to have been confined very much to the company of those who are like themselves?—That is one of my reasons certainly, but I have many very serious reasons besides. I want the deaf child to be exactly as a hearing child, a member of family life. I want the deaf child to see daily life in all its phases in every respect, and I maintain that a deaf child cannot see that if he is with 200 or 300 children in a large asylum.

7382. Have you ever collected any statistics as to the causes of deafness?—I have.

7383. Can you give us any information as to the results of the intermarriage of deaf people, or as to the effect of the marriage of blood relations?—I find that some of the parents of deaf children are first cousins. It is a question which has been very much discussed amongst savants.

7384. Have you any practical experience in the matter?—I have practical experience so far that I have very often traced them amongst cases in my notes as being the children of first cousins, or of those who are related in the second generation.

7385. Have you any experience with regard to the effect of the intermarriage of deaf persons themselves?—I have no direct experience; I have heard it second hand and therefore I do not know whether it can be admitted as evidence; but personally I always do everything in my power to prevent the intermarriages of deaf people.

The witness withdrew.

Adjourned to to-morrow at 12 o'clock.

32, Abingdon Street, Westminster.

Friday, 12th March 1886.

PRESENT:

LORD EGERTON OF TATTON IN THE CHAIR.

SIR HENRY SELWIN-IBBETSON, BART., M.P.
ADMIRAL SIR E. SOTHEBY, K.C.B.
W. TINDAL ROBERTSON, ESQ., M.D.
B. ST. JOHN ACKERS, ESQ.
E. C. JOHNSON, ESQ.
CHARLES FEW, ESQ.

CHARLES E. D. BLACK, ESQ., *Secretary.*

Mr. JOSEPH DE CASTRO examined.

Mr. J. De Castro.

12 Mar. 1886.

7386. (*Chairman.*) You are one of the committee of the Jews' Deaf and Dumb Home?—Yes.

7387. How long has it been founded?—The home was established in 1865.

7388. Has it been supported entirely by voluntary contributions?—Entirely by voluntary contributions and by paid pupils; we take pupils in on payment, but we have not many of those. The reason why it was established was because there was found to be a great difficulty in obtaining admission to the Old Kent Road institution, inasmuch as the children had to be admitted there by the votes of subscribers and governors, and there being a large number of subscribers and governors it was difficult for the children to gain admission unless they had a large support of friends at their back. The home was started in Mount Street, Whitechapel. Mr. Hine was the first master appointed, till it was decided to adopt the oral system, when Mr. Van Praagh was engaged as director. The present director, Mr. Schöntheil, came to us in 1872, and is with us now. The home was removed from Burton Crescent to Walmer Road, Notting Hill, where it now is, in the year 1876. The pupils increased in number annually, the present number is 31, being 20 boys and 11 girls. They mostly come from London, but still there are some from the provinces, notably Birmingham, Manchester, and Liverpool.

7389. Are they exclusively Jews?—Yes; the institution is certified for the reception of pauper children, that is to say, where we remove children from workhouses. At the present moment there are not any such children in the institution, but there have been two occasions on which children have been removed from workhouses under the Pauper Removal Act, and then we receive 8*s.* a week or 20*l.* a year from, I believe, the guardians of the workhouse. I am not quite clear from whom we get it, but I believe it is part from the guardians and part from Local Government Board, but through the guardians. In that respect we are on exactly the same footing as other institutions, like the Jewish Orphan Institution at Norwood, for instance, where they receive a number of children under the Pauper Removal Act; I think the workhouse authorities pay the money, we get it from somebody authorised by the Act to pay us. As I have already stated the institution is supported by voluntary contributions and by paid pupils. The children are freely admitted to the home by the voice of the Committee; none are excluded if there be room for them. The building is capable of accommodating 30 ordinary pupils and four private pupils, but it stands in very large grounds of its own, I think it was a house belonging to one of the bishops in years gone by, and the building is capable of course, if a demand arose, of being increased, if we had the funds to do so. With regard to the cost per head, the cost per head is heavy, at the present minute it is about 42*l.* including everything; but you will find that small institutions always cost more than larger ones, because the director and teachers could take a larger class at the same cost as a smaller one. Then again the diet in this

establishment, as in the case of other institutions for our denomination, is very much more liberal probably than in other institutions. Then the teaching is of a more expensive nature, because it is on the German system; but with regard to the teaching that is a matter which I had better leave to the director. I have no knowledge myself upon that point. The children are apprenticed on leaving the school, and in every case, I think but one, they have turned out useful artizans or useful to the persons to whom they have been apprenticed. The institution pays premiums amounting to about 20*l.* or 30*l.* per head, and the trades that are generally chosen, are sign writers, boot rivetters, brass polishers, and one or two others; and for the girls, dressmaking. If any member of this Commission visited the institution, I think they would find that the system itself was perfect.

7390-91. Have you an infirmary in connexion with this institution?—We have an infirmary, but at the present moment, and for some time past, it has not been used; there was some little illness in the institution about August, and the children so suffering from illness were removed; it was not a fever but an illness, and we were rather anxious lest it might spread through the institution.

7392. Have you any invested money for providing a bed?—Yes; Miss Goldsmid, the aunt of Sir Julian Goldsmid, and the sister of the late Sir Francis Goldsmid, gave us this year, I think, 1,200*l.*, and we have just opened a bed under that gift.

7393. Is there any sum capitalised from the proceeds of legacies and donations?—Yes. If you turn to the report you will find it given in the balance sheet.

7394. Your assets appear to be about 6,000*l.*?—6,000*l.* is the capital.

7395. Is that besides your leasehold premises?—Besides our leasehold premises. That 6,000*l.* is invested in India Stock, I think.

7396. Are you obliged to refuse admittance to any applicants?—Yes, at present we are. There are two or three cases from Birmingham and some of the provinces which we cannot admit.

7397. Is there any other Jewish institution for the deaf and dumb in England?—No.

7398. Therefore you get applications from the provinces?—Yes. This institution was the outcome of an idea of the late Baroness Meyer Rothschild, the mother of Lady Rosebery. She took a very great interest in the establishment of the institution. We think that we could do a great deal more good if we had more money at our disposal.

7399. Is yours an institution which you think should be subsidised by Government aid?—Yes, I should think it ought, certainly, if other institutions receive it.

7400. Would you be prepared, if you received such Government aid, to receive children sent by the London School Board for education and maintenance?—That is a different matter; that would, I suppose, involve our institution ceasing to be sectarian, unless it might be specially reserved for Jews. I doubt whether we would throw it open; I might almost say that we would not. Our institution always has been kept as a separate institution. The deaf and dumb are so prone to form attachments, ultimately ending probably in marriage, and mixed marriages are, of course, antagonistic to the principles of Judaism. We have a child in the institution at present, and I believe we shall soon have room for another, the parents of whom are deaf and dumb; the result of that marriage has been four deaf and dumb children.

7401. Is not it the case that, owing to Jews intermarrying with each other there are more deaf and dumb children among the Jews?—I do not think so; you will find a table in the report giving the initials of the children and their age and the probable reason of their being deaf and dumb; but that is merely jumping at a conclusion.

7402. I see that there are five out of the number whose parents are first cousins?—I am a living witness that such effects do not happen from such causes in all cases, because my parents were first cousins. I know it is the theory with some people that intermarriage among relations has a tendency to produce deaf and dumb children, but I do not know of a sufficient number of such cases to justify one in coming to the conclusion that such marriages have such effect. I do not think that we have much more than our proportion of deaf and dumb.

7403. Do you think all deaf and dumb children should be compulsorily educated like other children?—I think they ought, certainly; and I think anyone who saw the system carried on by Mr. Van Pragh and by Mr. Schöntheil in our institution would see the great results which are obtained by that system. I went up to the institution last Sunday to see Mr. Schöntheil, and I found Mr. Schöntheil was out, and accordingly I wished to send up a message to Mrs. Schöntheil. The teacher, who was there in the absence of Mr. Schöntheil, touched one of the boys on the shoulder and told him to take the message up to Mrs. Schöntheil; the boy got up and went with his message, and said, when he came back, Mrs. Schöntheil will be here directly; and Mrs. Schöntheil came in.

7404. Would he have understood what he was wanted to do if you had asked him to take the message?—Yes, I think he probably would; I cannot talk to them very well myself; instead of speaking I begin to make faces or try to speak too demonstratively. If they were seated here, and were to see me speaking as I am now, they would watch the lips and understand me, but the moment you go into too elaborate gesticulations they are unable to follow you.

7405. Are you satisfied generally with the result of the education in your institution?—Yes, I think Mr. Schöntheil is a thoroughly efficient director; his testimonials are very good, and the result no doubt is very good. The institution is open at all times to anyone who would like to see it.

7406. Have you followed the children in after life to ascertain whether they have succeeded in industrial work?—I have been a subscriber for years to the institution, but I have not taken a prominent part in the committee except for about 17 or 18 months. I do not know of any child who has been apprenticed from the institution since I have taken a somewhat more prominent part in the administration of the affairs of the institution. I believe the committee look after them in after life.

7407. Do you think your institution takes in all the deaf and dumb Jews in London of teachable age?—If we had room we should not refuse any deaf and dumb children that came to us except they were under a certain age. I do not think, according to our rules, they can come in under seven years of age. If a person in an exceedingly good position in life wished to avail himself of the benefits of our institution by placing his child in it, no doubt we should kick against it.

7408. You receive paid pupils?—Yes.

7409. Of course they would take the place of poorer children?—Naturally, but they have their room to themselves; we have two rooms. We have one pupil whose family is exceedingly well-to-do, but that child does not sleep at the institution, though it receives the benefit of the education given there.

7410. Have you any opinion as to the advantage of having deaf and dumb children educated in an institution where they would be boarded and maintained, as against being educated in a day school where they would go home daily after they had received their school instruction?—I should think it would be a disadvantage that they should go after school hours to the homes of their parents or friends. We do not call our establishment an institution, we call it a home; we want to make a home of it. The director and his wife associate with the children after school hours, and enter into their recreations and amuse them. Children unless they are very forward in their education are apt to degenerate when they go to the homes of their parents.

7411. Have you a fire escape staircase?—Yes, outside the house, which any one could walk on without any fear at all, and to which there is easy communication from each bedroom. That has been provided to facilitate the escape of the children if there were a fire. In the case of fire it is difficult to rouse inmates who are in possession of all their senses, it is much more difficult to rouse people who are deaf and dumb.

7412. (*Mr. Few.*) The fees paid for apprenticing children range from 20*l.* to 30*l.* per head; what steps do you take to select proper masters and mistresses with whom to apprentice the children?—Steps are taken in this way, a child is asked what kind of business he would like to follow; the director satisfies himself whether the child is capable of doing this or that, and

Mr. J. De Castro,

12 Mar. 1886.

then advertisements are placed in the newspapers, or the books of the Jewish board of guardians are looked to to see who require apprentices. We use the register of the Jewish board of guardians for our information; they do an enormous amount in apprenticing; and there is an industrial committee appointed to visit the masters twice a month or something of that kind to see that the boys are comfortable.

7413. Do you pay the 20*l.* or 30*l.* all at once, or do you pay it by instalments?—It would depend on the arrangement, but I should think in instalments; I have not myself had to do with apprenticing yet at this institution.

7414. Your view seems to be in favour of establishing a home rather than treating the children as day scholars?—Certainly; I have no doubt in my own mind upon that.

7415. Of course, in the case of a very poor child, if you bring him out of his poverty-stricken home, if I may use that phrase, you elevate him in every way?—Certainly, in every way; he gets good food and receives good education, and in every way you raise the status of the child.

7416. Do you or not find in cases of that sort that the child gets, if I may say so, disgusted with its home when it goes back to it?—I do not think so, I have never found instances of that; of course, that would apply to all institutions, it would not apply especially to this.

7417. What becomes of a pauper child when his time is up and he leaves if he is not apprenticed?—He goes back again to his parents or guardians.

7418. And your supervision of him ceases?—Yes, unless we are specially asked to look after him.

7419. (*Admiral Sir E. Sotheby.*) Was the voting system ever adopted at your institution?—No, the selection is always made by the committee.

7420. Have you ever thought if you adopted the voting system you would get more subscriptions?—That has been mooted, because it is said that persons who give money require something in exchange; but we want to take all the children in that we can, without running the risk of children who have not friends being left out.

7421. You think that those who had no friends would be left out in the cold?—That is a certainty, I know it from experience of large institutions. I know it from my experience of the Jewish Orphan Institution at Norwood. Children are put up there four or five times, and unless they get the interest of the Rothschilds, or some one of influence, or some energetic man, they get three votes perhaps, whereas a child taken up by the Rothschilds will perhaps get 1,000.

7422. If you had vacancies would you take in other children who are not of the Jewish persuasion?—I think I must say we should not.

7423. You spoke of examinations; who conduct the examinations?—The director examines the children; it is a public exhibition rather than an examination.

7424. The examiner belongs to the institution?—Yes, but Mr. Schöntheil will be able to give you full information as to that.

7425. Do you teach any trades?—No.

7426. Is there a gymnasium?—Yes, in the gardens there is a swing and that kind of thing.

7427. Who does the domestic work at the establishment, the servant's part of the work?—Ordinary servants we have three female servants.

7428. How many girls have you in the institution?—We have 11 girls against 20 boys.

7429. Do not they do any domestic work?—The matron looks after them, and they just begin to learn domestic work by assisting the servants; but they are not doing quite menial work, they tidy the rooms and make the beds.

7430. Do they learn any cooking?—Not to my knowledge.

7431. As a rule, do you think that the poor among the Jews are of a poorer class than among the Christians?—I do not think there is that very abject poverty among us that there is among Christians, I do not think there is real starvation; I do not think there ought to be, considering the large amount of money subscribed and the time given by persons looking after them.

7432. (*Mr. St. John Ackers.*) You say that there are 20 boys and 11 girls in the institution, is that the usual proportion?—I think that has generally been the proportion; boys are more often deaf and dumb than girls, I have generally found it so.

7433. You say that there are no trades taught during the school time; do you teach the boys the use of tools or any manual work?—They work in the garden, but I think that is more as amusement than anything else; I do not know myself that there are any trades taught, that is to say, that anyone comes who is a skilled artisan for the purpose of teaching them; I should think not.

7434. Do you consider that the Jewish deaf and dumb children of ripe school age, taking the whole of the United Kingdom, are at school?—I should think certainly not; we have at the present time applications from the provinces that we are unable to take in.

7435. Do you follow the after life of your pupils other than the pauper pupils?—I do not know; the two I spoke of are still on the establishment; I do not know that any of the paying pupils have arrived at an age at which they would leave the establishment.

7436. (*Dr. Tindal Robertson.*) Can you separate the expenditure on education from the other general expenses of the institution?—The education expenses would, of course, be the salaries which are stated in the balance sheet; the salaries would be those of the director and the assistant teacher for the boys, and there are two female teachers; that would be four, and, I think, the amount of the salaries is 446*l.*

7437. The balance would be the general expenditure?—Yes; one expense would be the board of the children and another would be ground rent and taxes. It was upon the real outlay that I based my calculation when I said that taking the outlay at 1,200*l.* the expense of 30 pupils would come out at 42*l.*

7438. Supposing you had more than four applications from well-to-do children, would you take these in to the exclusion of any poor children who might be applying for admission?—Not if other children were waiting for admission, certainly not.

7439. You would prefer the poor children for whom you are supposed to find room if you have it?—Yes, we should keep it as it is, a charitable institution.

7440. We have had it in evidence before us, from gentlemen who know something about the matter, that it is an advantage to deaf and dumb children to be brought up a good deal in the society of other children, in order to make them more independent in after life; do you agree with that idea?—If they are fairly forward in their education I see no reason why they should not, but while they are really learning the chances are, as I said before, that in home life they may undo the good that has been done during school hours.

7441. It comes to this, that you would have deaf and dumb children educated together in their early life?—Certainly, that is my opinion, speaking of the oral system.

7442. You think it would be an advantage to have them together in early life, and then you would get them as soon as possible after they were educated, into the general society of other people?—Yes.

7443. You said that you had in your institution children who were the offspring of deaf and dumb parents; do you think it possible that by educating the two sexes together under one roof attachments are formed that may result in marriage, and the production of offspring with congenital deafness?—I think the affliction under which these persons labour is such that no one outside their own circle would marry them, and therefore they start at great disadvantage. If they wish to marry, it seems to me the difficulty is so great that they must come to persons who are similarly afflicted with themselves. I do not know myself of any case in which a deaf and dumb woman has married a speaking man, or where a deaf and dumb man has married a speaking woman, although I have since heard of one. The offspring of this marriage all speak and hear.

7444. I wanted to know whether you thought it would be a disadvantage to bring them together, because I think it has been pretty clearly shown that by the intermarriage of deaf and dumb persons there is a greater chance of producing deaf and dumb offspring?—Of course there is.

Mr. J. De Castro.

12 Mar. 1886.

7445. Have you any idea as to the per-centage of deaf and dumb cases from the intermarriage of blood relations?—No, I have not; but the table attached to our report gives the relationship of the parents, and the supposed reason why the children who have come to our institution are deaf and dumb, but it is a mere supposition.

7446. You have not taken the trouble, probably, to ascertain whether there is more deaf-mutism in your own faith than in any other?—No, I have never found a greater proportion; 30 children together looks a large number, but it is not only London that they are collected from, but all the provinces; there is a very large number of the Jewish persuasion at Birmingham and Manchester.

7447. That brings me to the question whether you think that the present system of education in institutions like your own is the best that could be adopted; would it be advisable, do you think, that other institutions of the same kind should be established in the larger towns in the country?—Yes, but I am afraid that they could not afford to keep them; the teaching staff is so heavy. In Manchester and Liverpool there are some well-to-do people, but I do not know how such institutions would get on in other provincial towns.

7448. Suppose State aid was given to your schools, without your being obliged to receive children not of the same faith as your own, would there be any objection to Government inspection in that case?—Certainly not. Of course we should consider, if we received State aid, that we must immediately place ourselves under Government inspection; the only drawback to Government inspection would be if it interfered in any way with the religious education as far as regards the hours devoted to that education. For instance, take the largest free school in the world—the Jews' Free School—they have State aid; they have a very large sum from the Government, but there are only certain hours in which they are allowed to teach Hebrew and the Jewish religion, because the other hours have to be devoted to secular education.

7449. Do you think there is a very large number of poor deaf and dumb children belonging to the Jewish faith who do not get admitted into the institutions in the country?—No, I do not think there is a very large number; there are certainly some, because we have applications at the present time. I do not think the number is large.

7450. You think, therefore, that the majority are already in institutions of some kind?—I think they are; if they do not come to us, I think they are in institutions of some kind.

7451 (*Mr. Johnson.*) Have you any statistics as to the number of Jewish children in England who are deaf and dumb?—No, nor do I know how they could be obtained; we should be very glad to get them for our own information.

7452. Have you a lease of your building or is it freehold?—We bought the ground lease; it is leasehold.

7453. I see you receive 250*l.* from private payments; what is the ordinary payment for a private case?—In some instances we have 60*l.*; in the case I spoke of where the child belonged to a well-to-do family we have 60*l.* a year, but from the middle class we have from 30*l.* to 40*l.*; sometimes we ask 50*l.* and take 40*l.* We just make inquiries to find that the parent is not coming to us to relieve himself from expense which he is really able to bear.

7454. Do you keep any register of the cases that have passed through your institution?—Yes, certainly.

7455. But you make no inquiries about them after they have left the institution?—No, our jurisdiction falls through the moment they leave out institution.

7456. (*Chairman.*) Can you give us the addresses of any of those trained in your institution and who are now apprenticed?—Yes, I could send them to you.

7457. (*Mr. Johnson.*) Have you a considerable number that are now apprenticed?—I could send you that information; no apprentice has passed through since I have been on the Committee.

7458. You said that you think it is undesirable that the deaf and dumb should intermarry; are the males and females kept distinctly separate in your institution?—No, except in the dormitory; the class room is a large room with open folding doors, and the younger children sit together indiscriminately as they do at any other school; the boys are probably more advanced than the girls.

7459. Are they instructed together; do they sit together a number of hours in the same room?—Yes.

7460. And do they play together?—Yes.

7461. In one common playground?—Yes.

7462. Do not you think there is a disadvantage in bringing them too much together, from the tendency to form attachments that might eventually lead to marriage?—But it is difficult to act otherwise.

7463. You are aware that in some of the deaf and dumb schools in the country the sexes are kept entirely separate?—I am not aware of that.

7464. Do you think it possible to have State aid and yet make such arrangements as would not interefere with your religious instructions?—Certainly, if State aid did not impose upon us very heavy restrictions. That is the point, what restrictions would State aid involve. My object is to plead for State aid for the institution; but then we must know before we accept State aid what restrictions are going to be put upon us.

7465. Then it would be a conditional acceptance?—One does not like to accept State aid without knowing what it involves.

7466. Yours is an exceptional case?—I think all deaf and dumb institutions are exceptional cases.

7467. But your institution is an exceptional institution?—Yes, no doubt.

7468. Do you think the expenses of the staff are much larger in your mode of education than they would be by the sign system?—Certainly, there is no doubt of it; because the sign system is almost open to anyone to teach, whereas there are very few teachers of the oral system; the language of fingers can be taught to almost any child, and it is in the power of that child to communicate with any person; but the oral system is most difficult.

7469. At what period do you take children into your home?—Mr. Schöntheil will tell you that; I think they leave when they get to the age of 15 or 16; the age of coming in I do not know, they do not take them in as babies.*

* I have since ascertained that it is from seven years. Eight years is supposed to be the full period for the education on the oral system. (J. D. C.)

The witness withdrew.

Mr. S. SCHÖNTHEIL examined.

Mr. S. Schöntheil.

7470. (*Chairman.*) You are director of the Jews Deaf and Dumb Home?—Yes.

7471. How long have you been so?—Since October 1872.

7472. What has been the average number of pupils under your charge?—At the time when I first came to the institution I think we had 12, and they have been steadily increasing in number; at present the number is 31.

7473. Will you tell us the age at which children are admitted and the length of time you keep them?—As regards the length of time that we keep them, at present my committee does not interfere in that matter, they generally leave it to me to tell them that such and such a pupil ought to leave; and I make it a point not to keep either a boy or a girl after the age of 15, so the average time we keep them would be about eight years. I admit them at seven, and if I can possibly help it, I do not dismiss them before they are 15.

7474. Do you teach the boys and the girls together up to the age of 15?—Yes, our classes are mixed; they consist of boys and girls.

7475. Do they play together in the same playground?—Yes.

7476. Do you not see any objection to having the two sexes mixed together?—None at all. We have a very

Mr. S. Schöntheil.

12 Mar. 1886.

small playground. I very often let the children go out for a walk to Wormwood Scrubbs or to Kensington Gardens, or somewhere else for a good run; and when I cannot let them do that I let them run about in a large piece of ground that we have adjoining our building. I do not advocate their all playing together in the small playground that we have.

7477. Have they games?—Yes, they play at games of their own invention. The teachers do not interfere in that.

7478. Do they play cricket?—Yes, in Wormwood Scrubbs. The only instructions that I give my teachers as regards games is this: if he finds them doing nothing and not knowing what to begin with to amuse themselves, to suggest games to them; if he fails I look after it myself and suggest some games.

7479. Have you found any of your pupils intermarry in after life?—One of my pupils, a girl, married a hearing man; another one was engaged to a deaf and dumb man, upon my own suggestion, because I had so thoroughly inquired into the cases, and I was satisfied that I could well advise them to marry without any scruple; but the engagement was broken off.

7480. They were not cases of congenital deafness and dumbness, I suppose?—Not in either case.

7481. What are the salaries of yourself and your teachers?—My salary at present is 200*l.*, and everything found, that is to say, board and lodging for myself and my family, which, considering that it is a large one, is a considerable item. One of my teachers is getting 30*l.* and her mid-day meal, the others get smaller salaries, and everything found.

7482. How many teachers have you?—I have at present three teachers, if I may call them all so. One of them is really a young girl about 16, who is a kind of apprentice; she is placed in the institution to learn how to teach, and she assists. Being a small institution we help ourselves as well as we can.

7483. Do you always have some students in training?—No, I train my own teachers; but ours is not considered a training school. I have trained several; although we do not bear the name of a training school.

7484. Is there any difficulty in getting trained teachers?—To my mind there is the greatest possible difficulty.

7485. Do you think it would be advisable to encourage any institution which would examine teachers?—Certainly; not only do I think it desirable, but I have taken steps (and I am glad to say with success) to call into existence what is called the College of Teachers of the Deaf and Dumb, which examines teachers after they have acquired that information which they ought to have; and that college gives certificates.

7486. Is the salary which is generally given to teachers of the deaf and dumb smaller than is likely to attract good teachers?—Yes. The position of assistant teachers in this country as compared with their position abroad is, to my mind, a most miserable one, and the state of things as regards their position is such that one is surprised at it.

7487. I am speaking of teachers of the deaf and dumb as compared with the ordinary teachers in an elementary school?—The position of an assistant teacher of the deaf and dumb is much worse, because an assistant teacher in an elementary school has some prospect which to a certain extent makes up for the smallness of the payment. Some observations of mine on the subject are contained in a paper and which I read which is embodied in the report of the proceedings of the conference of headmasters of institutions for the education of the deaf and dumb, held at the Yorkshire Institution for the Deaf and Dumb at Doncaster on May the 30th and 31st, 1882, entitled, "How to keep up a Supply of Efficient Teachers."

7488. In speaking of the position of teachers on the Continent as compared with their position here, you speak from your personal knowledge?—Yes, I do so as to the state of things in Germany.

7489. Will you tell us how the teachers in Germany are trained?—In the first place a person wishing to become a teacher has to have passed successfully either the first three standards of the Real-schule or four standards of the Gymnasium, the former aiming more at technical instruction, though it is not exactly what we should call a technical school; it is what we might call the modern school, while the latter may be called the classical school. In the Real-schule they would lay more stress upon modern languages, natural philosophy, and so on, while in the Gymnasium they do not lay so much stress upon that as they do upon Greek and Latin. First class certificates from these schools enable the student to undergo the examination which is necessary before entering the training school, in which he remains three years; after three years he has to pass his examination, and having obtained a full certificate he can enter himself as a student at a deaf and dumb institution, not at any one, but at a particular deaf and dumb institution appointed for the purpose. He has to pass two years in that institution; during the first year he is a looker-on, and gets instruction from the head master in the art of teaching the deaf and dumb.

7490. Who pays for him all this time?—The Government, the same as in the case of ordinary teachers, providing he gives satisfaction. After the second year, on passing his examination satisfactorily, he is employed not as a regular, but as what they call an extra assistant teacher under the care of a regular teacher, being only allowed to teach under the close superintendence of an experienced teacher. After having given full satisfaction to and having been reported on by that experienced teacher, he can apply for the post of an assistant teacher in any deaf and dumb institution in which there may be a vacancy. His salary varies, as far as I could ascertain two years ago, from about 150*l.* to 200*l.*; and if he wishes to qualify for a head mastership he has after a certain number of years, which I think is five or six years, if not more, to present himself before an examining body composed of two head masters of prominent position (that is to say, head masters known to their colleagues and to the Government as having the very best schools) and one member of the Government. If he passes that examination, which is a most rigorous one, then he is entitled to apply for a head mastership.

7491. The pay of head masters varies also, I suppose?—Yes; but there is not much variation in the salaries of head masters; the difference is comparatively small as compared with the difference in the case of assistant masters; perhaps there would be a difference of 50*l.* or a little more. An article of mine headed: "On some "schools for the deaf and dumb in Germany and the "training of teachers there," is embodied in the proceedings of the conference of head masters of institutions and other workers for the education of the deaf and dumb, held at the rooms of the City and Guilds of London Institute at South Kensington on Wednesday, Thursday, and Friday, July the 2nd, 3rd, and 4th, 1885.

7492. Your system is founded on the German system?—My system is the pure oral system.

7493. Did you learn that system on the Continent or in England?—I went through somewhat the same training as I have described. I went through the Real-schule, and then entered the Training School for Teachers, the course in which at that time was for two years, and qualified as an ordinary teacher for normal schools. At the same time I went through a course of instruction in the teaching of the deaf and dumb, the blind, and idiots, and I got certificates for all those subjects.

7494. Are they all taught together in Germany?—No, they are not; but I had a special desire to acquire knowledge in those subjects. It was obligatory upon all whether intending to become teachers of the deaf and dumb, or not, to learn the teaching of the deaf and dumb; but I had a special desire for a little knowledge of other subjects too, and I qualified also for the teaching of the blind and idiots. I did much better in the teaching of the deaf and dumb than in teaching of the blind and idiots, and I was appointed at once assistant teacher at the Deaf and Dumb Institution at Vienna. I rose rather rapidly; I was there about eight years and during the sixth, seventh, and eighth years I was first teacher; I rose in fact from the lowest to the very highest place which was to be obtained there; and after those eight years, upon the recommendation of the head master there I took the post which I now occupy in London.

7495. Is it easier to teach the oral system in German than in English?—Yes, because the German language lends itself much better to it; the German language is softer than the English, in fact, the English language is one of the hardest languages there are.

7496. English people generally do not open their mouths in the same way as foreigners?—Exactly so, that is what renders us so conspicuous in speaking English, because we open our mouths too much, we are too distinct.

Mr. S. Schöntheil.

12 Mar. 1886.

7497. You had great success in teaching at Vienna?—I was considered fairly successful.

7498. With your experience, do you think you would have been equally successful in London as at Vienna?—It is not for me to say. I would have tried to do my best.

7499. You think that the pure oral system is the best for teaching the deaf and dumb?—I have no doubt about it. It is not only my own opinion but the opinion of everyone who deserves the name of a teacher on the Continent or in America, and I think in England now. That question has now passed the stage of disputation and entered upon that of demonstration.

7500. I suppose you are aware that there are still advocates of the sign system?—Yes. To my mind they are very few, and I do not think we shall hear much of them as time goes on.

7501. Do you think that the oral system is so successful and so perfectly established by the consent, as you say, of many people abroad and at home, as the best system, that the State could introduce the oral system compulsorily into the deaf and dumb schools?—I have not the slightest doubt about it after all that has been done.

7502. Then you think the time has arrived when it would be fair to demand that State aid should be given to the proper education of the deaf and dumb in the same way as State aid is given to the education of other children?—I think it is a gross injustice that it has not been done before, and I think the sooner it is done the better for England, because as compared with other countries the state of things as regards the education of the deaf and dumb is an anomaly for which there is no explanation whatever.

7503. Do you know many deaf and dumb in London who have been only taught by the sign system, and who have failed to earn their livelihood in consequence?—I have very little experience of deaf and dumb persons who have been taught by the sign system.

7504. Would you go so far as to say that if they are taught on the sign system they do not have an equal chance of earning their livelihood as if they are taught on the oral system?—I should think so, because if a boy is not able to speak I should imagine that people would be much less disposed to take him as an assistant or an apprentice, his intellect is much duller than in the case of a speaking boy. If I go to a master to ask him to take a boy as an apprentice the first thing he says is, "I cannot bother myself with these signs"; but as soon as I say "My boy is able to speak," he is very much surprised, and he says "What do you mean?" I tell him that the boy is really able to speak, and then as a matter of curiosity he is only too delighted to take the boy; several of our boys have been apprenticed and are getting on fairly well.

7505. You find they are able to make themselves understood?—Clearly understood.

7506. And they understand what their masters say to them?—Yes; any moment I should be prepared to prove, by living instances, that the results which I speak of are obtained by our system. I could produce letters from pupils which you would not for a moment suppose were written by a deaf and dumb person.

7507. Are there any of your former pupils now in London who are earning their own livelihood?—Yes.

7508. If they were summoned here, would they be able to understand the questions which members of the Commission might put to them?—I suppose they would at first have a little more difficulty in understanding any member of the Commission than they would have in understanding me; but after a few minutes, when they had got a little more accustomed to your way of speaking, they would be able to communicate with you.

7509. Will you describe what is your mode of teaching the deaf and dumb, from the beginning when they enter school, on the pure oral system?—The general mode of procedure is this:—In some institutions they spend a good deal of time in what they call preparatory lessons; that means teaching the children to imitate, to do exactly as the teacher does. As an illustration, the teacher would raise or lift the right hand, or raise or lift the left arm, or open his mouth, or go through various little movements, just to drill the children into imitating those movements. But the exercises (which I have seen very well done in some schools abroad, and which, no doubt, were of great benefit to the children), I think can be dispensed with, and, in fact, I do dispense with them. Instead of going through those exercises I admit my children at the age of seven, when I can fairly expect a child to imitate without having had any previous lessons how to imitate, because I think all those thoroughly versed in the laws of psychology will bear me out when I say that the power of imitation is a power that thrills through every fibre of the child, and I do not think that any preparation is quite necessary. Therefore I admit my children at that age, when they are able to imitate, and I begin teaching the vowels, sounds which are the easiest. Having enabled them to utter these sounds, the ice is broken, so to speak, and your way is clear, you go ahead without much difficulty.

7510. Are you speaking now of those who are entirely deaf, or those who are partially deaf?—That makes little or no difference; partial deafness only makes this difference, that any perception of sound renders the production of sound much easier and more clear, so that if a child has the faintest perception of sound, then he will have less difficulty in producing sound.

7511. How do you teach a child to modulate his voice so that his voice shall not be harsh, as very often the voices of the deaf and dumb are?—That is one of the greatest difficulties that we have to deal with.

7512. Will you tell us how you teach the children to modulate the voice?—If a teacher be well qualified for his work, if he be well acquainted with every organ necessary for the production of sound, he will have comparatively speaking an easy task to produce soft and smooth sounds. Perhaps I may point out a thing which I dwell upon in several of my papers, especially in a paper which I read in America; that is that the production of sounds should not be taught in what I may call an unnatural way, but should be taught in the most natural way possible, without any exaggeration, without undue force, without opening the mouth too widely and so on. Then to proceed with my description of the mode of instruction. When the vowels are taught, or when some of the vowels are taught, we proceed to the consonants, keeping strictly to the rules of general pedagogy, to proceed from the easiest to the more difficult. And as a man who is thoroughly versed in the physiology of sounds is fully acquainted with which are the easiest and which are the most difficult sounds, he will graduate those sounds, and the teaching of them involves little difficulty in the hands of sensible teachers, with perhaps one or two exceptions. Then the vowel sounds are connected with consonants, in such a manner as to begin either with the vowel or with the consonant, and that being done we are launched really into syllables and words, and the rest is only a matter of time. And, again, it entirely depends on the industry and skill of the teacher how soon that is achieved. I am speaking now of practice and not of theory. I am speaking of what I have done for years. I have succeeded in as short a time as three months in getting my children to speak mechanically fairly well, I mean words not of undue length, not of polysyllables but of monosyllables or words of two or three syllables; when that is done of course we are ready to begin what is the main task of the teacher, not to impart mechanical speech but to cultivate the mind, to give speech, and with it knowledge. Here again the modes of proceeding which various teachers adopt differ very much. Everyone of those modes has its advantages and disadvantages, but if you will permit me to give you my way of proceeding I will speak to that, because I am most familiar with that, though I am familiar with all the other ways. I generally confine myself to giving the children knowledge of all those objects round them which require neither a picture nor a gesture, but simply pointing at. The children are delighted to learn the names of the things around them, and they learn simultaneously to speak the names and to write and to read them from the teacher's lips. Of the three things speaking, writing, and lip reading, I lay the greatest stress upon the lip reading. I may mention that I always make it a point that the name should not be written first, but should be given verbally, that the child should be first taught to read that from the lips, and then when that has been done that it should be written out for the child, because lip reading I hold to be the very backbone of the whole oral system, and without lip-reading the whole edifice must fall to the ground; without it

Mr. S. Schöntheil.

12 Mar. 1886

the teaching does not deserve the name of teaching, since the system aims at the eye taking the place of the ear; and therefore the more the eye is cultivated the easier the after work will be. When I have taught the children the names of a sufficient number of objects and things and persons round them I extend that sphere considerably, and begin giving them the adjectives, showing them the qualities of those things, proceeding, of course, according to the strict rule of an educator from the easier to the more difficult. For instance, to give you an illustration, I give qualities which can be seen first, then I give qualities that can be felt and tasted, and so on, and then I proceed to abstract words which are learned by analogy. That being done, I go to verbs, that is to say, what these subjects are capable of doing or are doing. Here I may say that some teachers take verbs first. That being done, having taught the pupils nouns, adjectives, and verbs, we are in a position to form a sentence, and as soon as we are able to form a sentence we enter upon conversation; we form short sentences on things quite familiar to the children, that want no explanation whatever, and we assist ourselves with pictures. Speaking of pictures, I should say one word more in order not to be misunderstood; I think that there is a notion prevalent that pictures are most necessary for the teaching of the deaf and dumb, but I think there is one misconception on the point, and that is this, a good many teachers think that pictures create impressions, that is a great mistake, pictures recall impressions, but do not create them; therefore, we teach at first without pictures, and only use pictures to recall impressions made by reality. When once the children are able to converse I need not say that a large field is opened, and in dealing with the children at this stage it is a great advantage if the teacher knows the structure of more than one language; because a man knowing only one language is just like a man who has only seen one colour in his life-time and does not know what the others are, or like a man who has no measure wherewith to measure anything; if a workman wants to measure he must have something to measure with, and if a man wants to have a thorough knowledge of the structure of language he must be able to measure one language by another language. If a teacher be acquainted with, at least, two languages, then he will have no difficulty in making out such graduated lessons as will before long put his pupils in possession of the simple rules of grammar, and enable them to construct a short but thoroughly grammatical sentence. This being achieved, the acquired knowledge is utilised in every possible way, the children are constantly spoken to in the playground and everywhere else, and knowledge is imparted to them in no other way than by speaking. As I put it in one of my papers, speech can only be acquired by speech, which especially relates to living languages. If you asked me about dead languages I should give you another opinion about it. I am speaking of living languages.

7513. Do you think that the two languages which the teachers should be conversant with should be living languages, or one of them a dead language?—That makes no difference.

7514. Would you select any particular language for the second language?—I should say if the teacher was thoroughly versed, say in Latin or Greek, that would be a great help, because the structure of those languages is so beautiful, so complicated, and so cultivating to the mind, that either of those languages is an excellent standard to measure any language by; if the teacher knows another modern language of course it is a great help; I do not want to put my standard too high or I would have said he ought to know one dead and one living language besides his mother tongue. In Germany that is generally the case.

7515. Either German or Italian would be a very good language?—I would give the preference to German, because the most useful literature on the subject is written in German, and from that point of view I should strongly recommend German. Then every possible branch of knowledge is imparted to these children in class, it is not individual teaching any more, but class teaching.

7516. Hitherto you have been speaking of individual teaching?—Yes. If I want to elicit a sound I must take each child individually, but the others are looking on at the time, and in the hands of a skilful teacher it can be made from the very beginning class teaching.

7517. How many would you have in a class?—In the lowest classes there is a consensus of opinion that there should be no more than 10 or at the utmost 12. I have had 15, but I found it was too hard work for me. I should not exceed 10 or 12, but later on you have much larger classes. I had 20 and 25 in the upper classes, and they were efficiently taught. After, say, three or four years' teaching in the way I have indicated the children are really to all intents and purposes, as regards teaching, on the same level as hearing children, and there is hardly any difference between them, with the exception that the teacher must teach in such a way as to make it possible for all the children to have a full view of his mouth. Of course the classes cannot be of the magnitude that they are in ordinary schools. I do not know what is the case in England, but I know that before I really was a well-seasoned teacher I had a class of 110 hearing children, whom I taught to the full satisfaction of my experienced superior who watched most carefully what I was doing. Of course such things are not to be thought of in teaching the deaf and dumb; but comparatively speaking large classes can be taught by efficient teachers in the higher classes, and there would be hardly any difference then between a class of deaf and dumb and a class of hearing children; you use the same books, there is no necessity for special books. In my experience of 25 years, I have never been using deaf and dumb books, I always use the books that you have in ordinary schools, and I find no difficulty in making them useful to my pupils.

7518. In Germany are deaf and dumb children taught with hearing children after a certain period?—Not to my knowledge.

7519. Are they taught with blind children?—No; there are some deaf and dumb schools connected with blind schools, for instance, the one at Brussels; but the deaf and dumb are not taught with the blind.

7520. What you have described is what you are in the habit of doing with the children who come before you; have you to do that yourself, or have you teachers fully competent to do what you have described?—That is a question which I have some difficulty in answering in the affirmative. As I said before, teachers in this country are a thing of the future, I hope not of the very remote future.

7521. In what respect are they deficient; is it that you cannot get teachers of sufficient intelligence for the low pay that is offered to them, or that the oral system has not been long enough in operation in this country to attract good men to learn it and to perfect themselves in it?—I should attribute it to the following causes: In the first instance, general education altogether has been sadly neglected in this country compared with the outer world, if I may say so, and the science of teaching is, comparatively speaking, of very young growth in this country. I do not think there are many people even now who are fully versed in such works as those of Pestalozzi and the other great creators of modern education.

7522. This system which you have been describing to us to be successful must necessarily be worked by intelligent and well-trained persons?—Yes, by real teachers, men who know the science of teaching.

7523. And also the physiology of the vocal organs?—In addition to his being a good teacher, and having acquired all that is required for a teacher in elementary schools, he must have special knowledge of teaching the deaf and dumb, or in other words, he must be a specialist; he must have general knowledge first, and not begin by studying his speciality, which is what they do here.

7524. I suppose very few of your teachers up to the present time have had the qualification of knowing two languages, which you say is essential?—None at all; but if we cannot have what we want we must be satisfied with what we can get.

7525. After four years' instruction on the system that you have been describing, do you consider that the children ought to be able to speak to other people, and to understand other people speaking to them?—Their education is not finished after four years, not completed; but after four years' teaching a deaf and dumb boy is certainly very much on the same level in the way of teaching as a hearing boy, and if he gets an additional four years of instruction, as he ought to have, he ought to leave school with a fair amount of elementary knowledge, putting him on the same level as a well-taught hearing boy at the age, say, of 13.

7526. Then the way you put it is that the deaf and dumb are naturally more backward than other children,

that they are about four years more backward than other children, and that they require four years more teaching in order to bring them up to the standard of speaking and hearing children?—At least that. You can hardly compare a deaf child with a hearing child.

7527. He must be at a disadvantage, but the amount of disadvantage must depend a good deal on the individual?—I will give you the opinion of one of the greatest men in the profession, who says that if an institution discharges its pupils with that amount and fluency of language which a normal child at six years of age possesses, it has done its task well. You must remember that an ordinary child coming to school possesses an amount of knowledge which is embodied in the language which he has acquired, while a deaf and dumb child comes with nothing. The one is a *tabula inscripta* while the other is a *tabula rasa*, and we have to inscribe what we can on the tablet; and if we cannot get in by the door we enter by the window, and after we have entered by the window then we are able to begin where you begin with a hearing child.

7528. (*Mr. Johnson.*) I see you object very much to the deaf and dumb being left to charity?—Yes, I very strongly object to it.

7529. And you object to collecting them together in institutions as we do in this country?—No, I do not object to that.

7530. How would it be possible to have an institution supported except by charity?—I should say this: teaching and maintenance are two distinct things, and while it may be wise to ask for things which are obtainable, I think it is folly for anyone to ask for things which are absolutely unobtainable. If it was possible that a deaf and dumb child could be brought up and educated in such a manner as to be positively ignorant of the existence of another deaf and dumb child, it would be the greatest possible boon; since, however, such a thing is positively impossible on account of the expense it would entail in addition to the pedagogic disadvantages which it would bring with it, there being no emulation, and so on, it is an unavoidable thing, to bring them together in institutions where they can have the advantage of efficient teachers, and the apparatus required for the teaching, and so on

7531. But the institution to which you are attached is a charitable institution?—Yes.

7532. The maintenance is carried on, as I understand, by charity?—Yes.

7533. And that charity avails itself of the greatest talent it can possibly obtain to teach its children, if you will allow me to express that opinion. Do you think it could be better for the State to undertake entirely the training, the education, and the maintenance of deaf children?—Yes; if it would not be asking too much that would certainly be the thing. But, again, it is no use asking too much, and therefore I should be highly satisfied if the State would come up to what is its strict duty, to provide for the education of deaf and dumb children; the maintenance, I think, could be left to charity. I find that charities are much more willing to construct, to put up buildings, and to provide food, than to instruct; construction seems to go down with them, and they do not seem to mind how much they pay for feeding, but if you say to them, We want a much more efficient teacher, which means paying much more money, they say, After all they are only poor children; if we cannot give them a whole loaf, they must be satisfied with half a loaf; forgetting that it is really moral murder if a child who has the ability in it to become a useful member of society if well taught, is turned out of the institution or school half taught, or worse than half taught. The whole affair is a farce, and therefore I should think it is most imperative on the Government not only to provide, but to closely superintend the education of those children. Of course, if it be not asking too much I should say provide for the maintenance, but I think that would be asking too much.

7534. What is your opinion as to the education given to the deaf and dumb in the schools of the London School Board?—If you will absolve me from answering that question I should prefer not to give an answer to it.

7535. Do you think it satisfactory?—That is about the same question. I do not think I ought to pass a criticism on the education given to the deaf and dumb in the schools of the school board. I will answer your question by saying that it is almost impossible to be good; the course of instruction is so short that it cannot be good at present.

Mr. S. Schöntheil.

12 Mar. 1886.

7536. Your opinion is that the education of the deaf and dumb which is provided by the school board is not satisfactory?—Anything but satisfactory.

7537. Have you any statistics with regard to the number of deaf and dumb children in England and Wales?—I have not gone into the figures, but I believe it is one in about 1,400.

7538. Do you keep any register of the cases that have passed through your institution?—I have a full register of every case.

7539. Are you able to ascertain what has become of them after they have gone out of the institution?—I do not know that I could say what they are doing now, but I generally follow them up for a number of years.

7540. Could you tell me approximately the number of persons that have passed through your school, and who are now engaged in the ordinary occupations of life who speak by the oral system?—All the pupils that have been under my care speak by the oral system.

7541. What would be the number that have passed through your hands?—I could not give you the exact number.

7542. A hundred, should you say?—No.

7543. Fifty?—Not even so many as that; not perhaps more than 20.

7544. Twenty that have passed out perfect from your institution?—I would not say perfect.

7545. How many have come under your instruction during the time you have been director?—I could not give you the exact number; I should think about 30) perhaps, or something like that; between 20 and 30.

7546. Those 20 or 30 would have fairly learnt the oral system?—Yes.

7547. You have some out-pupils, have you not?—Yes, day boarders.

7548. What becomes of them after the school hours are over?—They go home to their respective parents.

7549. Do you find that they pick up signs from their parents?—I understand your question to point to this: Which is the best system, to keep them with their parents or in homes? My answer is that it entirely depends upon what kind of homes they have. If a boy or girl has a home presided over by intelligent parents who will take the trouble, and have intelligence enough and nicety enough to understand the gravity of the subject, they will take all possible pains with their children; they will watch them, and they will assist them, and they will have the advice of the very man who teaches them; and then nothing better can exist than going home and mixing with the world, because if we want to educate our children for the world we must give them a language spoken in the world, and they must see all that is going on in the world. The very best institution is a kind of barrack, therefore going home is the best thing. If, however, a child goes home to a squalid dwelling where the parents hardly deserve that name, and where it sees nothing but bad example and so on (I do not wish to enlarge upon that), of course it is much better for that child to be taken care of by intelligent teachers than to remain in a home where it is not properly taken care of.

7550. My question had not reference to moral teaching, but to the question of whether they picked up from their parents a language other than the oral language?—The moral question enters into it. If the parents be intelligent people they speak to the children, and I could quote to you an instance perhaps that would make it clearer. There is a boy who has been with me for about four years. His parents are well-to-do people, who have only got three children, and they take the utmost care and pay the utmost attention to their children. The mother went so far as to have private lessons of me in order that she might be able to manage her boy well; and the amount of language and knowledge that that boy has is a matter of surprise, not only to me, but to all who know him. The boy travels by himself, pays visits, goes errands, brings messages, and writes letters.

7551. I suppose that is an exceptional case, is it not?—It is an exceptional case, so far that the parents are an exception. Such parents are very rare and far between.

7552. I suppose they pay 60*l.* a year?—Yes, they pay 60*l.* a year.

7553. And, therefore, they are in a better position than most parents, and added to that they would learn

Mr. S. Schöntheil.

12 Mar. 1886.

anything they could for the benefit of the child?—Yes, the mother had special lessons

7554. If the children go to bad homes what is the result?—The children resort to natural signs, because the parents are much too ignorant, and too indolent to speak, which, of course, in the first stages requires a vast amount of patience, and, to a certain extent, skill, which is not at their command; and then they resort to making all sorts of signs, and those are imitated by the children, and instead of the institution deriving help positive injury is done.

7555. Do any of your advanced pupils ever assist in the education?—If you mean to ask whether they act as a kind of monitors or pupil-teachers, they do not.

7556. Are they not sufficiently instructed for that purpose?—I maintain that one child ought not to teach another.

7557. We have seen the great advantage amongst the blind in taking a blind person to educate blind children?—That is different altogether. I know them both and know what they are. The education of the deaf, or rather I should say the teaching of the deaf and dumb (because there is a difference between the education and the teaching), and the teaching of the blind are two utterly different things, and have no more to do with each other than the most remote objects in the world.

7558. As you have some experience of the blind, I would ask you whether you have any experience of deaf and dumb people working with blind people in workshops?—I have no experience whatever of that.

7559. Is it the case on the continent that the deaf and dumb are sometimes associated with the blind in their work, not in their education?—My opinion would be very worthless on that subject, because I have no experience.

7560. I understood you to say that you made use of the ordinary books that are used for normal children?—Yes.

7561. Is that the practice in all institutions devoted to the oral system?—In a good many it is; and where that is not done books are written specially for them, but approaching so approximately to the ordinary books that no deaf mutism is implied.

7562. What length of time does it take to train a child on the oral system to read an ordinary book fairly well?—That again depends entirely upon the skill of the teacher. In the hands of a skilful teacher the child will be able to do that much sooner than in the hands of an ordinary teacher. On the other hand, it depends also upon what you understand by an ordinary book. We have books of the first, second, third, fourth, fifth, and sixth standards. If you mean by an ordinary book an ordinary narrative, such as for instance, a fable of Æsop, or a story on that level, then I say that a child ought to be able to understand that quite well after four or five years' teaching. My pupils are able to do it after six years' teaching, and after seven or eight years' teaching they are able to transpose a plain piece of poetry into a fairly well done piece of prose writing of a story. The very task that I set my pupils this morning was to transpose into prose a little piece of poetry about the young mouse and the old mouse seeing a trap, and the young mouse speaking of the kindness of the people who put up such a nice dwelling; and I have no doubt that when I get home the thing will be ready for me.

7563. We have understood that you mix the male and female pupils together in the class rooms?—Yes.

7564. And also in the playground?—Yes.

7565. Do you not think that that tends to make them so far known to one another that they might eventually intermarry?—I am of opinion that it has nothing whatever to do with it, because if these people are taught well they become intelligent enough by the time that they are of marriageable age, to judge for themselves what is good and bad for them.

7566. (*Dr. Tindal Robertson.*) You said that you had had experience with regard to the blind; what system do you think is the best for teaching the blind?—I really could not give you an answer to that question, because I have not been practising the teaching of the blind, and therefore all my knowledge is theoretical; and one is really hardly justified in giving an opinion from mere theory. The opinion would be quite worthless.

7567. I presume that you are acquainted with the different systems?—Yes, I have an insight into the various systems, but as I have already stated, as I have not been practising in schools for the blind, I should not venture to express an opinion upon the systems. I may say that if ever I have a chance to teach the blind I have something in my mind which is positively different from all the systems hitherto in work; but that is also worthless because I have not tried it, and I should not like to speak about it without its being tried.

7568. To put it in a practical way, supposing that you had a blind child by which system would you have that child taught?—I could not venture to express an opinion upon that. I do not like to venture upon a field where I have only theoretical knowledge.

7569. (*Admiral Sir E. Sotheby.*) Is the education on the continent and in the United States entirely on the oral system?—To my knowledge it is entirely so on the continent. So far as my knowledge goes, in the United States of America there are still a good many institutions on the sign system.

7570. (*Chairman.*) But I suppose you do not know that from personal knowledge?—No, I have never been to the United States, but a colleague of mine, Mr. Grünberger, occupies a very prominent position in America. He came from the same school as myself, we stood opposite one another for years, he used to have the third class and I the fourth.

7571. Do you think that the Government of England is behind foreign Governments in giving support to the education of the deaf and dumb?—Undoubtedly.

7572. You have stated that the oral system is by far the best in every way?—Certainly.

7573. In respect to the pulpit or public platforms, where the audience cannot see the speaker, how does the oral system answer?—I should simply say that we are not expected to give our pupils hearing, which nature has denied them. It would be very wrong of a man who lost his leg, and got a very nice wooden leg which enabled him to walk, but not to dance, to say, "I will not have a wooden leg because I cannot dance with it." We help our pupils as far as we can, but to expect that a deaf person should follow a sermon at some considerable distance, would be simply expecting too much. It would be a small thing to ask a congregation or parish if they wished to have their deaf and dumb congregants attending divine service, to give them such accommodation in the church as would enable them to see the lips of the preacher, and to follow the sermon.

7574. But cannot a conversation be carried on equally as fast by the manual as by the oral system?—Yes, undoubtedly. The only difference would be this, that the audible speech is a means of general intercourse and accessible to everybody; while the manual system of communication is only given to a few, and the multitude are not able to understand it, neither to use it, nor to follow it.

7575. But you are doubtless aware that services are now performed entirely by the manual system?—Yes, I understand so. I will put it in a very terse form. Fancy a native of England being able at the same time to speak a foreign language; surely he is not worse off because he is able to speak a foreign language in addition to his own, than another person who is only able to speak his own native tongue. If your deaf and dumb pupils be brought up and taught efficiently on the German system, if you think that these churches, and so on, carried on on the manual system are doing a great deal of good, and are to exist, let the deaf and dumb people then acquire, as in fact they do acquire, the manual system and know both. The manual system is acquired in a few minutes so to speak. I venture to say that my pupils would acquire the manual system in half an hour's time.

7576. Is not that a great advantage?—Let them avail themselves of it; we do not object to their availing themselves of it after they have been brought up properly. If a deaf child is brought up and taught on the manual system he will positively never acquire audible speech efficiently. The thing will be a kind of ornament only.

7577. But do you mean to say that adults, for instance, who have been in the habit of talking on the manual system cannot adapt themselves afterwards to the oral system?—No, positively never; while, on the contrary, if the child be brought up on the oral system, and be thoroughly acquainted with that mode of communication, which is general, he will have no difficulty whatever in

Mr. S. Schöntheil.

12 Mar. 1886

acquiring the manual system in an hour's time or two hours' time.

7578. You know from experience that a person who has been brought up on the manual system cannot adapt himself to the oral system?—Yes, perfectly; I attach my name to that, because a child who is once used to look for the movements of the fingers, and who talks with his fingers, will never talk with his mouth. As I put it in one of my speeches, nature seems to have destined the mouth to speak and the hands to work, and not the reverse.

7579. You have examinations at your college?—Yes, we have.

7580. Are the examiners gentlemen outside the institution, or are the examinations carried on entirely by yourselves?—Our examinations do not deserve the name of examinations in the sense in which you use the word. Our examinations are what we call (I am sorry to reproduce a name so peculiar) "shows," to elicit pounds, shillings, and pence. When we want money then we have an examination, and then the public comes to the show, as they call it, and those who admire what has been achieved generally open their pockets; and the admiration is not the chief object, but the opening of the pockets.

7581. Would you not elicit more sympathy from outside if you had an external examiner?—We do not object. We have visitors who come to see what we are doing.

7582. You are in the habit of constantly speaking to people who are deaf and dumb; would your pupils be able to answer as well to a person who is not in the habit of speaking to them?—Yes, with a little more difficulty than in reading my lips after a little time.

7583. You have 31 children at your school, I think?—Yes, at present.

7584. Could you undertake a greater number if you had the means of enlarging the building?—If we enlarged our building of course we could.

7585. To what number could you extend it?—To any extent. We have about three-quarters of an acre of ground there.

7586. Could you yourself supervise a much larger number of children?—Yes, I could supervise an institution of any number, really, if I had the proper assistance *ad infinitum*, not a thousand I suppose, but within a reasonable limit.

7587. Is there a school or institution for the deaf and dumb in your locality?—Not very near; the nearest would be in Brondesbury; that is a private institution.

7588. Would you object to ordinary deaf and dumb people being taken in provided that you had vacancies?—May I ask what you mean by ordinary deaf and dumb people. Do you mean gentiles?

7589. I do?—That is a question which really does not belong to me, but which is for my committee to decide.

7590. Would it not be better if the girls were taught more domestic work?—They are taught domestic work.

7591. In what way?—I allow them to go down whenever the matron requires them, and to assist in the kitchen, and making beds, and so on.

7592. Do you teach arithmetic and writing together or which do you teach first?—You cannot begin with arithmetic. Arithmetic has to be clothed in the garment of language, and you cannot put on a garment until you have got it. We have to teach language first, and it is only when the children are advanced enough in language that we teach them arithmetic.

7593. (*Mr. St. John Ackers.*) Would it not be possible for one to go to a meeting and hear a sermon, or a lecture, and give any deaf person, taught orally, the substance of what was being said by word of mouth without anybody knowing that you were speaking to the deaf person, that is to say, speaking without sound?—Perfectly possible.

7594. So that if any orally taught deaf person goes to a lecture, or to a sermon, and has a hearing friend with him, he is able to get the pith of the discourse of the lecture?—It is perfectly possible. In fact I may say in illustration of that, that we have a synagogue attached to our institution; the congregrants chiefly consist of outsiders; and those of my pupils who are able to read Hebrew (you know that our service is all conducted in Hebrew) are sitting on one side, whilst my own seat is somewhat raised. All that I need do is to turn so slightly that nobody else observes it but my own pupils; and they follow the service beautifully, because I tell them exactly what is said.

7595. You are speaking of an ordinary Jewish service;—I am speaking of the service in my own institution.

7596. Have you any statistics kept of the deafness of your children?—Yes.

7597. Could you send to the secretary of the Commission such statistics, giving the degrees of deafness and the causes?—Yes, I can supply them to you now. They are all in our report. It is in the latest report which I believe Mr. De Castro supplied to his Lordship.

7598. And as to the eye sight also?—No.

7599. You stated that there is not much difference between the salaries of head masters and assistant masters in the German Schools, perhaps only about 50*l.* or so; but do not the head masters also receive board and lodging which the assistant masters do not receive in many instances?—I do not think that they receive board, but they receive lodging; and more than that, they generally have very fine apartments set apart for them, and they live in a very nice style; and it would be very well if the English would imitate them in that respect. They have a suite of rooms, of what I should call a most elegant character in most cases. They are not boarded but they are lodged.

7600. It is hardly necessary, perhaps, to ask this question of you, but there is a general impression that teachers of the deaf and those who want to speak to the orally taught deaf should be shaven; was it your experience of the German teachers in that respect?—That is quite an exploded idea. And let me say (because it is a very general mistake) that the children never read from the lips. Lip-reading is somewhat a misnomer. Children read from the whole expression of the face. Face-reading would be a much better term than lip-reading. In addition to that, I should say that the lip-reading is carried on somewhat in the same way as our own reading. Represent to yourself for one moment the reading of a child who is beginning to read, how spasmodically that is done. Why? Because that child reads sound after sound. A person acquainted with the language and reading fluently does not read sound after sound, but when we begin a sentence we take in the whole at a glance, and know at once what is the end. We get what we call total impressions, and not single impressions. That is exactly the case with lip-reading. When I say to one of my advanced children, "What have you been doing?" such a child knows at once what I am going to say before the sentence is completed; and therefore it is quite immaterial whether the speaker be furnished with a moustache or not. I could quote most telling instances. A colleague of mine who is at present at the head of one of the very prominent institutions in Vienna, Mr. Lehfeld, has one of those very long over-hanging moustaches, and the children read from his lips very fluently. He stood in the same room with me for years; he had the upper class, and I had a lower class.

7601. You spoke of pedagogy; is that understood by the assistant teachers of this country?—They hardly know the meaning of the word, not to speak of the substance that it carries.

7602. Is the teaching of articulation without making lip-reading the essential part of the system, in your opinion, the pure oral system?—No, certainly not, as I understand it. Teaching to speak with just a slight cultivation of the power of lip-reading is doing the thing not half, but hardly the hundredth part. I may call your attention to the paper which I read on the subject in which I strongly dwelt on that point. Lip-reading is the very backbone of the German system; and let me follow that up by making one or two remarks. Good lip-reading will only be possible in those schools where the articulation is a natural one. Where the articulation is an unnatural one, the children will not lip-read. Therefore, lip-reading is a consequence of really good teaching, and the things balance one another and help one another. If the articulation is good the lip-reading will be fluent; if the lip-reading be fluent the command of language will be greater, because the communication will be easier. What is done in a bad school in that way in three hours is done in a good school in half an hour. From the cultivated teacher or from the cultivated persons who surround the deaf and dumb child there will be a perennial flow of ideas to the deaf and dumb child, and that child will acquire a fluent command of language just as

Mr. S. Schöntheil.

12 Mar. 1886.

the hearing child who hears the same word learns it. Therefore good lip-reading will facilitate the command of language as it is in its turn facilitated by good articulation. By the power of lip-reading the German system stands or falls.

7603. It has been stated that the pure oral system, while able to teach the children of well educated parents, is not of universal application for poor children; will you give us your practical knowledge on that subject, both abroad and in this country?—I must say that I cannot see for the life of me what pounds, shillings, and pence have to do with the progress or want of progress of a deaf and dumb child. I should say that the intellect has no banker. The two things have nothing to do with one another, except to this extent, that if the deaf and dumb children reside with their parents, then I should say that well-to-do parents, who are supposed to be more cultured and have more time to devote to the elevation and cultivation of the minds of their children, will further their children in their studies; while the poor, whose time is taken up with their manual work, cannot devote any time to their children, and, therefore, those children will be at a disadvantage from that point of view But so far from there being a difference between poor and rich children in the way of attaining knowledge, if I may be permitted to express myself as a Jew, I should say, as one of the wisest men said, "Take special care of the "children of the poor, for they are the promulgators of "knowledge."

7604. It has also been stated that the pure oral system is unable to educate children of as low and intellectual standard as can be educated on the sign system; will you give us your experience upon that point?—I should say that "a child of a low and intellectual standard" is a relative expression; it is not defined. If you say that a child is idiotic, then I say that child being idiotic wants a teacher who is sufficiently able or educated to grapple with that difficulty. If I had to teach idiotic children I should know how to teach them, because I have learnt how to teach idiots; but the ordinary teacher will not be able to teach an idiotic child. If a child on the contrary is not idiotic, but an ordinary child who is not very bright, but is accessible to teaching, or able to be taught, then I should think that he is just as able or better able to be taught on the pure oral system, which certainly tends much more to develope the mind, than on the manual system, which tends less to develope the mind.

7605. (*Mr. Few.*) I gather from your answers that under any circumstances, and in any state of mind of the child, whether it be of a strong mind or of a feeble mind, you are entirely in favour of the oral system?—Quite so.

7606. And that in your opinion no state of circumstances as regards the child's mind would arise in which the manual system would be preferable for that child in after life to the oral system?—I can only repeat, in reply to that question, my answer to the question that was put to me by Mr. Ackers, that if the child be at all able to be taught then the German system would be the better way to teach him than the manual system.

7607. With regard to what has been suggested on the question of State aid, your institution, I suppose, would be happy to have State aid in the matter of pounds, shillings, and pence?—That is a question which behoves to be answered by my committee again, as I have nothing to do with the pounds, shillings, and pence, mine being entirely an educational department. But at the same time these two departments to a certain extent touch one another in this way. If the Government attempted, as I do not for a moment suppose it would attempt, to interfere with the religious instruction of the children, I presume that my committee would not agree to it, but would rather forego the help that you give, since that which constitutes it paramount as an institution, which otherwise would not be required, would be gone; if it was not a Jewish institution we could send our children to other institutions.

7608. I wish for the moment to leave out of consideration the question of religious instruction; but as regards the daily instruction on earthly things, reading, writing, and arithmetic, and so forth, you have, I suppose, a curriculum which you work on week by week?—Day by day.

7609. And, as a rule, I suppose you select your own books for your own course of instruction?—Yes.

7610. Supposing that State aid were offered for the support of your school, and that it were made a condition that, say, an inspector from one of the Government offices should have supervision of your school with a power, if he thought well in his judgment, not in yours, of altering your curriculum, or propounding to you a new set of books, so that your freedom of action as headmaster was clogged, either as to your curriculum or as to your books, do you think it would be wise on the part of your committee to accept State aid?—That entirely depends I should say upon the procedure of the Government. If the Government appointed, as it ought to appoint, what we call a thorough practical school-man, well adapted to supervise other school-men, no schoolman would resent taking his instructions or complying with his advice. While if the Government were so shortsighted as to appoint men who were not qualified to superintend men who know their work well, then I should say that the thing would create a great deal of ill-feeling, and I presume that it would not work smoothly, and ultimately the course that would be taken is plain, the committee would say, "We would rather "give up the pounds, shillings, and pence, and do our "work efficiently."

7611. (*Sir Henry Selwin-Ibbetson.*) That is to say, I suppose, that you would see no objection to the inspection of your school by a qualified person, so long as that inspection went only to the length of testing the education given, so as to ensure that the Government grant was properly applied?—I should have no objection whatever.

7612. So long as there was no undue interference with the teaching that was going on properly?—Exactly.

7613. But such of your evidence as I have had the pleasure of listening to, shows that you believe that, at present, the system adopted here is a failure for want of sufficient support in the teaching branch?—I do.

7614. And that money, either from the Government or in any other form, applied to a proper system of training teachers for the future, would be almost the best mode of bringing about a proper condition of our deaf and dumb population?—That is my opinion.

7615. The children being educated by those teachers upon the oral system?—That is quite my opinion.

7616. The oral system, in your opinion, must be taught first, if taught at all; and the child can afterwards avail itself of other systems when it is properly grounded in the first; but it cannot avail itself of the oral system if it has previously had the other teaching?—Yes, that is what I meant.

7617. Therefore, a great deal, in your opinion, I suppose, depends upon the homes of the children and upon whether the home influences would encourage and continue the oral system, or whether they would on the other hand militate against it, by bringing in other systems to interfere with it during the teaching years?—Yes; that opens the question of day schools and boarding schools, and I should give the same opinion as I have given on several occasions publicly; I think the last occasion was at the Health Exhibition, when I spoke somewhat in discussion with Sir William Dalby on that point. The prevailing opinion of men of weight is this: In villages and small towns where proper homes can easily be provided for these deaf children, not more than one being in a family or, perhaps, two (but, one would be the best), day schools are very much preferable to boarding schools. On the other hand, in large towns like London where those who are of such a social level that one could expect them to give these children a sound good home education do not take such children, you would have to board them in a stratum of life where they are taken for the mere gain of a shilling or so a week, and where little attention is paid to them, and where, in addition, they would be exposed to all the dangers of the streets, it is beyond all doubt that boarding schools are much preferable.

7618. You would concentrate the children in large towns in schools for the purpose, whilst you would approve of their being day scholars in the rural districts?—Yes.

The witness withdrew.

Adjourned to Wednesday next at 12 o'clock.

32, Abingdon Street, Westminster.

Wednesday, 17th March 1886.

PRESENT:

LORD EGERTON OF TATTON IN THE CHAIR.

ADMIRAL SIR E. SOTHEBY, K.C.B.
W. TINDAL ROBERTSON, ESQ., M.D.
B. ST. JOHN ACKERS, ESQ.

F. J. CAMPBELL, ESQ., LL.D.
E. C. JOHNSON, ESQ.
ROBERT MCDONNEL, ESQ., M.D.

CHARLES E. D. BLACK, ESQ., *Secretary.*

MR. ARTHUR KINSEY examined.

Mr. A. Kinsey.

17 Mar. 1886.

7619. (*Chairman.*) You are the Principal of the Training College for Teachers of the Deaf and Dumb at Ealing?—Yes.

7620. Since when have you held that office?—The school was opened in 1878, but I was formally appointed by the committee in 1877.

7621. What had been your previous connexion with the subject of the teaching of the deaf and dumb?—Some few years before that a member of this Commission wished to engage a teacher of the deaf and dumb on the pure oral system, and I was introduced to him, and in order to qualify myself I visited various institutions for the deaf in this country and on the continent and in America. But first of all I may say the gentleman to whom I refer had a very large experience of his own, which he communicated to me in reference to all matters connected with deaf mute education in this country or on the continent, and in the United States and Canada. Of course, by this country I mean Great Britain and Ireland; further I had the benefit of all his notes, his counsel and advice, and so forth. After spending some two months or so with him I visited certain English schools in order to see what was being done in those schools, and then I afterwards visited various institutions on the continent.

7622. Those schools in England being on the sign system?—Not all of them. I visited schools conducted on both systems. My general instructions from this gentleman were to make myself as fully as possible master of everything connected with deaf mute education, to make myself acquainted with the sign system, the combined system, and the oral system, but to study particularly the oral system, because that was the system which he wished to get adopted in this country. Now there were at that time in England (I am speaking now of the year 1875) three German teachers, at least two were Hollanders and one was an Austrian, who were teaching children on the oral system; there were also two private schools teaching more or less an oral system, and one of those institutions I may say was called a training college, but apparently they had not trained teachers except teachers for use in their own school, as there were none available for the general public. Hence it was that the gentleman to whom I refer conceived that there was an urgent necessity for a training college that would systematically train teachers upon the German system.

7623. Was there no training college at that time?—There was what was termed a training college at that time in Fitzroy Square which was established in 1871, and the school in connexion with it was established in 1872. That college was applied to for teachers, and there were none forthcoming.

7624. It had not been established long enough, I suppose, to provide them?—Later on it was again applied to and there were none to be had then. That establishment commenced teaching deaf and dumb children as early as 1864, but it was only a school for Jewish children. Afterwards the scheme was enlarged to take in children of all classes, and then it was that a proposal was made to train teachers, but beyond training teachers for their own establishment, we cannot find any evidence that they had done more, because when they were applied to there were no teachers to be had. It was on that account that this gentleman undertook to establish a second training college. He himself and another gentleman were obliged to send to America for teachers, they would not take foreigners, not liking the foreign accent and the imperfect speech. They could not get English teachers and they were obliged to send to America for instructors; but in America they had only an imperfect kind of system. Then to continue my statement of what I did in order to qualify myself as a teacher of the deaf, having examined these schools in England, I studied at the celebrated school of Osnabrück, in the province of Hanover, which was under the direction of one of the ablest teachers in Germany on the advanced system, Herr Rössler. I may say that in Germany we have varieties of the German system; some are old fashioned, some are more advanced, and others are in an intermediate stage. Herr Rössler was quite an advanced teacher. He was a pupil of the celebrated Professor Moritz Hill of Weissenfels. I was with this director for a little over 12 months.

7625. You spoke German, of course?—I spoke German. I had been partly educated in Germany. I spent all my time in the schoolroom from early morning to evening, in addition to which I received a theoretical instruction by private lessons from the director himself, which instruction I was enabled to have by the liberality of the gentleman who sent me there. I may say *en passant* that money certainly was not spared in fitting me for carrying on the work for which I was intended, and if I failed it was my fault, not his. The staff at the institution to which I refer was of an exceptionally high standard. When I tell you that three, if not four, out of the staff of eight are now heads of important institutions in Germany, you will see that the director had working under him at the time that I was there a very exceptionally good staff. At Osnabrück I may say I studied in all the classes, and I taught in all the classes after I was first permitted to teach. After I had been there six months I was permitted to practise in the classes, from the lowest to the highest class, and when I left I received testimonials from the director and his head masters as to my fitness to introduce the system into England. Then I spent between three and four months after that in visiting the celebrated schools. I do not say I visited all, but most of them, which had been marked out for me by this gentleman. I examined into the systems to see in what way they varied from the training I had received. After I left Osnabrück I first went to the school at Hildesheim, also in the same province. Then I went to the school at Leipzic, which is the chief school in Germany, founded by Heinicke, and which is the Mecca to which most persons go who want to find out anything connected with the education of the deaf and dumb on the speech system; but in my estimation it is the most inferior school on the continent. That is the great school to which everybody goes who knows nothing about the matter, and from which they come away with wrong impressions altogether; it is a very poor school. After I went to Leipzic I went to Dresden, and saw the institution there. I then went to Vienna and visited the Imperial Institution there, under Herr Venus, and also the celebrated Jewish School in Vienna, under Dr. Deutsch, where I certainly saw some very surprising results, more surprising than I had seen in any other school. That was owing to the fact that the director, Dr. Deutsch, was a most brilliant teacher himself, and he confined himself to some exceptionally intelligent children, and gave the whole of his genius to making them very accomplished scholars. That is a great mistake, there is no doubt about, because it has a tendency to make one believe that more can be done on the system than really is the case. Then I went to a capital school near Vienna, kept by a gentleman

Mr. A. Kinsey.

17 Mar. 1886.

named Herr Lehfeld, who was a pupil of Dr. Deutsch, and afterwards I went to the school at Riehen, about four miles from Bâle. I should like to dwell some few minutes upon that school. It is the most celebrated school on the continent, or rather was; unfortunately Mr. Arnold, who made it so celebrated, is dead now, and it has fallen on bad times. I was so struck with the teaching at Riehen and the results that I spent a month in the little town, with its population of 2,000 peasants, and I certainly never saw anything to equal the results there obtained.

7626. Does it go on still?—Yes, but it is not anything like so good a school as it was since the death of Mr. Arnold. The speech was something extraordinary; the lip-reading was marvellous; and I never observed such discipline in a school in my life as I saw at Riehen. I will give an instance to show the results attained at that school. When I reached Riehen in the evening I sent my card over to the institution with a message asking whether it would be convenient for me to call the next morning. A little girl came to me about 8 or 9 o'clock and introduced herself to me. My practised ear told me she was deaf, but an ordinary person would never have dreamed that she was deaf, She lip-read from me as easily as you understand me now. I sent purposely a long involved message by her to the person who had sent her, and I inquired the next day how the message had been delivered and what she had said, and I found she had repeated the message perfectly accurately. I had a conversation with this little girl I daresay for about 15 minutes; she was not a show pupil like those pupils that I have alluded to at the Austrian Institution; she was one of a class of pupils, they were not all as good, but they were all much above the ordinary standard.

7627. How many were there in the school?—Forty, with four teachers. Mr. Arnold, the head master, was the chief teacher, his great success was due to his looking after the children very carefully out of the class-room as well as giving them instruction in the class-room. If you teach children to speak well and then allow them to go by themselves and do not encourage them to make use of their speech in ordinary daily matters you will not develop their conversational power as you will if you keep them to lip-reading and constant talking.

7628. Do any of the children communicate by signs among each other in schools where the oral system is taught?—No.

7629. Is that prohibited?—Yes, I have seen signs used in some of the German schools, that is to say natural signs, not artificial signs, signs which originated with the children at home and which they had seen used by their parents and those who had dealt with them before they were educated, but in the school of which I am now speaking there was no pantomime. no gesture, the whole thing was done by word of mouth. I was so pleased with that school that I exceeded my instructions and remained there a whole month and made myself, I think, master of Mr. Arnold's system, which I found to differ somewhat in its details from any other system that I had seen. I will not trouble the Commission with those details.

7630. Was instruction given there in the anatomy and physiology of the vocal organs?—No, there were no students, it was not a training college. At Osnabrück, as I have stated, I went through a course of private lectures which embraced the anatomy and physiology of the throat, the ear, and a portion of the nervous system. It struck me that a knowledge of those subjects was absolutely necessary or very necessary for the teachers of the deaf.

7631. You found it very useful?—I found it more than useful.

7632. Indispensable?—Yes, I think I may say indispensable. To continue my account of my training, after I left the school at Riehen I visited the National School at Paris. It was at that time conducted on the sign system. I may also mention that the head master, Mons. Leon Vaisse, lost his position there because he desired to introduce the German system into the institution. It was after the terrible struggle in 1869 and 1870 with Germany, and nothing German of course found any favour in the eyes of the French; M. Leon Vaisse accordingly lost his position; but I am pleased to tell you that now they have made him honorary director of his own institution, and they have adopted the German system. I visited that school, of course I did not take the same interest in that institution as I did in the other institutions I have been speaking of. I then saw a private school at Passy, near Paris, of which Mons. Hondin was the eminent director, he is unfortunately dead. I saw there some admirable teaching on the oral system, and there I saw French children being taught to speak and lip-read the French language.

7633. That is more difficult than German?—Yes, more difficult than German, and more difficult than English, and far more difficult than Italian. I went to some Italian schools afterwards. The Italians were then making their great effort to establish the system, and Italy now has admirable schools conducted on the oral system. Then I was directed to cross the Atlantic and see what was being done in the United States.

7634. In what year was that?—1876; it was the autumn of 1876. The first thing I did there was to place myself under Professor Graham Bell. You may possibly have heard his name mentioned in connexion with the system termed visible speech, invented by his father a great many years ago, which was a system of universal alphabetics. I believe it was offered to our Government, they did not see their way to purchasing it; it was also offered to several other Governments, and they did not see their way to purchasing it, and so it remained in abeyance till Professor Bell adapted it for the development of articulation in deaf children. It was in general use in America at the time I visited that country in those schools which were conducted on the oral system or some modification of it. The gentleman whom I must again refer to directed me particularly to make this visible speech system a special study, and to draw my own conclusions as to its value. His own child was being taught by means of visible speech. At that time I may say that Professor Bell was inventing his celebrated telephone. I was in Boston about a month; I attended the Boston school, the Horace Mann school for the deaf taught upon the oral system, and from there I went to the Hartford Institution, the first one that was founded in the United States which was conducted on the sign system, a little articulation being also taught, and there it was very badly taught indeed. One of their teachers said, "I do not think much of the articulation system." I said, "Neither do I if you put it that way, a system "which merely teaches articulation to a few children "for a few minutes a day is not a system to be com-"mended at all." That was the practice at Hartford and that is the practice in many of these institutions which profess to be teaching speech. They were teaching articulation, it is true, but it was mechanical articulation, of no use or value to the child. This particular teacher complained to me that he had wrecked his constitution in the course of five years in teaching articulation. The answer is very simple; you must have had either a very poor constitution, or you have been teaching very improperly, because there are teachers abroad who have been teaching 50 years articulation, and they are just as hale and hearty as ever. The process of teaching articulation at Hertford was certainly very painful. At the time of my visit two ladies were engaged in teaching it, and no doubt their constitution was going. The teaching used to consist of mechanically uttering vowel sounds all day long to a different set of children; two children would be brought in at 9 o'clock and would be kept for 15 minutes saying "ha," "ba," "ta," or whatever it might be, imitating the teacher; then they would be sent out and would not come back till the next day. Then two or three more would be brought in, and the teacher would go through the same process with them. Then afterwards I went to the Clarke Institution in Northampton, in Massachusetts, which is the best known institution in America, and which is handsomely endowed; all the teachers there are female, except those employed in technical training, teaching trades and what not. There they were using the system of visible speech, but I cannot say very much of that school because there were so many of the pupils who were semi-mute and semi-deaf; those, of course, it is much easier to teach than those who are congenitally deaf and dumb, but they did not excite the same great interest in me. I saw a little private school on the River Mystic, in Connecticut, where a self-taught genius, Mr. Whipple, was at work teaching deaf and dumb children on a system somewhat akin to Professor Bell's visible speech. I will not trouble you with what visible speech is, but the general idea is that, whereas our letters do not visibly represent any particular sound, being quite arbitrary, you should have speech symbols, which speech symbols are supposed to give diagrammatically the positions of the organs of articulation in the utterance of any given sound. I will
