give an illustration (drawing a diagram showing a semicircle to represent the lips, a line across to represent "Shut your lips," and an arrow head to mean "Open your lips"), and emit a puff of breath, this would represent the power of P). This Mr. Whipple at Mystic, in Connecticut, had a system of his own father's invention, somewhat akin to this, only it was an improvement in point of simplicity on Professor Bell's system so far as teaching the deaf is concerned.

7635. Is Professor Bell's system still taught in America?—Yes, my own conclusions were altogether unfavourable in regard to the use of visible speech in teaching the deaf, and I told him so. At the time we were very good friends and are still, but I may say this, that those conclusions of mine have been borne out by persons of experience who use visible speech, because it is now in disuse in those schools in the States where it was formerly used. Professor Bell, whom you are probably aware is now a very rich man, has a little school of his own in New York, and he retains his system of visible speech in the teaching in that school; he is constantly making experiments as he says. Then I went to a school at New York for the improved instruction of deaf mutes. People still persist in calling children who speak mutes, I am sorry to say, both in America and in this country; we find that the public are not yet advanced enough to understand that when we speak of our own children as deaf who at one time did not speak they are not necessarily dumb; if we simply spoke of them as being deaf the idea would be that we were speaking of children who had lost their hearing when they were eight or nine years of age, they do not fancy that we are speaking of a class who once could not speak. This school for the improved education of deaf mutes was conducted by a German teacher from the Jewish School at Vienna. That was unquestionably the best school in the United States on the oral system. I am sorry to say that this gentleman has thought fit somewhat to modify his practice of teaching now he has lived in the States so long that he has begun to imbibe some American prejudices. Long ago he came to the conclusion that the German system was no longer a sufficient one for the American deaf, that they must have a national system of their own, that whereas the German system could only teach up to a certain point these American children wanted a great deal more information than could be conveyed by the German system. How utterly wrong he was in his estimate of the capabilities of the German system I need hardly press upon this Commission. I remember the kind of teaching that was given both at Osnabrück and at Dr. Deutsch's institution at Vienna, and at Riehen. They were teaching all the ordinary subjects taught in a middle class school, in addition to which they were teaching science, and in my own school we are teaching now mathematics and Latin, and if we only had time we would be teaching modern languages as well. When I was at one of those schools abroad I conversed more or less well with several deaf mutes in three languages, they lip-read and answered, and we carried on our conversation in more than one language, so you must not suppose for a moment that the German system is available for the acquirement of only one language, and that only in a limited degree; once you acquire a language you can acquire anything else. The amount of knowledge that may be acquired is merely limited by the time of education, and your pupil's ability. Then I visited the great institution in New York, at Washington Heights, one of the largest, if not the largest in the world, with something between 300 and 400 pupils the teaching all being conducted on the sign system. After this I went to Washington. There is a large National College established at Washington, which is conducted strictly on the sign system, when I say the sign system I mean also finger talking, that is always used, reading and writing is common to all systems only it is of a different quality in the sign system schools to what it is in the German system schools. In this National College there was a university course going on, young men who had been trained at other schools came there as one would go from a school to a university, and attached to this National College was an elementary school called the Columbian Institution where the pupils were also being taught by signs. In that college, as professors, there were no less than four gentlemen who were deaf, but who were speaking persons, that is they became deaf in adult age, they would speak to their hearing colleagues and their hearing colleagues had to answer back to them on their fingers or by signs. I said, well if you cannot teach speech you might learn lip-reading; your hearing colleagues might then talk with you instead of going through the cumbrous process of making signs; but I believe up to this day those gentlemen are still dependent on the hand alphabet and signs in order to communicate one with the other. There is no reason for it at all. I think if I remember rightly those are all the institutions I saw in America; when I say saw them, I wish the Commission to understand that I not only saw them but I used to spend day after day in watching the progress of the instruction and taking my full notes and afterwards discussing with the different professors the advantages and disadvantages of the system they were using. Before leaving the American schools I will say this of them, that we certainly envy them very much their appointments, the money with which they are endowed, the assistance which they receive from the State. The appointments, I might almost say the luxury, of all the institutions of New York are certainly a matter to make us feel envious about; but as for their system, I think with all their liberal means they ought to have adopted the German system many years ago. Then, too, there is another point to be borne in mind with regard to American education. The ordinary course in an institution on the continent is about seven or eight years, in some districts it is only six years; but the general consensus of feeling is that there should be an eight years' course at the very least, and a limited number of pupils to a master, 10, or some advocates would say eight. I believe I am correct in saying that in America a child may receive a free education, ending with his university course lasting over about 16 years.

Mr. A. Kinsey.

17 Mar. 1886.

7636. You mean from 6 to 22?—Yes, or 7 to 23.

7637. Eight years' elementary education is provided by the State and eight years' university education is provided by the National Government?—Yes, I believe that is the case. That finishes my description of my visits to the American institutions. I returned with a mass of information and notes and so on to this country, and was engaged then with the founder of this college for several months in organising the scheme and establishing the society.

7638. What year would that be?—I am speaking of 1877. We were engaged for some time in getting together the society, in interesting friends, and in giving lectures and so forth. My leisure time was then employed in studying anatomy and physiology, feeling the value of knowledge on those subjects. I was most interested in the course of lectures which I had gone through at Osnabrück; but I felt that I should like to clear up many points and make myself familiar with the matter. At that time I was mixing constantly with medical students, a great many of my friends were medical men, and through their kindness and interest I got the *entree* to the School of Anatomy attached to King's College Hospital, and also to the Museum of the College of Surgeons. I had access to their library and I attended at the British Museum, and so forth, and made myself as far as I could, as a layman, master of anatomy and physiology as applied to the organs of speech, that is to say, the organs of articulation, vocalisation, and respiration, the nervous system, the organs of hearing, the circulation of the blood, and the organs of vision. Those subjects are taught at Ealing.

7639. Do you teach them yourself?—Yes. Our society was established in 1877, and our school was opened in May 1878. If I may be permitted to say so the college was established, because we could not get any English teachers in England at that time.

7640. With regard to the operations of the college, in the first place, what number of teachers have you trained?—34 have received our certificate. Our course is a minimum of one year. We found it was necessary to have a preliminary examination, because the popular idea in this country used to be that anybody was good enough to teach the deaf. I shall have to refer to that presently. We thought differently. We came to the conclusion that for a teacher for the deaf you want in the first place a person who is a capable teacher of the hearing; and, secondly, he must have a special training to enable him to teach the deaf. We found persons applying to us to come in as students who were quite illiterate.

7641. What qualifications do you require?—That they should show by a preliminary examination before entering that they are capable persons; that is to say, that they had a good general education.

7642. Would you accept elementary teachers as being sufficiently qualified?—No; I do not think we should.

Mr. A. Kinsey.

17 Mar. 1886.

We should require them to pass our preliminary examination.

7643. Would you accept one who had passed a university examination?—Yes, any certificate of that kind we should accept without the preliminary examination, the Oxford and Cambridge Local College of Preceptors. We have had a great many applications; and though it appears in our Seventh Annual Report that we have, in the course of our seven years' existence, certified only 34 students, two of whom are honours students, I would say that no less than 100 have come under my hands in one way or another; of those 34 have been trained absolutely at the college and received our certificate; others have had to withdraw from one reason or another; some have failed, and a considerable number were rejected on the preliminary examination. The minimum course is a compulsory one of 12 months' attendance at the college, a minimum course of two years would be far preferable, and the student witnesses the teaching in each class. We have now a small school of 22 pupils, but still they are of different grades, those of this year, the year before, and so on, back to the year of our establishment in 1878, the teaching in each class is, of course, of a different character, the subjects taught are different. The students take their notes of the teaching and have matters explained to them which they have not understood in the course of the lesson. After one term of three months, or perhaps by the middle of the second term, they are set to practise teaching under the eye of a qualified assistant, myself, or any qualified assistant who happens to be at work at the college at the time. Their other education is given to them by means of daily lectures. Those lectures embrace for the first term, first, a general knowledge of the deaf mute as an individual, and as a person afflicted and requiring special educational treatment. I do not say special treatment in any other respect, but special educational treatment. Secondly, the history of deaf mute education. Thirdly, a knowledge of the various systems that have been employed, and are employed in teaching the deaf, and their respective advantages and disadvantages. We do not limit ourselves to our own system; we dip rather deeply into other systems, not in order that our students should use them, but rather that they should avoid them. Then a large proportion of the term is taken up with the study of the mechanism of speech. I left out one rather important item when I was giving the course of instruction that I went through in Germany. I was taught the mechanism of speech in Germany, but then it was German articulation which had to be adapted to English speech. Now you will remember that I mentioned the fact that in those early days, 1872 to 1875, the teachers who were capable teachers of the German system were foreigners, they had not adapted the German articulation or the Dutch articulation to the English language; and, as an instance, I will give you an illustration of the teaching which even now goes on. In teaching English deaf children the word "ape," "a" will be written on the black board and the sound given will be "ah"; then comes "p," taught as a vigorous puff of breath, which, with the "ah," sounds like "ahp"; we do not recognise that unless it is the Cockney pronunciation of "harp"; but then a stuffed monkey is brought in and we find it is the word "ape," but the children pronounce it "ahp." I will not trouble you with more illustrations. After being taught in Germany the mechanism of speech sounds, I had to adapt the sounds to the English language. The lectures upon the mechanism of speech sounds at our college occupy a very large portion of the first three months. The next three months are exclusively taken up with anatomy and physiology, entirely confined to the upper part of the body, and embracing the organs of respiration; we do not go further than that; we have nothing to do with the limbs; we devote ourselves entirely to the head, the chest, and the throat.

7644. You do not teach calisthenics, or anything of that kind?—No, not to our students; our children are all drilled and taught single stick, and so on, and just now I have been requested to have a dancing class formed. We should do a great many things if we only had more money; the want of money is the thing which is troubling us at the present time. I am hoping to have lectures every week or every fortnight in our big hall when we get it. Our children have plenty of out-door exercise, foot-ball, cricket, hockey, and so forth, and they are regularly drilled in fine weather twice a week; they have fencing exercises, Indian club exercises, and dumb-bell exercises, and athletic sports also. To continue what I was saying with regard to the course of teaching—I had got to the end of the second term— I will now go the third term. The students in the third term are taken through a course of lectures on sound, on visible speech, and one or two methods of developing articulation, and, finally, the origin, structure, and development of language, more especially as applied to the deaf. This occupies a minimum period of 12 months; we refuse to examine them under 12 months.

7645. Who conduct the examinations?—The examinations are conducted by five examiners appointed by the committee of management; three are appointed for the general examination, and two are appointed for the special examination in anatomy and physiology. The two medical examiners represent both branches of the profession; one is M.D. and F.R.C.P., &c., and the other M.R.C.S. and Lecturer on Anatomy and Physiology at one of the London hospitals. They receive the examination papers, but know nothing of the students; all the papers are sent in under a *nom de plume*, or a cypher, they are examined and marked by the examiners and sent down to us, the other examiners, I being one. The founder of the society has acted as another, and I will say this of him, I suppose he is hardly to be considered a layman, inasmuch as he has been actively engaged in teaching his own child for many years past; and, as far as the German system goes, probably knows more about it than any head master in the country, therefore is a very competent examiner. The other, who is a lady, has hitherto been a professional teacher. She has been engaged in the work of teaching 22 years past now, and has always been desirous of teaching on the oral system. She began teaching with a few signs and the manual alphabet, but abandoned them as soon as she possibly could; then took to the Bell system, and abandoned that; then took to the German system, but I am glad to say has no intention of abandoning that. The students are examined by papers, and are examined *viva voce* on their papers; anything not clear in their papers they are examined very strictly upon, then they give evidence of their ability to conduct practical teaching. Several classes of different grades are given to them, and they are required to conduct the teaching of those classes. If they get half marks they get a simple pass; if they get more they are marked according to their position; and if they get 85 per cent. of marks they get an honour certificate, but they are not permitted to take an honour certificate unless they have spent a minimum course of two years.

7646. How many pass the honour certificate, having gone through a course of two years?—The examination is the same, but the result of the examination must be very much more satisfactory than for the ordinary pass. 50 per cent. of marks will entitle a candidate to pass, 85 per cent. will entitle him to an honour certificate. We have granted two honour certificates.

7647. We have been told that the Examining Board of the College of Teachers of the Deaf and Dumb was instituted last year, in order to meet a want which existed in respect of the examination of and the granting of certificates to teachers of the deaf and dumb?—I should like to say something with reference to that examining college, because I think there is a misunderstanding with regard to our action in relation to that college.

7648. What has been your action with regard to that college?—To abstain from connexion with it at present. A quarterly review of deaf mute education has just been started by the gentlemen composing that examining body, and in that review you will find a supposed conversation between Y and Z on the establishment of the college, and this is part of the supposed conversation. "Give "me the points of difference by way of contrast," that is between the new examining college and the one at Fitzroy Square and the one at Ealing, and the answer is this, "At "a training college continuous residence or continuous "attendance is an essential condition of the training. "Without one of these qualifications no one can be "certificated or even examined, for no one is eligible." That is a statement put forth in this review, and which was made also in public by one of the vice-presidents of the College of Teachers of the Deaf and Dumb, and the responsible editor of the review at the last conference of head masters held last year in one of the rooms of the City and Guilds of London Institute, Mr. Woodall, one of the members of this Commission, being present upon that occasion. That statement I felt called on to contradict, and I did contradict it. Mr. Stainer, the energetic inspector of the classes for the deaf and dumb under the school board (a man who has done as much for the education of the deaf and dumb as anybody in this country, the work he has done needs no commendation from me, it is quite sufficient to speak for itself), attended one of our committee meetings a year ago, and asked us with regard to this examining body. We said we should be pleased to lend our utmost assistance to favour a well-considered scheme, and that when he had arranged it out a little more in detail we should be pleased, if he would attend again a meeting of our committee, and we would give it further consideration. With regard to that statement that we would not examine students unless we train them, we say point blank as appears by our minute book, that we will and would examine any students come up for our examination. We will examine any who are students, no matter where trained, who apply to us as an examining body.

7649. Is it your view that the establishment of this examining board was not necessary, because you were willing to do the same thing that that was established to do?—It was absolutely unnecessary from our point of view. The only *raison d'être* is this, that we do not examine students who have been taught on the sign system, because we do not profess to follow such method, we train on the oral system, and we will examine anyone who comes up for examination who has been trained anywhere on the oral system. A lady who has just come over from America wants to know if she may be admitted to the Ealing examination. I said, "Certainly." She has been trained under Professor Bell.

7650. Would you give her a certificate?—If she passed our examination, but I doubt whether she could, as I pointed out to her. I said our examination embraces studies that you have never undergone; we want teachers in future to be thoroughly good teachers; to know all that ought to be known. The scheme of the founder of the society was based upon this, that you should have a proper system, and teach it properly and thoroughly, and this cannot be done unless you have good teachers who know the system thoroughly.

7651. You attended the International Congress at Milan in 1880, as representing the English section. I should like to ask you whether that Congress passed the following resolutions:—"1. That the oral method ought "to be preferred to that of signs for education and "instruction of the deaf and dumb." "2. That the pure "oral method ought to be preferred;" and "3. Con- "sidering that a great number of the deaf and dumb "are not receiving the benefit of instruction, and that "this condition is owing to the impotence (*impotenza*) of "families and of institutions, the Congress *Recommends*: "That Governments should take the necessary steps that "all the deaf and dumb may be educated"?—All those resolutions were passed and they were passed almost unanimously. I may say in that important Congress, by far the most important Congress that has been held, the great vote about systems was taken, if I remember rightly, on the third day, it might have been towards the end of the second day, and that it was carried by a majority of 160 to 4.

7652. That was the first resolution which I read?—Yes, the minority of 4 were members of the English speaking section; three from America and one from England. I should like to say a word about that International Congress. After the Ealing Society started, the first conference we attended was in London in 1877. We went there in the fullest strength we could muster, that was not an International Congress, but a Conference of head masters and other workers in institutions for the deaf and dumb, it was an important Conference so far as England was concerned.

7653. Was there any advance of feeling in favour of the oral system between the Conference of 1877 and the International Congress in 1880?—I do think that our society can claim credit for this, that we forced an interest to be taken by other societies in these conferences; and whereas for instance Fitzroy Square was not represented in the 1877 Conference at all, and was not represented in 1880, our small society with its limited funds was represented by nine members, six of whom were present at Milan. At that International Congress there were only three other members representing the whole of the United Kingdom, and America was represented by three also. But that International Congress made such an enormous stir all over the continent and in England that a much greater interest began to be taken in the matter. We published that little book which you have before you at our own expense, and it came out as a summary of the proceedings some six months before the official volume did, and that was spread broadcast to enlighten people with regard to what was being done. The consequence was that at the Brussels Congress three years later the place was crowded with representatives from England and elsewhere, they found they were obliged to go with the times.

Mr. A. Kinsey

17 Mar. 1886.

7654. What happened at the Congress at Brussels in 1883?—The question of system was not before the meeting, the battle of the systems had been fought and won at Milan; in our own country little skirmishes went on now and again, but on the continent it was absolutely decided, so decidedly was the battle won, that whereas there was only one German present at the Milan Congress, the large body of persons who voted there were French, who had been bitter opponents of the German system for years. The victory was won by them, for the German system and they went over in a body. The whole system in France is now changed from the French system to the "pure oral," they will not call it "German." The resolutions which were passed at the Brussels Congress had more to do with the details of management of institutions, whether trades should be taught and so forth; there was no discussion as to system.

7655. Will you tell us what you consider to be the physical and mental advantages of the oral system over the sign system?—Signs cannot develop the intellect. No doubt by signs you may teach names and actions, but to convey abstract ideas by signs is one of the most difficult things in the world. The way to test the knowledge of a sign-taught pupil is, not to allow the teacher to make so many signs and say, I have told the child such and such a thing; say for instance a long question on a current topic is suggested to be presented by the teacher to the child, you do not know whether he has told the child the question correctly or not; the child makes signs which the teacher puts into his own language, and you are asked to believe that it is the child's language and ideas. If you conducted the examination by written language you would find that the question you wrote, if lengthy and involved, was not understood by the sign-taught pupil; and on the other hand his answers back to you would not be intelligible to your mind. In teaching purely by language you can test the result yourself; you can go into a school where the oral system is taught and put your own questions; you can ask in your own language questions upon any given subject, and hear with your own ears the answers that are returned; you can do that without any teacher being present. When language is once taught there is no limit to subject teaching.

7656. You can deal with the deaf child then as if he were on the same level as a hearing child?—Yes; you can teach him anything he is capable of learning supposing deafness is the only thing that is the matter with him.

7657. Do you consider it a great advantage to deaf children that they should be able to use speech instead of signs?—It is an incalculable advantage, no doubt about it.

7658. Are they able to speak with the same intonation of voice as other people?—No, we cannot expect that.

7659. With the exception of that they can speak as well as other people?—Yes, and some of them speak very naturally indeed. One of my pupils who was born totally deaf, and who had been with me six or six and a half years, was the other day at an evening party with his sister. A medical man went up to his sister and said, "I understand you are teaching the deaf to speak "on some new fangled system." She said, "I am "teaching the deaf to speak, children who were once "dumb, but it is no new fangled system." He said, "I have heard something of it; I do not believe in it." She said, "I have a brother here who will convince you at once." The medical man said, "Where is he"? and she pointed to this very boy, and said, "Go and talk to him." The medical man replied, "No, that cannot be "the boy you mean surely; I have been talking to that "boy for the last 15 minutes." She said, "That is my "brother; he was dumb once." Then this medical man said, "That is most extraordinary; I thought there was "something curious about the child's voice." So that the voice was not so unnatural as to attract very much attention in that case, but the intonation of voice of deaf persons cannot be like our own.

Mr. A. Kinsey.

17 Mar. 1886.

7660. The voices of those who have not been born deaf, but who have become deaf in early years, are better than the voices of those who have been born deaf?—Yes.

7661. And if they have some slight hearing their voices are better than the voices of those who have no hearing at all?—If they have a slight hearing, or some remembrance of having spoken, their voices will be more natural, but unless they are carefully taken in hand when they become deaf and taught on this system those poor creatures become dumb; that has been found to be the case over and over again in our institutions. Then socially, of course, by being taught on the oral system they are placed on the same level with hearing people. The segregation of the deaf and dumb is very sad to see, they form a class apart from the hearing community, there is a certain amount of mistrust among them, they do not like hearing people, and I think most hearing people do not like them. They think that hearing people are apt to despise them, and make game of them, and there is a very strong class feeling between them; the consequence is that there is a tendency for the deaf to get together; that tendency is got rid of by their being taught on the oral system. One of our little deaf children, a girl, who has been taught to speak, was kept at home last Sunday instead of going to church, not being very well, and I sent my own little boy, who is possessed of hearing, a child two years and nine months old, to keep company with this little deaf girl, and they talked to one another for two hours and a half, she reading the lips of my child, and she speaking back to him just as if they were two hearing children, instead of one being a hearing child and the other deaf.

7662. Do you recommend that any technical training should be given in schools for the deaf and dumb?—Not if it interfered with their general education. So long as it did not interfere with their general education, I should very much like to see it. I think everybody is better for being mechanically handy, and in schools for the poor that is very important. In all schools for the poor I think some decided effort should be made to give a year or more technical education at the end of the ordinary education.

7663. You think that deaf and dumb children ought to be kept longer at school than other children?—Unquestionably. I would give them at least ten years if I could.

7664. To what quarter would you look for defraying the expenses?—That I must leave to the Commission. I hope the money would be forthcoming in this country as it is everywhere else.

7665. Do you advocate for poor deaf and dumb children being supported in institutions in the same way that other children are supported and educated in industrial schools?—I am preparing tables which will show the way in which foreign schools are supported, but I have not yet been able to complete them, but I may say that the money is found partly by the province, partly by the town, partly by the Government, and partly, though to a very small extent, by individuals. Here it is all done by charity. Boards of guardians, I believe, are permitted to expend 20*l.* a year on deaf children as well as hearing children.

7666. You have none of that class?—No; but I may say that we sometimes have children in the school who pay us not more than 20*l.* We can only take such children in when we have money in hand. The founder of this institution was so eager to see it speedily established that we were obliged to come before the public as early as possible to show that a deaf born child could be made to speak and understand; and when we started, in order to do this, we were obliged to take the children of educated parents; we could not take the children of poor parents because they were not the material for us to work on rapidly.

7667. How rapidly can you teach the children of educated parents by the oral system?—Children of educated parents vary very much in their ability; but we say to a parent, "Do not think of taking your child "away under eight years; we will turn out a very "creditable specimen of what we can do if you leave "your child with us for eight years." I think there are few hearing children of the same class who would not have a longer time than that.

7668. A deaf child is retarded in its education by at least three or four years as compared with a hearing child?—Yes.

7669. For that due allowance must be made?—Yes.

7670. That allowance must be made in any scheme of compulsory education?—I think it would be only reasonable to make such allowance.

7671. Do you think that all schools for the deaf and dumb should be inspected by Government in the same way as other schools are inspected?—I suppose those schools which were receiving Government assistance must necessarily be inspected by Government.

7672. Would you advocate that all schools for the deaf and dumb should be inspected by Government?—Yes.

7673. Whether private schools or schools receiving State aid?—Yes, I would advocate a system of inspection of private schools too, because if the Government made up their minds to adopt a certain system I think that the Government ought to see that that system was properly carried out, and they would see that for themselves if they had competent inspectors.

7674. The inspectors would have to be experts for the deaf and dumb?—Yes.

7675. You quite recognise the advisability of Government inspection of deaf and dumb schools, even if they should not receive any State aid?—Yes. I think it would be wise in justice to the system that you should have a means of ascertaining whether a school which professes to teach spoken language to the deaf really did so or not.

7676. Can you tell us anything with regard to the employment of the deaf and dumb after they have left school?—That has not come under my cognizance at present. As an illustration of what our pupils could do after they left school, I may refer to the case of a boy who is leaving school now; his parents cannot continue his education any longer, though I am actually offering to keep him for nothing; they want him to go to work. I have asked my committee (and I daresay my committee would accede to my request) to let me have that boy as an assistant secretary; that boy would be invaluable to me in that capacity. He is a boy of only 14 years of age, who ought not to go away from school yet; but he would be of great assistance to me in writing letters from dictation and in carrying out directions that I might give him. That is an illustration showing what these boys could do in after life.

7677. You think this boy would be available as a clerk?—Yes, quite.

7678. Is there any other point that you would wish to bring before the Commission?—I should like to say a word or two upon the training of teachers abroad and at home, and to draw a contrast between the one class of teachers and the other. I believe that until the establishment of the Ealing Institution the training of the teachers was not systematically or in any way scientifically carried out in this country. Whether our efforts have been successful it is not for me to say; still we have made an effort to give such a training to teachers. We find that in foreign countries the efforts to give a systematic and scientific training to teachers of the deaf and dumb have been in practice for years and years past. In Germany the teachers are systematically trained. There is at Berlin a teachers' college; at Milan, in Italy, there is a teachers' college; and if you will allow me I will give you the curriculum at that college. I have the original in Italian, but I have also a translation, and it will be perhaps more convenient for me to give the translation. The college is called the "Training School "near the Royal Institution of Milan to prepare "teachers capable of instructing deaf mutes." This teachers' college was founded in the year 1830, it was reformed by statute in 1863, and since 1865 it has been in regular work. "The course of instruction takes nine "months, and lectures are given for two hours on Sun-"days and three on Thursdays. The principal gives "the lectures on practical and theoretical teaching, the "catechist those on the method of teaching religion, "and a medical practitioner imparts knowledge of "anatomy and generally physiology, especially regard-"ing the respiratory and vocal organs. Besides these "lectures, the students are also present at the lessons "given by the teachers of the separate classes. At the "termination of the scholastic year the students undergo "an examination on what they have learnt before a com-"mission chosen by the acting committee, and receive "a certificate of capability signed by the Minister of "Public Institutions." That is the curriculum at the Italian School at Milan. I must say that the Italian schools just now contrast favourably with the best German schools. The schools that I saw in Italy after that international congregation at Milan were admirable, and we certainly must attribute that to the fact of this existing training college, and the excellent social and educational status of the teachers in there. In Germany they make a strong point first of all of having thoroughly trained teachers from the seminaries before they receive a special training in the teaching colleges, and their curriculum includes amongst other studies an intimate knowledge of anatomy and physiology. In Germany candidates for the post of teachers of the deaf and dumb have to go through a three years' training in the institutions, and then they receive a Goverument certificate and a Government appointment. What I wish to impress upon the Commission is that there is a systematic training on the continent for teachers, and first of all teachers who wish to go through a special training for the education of the deaf and dumb have to show that they have had a good general education.

7679. You wish to get a similar class of teachers in this country?—Yes, and I would, if I may be permitted to do so now, quote the words of a very eminent English teacher, Mr. Scott Hutton (a sign teacher I am sorry to say), at the conference of head masters which was held in this country in 1881, who quotes from a gentleman who is at the head of the profession in America, Dr. Gallaudet.

7680. We want you to give us your own experience?—My general experience is stated in a very few words. In my opinion the assistant teachers in those institutions, which I have myself personally examined in this country, are a class altogether far below the assistant teachers in the continental schools, and in the American schools too.

7681. Does that arise from the low scale of wages given to assistant teachers?—I think that it is so, very likely.

7682. And is there a career open to those teachers at the present time as there is to other elementary teachers?—Not as things exist at the present time. There is the trouble we have in getting a good class of male students at Ealing. We have to pay them in fact; hitherto we have paid our male students.

7683. May I ask upon that what fees do you charge for your students?—I am very pleased to be asked that question. Our fees to in-students are 50*l.* per annum. Our expenses are heavy.

7684. That is to say this, those are the fees for which you board and lodge them?—We board and lodge them, and I may say that at present, considering our expenses, the table that we keep, which is a liberal one, and the rent, rates, taxes, fire, light, and all the rest of it, we calculate that we hardly make a sixpence out of that 50*l.* a year; so that practically their tuition is free. We wish them to come in, and if they do not choose to come in, but remain out, we then charge them a fee of 45*l.* They lose two things and we lose one. We lose their services which they would give to our children as overlooking them out of school hours, and being with them, acting as nursery governesses; and on the other hand they lose what we consider a very important part of their training, namely, that they shall make themselves fully acquainted with all the requirements of a deaf child out of the class room.

7685. Your pupils, I think you said, paid some of them 20*l.* a year?—They vary; we have a very elastic scale.

7686. Will you tell us whether some of them pay 20*l.* a year?—We have an elastic scale which begins at the nominal sum of 200*l.*, and goes down to an actual sum of 20*l.*

7687. How do you mean a nominal sum of 200*l.*?—We have none at that scale; there is no pupil who pays us 200*l.*

7688. You have a nominal requirement of 200*l.*?—Yes. If a rich parent came to us and asked us to educate his child we should say yes. If he said, "What are your fees?" the answer would be "We shall ask you, "considering that you can afford it, 200*l.*"

7689. What is the highest you get?—I am not the secretary, and therefore I cannot absolutely be certain. I have nothing to do with money matters, but I think the highest fee we receive at the present moment is about 120*l.*, and the lowest is 20*l.*

7690. I see in your last balance sheet, the balance sheet of 1884, which I suppose is the last, that you received 1,376*l.* in pupils' fees?—Yes.

Mr. A. Kinsey.

17 Mar. 1886.

7691. So that you must have had a certain number of pupils at a larger sum?—Yes. Of course I could give you all this information, but I was not prepared to be asked any questions about that; I thought it was outside my province. I can get you full information if so desired upon these matters. I must tell you that included in these fees are what we term lip-reading fees; that is to say, when persons who become deaf in adult life come to us to learn how to understand the spoken language by watching the lips (I refer to those who are adults who come to us for private lessons, and those are very often very remunerative); in some years those fees have stood higher than the fees of the deaf children.

7692. I see that the educational salaries paid in that same year are 751*l.*; does that include your salary?—It includes my salary.

7693. What would your salary be?—My salary would be 400*l.*, which includes a salary of 60*l.*, which was paid to a lady superintendent.

7694. What are the salaries you pay to your assistants; what do they vary from?—One assistant, the lady principal, I think, receives 130*l.* at present; it is a rising salary per annum up to 200*l.* But then there is this to be said as regards that salary, that this lady had a private school, and that private school was amalgamated with ours.

7695. A private arrangement, in fact?—A private arrangement; and if I were now wishing to get an assistant teacher, unless it was somebody very exceptionally good, I do not think that a rising salary of 130*l.* up to 200*l.*, would be necessary to be paid.

7696. I suppose your institution was founded upon a previous educational institution in the same spot?—No, it is a private house belonging to a member of our committee. We got it on rather more favourable terms; but it is not large enough for our requirements.

7697. Do you propose to add to the building?—We do, or to obtain a larger one. I may say that we find that necessary, because we cannot take the number of applicants who come before us for training as students.

7698. (*Mr. Johnson.*) The Leipsic system has been the generally received system up till now, has it not?—By the Leipsic system you mean the German system as founded by Heinicke, the first head of the Leipsic institution.

7699. Your system is not that?—It is an advance upon that. They retain at Leipsic nearly the old system as Heinicke introduced it. Since then the system has advanced, and we ourselves at Ealing consider ourselves as advanced as the school at Riehen, near Basle.

7700. What is the total number of pupils that you have actually turned out from your college, I do not mean professors?—I have here a table of British institutions, and the progess of the German system since the year 1866.

7701. That is not quite what I ask. The number of pupils that you have turned out from your college since it was established is what I want to know?—We have turned out none. We have got 22 pupils; three or four of them have left us.

7702. You have 22 pupils in the college now?—Yes.

7703. But you have never yet perfected anybody, and turned them out?—No, that is so. We have not been long enough at work.

7704. Have you any experience of the teaching that is given in the board schools here for the deaf and dumb?—I have not had a personal experience of the last two or three years, nor in the London School Board schools.

7705. I am talking about the London School Board?—I have of the provincial school boards, but I have not been myself into any class of the schools of the School Board of London for the last two years. I am always promising myself to go to look after my own students to see how they are getting on.

7706. Most of your own students are now masters, are they?—Or mistresses.

7707. I suppose you believe that the present system employed by the school board is the correct one?—I hope it is, if my students are permitted to carry out the system as they were trained. I have heard, in fact, I know it as a matter of personal knowledge, that there is an attempt to introduce an American innovation in teaching in those schools, and pressure is put upon my students, who have been trained strictly on the German

Mr. A. Kinsey.

17 Mar. 1886.

system, to abandon their strict Ealing training and to adopt a novelty just freshly imported from the United States.

7708. Could you tell us in a very short way in what that novelty consists?—In beginning in the middle of a system instead of beginning at the beginning.

7709. Have any masters or mistresses been appointed by the school board to carry out that American system?—I have not heard of any such, because I do not know of anybody who knows it; it is only a recent introduction.

7710. (*Chairman.*) Will you explain what you mean by beginning at the beginning?—We have literally to begin at the beginning with deaf children learning to talk, in the same way as mothers and nurses have to teach hearing babies. You cannot teach a baby by saying, "Do you want your breakfast," and imagine that the infant is going to repeat and understand when it is just beginning to learn to talk. In developing articulation you should begin with elementary sounds, both vocal and non-vocal. To teach sylables and words or even the names of the letters of the alphabet first would be a great mistake, for instance, suppose you were successful in obtaining from a new pupil the articulated words papa, paper. Now these two words contain four letters, viz., p-a-e-r, and four sounds, viz., that of p, equal to a slight puff of breath; the next sound as of u in the word puff; the third sound ah; the fourth sound a, the first letter of the alphabet; but these letters transposed will form the following words; a, ape, are, par, pap, pare, pear, rap, rape, rep, reap, lar. It might be supposed that because a pupil could articulate the words papa and paper, that he could also pronounce at sight all the other words, but this would be found on trial quite delusive, whereas, had he been taught the value of each separate element, the case would be different.

7711. (*Mr. Johnson.*) Do I understand you that there are 34 certificated teachers that you have trained?—Yes.

7712. Out of 100 that have presented themselves?—Yes

7713. What is the reason for the difference, was it hat the rest of the people could not pass your examination?—A number of them, 18 of them, did not get through the preliminary examination from one cause or another. Some absolutely failed; some withdrew when they saw the examination papers; and others were rejected for the reason that they were not personally fitted to be teachers at all.

7714. Your "Pass" examination then is perhaps harder than in the other two institutions, which examine teachers?—I should think probably it was; I cannot say, because I have not seen the examination papers of the other college; I have never had an opportunity to see them.

7715. What is the ordinary price that a good assistant teacher in a school gets; I do not mean the head master but a good assistant?—The price which the London School Board pays at the present time for our certificate, and I daresay the certificate of the other society is 70*l.* rising 10*l.* a year to 90*l.*, I think, and possibly more. The provincial school boards pay 100*l.*

7716. Do you think that that is sufficient pay to get a superior class of men to go into the service?—Certainly, it is for women; whether they can get men is another matter, because you must remember the hours are very light as compared with the hours in some schools; they are all day schools; there is no responsibility; the work is from half past nine say, till three in the afternoon; they have all Saturday and all Sunday free; and they can eke out their income by private pupils very easily. I think that for women teachers 80*l.* to 100*l.* under those conditions is very good pay.

7717. Do you think the curriculum of education, the requirements before a person goes up for a certificate, are equal in the three bodies that give certificates?—No, I should think not. Of these 18 pupils that broke down for one cause or another in the preliminary examination, a good many found their way into the other society, the Fitzroy Square one.

7718. What is the weak point; is it that they do not get sufficient training in physiology and anatomy?—I should not limit myself to that.

7719. That is an important point you think, I presume?—I think so; but the mechanism of speech would be a breakdown for them, I should imagine, just as much.

7720. What proportion of your pupils are now paid?—We make a profit, small or large, certainly not large, on probably 60 per cent. of them, but I must really ask you not to take those answers with regard to money matters as being at all definite. I can get you the information, but I was not prepared for these questions.

7721. In the two other examining bodies besides your college, do they examine in other systems besides the oral?—One does certainly, the newly established examing board of the College of Teachers.

7722. They examine in both systems?—Yes.

7723. (*Dr. Robertson.*) You have stated that the pay for the teachers in the London School Board was about 70*l.* a year to begin with?—Yes.

7724. Can you give us an idea of what the pay, for the corresponding class of teachers, would be in Germany say?—We have to take many things into consideration there. If I were to put it in pounds, the money would seem about the same perhaps, but then living in Germany is so very much cheaper. I cannot tell you offhand what the pay of an assistant teacher would be.

7725. You have a balance sheet, I think, of the institution with you?—We have our balance sheets from the beginning.

7726. Could you give us the average cost of the keep of the inmates of your institution?—I could. Our food rate is about 8*s.* 3*d.* to about 8*s.* 6*d.* per head per week, and I take it that the board and lodging, gas, firing, and so forth amounts very nearly to the sum; something under a pound altogether; I think about 17*s.* or 17*s.* 6*d.*

7727. What is the number of teachers?—We have at present only two.

7728. What do you think, from your experience, is the proper average number of pupils who ought to go to each teacher?—Not more than 10; take that as the average. In the first two or three years you have to teach each child individually on the German system. There is no class teaching possible; you have to manipulate so to speak each child by itself. In the fourth, fifth, or sixth year you may teach 50 in a class, as many as can see your lips; just as in a lecturing theatre you can address with profit as many students as can hear you. Those on the back bench if you speak in a low voice cannot get the same amount of information as those on the front bench; and so it is with our pupils. In the first year or two you must take each child in front of you as it were.

7729. In teaching physiology I suppose you teach such an amount of physiology as is necessary for the pupils in that particular branch; but you do not profess to teach physiology as a branch of general education?—No, this is not for the pupils but for the teachers, it must be understood.

7730. Are you aware that there is a Worcester College for blind sons of gentlemen?—I have heard of it.

7731. Is there anything of the same sort within your knowledge existing in this country with regard to the deaf and dumb?—I have not heard of any such.

7732. Have you any experience of the deaf and dumb going to the universities and embracing a profession?—I have. There is a pupil of our present lady principal who has matriculated at the Dublin University. She will be able to answer that question better than I. That pupil was dumb; he is not dumb now, having been taught to speak. I do not know whether Mr. Arnold of Northampton has been before you, but he would be able to tell you (he has a small private school) that one of his pupils matriculated at the London University. Then there is a gentleman who has a B.A. at Cambridge.

7733. Is there any fund, or any society, by which any fund could be raised, by which the sons of the poor deaf and dumb people might be advanced if they have ability for it?—I do not know of any.

7734. (*Mr. St. John Ackers.*) You have mentioned that the founder of your school was so anxious to get this pure oral system adopted in this country that the society only took the children of educated parents?—Yes.

7735. Was it his own wish that that should be the case?—No, very much the reverse; he desired to have the school established for the poor only.

7736. Judging from your own practical experience, are the children of the poor equally able to be taught with the children of educated parents?—Quite.

7737. It has been stated that this system cannot teach children of low intellectual power; will you tell us whether at Ealing you take children only of superior intellectual power?—We take children of all kinds and descriptions at Ealing, so far as their mental capabilities go, for this purpose. We take boys and girls. I must tell you that it is a mixed school, and all deaf schools which I have seen are mixed because in training teachers you have to show how children vary as to the sexes and also as to their mental capabilities. We have had at Ealing, I am certain, two or three cases taken for that special purpose, of children so mentally deficient that they would not have been admitted into a sign school.

7738. By mentally deficient, do you mean that the power of intellect was deficient or that they had an undeveloped intellect?—I mean both, you cannot always determine whether a child is really mentally deficient or of an undeveloped intellect; you cannot determine at first. If the child is idiotic of course you can, but many children admitted into an institution will require a certain amount of trial by the teachers, to ascertain whether they can be fully benefited. I would like to add to my answer with regard to this question of teaching those who are really mentally deficient or apparently mentally deficient, that upon the very best authority on the continent the doctrine has been laid down, that if a child can be taught on any system at all it can be taught by the German system or pure oral, and better by that system than any other.

7739. And as far as your experience goes, is that a correct view?—Certainly, most correct.

7740. You stated that your students had to pay 50*l.* per annum; do you find that they are able to pay 50*l.* per annum?—I will say at the present time in answer to that question that we have four students in the house; we have two coming; we have three out-students, and we have one out-student coming. Now of these we have at present advanced two of the in-students half the fee of 50*l.*; we take two out-students in at a fee of 10*l.* a year instead of 45*l.*; one of our out-students we are paying a salary of 120*l.* to become a qualified teacher, and the other two students are paying us the 50*l.*

7741. But if you charge 50*l.* and only make them pay 10*l.*, how is that managed?—It is done to meet the necessities of the school board.

7742. But do you mean that you really only take 10*l.*, and yet you say you charge 50*l.* I want the Royal Commission to understand these matters?—We charge 50*l.* for in-students and if the sum is too much for them, if we have got any money in our assisted students' fund, we advance the money which they ask for.

7743. In your experience has that money been advanced over and over again to students?—Yes.

7744. Has it been repaid?—It has with a small exception.

7745. (*Chairman.*) It is nominally a loan?—Yes.

7746. (*Mr. St. John Ackers.*) Have you found that there are ladies and others willing to come and be trained at your training college, who if money is found for them are willing to repay it out of the income they can make out of their profession when they have got your certificate?—That is so.

7747. With regard to the International Congress at Milan, at which you were the secretary of the English speaking section, a statement has been made that that was a packed meeting; will you explain to the Royal Commission who were invited to the meeting, and who attended it?—As far as I know, not having had anything to do with sending out the invitations from Milan, I believe invitations were sent to all head masters of institutions, or secretaries that were known, whose names appeared in or reports, who were known to be in existence.

7748. (*Mr. Few.* You do not know that of your own knowledge?—It certainly is not within my own knowledge.

7749. (*Mr. St. John Ackers.*) Judging from those persons whom you saw attend, do you consider that invitations were sent out only to the advocates of one system?—I am perfectly certain, that they were not, because a very large number of persons attending that meeting, were at the time when they entered, on the first day of the meeting, sign-system teachers, engaged in teaching on the sign system.

7750. Did Germany, as a nation, refuse to join that International Congress?—Certainly not; they did not refuse, because they were represented by probably their head man, Dr. Treibel, of Berlin. He attended almost on behalf of the Government. The reason why the attendance was not larger was probably that these men could not afford it. Dr. Treibel came down, having his expenses paid.

Mr. A. Kinsey.

17 Mar. 1886.

7751. (*Chairman.*) He was sent by the Government probably?—I think probably.

7752. (*Mr. St. John Ackers.*) Was there a great change in the opinions of those present after having seen the working of the schools in Italy?—The change was almost universal; of the opponents of the sign system that remained uncontroverted; there remained only four, one being an Englishman, and three being Americans.

7753. Then I understand you to say, from your own personal knowledge, that a large proportion of those who attended that meeting came to the meeting as sign teachers?—Unquestionably.

7754. And they went away as the advocates of the oral system?—Yes, exactly.

7755. (*Mr. Few.*) How many children have you under charge at your institution now; I do not quite understand; you are chiefly an institution for instructing teachers?—Yes; we must have a practising school. Our practising school consists of 22 children. I am afraid we have lost two and therefore have only 20, but one is back temporarily.

7756. Are those children all paying children?—They pay but they are not all profitable children.

7757. But they pay more or less for being there?—Yes.

7758. They are not poor children who pay nothing?—No.

7759. Have you ever carried a deaf child through the whole course of education?—No. We have only been at work seven years.

7760. I mean yourself personally?—No, because I have only taught in my own institution seven years. Three other years I have been engaged in teaching elsewhere, so that I have never been engaged in any one institution for a full course.

7761. But your work is teaching teachers?—And teaching deaf children as well.

7762. As subsidiary to teaching teachers?—Yes.

7763. Teaching children is not your primary occupation?—Our primary occupation is to train teachers and to diffuse the system, and thirdly to get all deaf children in the country educated and if possible on the oral system. Those are our three main objects.

7764. You are altogether in favour of the oral system founded on your experience?—Yes, altogether. I should like to call it the pure oral system. The "oral system" means nothing to my mind except sham as a rule. The name "pure oral" was adopted at the Milan Congress; they did not like to use the word German, or to limit it to any one nation.

7765. You have never taken charge of one or more poor children who come from poor parents, and taken them in hand to teach them?—Yes, I have; nearly all the pupils in the school where I was trained were poor children, peasant children of the lowest class.

7766. (*Chairman.*) Abroad?—Abroad.

7767. (*Mr. Few.*) I gathered from your evidence that you were abroad getting instructions so as to enable you to form an opinion on the two systems?—I was told to visit so many institutions, and learn this, that, and the other system in order to be able to argue and discuss and hold my own as to whether we should adopt a certain system; and I was sent abroad especially to study the German system.

7768. You were sent abroad on the special lines of that pure oral system?—To study it in order that I might adapt it and introduce it into this country.

7769. You did not go abroad to form your own opinion as between pure oral and the sign system; you went on instructions on the pure oral system?—I was allowed a free opportunity of following any system, and, if I might be allowed to quote my own words on this very point, I think they express my meaning in better language than I can put it in at the moment. The passage is contained in the report of the Conference of 1877, the first conference that I attended. On that very point some questions were put to me very similar to the questions being put now. I was allowed full opportunity by the founder of this system to study each and

Mr. A. Kinsey.
17 Mar. 1886.

every system, but at the same time I was sent specially to make myself conversant with the German system in order to introduce it into this country. The passage is at page 108 of the Report of the Conference of Head Masters in 1877 in London. This is what I said upon that occasion:—"He" (that is myself) "had had the "great advantage of starting with the full knowledge of "all that Mr. Ackers had done in the direction of deaf "mute education, together with his experience, advice, "and counsel; but was under no obligation to that "gentleman blindly to commit himself to the German "system as being the very best method of teaching deaf "children. Far from it, he had been afforded every "facility by Mr. Ackers to study different systems in "different countries, Great Britain, Holland, Germany, "Austria, Switzerland, France, and the United States, "with express injunctions to obtain from Professor "Bell, at Boston, a knowledge of his system of visible "speech, and to watch the effects of such system in the "American schools."

7770. When do your teachers as a rule leave you, at what age?—They leave when they get their certificate.

7771. At what sort of age, 25 or what?—We have had them in as young as 17, we have also allowed married women to come at about 30. We do not like them to come in so late; we may take it that between 20 and 30 is the age at which they leave us.

7772. Do you happen to know whether they go, generally, into private families?—There are 16 of them have gone to the London School Board.

7773. Sixteen out of how many?—Out of 34. One has gone abroad to a large institution, five have gone to provincial school boards, and some are married and retired, I am sorry to say; and the others are in private families.

7774. And as far as you know none have gone into asylums for the education of the poor, such as the Deaf and Dumb Asylum at Margate?—Certainly; we have got no less than 15 in the Manchester Institution. The Deaf and Dumb Asylum at Margate would not have any from us; they never applied; but we have 15 at the institution at Manchester, of which our Chairman, Lord Egerton, is the President. Fifteen have been trained through our vice-principal, and five more in other smaller schools, board schools.

7775. Are you in favour of day schools as contrasted with boarding schools?—Personally, I must say I am not. I know it is a vexed question, and the founder of my own society and I do not quite agree upon that point. I think this, that perhaps some combination of the two might be the right thing; but I think that little children should be under their instructors until they have got a certain sufficiency of power of communicating with the hearing world. I think in a day school in a large city there is an element of danger, and always must be, where children have to come to and fro from their homes.

7776. I gathered from what you said that you consider that your course of instruction is higher than that which is pursued in Fitzroy Square?—In what way?

7777. In any way?—In the training of students, do you mean?

7778. Yes?—Oh, certainly. I should think so.

7779. And, therefore, I assume that your curriculum is higher than that in Fitzroy Square?—I only assume it. I have never seen their examination papers.

7780. (*Admiral Sir E. Sotheby.*) You stated that the education at Osnabrück and Riehen was most efficient?—Yes.

7781. Judging from results, do you think your training college would bear a fair comparison with those places?—Our work is so different. If I could be in my class-room all the time, and have no care and no trouble except the mere responsibility of carrying on the institution as a domestic one, I should myself quite feel that we are doing the same kind of work as that at Riehen; but being a practising school, although no doubt with very great care you will arrive at the same results, you see you must permit your students to have an opportunity of practising, so that in one sense the very best is not available in the teaching, in a training college for pupils that is; but, I think, practically it is a very very slight difference.

7782. Do you think that it is necessary to have one teacher for every 10 pupils?—I do; you may take that as the average.

7783. That is sufficient?—Yes; that is in a school of 40 there should be five teachers, that is to say, four teachers and a head.

7784. Have they at Milan a greater number of teachers than that?—No. As a matter of fact, at Brussels, the wish is to limit it to six or eight. I think that 10 is a very fair number.

7785. In respect of poor children, do you think that the asylum is a better mode of teaching than boarding?—It is a question of day schools and boarding schools. I have answered that my preference is for a boarding school; you see especially in the case of poor children they will play truant and make any excuse for remaining away from instruction, if they can.

7786. If they are kept at an asylum they will receive a much better education?—That is my own personal feeling.

7787. I see in Appendix C. of your report, "How to "change a sign school into a pure oral school." Do you consider that there is any difficulty in a child or an adult being taught the pure oral system after having been brought up on the sign or manual system?—We do not propose to do it, not in our advice there. We think that if you have been teaching a child by signs for several years, probably the best thing you can do is to go on and complete that child in the same way; but all new ones you bring in, teach them on the pure oral system.

7788. After having been taught on the manual system or the sign system, is it possible for deaf and dumb persons to be taught on the pure oral system?—It is possible but improbable.

7789. How would you propose to deal with isolated cases of deaf and dumb in the country?—I would send them to the nearest school.

7790. They could not be taught at the board schools in any way?—Not unless there was a special class and instructor for the deaf.

7791. But they might be taught the manual system, might they not?—Certainly not.

7792. That is so very simple?—The Americans will tell you that it takes four years to be trained as a competent sign system teacher; *i.e.* with a full knowledge of signs as a medium of communicating ideas.

7793. Are you aware whether any of your students have become governesses in private families?—Some. I have answered that question.

7794. Do you know St. Saviour's Church in Oxford Street?—I do not know the inside of it.

7795. Are you aware that there is a large congregation of deaf and dumb there?—I have heard so and read so.

7796. Do you know what system they adopt there?—Signs. Of course this evidence is hearsay and from reading. I have never attended a service there.

7797. Do you consider that an oral system is superior to a sign system in the pulpit when the person is not opposite to you, and cannot see your lips?—You are speaking not of the Church Service, but of the pulpit. I think that the German system is superior if the deaf person sees the speaker in the same way as the hearing person hears the speaker; we can be placed in a position in church where we do not get the benefit of the sermon through the sense of hearing; and a deaf child may be placed in a position in church where he does not get the benefit of the sermon through his sense of sight; but if he is placed in a favourable position, then he will carry away a greater knowledge under the German system than from any possible signs.

7798. If he catches only a few words of a sentence you think that he will gather as good a knowledge of it as you would if sitting in the corner of the church?—Yes. I have seen myself one church abroad, and confirmation classes, the whole service conducted orally and the congregation attending and taking full advantage of the service, an oral service, everything conducted orally. I have at the present time three children who are not fully educated; I do not call them fully educated. I hope they will remain with me another three or four years; they are going up for their confirmation on Friday week by the Bishop of London; they are now being prepared by a clergyman who is not a stranger by sight, but is a stranger in the matter of talking to them. At first he was a little diffident as to how he would get on. I said, "I will be in the room the first lesson you "attempt, and if there is any hitch I will put your "question for you." I have not had occasion to do it; he has been conducting the whole of those lessons in my absence.

7799. Do you see any reason why the deaf and dumb, taught on the oral system, should not take their proper position at the universities?—None whatever. It is merely a question of the preliminary education that has been given to them.

7800. You have got two teachers, have you not?—I have only one as a matter of fact. I am the principal, and there is the lady principal; these are the only two teachers. I have a student who is actually engaged in the practice of teaching in order to become a qualified teacher.

7801. But taking the figure under the head of "educational salaries" in your balance sheet, how many does that include?—That includes three.

7802. That is exclusive of yourself?—Two more, besides myself.

7803. Your salary you said was 400*l.*?—Yes.

Mr. A. Kinsey.
17 Mar. 1886.

7804. And the difference of that is 361*l.*; do those two others get 361*l.*?—Yes; but I explained that before, that one is a special arrangement, because the lady who is acting as lady principal gave up her school, and amalgamated it with ours, and we felt that we were obliged to offer her a larger sum in justice than we should have done.

7805. What does she get?—It is 130*l.* or 140*l.*, rising by 10*l.* a year up to 200*l.*; but that is a special arrangement which we should probably not make again.

7806. Your rent is 362*l.*; the house belongs to a member of the committee?—That is rent, rates, and taxes.

7807. The house is about 300*l.*, I suppose?—250*l.*

7808. And there are heavy taxes?—Very heavy taxes and heavy rates.

The witness withdrew.

Miss S. E. Hull examined.

Miss S. E. Hull.

7809. (*Chairman.*) You are one of the committee of the Society for Training Teachers of the Deaf?—Yes, I am.

7810. How long have you been on that committee?—Ever since it was founded.

7811. And you have also been an examiner in the annual examination?—Yes.

7812. How many times?—Every time.

7813. And you are also the lady principal of the institution?—Yes.

7814. Have you visited the principal institutions for the deaf and dumb on the Continent, in Germany and Italy?—I have, and some of those in America also.

7815. At what date did you visit them?—I visited some of the American institutions in 1872 and 1873; I went over at Christmas time, and the Italian schools in 1880, and the German schools and one in Switzerland in 1883.

7816. We have heard something of the American and Italian schools, but as you have been so lately as 1883 in Germany perhaps you would tell us something of the German schools you visited in 1883.* Will you tell us what schools you visited in that year?—I visited the school at Cologne, of which Herr Weissweiler is the principal. Then I also visited a school at Brühl, near Cologne, that is also on the oral system, not a very pure one.

7817. Are all these schools on the oral system?—Yes but the Brühl one was a poor one, I mean to say that it was not very pure.

7818. Is that a school for the children of the country district?—Yes (province).

7819. Do they use signs there?—They used some natural signs.

7820. Did you visit the schools in Saxony?—From Brühl I went to the Hamburgh School.

7821. What did you find there?—That is a very fair school; it was a pure oral school.

7822. In the town?—Yes.

7823. Taking the town children?—Yes taking all classes of children.

7824. Did you find the teaching good there?—It was fairly good; it was not one of the best schools.

7825. Was it as good as it is in England?—A great deal better. I am speaking of the pure oral system you know. Then I went to the Schleswig School, which is one of the most excellent schools in Germany. There is a most excellent system followed there with regard to weak-minded children, there is a complete separation of the weak minded.

7826. Weak-minded deaf and dumb you mean?—Yes a complete separation of them from the bright children. That is a most valuable institution. The head of it is Herr Engelke.

7827. Are these weak-minded children what you would call idiots in England?—Not idiots because they could not be taught then, but imbeciles.

7828. They are classed as idiots in England; in England they would go to an idiot class?—An idiot child is incapable of being taught anything.

7829. But there are children in idiots' asylums who are capable of being taught?—Those are imbeciles. Then besides imbecile children there are weak-minded children who are not absolutely imbecile, but are not capable of being brought forward so rapidly as perfectly bright and intelligent children.

7830. Are they born deaf and dumb?—They may have been born so, or may have become so from a very severe illness; the same illness that may have caused deafness may have caused an affection of the brain power, may have weakened it, and Herr Engelke has introduced this system (at present it is unique); he has two buildings, one very fine one, looking over the mountains, where the bright-minded children are under the charge of another master, Herr Köhler, but under the government of Herr Engelke. All the children when they first come are taken into the first building, where Herr Engelke himself superintends, and where they are boarders, and they remain there for two years. They are classified thus according to their ability: A, good; B, fair; C, low intellect; the bright children, classes A and B, are classified and carefully prepared, and after two years (I believe that is the time) they are drafted into the school in the other building. They are placed in families in the neighbourhood and they only attend school in the day; but the weak-minded children remain in the first institution; I saw there a child that had been five or six years under the sign school system which had failed completely with him, and who was now coming on nicely under the pure oral system.

7831. Do you mean those with weak intellect?—Yes, one of those with weak intellect. I myself strongly believe that the pure oral system is better adapted for the weak minded than the other system (the sign or manual system).

* List of the German Institutions visited by Miss S. E. Hull in 1883, with fuller particulars added from the Tables in the American Annals of the Deaf and Dumb Volume for 1881.

Location.	Principal.	How supported.
	Rhine Province.	
Cologne.	Weissweiler.	Private.
Brühl.	Feith.	Province.
	Schleswig Holstein.	
Schleswig (old building).	Engelke.	Province.
Schleswig (new building).	Köhler.	"
	Hamburg.	
Hamburg.	Söder.	City, voluntary contributions, and pay pupils.
	Brandenburg.	
Berlin.	Dr. Treibel.	State.
Wrietzen a Oder.	Walther.	Province.
	Hanover.	
Hild-sheim.	Rössler (1883, since left).	Province.
	Hessen Nassau.	
Frankfort a Main.	Vatter.	Province.
	Switzerland.	
Riehen (Basle)	Fresst†	Canton, voluntary contributions and pay pupils.

† Dr. Arnold, the founder of this school, has been dead some few years when visited by Miss S. E. Hull, the traditions of his method were being carried out by old teachers of his who have since left.

Miss S. E. Hull.

17 Mar. 1886.

7832. Is that in Schleswig-Holstein?—Yes, Schleswig-Holstein. Then from Schleswig I went to Berlin and visited the Royal Institution there; that is a training college of which Herr Treibel is the principal. From Berlin I went on to Wriezen.

7833. Is the Berlin one actually in Berlin?—Yes, in the town of Berlin. There are two institutions; this one was for all children, but I think for a higher class of children than the other one. The other one I did not visit; I believe they were principally Jewish children in the other institution.

7834. In your visit did you go to any other institutions besides the oral ones, any sign ones?—There are no sign ones in Germany to go to.

7835. That is what I wanted to know?—No, there are none. From Berlin I went on to Wriezen-am-Oder; it is in the province of Brandenburg, the principal of that is Herr Walther. That is a most admirable institution, one of the very best, Herr Walther is the superintendent of all the schools throughout the province of Brandenburg, he has a most excellent plan for the promotion of unity of instruction in the institution. That is an exceedingly valuable school. From there I went on to the Institution, Hildersheim, Herr Rössler was then the principal there; when I visited it that was a very good school. From there I went on to Frankfort-on-the-Main, and visited the school for the higher class children, that is children of the upper classes, under Herr Vatter. That is a most excellent school, but has advantage as I understood, of the pupils being the children of well educated parents, and of its being, comparatively speaking, a small school. I have been told there is another institution in the town for the children of the poorer classes. I did not know of that until afterwards, or I should have visited it. From there I went on to Riehen close to Basle. I saw Herr Fraser as the principal of that institution; but he had only lately been appointed, and there were still the traditions of Dr. Arnold in force and use, who was the original head, and really the former of that school.

7836. Is it kept up as it was before?—I do not know; I only know that when I visited it there were two ladies there who had been educated by Dr. Arnold, and who carried out Dr. Arnold's principles. Since I visited it they have left, so how it is carried on now I do not know, but that was a most excellent school. The children were very carefully kept from all signs.

7837. Is that all you visited in Germany?—Yes.

7838. Was there one common system running throughout?—Yes, more or less well carried out according to the capabilities of the teachers.

7839. Was the system of class rooms the same?—As a rule they had one class room for every class. In some of the poorer schools, where the place was a very poor place, they might have two classes in the same room, the one writing and the other having an oral lesson; but as a rule there was a separate room, and in all the best schools there was quite a separate room for every class.

7840. Was there any special arrangement of light so that the teachers might be seen to the best advantage by the pupils?—The rooms were all well lighted, but I did not take any special notice of that.

7841. Not lighted from above; they were side lights?—Yes, as far as I remember.

7842. Were they all taught on the same system?—All taught by speech.

7843. And what was their physical education?—Most of the institutions have very good gymnasia attached to them.

7844. Any trades taught, any occupation?—Those I did not see. I know that there are trades taught in some of them, but I did not see them.

7845. Do you think it is an advantage that the children should be occupied out of school hours?—I think it is most advantageous that they should always be occupied actively out of school hours, either in gymnastic exercises or, when they are old enough, in trades of some kind, either for pecuniary use or for amusement.

7846. I suppose in England, boys play at athletic games more than they do in Germany?—That would do as well, supposing they were made to talk *aloud*, but not to be permitted to make signs.

7847. How do you prevent their making signs?—If they are properly taught, and if they are kept properly occupied, they will always speak. If they are left idle, they are very apt to fall back to signs.

7848. How many of these schools were boarding schools and how many day schools; which system existed?—Both existed; some were one, and some the other.

7849. Were the children boarded out with their own parents?—If their own parents lived there, if not, they were placed in homes of the peasantry of the same class, and those homes were superintended by the heads of the institution; and I believe, in some instances, they were boarded with the masters.

7850. Did you find out whether those with whom they boarded endeavoured to carry out the same system of speaking as they were taught in the schools?—Certainly; we were given to understand that they did.

7851. Do you not think that the facility of learning German by speech is much greater than that of learning English?—It is a more phonetic language, but there is no reason at all why it should be easier. The English language is as easy to learn as any other.

7852. You think it is?—Yes, certainly. As regards learning lip reading, it is simply a matter of practice like anything else. Some hearing persons fancy that a phonetic language must be much easier, but I do not suppose it really is. That is a thing we can scarcely gauge absolutely, because everything is easy to a child who is taught it.

7853. But in German and Italian the words are pronounced as they are written?—Yes.

7854. Whereas in English the pronunciation varies so very much?—Yes. You see what you have to think of is this: that the deaf do not depend upon their ear for the pronunciation or for the spelling of the word; they depend upon their eye for the pronunciation; and they depend upon the written form for the spelling; and in their minds the two things are perfectly distinct. We do not find that our children make the slightest trouble about spelling. We say to a child the word "enough" and the child says "enough" till it can say it perfectly correctly. After we have obtained that we spell the word; it never troubles the child that that spelling has nothing to do with the sound of the letters. We do not use phonetic characters but the ordinary characters. It is always remarked that our children spell without mistakes, whereas other children at their age are making constant mistakes.

7855. You always write the word after you pronounce it, do you not?—They are not allowed to see the written form until they can speak it correctly by sound; that is a very important thing.

7856. You do not begin to spell until some time after?—I never teach them to spell at all.

7857. You do not allow them to see the written character until after they have mastered the sound of the word?—Yes.

7858. How long is the written character shewn the child after the word is spoken?—Two or three seconds. I mean to say that when I give a child a new word, I pronounce the word to the child, and the child looks at my mouth and pronounces it. When the child pronounces it correctly I then spell it by the ordinary alphabetic name of the letters, not phonetically. I should say "e"-"n"-"o"-"u"-"g"-"h" to the child, and the child would write it down. I should not spell it phonetically. The children are taught two separate alphabets, the phonetic alphabet and the ordinary alphabet. In schools where the opposite system is pursued, as I saw in America, where they were taught writing first and then the pronunciation, or where phonetic characters are used, the children are troubled about the spelling, because then they think in the written character and translate it into the spoken; but we make them think in the spoken and translate it into the written form, which makes all the difference. The point of greatest importance is, to get the brain to *think in spoken language*. Once make the deaf think in spoken language, as we think in spoken language, and they are the same as we are, as regards their minds.

7859. Do you think it is an advantage to have the children boarded at an early period of their education in your system?—Yes, I think it is of very great importance that in the early stages they should be, in order that there should be complete putting down of all signs. Of course the children, when they first come to an institution, bring with them a certain number of natural signs and gestures which have been the only means by which nature could enable them to communicate with their parents and friends. These must be put down, and they will gradually fall away as the children are taught speech; but if they were left at home, their friends would be very apt to continue using those signs, and then there would be a struggle in the children's minds between signs and speech which would be a great hindrance to the acquirement of spoken language.

7860. And another point is that the teachers obtain greater influence over their pupils if they are always with them?—Yes, they obtain a greater moral influence. It is especially necessary with children from the poorer classes, they come from miserable homes in which they have too often been sadly neglected, and where no moral influence has been brought to bear upon them; in fact an uneducated parent cannot bring either a moral or religious influence to bear upon a deaf child.

7861. Then you think in the case of the children of the poorer classes in England it is very desirable that in the early part of their training they should not only be educated but maintained in the institutions in which they are educated, in order to give them a fair chance of mastering the oral system as soon as possible?—Yes, I think so; and I think that after they have been for a certain time in the institution, they might then, if it were considered desirable, be as they are at Schleswig, and as they also are in Norway, placed out in families.

7862. Be boarded out, you mean?—Be boarded out and attend as day pupils.

7863. Now, are the educational appliances in England for the teaching of the deaf and dumb as perfect as they are in Germany?—I should say certainly not, because we have not the pure oral system in England yet except in some of the schools.

7864. With regard to pictures, do you attach much importance to there being a good series of pictures to teach the deaf and dumb?—That is a point which I am very urgent indeed about, that is to say, that we do very much need English pictures; we have nothing but German pictures.

7865. And no society has published any pictures for the deaf and dumb specially?—There is only the deaf and dumb dictionary published by the Old Kent Road Asylum; but those pictures are not useful for general teaching because they are very small. We want wall pictures.

7866. Why should not the deaf and dumb children use the same pictures as the National Society has?—They do; but the National Society uses many German pictures.

7867. They have improved very much lately in coloured pictures?—Yes.

7868. Formerly they were in black and white?—Yes; but still a number of the Kindergarten pictures from Germany are used in our national schools, I believe, and though those are very good as far as they go they are not English pictures, they do not show English life, they do not show English objects, they give the children different ideas as regards the different agricultural implements for instance.

7869. In the case of the deaf and dumb, it is much more essential that the pictures should represent the same objects as they see in daily life, or they give a false impression?—Yes, and we never *teach* (so to speak) *from pictures* with the deaf. Hearing children can be taught from pictures, because they realise that pictures represent objects, facts, and actions that they have seen out of school and which they have learned to think of *in words* (for instance a spade is a spade whatever its shape may be as represented). But with the deaf we teach from the real objects, facts, and actions themselves, in the first instance, and pictures are only afterwards used to recall those objects, facts, and actions. Therefore if we present a picture showing something quite different from what the children have seen, they cannot think that we mean the object, fact, or action to which we refer. That is why it is of such great importance that we should have English pictures. And then we also want text books to accompany those pictures, for the use of young inexperienced teachers.

7870. Would it not be desirable to make the text books as far as possible the same as those used by other children in the national schools?—They cannot be the same.

7871. Will you explain why?—Because we have to develop language with deaf children, and to do it much more slowly. Hearing children of seven years of age come to school with a large command of language.

Miss S. E. Hull.

17 Mar. 1886.

7872. The elementary text book must be different I understand you to mean?—Yes.

7873. But not necessarily the later?—The later may be exactly the same. In the first development of language with the deaf we need to give them the same gradual language teaching as the mother gives in the nursery.

7874. Is there a great want of some thoroughly trained teachers?—Yes.

7875. Do you consider that the teachers you have got now are as good a class as they ought to be?—Do you mean to say with regard to their education before they come to the Ealing Training College?

7876. Their general acquirements; are they as a class as well educated and as fit to train others as you think they ought to be?—Some of them are, and some of them are not, if you mean those who have come already to the Ealing Training College. You are not speaking of the individual students just now at the Ealing Training College.

7877. I said those at the college?—Do you mean the particular six or seven there now or all the students who have attended the college throughout the whole time?

7878. Throughout the whole time?—Some of them have been good, others have not been nearly as good as we should have liked, and we should be glad of an even higher class than we have now, because what we want is the very best class of teachers. The deaf require the very best teaching, and therefore we ought to have the best material to work upon; it is so in Germany.

7879. Is not the difficulty mainly a question of salary?—Yes it arises from its being impossible for these young women or men to support themselves during the time of training.

7880. How would you meet that difficulty; would you give them some allowance?—We ask that the Government shall do for the teachers of the deaf what it does for the teachers of the hearing.

7881. To subsidise their training colleges?—To subsidise their training colleges.

7882. Do you yourself lecture to the mistresses and the students?—No, only Mr. Kinsey.

7883. He lectures to both?—He lectures to the students. I take part in the teaching of the children.

7884. Are there men and women there?—We have one gentleman student at the Training College now; we have had one other.

7885. All the rest are women?—All the rest are women. We find it very difficult to get men to come. The difficulty which exists with women is still greater in the case of men, that they will not come for nothing.

7886. Is it desirable that you should have men?—Most desirable.

7887. Perhaps women in the earlier stages are best; is that your opinion?—No, I think we want both, men for the boys and women for the girls.

7888. Now what separation do you think is possible between the less intelligent and the more intelligent pupils of the deaf and dumb; what sort of system of teaching would you recommend?—I think myself that the system carried out at Herr Engelke's institution in Schleswig-Holstein is the best, that is complete separation in a separate building, but there is also the plan which is followed at Milan and other schools, of separating them in classes, letting them be in the same building but in separate classes; but I think the other plan very much preferable, because then they do not mix and the less intelligent children are not discouraged by seeing the brighter ones going out, leaving school that is, after a shorter term of study and also the weak minded ones do not hold the others back.

7889. But most of the institutions in this country are not very large, and in a small institution of course it would be rather difficult to classify them, would it not; I mean it would require so many more teachers the more you subdivide?—I do not see that it would make any difference if you get a better result in the end whether you have one set of teachers for the weak minded children and another set of teachers for the clever bright children, taking the same number.

7890. Do you think it is an advantage to have all the stupid children together, and so to do away with that

Miss S. E. Hull.

17 Mar. 1886.

spirit of emulation which is part of our public system?—But you never find two weak minded children precisely the same; one child brightens the other; and there would be a more even emulation between them than between weak minded and bright children.

7891. But the principle you recommend is not carried out in our public schools; is there anything exceptional with the deaf and dumb that that should specially require to be done in their case?—Certainly, we have still greater difficulties to contend with. With hearing children teachers have five senses to apply to, with deaf children only four, and if weak mindedness be added to that, it makes a still greater difficulty.

7892. You speak from the standpoint of the teacher that the teaching would be so much easier if there were the separation you recommend?—I am not speaking for the sake of the teacher but for the sake of the children.

7893. I wanted to know that?—It is not for the sake of the teacher. It would be terribly hard on the teacher who had to take the weak minded children. That is not the question at all, but what is the best for the children. If you ask what is best for the teachers I should say not to keep a poor unfortunate teacher for ever teaching the weak minded.

7894. Do you think that the education of the deaf and dumb should be made compulsory in England?—Yes.

7895. And do you think that that education should be compulsory on the pure oral system, or on a mixed system?—Personally, as I think the pure oral system makes the children happy and restores them back again to their friends and families and society in general, and gives them the proper mental grasp which the Almighty intended them to have, I cannot help saying it should be the pure oral.

7896. Or mixed?—Rather the sign system than mixed.

7897. With regard to religious instruction do you find much difficulty in imparting that under the oral system?—We can give far higher religious instruction, far deeper and more abstract ideas, by the oral system.

7898. I suppose you can convey all purely religious ideas more clearly than on the sign system?—Very much more; that is acknowledged by those who have been teachers of the sign system. I might, perhaps, be allowed, with regard to what the system can do, to refer to a young man educated by myself on this pure oral system, who became deaf at three years of age from brain fever, and who, therefore, had he been sent to an ordinary sign school would have been deaf and *dumb*. He is at the present moment in Trinity College, Dublin, passing examinations in Greek and Latin and mathematics, with his hearing fellows on the same ground, the examination taking place in the same manner, and he is passing them successfully.

7899. I suppose he had some recollection of hearing speech?—When he came to me as far as sound was concerned he was quite dumb; but his mother had always kept up the pronouncing of words with him by the movement of her lips. She taught him to read her lips, she did not know of the existence of the German system, but she had such a great horror of finger-talking and signs that she determined that she would, as it were, invent a system for herself and would teach the child by moving her mouth. She then afterwards heard of the German system and the father visited my school and left the child with me at the age of seven. When he was brought to me if I said the word "ship" to him he would move his mouth without any sound, but forming his mouth as he would do in uttering that word.

7900. He started with some advantage?—Yes, it was a very great advantage to him mentally; he was, however, taught precisely in the same way, that is, he was put back to the elements of sounds as if he had been born deaf; but the fact of his having once heard and of his language having been kept up by his mother's lips was of great advantage to him.

7901. Is there anything else that you wish to place before us. I think I have asked you questions on most of the points?—There is one thing that is sometimes made a difficulty, it has been so, in some of our conferences, with regard to the different dialects of the different counties in England. There is no more difficulty in that respect in our country than in other countries. When deaf children are taught to read the lips *easily* a difference of dialect is no more difficult for them than for hearing persons. When they have once attained a spoken language to pass into another language is no more difficult for them than for us.

7902. (*Admiral Sir E. Sotheby.*) Have you ever met any deaf and dumb people who stammer?—Never; but I have taught pupils who were not deaf, both having defective speech and defective palates.

7903. You never attempted to teach a person who stammered, and cured it?—I have taught people who could not pronounce the letter S, and that kind of thing, and I have taught them on the same system as that on which I teach the deaf.

7904. Do you think that the oral system could be used with advantage in cases of stammering?—Yes, I have used it in cases of cleft palate, and I have been very successful.

7905. Your students, I think, are rather a better class than the children, are they not?—They are both from mixed classes.

7906. I thought the students were of rather a better class?—Our children at Ealing are mixed; some of them children of well-educated parents, some of them of tradespeople.

7907. (*Chairman.*) The Admiral is asking, I think, about those who come to be trained as students?—Both of them come from different classes. We have some well-educated students who come to us, and some come as students who are only partially educated, and we have also children of well-educated parents and of partially educated parents.

7908. (*Admiral Sir E. Sotheby.*) Do any of those young women or girls who teach go out as governesses?—Yes, either as governesses or teachers under school board boards.

7909. Do you know what salaries they can command as governesses?—Originally when we first began they used to obtain as high as 100*l.*, or 120*l.*, or 150*l.*, I believe some of them had. Now generally in private families they have 60*l*, I believe some of them have had as low as 40*l.*, but as a rule 60*l.*, and under the school board I think it is 100*l.* or 120*l.*

7910. They have no difficulty, if they are well taught, in getting places?—No, no difficulty. Our students are generally engaged before they obtain their certificates, subject of course to their obtaining them.

7911. Have you any knowledge whether a large number of the poor deaf and dumb children are not educated at all?—A very large number.

7912. More so do you think than of those not deaf and dumb?—I believe it is compulsory for all hearing children to be educated, and the school board take them up and fine parents if they do not send them.

7913. The deaf and dumb you think are overlooked?—Yes.

7914. (*Mr. Few.*) Would you like or dislike being put under inspection by some officer appointed by Government?—I should like it very much indeed.

7915. Would you like it, supposing his curriculum did not suit with your view?—Well, I do not know.

7916. You must face that alternative?—I do not see how his views could disagree with my views; because if he sought the very highest good, the best for the deaf, which I suppose a Government officer would do, he would agree with my views.

7917. It would be dependent on his own judgment to a great extent: Supposing he were in favour of the combined system, you would rather be without him?—Well, I do not think that we shall get the combined system now; it is not likely that England will remain in the dark.

7918. I put it "supposing it is so." You may say it is ridiculous, but I say "supposing it is so," you would rather be without him?—No, I should not; because if he came to my school I should hope to convince him that his view was a wrong one.

7919. (*Mr. St. John Ackers.*) You have spoken about children with a low condition of intellect, with regard to special schools in Schleswig; taking the other schools, do they there take children of as low an intellectual power as the sign schools take them, speaking from your own personal experience in this country?—Yes, quite.

7920. And as poor?—Very poor.

7921. Have you not visited a considerable number of schools in Holland and Belgium besides those you have mentioned to Lord Egerton?—Yes, I have, but those are not pure oral.

7922. Those are in a transition stage?—They are in a transition stage, and therefore the system is not carried out in its perfection.

7923. Then you would not consider that Holland and Belgium could be cited as the best countries in which to study the pure oral system?—I have only visited one school in Holland, though several in Belgium.

7924. Is Belgium a country which should be cited as one to visit if you desire to see the pure oral system?—Most certainly not, in my opinion.

7925. (*Chairman.*) Then what is there that it is desirable to see there. Is it the failure of the other system that makes it desirable to see it?—Those schools are in a transition stage. You can see the difference; you can see the defects if you like.

7926. (*Mr. St. John Ackers.*) Can you see in Belgium a large number of persons who have been educated on the pure oral system, and gone out into after life?—No, they are in a transition stage.

7927. In your opinion are there a large number or a considerable number of children now in asylums for idiots who might be made self-supporting speaking persons if taught on the pure oral system?—I believe there are some, but I do not know how many.

Miss S. E. Hull.

17 Mar. 1886.

7928. (*Chairman*) Do you know any of your own personal knowledge?—I have been told that there were some in one institution in this country, but I have not seen them because I have not seen the children there.

7929. (*Dr. McDonnell, M.C.*) When you were visiting these schools abroad did you make any inquiries as to where the funds come from for the education of the deaf and dumb, how the funds are supplied?—I did not make that inquiry, but I know it from other sources.

7930. Does the money come from the State, or does much of it come from charitable persons having left money for that purpose?—It comes from both. Sometimes institutions are endowed by kings and dukes, and so on; sometimes they are supported by the State; sometimes by the commune, sometimes by the parish, sometimes by additional grants from charitable individuals.

7931. And this differs of course in different parts?—In different parts of Germany and France.

7932. So far as you know, are there any districts where they are entirely supported by the commune or parish?—Yes, I believe there are some entirely so supported, both in Germany and in France.

The witness withdrew.

Adjourned to to-morrow at 12 o'clock.

32, Abingdon Street, Westminster.

Thursday, 18th March 1886.

PRESENT:

LORD EGERTON OF TATTON IN THE CHAIR.

ADMIRAL SIR E. SOTHEBY, K.C.B.
W. TINDAL ROBERTSON, ESQ., M.D.
B. ST. JOHN ACKERS, ESQ.
T. R. ARMITAGE, ESQ., M.D.
W. AUCHINCLOSS ARROL, ESQ.
E. C. JOHNSON, ESQ.
ROBERT MCDONNELL, ESQ. M.D.
CHARLES E. D. BLACK, ESQ., *Secretary.*

The Rev. WILLIAM STAINER further examined.

Rev. W. Stainer.

18 Mar. 1886.

7809a. (*Chairman.*) You are one of the founders of the College of Teachers of the Deaf and Dumb?—Yes.

7810a. And in addition to the evidence which you have given us before, you can tell us the origin of this college, and the reasons which induced you to support its foundation?—Yes.

7811a. You had found a want of duly qualified teachers?—I do not know that I can give that as a primary reason for my taking part in the establishment of the college; it was for the general good of the cause.

7812a. And, therefore, also for the improvement of the teachers?—For raising the teaching and the status of the teachers.

7813a. Will you tell us what further reasons induced you to found this college; were there not already two colleges for the training of the teachers of the deaf and dumb?—There were two colleges for the training of the teachers.

7814a. Do they not also examine teachers?—They examine the teachers whom they train themselves, but there was no opportunity for others than those who had been trained in those colleges to pass any examination, or to obtain any certificate, or to establish their status, up to the time of the founding of this college. I have here copies of the circulars which Mr. Elliott and myself sent out. We said in the first circular, which was dated December 1884, that: "One of the greatest drawbacks in the work of educating the deaf and dumb is admitted, on all hands, to be the want of qualified teachers. For the obtaining of the requisite qualifications, there exists no suitable means of previous training, and there are no adequate tests by which they may be judged, no satisfactory guarantees that they are gained. Further, those who have by practice and study acquired such qualifications have no opportunity of gaining that recognition of status which they might obtain if they taught any other children than the deaf. We think it is highly desirable that this anomaly should be abolished, and that the teacher of the deaf should have the opportunity of submitting his qualifications to the scrutiny and judgment of an accredited body, for the purpose of examination, so that he should be in a position to receive such a certificate of competency as shall guarantee his fitness for his work. The advantages of such a measure are too obvious to need pointing out; they apply to the work itself, to the institutions in which it is carried on, to the head masters who are responsible for it, to the teachers themselves, and the profession to which they belong. We may also remark that the present position of deaf mute education suggests the strong probability that we are on the eve of important changes, and it is therefore the more necessary that some such provision as that here indicated should be carefully considered and promptly adopted. We beg to call your attention to the following outline scheme, trusting you will give your earnest consideration to the important subject we venture to bring before you."

7815a. Did you sign that as Principal Superintendent of Instruction of Deaf and Dumb Children for the School Board of London?—No, not in any way; I signed it as one of the secretaries to the Conference of Head Masters. The second circular, which was dated January 1885, is this: "We have received numerous replies to the circular in reference to the formation of the proposed College of Teachers of Deaf Children, and they are so favourable to the proposal that it is hoped the scheme will soon be in successful operation. In order to effect this we beg to ask you to nominate on the enclosed form five gentlemen as the examining body for the first examination, which it is proposed shall be held during the ensuing summer.

Rev. W. Stainer.

18 Mar. 1886.

"It is proposed too that the body so elected shall act "as an executive body to formulate and carry out the "scheme already submitted, with such modifications "taken from the suggestions that have been given in "the correspondence as may seem to them to be "desirable. It is thought that a subscription of half "a guinea, in the first instance, should be asked for "from those who are desirous of joining in the move- "ment, as expenses will be necessarily incurred in "printing, especially for the diplomas. The ballot "sent in will be submitted to the scrutiny of one or "more non-professional persons, and the result will be "communicated to you. In the event of the assembling "of a conference of the general body of teachers of the "deaf, which is proposed, it is hoped that a meeting of "the members of the college may also be held to take "the necessary steps to permanently and successfully "establish its working." Then there are spaces for five names.

7816a. Were the existing committee elected?—They were elected by the votes of the principals of institutions in the United Kingdom. The third circular was dated April 1885: "We beg to inform you that the "gentlemen whose names follow have been elected by "the votes of the head masters of institutions for the "deaf and dumb to serve as the examining body and "executive committee of the 'College of Teachers of "the Deaf and Dumb.' Their names are placed in the "order of the voting: Mr. Elliott, Rev. W. Stainer, "Mr. Howard, Mr. Sleight, Mr. Schöntheil. The com- "mittee have since their election given their best atten- "tion to the replies received concerning the scheme at "first submitted, and they have voted separately and "individually in writing on every point on which any "alteration has been suggested. The committee are "anxious to take the opportunity which the meeting of "the conference at the beginning of July will afford to "commence the real work of the college. The first "examination will therefore take place on the 29th and "30th of June next, at 11 a.m., at No. 13, Paddington "Green, London, W. All who desire to obtain the "diploma or certificate of the college are requested to "send in their names to one of the committee on or "before Monday, June 1st. The following is the "modified scheme that has been approved of, with the "modifications printed in italics." The scheme is: "1. That an examining board consisting of head "masters be elected annually, in the first instance by "the whole body of head masters of institutions for "the deaf and dumb in the United Kingdom, and in "subsequent years by the duly accredited members. "The board to meet yearly for the purpose of examin- "ing candidates in the theory and practice of educating "the deaf and dumb. 2. That such board consist of "not less than three members. 3. That the title of "the whole body of members shall be 'College of "Teachers of the Deaf and Dumb.' That after appli- "cation, and only at the first meeting of the board, all "teachers who produce evidence *such as shall satisfy "the elected body of examiners* that they have taught the "deaf and dumb successfully for a period of not less "than 10 years, shall receive the diploma of the college. "4. That candidates who satisfy the examiners in the "subjects chosen for examination shall receive the "diploma or certificate of qualification and be enrolled "as members of the college. 5. That such certificate "be the recognised qualification of a teacher. 6. That "there be a fee for such examination *of one guinea, and "a further sum of one guinea for the diploma when "granted.* 7. That the expenses be defrayed by sub- "scriptions from institutions, head masters, and ex- "amination fees. 8. That the time when the several "subjects will be taken, together with the books for "examination, be indicated by the examining board at "least six months previous to the date of examination, "*except the first examination, when it is probable that "a number of candidates will present themselves who "already possess the required knowledge and qualifica- "tions.* 9. That no certificate be granted to any can- "didate who fails to give satisfactory evidence of "knowledge and ability in regard to the following "*subjects marked a, b, c, d e, f, g. a.* The history of "the education of the deaf and dumb. *b.* The prin- "ciples of education. *c.* The intuitive method of "teaching elementary language *d.* The method of "teaching advanced language. *e.* The practical in- "struction of a class, *with black-board illustrations.* "*f.* The mechanism of speech with the anatomy and "physiology of the organs. *g.* The method of teach- "ing articulation. 10. That examination in the follow- "ing be optional on the part of the candidate: *h.* The "making and understanding of natural signs. *i.* The "ability to read finger spelling. 11. That the college "certificate shall specify the subjects in which the "candidate has passed." That is all that is essential.

7817a. The existing training colleges at Fitzroy Square and at Ealing only examine, you say, their own pupils or students?—I am not aware that they have examined any others.

7818a. Are you aware of your own knowledge whether they have refused to examine any who have not been trained in their several institutions?—It is impossible for me to say what applications they may have had in that direction, but I have not heard of any application being made, for the simple reason that it was under- stood throughout the whole of the profession that no one who had not been trained specially by the principal of the college would be admitted to the examination or entitled in any way to a certificate; and that idea has certainly, I think, since been definitely proved to be correct, by the fact that the authorities of the Ealing College have refused to admit or to grant a certificate even to those who have been trained by their own vice- principal. The vice-principal of Ealing College, Mr. White, was engaged by the committee of the Man- chester Institution, who paid the college 250*l.* for his services for one year as a lecturer, to teach and train the teachers at the Manchester School. During that time he was vice-principal of the college, because he received a salary from the college and not the amount paid by the committee. As vice-principal of the Ealing College he attended at the Manchester School daily, I believe, during the whole year, and gave lectures and instruc tions to the teachers. At the end of that time the students asked for some sort of recognition of what they had been doing by means of an examination, which they hoped would enable them to obtain a certificate; but they were distinctly told by the vice-principal of the Ealing College that they would not be allowed to sit for such certificate; and I take that as being tantamount to a refusal on the part of the authorities of the Ealing College to admit to examination even those who had been trained by their own vice-principal for 12 months. The reason of course it is not for me to assign, but it was mentioned that it was in consequence of their only having been under training for one year.

7819a. Your views being as you have stated, you thought it desirable that an examining college, as you call it, for teachers of the deaf and dumb should be founded?—Yes. I am speaking from the information that I received from two of the students who had been so trained, who came to us and made known that they had been refused, and offered themselves as candidates for our college in consequence. Our natural question was, "Why do you present yourselves to us when you have "already been trained and have had opportunities else- "where." And they said, "We have not had the oppor- "tunity, and therefore we come to you." We examined them, and passed them, and they are now members of this college.

7820a. You think that this college is meeting a want for the raising and testing of the education of teachers of the deaf and dumb?—This college or some such examining body.

7821a. How is the present supply of teachers in the different institutions for the deaf and dumb kept up; is it afforded solely by your college, or do the institu- tions themselves train their own teachers?—Speaking generally, from my knowledge, and it is pretty wide and extensive in connexion with the institutions, I think I may say, on behalf of the principals of the institutions, at all events of those I am personally acquainted with, that they prefer to train their own teachers, and having done so they wish them to be recognised in some way; and I consider the college that we have founded, or some similar examining body, essential for that purpose, to give a status to those teachers who have been trained and gained their experience in our institutions. A good work is being done in that direction, to my personal knowledge, in two very important institutions in the country, namely, the largest, which is Margate, and the next most important perhaps in many respects, that at Doncaster. Teachers have presented themselves to the college from the Margate Institution, from the Glasgow Institution, from the Manchester Institution, and from the Birmingham Institution.

7822a. Is the curriculum in which you examine of a higher or of a less comprehensive standard than that at the Ealing institution?—I should say that it was more comprehensive, but as regards its being higher that must be left as a matter of opinion. It is certainly much more practical.

Rev. W. Stainer.

18 Mar. 1886.

7823a. It is more comprehensive, because you examine both in the sign system and in the oral system; how is it more practical?—The examination in the sign system is optional. We should prefer not to examine in that system, but we wish in the first instance to meet the exigencies of the case, and we think by doing so we shall show that we are established on a broad basis, and not on a narrow one, and that in time, by persuasion and conviction, which is sure to arise in the minds of those who are willing to improve, the sign system will ultimately subside and the oral system will take its place, and when that comes to pass there will be no occasion whatever for us to include the sign system in our optional list of subjects for examination. It is more comprehensive, I think I may say, inasmuch as we take the subjects named in the schemes of various colleges, and we have carefully drawn it up, making a difference between elementary and advanced knowledge and prac- tical instruction in class with blackboard illustrations. The history and principles of education of course would be included in every syllabus.

7824a. Is the action of this college confined solely to examination, or do you meet on other occasions?—We have at present only had the meeting for the first exami- nation. We are about to meet again to decide upon our future course. In connexion with the college I bring together those members who reside in London who like to attend lectures and discussions on the difficult sub- jects in connexion with their work, I have done that last year and this year, and I intend to continue it. There is also, I may say, in connexion with the college a library in course of formation, which will be of great service for reference, as there is no library of the sort in the United Kingdom. The only collection that was ever made was allowed to go out of the country; it was purchased by the principal of the college at Washington, and that was a great loss to this country; but we hope to make up for it by collecting all the books we possibly can on the subject, and it is now being done in a house that I have lent for the purpose at Paddington Green.

7825a. I see from your published Quarterly Review that your members are divided into three classes, A., B., and C.; what is the difference between them?—The A. members have diplomas granted to them, having given satisfactory evidence that they have done good work for a period of 10 years. They include, I may say, the majority of the principals of the various institutions throughout the country. Class B. are teachers who, having already obtained a certificate at one of the col- leges, received the certificate without further examina- tion, and therefore they are admitted, as it were, *ad eundem.* Class C. are those who have passed the exami- nation to the satisfaction of the examiners, and include, as I have already said, teachers from Glasgow, Man- chester, Margate, and Birmingham, and from the London School Board.

7826a. Do you think it is advantageous that examina- tions should be conducted by an entirely outside body, and not by the principal of an institution examining his own students?—I think for my own part I should prefer not to examine those whom I had myself trained.

7827a. Is there anything further that you wish to say about the college?—It is impossible to say what it may develop into, it being in so early a stage of its growth, having been scarcely one year in existence at the present time; but we hope that it will tend in the direction which all earnest friends of the deaf desire. We have not set ourselves in any degree in opposition or anta- gonism to any existing institution. On the contrary, our desire is not to pull down, but to build up on vacant ground, of which plenty exists.

7828a. (*Admiral Sir E. Sotheby.*) You mentioned, did you not, the Margate and Doncaster institutions as being the two best institutions that you know of for the education of the deaf and dumb?—They are amongst the best.

7829a. You are decidedly in favour of the oral system, are you not?—I am a strong advocate of the oral system, and I wish it to become universal.

7830a. Are you aware that at Margate they teach upon the manual system, except one class, which they have introduced lately on the oral system?—The Margate institution has adopted the pure oral system, but like all other institutions where there are large numbers it will take time to work out, as it did in my own case under the School Board for London. At Margate they adopted a very wise plan when they were experimenting on the oral system; they took a separate building at Ramsgate, and they removed the pupils, whom they had since 1881 trained orally in the Old Kent Road build- ing, to this new school at Ramsgate, so as to keep them quite separate from the other children, which is a very important matter in the early stages of the adoption of the oral system; and that continues still, so that, inter- preting what you say, it is probable that you allude to the Margate institution, which up to a recent date was conducted on a combined system only, sending into the Ramsgate school the best of its pupils; but at the present time I am informed that the committee of the institution has adopted the oral system exclusively.

7831a. In your college do you propose to give lectures besides examining the students that may present them- selves?—I have explained what I am doing, but that of course at the present time is limited chiefly, in fact I may say entirely, to my own teachers. I have these meetings at Paddington Green, and I have had 26 and 27 out of 29 members present at the lectures and dis- cussions which I have already established. That, we hope, will still further extend, especially as I have already promises from some of our most eminent teachers to give such lectures as may be required.

7832a. You state that you have had students for examination from several places; how many have you had altogether?—We had 12 presented for examination and 11 of them passed to our satisfaction.

7833a. And your college has been in existence one year?—We have had one examination.

7834a. You say that you have a library of a peculiar nature; is it entirely of a technical character?—It chiefly consists of books on the instruction of the deaf and dumb and on collateral subjects. I have just bought a few medical books which I think will be useful for those who like to go into that subject; and we have contributions promised to this library from the continental institu- tions. There is no doubt that if we are spared to carry out our views in that respect we shall have the most valuable collection of books on the subject in the kingdom, and I hope that that will not be many years hence.

7835a. (*Mr. Arrol.*) At present I suppose your college is an examining board?—It is.

7836a. You do not give any tuition?—We do not give any direct tuition at present, nor have we any immediate idea of doing so; but as I have already said I believe that any society or institution which grows out of the necessity of the case and is not established for any whim, or fancy, or particular desire on the part of the founders, but is in the first instance tentative, and intended to grow, will show its power and elasticity by developing in that direction in which it may hereafter be found necessary. We hope that this college will do so, and it is not improbable that we may have to give direct instruction, although we have not undertaken it at present. Lectures and discussions are what we have had up to the present time.

7837a. You say that only 12 masters have come forward for examination; did all the institutions throughout the kingdom approve of this college being founded?—All the institutions with the exception of the two training colleges, which, granting their own certificates as they do, would of course naturally think that such a college was not necessary.

7838a. Then may we infer that the masters that are at present in the institutions are not sufficiently qualified to undergo the examinations, since only 12 came for- ward?—The 12 who came forward were assistants and not masters in institutions.

7839a. I use the word "masters" because they teach classes; I do not mean of course to say that they were head masters, but I will call them assistants. Do you think that the rest of the assistants throughout the kingdom are not qualified to undergo the examination and that that prevented them from coming forward?—No, I cannot draw such a conclusion. These things generally take time to establish, but we considered that we had made a very fair start in having a dozen candi- dates offered us for the first examination, and it could scarcely be expected that every assistant in the kingdom should come forward at once. I dare say many wise

Rev. W. Stainer.

15 Mar. 1886.

ones would prefer a little longer time for their preparation, and others might hold back and say, "We will see "what value is set upon this certificate when it is issued; "it is of no use our rushing to an examination until we "see whether it is appreciated or not," and in that connexion I may inform the Commission that we have reason to believe that our certificate will be highly appreciated, inasmuch as it has already been favourably received at the Glasgow Institution, who have offered us help in pecuniary and other ways; and the committee of the Margate Institution have recently passed a resolution to the effect that they will expect, and in fact require, their teachers in future to present themselves for examination and obtain the certificate of the college.

7840a. To show what average those 12 bear to the number of teachers, how many may there be throughout the kingdom?—Quoting from the table which was published last year, there are 240 male and female teachers in the United Kingdom in connexion with the public institutions which we have on this list.

7841a. You have referred to the Glasgow Institution; I am rather interested in the north, and therefore I should like to ask what position the Glasgow teachers took in obtaining their certificates?—I think I might say that they took a very high position. We had four teachers from Glasgow, and we considered that they did exceedingly well.

7842a. Did they all pass?—They all passed.

7843a. Do you think it is very possible to have a deaf and dumb individual so thoroughly trained to speak that it would be difficult for any ordinary person to discover that he was really deaf?—There are such, but they are quite exceptional.

7844a. (*Mr. St. John Ackers.*) With regard to the institution at Margate, have they determined to send the teachers to you for the certificate before they begin teaching?—I should think not. In all probability Mr. Elliott, the principal of the institution, will train them as he is doing at the present time, with a considerable amount of success. When he considers that they are capable and deserving of being presented for examination, I have no doubt that they will come up to be examined.

7845a. After they have had a certain amount of teaching and training in the institution?—Certainly after they have obtained a practical knowledge, without which they cannot pass our examination.

7846a. But my question was whether the institution at Margate desired to have teachers able to pass your examination before they were admitted to teach the deaf at that institution?—I have not been informed to that effect.

7847a. When you were last before the Royal Commission you gave it in evidence that, in your opinion, the authorities of the Training College at Ealing had refused to examine any teachers or others who had not been trained in that institution?—So far as I know that is so.

7848a. It has been given in evidence since and the book has been produced to show it) that that was an error; may you not also be in error in the statement that you have made in regard to the vice-principal?—I have given the authority upon which I made the assertion, viz., that of the students themselves.

7849a. You stated that two students had informed you that the vice-principal of the Ealing Training College said that they could not come up for examination?—That they could not be examined so as to obtain a certificate as they desired.

7850a. Do you, as an associate of that society, know whether the vice-principal would have any power to bind the committee, or to speak for the committee in a case of that sort?—I should consider that he would not act on his own responsibility, but would put the matter before his committee for them to decide; and therefore I conclude that it is the action of the society, and not his individual action.

7851a. You have thought it advisable to have thos three classes, and you have thought it advisable in the starting of this college to get those who have already been certificated in the two training colleges to come up for examination; was that done for the purpose of registration, or because you were not satisfied with the examination which they had already passed?—I must correct you. We have not wished or required any who have been examined before to come up for examination.

7852a. What is the object then of the Class B.?—Those who have already passed their examinations and got their certificates are admitted *ad eundem*.

7853a. Then that would be for the purpose of registration?—For the purpose of registration and to become members of the college.

7854a. Since the establishment of the training colleges and now also of the college which you have started, do you consider that there has been an increase in the study and knowledge of the assistant teachers of the deaf in this country?—I consider that the establishment of the training colleges has made an era in the instruction of the deaf and dumb in this country; that as soon as a college was formed at which a certificate could be gained, either by residence or otherwise, every teacher who was desirous of getting a proper status would wish to connect himself with such a college for that purpose, as I did myself. I was told by some of my fellows that it was *infra dig.* for me at my age to become a student; but I said, "As long as there is anything to learn I wish "to learn it, and I will pay my fees and take my place, "if necessary." Through Mr. Ackers' kindness I was not required to go like a schoolboy into the class, but I attended the lectures, and I was made an associate of the college; and if there were half a dozen more colleges and institutions I should endeavour to take the same steps. At the Oral Institution in Fitzroy Square they very liberally said at once that they should not require me to pay any fee, but that I might attend when I liked by arrangement with the principal, which I did; and he told me all he could, and afterwards I was presented with the certificate of qualification, and I was made a fellow of the institution.

7855a. You have a great knowledge of the assistant teachers and of the head teachers of the different institutions in this country; is it your opinion that the capacity, the knowledge, and the capabilities of those teachers are improving?—I have not the least hesitation in saying that there is a very rapid improvement at the present time going on in all our institutions. My personal knowledge of course is more intimate with the principals, and therefore I can only speak of them as a class; but judging from what I have seen in one or two of the institutions there is no doubt that their efforts are crowned with a very large amount of success in instilling into their teaching minds the desirability of greater efforts than have hitherto been made, especially in the direction of oral teaching; and I think that in a very few years we shall see all the old prejudices overcome and the oral system fully established in nearly all our institutions.

7856a. Do you agree that this article upon the College of Teachers in the "Quarterly Review of Deaf Mute Education" of January last is correct in the last two paragraphs, Y. and Z. Is this, in your opinion, a correct statement of the desire and object of the founders of your College of Teachers: "So then your entire scheme "is, as I take it, to have a training college to prepare "the teachers for the work, and an examining college to test the teachers and the work"?—That is our intention at the present time; but I should not like to say that we pledge ourselves to the limit of that statement. As necessity may require, as I said before, we should be ready to open our arms and embrace every form of useful work which might present itself to us.

7857a. (*Dr. Tindal Robertson.*) You have said that in your opinion the oral system is by far the best, and that it is likely ultimately to become the one system for the education of the deaf?—Yes.

7858a. Do you not think that the adoption of examination in any other system will tend to retard the advancement of the oral system which you yourself think so far superior to the others?—We do not make an examination on any other system a necessity for the obtaining of a certificate.

7859a. So I understood. But do you not think that the very fact that you put the sign system forward as a subject of examination will tend to retard the advancement of the oral system in the country?—I do not think so, because I believe more in the power of persuasion and conviction than in coercion. At present I could quote an institution which is holding back, very much to our regret. The principal is one who has very strong prejudices against oral teaching. I need not add that my belief is that it arises from want of knowledge on his part; but that, unfortunately, is

the case. If coercion were attempted in his case I believe that he would probably be backed up by his committee, and that he would stand out for a much longer time than we hope he will on our producing persuasive and convincing proofs of the superiority of the system which we have adopted.

7860a. But what persuasive proofs of the superiority of the oral system do you think there are in your adopting this other system as one of your subjects of examination?—I should not take it as a persuasive proof at all; our persuasive proof would lie in another direction. It would lie more in the fact that we make it only an optional subject, entirely unnecessary to the obtaining of the certificate; and the convincing proof that we hope to bring will be the results of good work in the institutions which have adopted the oral system.

7861a. You, I suppose, intend to hold yourselves up as the standard for the education of the deaf as holding the position of men of large experience; in that case do you not think it a disadvantage to admit as a subject of your examination a system which professedly you yourself believe to be an inferior system?—Personally I do; but our own body of examiners is established so as to take in a wide scope; we have voted on these points and the majority have at present their way.

7862a. (*Mr. Johnson.*) Do you not think that it is rather an undesirable thing to have three colleges which grant certificates?—It is perhaps undesirable to have more than one university, but there are several. It would be very desirable that these colleges should all unite, and that is what I should aim at.

7863a. You do not see any reason why they should not unite?—No, I cannot see any reason.

7864a. Is the same curriculum of education required to pass your college as to pass the other two colleges?—There would not be much difficulty in making an examination suitable to the students wherever they were trained, if there were no antagonistic principles in the field.

7865a. The only real difference, as I understand, between the other two colleges and your own is that you examine on the oral and on the sign systems, whereas the other colleges only examine on the oral system?—I would rather not say that we examine on the sign system, because that statement would imply that we make it an essential point.

7866a. But you say that it is optional?—It is entirely optional, and for my own part, as I have already said in the answers which I have given to Dr. Tindal Robertson, I should prefer it left out.

Rev. W. Stainer.

18 Mar. 1886.

7867a. Still I suppose you think it is desirable that there should be some examination of masters who are following the sign system only?—A sign system master could not possibly pass our examination at the college.

7868a. I do not mean your examination, but do you think it is a desirable thing that those masters who do follow the sign system should be examined by somebody?—I should certainly, on any examining board, object to admit as a candidate one who declared himself to be a teacher solely on the sign system. Indeed he could not come within our syllabus, which requires knowledge of the oral system.

7869a. You examine in the sign system as well as in the oral system?—The sign system is admitted optionally.

7870a. The oral system necessarily and the sign system optionally?—The optional examination in the natural signs and the finger alphabet I may say is there only on sufferance, according to my own view of the matter. I cannot speak for others; but we hope that it may ultimately be omitted. It is rather to embrace those teachers who are doing good work, though not perfect work, on a combined system inferior as it is to the oral system; and it is done more I consider (if I may represent the views of the body, of which I am only one) to include them, so as to unite all at first, rather than for any other reason.

7871a. Was your college started after the other two colleges?—Our college was only established last June.

7872a. And I suppose it was established because you thought that there was a deficiency?—The result has already proved it so.

7873a. Of the 12 teachers to whom you have given certificates, how many have been examined on the oral system and how many on the sign system?—They have all passed on the oral system, or else they could not have obtained their certificates; 11 out of the 12 who presented themselves passed.

7874a. How many out of those passed in the sign system?—I cannot tell you how many wished to be tested without referring to the list, but my impression is not more than two.

7875a. Then there is no college or institution where the teachers who make use of signs only can be examined?—None at all.

The witness withdrew.

Mr. WILLIAM VAN PRAAGH further examined.

Mr. W. Van Praagh.

7876a. (*Chairman.*) You have given evidence to us with regard to the school and the college at Fitzroy Square; do you wish to say anything further with regard to the oral association with which you are connected?—Yes Last week I strictly limited myself to answering the questions that were put to me. In doing so I find that I forgot to mention one or two things that I was requested to mention by the committee of the association, and also one or two important points connected with the question of State aid; and therefore I must thank the Commission very much for allowing me to again appear before them, to say in a very few words what I omitted last week. I am deputed by the members of the association which I have the honour to represent to say that they are one and all most anxious to call the attention of your Commission to the necessity of State aid for deaf children, firstly, to secure efficient tuition for all deaf children in the United Kingdom, secondly to ensure more skilled teachers, and, if possible, to make the attendance of deaf children at schools compulsory. A capitation fee is required for every child's instruction and sufficient grants to training colleges to enable persons of small means to have the advantage of a thorough training as teachers. I wish particularly to point out that State aid is granted in all continental countries, in America, and even in our colonies. In the majority of continental countries the State does not provide for the entire cost of the education of the deaf; it is supplemented by private benevolence. I would press upon your Commission the necessity of devising a plan whereby parents who are not actually paupers should pay for their deaf children's instruction according to their means, in fact to the same extent as they do for their hearing children. The education of the deaf having been up to now entirely in the hands of charity, it has tended to pauperise this class. And why, after all, should not parents pay the same amount for their deaf as they do for their hearing children? School boards may do much towards establishing classes for deaf children, which in the larger towns will undoubtedly prove efficient. For example, the London School Board, under the Rev. William Stainer, can and does provide for the instruction of deaf children in the metropolis. An increase of power ought to be given to the school boards for the instruction of the deaf, the tuition of a deaf child being far more expensive than that of a hearing one. In many instances maintenance will have to be supplied as well as education. If the boards cannot have extended power to meet the education of the afflicted classes, it would, in my opinion, save immense trouble and reference to various public bodies if we could have a special Education Act for the deaf. State aid must naturally be accompanied by Government inspection, and I am most anxious to urge the necessity of payments being made according to attendance, and not by results. We must not forget that we have to deal with a class of children who are not all equally endowed with mental and physical capacities; and in paying by results an act of the greatest injustice would be committed, as the teachers ought to receive the largest grant for the most backward child. In referring to the Report of the Conference convened by the Manchester Institution, on the 8th of January 1885, you will notice that many institutions were very reluctant, and indeed refused to ask for State aid. Why should they have refused? No institution ought to fear, and I hope no institution does fear inspection. I surmise that they

Mr. W. Van Praagh.

18 Mar. 1886.

feared the system of payment by results, interference with their management, and choice of inspectors. Will the Government secure the services of men who are thoroughly conversant with the subject, and who have sympathy with the deaf? State aid ought not to interfere with the management of the various institutions. On the continent no committees of institutions or schools are interfered with, except that they are subject to the occasional visits of inspection by the various Government and local bodies from which they receive grants. The greatest hindrance to the improvement of the instruction of the deaf is that their capacities and wants are not thoroughly understood. State recognition would raise the status of our work, and although it might be objected that Government grants would be an extra burden upon our ratepayers, I venture to say that it would be better policy to bring up a certain class of men and women to be self-dependent members of society than to have them thrown eventually upon us as paupers. With proper tuition a deaf mute can be made an independent member of society, and surely, as every parent specially loves his afflicted child (perhaps even more than his other children), so ought the State to provide for its afflicted children on an equal, if not on a better footing than for its hearing subjects. I think I mentioned last week that our association promotes day schools for the education of the deaf children in the country, exclusively, as against homes.

7877a. You wish to make that system of homes universal?—Yes. I wish to mention that the association which is represented by me now is the promoter of day schools, and that that system has great advantages; but I will not dwell upon those advantages, because I did so last week. The two great points that I wished to put before you were, in the first place, the payment by attendance and not by results, and in the second place: inspection.

7878a. You said last week that a capitation fee of 10*l.* would be sufficient; that I suppose would be on the assumption that it was upon attendance rather than upon results that the capitation grant would be given?—Yes, I have taken into consideration the opinions which I have heard from various members of the profession who have very largely discussed this matter amongst themselves; and the eventuality of payment by results was sufficient to make them afraid of State aid.

7879a. The expression "payment by results," if it is compared with what is done in the elementary schools, would no doubt be misleading, because you could not get the same results from deaf and dumb children as you could from hearing children in the same time and at the same age?—You could not judge them by the same standard.

7880a. Therefore the payment by results must necessitate quite a different set of standards by which to judge of the progress of the education of the deaf and dumb?—Certainly.

7881a. But given a different set of standards, there would appear to be no reason why there should not be payment when children reach those special standards. The State goes on the assumption that it pays for certain work being done; unless that work be tested by some result (which is probably called a standard of some kind), what guarantee would the State have that the children were making any progress?—I said just now that State aid would necessarily involve State inspection. The inspectors who would know something of the work would be able to judge of the amount of work that a deaf child could do.

7882a. Therefore, the first thing that would be necessary would be that you should have, not the ordinary inspectors of the Education Department, but inspectors specially qualified by their training and knowledge of the subject to judge of the progress of the deaf and dumb children?—Yes. Of course a man like that would be able to get an average idea of the progress of the children, but he could not lay down any rule. We have deaf children, never mind upon what method they are taught, who will always remain behind the others.

7883a. Your point, I understand is that provided the inspector appointed by the Government is satisfied that the children are being taught so far as their intelligence will allow them to be taught, they should be paid for, rather than that they should be paid for under any special standard?—Yes.

7884a. By attendance I presume you mean attendance accompanied by certain conditions which would satisfy the inspector?—Certainly.

7885a. It would not be sufficient that they should simply have been to school, and not been taught anything?—No, it would be a matter for the head master or the principal of the school to explain the reasons in cases that had made no progress.

7886a. Then it would be attendance limited by certain conditions?—By the progress made according to the child's individual powers.

7887a. That means under certain conditions?—Yes. This is all I am deputed to tell you on the subject of State aid. I may mention that I have some lists of Continental and American schools which may afterwards be useful, and copies of which I can put at your disposal translated into English; and any further information that you may require I shall be happy to furnish you with. The question foremost in my mind was: Why should some schools refuse this State aid for which we are all pressing so hard? We know how the hands of every teacher and every committee are fettered by the want of funds; why should they refuse? I surmise, as I said just now, that it is simply because they are afraid that they would be interfered with in their management, or that the payments would be by results and the choice of inspectors.

7888a. I gather then from what you say that the feeling is that the grants given by the State to those schools should not be given according to the ordinary Education Department rules, but should be guided by rules specially made, having due regard to the difficulty of the instruction of the deaf and dumb?—Yes, we shall either have to draw up a special standard for deaf children in a normal condition, or we shall have to do as we are doing now. If you visit the deaf and dumb schools in the country you have no guide to go by; there is no standard, and there is no given capacity, that is: where the difficulty will arise. Of course, deaf children as a rule can be taught to speak and understand language thoroughly, but still we must make a little allowance. You will find that a deaf child who enters school when six years old is very far behind a hearing child of the same age.

7889a. (*Admiral Sir E. Sotheby.*) Do you at your college examine outsiders independently of the pupils whom you instruct inside the college?—I presume that the examinations which you refer to have reference to the ladies and gentlemen who have received their training as teachers. I mentioned last week we examine anybody who presents himself to us upon payment of a fee.

7890a. Is that done purely on the oral system?—Purely on the oral system.

7891a. Do you consider that your college alone meets all the demand for such examination?—Yes. I consider that our college provides for all the wants of teachers, both for training and examination. We are not standing alone; the college at Ealing followed us a few years after our origin; and I think the two colleges between them are more than able to supply all the demand for teachers of the Kingdom.

7892a. (*Chairman.*) Did I correctly understand you to say in your former examination that you trained free of charge all teachers sent to you by any other institution?—Yes. Our committee sent out in the year 1881 a circular to all the institutions saying that we would train free of charge their present teachers, men who had already received instruction as teachers of the deaf, and who were willing to exchange the French for the oral system. I am sorry that I have not a copy of that circular with me, but it is referred to in my college rules.

7893a. (*Admiral Sir E. Sotheby.*) Do you know of any other college for examining teachers?—Yes, I know that there is a body of teachers called the College of Teachers, with its head quarters at Paddington Green, who only had their first meeting, I think, last year. They do not train, but they examine.

7894a. Was that college, in your opinion, necessary?—If you looked at the rules of the college in Fitzroy Square you would almost anticipate my answer. We train teachers, we examine, we certify, and we give every facility for examination and certification. Therefore I do not consider that the new college was necessary.

Mr. W. Van Praagh.

18 Mar. 1886.

7895a. In fact anybody who comes for examination to your college you examine?—Yes, on the oral system.

7896a. Without keeping them waiting for any time?—No college could possibly have examinations every day; we have our examinations at Midsummer and Christmas.

7897a. At your regular periods?—Yes; and we are always ready to receive any applicants who wish to be examined.

7898a. And you have never rejected any?—No. We have never received any applications from outside teachers, as I told you last week; we have had applications from people trained by us only. Of course the College of Teachers that you referred to just now also gives facilities to examine teachers who are trained on any other system but the oral system.

7899a. (*Mr. St. John Ackers.*) Have you seen a syllabus of the examination of the College of Teachers?—No, I have not.

7900a. Then you have no means of ascertaining in that way whether it is an easier examination than that of your Training College?—No, I have had no opportunity of judging.

7901a. Have any persons passed that examination who have failed to pass your examination?—No, none of my students who have failed have applied there as yet. The only thing that I have seen is that certificates have been granted to ladies who already held the certificate of the Fitzroy Square College; I understand that the certificates were merely given to them without further examination.

7902a. You mentioned in your evidence just now that the School Board for London took care of the children of the metropolis; are you not aware that there are still many deaf children of school age who are not in school in the metropolitan district?—Yes, we do sometimes get applications from such children; but I think that with the establishment of one or two more centres we could easily overcome this difficulty. At the request of the London School Board I examined the classes under the Rev. Mr. Stainer in the year 1884, and I had the impression then that all the deaf children of the metropolis could easily receive instruction if they were sent to school regularly.

7903a. But are they sent there regularly?—So far as I could ascertain they were.

7904a. You did not notice such an apparent want of regularity on the part of the scholars that were presented to you as would lead you to suppose that there was a very great difficulty in getting the attendance of those children?—I was rather favourably impressed, of course making due allowance for the difficulty of means of conveyance. Some children were living at rather a long distance and had to come by tram and omnibus; but I thought the attendance was very good. I very often send pupils to Mr. Stainer; only a few weeks ago I sent him some. I told you last week in my evidence that we send children to the board classes for instruction. I have some knowledge of the starting of classes in the country by school boards. The question is whether sometimes in the case of the children that are left out, as you mentioned just now, there are not circumstances which are not under the control of the school board, which prevent their attendance; for example, the want of means on the part of the parents, the want of proper clothing, the want of proper feeding, and the want of proper homes. I touched on that subject last week, and again in speaking to you on behalf of my association, when I said that it was not simply a question of education, but that it was a question of maintenance. Although our college is for teachers, and our school for deaf and dumb children of the middle and upper classes, still I have some experience by visiting other places with regard to the pauper classes. It is sometimes an impossibility to send those children to board school classes for want of proper maintenance. Therefore if the school boards do not get power to give parents the means to send their children to classes, how can we expect them to be sent there?

7905a. Then you are not aware that in the School Board district of London there are at the present time a large number of deaf children uneducated?—I was under the impression that the School Board had made provision for all the pauper children in London.

7906a. Is it, in your opinion, essential that all the deaf children of right age should be educated?—Of course, all the deaf children should be educated. As I have already said, if we do not educate our deaf children they become burdens to society.

7907a. (*Chairman.*) You mean if we do not educate them compulsorily?—Yes.

7908a. (*Mr. St. John Ackers.*) You spoke of the institutions that refused to join the petition of the Manchester Conference in favour of State aid and State inspection, I think you used the words "many institutions"; do you remember how many they were?—I have not a report of the Conference with me.

7909a. Was it not quite a minority that refused to join?—Still, however small that number may be, it gave me a very unpleasant impression, because I know so well the difficulties, as I have said before, that committees, with the best will in the world, have to contend with in providing efficient instruction; and even if that minority had been limited to one I think the impression would have been as painful as it is now. I was under the impression, however, that it was not limited to one.

7910a. I think there were about five. You were at the Conference, were you not?—I, together with a member of the committee attended the Conference as deputies of the association. The question is, why should the institutions refuse this State aid? Have they sufficient funds? If so, why do they not think of the other institutions? There are a good many deaf children who have no instruction simply because there is no money. I think that the question of statistics at the present moment is not quite correct. One sometimes hears statements that are a little bit overdrawn. As I explained to you last week, it is perfectly impossible to have schools and institutions for every small place in the country where there happen to be two or three deaf children.

7911a. From your knowledge derived from attending that Conference and otherwise, you believe that a large majority of the institutions and schools, and societies for the deaf of this country, would welcome State aid and State inspection?—I think that they would hail it with the greatest delight.

7912a. Would they hail that inspection with delight, even if it interfered with the present system of teaching?—That is a very difficult question to answer. From my standpoint I should say, "Give State aid exclusively to "schools following the pure oral system"; but the question is whether that would be fair. I think we ought to consider the question whether State aid should be made dependent upon the methods pursued. Naturally I should say that State aid should be given exclusively for the pure oral system; but I do not know whether the system does not require perhaps a little longer time to be thoroughly appreciated by some of our brethren who have not adopted it yet. In France the Government does give State aid to all deaf and dumb schools; all the deaf and dumb schools in France have now thrown aside the manual system, and have one and all adopted the pure oral system. I have here the report of the Inspector-General, M. Claveau.

7913a. In your opinion ought there to be a certain time allowed to the old institutions to change their system before an universal application of the best system be applied?—As an expert I should certainly advise most strongly that pupils who have been in the schools for five or six years trained on the finger system should not be interfered with, but should be allowed to finish their education on the system that they have begun with.

7914a. What length of time, in your opinion, would it be necessary to allow to elapse before State aid should be granted only to those schools following the pure oral system as in France?—I really do not see that there is any necessity to limit any time at all before we give State aid; it could commence at once.

7915a. Then, in your opinion, the State, while giving State aid to existing institutions, teaching the old pupils there at present on the sign system, ought to recognise only for new pupils the better system?—Certainly. That has been done before; there are institutions which have thrown aside the manual system, and have introduced the pure oral system.

7916a. That has been the case, has it not, in some of the very best instances of pure oral schools existing, such as Milan?—Yes, I remember the first teachers of Italy coming to Rotterdam to get the first glimpses of the pure oral system.

7917a. (*Chairman.*) How along ago is that, because the question of time is an important element?—That is about 18 years ago. I was living in England then, and I was

Mr. W. Van Praagh.

18 Mar. 1886.

merely a visitor to Rotterdam when I saw it. It was in 1869. As to other schools I do not think we need go further than our own country; we need not go abroad at all. If I am not mistaken the very institution of which the noble Chairman is President has altered its system in a short time, and the institution in the Old Kent Road has done the same. The only thing in which the deaf and dumb schools on the continent seem to have an advantage over us is that they appear to have discarded all at once all ideas of signs, and to have adopted in its entirety the oral system, without taking up any half and half mixed system.

7918a. (*Mr. St. John Ackers.*) You are afraid of what is ordinarily called payment by results, because you fear that the children of less intelligence would be discarded out of the schools if the Government grant depended upon examination?—Not entirely. The most clever children in the school are not always the same credit to their teachers as the very backward ones. Perhaps a child who, with the greatest trouble on the part of its master is able just to say a few words, really deserves a greater grant than a child who is eminently clever.

7919a. (*Dr. McDonnell.*) With reference to the question of State aid, supposing that this Commission, after very thoroughly investigating the subject, came to the conclusion that one system (I will not speak of either the oral system or the sign system) was clearly the best, you seem to think that that system should be the one adopted by the State and aided by the State?—Yes. If you make State aid dependent upon method.

7920a. One of the most important functions, therefore, of this Commission is thoroughly to investigate, and if possible clearly to make out which system is the best?—Yes.

7921a. Otherwise it would be impossible for any system of result-payment of any kind to be adopted, because you cannot pay by results upon several systems I take it?—If you adopted a certain system you could see what the average results ought to be.

7922a. There are several systems for teaching the deaf and dumb, are there not?—No, there are not several; happily there are only three.

7923a. We may compare those in fact to three trades; one person making coats, another making boots and shoes, and another making hats; how can you pay by results three systems which are totally incomparable? If you are going to have a system of payment by results must you not have some uniform system to which you apply certain standards?—The aim of all the systems is to give a deaf child an education fitting it to mix in society. The question therefore is which system gives a child the greatest advantages as a member of society. We merely have three ways of achieving the same end. I say that we get our aim by making the deaf child conversant with our own language and able to express himself in spoken language. My colleagues who have been before me, and who object to my arguments, say, "No, we think that sign language is the best way for "deaf mutes to express themselves." A third party said, "Why should you not give them the advantage of both." I say to this third, "You will do no good in that way, "because a mixed system is no good at all." But the three systems all aim at the same results. The foremost question is which deaf child has the greatest advantages as a member of society, the child who can explain its own wants by word of mouth in a language that is known to all, or the child who is only able to communicate his ideas to those who have learned his language?

7924a. That brings me exactly to the point with which I started, and upon which there is no difference of opinion between us, I presume, that it is the duty of the State to find out very carefully which is the best system, and then to give its aid towards the development of that system?—I have so much confidence in the pure oral system that I have no doubt the State will find that the pure oral system is the best.

7925a. (*Dr. Armitage.*) You state, as one of the principal reasons of the necessity of general education of the deaf, that if they were not educated they would be a burden on the country; does the education which you now contemplate should be subsidised by the State go beyond the simple teaching of speech and elementary school teaching, or does it include teaching trades?—Our plan of course does not include technical instruction, as I explained last week. The State ought to prepare its children to enter the ordinary workshops to learn trades in the same way as their more fortunate hearing brethren.

7926a. Do you know, as a matter of fact, what proportion of the children who have been trained on the pure oral system manage to support themselves in after life?—I am very happy to say that all the children who have left our school, are doing extremely well and do support themselves.

7927a. By what trades?—As painters, sculptors, lithographers, and other occupations, which I mentioned last week.

7928a. Do you think that it would be a desirable way for the State to test the results of a school, or at least that it ought to be taken into consideration, whether the pupils after leaving the school are able to maintain themselves?—I certainly think so. You will find that to be the case, particularly abroad, and I hope to be able to convince the Commission with my pupils that those boys and girls who have been trained on the oral system mixing with their fellow workmen are much better than those who have been trained on the silent system. They converse with their fellow workmen, and are almost their equals.

7929a. Do any of the schools for the deaf and dumb keep up regular communication with their pupils after they leave them?—Yes, though personally I object very much to what I call the class ideas, the class meetings. I try as much as possible to avoid deaf children meeting one another in after life. That is one of the great aims of our day schools. We like our deaf children to be like ordinary members of society, and not to have the deaf always mixing with the deaf. We make inquiries, and try to find out what our own pupils are doing in after life; that we think is our duty.

7930a. Do you keep a register, so that you could turn to the name of any of your former pupils, and find out at once what they have been doing since they left you?—I keep such a register privately, not officially, because our school exists simply to give our deaf children instruction, and when they have once gone through their course of instruction they have really left us to all intents and purposes.

7931a. Is such a register kept at any of the schools for the deaf that you know of?—I am not prepared to answer the question. I have kept such a register privately, as I have told you, and as a rule when pupils leave the school the various trades that they follow are entered in my register, and I believe most principals of schools do the same.

7932a. Does it occur to you that, supposing that the school knows anything of the whereabouts and the circumstances of its former pupils, it would be a good plan for the Government to give a small capitation grant for the teaching, and a larger one as a yearly premium to the school for every one of its former pupils who has become self-supporting?—I have not given that question much consideration, and therefore I am not prepared to give you an opinion upon it; but at *prima vista* I should say that I consider our duty is to give education. A boy who is well taught will always be able to find a good master. We must try to keep as much as possible to the hearing world. We do not see the Government making any provisions as to apprenticing its hearing children. The basis of our appeal is simply this; why should not the Government, which provides education for its hearing children provide education for the deaf? That is our great strength. Why should our afflicted classes be neglected, and our classes that can look after themselves be well attended to? Not for a moment would I depreciate what the Government is doing for the hearing; I think that education ought to be provided for every class, and particularly for the afflicted.

7933. Can you tell us how many pupils you have sent out?—I have a good many pupils, girls in particular, who do nothing, the children of gentlemen, and therefore I can only give you a rough guess. I have discharged up to the present moment about 148 or 150 pupils, and of all those children who have been apprenticed I always hear the very best news.

7934. In your opinion are the results, measured by the power of after self-maintenance of the pupils (not of your institution but of the schools generally throughout the country) satisfactory?—From my personal experience I may tell you that we have no difficulty whatever in apprenticing deaf boys. You will find plenty of masters. Only this morning I apprenticed a poor deaf boy. You can always find masters for boys with fair education.

Mr. W. Van Praagh.

18 Mar. 1886.

7935. (*Dr. Tindal Robertson.*) With regard to State aid you mentioned, I think, in your previous examination, that you considered that a sum of 10*l.* for a capitation grant would be sufficient for the education of those children; did I understand you aright?—Yes.

7936. This morning you have said that you also thought it advisable that the State should contribute towards the maintenance of the children as well as towards their education?—When I mentioned a capitation fee of 10*l.* I meant simply for instruction and not for maintenance.

7937. Is it your opinion that in addition to that 10*l.* there ought to be a State grant for maintenance as well?—In the case of poor children.

7938. Then do I correctly understand you to say that you think that that would be necessary also for blind children, and for imbecile children, and for other afflicted children?—I suppose that in the case of parents of the poorer classes who have children afflicted with blindness, deafness, or idiotcy, the same argument would hold good.

7939. If you think it necessary in the one class, do you not think it also necessary in the other classes?—Certainly. Without being a specialist for the blind, or for children who are mentally afflicted, still in my travels and being interested in the education of the afflicted classes generally, I have seen many institutions, and have had a great deal of experience about schools for the blind and for idiots; and in such cases where day schools can be established for children so afflicted, I suppose the same principles that I have put down for the deaf could be applied as regards State aid.

7940. (*Mr. Johnson.*) Was the manual system in France dropped suddenly?—It was not dropped suddenly. There is a little history attached to this if you will allow me to give it. There is in France a family named Pereire, the bankers, who had a relation some years ago who was a private tutor to deaf children, and who taught his deaf pupils to speak. One of his relatives wishing to commemorate his ancestor's work established a school in Paris, apart from the national school, one might almost say like the association which was established at the time of the Old Kent Road School. M. Pereire's school got for its director a very eminent and clever teacher, M. Magnat, who gradually got some friends around him who believed in the oral system. These men, very clever men, some of them medical men, called a conference in Paris in the year of the last exhibition, and there they agreed to institute international conferences. Those international conferences have resulted in the greatest benefit to deaf children abroad, and I may also add in our own country. The Conference of Milan, in the year 1880, which is, of course, very well known, resulted in, I might almost say, the conversion of every Frenchman present, even of those men who were sent by their Government purposely to object and to go against the oral system. I will even mention the name of a gentleman who was sent, M. Frank, a man who stands very high in the education of the deaf and dumb. The international conferences have gradually led to a better understanding of the principles of the German or pure oral system. The French Government has sent out commissions of inquiry, and has come to the conclusion that the pure oral system is the best, and they have universally adopted it. They have had very little difficulty in converting the teachers; they have one and all adopted it with the greatest enthusiasm; and the result, as I can show by the last report of the director, is most satisfactory. The French teachers have to thank my colleagues abroad for a great deal of assistance, but still they may congratulate themselves, and I too congratulate them most heartily upon the enthusiasm and energy which they have displayed in adopting the pure oral system. In Italy it has been the same thing. In Holland the school at Rotterdam under the direction of my worthy friend, Dr. Hirsch, has done the most to promote the knowledge of the system throughout the world.

7941. What steps have they taken to provide for those pupils whom they originally had under instruction in the manual system?—In some instances they have tried to break off the manual system where the children had not been under tuition for too long a time, and have taught them orally. Under other circumstances they have taken away children who had been four or five years under tuition, and let them finish their education on the French system, confining the instruction in the pure oral system to new comers only.

7942. They have done, as I understand they are doing at Margate, in this country, that is to say, they are keeping the old manual pupils, and by degrees they are introducing the oral system?—But they do not intend to continue the manual system. The manual department will eventually disappear *in toto*.

7943. But I want to know what becomes of those pupils who, when the change takes place, have almost completed their education in the manual system?—Their education is completed in the manual system. It would be absurd to begin afresh with a boy who has had seven or eight years' instruction unless he be a semi-mute. Of course one acts according to the individual merits of the case; but if a child has received instruction for a good many years in the manual alphabet, I would always advise that he should be allowed to go on in that way.

7944. Because I suppose you cannot combine the two?—We cannot combine the two, and in fact the combination of the two is the system which I most abhor.

7945. Do you think there is any advantage in there being three examining bodies now for certificated teachers, one at Fitzroy Square, one at Ealing, and one at Paddington, the curriculum at all those colleges being almost the same, with the exception of one college where they examine in the sign system? Do you not think that it would be a desirable thing to have one examining body for the whole of the teachers employed on the oral system, or on any other system?—This is rather a difficult question. I touched upon the subject very slightly last week. I was invited by the conveners of the college that you referred to, the college of teachers, to join them. I simply said to my friends, "How can you ask me such a question? How can I "belong to your examining body if I, in my position, "train, certify, and examine "teachers?" We were speaking just now about the transition of systems. The gentlemen whom I refer to now are all on the right road to the right system in my opinion, and I did not, and do not wish to cast any slur on any of their exertions. Why they have not asked us to examine the teachers whom they considered qualified I do not know.

7946. When you say "us" whom do you mean?—The Fitzroy Square College which I represent. Of course I train the pupil teachers, and the teachers for Mr. Stainer, and they receive our certificate. I was told that there would be more confidence if there were a college of teachers which was presided over by the representative teachers of the country. Of course it was not a very great compliment to myself, but still I swallowed it for this reason; that I want to get all these gentlemen to follow the path of the pure oral system, in which, if once universally adopted, alterations as regards examinations can easily be made. I perfectly agree with you that an examining body ought to have a certain standing, the only drawback of that college of teachers is in my opinion this (it has not occurred yet, but it might occur). Supposing that one of my candidates were to fail he would say: "Now Mr. Van Praagh, I "am very sorry that I failed; I shall go to Paddington "Green," and supposing that he passed there that would look rather awkward for me as the head of the college in Fitzroy Square. But as a body if they like to have a college of teachers of their own and examine teachers I hope they will do very well. If there are persons who will not be examined by either Ealing or Fitzroy Square they must go there.

7947. Then you look upon that as a last resource?—I do not look upon it as a last resource; I want candidates to come and be examined by us if possible. There are objections to having three examining bodies. When students are trained at a certain college they like to be examined by that college. I do not imagine that any one who was trained at Ealing would apply to me for examination, nor that anybody who had been trained by me would apply to Ealing for examination. But there may be a good many teachers who have had private training who would not like to be examined by us, but who would go to the College of Teachers. Another objecton that I have to the College of Teachers is the examination of teachers who follow the finger system.

7948. The evidence that we have had here to-day from Mr. Stainer is that the examination in the sign system is optional, but I understand that the examination in all the other questions appertaining to the oral system is obligatory?—That sounds to me extremely ambiguous,

Mr. W. Van Praagh.

18 Mar. 1886.

because teaching articulation on the pure oral system excludes all signs, and all finger alphabets. Therefore if you want to make the one obligatory you must do away with the other.

7949. I do not think you quite understand what I asked you. There are three examining bodies at the present time, all of them examining on the oral system, but one of them examining also on the sign system as well as the oral system, that examination on the sign system, however, not being a necessity but being an optional thing?—I understand you to say that the examination in articulation one is obliged to pass, and that the finger examination is optional.

7950. All that tends to my question, whether it would not be a desirable thing to have one examining body instead of three?—I do not know how it would be if we had State support for the training of teachers. No doubt we ought to have a body to examine the teachers for Government certificates; but so long as our colleges are entirely supported by private bodies, I cannot expect that there will be one examining body for all.

7951. (*Chairman.*) Are there any cases where from malformation of the throat or palate the oral system could not be taught?—No; happily there are very few cases of defects of speech combined with deafness. Cases of cleft palates are extremely rare; I have had them, and then a deaf child with a cleft palate will learn to speak as imperfectly as a hearing child with a cleft palate. Every deaf child can be taught to speak except an idiot.

7952. So that there is no case in which a deaf child could not be taught the oral system, unless the palate be so shaped that even if the child heard it could not speak?—No; it does not often happen that a deaf child has a cleft palate, but I have had almost every variety of case, and I have always found that every deaf child, whether it has a cleft palate or not, can be taught to speak. Cases of deaf children with cleft palates are extremely rare, some deaf children have extremely high roofed palates. They can always be taught to speak, but they will not speak so well as those who have perfect organs

The witness withdrew.

Mr. HARRY W. WHITE, Principal of Private School for Deaf Children, 115, Holland Road, Kensington, W., examined.

Mr. H. W. White.

7953. (*Chairman.*) You are now engaged in the education of the deaf and dumb, are you not?—Yes.

7954. In a public or in a private capacity?—In a private capacity.

7955. You have been vice-principal of the training college at Ealing, have you not?—Yes.

7956. And you were also lecturer on the pure oral system at the Old Trafford Institution at Manchester?—That is so.

7957. There has been some question as to whether the training college at Ealing examines and gives certificates to students or teachers outside their own body; what was the practice when you were connected with that institution?—I am unable to say whether there were any applications from the outside, but there were no outside persons examined during my connexion with the college.

7958. Are you connected in any way with the new college for teachers of the deaf and dumb?—No, I am not.

7959. Were you educated at the Ealing College yourself, or at the Fitzroy Square College?—At Ealing.

7960. You have been educated on the pure oral system?—Yes.

7961. Have you visited any of the institutions on the continent?—Yes, I have visited several institutions in Belgium, and I was at the International Congress which was held there in 1883. I had an opportunity of visiting several of the institutions at Brussels, Antwerp, Bruges, and Ghent.

7962. Are they in a perfect state, or in a transition state?—At that time they were in a transition state; I did not see any in a perfect state to my way of thinking.

7963. You have gone into the question as to the number of the deaf and dumb population of school age, have you not, in a pamphlet which you have written?—I have. I took great pains to get at the right figures. Of course, we are all open to correction, but I think they are as near right as possible; I endeavoured that they should be so. They are taken from the census returns of 1881.

7964. In your opinion, nearly half the deaf and dumb of school age are not at school?—Yes.

7965. Are you in favour of their being compulsorily educated?—I am, most decidedly.

7966. Are you in favour of some State aid being given by a grant of so much per head?—Yes, certainly.

7967. Have you seen the Manchester School Board resolutions?—Yes. I should not be at all in favour of the payments being based entirely upon results, on the ground that there would be, so to speak, forced work, and not what I should call honest work, in order to get the grant. I do not believe in the matter being pushed and driven to such an extent. In my opinion, it would prevent the work being thorough, in order to make a show when the time arrived. I do not approve of payment by results. The work is not carried on in such a methodical, quiet, and regular manner as it would otherwise be.

7968. Your experience in Manchester was with a school where they were trying to introduce the pure oral system, was it not?—Yes.

7969. When you first went there was that the commencement of the change?—No, they had endeavoured to introduce the system, and I suppose it would be maintained that they had introduced it. Of course one is very delicate upon a matter of that kind; there are certain susceptibilities to consider; I think they claimed that they had introduced the system; but I went there to assist them to carry it on to probably a higher pitch, and further extent.

7970. Do you claim that you made great progress in the teaching of the teachers there?—Undoubtedly.

7971. And also the pupils themselves?—Certainly. Of course my individual efforts could not have shown very great results in the children except through the teachers that I trained. I could not be expected to teach 160 children, nor would my results be very much in twelve months; but I think that, taking class and class with the teacher that was attached to it, the whole tone of the training showed itself clearly in the education of the children.

7972. Had all the children whom you have taught been always taught on the oral system, or did you take any pupils in transition from the sign system in the classes that you had to teach?—In the classes that I had to teach they were all children who had only just entered when I arrived, and who had not been under any other instruction. In some of the classes, however, there were children who had been for some considerable period previously taught signs, which was in my opinion a very serious drawback.

7973. Still, do you think it is desirable, if they are young enough, that even though they have had some acquaintance with the sign system they should be taught the pure oral system?—Certainly. I should have regretted very much if several of the children whom I saw had been left in the sign classes, because they were bright children who had not been very long in the school, and it would have been a pity to have let them remain in the sign classes.

7974. Did those children use the sign system after the school hours?—Oh, yes, very much.

7975. Do you think it is absolutely necessary for the successful working of the oral system that the children should be separated from those who might and do use signs?—Undoubtedly I do.

7976. At what age do you think the oral systen should be begun?—At the age of from seven to eight, I should say.

7977. How many years' instruction do you think that every child ought to have?—At least eight years.

7978. Do you think that the teachers should be better trained than they have been hitherto?—Certainly I do.

I do not think that the question of the training of teachers has been a prominent one at all, and I think it deserves prominence.

7979. Do you think that if the training colleges received some subsidy from the Government they would be able to do more for the training of the teachers under Government supervision?—Yes I do; that is what I am hoping to see.

7980. Do you think that they ought to receive as large a subsidy as the training colleges for our elementary school teachers receive at present?—A larger subsidy, I should think, because the requirements are greater.

7981. Do you think that every one who teaches deaf and dumb children should have a previous training in general education?—Certainly, if possible, but I should not make it a *sine quâ non*.

7982. Would not that requirement introduce a higher calibre of attainments?—I think so, undoubtedly; it would give them a power of teaching which they would otherwise probably not possess at the outset.

7983. Do you think it desirable that teachers should know more than one language?—Not necessarily. It is desirable, no doubt, that one should be accomplished, but I do not think it is necessary for ordinary public schools.

7984. How many pupils do you think that a teacher ought to have in the oral system?—Not more than 10.

7985. I suppose you agree with other witnesses who say that each child at first must be taken separately?—Certainly.

7986. Do you attach much importance to the classifying of children and keeping them apart in separate school-rooms?—I think it is a highly important matter, and upon that it seems to me much of the success of the school depends. It is a very important matter indeed to classify children.

7987. It involves considerable additional expense, of course, to have separate schoolrooms?—Naturally it does; but separate schoolrooms in my opinion ought to be absolutely insisted upon.

7988. Then ought it to be insisted upon by the State if the State gave assistance to the schools?—Certainly.

7989. Upon the ground that separate school rooms are better lighted and more perfectly quiet?—They are more quiet. Supposing that there are five classes down one side of a schoolroom (as I have seen) and five on the other, you go into that room and you hear a most fearful noise; you cannot tell what is going on, and the teacher at class A asks a question of one of his pupils, and he is interrupted by all the children in the other classes talking at the same moment perhaps. It is impossible to distinguish the different sounds.

7990. It is a great thing for the child not to have its attention distracted by any noise going on around it?—Undoubtedly.

7991. Although I suppose the child would not actually hear the noise?—It is not the noise that would distract the children's attention so much as the appearance and the movements of the children's bodies; they would be constantly moving their eyes about to see what was going on. The teacher would be confused by the noise.

7992. Are you in favour of children being brought up in large institutions, or would you have a system of day schools with the children going home, either to their parents or being boarded in neighbouring lodgings, among those who undertake to look after them?—I am in favour of boarding schools as opposed to day schools.

7993. Do you think it is desirable that the deaf and dumb children should associate as much as possible with other people?—Yes, certainly.

7994. And not be kept apart by themselves?—No, they should be as much as possible with hearing children.

7995. Upon what ground do you think that there ought to be boarding schools, because that of course naturally separates them still further than they would be if they lived in lodgings or with their parents?—I have several reasons for wishing to see them put into boarding schools. One reason is that, in the homes or lodgings which would be provided for them the same constant supervision could not be exercised as would be exercised in a school by the people who had charge of them.

7996. You mean the supervision as to talking?—Yes, preventing signing, and so on. Another thing is that the same interest could not possibly be taken in the children by a stranger as by those who were responsible for their education, and consequently they would not receive the same instruction out of school.

Mr. H. W. White.

18 Mar. 1886.

7997. Could not that difficulty be met if for the first two or three years they received instruction from a teacher in a boarding school, and after they had made some progress were boarded out?—I should have no objection to that.

7998. The objection to boarding schools is of course that the expense would be greater than the expense of boarding out?—Certainly. What I was speaking more of is the initial stage. When a child first comes under school discipline the influence of the school is better than the influence outside. Another thing is that, the attendance is more regular in boarding schools. Weather and many other things prevent children from attending school if they are far away.

7999. Have you paid much attention to the causes of deafness?—Yes, I have gone into the matter to some extent.

8000. Have you gone into the matter at all in foreign countries, in Switzerland for instance?—I have not looked into the matter recently so as to be able to give information upon it.

8001. Have you been in Switzerland?—No, my knowledge is derived from the figures which I have taken from different works.

8002. Have you taken them from published statistics?—I have taken them from English works which have been published, and the figures given as from Switzerland, but not directly from Switzerland.

8003. Is there a larger proportion of deaf and dumb in Switzerland than in other countries?—Yes.

8004. Do you think that that larger proportion is created by the closer intermarriage of families in Switzerland?—Undoubtedly; it is on account of the peculiar conditions of the country, from its being mountainous, and from the intercommunication being cut off by reason of the valleys and the mountains. The young people are thrown more together, and naturally they intermarry more; they have not the same facilities that we have here of intermixing.

8005. Is there anything that you wish to say as to the best way of converting the schools from one system to another, or as to the rapidity with which it can be done? Has it been carried out at Manchester as rapidly as you think it could be carried out?—No, I do not think it has been carried out as rapidly as it might have been.

8006. Of course you are aware that they were delayed there by the fact of the building not being large enough to carry out the two systems with separate rooms for each?—Yes, I am aware of that.

8007. Can you give us any information from your experience there as to the best way of converting one system into another?—When I went to Manchester, of course the tone of the institution was undoubtedly sign. From the point of view of a pure oral teacher it was like a fever lurking about (that is a rather strong way of putting it), and it wanted removing before you could expect to do anything with the children on the opposite system.

8008. You mean the fever of the sign system?—From our point of view, though that is rather a strong way of putting it; but it certainly was very infectious. The new children and the children taught on the oral system were very prone to fall into the ways of those who had a system of signs around them. The consequence was that I saw it rapidly running through the whole institution. In six weeks or two months the children who had newly entered were as full of signs as those who had been there for six years, though probably not knowing so many signs. The only hope of introducing the pure oral system would have been the removal of the whole of those sign children, and that is what I advocated. I wrote a letter to the committee and advocated the taking of a new house somewhere in the neighbourhood for the purpose; but they said that they could not possibly do it, that the expense was more than they could meet, and that things would have to go on as they were going on. Of course I was never tired of constantly bringing it before their notice; they were paying me as they thought a very large sum, as no doubt they were, for carrying out the system, and I thought they were losing money, and that my time was being thrown away, and I wanted them to get as much as possible for their

Mr. H. W. White.

18 Mar. 1886.

money. At last they agreed to put a screen in the dining hall to divide the two classes, and then they endeavoured to prevent their meeting out of school hours; but it was the commonest thing in the world to see one of the sign children, and one of the oral children talking in the passages if they met there.

8009. Still you converted the committee to the oral system before you left?—They have made wonderful strides in that direction now I am happy to say, and they have a school actually as I or any other oral teacher would wish to see it, with separate schoolrooms, and undoubtedly it is the best school in England.

8010. Do you think it necessary to have a college of teachers in order that the teachers should be properly certificated?—I certainly think that there should be something for the teachers to expect if they go through any course of training. A teacher when he has received a certificate thinks a good deal more of himself; he considers himself to be one of a certain body, he is identified with education, and he has something to show for it, and he takes more pride in his own work. Therefore where there is no such opportunity offered it is much to be deplored, I think. I think that a certificate of some kind is of very great value.

8011. We have had it in evidence that two of these training colleges do give certificates; but is the certificate of an independent body like this newly formed college considered to be of greater value than a certificate given by the institution in which the student has been trained?—In whose eyes do you mean?

8012. Is it of more value in the eyes of the person who applies for it, and has it more pecuniary value in the eyes of the general public?—That is rather a difficult question to answer.

8013. But is it only upon the ground that the certificate of such a college is of greater value that the college should be supported, because the two existing training institutions already give certificates?—So far as I can see it would be impossible for the teachers outside Ealing, or Fitzroy Square, for the matter of that (I am not so well acquainted with the Fitzroy Square institution) to enter Ealing as outside people and to take the certificate.

8014. You mean that they would not be able to pass the examination without having been trained in the subjects in which they would be examined?—Certainly they would not.

8015. And on that ground only?—On that ground only. Therefore I say let them get what certificate they can.

8016. Do you know that the certificate which is given by the College of Teachers is more easily obtained than the certificate which is given at either of those two colleges?—Undoubtedly. My reason for saying so is this, that I myself trained two teachers at Manchester, and I should have been very sorry to have sent them up after 12 months to Ealing to compete for the certificate there; yet they went up for examination to the Deaf and Dumb College at Paddington Green and passed high, took high honours, I might say. So I was told by the examiners afterwards. My opinion is based upon the fact that they could not have got through Ealing at all.

8017. Your knowledge is principally confined to the college at Ealing, is it not?—Yes.

8018. Do you think then that the examination at Ealing is more severe than that which is conducted by the College of Teachers?—Undoubtedly it is.

8019. In what points?—The theoretical portion of the examination I am speaking of only.

8020. You mean the knowledge of what subjects?—The knowledge of such matters as anatomy and physiology, sound, and the mechanism of speech considered scientifically, and so on.

8021. In all these points you say that the Ealing examination is much more severe than the examination of the College of Teachers?—Unquestionably very much more severe.

8022. Are you acquainted also with the course at Fitzroy Square?—I am not; I am not able to give an opinion about Fitzroy Square.

8023. (*Mr. Johnson.*) I suppose that they require physiological certificates before they admit candidates for examination at both the colleges?—I am not aware that they do.

8024. Do you think it a desirable thing to have one board for the examination of masters who present themselves?—Undoubtedly, if it were possible. I do not believe in two or three boards of examiners; I think it brings the thing into disrepute where you have several boards and several certificates from different bodies. You want one recognised body, if possible.

8025. As in the medical profession in London?—Yes.

8026. Could you tell us how you have arrived at the opinion that half of the deaf and dumb children of school age are not educated?—I am bound to say that that is to some extent based upon hypothesis.

8027. You have no statistics to go upon?—No, it is based upon the writings that we have been obliged to go by for many years.

8028. Have you any experience at all of the education of the deaf and dumb under the school board?—I have visited several of the schools at different times, and seen what they have been doing, but nothing more than that.

8029. When you said that you did not think that more than half the deaf and dumb children were being educated, did that apply to board schools?—It applied to the whole country.

8030. Are you at all aware of the number of deaf and dumb children that are educated in the board schools in London?—I cannot tell you at this moment. When I drew up that list which was published, the whole of the London Board Schools were included, and I traced the increase in the last few years in the London Board Schools alone.

8031. From the experience that you have had at Manchester, do you think that half the deaf and dumb children there of school age are educated?—I could not say without going through the figures. It seems to me that we have nothing definite to go upon except the writings of men who have gone into the matter and traced the thing out.

8032. I suppose you are aware that in connexion with the board schools there are homes to which a great number of these children are taken in the evening, from the Monday to the Friday?—Yes, I am aware of that; they go to their own homes on Fridays.

8033. Do you object to that?—I do not object to that; I object to day schools. If those children went home every day in the evening, and returned to school the next morning from their own homes, I should object to it very strongly, because the influence would not be good, and they are much better provided for in the homes; but I should certainly prefer that they remained at the homes the whole time, if possible.

8034. Under school supervision? — Under school supervision, instead of going home on Friday.

8035. Are you against the deaf children who are taught on the oral system being associated with the sign taught children after school hours?—Most decidedly.

8036. Do they (the children taught on the oral system) lapse at all into the sign system when they are associated?—To some extent they do, either more or less. It depends upon the atmosphere in which they are trained.

8037. And there is a pantomime system of signs, and not a settled one?—It is not what we should term an arbitrary sign system, but simply a natural sign system.

8038. What was the number of pupils in the school when you arrived in the country who were only making use of the sign system?—They were not all being taught by the sign system. It had been originally an entirely sign system school, and it was then being transformed into an oral system school.

8039. How many oral pupils had you there?—A hundred, but out of the hundred a considerable number had for some years been taught signs.

8040. Then was it a combined system?—They were not supposed to be taught on the combined system; they were taught orally in school, but they used their signs without any reference to speech out of school. Some of them had been for two or three years in the sign classes, but when the school was re-arranged those children were taken out of the sign classes in order to form the nucleus of an oral school, which was, in my opinion, a mistake.

8041. And they were isolated as soon as the arrangements could be made by the committee?—They have not been isolated yet, but they will be when the new buildings are opened, I believe; they will have separate schoolrooms, and they will be more closely supervised.

Mr. H. W. White.

18 Mar. 1886.

8042. Do they unite in play the sign and the oral systems?—They are not supposed to unite in play because they have their separate playgrounds; but they unite more domestically in the house, moving about from one corridor to another. You might see in the corridor several oral children and several sign children, and they stop to chat.

8043. Do you find that the oral children exercise an influence over the sign children, so that the latter desire to give up signs and speak orally?—A very strong influence, provided that those children are sufficiently imbued with the pure oral system. You could not expect a child who had just entered the school on the pure oral system to do so. I have seen children educated on the pure oral system look with horror upon children making signs.

8044. Where did you get your statistics from with regard to Switzerland; could you give us the names of the authors?—I got them from pamphlets published in English; I should not wish to put that forward as any evidence at all.

8045. (*Dr. Tindal Robertson.*) I think you said that you had come to the conclusion that the pure oral system was infinitely the best system?—Yes, undoubtedly.

8046. Will you kindly state to the Commission your precise reasons for coming to that conclusion?—I have many reasons for having come to that conclusion. One very great reason is that, in my opinion it is better in the interests of a child that it should be taught on the pure oral system; that is to say that the child is a better child when educated on the pure oral system than if it were taught on the sign system; it is a more intellectual child, and it is also more fitted to mix with ordinary people; both its moral tone and its physical tone are higher. No doubt there are isolated cases where children brought up on the sign system have been perfect Hercules of strength in every sense; but there is no doubt that the action of speech and the development of the muscles and lungs must promote health and the circulation of the blood. Besides that there is the fact that by speech and ordinary spoken language you can convey to a child's mind abstract religious truths, which there is very great difficulty even by speech in imparting to a child, whereas by signs it is absolutely impossible.

8047. Could they be conveyed by writing?—No, I do not see how you could convey a very deep religious truth by writing.

8048. Not so well as by speech?—No.

8049. Are you aware that as a matter of fact deaf children are more apt to keep their mouths open and breathe through their mouths, and not to breathe through their nostrils, and that therefore they are more subject to diseases of the chest and lungs?—Certainly; and that is one of the faults that we propose to correct at the outset.

8050. Do you think that the system of oral training does mitigate that condition?—Undoubtedly, for this reason; that the whole of the respiratory organs are used naturally when the child is brought up on the speech system, whereas they are not used when it is brought up on the sign system. Then there is another thing, that in the pure oral system those peculiarities are known to exist and are instantly stamped out as being very strong defects; whereas in the sign system classes they are not recognised at all and they are not regarded as defects. I have seen children in sign classes making the most hideous noises, with their mouths wide open breathing through their mouths, and very unpleasant appearances in the nose, and so on; and yet they have not been regarded as defects but they have been allowed to go on year after year, whereas they would not be put up with for a week by a pure oral system teacher who knew his work.

8051. Judging practically, therefore, do you think that the pure oral system would be more likely to conduce to the health of the children trained by it as well as to their mental education than the sign system?—Undoubtedly.

8052. You have spoken about State aid; what amount of State aid would you be inclined to say would be advisable for the training of those children?—That is, of course, a very difficult question to answer. It would depend upon the size of the institution, and upon the general working of the institution. Some institutions are much more expensive to work than others; and some would require more than others.

8053. Would you be prepared to go so far as to say that not only should State aid be given for educational purposes, but also for maintenance?—Certainly, it should be given for maintenance as well.

8054. For the whole of the afflicted pauper classes?—Yes.

8055. For the deaf children and the blind children as well?—Yes, both for the blind and the deaf and dumb of course. What I did for one class I should extend to the other.

8056. (*Chairman.*) The Manchester School Board resolution applies to both?—Yes.

8057. (*Dr. Tindal Robertson.*) We have heard to-day with regard to this newly formed college of teachers, that they have an optional examination for the sign system; do you think that the fact of there being such an examination is likely to retard or to promote the spread of the oral system for the education of the deaf in the country?—The question of its necessity at present is one thing; but I certainly do think that its existence at all is apt to retard the progress of the pure oral system. At the same time, under present conditions, I do not think that it is altogether out of place for many reasons which I will explain afterwards, if you consider it necessary.

8058. I should like to hear just one reason, because it is an important point?—It all turns upon the question of the Government grant, and if the Government grant were introduced those objections would instantly disappear. In the large institutions a considerable number of children enter at the age of 12 or 13. Those children have been brought up in absolute ignorance up to that age in homes, though they are scarcely homes; they are as much in the fields as in the house, and they have had no kind of happy influence at all. Several such children were brought into my own class, and it must naturally be the case that such children cannot remain at the institution for any considerable length of time; if they come at the age of 12 or 13 they cannot stay more than two or three years at school. Then the question arises, upon which system is that child to be educated. It comes in full of signs at the age of 13; I myself would not undertake to teach it on the oral system: I should say, "No, I will not undertake the education of that child at all." I would not teach that child for two years only, because I should consider that all my hard work would be thrown away. Such things ought to be stamped out. Why do they exist? It is because the parents cannot afford to send their children to school. If the parents were enabled to send their children to school by the help of the grant those cases would disappear and we should not have children of 13 coming into the school. But at present they must be taught, and my opinion is that they will have to be taught on the sign system, because it would break a man's heart to have to teach children of 13 on the oral system, who were only to remain two or three years at school.

8059. Do you think that the time will ever come when the sign and manual systems will disappear altogether?—I see no reason why they should not.

8060. Do you think there is every reason why they should?—At present there are very few reasons why they should. If the Government take the matter up and grant assistance to the work, I see every reason why the sign system should be stamped out, and the oral system entirely established in its place.

8061. Then you make the disappearance of the sign system a question of Government interference?—Entirely. It is a question of money. All the institutions would have their teachers trained if they had the money. That is the one cry, "We cannot afford it."

8062. (*Mr. St. John Ackers.*) It has been stated in evidence that you told some of the students whom you had trained in Manchester that they could not be received for examination at the Ealing Training College, is that so?—I certainly did tell them so.

8063. Will you give your reasons for having made that statement to the students?—I am unable to give my reasons absolutely clearly at the present moment, because it is so long ago; but if I remember rightly an application was made to Ealing as to whether those teachers could come up for examination.

Mr. H. W. White.

18 Mar. 1886.

8064. (*Chairman.*) In what year was that?—In 1884. An answer came back, I think, through the secretary of the Manchester Schools to the effect that they could not be admitted. I am speaking under correction. But any way, there was considerable dissatisfaction expressed to me by the teachers; they came to me in a body, and complained that they had been badly treated, whereupon I told them that they need not concern themselves so much about it, because they would not have passed if they had gone up, so that it was no use making a bother about the matter; that they should take it as quietly as they could, and do as much as they could in the time. I did not consider that they were aggrieved in any kind of way because they would not have passed. I may have received a letter, but I cannot remember at the moment; however, I can trace the matter out if you think it necessary.

8065. As you have already said, if they had come up they could not have passed the examination?—They could not.

8066. How long were you yourself in training at the training college at Ealing, before you were allowed to go in for your examination?—Two years and a half.

8067. Were you then qualifying to become vice-principal?—Yes.

8068. Then in the opinion of that body it would be necessary to have at least a two years' course before you could expect a person to be thoroughly trained in the system?—For any responsible position most certainly.

8069. You have already stated that you had not sufficient time to train the teachers at Manchester, and that although you made, as you believed, a great improvement, still a great deal more might have been done?—Yes, and as I said, if they had had two years' training they might have gone up and passed the examination One reason is this, which is of a very important nature. At Manchester they are both students and teachers, whereas at Ealing they are simply students and not teachers. You cannot expect a student who has to work in some cases 12 and 14 hours a day with the children, to study in the same manner as you can expect a young lady at Ealing to study who has nothing to do but read her notes up. At Manchester they are both teachers and students earning their living, whereas at Ealing they are not earning their living, but are paying for the instruction.

8070. You have stated that in your opinion those children who have been taught on the sign system for a short time, and who are bright children, should be taught on the oral system?—The cases I mentioned were the cases that I specially noticed of children who had only recently joined and who were very bright exceptions.

8071. Do you consider that a child who has once been taught on signs should be removed from the sign department and brought into the pure oral department with the new children?—If a child has not been taught on the sign system for any length of time, I think it would be a very cruel thing to keep the child with the sign classes.

8072. That would turn entirely upon the question whether the child depended upon signs or not?—Certainly.

8073. If the child depended upon signs, would it not have an evil effect upon the children in the oral classes?—If a child had been for a few months in a sign class, and it was a bright intelligent child, and I saw that child, I should remove it into the oral class rather than keep it for eight or nine years in that sign class.

8074. Do you think you would be able to stamp out those few signs that it had then got?—Certainly.

8075. You have taken considerable interest, have you not, in the improvement of the furniture of schools for the deaf?—Yes, I have.

8076. May I ask you whether that is a correct drawing of what you desire to see (*handing to the witness a drawing of the Heinecke circular desks*)?—Yes, it is a plate engraving of the desks in my own schoolroom.

8077. Are the Heinecke circular desks those which you have approved?—Yes.

8078. Special furniture such as this is necessary, is it not, or at any rate very desirable, in the teaching of the deaf on the pure oral system?—Undoubtedly.

8079. Do you consider that in all State aided schools for the deaf accurate statistics of the causes and degrees of deafness should be kept?—Certainly it is a very important matter; and nothing should be withheld as to the degree of deafness.

8080. (*Mr. Arrol.*) Do you think it is possible to train a very dull child who is not imbecile on the oral system?—Certainly.

8081. Do you consider it necessary that the deaf and dumb should have very sharp vision, so that they may understand what is being said to them by any ordinary individual?—It is not absolutely necessary, but it would stand in precisely the same light as the acute hearing of an ordinary child in a hearing school. Whereas the child with acute hearing in an ordinary school would hear quickly and readily, the child who is slightly deaf is under some little disadvantage just in the same way that a child who cannot see with the same degree of proficiency as another would suffer in a seeing school.

8082. But with reference to carrying on general conversation do you think that you can have one universal oral system for those who are short sighted as well as for those whose sight is good?—I have advocated one system, and it is very difficult for me to answer a question as to whether only one system should be used, to the exclusion of any other possible system. I should say that if we were to take the whole of the number of deaf and dumb children that could possibly be brought together in this country you might find one or two with such defective vision and with such malformation that it would be absolutely impossible to carry on their education with any great results; therefore I should not attempt to teach them, especially in a large class. An individual parent might, by taking his own child, do a great deal with it, but otherwise it would mean a large sum of money for individual care and attention. In ordinary institutions where one teacher has 10 or 12 children to look after it might be a mistake to enter that child in the class if its sight were so defective.

8083. Has your experience led you to observe that the deaf and dumb are at all defective in their vision?—Not by any means.

8084. You touched, I think, upon the question of religious training, and you said that you think it difficult to give any information upon these points through the manual system; how do you deal under the oral system with, say preaching. It is impossible, I apprehend, that the deaf can watch and discover from the vibration of the lips or the tongue at a distance what is being said?—Under certain conditions it would be impossible, undoubtedly, unless the children got a fair view of the speaker. Then again one must remember that a clergyman is apt to turn himself from one side to the other, which would be a disadvantage; but putting aside the preaching they would have the great benefit of the knowledge of language conveyed in the Prayer Book and the Bible, and they would also have the immense advantage of conversations with the clergyman at the school and at their own houses and so on, which would be of immense benefit, even supposing that they could not follow the sermon. They have all the advantage of conversation with, and instruction from, the clergyman of the parish, which a sign system child is excluded from except through the medium of an interpreter; and that, of course, we know means very little.

8085. (*Admiral Sir E. Sotheby.*) You said that there were two pupils sent up from Manchester to be examined at the college?—Yes.

8086. And you were surprised that they passed?—I was not surprised at all that they passed.

8087. You say that they could not have passed at Ealing?—No, they certainly could not.

8088. Did you know what degree of efficiency they had arrived at?—Certainly, I knew exactly what they could do.

8089. How did you know?—From the papers that I set them to write, and from my own examination of them.

8090. I did not understand what was your position at Manchester. What was your position at Manchester?—I was lecturer, and I was there to train the teachers.

8091. Was that when you were vice-principal at Ealing?—At the same time.

8092. You held both posts at the same time?—Yes.

8093. Supposing that there were 20 or 30 deaf children sent to one of the board schools in London, what extra accommodation would be necessary in that building?—They would want a separate schoolroom.

Mr. H. W White.

18 Mar. 1886.

8094. Would one room do, or would two rooms be necessary?—I do not think that one room ought to contain more than 10 children if you can possibly meet the expense..

8095. Is it possible for an adult who has been taught on the manual system to be taught on the oral system afterwards?—No, certainly not.

8096. Then he must stick to the manual system?—Yes, the organs of speech in an adult are not sufficiently flexible for him to learn the oral system.

8097. Do you think we are very much behind other countries in our education of the deaf and dumb?—We are certainly very far behind Germany and Switzerland.

8098. Do other governments support the education of the deaf and dumb more than we do in England?—Yes. At this point the Chairman asked whether there was anything further I wished to communicate to the Commission? I should like to have mentioned the question of the admission of pupils during the term. That seems to me to very important in public institutions. The junior classes are made up when the term commences and when the children have just entered. Supposing that there is a class of 10 children (I had two classes of 12 each to teach) those children require a considerable amount of individual training at the commencement. At first you have to teach them separately. The time then comes when you may group two or three together, and in a month's time you may out of the 10 or 12 children get as many as five classes. Then you begin to teach them in little batches. At the end of the month I found, when I went up into the schoolroom one morning, that there was a new pupil, and there had to be an extra class for that child because all the others had risen up. At the end of another month, when I went up, I found another new pupil. If I had been a young teacher who had just commenced it would have been enough to have discouraged me so that I should have failed with all the others. The extra work with these new pupils filtering in during the term was enough to discourage any young teacher, and the results could not be satisfactory. That is what I am told is one of the great evils of public institutions; it certainly was so at Manchester. The head master said that if I could only manage to represent it and to get it altered, I should be doing a service to every institution. I believe at Liverpool it is customary to do the same thing. There should be periodical admissions.

8099. (*Chairman.*) That is merely a question of the internal economy of the school?—But it all enters into the educational results. It is over weighting the teachers to have new pupils entering in at different times during the term.

8100. I suppose you mean that in institutions they sometimes admit children in the middle of the term?—Yes, at all times when they are presented, instead of coming in say at Midsummer and Christmas in batches. Then the teacher would have his class, and be able to keep them all together and carry them on.

8101. If that is to be done it simply means more teachers, because the new ones that come on would require a teacher to themselves?—It merely means keeping them out until the term commences, and only admitting them at fixed periods.

8102. If the pupils were allowed to come in in the middle of a term, it would take the entire time of a teacher to look after those alone?—You could meet it in that way by having an extra staff.

8103. It is merely a question of expense?—It is merely a question of expense or arrangement.

The witness withdrew.

Adjourned to to-morrow at 12 o'clock.

32, Abingdon Street, Westminster.

Friday, 19th March 1886.

PRESENT:

LORD EGERTON OF TATTON IN THE CHAIR.

THE RIGHT HON. SIR HENRY SELWIN-IBBETSON, BART., M.P.
W. TINDAL ROBERTSON, ESQ., M.D.
B. ST. JOHN ACKERS, ESQ.
T. R. ARMITAGE, ESQ., M.D.
W. AUCHINOLOSS ARROL, ESQ.
E. C. JOHNSON, ESQ.
ROBERT MCDONNELL, ESQ., M.D.
CHARLES E. D. BLACK, ESQ., *Secretary.*

The Rev. CHARLES MANSFIELD OWEN, M.A., examined.

Rev. C. M. Owen, M.A.

19 Mar. 1886.

8104. (*Chairman.*) You are honorary chaplain and secretary to the Winchester Diocesan Mission to the Deaf and Dumb?—Yes, my whole work in connexion with the deaf and dumb is of a purely voluntary character.

8105. You are familiar with the way in which the education of the deaf and dumb is carried on both in London and the provinces?—Yes.

8106. Your work as honorary secretary of this diocesan mission brings you in contact, of course, with the deaf and dumb in that portion of the diocese which is in London?—Yes, with the deaf and dumb who are receiving education, and with the deaf and dumb after they have left the institutions as well.

8107. You have interested yourself in the education of the deaf and dumb for a great many years?—Yes, I have been able to talk in their language ever since I could talk with my lips.

8108. Do you know both the oral system and the sign system?—Yes. I am perfectly conversant with both systems.

8109. Are you conversant also with the training colleges, and the institutions for the training of the deaf and dumb?—I am particularly conversant with the institutions on the sign system, but I have been over the various oral schools and taken part in examination work in those schools.

8110. Will you tell us what are the schools where the sign and manual system is exclusively adopted in London and the provinces, first of all in London?—The institution in the Old Kent Road is moved to Margate now.

8111. There is now no institution in London where the sign system exclusively is adopted for teaching the deaf and dumb?—No; St. Saviour's, Oxford Street, is entirely a religious centre for services and lectures, and the services and lectures are conducted on the sign and manual system, exclusively.

8112. In the provinces are there many institutions in which the deaf and dumb are taught on the sign system?—In the provinces in a very large majority of the institutions the education is conducted on the sign and manual system. There are in some cases classes for deaf and dumb children who have not been deaf from their earliest infancy, who have become deaf from fever or something like that, they are taught orally as well as by the sign and manual system by what is called the combined system.

Rev. C. M. Owen, M.A.

19 Mar. 1886.

8113. Where is that carried on?—In various institutions. For instance, we have at Edgbaston, near Birmingham, a small class of those taught on the combined system, and not on the exclusively oral system; that is a class of pupils who when they came to school we found had heard once in their lives.

8114. Knowing both systems are you in favour of one system over the other, or are you in favour of the combined system?—I am in favour of the sign and manual language exclusively for deaf mutes, those who are born deaf, but in the case of those who have once heard language, and who have become deaf from fever, or causes of that description, I think where they show a capacity for the lip reading the combined system is the best, but not pure oral.

8115. On what grounds do you think that you can teach it to the one and not to the other?—Simply from one's general knowledge and experience of those who are born deaf mutes.

8116. Have you found from experience that it is impossible to teach them orally?—I have never yet seen a satisfactory case of a born deaf person, that is to say, a person who could be absolutely certified to have been born deaf, who is a good lip-reader or speaker. I have seen a few cases among those who were not born deaf and dumb, but who once knew what articulate sounds were, but I have never seen a case of a born deaf person who could speak and lip-read satisfactorily.

8117. Are you acquainted with all the oral schools in England?—I cannot say that I am acquainted with all; I have been over representative schools.

8118. You have not any great familiarity with them?—Not the same familiarity as I have with the others.

8119. Therefore of course your experience as to persons who have been taught in those schools not being able to speak is of a limited character?—I have taken special care to examine and cross-examine and enter into the education of those who were certified to me as having been born deaf and dumb, and I find their knowledge of language, after they have been through a course of education on the oral system is limited to the smallest possible extent.

8120. Have you ever come across deaf and dumb persons engaged in industrial occupations who have been taught orally?—Yes.

8121. Do you think they get on worse than those who have been taught by the sign and manual system?—Yes, decidedly.

8122. What number of cases have you known of deaf and dumb persons who have been taught by the oral system, who have failed in getting employment?—I cannot say they have failed, but I do not consider they get on so well. I cannot point to absolute failures in the one case or in the other, but those who have been taught orally do not do so well. In the first place they are not so acceptable, and in the second place a great many of them have to give up their orally taught system and fall back upon communication either by signs or gestures, or written language.

8123. If they have to do that they are worse off than those who have been taught by the sign system in the first instance?—They are worse off than the others. It stands to reason that if those who have been orally taught, have in after life to take up the sign and manual language, the result is that all their best years have not been concentrated upon the method of teaching best adapted for them, and they are handicapped in after life.

8124. Is it not much easier to obtain a knowledge of the sign and manual system than of the oral system?—Decidedly easier, and the deaf and dumb person is more benefited by acquiring a knowledge of the sign system than of the other.

8125. Is it not better to begin to teach children the oral system than the sign system, because if they fail in learning the oral system they still can fall back upon the sign system, whereas if they begin with the sign system it is almost impossible for them to learn the oral system?—I cannot agree with you in that, for this reason: you will admit that the object of all education of deaf mutes is to enable them to hold intercourse and communication with the outer world, and there is no channel, I maintain, which will connect them with the outer world in the various phases of life in which they move so powerfully as written language, and they can only gain a full knowledge of written language under the sign and manual system. Let us take five years of oral taught instruction against five years of sign and manual instruction. The five years spent in sign and manual instruction will give the pupils far more knowledge of written language, and therefore knowledge useful to them in mixing with the world, than the five years of oral instruction. The oral system is a very much slower system; it is a much more difficult system.

8126. You say their success in life depends upon their being able to communicate with other people. The majority of people do not use signs, they use language, then if the deaf and dumb use signs, are they in a better position than if they have been taught to speak?—I maintain that a person who has had five years' instruction in the sign and manual system goes out into the world far more charged with general knowledge, and knowledge of written language, and far more able to make his way in the world, or enter into society, than a person who has merely been taught orally.

8127. He cannot speak?—He can write and make signs for himself.

8128. Is not it more difficult for a deaf and dumb person who cannot speak to get employment?—There is very great difficulty in understanding the language of those orally taught, that is my strong point. I have been conversant with deaf and dumb people from my earliest days. For example I can refer to the case of the son of a military officer who had been taught for many years on the oral system. I was referred to him as a wonderful specimen of the results produced by the oral system, and I went to see him, and I was obliged to ask him to converse on his fingers or on paper, I could not understand him; it was painful to listen to him, the sounds he produced were most irritating to one's ear.

8129. Where was he educated?—At a well known oral school, I believe.

8130. At what school?—He was educated, I believe, under Mr. Arnold. I should like the Commissioners to examine him, and I should like them to examine a few more who have been orally taught, and I venture to say the Commissioners would find that it is very difficult to understand them at all. This gentleman I speak of is a very good specimen, because he is an intelligent man; he has been brought up under favourable circumstances, his father is well educated, and he has spent a good deal of money on him; he is in a good position in life. Though he has had every possible advantage I maintain that his knowledge of language is not so good as that possessed by many others who have been trained under the pure sign and manual system, such as Mr. Pearce, an ordained deaf and dumb clergyman under me in the diocese of Winchester.

8131. Does he only communicate with the outer world with his fingers?—Only with his fingers, and by writing.

8132. What is the course of education in the schools in which the sign and manual system is taught, speaking generally. First of all is there any variety in the instruction throughout England, or is it uniform in character?—In the main principle it is uniform in character. Teachers have their own little idiosyncrasies, and their own special methods.

8133. Are the signs uniform, or are different signs used in different schools?—That is one of the wants of the day, a uniform code of signs.

8134. There is no uniform code of signs?—There is not a uniform code of signs; the signs differ, though there is enough uniformity for all practical purposes, still it would be a great thing to have absolute uniformity. We cannot agree upon a uniform code of signs; if we could, it would be a very important thing.

8135. Is the sign system as taught in England understood in America, or on the continent?—To a great extent; but the alphabet in America is an entirely one handed alphabet, and it is a most difficult alphabet.

8136. With regard to the continent, are the signs used there the same as those used in England?—There is a great similarity between the French system and the English system.

8137. Is the difference between the English and continental systems and the American system in the alphabet, or in the conventional signs for expressing certain phrases?—The difference is in the signs. In the two handed alphabet in England you have the letters, a, b, c, and d, and so on. The one handed system is almost uniform as regards the alphabet, but it has a code of signs which is not uniform with the signs generally used in England.

Rev. C. M Owen, M.A

19 Mar. 1886.

8138. How many years does it take to teach the sign and manual system?—If you take a child that has been taught the oral system for three years, you will find that that child knows but little in comparison with what a sign and manual taught child would know in three years. Then an oralist would say to me, we agree that the first three years of teaching by the oral system is a very laborious process, but it is after that period that we make a great spurt. On the other hand I say after that period all the spurts in the world do not make up for time lost, I say if you spend seven years in teaching a child by the sign and manual system, you will send that child out into the world infinitely better taught, with infinitely greater knowledge of language, with infinitely more capacity of communicating with the outer world, with infinitely greater aptitude to suit himself to any calling, than if he had been kept for seven years under the oral system.

8139. What are the professions which sign taught deaf and dumb people usually adopt?—It depends on the class of life in which they are born, for instance, some go into offices as clerks, they take any secretarial work, they do very well as draughtsmen, they do very well as engineers. If you were to go to the Brighton school which is a pure sign taught school, under Mr. Sleight, one of our ablest teachers I think, he would show you drawings most beautifully done. The book illustrating the voyage of the "Challenger" for instance, if my memory mistakes me not, is entirely illustrated by a deaf and dumb pupil of Mr. Sleight's, and I maintain that a deaf and dumb person, if the conditions are favourable, and if he has been properly taught, holds his own anywhere. I do not like to hear the deaf and dumb looked upon as lunatics, all things considered they will compare favourably, if properly taught, with any class of Her Majesty's subjects.

8140. How long is it before a teacher can convey abstract ideas, ideas of religion or political economy for instance, to a child of a certain age?—It depends on the capacity of the child.

8141. I do not suppose that a boy after he had been at school three years, if he began very young, would be able to take in abstract ideas in religion or political economy, but speaking generally how long would it take to convey such abstract ideas to the mind of a deaf and dumb child?—Speaking generally, taking all things into consideration, in three years under the sign and manual system, or the combined system, it is marvellous how much a child can be taught. If they are 10 years old before they go to school they do not get on so well as if they begin earlier, they do not do so well between the ages of 10 and 13 as they would between the ages of eight and 11.

8142. What time ought they begin to go to school?—Between the ages of seven and eight, and remain till they are 16; they ought to remain at school for seven or eight years if you want to educate them properly. I do not say for a moment that it requires a stay of seven or eight years in an institution conducted on the sign and manual system to make a person equal to one who has been orally taught in the same number of years. I still maintain that after eight years instruction in the sign and manual system a child will know more than half as much again as an orally taught child who had been under instruction the same number of years. If you ask me to what age I think a child ought to be kept at school to be made a useful member of society I should say seven or eight years.

8143. During that period of education what physical or technical training should the children have?—As to physical training for the development of the muscles, the boys ought to have very large and efficient playgrounds, gymnasiums, and so on, the more exercise the better. Then they should be taught domestic work, blacking boots, cleaning knives, and that kind of work.

8144. Any trades?—No, certainly not, I will come to that presently. Then I should say that girls ought to have the usual playgrounds which girls can have, and also be taught domestic work, scrubbing, and cleaning rooms and so forth.

8145. We have been told that many of the children who are brought up upon the sign and manual system suffer from delicate chests and throats, and that one advantage of the oral system is that it trains the organs of speech and strengthens the throats and chests of the children; is that your experience?—I should like to contradict that in the strongest possible terms that genteel language will permit of.

8146. That really is a medical question, is it not?—Yes; but you are asking me my experience. Looking at the general condition of those who are taught by the sign and manual system I wish entirely to deny that statement most emphatically.

8147. Do you find that deaf and dumb children breathe through their mouths or through their noses?—I think they breathe like other people; I do not think there is anything particular in their way of breathing. I have never noticed any difference.

8148. Are not their mouths constantly wide open?—Except a few guttural sounds when they are talking I have not noticed any difference between deaf and dumb people and hearing people in that respect. I have not observed anything that could be traced to any method of teaching.

8149. But the question is whether something is not to be traced to the want of teaching; whether their mouths are not open more than the mouths of other people by constantly breathing through their mouths instead of through their noses?—It is a great comfort to society when the deaf and dumb do not open their mouths, because when a deaf and dumb person does open his mouth the sound is so objectionable that one avoids him.

8150. You think they never can be trained to speak properly?—It is but a very small per-centage that can ever be trained to speak in a language acceptable to those who listen to them. Sir William Dalby in an extract which I have before me, speaks decidedly in favour of the sign and manual system of teaching children. Suppose you bring forward the best orally taught man in the world, after all his language is practically dead, because articulated language is nothing if the person to whom it is spoken cannot understand it; whereas the sign and manual system is for the deaf and dumb a living language. I think that is a strong point. When I took Mr. Pearce before the Queen, what delighted Her Majesty was the animation, the vigour, the expressiveness with which the conversation was carried on without a word being uttered.

8151. Are you in the habit of preaching to the deaf and dumb by signs?—Yes.

8152. Do you find any difficulty in conveying abstract religious ideas to the deaf and dumb by signs?—Of course it is necessary to make the instruction as simple as possible. For instance, at the next confirmation some deaf and dumb persons will be confirmed. While the bishop is giving his charge to the other candidates I shall be translating what he says to my deaf and dumb candidates. I shall probably condense any abstract notions into more simple language, but there are no ideas of a practical or simple character which cannot be conveyed intelligibly to the deaf and dumb who have been taught by the sign and manual system provided they have a sufficient knowledge of language. Another strong point is this, which bears on the welfare of the deaf and dumb who have been taught on the oral system, when they leave school. I asked a teacher, I do not want to mention his name, I asked a professional teacher whom you have had before you, who is a great upholder of the oral system, "What are you going to do "with your pupils when they leave school, when they "want religious instruction, or want to attend lectures?" and his reply to me was "When they leave me they "must go and learn the sign and manual language."

8153. We have not had any evidence to that effect from those who teach the oral system?—Then I am afraid you have not extracted it.

8154. You heard that from a gentleman who you say has been a witness before us?—Yes. I went and examined his oral class, and I got very little indeed out of it. I never was so disappointed in my life. I said, "What will these do when they leave school? You are "training a body of children who, when they go out "into the world are handicapped with regard to "religious ministrations, or lectures, and so forth." He said, "Yes, I know when they leave me they must learn "your system if they want to receive religious instruc-"tion or to get any benefit from attending lectures."

8155. Are you speaking generally of those who have been taught on the oral system, and not of an isolated case?—Yes.

Rev. C. M. Owen, M.A.

19 Mar. 1886.

8156. You say generally all those who have learned the oral system, in order to get the benefit of religious ministrations, have to learn the sign and manual system?—Yes; take St. Saviour's Church, Oxford Street, where I so often preach. I have a strong light over my head, and I gesticulate with my fingers, and I can be seen and understood by a large number of persons, some of them being a good distance from me; whereas if I had to speak to a number of orally taught persons I do not think they would understand me if they were at the distance that the chairman is from me, however distinct and clear my enunciation might be, and however free I might be from moustache and beard. There is so much personal contact required in this oral system; you have to get close up to your pupils to be understood.

8157. You come in contact with deaf and dumb persons who have been taught on the oral system as well as with persons who have been taught on the sign system?—Yes; my mission work throws me constantly among the deaf and dumb who have left institutions, and I come across some who have been orally taught.

8158. Do you give them religious ministrations in oral speech?—Never orally, always by sign and manual language.

8159. Do you refuse to give them the benefit of religious ministrations unless they take them in sign and manual language?—I do not refuse, but I find that it is practically impossible to give religious instruction to a large number except by sign and manual language.

8160. You have given up speaking to the deaf and dumb in your religious services or ministrations?—I never began it; I never tried it, and I never would try it, because I considered that it was impracticable where any number of deaf and dumb were brought together.

8161. Suppose you were called to the bedside of a person who could speak orally, would you communicate with that person orally or by signs?—If that person could speak in anything like intelligible language I should ask him to speak orally, but it is such a very small per-centage that can speak in language that even I can understand, that I am generally obliged to ask them to speak by their fingers if they can.

8162. The oral system has not been introduced very long in this country?—No; I do not object to modern innovations.

8163. Comparatively speaking there are very few adults at present who have had the benefit of oral instruction?—Yes, I do not see how it ever will become very general, because it is as natural to the deaf and dumb to talk by signs and gesticulations as it is for me to talk by my lips. Go to an oral class, and then go out in the playground with them and see how many talk to each other. You will find that they fall back upon signs and gesticulation. When they go into the outer world they have to learn the sign and manual system, and therefore they leave school handicapped because they have to pick up the sign system afterwards, and they do not attain the proficiency they otherwise would. Suppose I am taught at an oral school for six years, and then I go out into the world and have to pick up the sign and manual language, however quick I may be I cannot arrive at that efficiency and get that general knowledge of language and so on that I would have got if my education had been conducted throughout on the sign system. The deaf and dumb who are taught orally when they leave school fall back on the sign and manual language.

8164. There must have been some reason why some schools in the north of England, for instance, have given up the sign and manual system and introduced the oral system?—If you would like me to give my opinion I think the public are hoodwinked by this oral system. I am not a paid agent of any system, and my object is to do the best I can for the deaf and dumb, and I am bound to say from conviction that I think a great deal of what is said about the oral system is claptrap. I have prepared a paper giving my reasons for my preference of the sign and manual system over the oral system, which I will hand to the Commissioners (*handing it in*). When people say the deaf and dumb taught under the oral system can go and mix in the world on a level with the rest of the community I say it is a falsehood, though no doubt an unintentional one—they cannot do it.

8165. With regard to the industrial training of the deaf and dumb, whether in schools or after having gone through a course of education, have you any remarks to make to the Commission?—I am dead against any trades being taught in schools.

8166. Will you tell us why?—For two reasons: First of all from my point of view that period of school life, for the deaf and dumb of all people in the world, should be devoted as much as possible to giving the pupils a knowledge of language and general knowledge, and therefore they should not have any of the time at their disposal curtailed by learning trades. All the time that they are at school is wanted and more than wanted for the acquisition of a knowledge of language and general knowledge to fit them for fighting their way in the world when they leave school. On leaving school they ought to be apprenticed, and therefore every institution should have what is called an apprenticeship fund, out of which pupils should be apprenticed after leaving school.

8167. Would you include drawing in the general education?—Yes, that would be part of the educational system. I would say by all means teach drawing, but I would not teach trades. I mean such trades as shoemaking or anything of that kind. The teaching of trades has been started, and tried at Doncaster, under the late Mr. Baker, a relative of the archbishop's but the plan has since been abandoned.

8168. Do the teachers of the sign and manual system compare favourably or otherwise with average teachers in our elementary schools, are they trained men?—They are picked men to a certain extent, but the great misfortune is this, that most of the institutions, with the exception of the favoured Margate institution, are so poorly endowed that the salaries which they are able to offer are not sufficient to get first-rate men. Here I should like to say that I look upon it as a matter of the utmost importance that we should get State aid for our institutions in order to enable us to get better teachers. When we advertise for teachers we cannot offer sufficiently good salaries to enable us to get first-rate teachers.

8169. What qualifications do you require from teachers; do you require that they shall possess the qualifications required for certificated teachers for elementary schools?—The higher the standard they have passed the better we like them.

8170. As a matter of fact do you get them?—We do not get them because we cannot offer sufficient salaries.

8171. That is common to both systems?—Yes, all systems should be supported by State aid, in the way of a capitation grant.

8172. What capitation grant do you think ought to be given for the deaf and dumb?—I think we ought to have these institutions brought under Government supervision, not Government inspection. We ought to have a capitation grant, and then we ought to have one or more inspectors, an inspector for England, an inspector for Scotland, and an inspector for Ireland, who would go round and report on deaf and dumb schools periodically, not examine them. I think it would be unfair to give a grant to any deaf and dumb school, either an oral school, or sign and manual school, according to attainments. The principle should not be payment on results, or at least not solely on results. We ought to have one or two inspectors to go round to the various education centres in the country and report, and a grant should be given on the capitation system, provided always that a fair amount of general results were attained, not individual results, but general results.

8173. You would advocate that State aid should be given by means of a capitation grant not only to schools on the sign and manual system, but to schools on the oral system?—Quite so. I want the others to have the same as ours. If A.B. were an inspector, I should trust him to give the same fair and impartial examination and scrutiny to an orally taught school as to a sign and manual taught school.

8174. Is it your opinion that the general results attained by education on the sign and manual system, compare favourably with those attained in orally taught schools?—My opinion is that the results in sign and manual taught schools are very much more satisfactory than those attained in orally taught schools. I maintain a sign and manual system institution, or a combined system institution, will show infinitely better results than an oral institution. If I had only myself to please I should go in for payments by results, because I know that the institutions on the system that I advocate would bear the test, but I do not think that would be fair to other institutions.

8175. You would not subject deaf and dumb schools to the same standards as elementary schools?—No, I should take it for granted that the inspectors, if appointed, would be men who would know something about deaf and dumb teaching. A deaf and dumb child at 10 years old, of course, will not compare favourably with our national school children of 10 years old.

8176. Whatever system was adopted a deaf and dumb child must be at least three or four years behind a hearing child?—Yes, the mind of a deaf and dumb child when he comes to school is a perfect blank, the initial instruction of a deaf and dumb child is a most painstaking and laborious process.

8177. Will you look at the resolution passed by the Manchester School Board (*handing it to the witness*), and say whether you have any remarks to make on it?—I would qualify that, because if you went by test examination it would be hard for the oral system. What I am most strongly against is the system of day school instruction for the deaf and dumb, whether taught orally or by the sign and manual system.

8178. That at once leads to the question of the necessity of maintenance in the case of poor children?—Undoubtedly. I hope the Commission will strongly recommend that guardians or school boards should in some way meet together and arrange a scheme of combined education and maintenance. The guardians say they cannot educate, and the school board say they cannot maintain.

8179. The guardians have the power of maintaining?—But they do not exercise it.

8180. You would say that the proper authorities should be compelled to maintain?—Yes, I would. I have lately been transferred to Edgbaston, in which parish there is a deaf and dumb school, that, in fact, is one reason why I accepted the charge of that parish, and there we have tremendous battles with the school board and the guardians with regard to the education and maintenance of deaf and dumb children; and I hope the Commission will make some recommendation that will lead to the settlement of the squabbles which now take place between boards of guardians and school boards with regard to the education and maintenance of the deaf and dumb. Speaking generally, all over the country I would compel guardians or school boards, or some authority to send deaf and dumb children to an institution. I am strongly against the day school system.

8181. Do you think that the children should not go home at all to their parents. I mean that they should have no vacations?—They should have vacations certainly; I would be liberal in vacations. I am in favour of holidays once a year instead of twice a year, but I would not press that. At Brighton for instance they have holidays once a year, and then they do not lose so much, because when a deaf and dumb child is at home he loses a good deal of his knowledge.

8182. Do those who have been taught on the sign system lose any of the knowledge which they have acquired when they go home?—They get demoralized; they get out of dicipline when they go home to their parents. We want every day we can get in the teaching of the deaf and dumb, for it is up hill work to teach the deaf and dumb, and the less holidays they have the better. I think sign and manual taught children do not lose so much as the others when they go home for their holidays; but whether they are taught by sign and manual or orally the longer they are kept at school the better. It is general training and dicipline that they want, and they can only get that in an institution. Let me refer to what it has been found necessary to do in London. When the day school system of teaching the deaf and dumb was started under the school board Mr. Stainer started homes for the children. That has been done voluntarily. Why has it been done? Because the day school system is not sufficient in itself. The children want to be brought under some constant moral training which only a home or institution can provide. Therefore I strongly recommend that all state aid should be given support of institution as against the day in school system. The day school system is a much more expensive system for the results you get.

8183. We have had it in evidence that it is not, that is to say that if you have the day school system you are not obliged to spend money in a large building, if you have an institution you must have a large establishment?—Quite so, but I am looking to the results, you have to put in the one scale, the amount paid for your purchase and in the other scale you have to put the thing purchased. The amount paid may be a little more in the case of an institution as compared with a day school, but the thing purchased, the trained child, is infinitely superior.

Rev. C. M. Owen, M.A.

19 Mar. 1886.

8184. We must look at the expense of the one and the expense of the other. Is not it the fact that the day school system, where children might go home to their parents, or be boarded out with persons of their own class, does not involve near so much expense as institutions? You say there are advantages to counterbalance the extra expense but still the extra expense must be borne in mind?—Yes, in pounds, shillings, and pence you save by the day school system, because you save the board, but you have to pay superintendents and heads of each department; it is an expensive system even that.

8185. With regard to the mixing of the sexes in schools, do you advocate their being kept together till they arrive at the age of 15 or 16, up to which age I understand you think they ought to remain in school?—Yes, I would mix them together.

8186. Up to the age of 16 you would have both sexes together?—Yes, I would mix them together in this way. They would come together in the same room, or there might be, as in the old London institution, one room facing one way for girls, and another room facing the other way for boys. I prefer them being in the same large school room together; seeing one another constantly is good for them. The passions of the deaf and dumb are undoubtedly strong, but evils which are to be guarded against, if possible, are less likely to accrue if they are trained together than if they are kept apart till they are of a certain age and then meet with a sudden rush as it were.

8187. Do you find in after life the deaf and dumb associate very much together?—Yes, very much indeed. They are very clannish.

8188. Do you know anything about intermarriages of deaf and dumb persons?—Yes, I have married them myself in the deaf and dumb language.

8189. Do you think it is desirable that deaf and dumb people should be encouraged to intermarry?—I would not encourage them, because it is so very inconvenient for both parties socially; but I would not discourage them on account of any fear that the result might be that children might be born with any congenital defect. I would far sooner discourage the intermarriage of cousins. You find that intermarriages between deaf and dumb persons are not nearly so pernicious as regards results as the marriages of blood relations. The offspring of the deaf and dumb are not so likely to be deaf and dumb as is commonly supposed. In support of what I have just said on this point, I might perhaps be allowed to read what Dr. Peet, of New York, says in favour of the sexes being trained together in schools. He says "Where the sexes daily see each other it "accustoms them to habitual decency of thought, "manner, and expression; they are under the moral "influence that in families and society preserves the "virtue of the young. If for this moral control, aided "by constant supervision, we should substitute strict "seclusion from the other sex, it is to be feared that in "circumstances of temptation their fall would be inevitable." That is strong evidence in favour of both sexes being trained together at school.

8190. That is justified by your experience?—Undoubtedly.

8191. Do the institutions with which you are acquainted all over England follow up their pupils when they leave school?—That subject of following up the old pupils I consider a most important one.

8192. You said something with regard to an apprentice fund?—I think an apprentice fund is important in every institution, because it is a tie between the institution and the deaf and dumb when turned out. It is most important that there should be this connexion maintained between the deaf and dumb when they leave the institution and go out into the world. As long as they are in the neighbourhood of the school where they have been brought up, it should still be their home. The master should continue to take an interest in the welfare and progress of the deaf and dumb pupils after they leave school. It is of the utmost importance that an apprentice fund should be maintained in connexion with every deaf and dumb institution for that one reason, so as to be a connecting link between the institution and the

Rev. C. M. Owen, M.A.

19 Mar. 1886.

individual who is apprenticed; and I think every institution should select visitors from the staff of teachers, whose special duty it should be, under the direction of the managing body, to visit those apprentices and to see that they were being properly treated by their employers, because employers often behave badly to the deaf and dumb, I am sorry to say, because they take advantage of their want of general knowledge very often.

8193. Are the deaf and dumb as a class industrious?—I think they are industrious as a class. I maintain that in industry and in every other way, taking all things into consideration, they will compare favourably with other classes.

8194. They are not given to begging?—I do not think they are given to begging any more than others are.

8195. Are they less inclined to beg than other classes?—The difficulty is this, we find it is very difficult indeed to get employers of labour to take the deaf and dumb.

8196. Particularly if they have to communicate with them on their fingers, you mean?—I do not think that, but they have the idea, and it is a general idea, that the intellect of a deaf and dumb person is tremendously below the average, and it is a most mistaken idea.

8197. Is that generally overcome?—It is generally overcome if they will only give the deaf and dumb person a fair chance. Employers of labour in Brighton have come again and again to the school for a second and a third deaf and dumb pupil, they are so pleased with the way they have turned out.

8198. In what trades?—Shoemaking and various trades. In addition to the establishment of an apprentice fund in connexion with each institution, I would strongly recommend the establishment of missions to the deaf and dumb all over the country. With the exception of London my own diocese of Winchester is the only diocese, with the exception possibly of Durham, which is just starting a mission, in which the church of England has established regular missions to the deaf and dumb. I think mission work should be taken up in every diocese, apart from the moral good that would necessarily result from it, as a means of keeping a hold upon the deaf and dumb after they leave school. In school the deaf and dumb are brought together for a while, then they are suddenly dispersed, and live isolated lives. It is most important that they should be brought together and have a good, religious and secular training after they leave school. Mission work amongst the deaf and dumb is most important.

8199. Is there any deaf and dumb mission in Wales that you are aware of?—There is a little mission at Swansea, that is the best in Wales. What I want to enforce is the importance of establishing diocesan missions such as that in the diocese of Winchester, which we started some few years ago; and I will give to each member the last annual report of the mission work in the diocese of Winchester, which is the most complete mission out of London. As I have said there is a good institution at Swansea carried on by an estimable man; but mission work in town and country all over the United Kingdom is what we want.

8200. Is there work enough in each diocese for one man?—In Hampshire and the Isle of Wight we have 300 cases.

8201. In every diocese would there be enough deaf and dumb to justify the establishment of a mission for the deaf and dumb?—One or two dioceses might be amalgamated. I think there would be enough in each diocese; the great difficulty is getting men who can do the work. I could start a mission in the Exeter diocese if I could get a clergyman who could do the work. There are very few clergymen who can talk at all on their fingers. I happened to have a first cousin deaf and dumb, and that led me to learn the sign and manual language; but there are very few clergymen who could take it up, and that is our difficulty. At the Royal Association in Oxford Street we are entering upon a system of training men as missionaries to the deaf and dumb.

8202. Clergymen or laymen?—We have trained laymen at work, but we have a young man named Gilbey who is now attending lectures at King's College with a view to taking Holy Orders. He is one of our lay missionaries, and he is also attending lectures at King's College, and when he gets to the proper age he will take Holy Orders, and come on our staff of ordained missionaries.

8203. Is he deaf and dumb himself?—No, I do not advocate the training of deaf and dumb persons as missionaries. A speaking and hearing clergyman like myself can not only do all his work amongst the deaf and dumb, but he can appeal in pulpits, or at public meetings on behalf of the deaf and dumb. We do double work, and that is most important. Mr. Pearce, who is the only ordained deaf and dumb minister in England, is a very superior man altogether. I do not know where you would get his equal; and therefore, I recommended that he should be ordained, having a full knowledge of him, and knowing what a very remarkable man he is, but such a case as his would be an exception, not the rule.

8204. (*Mr. Arrol.*) Can you give the Commission any information as to the success in after life of those who have been turned out of the oral schools in Germany?—No, I cannot; because I have not been long enough in Germany.

8205. (*Mr. St. John Ackers.*) You referred just now to a paper which you have now laid before the Commission, which was printed in the first instance in one of the Hampshire papers, had you sent a copy to each member of the Commission before to-day?—No.

8206. You sent one to me?—I do not remember sending it; my secretary may have sent it, or Mr. Pearce may have sent it.

8207. You refer in that paper to two statements, one made by the "Times" newspaper, and the other by a newspaper called "Truth." I see you speak disparagingly of the one in the "Times" newspaper, and you quote approvingly the one in "Truth"?—Undoubtedly.

8208. You say in your letter that you move up and down in society, and then you say that society shrinks from the deaf and dumb who have been taught to speak?—That is so, so far as my experience goes.

8209. Do you consider that that society paper you have quoted is a good judge on the subject?—I simply quote that extract because it gives a report of the bazaar. I did not see any other paper that gave any account of it.

8210. You did not see an account of the bazaar in other papers?—I only saw it in "Truth;" had I seen it in other papers I should probably have quoted the others, but I happened to see it in "Truth;" it was sent to me.

8211. You are not aware that those papers gave a very different account of the bazaar, that they gave a very favourable account?—I did not see them.

8212. You are not aware that "Truth" is the only paper that gave an unfavourable account?—Possibly that is why it was sent to me.

8213. You have circulated this letter widely?—Pretty freely.

8214. You say you did not read other accounts of this bazaar, but you simply circulated this letter on reading the account in one paper?—The letter is reprinted with additions from the "Hampshire Chronicle." The original of this letter appeared long before the paragraph in "Truth." I was looking over the reprint, and this extract from "Truth" came, and I incorporated it in the letter.

8215. Without attempting to find out whether it was correct or not?—It was sent to me; I had never seen the statements in it contradicted. Of course I cannot be expected to read all the newspapers.

8216. You published this statement without attempting in any way to verify the truth of the statement by seeing the accounts in other papers, or speaking to persons who were at the bazaar?—I submit that it is impossible for me to verify all the statements that I find in newspapers.

8217. Did you or not circulate this extract from one paper without having taken pains to verify the truth of it?—I did not write to the editor of the paper to ask him whether it was true or not.

8218. Were you present at this bazaar?—I was not.

8219. Did you take any trouble to verify the statement in "Truth" by getting information from persons who were present?—No, I gave it as a quotation from "Truth."

8220. Do you agree with everything in that extract?—I agree with the substance of it; I throw it in as a quotation. I merely use it as a quotation; the quotation agrees with my general experience in my work amongst the deaf and dumb.

8221. In the next paragraph you speak of a meeting held at Kensington, and you say one of the speakers is reported to have said so and so; it is not in inverted commas. How did you obtain the information with regard to that meeting?—I cannot give you chapter and verse for that.

8222. Was it from a newspaper?—A newspaper or a letter; I was not present at either meeting. I simply give what took place as quotations.

8223. Why did not you give the exact words that were spoken at Kensington?—I had to condense and say as little as I could under the circumstances. My memory does not serve me whether I got the account of what took place there by a private letter or from a newspaper. I can vouch that the words I give were the words conveyed to me, whether by letter or by a newspaper cutting I cannot tell you. I only know that they were conveyed to me, and I embody them in my letter as a quotation, and I agree with the general purport of the quotation.

8224. In one case the words used are quoted, in the other case apparently the effect of what was said is given?—"One of the speakers is reported to have said "that when the deaf speak only in the sign and manual "language they are a people apart, and the affliction "descended from generation to generation, *whereas, by "the present means, they are at once admitted upon equal "terms as members of the whole human family.*" Then I say "The italics are my own." That is probably a quotation from a public newspaper.

8225. (*Chairman.*) You do not guarantee the accuracy of the words, but you simply adopt them as your own?—Quite so. To the best of my belief the quotation was from a newspaper. With the general principle stated in the remarks which I quote I agree. I am not answerable for the quotations if they do not rightly give what was said. I say if that statement was made it is an exaggeration. I did not hear it made. If the statement was made I deny the truth of it.

8226. (*Mr. St. John Ackers.*) To the best of your memory did the report which you received state whereabouts at Kensington the meeting was held?—I absolutely cannot answer that question.

8227. Did it say by whom the statement was made?—I cannot tell you.

8228. Did it say to what society the speaker was attached?—I cannot tell you.

8229. You publish the quotation and spread it broadcast throughout England without attempting to verify the truth of it?—I should have verified it had I thought the source from which I got it was a questionable source; I did not take any steps to verify it because I did not consider the source was a questionable one or an unworthy one.

8230. Are you in the habit of publishing letters on the subject of the education of the deaf and dumb and quoting from newspapers and other sources without attempting to verify the truth of the statements which you may receive?—I never attempt to verify a quotation if I consider it is a fairly worthy source that it came from, such as a public newspaper or otherwise.

8231. Have you had much intercourse with those who are teaching on the oral system?—I meet them constantly from time to time and talk to them.

8232. Have you ever come across any teacher of the oral system whose views were identical with the views of the speaker whose words you have put in this letter: "when the deaf speak only in the sign and manual "language they are a people apart, and the affliction "descended from generation to generation"?—I have not heard anybody express those views. That is a quotation from a letter or a newspaper, I do not know which, I think it was a newspaper.

8233. You have not heard any advocate of the system express those views?—No.

8234. (*Dr. McDonnell.*) You spoke of communicating by writing as if it were more particularly an adjunct of the sign and manual system; is not writing a means of communication common to those taught under the sign and manual system, and those taught under the pure oral system?—Yes, the system of writing, of course, is common to everybody whether taught on the oral system or taught under the sign and manual system, but I maintain that those who are taught under the sign and manual system are better able to write and to understand writing. Those who are taught under the sign and manual system from the general knowledge imparted to them during the time of teaching are more in a position to write well and understand well written language; they have a greater knowledge of written languages than those who are taught under the other system.

Rev. C. M. Owen, M.A.

19 Mar. 1886.

8235. But a deaf and dumb person if he lost his way in London, and wanted to ask some one whom he met in the street to direct him where he wanted to go could write his question whether he had been taught by the oral or by the sign system?—Undoubtedly.

8236. So far as writing is concerned they stand upon common ground?—As regards losing their way, but not as regards making their way; written language will attain a higher standard under the sign and manual system than under the oral system.

8237. (*Chairman.*) I understood you to say that the time that was taken in the oral system prevented written language being acquired so rapidly as under the sign and manual system?—Yes, and so efficiently; of course written language is not limited to the sign and manual system at all.

8238. (*Dr. McDonnell.*) Seeing that among hearing people with whom the deaf and dumb come in contact, there is such a very small per-centage of people who understand the sign and manual system, is not it an enormous advantage for a deaf and dumb person even to be able to speak a few words orally?—I do not think it is an advantage if the few words would be unintelligible.

8239. (*Dr. Armitage.*) You recommend apprenticeship funds being established?—Undoubtedly.

8240. Are any such apprenticeship funds established?—Some institutions have an apprenticeship fund. The Old Kent Road institution has a very large endowment, and they appoint a man to look after the apprentices, and to keep up a connexion between the apprentices and the institution.

8241. That institution keeps up its intercourse with the pupils after they have left?—Yes, a connexion is kept up; there is a visitor appointed by the institution.

8242. Is a register kept of each former pupil in the institution?—There would be a register, I should imagine, though I cannot speak accurately about that; money is paid out annually or at certain periods, and I imagine that there is a careful register kept.

8243. Do you know whether such a system is carried on at Edgbaston?—Yes.

8244. What funds have you for apprenticeships?—Our funds are very low, indeed. We are almost in a state of bankruptcy. We have 40*l.* apprenticeship fund, and we never give less than 5*l.* in any case.

8245. How long have you been connected with the Edgbaston institution?—I have known it a long time, but I have been connected with it for the two and a half years that I have been at Birmingham.

8246. Do you know whether an accurate register is kept there as to the circumstances and doings of former pupils?—Hitherto a very imperfect record has been kept, but since I have been there we have moved, and I hope to be able shortly to establish a more intimate and systematic connexion between the institution and its former pupils. Hitherto there has been no systematic visiting. We find that the former pupils have been very much neglected, and we hope to develop a much more careful system, such as that at the Old Kent Road, so as to maintain a careful supervision over the apprentices.

8247. Can you tell us from your general knowledge of the adult deaf whether they usually find profitable employment in after life?—A great many do not find employment, but that is to be attributed to various causes, possibly their being intellectually below the mark, but as a whole they get a very fair amount of employment, and they compare very favourably with other classes in that respect. Some are constantly out of employment because they have been badly trained and taught, but those who are efficient in their various occupations generally get a fair amount of work; it depends upon the individual.

8248. Can you give us an idea, taking the males first, what per-centage of them maintain themselves; would it be one-third, or a half, or three-fourths?—I have never been into those statistics; I could not give you the per-centage. I should think, roughly speaking, two-thirds.

Rev. C. M. Owen, M.A.

19 Mar. 1886.

8249. To what extent do the females get employment?—A great many go back to their homes and do the domestic work of the house. Others do dressmaking work, but it would be only a very small per-centage of them that get their own living.

8250. Do any deaf and dumb females go out as domestic servants?—A few, but very few. Obviously they do not make very good servants, because they cannot answer bells to begin with; they are not apt at receiving visitors; their going out as domestic servants is discouraged in every possible way; though in schools they are trained for domestic work for their own household they are not trained as domestic servants; they are practically unfit for it.

8251. You say that you have paid rather special attention to the question of intermarriage among the deaf and dumb?—I have taken great interest in that, because I have often been called on to marry deaf and dumb couples, and I have been often abused for doing it. I do not see any objection to the deaf and dumb intermarrying except inconvenience in a social point of view.

8252. You do not consider that deafness is hereditary?—No, not necessarily so.

8253. Do you practically know any of those who have intermarried who have deaf and dumb children?—Of course some have, but that is a medical question. I do not think it can be traced to the fact of the parents being deaf and dumb, more than to other causes. Of course some deaf and dumb persons have deaf and dumb children. The large proportion of deaf and dumb marriages certainly do not entail deaf and dumb offspring if other conditions are favourable. For instance, supposing that A.B. and C.D. marry, the children are not specially likely to be deaf and dumb, but it is advisable for them to mix freely with hearing people.

8254. According to your experience then, the children of the deaf and dumb are not more likely to be deaf and dumb than those of any other section of the community?—Certainly not; not half so likely as the children of those who marry within the limits of consanguinity.

8255. (*Dr. Tindal Robertson.*) You said in answer to his Lordship that you knew of two cases which were illustrative of the objections to the oral system. You gave us an account of one of those cases, and then you broke off and went on to some other subject; will you give us an account of the other case?—I only quoted two, but there are three specimen cases with which I am specially acquainted. There is a pupil of Miss Hull's, and also a pupil once taught under the oral system at Winchester, if you wish to have special cases; but those come across me in my mission work in the diocese of Winchester. I do not know where Miss Hull's pupil is now; she was shown to me at Southampton some little time ago.

8256. Was your objection to the speech on the oral system to the guttural sounds or to the imperfection of the speech?—To the imperfection of the speech and the disagreeable sounds, and also I think the want of general brightness and general knowledge. I think that orally taught children are more depressed in spirits than sign taught children.

8257. Will you state your reasons succinctly and precisely for your preference of the sign and manual system over the other system?—I should say that the sign and manual system is preferable, because in the first place you can teach more in a given time. It is preferable, secondly, because it is not such an expensive system, I think. If you take the deaf and dumb in the sign and manual institutions and in the oral institutions, you will find that the cost of those who are in a sign and manual institution is, roughly speaking, about 25*l.* each; and if you take an oral school you will find that it is between 35*l.* and 40*l.* Thirdly, when they leave school, I think the orally taught children are handicapped, inasmuch as they are not turned out into society charged with so much general knowledge as the sign and manual children. Fourthly, the tendency is that when they leave the schools they drift back into what seems to me the more natural means of intercourse, viz., the gesture and sign and manual language, and of the written language. And fifthly, in a religious point of view, there is more difficulty in teaching a definite number of deaf and dumb people brought together under the oral system.

8258. Have you had a good deal of experience with regard to the orally taught as well as with regard to those who have been taught on the other plan?—I am bound to say that my experience has been more with regard to those who have been sign and manually taught, because I find that when one or two who have been orally taught get into the world they more or less fall back upon the sign system. I do not think that they maintain the principles upon which they were educated.

8259. Have you ever come in contact with persons who have been pretty thoroughly taught on the oral system who have afterwards relapsed into the sign system?—The system of oral teaching is, comparatively speaking, a modern system; it has only been going on about 15 or 16 years. I presume that this young man to whom I have referred would be considered a very good specimen of an orally taught person; and he was brought under my notice as a very good specimen of an orally taught person, of very high intellectual attainments, and very high social privileges in the class of life in which he was brought up, his father being a professional man; and I am bound to say that I do not consider that his success from a practical point of view is great.

8260. Is the sign and manual system usually used to communicate with foreigners in foreign languages, for instance?—That would be a difficulty, the want of a general code of signs. Of course there are some deaf and dumb persons who can speak in the French language. It depends upon circumstances.

8261. But I am speaking of the present state of circumstances?—For instance, if a deaf and dumb orally taught child and a deaf and dumb sign and manually taught child were both turned out in France they would be equally adrift as regards the French language, although by means of natural signs the manually taught child could more easily make himself understood than the orally taught, and therefore would have the advantage considerably.

8262. That is not quite the point. Supposing that there was a knowledge of the language imparted in this country beforehand, which system would it be most easy to practise in the country?—Supposing that I was taught orally and knew French, if I went to France I should be under a disadvantage, because the oral system is not universally taught in France.

8263. I think I understood you to say that the oral system is not taught in France?—It is taught, but it is not the acknowledged system, the French system.

8264. (*Chairman.*) Do you speak from personal knowledge, because we have had evidence directly contrary to what you are now stating?—I have not been amongst the deaf and dumb in France.

8265. (*Dr. Tindal Robertson.*) With regard to the health of deaf children, do you think that as a rule they are equally healthy with other children?—Very often they are deaf and dumb perhaps from scrofula, or some other disease being handed down by inheritance; but I do not think they are more unhealthy than other children. Perhaps they are a little more unhealthy in our deaf and dumb institutions, but that is probably from inherited disease for which *per se* they are not individually responsible.

8266. Have you found from any medical friends to whom you have spoken upon the subject, or from your own experience, that they are more liable to diseases of the throat and of the respiratory organs in consequence of their condition?—No, not in consequence of their condition, unless there is some family circumstance to account for it, unless their parents have been immoral, or something of that sort. All conditions being equal, I do not know that there would be any greater liability to sickness in a deaf and dumb institution than in any other.

8267. Do you think that apart from the teaching of speech, it would be physiologically an advantage to them to use their throat and all the respiratory organs more fully than if they remain silent?—I do not see why that should be, but that is a point upon which I think medical evidence would be more satisfactory; it is a point of which I do not feel qualified to judge.

8268. You have suggested that it would be an advantage to both systems to have State aid; how far would you carry it?—May I ask whether you mean how much it should be per child?

8269. I could not ask you what should be the actual sum, but his Lordship has asked whether you would also extend it to maintenance as well as to education; do you mean that the deaf and dumb children in the country should receive sufficient for education and

maintenance from the State?—I think that as in our national schools there should be some payment on the part of the parents in cases where they can pay, and that those who come under the heading of pauper children should be paid for by the Government. I do not believe in free education, and I should not take away parental responsibility in the case of the deaf and dumb any more than in the case of any other class. I think that the parents who can afford to pay should pay, and that the State should meet the expenses of an institution by a capitation grant.

8270. You think that the State should pay for the education, and the guardians or some local authority for the maintenance?—Yes, I think that the guardians should have authority to pay entirely for pauper children.

8271. If you applied that to the deaf and dumb I presume you would also apply it to the blind, and to imbeciles, and to other children of the destitute classes of the community who are afflicted in that way?—I certainly should apply it to the blind; I do not know about imbeciles.

8272. With regard to the missions which you said you thought would be a great advantage to the country generally, in what way would you propose to provide for the expense of them?—Purely by voluntary contributions. It is a matter of religion, and I do not think that the State ought to be asked in any way to contribute towards it. I do not think that it would be fair for me, with a distinctly Church of England mission to the deaf and dumb, to ask the State, which gets money from all denominations, to pay for it.

8273. Do you suggest that in addition to the State providing for the education and maintenance of the children, it should also provide for or subsidise the training of the teachers?—I think that the best training for teachers is in schools where they are at work.

8274. Would you suggest that the State in addition, as I said, to providing for the education and the maintenance of those children, should also contribute towards the training of the trainers?—I think it is highly desirable that we should get the most efficient staff of teachers that we possibly can.

8275. But how would you suggest that it should be done?—Only by special training colleges.

8276. How would you meet the expenses of those training colleges?—Probably the State would give something, a supplementary aid. I suppose the only way in which that could be met would be by the individual teachers who enrol themselves for instruction, paying, or getting through their friends, or otherwise, a certain amount a year to meet the cost of their training.

8277. Then in fact you propose that the State, in addition to the payment for the training of the children, should also contribute towards the payment for the training of the teachers?—I think that is highly desirable if the State would go in for that expense. If not, the teachers at the various institutions must keep up their own work side by side with their teaching work, and pass certain examinations at certain periods, and qualify themselves in that way, sitting for certificates as we should say, but not being at a training college.

8278. With regard to missions you said that the expense should be met by voluntary contributions; will you tell us in what way you were able to establish your mission, because it would serve as a precedent?—First of all I got the bishop's sanction, of course. Then I sent circulars to every beneficed clergyman in the diocese, and a regular form to fill in, "Are there any deaf and dumb in your parish? What is their name and age? Where educated? How long at school? Can they read and write well? What are their general attainments?" That return was sent in. Then we got a committee of the leading clergy of the diocese, including the dean, with the bishop of the diocese as patron. Then I found a suitable missionary, Mr. Pearce, of Southampton, who has since been ordained. Then we got the permission of each beneficed clergyman to allow Mr. Pearce, or myself, to work in his parish; and then we established various centres, Portsmouth and Southsea especially, where the largest numbers were; and then at various centres we trained them for confirmation. I get the money by voluntary contributions, and by preaching three or four sermons a year, and in fact, anywhere I can.

8279. (*Mr. Johnson.*) Have you ascertained the opinion of the general class of the deaf and dumb that have come under your notice as regards the advantages to them of the two systems respectively?—The deaf and dumb with whom I am most conversant are all dead against the oral system. The deaf themselves prefer the sign system.

Rev. C. M Owen, M.A.

19 Mar. 1886.

8280. The deaf and dumb who are already perfected in the manual system do not see the advantage of having speech?—Undoubtedly not.

8281. Is that opinion arrived at from knowing a very large number of deaf and dumb persons?—It is from general intercourse with them. I cannot say exactly how many deaf and dumb I do know, but I know a great number. Those who can converse with me in the sign language, or in the written language, do not like the lip system. My opinion is that the lip system is not acceptable to the deaf and dumb with whom I come in contact.

8282. Still, do you not think that if the system were carried out perfectly it would be a great advantage for deaf and dumb people to be able to speak in the language of the ordinary world, one to the other, as compared with the sign system?—Under a great number of "ifs" it would. If the system was carried out advantageously; if there was some guarantee that the orally taught themselves would not lapse into the sign and gesture language; if all people were clear in their labial movements; if people did not wear moustaches; and if various other conditions were fulfilled, then I think it would be a very good system.

8283. But you think that the system is surrounded with so many "ifs" that it is not desirable?—Precisely so.

8284. How do you, at the present moment, obtain your teachers?—If we want a senior assistant master we either advertise, or else we possibly know some institution, say perhaps the one at Margate, where there is a third or fourth assistant who would like to come to us as a senior or second assistant.

8285. You spoke of the importance of examination; I suppose you are aware that the Commission has been told that there are three bodies who now grant certificates?—Yes, the College of Teachers, and so forth.

8286. To which of those examining boards would you give the preference?—The College of Teachers is a very modern institution.

8287. I do not know whether you are aware that only one of those institutions examine on the sign system; have you any knowledge of persons who have been employed in your schools having been examined on the sign system?—No.

8288. Then you really create your own masters in the different institutions, and they are not subject to any examination?—No; for instance taking our institution at Edgbaston, when a vacancy occurred in the head mastership, Mr. Townsend was elected because of his well-known position under Mr. Elliott, at the Old Kent Road, and at Margate.

8286. I see that one of your reasons against the oral system is that education and religion are inseparably connected. You say, "Time was when education and "religion were inseparably connected, but those whom "God hath joined together man hath put asunder. "One of the late instructors of the oral system in London "once told me that they were obliged to look upon it "purely in an educational point of view; he did not "hesitate to acknowledge to me that it was not a good "system for imparting religious instruction to a number "of deaf and dumb children collected together, and sug-"gested that when they left school it would be time "enough to pick up the sign and manual language." I suppose he thought it was time enough for them to have religious instruction when they left school, was that so?—He said that we, as directors of education, must not take into consideration the religious aspect. He said, "It is quite right for you, Mr. Owen, who are "engaged in mission work, but we have to see how "much knowledge we can drill into the mind in a given "time."

8290. Irrespective of religion?—Irrespective of religion, and that when they leave our school they must pick up that system by which religious instruction is best conveyed to a number of people.

8291. You do not think it possible in the earlier stages of their education to give children religious training by the oral system?—Only to a small number with the class in very close proximity to the teacher.

Rev. C. M. Owen, M.A.

19 Mar. 1886.

8292. But you think that with the sign system you can teach a whole room full together?—You can.

8293. What is the ordinary congregation of one of those churches where the sign service is performed?—St. Saviour's, if it was full, would hold 300, I suppose; but it would be very crowded with that number.

8294. Are all those persons who attend there persons who have been taught upon the sign system?—Some may be; but it is open to the whole of London, and oralists or anybody may go there. All instruction is given on the sign and manual system. I cannot tell who attend; you have all comers, like any ordinary congregation.

8295. You say that very few of those who are instructed in the oral system speak intelligibly; do you mean that they are not able to hold ordinary conversation?—I mean ordinary conversation.

8296. Will you explain what you mean by their not using intelligible language?—Take the case of A. B. taught under the oral system. A. B. sits down to dinner with his father, his mother, and his sister, and he is not able to enter into the general conversation of that little circle of those with whom he is most familiar, and with whom he has been brought up from his earliest infancy. *A fortiori* he will be still more out of it when he is brought into contact with people whom perhaps he never saw before.

8297. Do you mean to apply that to everybody who is brought up on the oral system?—Not to everybody, but I should think it would apply to the great majority.

8298. Then you do not think that there are brilliant exceptions to the ordinary rules. Have you ever seen a merry company with an orally taught deaf and dumb person who speaks fluently?—I have not. I have not the least reason to doubt that there are such brilliant examples; but I should think that they are the exception and not the rule.

8299. You are entirely against day school instruction, are you not?—Entirely.

8300. In short terms, what are the salient objections that you have to it. You understand that the present instruction in the board schools is a day school instruction?—Yes, but I think that the very fact that, although it is voluntary work, it should be supplemented by home teaching is a proof that it is very desirable to have a system of training. The important thing is not the driving of so many letters of the alphabet and so many words into their minds in a given time; it is the general training which is given in an institution and only in an institution; it is the discipline, the early rising, the whole moral tone about an institution which is most important, and which a day school can never supply.

8301. Not even with the establishment of supplementary homes?—It would never be the same as an ordinary training school, and I think it would be a great deal more expensive and more troublesome.

8302. I gather that your opinion is that all the instruction of the deaf and dumb should be in institutions?—Most decidedly, if it can be so it would be far preferable to have it so.

8303. In both systems?—I would have institutions on both systems, and where the present accommodation is not sufficient in institutions I think that State aid ought to build a wing and provide for it.

8304. Is your sign system an uniform sign system, or are there modifications of it in the different institutions?—Yes, there are decided modifications in the various institutions.

8305. To any great extent?—Enough, I think, to be objectionable. If an universal code could be agreed upon it would be very much better, but I do not think that the difference is enough to form any bar to its general use.

8306. Would a boy educated at Newcastle on the sign system be able to understand a boy educated on the London system?—Certainly.

The witness withdrew.

Dr. EDMUND SYMES THOMPSON examined.

Dr. E. S. Thompson.

8307. (*Chairman.*) You are physician to the Brompton Consumption Hospital?—I am.

8308. Has your attention been much called to the deaf and dumb in connexion with weak chests and weak throats?—It has; I have had a large number of deaf and dumb under my care.

8309. In connexion with their special physical defect?—No, they come to the hospital as having chest affections.

8310. Do you find that in the deaf and dumb there is either a want of physical development or some imperfect development, or any special formation of the throat and chest?—Yes. It is a very large question. I think there is a special formation as regards the mouth and nose, because in a large proportion of instances they breathe entirely through the mouth instead of through the nose; and as the result of that breathing through the mouth a good many changes occur. The ear goes wrong; the eustachian tube gets out of order and becomes blocked. The fact is that the eustachian tube only opens during the act of swallowing, and when a person has the nose closed and the breathing is entirely carried out through the mouth, the air hardly enters the eustachian tube, and it gets blocked, and becomes useless; and as a secondary result the ear deteriorates still further, and many people who begin life as hearing people become deaf in consequence of mouth breathing. That is the first point. Then the next point is that the nose has the power of warming and moistening the air; and if the air goes directly to the wind-pipe through the mouth it is not warmed or moistened as it should be, nor are the particles of dust separated. The nose is a natural respirator; it arrests particles of dust, and it warms and moistens the air. So that we find that when the mouth is used for breathing and the nose is not used for breathing, dusty air, cold air, and dry air is respired; so that as the result of those three defects bronchial trouble is set up; and it is very much the same kind of bronchial trouble that people get who breathe dust in their occupations, those for instance who are millers, or masons, or potters. Then as regards the expansion of the chest, as a rule deaf mutes take very little active exercise. At schools they do not go in for sports which expand their chests; they live a sedentary kind of life, and as a rule they have very narrow chests, and do not use their chests fully, and secondary disease of a tubercular kind is very apt to be set up. I have no doubt that you have had statistics before you which show that the mortality amongst deaf mutes is very high indeed about the time when consumptive diseases show themselves, that is to say, between the ages of 18 and 30.

8311. If you have any statistics of that kind that you can put in afterwards they will be very valuable?—The census statistics show that the number of deaf persons living to the age of 40, or 50, or 60, or 70, is proportionately less than at earlier ages in any ordinary population. They die off in early days.

8312. But is not that partly owing to the fact that deafness and dumbness is connected with general weakness, either from consanguinity, or from hereditary syphilitic taint?—Yes; it must be allowed that the deaf are from hereditary and from acquired causes below the average in vitality; and I think the causes that I have mentioned with reference to lung disease show that they are to more than the average degree subject to pulmonary dangers; and the conditions of their life are such as to lead to stagnation rather than to active exertion.

8313. Then do you think it an advantage, independently of anything else, that the oral system should be taught to the deaf and dumb from early youth?—I can imagine it possible that in any other system great efforts might be made to encourage exercises, such as shouting and running about; but I think that there can be no question that the regular and systematic exercise of the vocal organs which takes place in the oral system is a very great advantage; and I certainly have noticed a difference in the appearance and condition of the children in the oral as compared with the mute schools.

8314. You do not know whether in the schools on the sign system they attempt to exercise the throat in articulating, if not in speaking?—I think that since

attention has been drawn to the subject an effort has been made in that direction.

8315. That might obviate some of the objections to the children being brought up on the sign system?—No doubt, to a certain extent; but the value of systematic training and exercising of the voice, as is done in the oral system, is so real, that if it were merely a subsidiary thing I should think that it would probably not be done nearly so well.

8316. It could not be done as it is done in training under the oral system?—No, I do not think it could. Then as regards the condition of nose breathing and mouth breathing, in the schools where children are kept mute, you find that a very considerable proportion (I am not prepared to say what proportion) have that narrowness of palate and closure of nostril which comes of the mouth breathing; and I have had occasion to notice that several children who have come under my eye before being taught on the oral system have had this constriction which has gradually departed under the influence of the oral system. I am not aware that that occurs, and I should be surprised if it did occur under the other system. I believe it is a result of a regular systematic training in breathing through the nose and speaking with the mouth, putting the organs in the normal state, in fact. I have been very much struck with that, because in several instances I have had to examine children before admission to the Ealing College, and I have been inclined to discourage their admission on the ground that they were not properly formed, that they were imbecile, but in, I think, three instances, my fear has proved to be groundless, the evil has been overcome, and the narrowness has been removed, so that now one does not notice it at all.

8317. Speaking of animals, does a monkey, which has a very imperfectly developed nose, breathe through its mouth?—I do not know whether I can answer that question; the monkey has a very broad nose and open nostrils.

8318. (*Mr. Johnson.*) Monkeys die very much of phthisis, do they not?—Yes, they often die of phthisis.

8319. (*Chairman.*) Do you think that this development of the chest, and lungs, and throat, also tends to raise the general character and condition of the system, and therefore to improve the intellectual condition?—It does, and I may illustrate that in this way. It has been observed that those deaf and dumb persons who have not been taught to speak are highly susceptible to chilblains, which is an evidence of defective circulation; whereas the exercise of the respiratory organs tends to oxygenate the blood, and to increase the activity of the circulation, and to keep up the warmth of the extremities; and chilblains are not noticed in those schools where the children are taught to speak, to anything like the same extent as where they are not taught to speak.

8320. And that is an additional reason, therefore, why the deaf and dumb should be encouraged to take physical exercise more, rather than less, than other children?—It is. I have no doubt that in a well arranged school immense effort is made to encourage active physical exercise. The deafness of children is very apt to make them play not quite so readily as other children; and they are apt to drop out in field sports unless a great effort is made to encourage them to play cricket, football, and so on.

8321. For that reason, do you think it desirable that they should be able as soon as possible to mix and communicate with hearing people, instead of communicating by signs amongst themselves?—I do. I think that one of the great evils of the old system was that they were so entirely associated together as a class apart, and that they were not encouraged to take active exertion and to enter into the interests of life with others. I think that is an enormously important point. If they are thrown in close association with other deaf and dumb children, they are extremely apt to intermarry, and we know what happens under those circumstances.

8322. Do you think that that has any marked influence?—I think it has, and I think that those who have taken the other side have hardly taken into consideration the question whether the individuals have been born deaf or not. Supposing that it is acquired deafness one would not expect that it would be transmitted; but I believe the evidence is very strong indeed that in the case of congential deaf mutes the danger of deaf mute children being born is enormously increased. I am quite aware that a different opinion has been expressed, but I believe it is due to that point not having been properly considered. If a congenital deaf mute marries a hearing person 1 in 135 of the children will be born deaf; if two congenital deaf mutes marry the proportion will be 1 in 20; whereas in the ordinary population, the probability of having a deaf child is but 1 in 1,700.

Dr. F. S. Thompson.

19 Mar. 1886.

8323. Do you also attach importance to consanguinity as a cause of deafness?—I do. I have taken a good deal of interest in the question, and I have made a point of inquiring, when deaf mutes have been under my care, as to their parentage, and in a very large number of cases they have been the children of cousins. Forty-five per cent. of the applicants for admission at Ealing have been the children of those thus related. On the other hand I know, and I suppose we all know, a number of cousins who have married, but who have not had any deaf mute children; the evidence which has been collected is to this effect: The Rev. S. Smith gave particulars of five intermarriages of first cousins, followed by the birth of 21 deaf mutes. Scott Hutton, of Halifax, N.S., gives 15 marriages of first cousins, with 37 deaf mutes, and 7 of second cousins leading to 17 deaf mutes. The Irish census returns show 85 marriages of first cousins and 144 deaf mutes, and of 63 marriages of second cousins, 114 deaf mutes. The intermarriage of cousins in the second generation has been followed by a much higher average. There are some most remarkable genealogical tables which I remember seeing some years ago, as to two or three families in which deaf muteism has occurred from generation to generation.

8324. Has your attention been called to Switzerland as being especially fruitful of this kind of affliction, Switzerland being a mountainous country where the villages are isolated and where intermarriages of blood relations might be supposed to be frequent?—There is a great amount of idiotcy and cretinism, but I think it is more imbecility than deafness. My attention has not, however, been specially called to the question. When in Switzerland I am so much among the snow mountains that I cannot say that I have observed those matters particularly.

8325. It has been stated before us that intermarriage amongst the Jews has caused rather an abnormal number of deaf and dumb; has that been brought under your notice?—When the Jews' Institution was founded that reason was assigned.

8326. On the other hand we have had doubt thrown upon that by another witness?—The Jews are a peculiarly fine race, and I think those who know more than I do about the breeding of cattle know that if there is a special selection made of fine animals the intercommunion does not produce such evil effects as it does when the unhealthy are not excluded.

8327. Not for a long time, but it does in the long run?—Doubtless.

8328. Have you much personal acquintance with deaf and dumb who have been taught on the oral system, so that you can tell us whether you think that they are generally able to converse with ordinary people, and whether their voices are much affected or are abnormally strident, or harsh, or unpleasant to listen to?—I have seen a good many children, but not so many adults who have been taught on this plan.

8329. In consequence of the recent period at which the oral system was introduced?—Exactly. I saw one remarkable instance in the case of a gentleman whose name I should be glad to be able to mention. He is a professor whom I met in Norway, who can speak a number of languages. He is a gentleman who wrote one or two letters to the "Times," but I cannot at the moment recall his name. He understood everything that I said to him in English, and showed by his answers that he did so. His English was not particularly good, but I do not think there was the least difficulty in understanding him, nor was there any harshness. He spoke like a foreigner. But amongst the children I have seen, those who have been well taught all spoke in a very pleasant voice. The breaking up of the words, which is apt to occur until quite an advanced stage of knowledge is reached, makes it distinctly unlike the ordinary English. I remember in one instance having a conversation with a lady, and not knowing until afterwards that she was deaf, but I thought it was the most exaggerated piece of Americanism that I had ever heard; she spoke with a most dreadful twang, but I was not aware in conversation that she was deaf at all.

Dr. E. S. Thompson.

19 Mar. 1886.

8330. Of course defects in the teacher would be reproduced in the pupil, and therefore if the teacher's pronunciation was vulgar, or in any way provincial, that defect would probably be exaggerated in the pupil?—Exactly. And in England so many of our teachers are foreigners. I suppose that almost the best, if not the best teacher in England, is Mr. Schöntheil, and if you hear him make a speech it is very curious English indeed; he does not speak at all like an Englishman.

8331. He is very fluent?—He is; but it is not to be wondered at that the children taught by him (and he teaches extremely well) should reproduce his peculiarities; and in the case of many of the children taught in England one would have thought that they were German Jews, although they are not. There is a peculiarity in their pronunciation which would lead one to fancy that the peculiarities in their speech must have been from inheritance rather than from education.

8332. For that reason is it not of great importance that the teachers of the deaf and dumb on the oral system should be highly trained and educated persons?—Most important, because otherwise they are sure to bring discredit upon the system, and to lead many to think that it is a futile effort to teach the deaf and dumb at all. It seems to me that it requires a great deal of careful training and patience; I do not think it requires any superhuman amount of patience or perseverance, but it does require a steady application to the rules which are laid down.

8333. And I suppose it requires in the first instance considerable personal supervision and care in each individual case?—No doubt it does. I should think that it would be impossible to teach any large number at once in the first stages.

8334. Do you think also that the teachers of the deaf and dumb should be qualified by their knowledge of the structure of the throat and mouth, and of the organs of speech, to give the best and most scientific instruction?—I do, and I do so on two grounds. The first ground which seems at first sight to be unimportant, but which really I believe is important is, that if the attention is not drawn to the actual state of the organs which lead to hearing, and which lead to speech, there is a most strange belief, which is held very largely even amongst intelligent people, that there is a necessary connexion between deafness and dumbness. People are so extraordinarily ignorant of the construction of the organs of the human body that they fancy dumbness is a necessary consequence of deafness; and when you tell them that the deaf can speak they are quite startled, and can hardly believe it to be possible, because they have always regarded the two as being associated the one with the other; whereas if their attention is drawn to the structure of the organs, and they see that the ear is a distinct organ, having all its parts perfect, and that the vocal organ is a distinct organ being connected only by quite insignificant nerves with the ear, then there is a good hope that the teachers at any rate will be able to hand on to others the fact that deafness and dumbness are two distinct things, and that dumbness need not and ought not to follow deafness, and that it only follows it in consequence of ignorant and false habits which have been formed, making many people dumb, for instance, who have had their speech until they were eight or 10 years of age. The next point is as regards the direct teaching. The teaching to speak depends upon a knowledge of the physiology of speech. It is necessary to know exactly what the structure of the organ of the voice is, how it is moved, how the air from the lungs passing by those vibrating chords leads to vocalisation, how the expansion of the chest is necessary in order to get a sufficiency of air to produce a note of the voice. Then again, I think, it is absolutely necessary that a good deal of knowledge should be given about articulation, what takes place in the mouth, what the tongue has to do in speech, what the lips have to do, what the nose has to do, and so on. If that knowledge is accurately learned then a teacher will be in a position to ascertain what is the defect which any child has in its speech, why the voice is nasal, why a child lisps instead of getting a proper note; they know it is due to putting the tongue in the wrong place and so forth. So that I look upon it as absolutely essential that there should be good physiological teaching.

8335. Would it be possible to teach a deaf child to sing. The teaching of singing involves in the ordinary way a much greater acquaintance with the modulation and flexibility of the voice. Would the same sort of knowledge be required to teach a child to sing?—No doubt it would be very difficult to teach a child who is absolutely deaf the exact modulation of the notes of the voice.

8336. I put an extreme case, whether it would be possible physiologically to teach a deaf child to sing?—I should think that it would not be possible to teach a perfectly deaf person to sing with absolute success, but I see no physiological reason against it; it is only that the ear would not correct the defective modulations. Among some of the best speakers that I have seen, the necessary lack of realisation, whether there is much noise in the room or not, is a great difficulty.

8337. Have you ever heard anyone taught on the oral system make a good speech in public?—No.

8338. I suppose it has not been taught long enough for such a result to be obtained?—I have heard some of the children at Ealing make little observations, a sentence or two. "I have been asked to say that "refreshments are in the next room," and so on.

8339. But they do not attempt to recite?—They do; but I do not think I ever heard them.

8340. I am only asking to what extent they can be taught?—I do not think there is any limit of that kind.

8341. But do you think that they can be taught to speak so that they can make their way in life fairly well for all ordinary professions and avocations?—I am quite sure they can.

8342. We have been told, especially with regard to religious instruction, that under the oral system it is very difficult to give religious instruction to large bodies, whereas under the sign system it has been possible; and that when those who have been taught on the oral system seek for religious instruction they are obliged to learn the sign and manual system, in order to avail themselves of religious instruction, such as is given in the churches for the deaf and dumb. Do you think that the pure oral system or a combined system is the better?—The combined system *i.e.* sign and oral has been found a failure, signs withdraw the pupils attention from the lips, which is necessary for successful lip reading, and these frustrate the efforts of the best oral teacher. I think that at first a child who comes under the sign system gets a little contact with the outer world more quickly perhaps than when it has to go through the laborious process of learning lip reading, and that it may be possible, supposing, for instance, we know that a child is going to die in a year, that by means of the sign system some kind of religious instruction might be given which would be lacking in the other case; but I should be inclined to think that that was the only advantage, because if you asked the most skilled signer to sign, say the Lord's Prayer, and try to follow him, it is the crudest notion that you can expect anyone to get of religion, and its elevating thoughts.

8343. I suppose that abstract ideas might be paraphrased in some sort of way?—Exactly.

8344. And it is very doubtful to what extent the paraphrase represents the real idea?—Yes, very doubtful.

8345. Of course it must depend a good deal upon the person who paraphrases it?—Yes, very much. My own feeling is that it is one of the great advantages of the oral system that it makes it possible to place the person taught in the same position as regards religious training as another. Not in the first few months, but directly they have learned the first lessons in reading from the lips the field of knowledge begins to open out to them in the same way as it would to a hearing person.

8346. Would they not be able to receive the visits of an ordinary clergyman, whereas those under the sign system could only receive the visits of a clergyman who had been taught on the sign system, and the evidence we have had is that there are very few who know that system; is not that so?—It is so undoubtedly. When accurate reading from the lips is gained, then the whole field of religious opportunities is thrown open.

8347. Do you think that one who was well established in the oral system could understand an ordinary preacher within a reasonable distance of him?—Yes, I do; but just as a deaf person catches a word from the fingers and imagines a great deal, so a person reading from the lips is very apt to be satisfied with a partial rather than a complete knowledge of what is being said. You find in cross-questioning them, and asking those who are deaf and have been taught by the oral system what has been said, that they give you only a fairly accurate statement of what has been said; they do not follow word for word; and I do not know that you would expect them to do so. It is a point upon which I should like to have some further information than I am able to give the Commission, whether those who have been taught by a sign system are able in the same way to appreciate the fields of literature. My impression is that they have a number of deaf muteisms, and a peculiar way of looking at things, which puts them at a great distance from really entering into the fields of literature as a person taught on the oral system can. My impression is that in this respect there is a very marked distinction.

Dr. E. S. Thompson.

19 Mar. 1886.

8348. Do you advocate the oral education of deaf children compulsorily?—I do.

8349. Are you also in favour of a Government grant being given to them as in the case of other children, such grant being of a proportionate amount, taking into consideration the additional expense that is necessarily connected with deaf and dumb education?—I have seen some of the terrible effects of no education at all in the case of poor creatures who have become imbecile, although they were simply deaf. They have been born deaf or become so in infancy; they have had no training, and they are hardly better off than an idiot. That being the case I feel that it is a great slur upon the nation to allow such a thing as this to take place. Charity has apparently failed to reach more than just the very outskirts of the difficulty, and I certainly think that the experience of other countries, take Norway for example, where all the deaf are compulsorily taught, is very much better than our own; and I cannot doubt but that if it were made compulsory in this country, the terrible evils of leaving the deaf untaught would no longer be a slur upon our humanity.

8350. You are aware that the oral system has, comparatively speaking, only recently been introduced into this country, and that there are a good number of schools where the pupils are still taught on the sign system; are you inclined to think that the State, if it makes education compulsory, should select either of the two systems, or that it should leave the two systems gradually to work side by side till the better system is generally adopted?—I am of opinion that the matter has been faced by those who are competent to judge, and that the decision has been arrived at, as at Milan, by an overwhelming majority, that the oral system is so unquestionably superior, that it would be a very great pity to maintain the other system longer than is absolutely necessary to finish the education of those who have begun upon it.

8351. That is the only limit which you would place to the existence of the sign system?—That is the only limit. I have reason to believe that those who are sufficiently intelligent to be taught on the sign system are sufficiently intelligent to be taught on the oral system. I know it has been maintained that there are some who are so deficient that they have not sufficient intelligence to be taught upon the oral system, but my experience would lead me to believe that that is not the case. Some of the children to whom I have previously referred were, certainly, so deficient that I hardly supposed at first sight that they were capable of being taught as they have been.

8352. In some of the idiot asylums there are some who are deaf and dumb, and some who are supposed to be imbecile; do you think that there are some who are supposed to be imbecile, who might be taught?—Dr. Langdon Down tells me that patients are sometimes brought to him who are supposed to be imbecile whom he finds to be simply deaf.

8353. There are some now in idiot asylums who might be educated, you say, upon the oral system?—I think so, Dr. Langdon Down has an institution for imbecile children of the upper classes, and he was for a time the medical officer at Earlswood.

8354. You have spoken of the Norwegian schools; can you tell us what the State does for the deaf and dumb in Norway?—The State ordains that all the deaf, dumb, blind, and imbecile should be taught, and that from the ages of seven or nine, they should be under instruction for eight years. As regards the expenses of education the State pays for the teaching, and the expenses of maintenance are paid by what we should regard as the parish, or the commune. Even the children of well-to-do parents are educated freely by the State, and the parent then supplies the velvet coat and the tricycle for the child, as I saw in one instance. It seems very curious to see children thoroughly well-dressed amongst the others.

8355. Are free schools common in Norway?—Yes, they are.

8356. It puts the children of well-to-do parents on the same footing as the ordinary children?—Yes, but there was a special Act passed in 1881 with reference to the deaf and the blind, which ordained that the teachers should be under inspection, and that the teachers were not teachers until they had certificates; and there is a system of inspection in the schools conducted by the department, by the medical officers nominated by the Government, and thirdly by the ecclesiastical authorities.

8357. Do the ecclesiastical authorities look after the general moral training, or education, and the medical officers after the physical well-being of the children?—Exactly. There are some rules about confirmation, that the children must be prepared for confirmation; and the same religious standard is expected to be attained by the deaf as by the hearing; just as at Ealing now where three boys are being prepared for confirmation and give great satisfaction to the clergymen of the parish.

8358. Is that on the oral system exclusively?—Yes.

8359. In the schools that you saw it was so?—Yes, I am rather inclined to think that one or two schools may still exist which are not under the oral system, but those that I saw were upon that system. The inspection seemed to be most rigid.

8360. May I ask what was the date of your visit?—The year before last, in 1884; I was very much struck with the influence which one of the teachers, Frü Rosing, had over her pupils; they seemed to be *en rapport* with her, and to know what she said with most wonderful precision and accuracy. She asked Mrs. Symes Thompson, who was with me, the names of our children, and then the pupils repeated after her names they had never heard before. One of the names, which is rather a curious one, the children could not catch; but when we were in the next room one of the little girls came and told us the name of this little boy. They could pick up words in another language and repeat them with great precision. The way in which the object lessons were given struck me as being extremely good for their small minds. They went into the garden to pick fruit, and then they described this as a red currant and that as a white currant, saying that there were four on a bunch and so on. The instruction was given in a way which interested the children, and one after another they all said their little sentence, and you felt what progress was being made.

8361. Have you any personal acquaintance with the systems in other countries, in France or Germany, for instance?—I have not been over the French schools, but I know the system in France, and to a slight extent the system which is used in Italy. In France, I understand that the oral system is rapidly taking the place of the silent system.

8362. With regard to the College of Teachers of the Deaf and Dumb, are you of opinion that it is desirable to have one examining body?—I think it is most important to decide upon such a body, because without it we cannot be sure that all the teachers are properly trained, which is so immensely important. I consider that the whole success of the system turns upon the efficiency of the teachers.

8363. And perhaps some of the shortcomings or supposed shortcomings of the oral system may have arisen from improperly trained or half-trained teachers?—I am quite sure that that is the case, and especially as regards the pronunciation.

8364. Are you connected with the Ealing College?—Yes, I am vice-chairman.

8365. Previously to the establishment of the College of Teachers, was the Ealing College willing to examine any others besides those of its own body who came up for examination?—Yes, and a resolution was passed to that effect, which it was hoped might have led to the formation of an examining body having the oral teaching as the necessary underlying basis, because it has been felt by the college very difficult in any way to encourage the sign system. Even to examine those who had learned it would seem to be rather a retrograde movement. The view that we take is that it is better to adopt the oral system entirely, and that it is a great pity to maintain the sign system, even indirectly.

Dr. E. S. Thompson.

19 Mar. 1886.

8366. But, as a matter of fact, nobody has presented himself for examination who has not been trained in the school?—I believe not, but we were prepared to examine such persons.

8367. Then this new college has been started, and students of your own training have applied for certificates from that college, and have received certificates without any further examination?—Yes, I believe that is the case.

8368. (*Mr. Johnson.*) In your experience what is the extent of the perfection of speech which is attained by pupils who have been instructed in the oral system who have come under your notice?—They can speak individual words quite perfectly, but as regards the continuity of a sentence there is always, as far as my experience goes, a manifest imperfection in the smoothness of utterance.

8369. Does that pass away with increased practice?—It lessens from year to year.

8370. But it is always more or less present, is it not?—I believe so, so far as my experience goes.

8371. In the experience that you have had on the continent and in Norway, was there the same condition of expression?—My impression is that in Norway they spoke better than I have ever heard them speak in English, but knowing so little of the language I do not consider that I am a judge. So in Italy, I think the impression on my mind is that they speak decidedly better than in England. But the fact is that unless one is thorough master of the language one is not in a position to judge.

8372. So far as you have been able to judge in England, from the cases that have come under your notice, the perfection of speech is not very great?—Considering the difficulties I think it is very perfect.

8373. As you would say in France it is very *lente*?—Yes, sometimes they speak too quickly, and hurry a sentence out too quickly, but as a rule there is a tendency to break up words into syllables, and to make syllables too distinct from one another.

8374. You said just now that those persons who were educated on the oral system had a better opportunity of taking advantage of the field of literature; is there any particular literature for the deaf and dumb?—For deaf mutes there is a particular literature; they have their own journal, which certainly is very curious; it contains many peculiarities of expression which are scarcely comprehensible to the outside world, whereas with the oral system there is no peculiarity at all.

8375. Is there much aptitude on the part of those educated on the oral system to avail themselves of the ordinary literature of the hearing?—I should say that there was greater aptitude than among children of the same age who have all their faculties.

8376. On account of the attention of the deaf children being more concentrated?—Exactly.

8377. I think you told us that they attained the sign system much earlier than the oral system?—They more quickly get some knowledge by it.

8378. Do you think that when once they have attained the oral system, when they leave the institution, or the supervision of the instructor, they at all fall back into the natural sign system. I do not mean the written sign system, but the ordinary pantomimic system?—I do not think they would, unless they had begun with it. If they had begun with the sign system, and then gone to the oral system, they would go back to the sign system; but if they had never begun with the signs, they certainly would never take to them.

8379. You must have great experience amongst this class. Do you know anything with regard to the education which is given in the board schools?—I know several of the teachers who have been teaching the children in the board schools.

8380. Do you think that it is absolutely necessary that the orally taught children should be isolated?—Yes, it is essential that they be absolutely cut off from the sign taught, but not from hearing children although the deaf must be separately taught in the early stage.

8381. They must have separate class rooms, in fact?—They must have separate class rooms at first. I should think that perhaps the deaf children would interfere more with the hearing children than the hearing children would interfere with the deaf children. The hearing children would always be looking on and listening to the deaf children, and would be very much interfered with by them.

8382. Do you think that the association of the two sexes in an institution is not fraught with any danger?—I do not think that the condition of deafness materially alters that.

8383. Are you in favour then of the girls and boys being separated into different classes, and in their playground?—I am old fashioned enough to think that our English mode is better than the American mode, but I have no particular conviction about it. I think it would be probably wise, if it were possible, to keep the children apart.

8384. On account of not giving the deaf people of both sexes the chance of making one another's acquaintance, which may end in marriage?—I do not think that those taught by the oral system would be at all so likely to marry those who had been taught side by side by them, as in the case of those taught by the sign system. In the case of those who were taught by the oral system, all their associations would be with the hearing, and it would be extremely unlikely that they would intermarry.

8385. Do you know any instances of intermarriage?—I have not known an instance of the intermarriage of those taught on the oral system, but I have known instances of the intermarriage of deaf mutes.

8386. To what do your attribute the high amount of mortality amongst the deaf mutes? — It is chiefly owing to chest diseases and to a large extent to their low vitality. I suppose too there is a greater danger of accidents on account of their not being able to hear carriages coming. I remember an instance in which in the Accidental Insurance Society, a deaf person was written up high as being deaf on the ground that he was in greater danger by reason of his deafness.

8387. Your opinion is distinctly that the deaf and dumb are more subject to pulmonary complaints than perhaps I might say the blind?—Yes, that is my distinct impression. I have no statistics to go by, but my impression is very decided that such is the case.

8388. Would you kindly furnish the Commission with any statistics which you have of that kind?—I was for a long time assistant physician at King's College Hospital and also at the Brompton Hospital for Consumption, and I had about 20,000 out patients at each hospital; and my belief is that the proportion of deaf mutes in the case of the Chest Hospital was at least twice as great as in the other hospital. I never took statistics on the subject, but that is my impression; and you will find that in institutions for the deaf chest affections are very common. There is a peculiarity also about their cough. When deaf mutes cough they do not fill their chests sufficiently to get rid of the expectoration; it is a choky, disagreeable, and curious sound, which arises from a defective chest expansion before the effort of coughing.

8389. And that chest expansion is not assisted by ordinary exercise, though it is more assisted by the plan pursued in teaching on the oral system than it would be upon the sign system?—Yes, the oral system would put them in a more natural state.

8390. The one system would call the organs of respiration into a certain amount of activity, and with the other system the only muscular action which you could get would be the muscular action in the playground?—One deaf mute that I knew said that his recovery from chronic bronchitis was due to reading and shouting.

8391. (*Dr. Tindal Robertson.*) In different countries that you have been through you have seen the different schools; which country do you think has the best schools?—I have never seen a school which I thought so well managed as the one at Christiania, under the care of Frü Rosing. It struck me that her teaching was exceedingly good in every way, both her own teaching and that of her governesses.

8392. Will you kindly tell us what are the causes of deafness, irrespective of the hereditary causes?—Scarlet fever is probably the most common of all, affections of the ear following throat disease in scarlet fever. Then deafness often comes on after measles, and sometimes after whooping cough. It is met with as a result of inflammatory affections of the brain and hydrocephalus. Those are the main causes.

8393. Can you suggest to the Commission any preventive treatment, or any plan by which preventive treatment could be put before the public, or in any way brought to bear upon those different causes?—I think it possible that some such instructions might be given as were given by Dr. Bridges to be distributed throughout schools, as to the best ways of dealing with the common affections. A statement as to the importance of keeping the ears in order in acute fever might be of service; but I think it is more to be done through the medical profession. With better knowledge many ears have been saved which formerly would have been sacrificed.

8393*a*. It has been suggested to us in the course of our inquiries as to the blind, that a paper might be sent round by means of the guardians and overseers, or some parish authorities, conveying information as to the prevention of infantile ophthalmia; could anything of the same kind be done with regard to those conditions of deafness which are apt to come on in young children?—I think it is well worth consideration. One or two sentences about the prevention of ear disease might be incorporated in such general directions.

8394. Do you think it would be possible in that way to save a good many cases that now suffer?—Yes, I think it might be. As a rule these affections occur in very early life before the children get to school at all.

8395. Of course they would have to be taken to the homes of the mothers themselves?—Yes.

8396. With regard to those cases of dumbness of which you say there are a few irrespective of deafness altogether, do they depend upon diseases of the brain?—I believe that such cases have been recorded, but I have never met with one. Here and there there are congenital defects in the larynx, the vocal apparatus being defective. Then again there are cases allied to idiotcy in which, together with the absence of proper brain power, is the special absence of power over the vocal apparatus; but the cases are extremely rare.

8397. We have had cases of what were probably improperly called idiopathic dumbness mentioned to us; I presume that such cases would be almost always, if not always, dependent upon some cerebral disease?—I should think they would be, or upon some defect or malformation of the vocal organs. But a person can speak very well without a tongue, and he can speak even without a larnyx. Speech is not always associated with perfect vocal organs; you may speak with very imperfect organs.

8398. May I ask whether there is any text book which is generally used?—Dr. Fothergill has written a very good text book on physiology which gives you the organs of special sense.

8399. But is there any text book in use at these particular classes, either at Ealing or elsewhere in oral schools, which gives in relation entirely to the subject of physiology such an amount as is necessary for instruction in these particular cases?—I do not think that there is any special book, but any ordinary physiological book would give it. I am not aware that any book has been prepared specially for the purpose, nor do I think it would be necessary. It might be well to keep out of the sight of the young governesses the physiology of generation, and so forth; otherwise I think there is no reason why they should not have the ordinary physiological books. It does not occur to me that one wants any special books.

8400. Was there not in the room that you had at the exhibition, when you had the Ealing College represented there, some physiological book?—I am not aware whether there was or not.

8401. Is there any one particular book which you would recommend in preference to any other for the special purpose of instruction in this branch?—I have examined the papers of the pupils on anatomy and physiology; but I had not anything to do with the selection of the book, nor did I know that there was any special book selected. I have always looked upon Carpenter's Physiology as the standard book, but that is unnecessarily large for such a purpose.

8402. Is there one that you would specially recommend?—I have not specially thought of it.

8403. With regard to the different boards of examination, it was brought under your notice that with regard to this new college of teachers, as it is called, for the deaf and dumb, the subject of sign and manual teaching was included although it was only optional; is it in your opinion on advantage that that should be so, or do you think that the introduction of such a subject would rather prolong the teaching in that particular system?—I should certainly regard it as tending to prolong it. I do not think that any more teachers of the sign system are required than are sufficient to complete the education of those pupils who are now under tuition.

Dr. E. S. Thompson.

19 Mar. 1886.

8404. Therefore, you do not think the examination in that particular system is necessary?—No; but I think that the examination in the oral system ought to be not optional, but obligatory upon every teacher.

8405. And that no teacher ought to be allowed to teach unless he had attained, as I think I understood from you was the case in Norway, a certificate from some proper source that he was qualified to teach, and to teach well?—Exactly.

8406. (*Dr. Armitage.*) Is congenital deafness common?—No, it is not common, but it is exceedingly difficult in any given case to know whether the deafness was congenital or not. Parents generally tell you that the deafness resulted from an illness in earlier days, and it is extremely difficult to get definite evidence about it. In cases in which it is hereditary, you naturally rather infer that it has been congenital; but of course that may not be a true inference; it may be that in the case of the parents, as of the children, some acquired disease which caused deafness has occurred.

8407. Is deafness common in very early childhood?—Yes; it is said that one person in about every 1,700 is deaf, but deafness as the result of scarlet fever in early childhood is not very uncommon.

8408. Is there any other cause producing deafness in very early childhood in the same way as we get blindness in early childhood, in a large proportion of cases, independently of scarlet fever?—Diphtheritic affections occasionally lead to deafness.

8409. Are there any reliable statistical tables as to the causes of deafness at different ages?—I have not seen any such statistics or tables, but Sir William Dalby has written on the subject.

8410. (*Mr. St. John Ackers.*) It has been stated in evidence that there is no reason why, in the opinion of the witness, deaf parents should have deaf children if they have talkative nurses; will you kindly tell the Commission whether that is a scientific and true way of looking at this matter?—It certainly does not seem to me very scientific, I confess. If a child is born deaf, the fact of its having a talkative nurse would have very little effect.

8411. You were asked, I think, by the Chairman, whether you have ever heard reciting. Are you not aware that the orally taught deaf can recite and can act plays in public, and do things more or less like hearing persons?—I understand that in Milan a representation took place which interested those who saw it very much, in which a number of children who were congenitally deaf, that is to say, deaf from birth, recited, and recited so that those who understood Italian could follow them, but I was not present.

8412. Have you examined the papers in anatomy and physiology of the students at Ealing for some years past?—I have.

8413. What is the general character of those papers; is it in your opinion a thorough and sufficient knowledge that is acquired at the training college in those branches?—I have been very much pleased with the papers. I think they show an amount of knowledge of the anatomy and physiology of the organs concerned, which is extremely praiseworthy, as proving that the teaching is not so superficial as one might have fancied, but really very thorough indeed. In fact, the papers are much better papers than would be written by medical students who are asked questions with reference to the ear and the voice.

8414. Who gives that instruction?—It is given by the Principal, I believe, entirely.

8415. Then the Principal must be thoroughly well acquainted with these branches?—Thoroughly well.

8416. Do you consider it desirable that accurate statistics of the causes and degrees of deafness should be kept in all schools for the deaf?—Most important. It is extremely important that we should collect reliable data upon these matters.

8417. With regard to the very interesting point that was brought forward by the Chairman with regard to animals, are you aware that any animal breathes through the mouth, unless it is in an overpressed or unhealthy or unnatural condition?—No, I am not aware of it, but I am prepared to believe that it is so.

Dr. E. S. Thompson.
9 Mar. 1886.

8418. (*Mr. Arrol.*) You stated that the average life of a deaf and dumb person is shorter than that of other portions of the community; what may the average life be?—I am afraid I cannot answer that question. I collected some evidence on the subject some years ago, but I have not got it in my mind, though I believe it is attainable.

8419. Is it much shorter than the ordinary period of life?—Yes, considerably shorter; I should think probably as much as 8 or 10 years shorter, and perhaps more.

8420. What proportion of deafness do you think is due to illnesses, and is not hereditary?—I should be inclined to think that probably more than half was the result of illness, and that less than half was due to congenital causes. Probably it may be that not more than 25 per cent. would be due to congenital causes, but that is a question that I am not prepared to answer. It is of course very difficult to be certain in any given cases; the parents are very unwilling to allow that it was hereditary, and it is extremely difficult to ascertain what is the cause of the deafness.

The witness withdrew.

Adjourned to Wednesday next at 12 o'clock.

32, Abingdon Street, Westminster.

Wednesday, 24th March 1886.

PRESENT:

LORD EGERTON OF TATTON IN THE CHAIR.

ADMIRAL SIR E. SOTHEBY.
W. TINDAL ROBERTSON, ESQ., M.D.
B. ST. JOHN ACKERS, ESQ.
E. C. JOHNSON, ESQ.
CHARLES FEW, ESQ.
C. E. D. BLACK, ESQ., *Secretary.*

Rev. CHARLES RHIND examined.

Rev. C. Rhind.
24 Mar. 1886.

8421. (*Chairman.*) You are Senior Chaplain of the Royal Association in Aid of the Deaf and Dumb, in Oxford Street?—Yes. I may say I have been 57 years teaching the deaf and dumb. All my life has been devoted to it.

8422. You can tell us what the operations of the association are?—Yes. I have been 25 years connected with the association. When the Rev. Samuel Smith, my predecessor, was the chaplain at St. Saviour's, I had the charge of the whole of the south of London. At Mr. Smith's death I was appointed in his place, only not as secretary. I prefer to confine my work entirely to church work amongst the deaf and dumb generally, so as to be relieved from all responsibility as to secretarial and money matters. Mr. Murray has been appointed secretary.

8423. Will you state what is the organization of your association with regard to providing both religious and secular instruction for the adult deaf and dumb in London?—We have nothing to do with the young, except pushing them forward and watching them until they are placed in schools. We have no control over them, but simply in the course of visiting the deaf and dumb we push the children forward as best we can. Our work is with adults, those who have finished their education; we watch over them all their life, from the time they leave school up to death. We do what we can in the way of apprenticing them. We visit them at their homes, and we relieve those wanting relief and who are in any kind of trouble. Then there is a church for them to attend on Sunday, and lectures are given in the week.

8424. You divide London into five districts?—Yes.

8425. How many chaplains have you?—Two, and several missionaries. I am senior chaplain for St. Saviour's, and I have all the charge of this side of the Thames. The Rev. Mr. Sturdee has charge of all the district the other side of the water.

8426. What number of lay missionaries have you?—Five, and we have also Sunday helpers at the Bible class.

8427. Do you think your institution covers the larger proportion of the deaf and dumb in London?—Our endeavour is to look over the whole of London, and we go beyond London. We visit the suburbs as well, wherever we are called upon. We go and visit them so far away from London as Walthamstow, and in different directions beyond the limits of London.

8428. The services at your church are entirely conducted on the sign and manual system?—Yes, but in May, June, and July the church is open to the public on Sunday afternoon. We have then special preachers for those services, and the public are invited. One half of the church is for hearing people, and the other half for the deaf and dumb. The whole of the service is spoken, and the preacher who is speaking is in one pulpit, while I am in the other pulpit communicating silently to the deaf and dumb what the other preacher is speaking. Those services are to show how the services for the deaf and dumb are conducted, and to induce the public to take an interest in the society's work. Then we have confirmation and Bible classes. The Bible classes are a great success. Those classes are in the afternoon. My daughter teaches the young women, and Mr. Gilby, who is now being trained for a clergyman, takes the young men. I confine myself to the confirmation class and the baptisms in the afternoon.

8429. Do you send deaf and dumb children exclusively to sign and manual schools?—I do not send them to any particular school. If I see they are too young to go to Margate I send them to the board school under Mr. Stainer. The Margate institution does not admit children below a certain age; if they are below that age I send them to Mr. Stainer for instruction. If they are of an age to be admitted into the Margate institution I send them there on account of the advantages they get. They have board, clothing, and education free, and when they leave school after five years they have a 10*l.* premium from the society to be apprenticed to a trade. I tell the poor people of these advantages, and knowing the system and approving of the system I advise them to send their children there when there is a vacancy; they have to wait for their election.

8430. At Margate instruction is given both in the sign system and in the oral system?—Yes. They have one school at Ramsgate for the oral instruction and one at Margate for the sign and manual instruction.

8431. You say you generally send them to this school at Margate or to Mr. Stainer?—Yes, I think I have sent as many to Mr. Stainer as to Margate.

8432. Do you send any children to any school where the sign and manual system is alone taught?—I have sent children to other institutions where the sign and manual system is alone taught; when they were too old for Margate or the board schools.

8433. Why do not you send them to where the sign and manual system is taught alone?—Because of the advantages at Margate to which I have referred.

8434. Independently of those advantages would you send them if you had your choice to a school where the sign and manual system alone was taught, or to a school where the oral system alone was taught, or to a school where the combined system was taught?—I should prefer to send them to a school where the combined

system was taught in order that it might be tested whether the pupil could be best taught by signs or by the oral system. I have taught by both systems, and I know what they are, and I have brought forward pupils who have shown in public their power of speaking; there has been no trickery about it, a Bible has been handed to the company and they have been asked to open the Bible at any particular chapter of any particular book, and then it has been handed up to the chairman and the little boy has read out from the chapter.

8435. As you have had experience of both the sign and manual system and the oral system, can you say whether there is any advantage in one system over the other in respect of religious teaching?—I think religious instruction can be best given in the sign and manual system.

8436. What I ask you is whether there is any advantage in the one over the other?—I should say from my experience the advantage was with the sign and manual system, consisting as it does of the alphabet, conventional signs and a natural language by signs. With regard to natural language by signs, I may say I have a perfect command of that way of communication with the deaf and dumb. When I was 16 years of age, I went to the Old Kent Road Institution; I was teacher there for 11 years on the combined system. During those 11 years I lived at the asylum, and I only went out to see my friends once a week. All the rest of the time I was with the deaf and dumb, and they taught me their language, so that I have now a perfect command of their language. I may give an illustration to show the advantage of being able to communicate by natural sign language. When I had charge of the south of London, in my visits to deaf and dumb poor in Rotherhithe, I was told that a poor deaf and dumb woman had been picked up in the middle of the night and removed by the police to the workhouse, and they wanted me to go and see her. I went to the workhouse, and they took me up to the poor woman, who was lying in bed very ill; I began to ask one or two questions, and I found she could not talk on her fingers. I found she had not been educated, though she was about 22 years of age. I was with her for some time, and I went away, saying I would call again. The next time I called I began to make signs; she did not know how to write, and she did not know how to talk on her fingers, but she could understand my signs. (I can talk to the deaf and dumb who have not had any education as I have had to do in police courts.) I asked her in this way (*describing by action*) whether she could sew; she shook her head for no; communication between us was then beginning, she began to see that I could talk to her; then, by signs, I understood she was a servant. She indicated that she had been engaged in scrubbing floors and making beds, then she indicated by her actions that she had some cause to be angry with a man with a beard. Having got so far, I asked the master to bring me a large sheet of paper and a lead pencil; they laughed at me, and said, "The poor woman cannot write"; I said, "Never "mind, bring me the sheet of paper." They brought the paper and the pencil, and I put the paper on the woman's lap (she was in bed), and I put the pencil in her hand, and I invited her to use the pencil. (*The witness went on to describe the signs he made to the woman and the signs she made to him, and also the diagrams she drew on the paper, from which he arrived at the conclusion that she had been transferred from a railway to a cab and then had wandered about till the police had got hold of her.*) The guardians advertised for the relatives of this poor woman but they could not get any information as to her whereabouts. Then I said to the master, will you ask the board of guardians if they will allow me to have a cab for the day, and I will try and find out where this woman lives. On my next visit I was told that the board would most willingly let me have a cab for the purpose; so accordingly we got a cab and I got into it with the girl, and the cabman asked where he was to go. I got from the girl, by signs, in which direction he was to start, and by a number of signs from her in the course of our journey. I directed the cabman which way he was to continue going till we got to the London Bridge station. Directly I got there I told him to stop, for I thought that must be the point we were to make for, but the woman signed to go on; the cabman went on and directly we got to the end of the bridge she motioned that we were to stop and go down the steps to take a steamboat, as I supposed. I accordingly sent away the cab and we went down the steps. Then I asked her by signs in which direction we were to take a steamer, whether Greenwich way or Lambeth way, and she pointed towards Lambeth. I took two tickets for Lambeth, and at each pier we passed I motioned to her asking her whether we were to get out there; she gave no gesture of assent till we got to Lambeth, then we were to get out. When we got out she went first; I followed till we came to a house where we stopped. The door was open and she went upstairs, but I saw there was a bill in the window that the house was to let. There was no one in the house; then I thought, if she knows the house, as evidently she does, there must be some one in the neighbourhood who knows her, so I went two or three doors off to a dressmaker and asked her if she knew this young person I had brought with me; and she immediately said, Why that is dummy. So I said, "Here is somebody who "knows her. Do you know anything about the house "in which there is a bill saying the house is to let;" and the dressmaker answered, "Yes, that is where her father "and mother lived, her mother is dead, and her father "has gone away, and he has been hunting everywhere "after her, he thought she must be dead." So I asked her to give me the father's address, and she gave it me, and I took the girl over and rang the bell, which was answered by her sister, and the scene that took place when the two sisters met, and the joy of the father at finding his child, I cannot describe. This shows the value of natural signs.

Rev. C. Rhind.
24 Mar. 1886.

8437. A foreigner if he could not speak the language of the country he was in would adopt the same means of communicating with the natives of the country he was visiting?—Yes, I have done so myself; in a foreign country I have made myself understood by signs.

8438. Do you not think it useful to teach the deaf and dumb a spoken language rather than a language by signs in order to enable them to communicate with hearing people?—As far as my experience goes the signs help me to explain what I may be teaching by means of writing, and when I am teaching on the oral system signs help me; for by natural signs, if the pupil is making a disagreeable noise in his throat, or speaking too loud, I can indicate that he is to modulate his voice a little.

8439. Have you found when you have taught the deaf and dumb by signs and by the oral system also that they have preferred the signs to the speaking?—Yes, they prefer the signs. I always find that.

8440. It is more easy for them to communicate by signs than by speech?—Yes, they merely regard speaking as an adjunct to the signs.

8441. Independently of the question of communication, have you observed any beneficial effect upon the general physical health of the deaf and dumb who have been taught by the oral system?—Medical men say that the oral system has a beneficial effect upon their health, but in my experience I have found that those who have been taught on the sign and manual system are just as healthy as those that have been taught on the oral system.

8442. As far as you could see?—As far as I could see. I could not see any difference.

8443. Have you any difficulty in teaching in the first instance by signs, abstract questions, such as theological doctrines or any abstract ideas?—We could not give the deaf and dumb a religious lesson at the beginning by signs. It was stated at a public meeting that without education the deaf and dumb have no idea of the existence of a Supreme Being. There happened to be a clergyman present who was very sceptical upon that point. He said, "I cannot believe that; I think God "certainly would instruct them in some way or give "them some innate ideas upon the subject." He came to the asylum in the Old Kent Road to investigate that question, and he also went to Paris and Manchester to follow up the same inquiry. When I was on a visit to Manchester, the late Mr. Bingham, the head master, who was a clever teacher on the sign and manual system, told me about this clergyman calling there, and Mr. Bingham said, "There happened to be in my study a "little private pupil (a gentleman's son) preparing his "lesson for the morning." The clergyman having told him the object of his visit Mr. Bingham said, "Here is a "little boy who was born deaf and dumb; ask him the "question and he will give you an answer, perhaps, "better than I can myself." The clergyman took the little boy's slate and wrote, "Will you please tell me "had you any idea of the existence of God before you "were educated?" He wrote, "No, sir, none what-

Rev. C. Rhind

24 Mar. 1886.

" ever." The clergyman was not satisfied with that; he went on to write, "But when you saw trees growing " and the rain falling and the sun shining, and the " moon and the stars, and people living and dying " about you, did you not think there was some Supreme " Being, some First Cause?" The answer the boy wrote was, "I never thought about it;" but he went on to write, "I remember when I was at home with my " parents, my mamma, who had taught me the names " of my brothers and sisters, and the names of the " articles of furniture and other things, one day wrote " on my slate 'God,' and went to the window and " looked up very seriously at the sky. I looked at the " word and I looked at my mamma, and I thought I " understood her. The next day, when I came to my " lesson with my mamma, I remembered what she " told me the day before, and I wrote down on my slate " 'God,' and I showed it to my mamma, and then I " went to the window and waited a little while; after " waiting a little while I pointed up and then pointed " to the word 'God.' She patted me on my head to " make me understand that I was a good boy, and she " thought that I understood it, but the fact was, when " she wrote 'God' and took me to the window and " pointed up and looked so serious, I saw a little cloud " passing, and the next day I was waiting till I saw a " little cloud passing, and then I wrote the word 'God.'"

8444. What age was that child?—He must have been, I should suppose, about 16 from what Mr. Bingham told me. He had nearly completed his education. You ask me, How do you teach them religion? How do you teach them to understand the theory of the existence of a Supreme Being? I say we cannot teach them that at the commencement; if we tried to do it we should fail, as the mother of that boy failed. They must have some little knowledge of language before you can impart religious ideas to them. We gradually lead them up to those ideas. For instance, suppose a boy's father is a carpenter, we teach him what a tree is from which the wood is obtained with which his father works. He knows what a tree is, because we point to it and say, that is a tree. Then we say, trees grow in forests or in fields. Then we tell him, trees are cut down and sawn into boards, that is called wood. Then we say, carpenters make chairs, tables, and other articles of furniture of the wood. Then we say, a carpenter cannot make a tree from which the wood is got, God makes the tree. Then he gets hold of the word "God." Perhaps at first the child will not understand it; it is only by degrees that we get the idea of a Supreme Being into the mind of a deaf and dumb child. The father of a boy perhaps may be a gardener, he says, "My father can make a tree, " because he put a slip into the ground, and it grew to " be a tree." "But who made the slip; did your father " make the slip?" "No"; and then you get into the mind of the child that the slip was obtained from a little seed and you tell the child that God causes the rain to fall, and the sun to shine, and then it begins to grow.

8445. With regard to adult deaf and dumb, do you find that when they come to your church they are invariably able to understand all the signs?—Yes. I make it all so plain to them.

8446. Do you use the alphabet or signs?—Both; the natural signs are more impressive. By using them we appeal directly to their hearts. I could not do without the natural signs. If I merely conveyed what I had to say to them by spelling on the fingers, they would fall asleep; but the moment I begin signs they are all alive, and their whole attention is riveted upon me. It wants a long training before you can become master of the sign language.

8447. The oral system has not been in use a very long time. Do you find that any who come to your church, who have been taught on the oral system, are not able to understand your natural signs, as well as those who have been taught all their lives on the sign and manual system?—They may not understand the natural signs at first, but they have learnt to spell on their fingers. I forgot to mention this, so that they know what is spelt, and they gradually learn the signs after. There are some few of my congregation who are not dumb, but who are only deaf. They have learnt to spell on their fingers, and they have fallen into our ways, because they are deaf. They talk as well as I can, and we have found them very useful in our Bible classes. Several deaf and dumb persons who have been taught on the oral system come to my church.

8448. Do you think that by conducting a service on the oral system you could reach as large a congregation as you can on the sign and manual system?—No; I do not disapprove of the oral system. I am in favour of teaching articulation, but at the same time I do not approve of giving up the signs; I believe the sign system never can be given up, because we must always have some deaf and dumb who must be taught on the sign system and who cannot be taught on the oral system.

8449. Have you ever seen or heard of a church with a congregation consisting of deaf and dumb persons who have been taught exclusively by the oral system, which congregation was as large as the congregations in your church where the service is conducted on the sign and manual system?—No, I have not heard or seen anything of the kind.

8450. You do not know whether such a thing exists?—I have not heard of any such place.

8451. What proportion of those who attend your church have been taught on the oral system?—Very few comparatively. We have one or two who have come from Mr. Van Praagh's school, and several who have been taught under Mr. Stainer; they come to us for aid. When their education is over they come to our society to help them, and we apprentice some, and they become attached to us through our taking them in hand.

8452. Do you find that those who have been brought up on the oral system are more intelligent than those who have been brought up solely on the sign and manual system?—On the contrary, I think those who have been brought up on the sign and manual system are more intelligent; for instance, I have just got a lad apprenticed who was educated at Margate, his parents are deaf and dumb, they have two children, a boy and a girl, and that boy turned out a first class pupil from Margate, because, his parents being deaf and dumb, the boy had the benefit of their instruction from infancy. When he went to school he was head of his class, and he continued head of the school till he left. The use of signs brightens them up and gives them a clear understanding of written language.

8453. Speaking generally, what is the time you think it would take to teach a boy on the sign system properly?—Five years is the usual time allowed on the sign system.

8454. On the other system eight years has been stated to be the time required?—Yes, it takes a longer time. After leaving Old Kent Road I was at Belfast, then I went to Wales, and then I went to Edinburgh. When I was in Edinburgh I saw the sign system was the best. I dropped articulation because, on account of the limited time that the children remained at school, there was no time to teach it, and I found that they became first class pupils on the sign and manual system.

8455. You give lectures at your institution on week days?—Yes. The lectures are enjoyed very much, indeed; they are given every Tuesday evening. Yesterday evening, a most excellent lecture was given by a deaf and dumb gentleman, most of it in natural language, the subject being "Lord Chesterfield's advice to his son." Our report shows the course of lectures given last year during the season from April to the end of March. The lectures are very much appreciated, sometimes we have dissolving views.

8456. I see some of these lectures were given *viva voce*, and interpreted by you?—Yes, and sometimes hearing people come. The public are invited when the lecture is spoken, and they may hear the spoken lecture while we interpret it to the deaf and dumb.

8457. With regard to the funds of the institution, have you any funded property?—Very trifling; there was a legacy left lately, and the Committee agreed to fund it, but it is generally taken out very soon; we get into debt again. At the end of our report, there is a general statement of the receipts and expenditure, the receipts being 2,204*l.* and the expenditure the same amount, less a balance of 412*l.*

8458. Was the church built out of your own funds?—Out of subscriptions; we have a building fund.

8459. You have another church besides St. Saviour's?—St. Barnabas; that belongs to the society, but it is on the south side of London; it is at Deptford.

8460. Is it completed?—Yes, and out of debt.

8461. Can you tell us whether all the adult deaf and dumb are earning their livelihood?—Very fairly. If you compare them with hearing people, I should say the deaf and dumb are doing as well as hearing people, but there are, certainly, some out of work.

Rev. C. Rhind

24 Mar. 1886.

8462. Of course, among the deaf and dumb, as well as among hearing people, there will be some who are not very industrious?—Some are not deserving; some get addicted to drink, and we have to caution them, and some through ignorance quarrel with their masters; they want an increase of pay, and they leave, and then they cannot get taken on again unless we go to speak for them.

8463. Has there been an improvement in the education of the deaf and dumb in the last 10 years?—Most decidedly; there are not so many cases of deaf and dumb in the police courts as there used to be; we used to be constantly called on to go and interpret for deaf and dumb people who were taken up.

8464. Do they, generally speaking, understand written language?—Not perfectly; if you advance them on in their education, of course, they are more perfect.

8465. Can the large proportion of the deaf and dumb who have been educated understand written language. I am not speaking of exceptional cases?—It depends upon the education that has been given them; sometimes they remain only four years at school, and then, of course, they do not understand written language correctly. If you put a question to them, in all possibility you would put it in an idiomatic style; you must put your question in very plain language or they will not understand it, just as if you were talking to a child.

8466. Do the deaf and dumb have a sort of language of their own?—The language that you use in communicating with them must be plain and simple; you must use the simpliest words you can so as to convey to them the meaning of what you want them to understand.

8467. Are you in favour of the compulsory education of the deaf and dumb the same as other classes?—I think it is most important that their education should be compulsory.

8468. In what way do you think the State should see that they are educated?—I think the same plan could be adopted in the case of deaf and dumb children as is now adopted in the case of hearing children.

8469. Of course they must be taught separately from the other children?—Yes, there would be schools for that purpose.

8470. Should these schools in your opinion be supported by capitation grants?—I have not formed any definite idea upon that; one does not know whether to send them to board schools or institutions. If you send them to institutions you must give a grant; if you send them to board schools then an arrangement can be made with the school board.

8471. The board schools do not give maintenance; do you think it desirable that deaf and dumb children should be sent to institutions where they could be boarded as well as educated, or do you think they ought to go to their own homes after being taught in school?—I should prefer institutions.

8472. Whether such institutions were conducted by public or private funds you are in favour of deaf and dumb children being brought up together and boarded?—Yes, I am in favour of that, for this reason, when they come home they are generally the butt and ridicule of all the children about the place; they are provoked and they lose their tempers, and they prefer to go back to school after they have been at home. I, however, do not say this of all, but chiefly of the poorer class who are allowed to run about the streets.

8743. You think that in such institutions, by whatever funds they were supported, the children would not only be better educated but would have a better chance of getting on than if they were among hearing children of their own class?—Yes, they want to have special training and special supervision.

8474. Do you know the operations of the school board in London with regard to the education of the deaf and dumb?—I know Mr. Stainer.

8475. Have you attended their schools?—Two or three times.

8476. Are they well conducted?—Yes.

8477. Is there a difficulty in getting good teachers for the deaf and dumb?—There is a great difficulty, we want a place for the training of teachers.

8478. In your opinion ought a training college for teachers of the deaf and dumb to have Government assistance?—Decidedly, I think so, unless they could take into board schools a kind of pupil teachers, and let the masters bring on the pupil teachers in the same way as I was trained myself; the first time I saw a deaf and dumb child was when I first went to be a teacher.

8479. Did you go as a pupil teacher?—No, I was paid a salary at once.

8480. Up to that time you had no previous training?—No, I had never seen a deaf and dumb child.

8481. How long was it before you were able to teach there?—Some things I was able to teach at once with the help of an experienced teacher, but it took me five years before I could venture to stand up to sign in the natural language the morning and evening prayer to the whole school.

8482. Were you ordained at that time?—No, it is only lately that I have been ordained. My committee wished it. When the late Bishop of London saw me, he said, " Mr. Rhind, you ought to be ordained," and recommended me to work up for the examination, and I did so. I had to attend to my duties in connexion with the society till 7 o'clock at night; then after my tea I shut myself up in my room and I studied and studied until 1 or 2 in the morning. Then I went up to the examination at Fulham and I passed. The next year I tried for the priesthood and passed the priesthood examination. That was eight years ago.

8483. (*Mr. Fenv.*) You stated that you managed to watch over the deaf and dumb all through life?—Yes, as far as we can, that is in the visiting.

8484. Have you visitors to look after them?—Yes, I do it myself; we are each appointed to visit in our own districts; I have my district and Mr. Sturdee has his district. The missionaries also visit in their districts. Each makes a note of his visits in his diary for the inspection of the committee.

8485. I will keep to your district; you visit deaf and dumb people in the same way, I suppose, as a clergyman would visit his flock?—Yes; I have a little book with the names and addresses of my people as far as I can get them; I may perhaps not know half my people, but the names of those I do know are entered in my book. I have 300 names in my book, and those I visit. If I have not got their addresses I cannot visit them, but they send for me when I am wanted.

8486. I gather from what you say that you prefer the combined system as a mode of teaching?—Yes, as a mode of teaching I prefer the combined system.

8487. I gather that you approve of the institution at Margate. Do you approve of children being kept in institutions away from their parents, as they are at Margate, in preference to what is known as the day school system, where the children go back home every evening?—I prefer them to be in an institution as they are at Margate, because I know they will be better looked after.

8488. You think that anyhow some children will always require to be taught on the sign system?—Yes; children of weak intellect or with some malformation of the organs of articulation.

8489. Then, in your opinion, a child of weak intellect would be better able to learn the sign language than oral language?—I think so.

8490. As regards training schools or training colleges you have expressed the opinion that they should have Government aid?—Yes.

8491. What safeguards would, in your opinion, be required in giving Government aid to a training school; the point I want you to consider is this: that a person may go to such a school or college and be trained for six or eight years and afterwards alter his line of life altogether?—I do not think a person should be received in such an institution unless he undertook to enter into an agreement, or made some statement that it was his intention to follow out the instruction of the deaf and dumb.

8492. You would make the grant conditional on each pupil coming under some undertaking?—Yes.

8493. You would not recommend that there should be grant of money at so much per head whoever came to the training college, and then that the Government should take their chance as to whether the money was thrown away?—No; I think there should be some

Rev. C. Rhind.

24 Mar. 1886.

understanding whether the person coming to the college for instruction would follow it out.

8494. Because we have it in evidence that parties have gone to a training college or some kindred institution and have afterwards gone into another line of life?—I think that should be discouraged, because the object is lost of course.

8495. (*Mr. St. John Ackers.*) How many wholly uneducated deaf and dumb do you think there are in the metropolis?—I cannot say for certain, but I know a good number of the parents, particularly among the poor, are so careless about their children that they put off doing anything towards their education to the very last, expecting the asylum will elect them, and time is lost; many have no education at all, through having passed the required age for admission.

8496. Could you give any idea how many wholly uneducated deaf and dumb adult persons there are in the metropolis?—I could only give a guess, I could not say for certain, perhaps 50.

8497. Not more?—I daresay there may be more; I am keeping within the mark; I would say between 50 and 100, if we could find them out, but we have not done that.

8498. What proportion of the partially educated adult deaf and dumb do you think could write simple sentences and understand such simple sentences when written?—They break down here and there, and require certain words to be explained to them by signs.

8499. About what proportion do you think of those adults that have been at schools in the metropolis are able to write and understand simple written sentences?—You might say half of those who have been educated; it so much depends on the care that has been taken of the children after they leave the school; because when they leave school, though the education may have been very good, yet, if they are neglected, they do not put the education into practice, and it falls away.

8500. Would not it be desirable that your society, which has such a great knowledege of the adult deaf and dumb of this metropolis, should, so far as they possibly could, search out all the deaf and dumb in the metropolis and see how far they are educated and how far they are able to utilise their education?—You would require a special visitor for that purpose.

8501. (*Chairman.*) You mean your staff is unable to carry out that inquiry?—Yes, because it would interfere with their special work; but if the society had sufficient funds for the purpose, they might do it by appointing another special agent.

8502. (*Mr. St. John Ackers.*) If you had the means of obtaining those particulars you would not say that it would be undesirable to obtain them?—No, but our work is so great that I could not undertake it; I am worked from the moment I get up in the morning until 11 o'clock at night. I know from my work I could not give a hand to it.

8503. There may, in fact, be a very considerable number of adult deaf and dumb whom you at the present time are unable to reach?—Yes, quite so, having grown up without receiving any education, but some, when we do find them, we give them relief and find them employment.

8504. You spoke of a poor woman called "Dummy," and you said that you had no means of communicating with that person when she lay in bed, because she could not understand a single written word or a word spoken on the fingers; but if that person could have spoken, however little, would not it have been a very great advantage?—It would have been of no advantage compared with her natural signs, by means of which we held free and clear communication.

8505. Are you not aware that there are hundreds of deaf and dumb persons who have never been sent to any school whatever, who have yet been taught to speak simple words by their relations?—Yes, simple words; but that is not a language.

8506. Have your researches into this question been considerable abroad as well as in England?—No, my experience is confined to London and other parts of England, Wales, Scotland, and Ireland.

8507. From your experience are the deaf and dumb as long-lived as hearing persons?—I do not see any difference between the deaf and dumb and the hearing.

8508. From what disease or diseases do they generally die?—They die from various diseases; bronchitis is a prevalent complaint amongst them, but there are various causes.

8509. Bronchitis at any rate is one?—Yes, bronchitis and chest disease.

8510. You have stated that you cannot give religious teaching at first under the sign and manual system; are you aware that a statement has been made, I do not say in evidence here, that under the sign and manual system religious teaching can be given to the children the first week that they enter school?—I have never heard that.

8511. Did I rightly understand you to state that all the adult deaf and dumb who come to your church are able to understand your signs?—There are some who cannot understand *all* the signs. I will tell you why. My signs are from a London school; now some of the signs at Brighton would be different. They do not all use the same system of signs. (*The witness showed by his fingers the different ways of denoting "24th chapter."*)

8512. You have spoken of natural signs; what other signs do you use besides natural signs?—The conventional signs that certain schools use.

8513. (*Chairman.*) You use the alphabet?—Yes, but much more largely the natural signs.

8514. What are the conventional signs?—(*The witness showed some conventional signs by his fingers.*)

8515. Is there more than one alphabet?—Yes, the one with one hand and the other with two.

8516. Do the conventional signs differ as well as the alphabets?—The conventional signs differ according to the different institutions.

8517. You say that the conventional signs differ in different institutions; how many institutions use the same conventional signs?—I cannot tell you; I was trained at the London Asylum, so was Mr. Stainer, and so was Dr. Buxton; when we went to take charge of other institutions we established the conventional signs we learned there, but when you come to Brighton, they are different, for this reason, Mr. Sleight was not trained at the London Asylum, and established conventional signs of his own, and his teachers would take them to other institutions.

8518. According to your statement it depends on who is the head master and where he has been trained?—Yes. I do not know where my congregation come from, and sometimes when I am giving out the chapter and verse I spell it on the fingers as well as give it by the signs representing the numbers, so as to make myself understood by the whole congregation.

8519. (*Mr. St. John Ackers.*) In the full sign system are not there different alphabets, conventional signs, grammatical signs, and word signs?—Yes, according to the different institutions.

8520. In your opinion is it advisable to use many grammatical and word signs, or do you chiefly, so far as you possibly can, keep to natural and conventional signs?—I prefer to keep to natural signs and the manual alphabet as much as I can.

8521. In teaching a sentence by the sign system, do you not frequently invert the order of the sentence as it would be ordinarily written?—It depends on the education of the person I am dealing with. If he is a tolerably well educated person I should not do so. Inverting the order *when signing* is only to explain the words of the sentence, but all are taught to write correctly the sentence in the order of spoken language.

8522. Take the case of children; when they first come to your institutions, do you ever give them language in the ordinary order?—They would not understand it if I did. We commence with single words and show them the object, or use a natural sign for the meaning, then short sentences are taught by the use of natural signs and the manual alphabet together. It takes some time before they understand a complete sentence of any length, because they have to learn the use of the prepositions, conjugations of the verb, &c.

8523. (*Chairman.*) What difference do you make between the present and the past tense of a verb?—(*The witness made different signs to represent different tenses.*)

8524. Is what you are showing us now what you teach them after they have learnt to write?—Yes.

8525. Before you can teach the tenses of verbs, you must have taught them to write?—Yes, directly they come to school the first thing is to teach them to write, and the manual alphabet.

8526. (*Mr. St. John Ackers.*) In what do children educated on the sign system think. If they want to write a letter, do they think first in signs?—They do not think in signs. If I began to think of anything that I was going to eat, say bread, for instance, I would not think of the word "bread." I should think of the actual thing itself. I believe deaf and dumb persons think in the same way.

8527. Do you agree with those sign system teachers who consider that seven or eight years should be given to the instruction of a deaf and dumb child on the sign, in order to get the full results of the system?—Of course the children would be better educated if they had seven or eight years, because when they leave school at the end of five years, their education is very limited. It is a most difficult thing to get the parents to let them remain longer; they are put out as apprentices at the age of 15 or 16, and they remain apprentices till they are 21, when they go to work for themselves. If you make the period that they are at school longer their education should commence earlier.

8528. You said that deaf and dumb children, when they go home for their holidays, are the butt of hearing children?—In many cases it depends on the carelessness of their parents.

8529. Why should it be so?—I have been told that it is so generally. The hearing children tease them just to see the deaf and dumb using all these gestures; they do it to gratify a wicked propensity.

8530. Is not it, in your opinion, in a great measure owing to the fact that hearing children have no means of communicating with these deaf and dumb children?—They have no means of communicating with them except by signs, but I think they like to draw out the deaf and dumb children to show these gestures and antics.

8531. (*Admiral Sir E. Sotheby.*) You stated that it is necessary that the deaf and dumb should be educated in order to get any idea of the existence of God; are you aware that there are thousands of people 16 years old or so who can speak, who are equally ignorant of the existence of God?—I think all hearing people, even before they have received any education, have some idea of a Supreme Being, but I have never heard of an instance of deaf and dumb persons having any knowledge of a Supreme Being before being educated; the heathen, for instance, have an idea of a Supreme Being; they will worship something.

8532. Are not there among hearing people many people just as ignorant as the deaf and dumb of the same age?—Not just as ignorant, for they will have a spoken language, and also an idea of a Supreme Being. I have known instances of very ignorant hearing people talking about God; they will have some idea of the existence of a God, but you do not find that an uneducated deaf and dumb person has any such idea.

8533. There are several systems of signs apparently?—Yes; it depends upon where the master was trained.

8534. Would not it be a great advantage if there was one general system adopted throughout the country?—If it could be done, I should say it would be an advantage if one system were in use instead of several.

8535. Are you aware that there is only one oral system?—I did not know that; I have taught on the oral system and I understand it, but my system is a little different to what I have seen in others. I have brought forward pupils to address the public, but my system of teaching orally, perhaps, would be different from other teachers' modes of teaching. There is, of course, only one speech, but there are different ways of teaching it. I was very successful in teaching articulation.

8536. Would not it be an advantage to have training colleges for the sign and manual system as well as for the oral system?—I think it would be equally advantageous to have a college for the sign and manual system as for the other. If you were to suggest that one large college should be established from which teachers should be sent out, then there would be one system of signs spread all over the country, then you would have the conventional signs and all the other different signs all alike, people come to my church who have been trained in different institutions and I know that some of them do not understand some of my signs, although all understand the manual alphabet.

8537. Would not it be a great advantage to the deaf and dumb to be able to speak to their hearing fellow labourers and be able to lip read what they said to them?—Decidedly; I do not oppose the oral system, I am an advocate for it, I take the two together.

Rev. C. Rhind

24 Mar. 1886.

8538. If you have learned the sign and manual system can you learn the oral system?—I have done it myself. The pupil I referred to who spoke at a public meeting was taught first in the sign and manual system, I found by a little trial he had a good voice and I worked upon it and after he had been taught on the sign system I taught him orally.

8539. (*Chairman.*) Was he born deaf and dumb?—Yes.

8540. (*Admiral Sir E. Sotheby.*) We have had it in evidence that it is impossible to teach orally anyone who has been taught the sign and manual system?—But it is not, I have done it myself.

8541. You do not find that the one confuses the other?—Not at all. A deaf and dumb person who has been taught by the sign and manual system, and afterwards by the oral system, can drop his speech when he likes, or can use signs when he likes.

8542. You say you have learned the oral system?—Yes, I have taught it.

8543. Can you converse with one person on one side by the sign and manual system, and on the other by speaking?—Yes; the little boy I have alluded to was put to a test by the Chairman. Anybody at the end of the room was asked to put a question to the boy; they were told it was not necessary to speak loud, so someone put the question: "How many brothers and sisters have "you?" and the boy answered, "I have four brothers "and two sisters." The Chairman said, "Put the boy "in the corner by himself." The Chairman then requested me to write the boy's name on a piece of paper, and I wrote his name, Thomas Mackenzie, and he shouted out "Thomas," (*loud*), "Thomas," (*louder*), "Thomas," (*louder still*), but the boy did not move, and the Chairman said "I am satisfied, but I would not "believe that boy was deaf and dumb till I put him to "the test."

8544. (*Mr. Johnson.*) The boy did not answer him?—No, he did not turn round.

8545. (*Admiral Sir E. Sotheby.*) How many does your congregation at St. Saviour's consist of generally;—It varies.

8546. What would be the average?—Last Sunday evening I had 70, sometimes I have over 100; in the mornings it is not so large. A good many of them are poor people and they have to be at home in the morning cooking their dinners. I have a Bible class in the afternoon, and that large Bible class takes away from the attendance in the morning; they come from all parts of London. I provide a tea in order that they shall have the benefit of the evening service.

8547. What would be the average number?—The average is 39 in the morning, and 67 evening; 91 was the highest last year.

8548. Those who attend the church come from different parts of London?—Yes.

8549. If they are all paying attention do you consider that they all understand everything that you say?—Yes, I make it so perfectly plain that a person only half educated would understand me. I bring my subject down to their level, and with the use of natural language along with the spelling they understand me. I had 38 at the last communion.

8550. Supposing the church were quite full and you were speaking orally, would there be many people who might be sitting to the right and the left of you who could not see you speaking so as to understand you?—Some of them would not be near enough to me to understand me.

8551. Then you consider that for church services the sign and manual system has advantages over the oral system?—I do, decidedly, because no matter what part of the church the people are in, they will understand all I say if they pay attention.

8552. We have before us a picture of the deaf and dumb alphabet, have you in any book any pictures of the signs that are used?—No, not of the signs, only the alphabet.

Rev. C. Rhind.

24 Mar. 1886.

8553. You have told us that there are two alphabets?—Yes, there is the one handed alphabet used in France and America, and the two handed alphabet used in Great Britain.

8554. (*Mr. Johnson.*) Almost all the schools in Great Britain use the two handed alphabet, do they not?—*Not* all; some have adopted the one handed alphabet.

8555. What would be the proportion of schools in which the one handed alphabet is used?—I cannot tell. I know that at Belfast they have adopted the one handed alphabet, though I opposed it when I was there.

8556. What system do they use at Old Kent Road? The two handed alphabet.

8557. What is it at Manchester?—The two handed system.

8558. The majority of schools in which they use the sign and manual system they use the two handed alphabet?—Yes.

8559. It would be an exceptional case where the one handed alphabet was used?—In England it is.

8560. The number of people you have preached to on a Sunday is on an average 40, I understand you to say?—Yes, and a much larger number in the evening.

8561. What sort of ages are they; are they all very young?—No.

8562. Are they middle aged?—From, I should say, 18 to 60 or 70.

8563. Now, what proportion of those are pupils in institutions now?—None.

8564. They have perfected their education in sign system before they come to your church?—Yes.

8565. You say it would be more difficult for you to preach in the labial system, the oral system; for what reason would it be so?—Because they could not see.

8566. I thought you said everybody in your church could see?—They would see my signs easier than they would see the mouth.

8567. Have you any knowledge at all of any service being conducted anywhere in the oral system?—No, except at an ordinary church.

8568. We are talking of the deaf and dumb, of course?—There would be no special church for them, because they could go to an ordinary church for that; they do not want a special service.

8569. How is it with the deaf and dumb, or the born deaf, who are taught on the oral system; where do they get their religious service?—Some of them come to my church, and they have learnt the manual alphabet in order that they shall benefit by my church.

8570. That makes you, I suppose, prefer what is called the combined system?—No, that is not the reason.

8571. Will you tell me how it is that these people who have been trained on the oral system come to your church, if, as we have been told, it is impossible that the oral system and the sign system can go on together?—Because they find they can get more benefit and more instruction by coming to me than by going to a hearing church; that is the reason; and they learn the alphabet for that express purpose of getting the benefit of my services, and the lectures.

8572. But you do not quite explain to my mind, coming fresh to this question, how it is that the orally taught children, with regard to whom, of course, if they are taught in an oral institution properly, signs will be entirely excluded from their education, when they go out of that orally taught institution come to you to have a sign service?—Because they learn gradually the signs as well. I can tell you the case of two brothers. One brother was taught on the oral system; the other was taught on the sign system, and when he was taught on the oral system he went back to the signs, and they both talked together by signs.

8573. You say that even the orally taught lapse back into the sign system?—Yes, because they see the advantage of it. I do not say the whole; I only say some.

8574. Now might I ask you, being quite ignorant upon these questions, how it is that you would impart these signs and these alphabetical systems, do you impart them by writing?—How do you mean?

8575. I understand that as a matter of education you teach them writing first?—We teach them to write, and then to make them understand what is before them, we make use of these natural signs or the object is shown in a picture; then they understand the meaning; it is to convey to them the meaning of what is written before them.

8576. Will you please to explain to me how you would convey to a deaf and dumb person's mind that that (*pointing to an inkstand*) is an inkstand; how do you produce in that child's mind an impression that that thing there is an inkstand?—We write down the word, and then point to the inkstand and the written word.

8577. Then you do it by writing?—Yes, writing; we do it by writing first, and then by-and-by when the boy has learnt the word, and we know he has learnt it, we go to new words. There is no occasion to be writing continually as a sign may show he understands the meaning.

8578. How do you convey to the mind of the child the value of writing from the beginning?—They learn everything by writing, and the meaning explained by signs.

8579. But how do they learn that writing. In learning from the lip system, it is a question of the oral language of the speaking people; how is it you convey to these deaf children the value of the written language; how do you teach it to them?—We write it down, and they have to write it down. That is the example for them, but the meaning is always explained by natural signs and the manual alphabet at the same time.

8580. Then it is merely a mental store?—Here is the written lesson that the pupil has to learn. Now he has to do in writing just what is there, and then we show him the meaning of it by signs or actual objects, or pictures.

8581. (*Chairman.*) I suppose you teach these children writing the same as you do other children?—Just the same.

8582. (*Mr. Johnson.*) What I want you to explain to me too is this. Of course, a great many of us are ignorant of the way in which the education is carried on, and we want to learn. How do you teach a deaf and dumb child without oral assistance the difference between A, B, C, so as to convey it to his mind and produce the impression?—I will explain it in a way of my own. I had a pupil deaf, dumb, and blind. How could I teach a pupil like that, who could neither hear nor speak nor see. I had a pupil at Belfast deaf, dumb, and blind, who was getting on very nicely there. General D'Aguilar was a great friend of this boy, and put him there. The first thing was to teach him to keep his seat in the school room, to keep to one particular seat. That was his first lesson.

8583. (*Chairman.*) We want to know how you taught him to read?—I had to teach him by the raised letters of the blind, just in the way that the blind read by raised letters. There were two or three words, for instance, the word "key."

8584. Was it Moon's type?—I think it was Moon's; it was plain letter type, not Gall's, that is angular.

8585. (*Mr. Johnson.*) You must not mix the two together at this moment. My question is, can you teach a deaf mute the formation of letters without using any oral assistance?—I thought I would just explain it. Here was the word "key." I could not speak to him, I took his finger, and let him feel that word key, and I put a key into his hand. I wanted him to understand that k-e-y was that key, and he did not understand it at first. In the same way with the word "pin;" then I put a pin in his hand. Still he was all in confusion. Then I took the word "pen"; then I put a pen in his hand and took it away. Then I came back to the key, and put it into his hand, and took it away again; then the pin I put into his hand, and took it away again, and then the pen. Then I put the word "key" before him and made him take the key himself, and he held it up. That is how we teach them. We give the written word, but show them the object or else by a sign, one or the other. That is how the meaning of the word reaches the mind.

8586. Do you hold the opinion that the oral system can be worked side by side with the sign?—I do, because I have done it; that is how I was trained. I was trained to it.

8587. I think you said that there was a little difficulty between the deaf and dumb children, and the ordinary children. Do not you think it would be an advantage if they could communicate orally one to the other?—It would be an advantage.

8588. Do you not think it would relieve that perplexity you spoke of?—The relief they find is to learn signs; they prefer the signs to the speaking.

8589. Do you not think that if the oral system were employed it would remove that perplexity which you talk of, as existing between the ordinary talking children and the deaf and dumb ones?—I do not think the deaf and dumb would take to it.

Rev. C. Rhind

24 Mar 1886.

8590. You must have some experience of the oral system; do not they make any use of it?—They do use their speech, but I think after they have been taught the oral system they will go back to the signs, or rather take advantage of the signs to get more instruction. I do not say they will lose their speech, for they may use both, which some now do.

The witness withdrew.

Mrs. DANCY examined.

Mrs. Dancy.

8591. (*Chairman.*) You are head teacher of the board school at Surrey Lane, Battersea?—Yes.

8592. How long have you been there in that capacity?—At the Surrey Lane school only a year and a half; under the School Board five years; as I had a class previously at Farncombe Street, Bermondsey.

8593. Was that under the school board too?—Yes.

8594. In both cases were the class of deaf and dumb children the same?—Exactly the same, board school poor children.

8595. From what ages?—From four years to 12 and 13 years.

8596. Do they not keep them longer than that at the board schools?—No; they work as a rule when they are 13 years old.

8597. And what amount of education have they got at that age?—Not at all a perfect one; especially when they come late to school as some of the children do.

8598. But supposing they were to remain with you from four years of age to 12 or 13, could you give them a good education in that time?—Yes, certainly. Eight years is a fairly reasonable time.

8599. We have been told that it is not of much use sending these children to school before six or seven years of age; is that your idea?—I think a child could be taught at six years. I have a little child now to whom I taught sentences of little words and sounds at five years old.

8600. In fact, I suppose, except that they are much more troublesome to teach, there is no reason why they should not come at the same age as other children?—Not at all; then they get accustomed to school discipline.

8601. You have not pupil teachers enough, I believe? I have no pupil teachers at present.

8602. Do the deaf and dumb require more trouble and more care bestowed upon them than other children?—Much more.

8603. And for that reason it is more difficult to teach them when they begin?—Certainly, much more.

8604. What has been the number of those you have had under your instruction?—In the present class I have, do you mean?

8605. And you have no pupil teachers?—No, no pupil teachers. I have 14 children; the average attendance is about 12.

8606. Do you think that too many for your class?—The average attendance being 12, I can manage to teach them; 14, if they attended regularly, would be too many.

8607. Do you form them into classes?—Yes.

8608. Of course, after they have received a certain amount of instruction, you can teach a larger number together?—Yes, certainly.

8609. But at first they require individual attention?—Individual attention.

8610. And how many hours a day do you give to them?—Five hours.

8611. Five or six days a week?—Five days a week.

8612. Is Saturday a holiday?—Yes.

8613. Have you had much more experience with those who have been totally deaf, or only the partially deaf and dumb?—I have had more experience with the totally deaf.

8614. Are those you speak of the deaf from birth?—The majority of them; some of them have become so through inflammatory diseases in infancy.

8615. Have you taught them exclusively on the oral system?—Exclusively.

8616. And you had yourself been a teacher under the oral system previously to that?—Yes, in the Fitzroy Square Association.

8617. Did you go there merely to be trained as a teacher, or did you remain to teach?—Both; to be trained and to be a teacher at the same time. It was Mr. Van Praagh's original plan.

8618. How long were you employed as a teacher there?—Five and a half to six years.

8619. Do you think it would be possible to require all children who are deaf and dumb to be sent to school compulsorily, as other children are?—I think so.

8620. Have you much difficulty about the attendance of children; is there much irregularity?—With those who reside at a distance there is irregularity; I have some children who come from a long distance.

8621. How far do you suppose they come?—Two or three miles, and the weather prevents their regular attendance at that distance.

8622. Do you find that the parents are anxious to send their children to school?—Very anxious. As soon as they make any progress they are delighted with it, and they are very anxious for it.

8623. Do you think that there is more feeling among the parents in favour of compulsory attendance than there was; I mean from seeing the effects of the teaching that they receive?—Yes, I think so.

8624. Had you at first any difficulty with the parents, and have you less now?—I visit them myself. I very rarely call in the aid of the school board visitor; I think it is preferable to visit the parents ones self; I hardly call it compulsory. I explain to the parents when I go the loss to the child of not attending.

8625. It is not supposed to be compulsory now, is it?—Yes, I believe so.

8626. Is it acted upon universally?—I do not know what they do in the other parts of London. I believe so; but in my own case I call upon the parents myself instead of having the assistance of the board school visitor.

8627. But have you any reason to believe that in the district where the board school is, there are deaf and dumb children who are not sent to school, who might be sent to school?—I think not. I think I have all the children who are deaf in my district.

8628. But you cannot say that with regard to the whole of London?—No, I do not know about other parts.

8629. You say that the ages of the children vary at their entrance; what is the average length of attendance that you have had since you have been a teachee children in your school?—Three years under the School Board. The children being poor the parents cannot afford to keep the children at school long.

8630. Have you any means of knowing what becomes of them after they have left their school, whether they are apprenticed or whether they are taught any trade?—I believe they are taught some trade. I know one boy who left me went to assist his father in a printing business.

8631. Do the guardians assist in finding places for them?—I have not had any under my care who have been so assisted. I should believe they would do so if it were necessary.

8632. Are you in the habit of using those desks shown in that photograph (*handing a photograph to the witness*)?—Similar to these; a little more circular.

Mrs. Dancy.

24 Mar. 1886.

8633. You use circular instead of octagonal ones?—Yes.

8634. Do you attribute much importance to having desks of that character?—They are very useful for dictation lessons, and when the children are writing when they look up and see each other's faces.

8635. How soon do the children learn to write under the oral system?—They write immediately; writing and speaking are simultaneous. You pronounce a sound to the child, and the child pronounces that sound and writes it on the blackboard immediately.

8636. Do you write it on the blackboard, and does the child copy it?—Yes, after it has spoken it.

8637. Do you think it takes much longer to teach a child on the oral system than on the sign system?—I have not had any experience at all of the sign system. I should think it does.

8638. What time do you think it takes before they are able to read and to understand the spoken language?—To read books do you mean?

8639. Yes?—Short sentences they can read very early, short sentences from the ordinary cards that are to be seen hanging in an infant school; they can read those perhaps in a year.

8640. I suppose they can read long before they can understand the language? — They can read mechanically if you mean that.

8641. They can read before they can understand language when taught on the oral system?—Yes, they might when read mechanically, but we do not put any stress upon reading. Our great aim is to make them understand.

8642. They could read short sentences after a year, you say?—After a year and a half, perhaps; very little, simple sentences.

8643. Can they after the same time understand similar short sentences if you speak to them?—Yes, certainly; they understand before we allow them to read those simple sentences.

8644. You, as far as possible, keep the reading and speaking together?—Yes, certainly, speaking first; we do not allow them to read until they understand what they read.

8645. For instance, children who are taught on the sign system are taught to read also, and they are more dependent, of course, on the written language than those who are taught on the oral system?—Certainly.

8646. But do you think that the oral system enables them to make as rapid progress with reading and writing as if they were taught on the sign system?—Perhaps not. I have not had, as I said, any experience of the sign system, but perhaps not, but then we gain in the end. I believe it is the far better system of the two, but it takes a little longer at the commencement.

8647. Are your children boarded in your school?—No.

8648. They do not go to Mr. Stainer's Home?—No, there is no home in that neighbourhood.

8649. Do you find any disadvantage from the children going home to their parents?—The disadvantage of irregular attendance; no other disadvantage, I think.

8650. Do you find that the parent endeavours to keep up their education at home?—No, not the poor parent.

8651. Do they communicate by signs with the children or do they attempt to speak to them?—I think they speak in their own way, but they do not aid the teachers in correcting a child's mistake as they would if they were better educated people themselves and had more time.

8652. Do you attach much importance to their being in homes such as Mr. Stainer provides in other parts of London?—I hardly think that I do, considering that they are all deaf children together. If some of them were hearing children it would be a great advantage; but being all deaf children and not able to correct one another's mistakes, I do not think there is any great advantage beyond that of regular attendance.

8653. Have you ever known, in the parts of London that you are speaking of, these children when they return home in any way ill-treated or mocked by other children on account of their dumbness?—Sometimes they are. One boy always wanted me to go home with him, because the other boys fought him, and I did as long as I lived in a certain neighbourhood.

8654. Would not that be another drawback to the children going home?—Perhaps it would be; I had not thought of it.

8655. Particularly if they have a long way to go, say two miles, and have to run the gauntlet of any children who might take advantage of them?—Yes; I had not thought of that.

8656. Have you anything you wish to lay before the Commission generally as to the education of the deaf and dumb from your experience, both at the institution at Fitzroy Square and otherwise; have you anything specially to speak of, any suggestions you would make for the improvement of their education?—The school board might do so, if they could, in helping the children in after life when they leave school. If they could do that it would be a great assistance to the poor children.

8657. You think that there is a want then of the poor children being aided after they leave school?—Yes.

8658. In the way of apprenticing them out?—Yes.

8659. Nobody looks after the board school children, at present, after they leave school?—No.

8660. Do any private institutions look after them?—Mr. Stainer has just opened a home for boys to learn the use of tools. That is the only provision, I believe, at present.

8661. That is done entirely by voluntary effort?—Entirely.

8662. Do you know if there is any difficulty in boys obtaining employment as apprentices?—There is a difficulty if they have not remained at school sufficiently long to be perfectly educated, to be taught to speak properly on the oral system. If they only come to school two or three years, they are not able to speak perfectly when they leave, and, of course, masters then hesitate to take them.

8663. In what position then is a child half educated; does he fall back upon the sign system or does he perfect himself in the education which he has already begun on the oral system?—It entirely depends upon the people by whom he is surrounded. If his parents or friends urge him to speak no doubt he would endeavour to perfect himself; but if he is isolated and has no friends to assist him he would naturally fall back, I am afraid.

8664. Upon natural signs probably?—I am afraid he would.

8665. And a great portion of his education would in that way be lost?—Yes.

8666. What amount of reading and writing at the end of three years have they had; could a boy write an ordinary letter at the end of three years?—Yes, certainly.

8667. I thought you said at the end of three years they would be imperfectly educated, so much so, that they would not get a place?—A master would hesitate to take the boy at first, I think. He would be able to express himself fairly well, but not of course to write a letter such as a hearing boy would write.

8668. At the age you mentioned of 13 or 14, a boy who has only had three years education would not be much more advanced in education than an ordinary boy about eight, I suppose, would he?—No, and his speech would be imperfect.

8669. When you speak of the speech being imperfect do you mean that his enunciation or pronunciation would be offensively imperfect?—It is never quite perfect such as hearing children's; it would be of course less perfect after so short a time; also the command of language would be much less.

8670. Do you think that the language depends a great deal upon the way in which the child is taught; I mean the intonation in pronouncing language?—Yes, I think so; and the length of time at school. Also if a child comes early to school his pronunciation is much clearer than when he comes at 11 or 12 years of age.

8671. Are they more hard to teach at that age than they are when they are younger?—Very much more.

8672. When they come to you at that age what do you generally find their condition to be, do they use signs?—Natural signs.

8673. Are they in the habit of having their mouths constantly open and trying to make partly articulate sounds? — Sometimes they call out very loudly and shout and make a disagreeable noise. I have a girl now at the school who came in her 12th year; she is to leave

when she is 14. I wrote to her father to ask how he thought she had got on in the time, and to know whether he would like her taught on the sign system considering that she had not very much longer time to stay, I did not myself wish her to be taught on the sign system, but I wanted to know his feeling. He wrote back to say that he was very pleased indeed with the progress she had made in the time, that he could understand her and she him, and he had no doubt that she would understand everybody in a short time, and he decidedly did not wish her taught on the sign system, and thanked me for the pains I had taken. I thought it better to get the opinion of the father. She commenced her education in her twelfth year and she cannot stay longer than 14.

8674. What employment will she go into?—She tells me, ironing.

8675. In a laundry?—Yes, in a laundry.

8676. Was she a fairly intelligent girl?—A very intelligent girl. Through coming so late to school she has not a clear voice. I wanted to understand whether the father would prefer signing to imperfect speech.

8677. I suppose your experience would lead you to the conclusion that the voice is more flexible when they commence young?—Yes, certainly.

8678. And that it is much more difficult to give a good intonation if the education is neglected till so late a time as 11 or 12 years of age?—Yes.

8679. (*Mr. Johnson.*) I understood you to say that with regard to this child who had come to you lately, this girl of 12 years of age, you wanted to find out from her parents whether they thought it was desirable to instruct her in the sign system or the oral system. You would have any provision in the board school for teaching them on the sign system, would you?—No, I simply wanted to find out the real opinion of the father. I think it would be impossible to teach her on the sign system now.

8680. There is no provision in the board school for any other system than the oral?—No.

8681. When these children go home they are at home entirely for Saturday and Sunday?—From Friday afternoon till Monday morning.

8682. Do you think that they pick up any signs when they are away from school?—Natural signs. I do not think any artificial ones.

8683. Do you think that their going home for those two days interferes with the progress of their education?—Not if the parents were better educated and had more time to instruct them; rather the other way.

8684. But of course the parents being poor they go to poor homes and necessarily they will go to badly educated persons?—Certainly.

8685. I wanted to know whether you thought that detracted from the system, the going home for those two days?—I think it is counterbalanced by the life they see in their own homes and the impressions that are conveyed to them.

8686. Do you make it a *sine qua non* and do you tell the parents that it is desirable to speak to them and not make signs?—Always.

8687. And do you find that there is concurrence of opinion on their part, that they agree with you, and do what they can to carry that out?—As far as they can, but they have not the time.

8688. But the parents, I suppose, fall back to natural signs with which they have been accustomed to communicate with the children?—I do not think the parents fall back; they speak when they can, but they have not the time or the education to correct the errors that the children make. Perhaps a child makes a mistake in the school in the morning in a word or a sound, and the teacher spends as much time as she can in correcting that error and she knows the child is not perfect at the end of the day; if the child went home to an educated mother she would help the teacher, but a poor hard worked mother has not the time to do so, and the child returns next morning making the same error.

8689. Therefore, it makes the difficulty of the teacher greater?—Yes, but I do not think the child is worse off in its home than if mixing all the evening with other deaf children.

8690. I understand that most of the children who come to you come in a perfectly crude state as regards the oral system; they come from parents who have been accustomed to make certain signs?—Natural signs.

Mrs. Danc

24 Mar. 1886.

8691. When they go out of school, do they lapse at all back into those signs; when they are away from your supervision? — Until they have more command of language they will, more or less. It is hardly fair to expect they will not.

8692. What is the longest period for which anyone has been under your care?—In the board school, my own has been a shifting class. I have not been longer than four years at one place.

8693. Have you any of those that have been under you four years that speak fluently, fairly fluently?—I have left that class for a year and a half, but, I believe, one boy, whom I spoke of before, went to his father's business to be a printer, the other boy went a month or two after; I believe he went to work too, but I have not ascertained from the mother.

8694. I wanted to know about his fluency?—A child would not be fluent after four years.

8695. Do you believe that after eight years they would be fluent?—Fluent so far as any deaf children can ever be; they will never be perfect as we are in speech; their voices will never be so clear and melodious.

8696. I suppose the sentences are very distinctly enunciated, are they not, and what the French call *lente*, very slow speaking?—More or less slow; some children speak quicker than others.

8697. Have you seen, as the result of your teaching, children that you could hold a good conversation with?—Pupils at Fitzroy Square, I have. I have not had the time to see the children finish their education under the school board.

8698. Do you think it makes any difference with regard to the way in which deaf mutes get employed; can you say whether they are more employed in trades under the oral system, than they are under the manual system?—I should think, if they had been at school long enough to finish their education, they would be. The majority of masters do not understand the sign system.

8699. And you think that the boy taught upon the sign system and the boy taught upon the oral system would be on an equal footing?—No, I think the orally taught boy would be better, assuming that he had sufficient time; and I think it is not fair, unless the child has had sufficient time to finish his education, to guage what he can do.

8700. The majority of your pupils leave you at 14?—And some before that.

8701. But 14 or 15 is the ordinary age of apprenticeship, is it not, when they go into a trade?—I believe so.

8702. Now do you find that there is an equal number of boys in your experience that are taken by masters who speak upon the oral system and boys who go upon the sign system?—I have not had experience enough of the board school children. The pupils I had formerly were in a better class of life, and they did not need to go into apprenticeship; they get their living in other ways, in offices, I believe.

8703. But the best of the orally instructed people are never very perfect, are they, in enunciation?—They are always less perfect, certainly, than hearing children. We do not pretend to work miracles.

8704. (*Dr. Robertson.*) How long did it take you to acquire these powers of education when you were in training yourself?—I was five years in the Fitzroy Square Association.

8705. Did you know anything about it before you went there?—Not anything.

8706. Then that was about the time that you took, in your opinion, to become a competent teacher?—That is the opinion of those under whom I served; perhaps less time than that if I had been called upon to go out. I preferred to remain in my own association as a teacher, rather than to go out as as a certificated teacher in less time. I could have gone out and had a certificate in less time.

8707. Could you give me an idea how long it would take a person of ordinary intelligence to acquire the power of teaching in your system?—Two years, I believe, some say one or two years.

8708. Did you yourself get a certificate?—Yes.

8709. And from where?—The Oral Association in Fitzroy Square.

Mrs. Dancy.

24 Mar. 1886.

8710. About how many children do you think you have had under your training. I do not speak of the present number you have, but how many children have passed through your hands altogether since you first began your connexion with the school board?—I can hardly tell you.

8711. I do not want the exact number, something like an approximate idea is quite sufficient for my purpose? —I have not had one class always, but different classes.

8712. But taking the number of all the classes put together, about how many children do you think you have had under your care whether for a short time or for a long time, take the whole number?—30, or between 30 and 40, perhaps; I cannot be quite certain.

8713. Taking that number of those children, what do you think about their physical condition; is it equal to those of other children?—No.

8714. Inferior?—Inferior; much weaker.

8715. In what respects inferior?—They are not so strong, I think, as hearing children.

8716. How do they manifest it generally?—I think they die earlier. I have had several deaths of children whom I have taught.

8717. With regard to their mental powers, do you think that they are on an average equal with those of hearing children?—Yes, mentally, I think.

8718. On an equality or superior?—About the same, I think.

8719. Supposing they had not the deafness, you think you would teach them equally well?—Yes.

8720. Would you tell us briefly your reasons for favouring the oral system, as briefly as you can, but just to indicate to the Commission what induces you to prefer it?—I think it brings them more nearly on a level with hearing people. Of course, it does not make them quite equal, we never can do that, but it brings them more nearly on a level than the sign system. Everybody has speech; and in giving deaf children speech we enable them to communicate more freely with their hearing fellows. It will always be less perfect than our own, but even that imperfect speech is better than no speech at all, I think.

8721. I am rather more asking you with regard to your reasons for preferring it to the sign system?—Because speech, however imperfect, is better than signs. I think a mother would prefer to hear her child speak even imperfectly rather than never hear the child's voice at all.

8722. Do you think that the fact that the voice is, as you say, sometimes very harsh and disagreeable even, is any obstacle to teaching by that system; do you think that that would constitute any difficulty in the way?—Not in the way of the teacher.

8723. I mean in the way of practising it afterwards; whether it would be wise in the case of that young woman of whom you have spoken?—I think I have proved that it would be of more advantage to her than signs. She can make herself understood. Supposing she went into a room where there were 20 other young women, she could make herself understood by speech, and perhaps not one of the women would understand the signs.

8724. With regard to the education of these children, I suppose it is necessary that they should undergo a greater amount of preliminary education, as it might be called, than hearing children?—How do you mean "preliminary"?

8725. A special education in the first instance I mean is necessary; a special education for a particular class. It is necessary that they should have that?—Yes.

8726. Then under those circumstances do you think it advisable that they should be educated together in asylums for the first few years of their life?—As I do not undertand anything about asylums, perhaps I had better not speak about what I do not understand. Day schools have been my experience only.

8727. If you put a number of children together in asylums where they were superintended carefully, and had all the advantages of home comforts, and were not allowed to lapse into sign habits, do you think it would be an advantage over the kind of education they get under the present system in board schools?—I do not know that it would. A child gets life in its own home.

8728. Then I think I understand you to say that you think it is quite as good that they should be educated in day schools, and that they should go home and have contact with other people?—That is my experience. I cannot speak decidedly of asylums as I have never had any opportunity of judging. I would rather speak of the day schools. I have never had any experience at all of asylums or homes.

8729. You were taught yourself with regard to the anatomy and physiology of the vocal organs, were you not?—Certainly.

8730. Did you ever make any inspection of the childrens' throats, or look at them?—Always.

8731. Before you begin your system of training?—Yes.

8732. Do you find any difference?—Not unless there is malformation, that we see at once.

8733. But in cases where there is no malformation, still there is often in these children a good deal of thickness of the tonsils, enlargement about the tonsils especially; have you ever noticed that they are in the habit of breathing a good deal through their mouths, and not their noses?—Sometimes.

8734. What would be the per-centage; is it more so than in ordinary children?—I think so.

8735. Have you ever heard them sing or heard any attempt of children who have been taught by your system to sing?—Only those with partial hearing, not deaf children.

8736. Do you think it would be possible under any circumstances to teach absolutely deaf mutes to sing?—No.

8737. (*Rear-Admiral Sir E. Sotheby.*) The children remain at your school till about 14 years of age, I understand?—Not always. Till they are 14 years of age.

8738. What standard do they arrive at?—We have no special standard.

8739. Your system is quite different from that applying to other children?—Quite.

8740. Is your school quite a separate building?—Not mine. I have an ordinary class-room in the board school.

8741. And that can be always done, I suppose?—Not always. Sometimes the other department want the room, and then we have to move.

8742. But you would see no objection if there was a separate class room at all the board schools?—No objection at all.

8743. You say that the children when they first come are much behind hearing children of the same age?—Yes.

8744. And when they leave do they make up for that deficiency at all?—If they have been long enough under instruction they do.

8745. But suppose a child comes at the age, say, of eight years, and only knows as much as a hearing child of six years, when he leaves the school at 14, will he make up for the deficiency, and be equal to a hearing child of 14?—No. We put more stress upon the speech and language than upon other acquirements.

8746. Will he have as much knowlege in writing?—In writing. He will not know so much history and geography, perhaps.

8747. Are they quite equal in arithmetic to hearing children?—Nearly equal, I think.

8748. Have you any knowledge that children who have been taught on the oral system attend public worship where there is only the sign system used?—I think they go with their parents.

8749. To the ordinary churches?—Yes.

8750. We have it in evidence that many people who have been taught on the oral system prefer afterwards going to a church where the sign system is adopted, being able to understand both?—I have not had those cases. Two or three of my children go now to a Sunday school where hearing children go.

8751. When the children come to your school first have they been taught on the sign system?—No, none of the children under my care.

8752. They come perfectly ignorant?—Yes.

8753. May I ask your salary at the board school?—150*l.* a year. It is a higher salary than that of the other board school teachers, because my class was originally a little different; it was the first class established under the board, under the Oral Association, therefore it is a higher salary than the other board school teachers receive.

8754. Have you any knowlege of a college lately established on Paddington Green?—Yes.

8755. Do you know anything about the system of examination pursued there?—I do not know anything about the examination. I had a diploma from that college.

8756. Do you know if the examinations are more difficult or less difficult than elsewhere?—I do not know about the examination. Having already passed through my examination I did not go through one.

8757. When you received your diploma then it was not necessary to go through an examination?—No, as I already had a certificate.

8758. Do your children join with the other children in recreation and play at the board school?—Not very freely; the other children are not kind to them, as a rule.

8759. We have evidence that the other children, generally speaking, are kind to the blind children?—Perhaps the blind children appeal more to the pity of hearing children.

8760. They are not kind to them, you say?—They are not very kind to them. My own children prefer to play alone.

8761. Perhaps they are not equal in the different games?—They are quite equal in play. The other children deride them sometimes as being deaf, and they do not like it; they are very sensitive children.

Mrs. Dancy

24 Mar. 1886

8762. (*Mr. St. John Ackers.*) Do the deaf children under the school board come to school as early as the hearing children?—I think so, when they can find them. I have two little children of four and five.

8763. Will you please to explain to the Commission how you would take a deaf child in the first instance, and teach it just the first elementary lessons?—Before they can be taught to speak, do you mean?

8764. No, when you begin to give them articulation at all?—We give them first sounds, and then combine the sounds into words.

8765. By speech?—Yes, always.

8766. Before you have given the writing is there first sound?—Always. They must pronounce the sound before they write it.

8767. Then you have in every case the spoken word before the written word?—Always.

8768. How long do you teach them by speech before you use the written word?—As soon as they can pronounce the sound perfectly they write it.

8769. I suppose that is within a day or two from the time they first learn it?—Yes.

8770. So that practically their writing is never ahead of their speech?—It never should be.

8771. Do you speak to them in the ordinary full grammatical English, or do you allow what is called broken English in talking to your pupils?—No, we correct that at once. We always speak grammatically.

8772. There are no short cuts used in the language?—No, certainly not.

8773. Were you not the lady teacher at Fitzroy Square before you went to the board school?—Yes.

The witness withdrew.

Miss EMILY MARGARET PATTISON examined.

Miss E. M. Pattison.

8774. (*Chairman.*) What position have you as a teacher under the London School Board?—I am the senior teacher at Winchester Street, Pentonville class.

8775. How long have you been under the London School Board?—Three years and seven months.

8776. Where were you trained previously?—At the college at Ealing.

8777. Were you a teacher there, or did you only go there sufficiently long to get your training?—I was a student there.

8778. You hold the certificate of the Ealing College, do you?—Yes.

8779. What number of deaf and dumb children are under your care at the board school?—58 on the books.

8780. What is the average attendance?—About 50; between 48 and 50.

8781. How many classes have you?—About five classes.

8782. And have you pupil teachers under you?—Yes, we have three pupil teachers.

8783. How many classes do you undertake yourself?—I have the highest class myself, 16 children, mostly big girls, and one little boy.

8784. Do you ever take the younger children yourself for individual teaching?—Not often, I have sometimes, but the children I am teaching now I have had from the beginning in the case of most of them.

8785. Are your pupil teachers trained in your own school?—No, they attend college one half of the day, and are at school the other half.

8786. You have then only half of three, or have you three different teachers in the morning and three different teachers in the afternoon?—We have three pupil teachers, and besides that there are three certificated teachers. Of the pupil teachers two go to college in the morning and come to school in the afternoon, then one who is at school in the morning goes to college in the afternoon.

8787. Then you have always four or five teaching in the school besides yourself?—Yes.

8788. What number compose the lowest classes, containing the children, when they first come in; are they taught individually, or are they placed in classes when they first come in?—They are mostly taught individually.

8789. How long do they require individual teaching before they are put into a class?—That depends a great deal upon the children.

8790. Do you think six months or three months?—Quite that; it depends so much upon the children themselves, whether they are bright or amenable to instruction.

8791. Have you sufficient teachers in the school to give individual attention to all those who require it?—I think so.

8792. How many of your children at the present time require individual attention?—We teach them all individually, but we have them in classes arranged under different teachers.

8793. But if you have five teachers, and you have 50 children, how do you arrange to give individual teaching to them; how many require individual teaching?—I should think about 20 of them require individual teaching exclusively. At Winchester Street we have a very mixed school, several quite little children; you might almost call them babies.

8794. Four years old?—Yes, we have three at four years old, and then some others at five, six, and seven.

8795. How long do you give individual teaching to each of these children; not more, I suppose, than a limited time in the day?—We have only five hours a day to teach the children, and we must try to work the time in as we can.

8796. With your system, when the children come in and require individual attention, how long a time are you able to devote to each child individually with your present staff, half an hour?—I should say about 20 minutes in a day. We try to give as much as we can to each child.

8797. When you are not teaching them individually, what are they doing, sitting quietly in the class?—Writing and learning from pictures and objects in the room.

8798. Do you begin teaching them writing as soon as they come there?—Yes.

8799. As soon as you begin to teach them to speak?—Yes; of course we speak to them first, and then write

Miss E. M. Pattison.

24 Mar. 1886.

the word down, and then the child writes the word down and reads it out, and writes again from our lips.

8800. Do you teach much from pictures?—Yes, they are a great help to us.

8801. And are your pictures all of them printed in England, or are they foreign, do you know?—Some of them are foreign.

8802. Are your pictures adapted to English children, or are they more adapted to foreign children?—The large pictures we have are adapted to English children, I think.

8803. Have they words written underneath them in English or in foreign languages?—They have not the names written underneath the picture at all.

8804. Are the pictures you spoke of pictures of individual animals, and different objects of that kind, animate and inanimate objects?—Yes, we have a large set of pictures with the seasons and Commerce; then we have other pictures of different trades and so on; then we have Hill's pictures.

8805. What are Hill's pictures?—A series of 24 sheets of pictures, and there is a reading book that goes with them, and the children read from the book and look at the pictures.

8806. Do you use the books that are used in the ordinary elementary schools, or are they specially written for you?—We use some of the books that are used in the elementary schools; we use "Picture Teaching" a good deal.

8807. Have you printed sheets for teaching articulation?—Yes.

8808. That is a practice of articulation with consonants and vowels?—Yes, first of all the pupils are taught the one and then the other, and then combined, and they begin with the easy ones and go on to the more difficult ones.

8809. Have you turned out any children that you consider well taught on the oral system; I mean for the time they have been with you; are you able to say they have been well taught?—I think so, some of them have got on very well.

8810. Have you any failures; any that fail to get on at all on your system, in your own knowledge?—No, I do not think so. Some are not so quick as others; do not learn so quickly, require more time and attention, but I do not think we have had really any what I might call failure.

8811. Do you think that the children ought to remain longer in the board school than they do now?—I do not think they ought to stay less than eight years.

8812. Unless they come in young, you think they ought to stay longer in order to make up their eight years?—Yes, if you can keep them. I think they ought to come at the age of six or seven; then if you keep them for eight years that is the time during which they learn best.

8813. What do your children do when they leave school?—Most of the children at Winchester Street come from a home near.

8814. Then after they leave your school are they looked after in that home?—Yes.

8815. You mean that that is what happens daily?—Yes.

8816. But after their school training is finished do you know what becomes of them?—Some of them that have left have become dressmakers, I know, but they had homes to go to.

8817. Are they all girls in your class?—Mostly girls. We have a class of big boys now, but they are shortly to be removed. But some of the elder girls left soon after I went there and they went to their own homes, and I think that now they are dressmakers.

8818. (*Mr. St. John Ackers.*) Are there any male teachers for these school board classes?—One.

8819. Only one?—That is all I know of.

8820. You spoke of Hill's pictures, was Hill an Englishman?—I think they are translated from the German.

8821. Then all these pictures that you are using are foreign pictures?—I think they are all foreign with the exception of the pictures on trades, and I am not quite sure whether they are foreign or not.

8822. Do not many of these pictures show foreign birds such as storks sitting on chimneys and so forth?—Yes.

8823. Which of course our English children would not understand at all?—No.

8824. You spoke about picture teaching; would you teach any new object from a picture?—Not if I could get the real object.

8825. If you could get the model or the real object you would teach from that?—Yes, I should prefer that.

8826. In the same way I think you would teach from real actions rather than pretended actions, would you not? For instance, you would take a glass of water and drink that water and teach the children that that is drinking that glass of water, rather than take up an empty glass and pretend to drink?—Certainly.

8827. How often in the year are your deaf children received; at any one particular time, or twice a year, or at all times?—Whenever they apply.

8828. Does not that very much militate against the success of teaching the children and make it much harder for the teachers?—Yes, it does, because when you get your class into a nice order and a new one comes you have to begin over again.

8829. Have you had any experience of the working of Mr. Stainer's homes; have you been in charge of one of Mr. Stainer's homes?—I was there once for about six months.

8830. As far as you know are the homes conducted now in the same way as they were when you were in charge of one?—As far as I know, but I really know nothing about them now; I have left so long ago.

8831. Do you consider some such arrangement as those homes necessary in order to get the children to attend the classes?—I think so.

8832. (*Admiral Sir E. Sotheby.*) Is your school a separate building?—We have a room in the infants' department of the Winchester Street board school.

8833. Attached to the board school?—Yes. It is really the drawing room, right up at the very top of the building.

8834. You are entirely unconnected with the other part of the school?—Yes, we are divided from it.

8835. Do your children play with the other children at school?—Very rarely.

8836. Do they play by themselves?—Yes.

8837. Why do they not play with the others?—Our children go down to play at a different time, because sometimes the play grounds are crowded with the hearing children, and then there is not room for ours.

8838. Then I suppose they agree pretty well with the others?—The girls do pretty well, but the boys do not.

8839. Do you mean that the boys with the other boys do not?—The deaf boys would agree well enough, but the hearing boys fight with them.

8840. Illtreat them?—Yes, I think, they molest them because they are deaf and dumb. We have had a good deal of trouble with the hearing children to make them think that they must be kind to the deaf; they are much better than they used to be.

8841. You do not see why the deaf children when they leave the school should not get employment just as well as the hearing; are they able to get employment as soon, do you think?—I really have had no experience.

8842. You do not know if any of your girls have gone out as apprentices or dressmakers?—Some left soon after I came, and they got employment, I think.

8843. But have you girls now as old as 14?—I have one 16.

8844. You do not know, I suppose, what she is going to be?—I think she is going to be a lawyer's clerk; she is a very good writer and quick copyist; that is what her mother hopes her to be. The others, I think, will be dressmakers.

8845. At what training college were you brought up?—At Ealing.

8846. How long were you there?—12 months.

8847. But were you able to teach on the oral system after one year's training?—Yes, I was trained at the college, and taught there under the supervision of the principal.

8848. But you were there more than one year altogether, were you not?—I was only there just from September, and the examination was in the following July, and I passed then.

8849. You passed with a certificate?—Yes.

8850. Have you got a diploma from the new college established lately at Paddington Green?—Not a 10 years diploma. I have received a certificate from the College of Teachers of the deaf and dumb.

8851. Who examines your school; you are examined, I presume, like the other board schools; who examines that portion you are at the head of?—In the deaf classes we have not had any examination by the Government inspector as yet. Mr. Stainer always examines.

8852. Then how long has this school been going on without any examination?—Mr. Stainer examined them last year.

8853. How do you account for so many being at your school, you say there are 58?—There are two homes near, and then it is a centre for North London, and there are a good many children who live quite near to the school itself in the neighbourhood.

8854. Do you think that you get all the deaf children that live in the neighbourhood?—Yes, I think so.

8855. (*Mr. Johnson.*) You say that you use some pictures; do you use that illustrated vocabulary that was published by the Society for Promoting Christian Knowledge?—No.

8856. I suppose you are aware that it is extensively used?—No, I did not know that.

8857. You had no experience in the deaf and dumb before that 12 months' training, had you?—No; in fact, I do not think I had ever seen children that were born deaf. My own sister is deaf, but then she became deaf.

8858. And your opinion is that any talented young lady who devotes herself for 12 months to living in college would be able to pass her examination as a teacher?—If she worked hard, and had the wish to succeed, I do not see why she should not.

8859. Amongst these 58 children that you have got, what proportion of boys and what proportion of girls are there; is there a larger proportion of boys?—There is a larger proportion of girls.

8860. And is it not at the Winchester School, Pentonville, that a class has been established for older boys?—Yes.

8861. What they call the naughty boys?—Yes. They are not very naughty.

8862. But they were said to be naughty boys; it is at your school?—They are at our school at present, but they are only there temporarily until another class room can be obtained for them.

8863. What was the object of separating those boys from the rest of the pupils; can you tell me were they unmanageable?—They were getting big boys.

8864. What is the size of your class room?—About 30 feet by 17. The accommodation is very bad.

8865. You think that the want of accommodation is a drawback?—Yes, because we are all teaching in one room.

8866. Boys and girls are taught in the same room?—Yes.

8867. Do you think it is an advantage to teach the boys and girls together?—I think it is better in the case of boys, when they are big boys, to teach them by themselves. We have them now in one division of the room, and they are separated from the rest by blackboards, but of course the blackboards only go half way, and you can see both over and between.

8868. It would be desirable, would it not, that the classes should be screened off?—Certainly, if it were nothing else but for the noise.

8869. And attracting the attention of the other children?—Yes. Then when we are all teaching articulation or giving lessons aloud the noise is tremendous.

8870. The boys are all taught by one master?—Yes.

Miss E. M. Pattison.

24 Mar. 1886.

8871. Do the young ladies employed in teaching teach no portion of the boys?—Yes, we all have some boys.

8872. Younger ones?—Little ones, about 10 and seven and four.

8873. To teach these 58 children you have four teachers, and how many pupil teachers?—Three pupil teachers we have, and three certificated teachers.

8874. How many masters or mistresses are requisite for a class, or how many can one master or mistress attend to with a pupil teacher; I am assuming that the pupil teacher is the same as in the ordinary school, but trained to the deaf and dumb system?—Ten.

8875. With a pupil teacher they can manage 10?—Or even 12 with a pupil teacher.

8876. How do you get the pupil teacher; what proficiency have they for teaching; do they undergo any examination or training at any college?—They have to attend a college for two years for half the day.

8877. Before they are pupil teachers?—No, before they get their certificates.

8878. If you want a pupil teacher, where do you get the pupil teacher, and what qualification is required in the person to be made a pupil teacher?—I think they generally apply to Mr. Stainer. I do not know anything about them.

8879. But they have no special training for the deaf and dumb; they learn from you a good deal I suppose?—They see me teaching, and then they learn at the college, whichever college they attend.

8880. Is there a certificate at any of those colleges for pupil teachers?—Some of them have got a certificate.

8881. Is there any qualification for admission to those colleges for being a pupil teacher?—I do not think so, they go straight away to be admitted.

8882. I suppose you are aware that in the ordinary Government training colleges, the pupil teachers come in for examination, and then come into the college for training?—Yes.

8883. Would it not be a desirable thing if there was such a place where pupil teachers could come in and be thoroughly trained?—I have never thought about it. I know sometimes when some pupil teachers come they seem to take to the teaching almost directly and work away, but then again others seem to take a long time before they can get into it.

8884. What I want to ascertain is this: if you think they can be trained to teach the deaf and dumb without going into a college. That is what I want to arrive at; or do you think that it is a *sine quâ non* that they should go into a college?—Certainly, I think they should go into a college as half-timers, and spend one half of the day at college and the other half at school.

8885. But they could be pupil teachers if they liked without going to a college, could they not?—Well, I do not know that.

8886. Amongst those deaf and dumb pupils that you know, some have failed, have they not; some that have presented themselves as pupils at your school have not entirely been a success?—I do not think so.

8887. Then every one that has applied is a success; take a year, for instance?—I think so. We have not had really any failures.

8888. Do any of them go back from the oral sytem to that of the signs?—I do not think so. I have not known any go back.

8889. Do you ever remember any of the children that have been taught by the oral system in your school when they go to the playground using signs?—The little ones, but we do not permit them.

8890. The baby ones do it, you mean?—Yes. I have told the children they will never be clever if they sign, so they say they will not.

8891. And you discourage their mixing with the speaking children in the early stages for fear they should go back to signs; you like to keep them separate, do you?—No, I think it would be a great advantage if they would mix with them.

8892. In the early stages?—Yes, if they would only speak to them, *i.e.*, if the hearing children would take the trouble.

Miss E. M. Pattison.
24 Mar. 1886.

8893. But you do not think they do take the trouble?—It depends upon the circumstances of the children. People of the better class are only too delighted to speak to the children and hear them speak. The poor have not perhaps the amount of patience or care; but some would not have the children sign on any consideration.

8894. (*Chairman.*) You said that you had been only a year at Ealing, that is not the full training is it; is that the longest time that you can stay there?—Some of them stayed longer, but I only stayed that time. I got my certificate at the end of that time.

8895. Did you get the same certificate as those get who stay longer?—Yes, I passed as a one year student. On my certificate is written "one year's training."

8896. You are not aware whether there is not a further certificate given at the end of two years?—I do not know.

The witness withdrew.

Adjourned to to-morrow at 12 o'clock.

32, Abingdon Street, Westminster.

Thursday, March 25th, 1886.

PRESENT:

LORD EGERTON OF TATTON IN THE CHAIR.

ADMIRAL SIR E. SOTHEBY, K.C.B.
W. TINDAL ROBERTSON, ESQ., M.D.
B. ST. JOHN ACKERS, ESQ.
T. J. CAMPBELL, ESQ., LL.D.
E. C. JOHNSON, ESQ.
CHARLES E. D. BLACK, ESQ., *Secretary.*

Mr. JOHN BARBER, examined.

Mr. J. Barber.
25 Mar. 1886.

8897. (*Chairman.*) You are the principal of a deaf and dumb private school?—Yes.

8898. In what part of London, ?—Brondesbury.

8899. How long has that school been established?—About 20 years.

8900. What has your previous training been with regard to the education of the deaf and dumb?—I have been a teacher now for 27 years.

8901. Will you tell us where you have been engaged as a teacher of the deaf and dumb?—I first gained my experience on the finger and sign system at Rugby in a private school there, under Mr. Bingham, who was formerly head master of the Manchester School, and also of the Exeter School. I was with Mr. Bingham for about eight years, and since that time I have had pupils of my own.

8902. Have you taught by the sign and manual system the whole of that time?—I taught by the sign and manual system for about 19 years, I think, and above eight years ago I began on the pure oral system. So far I have reason to be very well satisfied indeed with the change that I made, in fact I made the change in consequence of being urged to do so by one or two deaf and dumb gentlemen, who had seen the system practiced on the continent.

8903. Your pupils, I suppose, are the children of well-to-do parents?—Yes.

8904. And the parents are naturally more satisfied with having their children taught to speak than to make signs?—Much more so.

8905. At what age do you take pupils?—I may say at almost any age. I take them from four years of age.

8906. Do you think that it is better that they should begin early?—I think so, decidedly.

8907. What teachers have you under you?—I have one at the present time.

8908. How many pupils have you?—At the present time I have five boys and six girls.

8909. Do you give them a great deal of individual teaching?—Yes.

8910. In that respect your pupils have an advantage which other schools where a large number were under the same teacher would not be able to give their pupils?—To a certain extent it is an advantage. In my school I take children at all ages, so that perhaps the school is divided into six or seven small sections or classes. One teacher is not able to take the different sections at the same time, therefore our work is greater.

8911. We have been told that in the board schools the deaf and dumb children get about 20 minutes individual teaching in the day. When they first begin with you how much time do you give to each pupil?—It depends a good deal upon their age when they first come. A boy or a girl at four or five years of age we give very little instruction to in the course of the day, not more than an hour perhaps, we do not think it advisable to do so. During the rest of the time the child is employed in learning to write, and doing a little Kindergarten work.

8912. Where do you get your teachers from?—I have had to get them hitherto where I could.

8913. Is there a want of trained teachers for the deaf and dumb?—There has been.

8914. Has that want been remedied to any extent?—I think it has been remedied to a great extent.

8915. Where have you got your teachers from?—Not from any particular place at all, merely by advertising or making inquiries among friends.

8916. Do you require certificated teachers?—No, when I took my last teacher I do not think there were any colleges that granted certificates.

8917. You have trained your teachers very much yourself?—I have been obliged to do that.

8918. Do you consider that the certificates which are now granted to trained teachers are sufficient for the purpose of procuring a supply of good teachers?—I think there is some defect arising from the requirement that a person in wishing to be a teacher must reside in a training college. I think that has hitherto been required; no one could obtain a certificate, I understand, unless he or she was resident in college.

8919. Do not you think it is an advantage to be resident in a training college?—I think under certain circumstances it might be an advantage, or to certain persons.

8920. But are you not aware that the College of Teachers of the Deaf and Dumb examines candidates for certificates wherever they have been trained?—Now I come to remember I think last month I was informed of that.

8921. That college has been only a short time in operation; perhaps you are not acquainted with the working of it?—I have known the working of it, but I understood that persons were obliged to reside there for at least one year. I was speaking of the Ealing College.

8922. Do you think that the existing system, with the addition of this college of teachers, is sufficient for the purpose?—I should think that the college at Ealing, the one in Fitzroy Square, and the College of Teachers of the Deaf and Dumb, if they continue on the lines on which they are now proceeding, would be quite sufficient.

Mr. J. Barber
25 Mar. 1886

8923. Are you in favour of the expenses of training colleges being supplemented by a grant from Government?—I think it would be very advisable. I do not know exactly the state of the finances of the training colleges, but I think it would be a very great advantage.

8924. Do you think that the teaching of the deaf and dumb should be made compulsory?—I do.

8925. Are you acquainted with the schools in London in which the deaf and dumb are taught?—I know very little about them.

8926. Are there many private schools for the deaf and dumb in London?—Not that I am aware of.

8927. Do you think that the schools in London, where the deaf and dumb are taught, are too crowded?—I have not been present in any of the schools when instruction has been given. Taking the whole of the country I think there are more schools for the deaf and dumb required than there are at present.

8928. What grounds have you for forming that opinion?—I say that from constantly hearing that a great number of deaf and dumb are seeking admission into the existing schools, and are not able to gain admission.

8929. You are speaking of country districts?—I am speaking of country districts. I am more especially speaking of the demands made on the Margate Institution which it is not able to comply with. I think the want has been supplied, as far as London is concerned, by the school board schools for the deaf and dumb.

8930. Are you aware whether they take in the whole of the deaf and dumb children in London who require education?—I am not prepared to say that.

8931. In what places in the country have applications for admission into schools been refused to your own knowledge?—In the Margate school they gain admission by means of votes, and I have understood that some children have to wait a long time before they get admitted.

8932. Do you object to that system of votes?—I do upon the whole. I think many deserving cases really are not able to gain admission simply because the parents of the child do not know how to go about gaining admission, or they have not the friends to help them. I have known one or two instances in which persons have been trying for several years, and have not been able to gain admission, in other instances they have got admission upon the first application.

8933. In what way do you think the State ought to aid schools if it makes the education of the deaf and dumb compulsory?—By grants, I should think, to existing institutions.

8934. Have you any definite idea as to the form in which it should be given?—I think it should be given on the number of attendances. In most of the schools in the country there are boarders; of course the number of attendances there could not be taken altogether into account.

8935. Do you think that the State ought to pay for the maintenance of deaf and dumb children as well as their education?—I think that the institutions should be assisted.

8936. Are you in favour of children being boarded in institutions as against their being taught in day schools?—I prefer their being boarded in institutions.

8937. On what ground?—I think there is a great difficulty in sending deaf and dumb children to schools generally speaking.

8938. In consequence of distance?—Yes, that is one barrier to their being sent to schools. Then I think when they are sent to schools and boarded out it is rather difficult to get persons to exercise supervision. I do not think persons generally understand how to deal with the deaf and dumb.

8939. How would you deal with isolated cases of deaf and dumb children scattered all over the country; what provision would you make for them?—I think they should be sent to institutions and boarded.

8940. Should these institutions be supported by the education rate, or in what way?—That is a subject that I have not considered.

8941. With regard to inspection by the State, do you think that all schools should be inspected?—If they receive State aid I certainly think they should.

8942. Whether they receive State aid or not?—I think it is an advantage to have schools inspected.

8943. Do you think that private schools should be inspected?—Certainly; I should not object myself.

8944. Do you think that it would give the public greater confidence in them?—Yes, and it would be a satisfaction to the teachers also.

8945. You would assume that the inspectors would be properly qualified men to gauge the instruction of the deaf and dumb, not the ordinary inspectors of elementary schools?—Not the ordinary inspectors.

8946. How long do you find it takes to turn out children thoroughly well educated on the oral system?—It depends very much upon the ability of the children, but I should say eight or nine years.

8947. How long do your pupils remain with you, to what ages?—Various ages; they generally stay 9 or 10 years.

8948. At what age do they leave you?—From 14 to 17; it depends on the time at which they come.

8949. Do you receive any at such an advanced age as 10 or 12?—I have had children come to me at 10 years of age.

8950. Do you find them more difficult to teach?—Much more difficult.

8951. Have you watched the career of your pupils in after life, and have you found that they have been able to continue the progress they have made with you in speaking?—I have not had many children leave me yet.

8952. As you have been teaching for 28 years, only eight years of which you have been teaching on the oral system, you have not yet sent out into the world many orally taught pupils?—Not many have left me.

8953. What has become of those you have taught on the sign and manual system; have you watched them?—A good many of them have no particular employment at all, they are independent.

8954. Have you ever tried to teach orally any who have arrived at mature age who were first taught on the sign and manual system?—I have one at the present time with me.

8955. What age?—She is 21 years of age.

8956. Was she taught first on the sign and manual system?—Yes.

8957. Have you found it difficult to teach her the oral system?—To a certain extent. She has been trying to speak for some time past.

8958. Was she born deaf and dumb?—I believe so.

8959. Do you think it is unlikely that any one could learn the oral system after having once learnt the sign and manual system?—No, I do not think so.

8960. In the case of poorer children it would be almost impossible for them to spare the time to do so?—Yes.

8961. It would be desirable, therefore in all cases to teach the poorer children either the oral system or the sign and manual system?—I would teach them the oral system.

8962. It takes longer to teach the oral system than to teach the sign and manual system, does it not?—No, I do not admit that it takes longer.

8963. We have had evidence that it takes longer. Supposing it does take longer, would there be any difficulty in teaching the children of the poorer classes, who cannot afford to remain so long in school, the sign and manual rather than the oral system?—I would rather if possible that they should be taught the oral system, even if they are obliged to remain in school a longer time.

8964. In the school board schools they leave very often after three or four years' instruction; do you think even then it would be better to have the oral system than the sign and manual system?—I think so.

8965. You think that the imperfect speech that they would acquire after the amount of instruction that they would receive in that limited time is better than no speech at all?—Certainly.

Mr. J. Barber.

25 Mar. 1886.

8966. With regard to religious instruction, have you attended the ministrations by signs in the church in Oxford street?—For several years I attended with my pupils.

8967. Did your pupils benefit from it?—I think so, certainly.

8968. Do you think it desirable that that system should be kept up?—Not if deaf and dumb children are taught by the oral system.

8969. Supposing the children are taught on the oral system, would they be able to go into an ordinary church and take part in the service?—I do not think they would be able to follow the sermon.

8970. How are they to receive any religious instruction if they are unable to follow the sermon in an ordinary church?—I think persons might call them together in a certain place and address them in the manner they could understand, by speech.

8971. Except in London that would be difficult to do, would it not?—In country places there are no church services now for the deaf and dumb.

8972. You mean there are no churches where the service is performed by the sign and manual system?—In some of the large towns they have services on the sign and manual system, but there are no such services in country districts.

8973. So far as you know, have any of those who have been brought up on the oral system gone to the church in Oxford Street in order to get instruction from the sermons and lectures?—Not any that I know of.

8974. We were told that a great number of the signs were natural signs; would not orally taught persons be able to understand those?—I do not think the signs are such as a child who had not been instructed on the sign system would understand; I know the children that I have at the present time would not be able to understand the preacher if they went to the church in Oxford Street.

8975. Then do you think that for those who have been instructed on the oral system you should organise a system of services for a limited number?—That might well be done in large towns.

8976. We have been told that the average number who attend at Oxford Street is 39 in the morning and 67 in the evening; could the preacher make himself intelligible to that number of people on the oral system?—Quite, in a suitable building if there was plenty of light in the building.

8977. The experiment of preaching orally to a number of persons like that, has not yet been attempted?—Not that I am aware of.

8978. Is there any other point that you wish to bring before the Commission with regard to the education of the deaf and dumb?—I might remark with regard to the oral system that I think it is preferable even for the poorer classes to the finger and sign system, because with that they are better fitted to communicate with people generally; and I think by that means they are better able to gain employment.

8979. Is that your experience?—It is my opinion, and my experience as far as my own pupils that have left me, because when those who are far enough advanced go home they are able to hold conversations with ordinary people, and they feel it a very great advantage themselves.

8980. Have any of your pupils gone into any of the liberal professions?—No.

8981. They have not become solicitors, for instance?—No.

8982. (*Admiral Sir E. Sotheby.*) Did I rightly understand you to say that you have 13 pupils?—I have 11 at the present time, the number varies.

8983. Have you room for more if you could yet them?—For two or three more only.

8984. What is the maximum number you have ever had?—13 in my present house.

8985. Are they gentleman's sons and daughters?—Yes.

8986. Have you ever had any reason to regret having adopted the oral system?—Quite the contrary.

8987. What is the system of education; do you teach your pupils classics?—I have never attempted that.

8988. What do they learn, you say you have them as old as 17?—Those are generally pupils who have come rather late, perhaps when they were nine or ten.

8989. If they remain with you as long as 10 years, will you tell me what your system of education would be in the latter part of their course?—I spend a great deal of time in giving them a thorough knowledge of the English language and English subjects generally. I think that is of very great importance. Some of the children have learnt a little French, but they are not learning French at the present time.

8990. Are they able to talk French?—I never attempted to make them speak French; I do not see why they could not be taught to speak French as well as English.

8991. We have had it in evidence that some of the dumb have gone to the universities; have you ever prepared pupils for the university?—I have never done so.

8992. Where did you learn yourself to teach on the oral system?—I learnt from Mr. Schöntheil, at Walmer Road, Notting Hill, the Jews' home.

8993. Have you ever had any examination at your own school by any outside examiner?—I have had no regular examination, but Mr. Schöntheil has sometimes come into the school and examined the children.

8994. You have not let the parents of your pupils know that there is going to be an examination, as is the case in a great many private schools?—No, the children come from all over the country; I send the parents a report of the children's progress.

8995. Have you ever, for curiosity's sake, been to any of the board schools to see the system there?—I have only been to one and that for a very short time.

8996. You must have separate classes for the deaf and dumb, must you not?—Yes.

8997. Would you be rather surprised if I said that in one case there were 54 pupils in one room?—It would depend on the size of the room.

8998. Say an ordinary sized room, 30 or 40 feet long; could 54 pupils be comfortably educated in such a room?—I should certainly prefer not to have so many children in a room. I think it would be very difficult to carry on the education in such a room with such a number.

8999. When you attended at St. Saviour's, how many used to be present on an average?—50 or 60; that is some years ago, when Mr. Smith was the chaplain.

9000. Did you consider Mr. Smith very efficient?—Very efficient indeed.

9001. Did the attendants at the service perfectly understand what he said on the sign system?—I think so, the ordinary sermons; his own sermons. I make that qualification, because, at certain times in the summer, they had a special preacher, and then Mr. Smith would sign the sermon that was delivered by the other speaking preacher; the congregation was mixed, and Mr. Smith interpreted what the other preacher said.

9002. Mr. Smith was able with his fingers to interpret as fast as the preacher could speak his sermon?—Yes; I think perhaps those of the congregation who were not so well instructed would not be able to follow him, because he would have to spell a great deal instead of using signs, and I think a person comparatively uneducated would not be able to follow; but when he gave his own sermon he was able to make the greater part of them understand thoroughly what he intended to convey to them.

9003. If those who have been taught on the oral system can see the face of a preacher, can they understand him better and far quicker than those who have been taught on the sign and manual system?—I do not think so.

9004. On the whole do you think that the sign and manual system is the best for church services?—I contend that you could have special services for those orally taught; they might be assembled in a room or in a church and addressed by a speaking preacher. Any person who would speak distinctly to them would be able to make them understand quite as well as Mr. Smith did by signs.

9005. Take the case of a church for the deaf and dumb like St. Saviour's, with a large number of attendants; would you prefer that the preacher should preach in the sign and manual system or orally?—If the church

Mr. J. Barber.

25 Mar. 1886.

was crowded I think by means of the fingers and signs you could make the congregation understand better, because they would not see so well.

9006. (*Mr. St. John Ackers.*) We have had it in evidence that the congregation at St. Saviour's are now about 40 on the average, do you consider that it is in a considerable measure owing to the advance of the oral system that a less number attend those services?—I should not like to express my opinion as to the cause of the number attending the services being less than formerly, if such is the case.

9007. You have withdrawn your pupils not on account of any want of efficiency on the part of the preacher, but because you have changed your system?—Yes.

9008. And the service at St. Saviour's is no longer suitable to your children?—No.

9009-10. You have told the Commission that you have taught on the sign and manual system, and that you are now teaching on the pure oral system; did you ever teach on the combined system?—Before I taught on the oral system, I did teach on the combined system.

9011. Do you consider that the combined system is a better system than the sign system?—I am not much in favour of the combined system. I would much prefer not teaching deaf and dumb children speech and lipreading, if I did not teach them on the oral system exclusively.

9012. You have had considerable experience of those three systems, will you tell the Commission in what way the sign system would express, say an ordinary sentence out of a newspaper, would a sign and manual teacher give that sentence to his pupils in the order of the English language, or in a different order?—In a different order, generally speaking.

9013. Is that confined to the very early stages of teaching, or does it run more or less through the whole course of teaching?—Through the whole course of the teaching.

9014. Take the sermons of Mr. Smith in Oxford Street; were those portions which were given in signs given in the order of the English language?—Not necessarily so.

9015. Should you say that half of the sermon given by Mr. Smith would be in the order of the English language?—Not half.

9016. Then it would be very difficult, would it not, for a pupil taught upon a system by which to a great extent the ordinary order would be inverted, to range his thoughts in ordinary English, he would find greater difficulty than those would find who had been taught from the first by a system in which the order of the English language was followed?—Quite so; much greater difficulty.

9017. Are you in favour of handicrafts being taught in schools for the deaf?—I could not speak from experience as to that.

9018. Have you ever yourself taught in any large school?—No.

9019. Do you keep accurate statistics of the degrees and causes of deafness among your pupils?—I have not done so. I only know the causes in a few instances. I am not able to put questions upon the subject to the parents of the pupils when they are brought to me.

9020. I gather from one of your answers which you gave to the Chairman that you think the present existing training colleges answer the purpose for which they were established; but do they turn out many male teachers?—Very few, I think.

9021. In your opinion is it sufficient that the deaf and dumb should be taught by women teachers almost exclusively?—Not at all.

9022. Then in fact some means are still wanted of getting hold of male teachers, and having them properly trained for the education of deaf and dumb children?—Certainly.

9023. Do you consider that persons destined for the teaching of the deaf and dumb, should have as long and as perfect a training as those who teach hearing children?—I think it is certainly desirable.

9024. You are doubtless aware that the State insists upon a two years' course in a training college for teachers of hearing children?—Yes.

9025. You would consider that a like, certainly not a less, course would be desirable for the teachers of the deaf and dumb?—Yes. I should prefer that they should in addition have had some previous experience in a school as pupil teachers before going into the training college. I think that would be a very great advantage.

9026. With regard to State aid, you said you were in favour of a grant by the State, and you said you thought it might be given according to attendances; would you be in favour of part of the grant being dependent on examinations?—If inspectors who understood the deaf and dumb thoroughly were appointed I think it might depend upon the result of the examination.

9027. To a certain extent?—Yes.

9028. (*Dr. Tindal Robertson.*) Will you tell us how long you were in acquiring a sufficient knowledge of the oral system to enable you to teach it satisfactorily?—I took lessons from Mr. Schöntheil for about three months, but before that time I had taught children to speak, I had been practising for some length of time in my own school, I gained some knowledge of it from Mr. Bingham with whom I was for six or seven years.

9029. Do you know where he acquired his knowledge of the system?—I think he acquired it from a Mr. Braidwood, I think he was a grandson of a Mr. Braidwood who had the first school for the deaf and dumb I have ever read about, in Edinburgh, at the end of the last century.

9030. Was Mr. Bingham's school conducted on the pure oral system or on the combined system?—In Mr. Bingham's school, which was first at Edgbaston near Birmingham, and afterwards at Rugby and Southgate, certain pupils were taught to speak, it was a kind of accomplishment more than anything else.

9031. Did Mr. Bingham introduce the system into his school from the fact that it was already taught abroad, or was it a spontaneous effort on his part?—I am not able to say.

9032. How long do you think it would take a man of fair ordinary intelligence to acquire a sufficient knowledge of the oral system to be able to teach it to deaf and dumb children?—If he had never had any experience at all I should think certainly to be able to do it properly he would require two years at least.

9033. Do you think two years in the case of a man of ordinary intelligence would be quite sufficient to enable him to teach it thoroughly?—I think so.

9034. With regard to the physical condition of the pupils who have been under your care, has it been equal as a rule to that of ordinary children?—Quite.

9035. Has their health during the time they have been with you, generally speaking, been as good as that of ordinary children would be?—Yes.

9036. Has there been any special ailment to which they have been subject?—I had not had any in my school.

9037. With regard to the mental aptitude of the deaf and dumb as compared with ordinary children what would you say?—I find them exactly the same.

9038. Take the average?—I think on the average they are like ordinary children.

9039. Neither better nor worse?—Neither better nor worse.

9040. Having changed your system entirely, first to the combined system, and afterwards to the purely oral system, will you tell the Commission succinctly what were your reasons for making the change to the oral system?—I was first urged by two deaf and dumb gentlemen to examine the system; I had no means of doing so till I went to Mr. Schöntheil's school and saw his pupils at their ordinary work; when I went I was very much impressed by their intelligence and their ability to understand spoken language, and their correctness of expression, I thought they expressed themselves so much more correctly and grammatically than the children I had taught on the finger and sign system that I considered the oral system had very great advantages over the sign and manual system. Before I went there I did not think persons taught by the oral system would be able to make themselves so well understood to ordinary people by means of speech, but when I saw the results attained at Mr. Schöntheil's school, I considered it would be a very great advantage to my pupils to teach them orally, and I determined to learn the system myself and to teach it.

9041. When you say that the pupils at Mr. Schöntheil's school expressed themselves more grammatically, I pre-

Mr. J. Barber.

25 Mar. 1886.

sume in the ordinary finger system the pupils are taught writing and the elements of grammar very nearly as thoroughly as they are by the oral system?—On the oral system, from the very commencement, before you are able to teach them any grammar whatever, at least from any book, they are taught pretty much as you would teach a hearing child, there would be no inversion of the order of the words, but if I were speaking to a little child by means of signs, the idea that struck me most I should present to the child first, for instance take the sentence "a good man," I should say "man" first and "good" afterwards. The child gets accustomed to that form; he thinks in that way and expresses himself in that way in writing.

9042. You told Mr. Ackers that people speaking by the sign system do not follow the order of ordinary English, will you give an illustration. Take the case, for instance, of a clergyman preaching in a church by the finger system, in what way would he invert the order of ordinary English, or alter it?—Take the Lord's Prayer, he would say, "Father our in heaven, Thy "Name hallowed, Thy kingdom come, Thy will done "on earth as in heaven."

9043. But up to this point I fail to see any difference except putting "Father" first instead of "our"?—"Father our, in heaven, Thy Name hallowed."

9044. They simply leave out such words as would not appear to be absolutely material?—Some of the ideas are presented differently, they are put in a different order from that which you would put them in speaking.

9045. Could you give us an illustration of that. If you say "Father" before "our" the idea still remains the same?—I think the ideas are clear to the mind of the child, but the difficulty arises in expressing them grammatically afterwards if he writes them down.

9046. Do I rightly understand you to say that you think that when a child receives an idea in this sort of language it receives it less grammatically than if the same idea is communicated by the oral system?—Certainly.

9047. With regard to State aid I understood you to say that you would be in favour of a sort of capitation grant?—Yes.

9048. And you also said that to a certain extent you were in favour of maintenance being provided by the State?—I think it would be necessary for the State to aid institutions where deaf and dumb children were maintained as well as educated if the whole of the children now without education were sent to school.

9049. I suppose you would be in favour of institutions as opposed to day schools?—Yes.

9050. Take the case of the provinces; would you be in favour of having a sort of provincial centre established which should be subsidised by the State, in order to provide for the deaf and dumb in the particular districts surrounding that centre?—I should be very much in favour of that.

9051. Have you given any thought to the question of the desirability of making provision for the advanced education of the deaf and dumb?—I have only thought that it would be very desirable.

9052. Are you aware that there is at Worcester a college for the blind sons of gentlemen?—Yes.

9053. Do you know whether there is anything of the same kind existing for the deaf and dumb?—I think not in England.

9054. Do you think that there would be an advantage in establishing an institution like that?—I think so, certainly.

9055. Do you think that among deaf and dumb persons, from your knowledge of them, there are many sufficiently apt mentally to be able to take advantage of such advanced education as would fit them for the liberal professions?—A great many of them, I think, are.

9056. Then would you think it advisable that exhibitions at universities should be established for the benefit of the class of persons of whom we are speaking?—Yes.

9057. Have you any suggestion to make as to how that might be best effected?—I have not.

9058. (*Mr. Johnson.*) I think you told us that your pupils formerly went to St. Saviour's Church in Oxford Street, where the service is conducted on the sign system?—Yes.

9059. And you were obliged to discontinue taking them there?—I discontinued taking them there when I began to teach on the oral system.

9060. In what way do you provide religious instruction for your pupils now that you have discontinued taking them to St. Saviour's?—I give them religious instruction myself.

9061. Do they go to any church?—Yes, they go to the services at an ordinary church.

9062. Are they able to participate in the services?—They read their prayer books, and so follow the service. They are not in a position to know exactly what is said by the preacher or reader.

9063. They are able to follow the service with the amount of education which they have had; they follow the written language rather than the sound language?—Quite so.

9064. I think you said that if 60 or 70 children taught on the oral system were collected together in a church, if there was sufficient light they would be able to appreciate what the preacher or reader said?—I think the preacher should be a person who thoroughly understood the manner in which he ought to address the deaf and dumb orally.

9065. We have had it stated by some great experts in the question of the education of the deaf and dumb on the oral system, that it requires at least one person to instruct every 10 children, and that the difficulty in taking them to church is that you have too large a number of children present with only one person to address them; do you see any difficulty in that?—In teaching, I think, you should not have more than 10 children in one class, because we have to take each child singly in certain things.

9066. But do you think that one preacher could preach to, say, 40 people?—Certainly.

9067. Provided you had plenty of light, and the preacher could see them, and they could see him?—Yes.

9068. Have you found that these orally taught children after they leave you lapse back into any sign and manual system?—I have no experience of any such case. Some of my pupils who have left, and who have brothers and sisters who have been taught on the system of signs converse with them by means of signs, but to hearing people they speak.

9069. I suppose the sign and manual system is very much easier to acquire, and therefore the children, if they lapse back into it, lapse back into an easier system?—I think so.

9070. You said that persons who had been taught on the sign and manual system might be very easily taught the oral system?—They might be taught to speak.

9071. Have you much experience of such cases?—I have had two or three pupils who previously to coming to me had been taught on the sign and manual system.

9072. Have you found that such persons ever revert back to the signs they originally learnt?—No, because they come to me with the sole object of being taught to speak.

9073. So far as you have been able to gather, what is the opinion of the deaf and dumb themselves as regards the systems?—I think those who have been only taught on the sign and manual system prefer the sign and manual system, but those who have been taught the oral system certainly do not want to communicate by signs.

9074. The majority at present have been taught by some kind of sign and manual system; there has not been sufficient time for the oral system to become general?—That is so. An old pupil of mine the other day wrote me a letter in which he said, speech is a great blessing for the deaf; and he went on to say that he had been appointed to some office in a club to which he belonged by the vote of the majority of the club. When they proposed to appoint him he pleaded the excuse that he was deaf, but they said, we do not mind about that, we can understand all you say, therefore we desire to have you as our president, or captain, whichever it was.

9075. He understood all they said by lip movement?—I do not think he would understand everything said by strange persons, but he could speak so that every one could understand him.

Mr. J. Barber.

25 Mar. 1886.

9076. The deaf and dumb who have been taught orally have a little difficulty in understanding what is said to them by an ordinary speaker if he is a stranger?—Yes.

9077. Does it require much practice to enable them to understand you?—No, and I do not think it would require more practice on your part to make a person who has been orally taught understand you than it would to learn to spell with your fingers; I think an orally taught person is in a better position than a sign and manual taught person, because the difficulty with people generally is to read the finger spelling, it is much easier to spell by the fingers to a deaf person than it is to understand the deaf person's finger spelling.

9078. You are entirely opposed to the combined system; you do not think that the sign system and the oral system might go together?—I do not think it is at all advisable to combine the two.

9079. You told one of the Commissioners that you thought it was a desirable thing that pupil teachers should be trained in schools before they were admitted into training colleges?—Yes.

9080. You think it better that the colleges should have to deal in the first place with persons who have had a little training in institutions than that they should have the crude material to begin with?—I think so, certainly.

9081. What do you suppose would be the difference between the respective standards arrived at by a person who had been a short time a pupil teacher in an institution, and one who had not been in any institution?—I think the one who had been in a school as a pupil teacher would have learnt a great deal more of the system of teaching, and he would also have become acquainted with the habits and peculiarities of the deaf and dumb to a degree that the other would not.

9082. You are probably aware that the Government gives a grant of 75 per cent. of the cost in ordinary training colleges upon the pupils that they turn out with a certificate; do you think it an advisable thing that the same plan should be adopted with regard to the training of schoolmasters and schoolmistresses for the special education of the deaf and dumb?—Certainly.

The witness withdrew.

Miss MARY HARE examined.

Miss M. Hare.

9083. (*Chairman.*) You have a private school for the deaf and dumb at Norwood?—Yes.

9084. When was it opened?—A year ago last January.

9085. How many children have you?—Six.

9086. Are they all girls?—I have two boys and four girls.

9087. What ages would they be?—The oldest girl is 14 and the youngest is six.

9088. Have you got any certificate from any training college?—I have a certificate from Ealing Training College. I was there two years. I have an honours certificate from there.

9089. Have you any other teacher under you?—No.

9090. What time are you able to devote to each individual case?—About an hour each.

9091. You have not been long enough at work to have been able to get the more advanced ones into classes?—I have now two that learn together; they are different ages. I take them together and I give them individual attention as well.

9092. Did you get much experience in training children on the pure oral system at the training college?—I was there for two years.

9093. You had classes to take charge of?—Yes, in the second year, under Mr. Kinsey.

9094. Did you take any particular class?—I took different classes from the lowest to the highest; about six children in a class was the most I had.

9095. Do you use any special appliances; the circular desk, for instance?—I have not got one yet; I intend to get one in time. The children are all at different stages at present, so it is not so necessary.

9096. Have you had many applications to receive deaf and dumb pupils?—Yes, a good many. Some of those I could not take; one was a child who had been taught by signs four years.

9097. Did you refuse to take that child?—Yes, because of the other children; I was afraid she would teach them signs, and also I thought she was rather too old to begin; that it would be rather a waste of time for her.

9098. And she would have given you much more trouble of course?—Yes.

9099. Are you in favour of all schools private or otherwise being inspected by Government?—Yes, I think all public institutions ought to be inspected regularly, but that private schools should be inspected from time to time.

9100. You would welcome, I suppose, any independent inspection which would give a guarantee that your system was thoroughly well carried out?—Yes, I think the inspection ought to be by some one who understood the working of the system and who was a thorough expert in it.

9101. From your experience do you think that the pure oral system is the one most suitable to all deaf and dumb children?—Yes, to all, I think.

9102. Have you any experience among the poorer children?—I have one child of the poor class, a little girl, who comes to me every day, whom I teach free of charge.

9103. Not a boarder?—No.

9104. Are all the others boarders?—Four of them are boarders; one boy comes every day, and this little girl that I have just spoken of.

9105. Would you take in any children paid for by the guardians?—I do not think I could. I would do it, but I do not think the parents of the other children would like it.

9106. Are you aware whether there are any deaf and dumb children of poor parents in your neighbourhood who are not being educated?—I have made inquiries but nobody seems to know anything about them.

9107. You are not in the district of the London School Board;—No, I am in the Croydon School Board district; I wrote to the Croydon School Board and they said they had no deaf and dumb children.

9108. You cannot say whether there are any deaf and dumb children or not in your neighbourhood from the inquiries that you have made?—No.

9109. Do you think the present system of examining teachers a satisfactory one?—Yes.

9110. Is it sufficient, do you think, to secure a supply of good teachers?—From my own experience I think it is, looking at the training that one has to go through at Ealing.

9111. Your experience has been limited to Ealing?—I only know of that college; I think the test that the teachers are put to is a perfectly good test for knowledge, and I think the teachers from there are quite able to undertake the education of any deaf and dumb children.

9112. Did you apply for a certificate from the new College of Teachers?—I was asked to take one because I had the Ealing certificate. I was not required to go up for any examination as I had that certificate.

9143. The certificate was sent to you?—Yes.

9114. Did you apply for it or was it sent to you without your applying for it?—I received a form and then the certificate was sent afterwards. I had a paper sent to me about it first to ask me if I wished to receive the certificate.

9115. Do you consider that your having that certificate has been of any assistance to you?—Not at all, as I had the other certificate.

9116. Which you considered to be sufficient?—Yes, quite sufficient. I have not made any use of the College of Teachers' certificate at all.

Miss M. Hare.

25 Mar. 1886.

9117. Do the parents before sending their children to your school enquire whether you have any certificate?—Yes, some of them.

9118. And you have been able to satisfy them by informing them that you have that Ealing certificate?—Yes.

9119. Is your experience the same as that of others that the pure oral system takes about eight years to teach?—Yes.

9120. Do you think that is the time that children ought to remain in school generally under that system?—Yes.

9121. And have you confidence that in that time you would be able to teach a child of ordinary intelligence to speak?—Yes perfect confidence.

9122. (*Mr. St. John Ackers*). Have you brought your certificate with you?—Yes (*producing it*).

9123. You passed as an honours student?—Yes.

9124. And the certificate says, "Passed the examination prescribed by the Committee at the end of the two years' course"?—Yes.

9125. That is the full course?—Yes.

9126. Are you aware of anybody having been trained at Ealing Training College for a longer time than two years?—No.

9127. Then that is the maximum term?—Yes.

9128. Do you consider that this certificate is the equivalent of what may be called the first class ordinary certificate for teachers of hearing children?—Yes.

9129. While you were at the Training College at Ealing, did the majority of the students go through the two years course?—No, I was the only one that went through the two years' course during my stay there.

9130. Those who only went through the one year's course, got the one year's certificate; so far as you know are they all employed?—Yes, all employed.

9131. So that there is at the present time at any rate a general demand for certificated teachers even of one year's training for teaching the deaf and dumb?—Yes.

9132. Do you consider that a one year's course is sufficient to make a good teacher of the deaf and dumb?—It is sufficient to enable him or her to teach, but the two year's course is far better, because, speaking for myself at the end of the one year, I felt that I could teach tolerably well, but at the end of two years I felt I was quite capable of teaching any child. I think you also get far more experience by going through the two years' course as a resident, than by daily attendance.

9133. Probably you are aware that two years is the time which is compulsory for teachers of hearing children in the Government training colleges?—Yes.

9134. Is it your opinion that there should be at least an equal course of training for teachers of the deaf and dumb?—Yes. I think they should go through a course of equal length to the others.

9135. Do you consider that a deaf child can be taught efficiently in a less time than a hearing child?—No.

9136. Are you aware that the ordinary hearing children have to remain in school from the age 5 till they arrive at the age of 13 unless they pass out sooner on an examination?—Yes.

9137. Do you consider therefore that it is unreasonable that we should ask that deaf and dumb children should be kept at school at least as long a time as hearing children?—I think if possible they ought to be kept at school longer.

9138. Do you consider that the time between the ages of 5 and 13 is the best time that deaf and dumb children should be at school, or would you prefer that they should have eight years beginning at a different age?—I should say that the eight years should begin at a different age. I should prefer that they should begin at 7 or 8.

9139. And remain till they are 15 or 16?—Yes.

9140. The Croydon School Board say that they are not aware of any deaf and dumb children?—Yes, I have written to the clerk and that is the answer I got.

9141. The Croydon School Board has nothing to do with the school board for London?—No.

9142. Is it within your knowledge that other school boards have made the same remark, that there are no deaf and dumb children in their district; and yet on a thorough inquiry being made deaf and dumb children have been found?—It has not come under my own knowledge, but I have heard that they have said that there were none.

9143. Are you acquainted with a Miss Macgregor?—Yes.

9144. Where is she teaching at the present time?—At the Leicester School Board.

9145. Are you aware that the same thing happened at Leicester, that in the first instance the authorities of the school board wrote to say there were no deaf and dumb children?—Yes.

9146. And that now there are sufficient for one class or more than one class?—For more than one class.

9147. Though at first the school board declared there were no deaf and dumb children of ripe school age?—Yes.

9148. (*Admiral Sir E. Sotheby.*) What do you charge for your pupils?—70*l.* a year.

9149. Do you charge the same for the boys as for the girls?—Yes.

9150. Would you have any difficulty in increasing the number of your pupils if you wished to do so?—No, I think not, I have had several applications, but the children have been mostly too young.

9151. Did you learn the sign and manual system previously to learning the oral system?—No.

9152. Do you know anything of the sign and manual system?—I have visited several sign and manual schools and attended the service conducted by signs.

9153. Have you ever visited any board schools for curiosity's sake to see the system of education of the deaf and dumb carried on in them?—I have visited one board school at Leeds, not any in London.

9154. You say that 10 is about as many as one teacher can take?—Yes.

9155. Ought the deaf and dumb children to have a separate room?—Yes, and I think they should also separate the children of weak intellect from the other deaf children.

9156. Is the certificate that you have produced the highest certificate that can be given?—Yes.

9157. (*Chairman.*) Your name, I see, is in class B, at the College of Teachers?—Yes.

9158. (*Admiral Sir E. Sotheby.*) This Ealing certificate is a sort of order of merit, and you received a certificate from the new college at Paddington Green?—Yes.

9159. What is the nature of that certificate?—It is a sort of honorary certificate. They gave it me because I had the other certificate, without going through any examination. They took it from my other certificate from Ealing.

9160. But it says here that your conduct was diligent, &c.; how could they give you a certificate?—That is from the college itself.

9161. You say that it requires eight years to be educated; do you mean to say that it requires eight years before a child can speak fluently?—It can speak fluently, but it requires eight years to give them a full command of language.

9162. And after that you think that they can take their place among hearing people, so that you would not know that they were deaf if you heard them speak?—You would always know that they were deaf, I think, but they would be able to make themselves perfectly understood by everybody. There would be a slight difference in their speech.

9163. I suppose the pupils pay for their education at Ealing; you paid, I suppose, for yours?—Yes, I paid.

9164. (*Dr. Tindal Robertson.*) Will you kindly tell us what is the curriculum of education which you either do teach, or propose to teach, when you get your classes into perfect shape?—To teach them first of all articulation; and when that is perfect to go on to simple language; and when they have sufficient language, to take up subjects; first of all religious instruction, geography, and arithmetic; and when their language gets more fluent still, to go on to other subjects.

9165. Including writing in the first?—Oh, yes, I omitted that. That goes with the articulation; it is taught at the same time. Reading, writing, articulation, and lip-reading are taught all together.

9166. Is that the order in which they come?—The lip-reading comes first. They lip read the sound, and then they repeat it; that is the articulation. It is written down before them, and then they copy it.

9167. What special subjects do you take afterwards when you have gone through these preliminary subjects?—If there is time we take subjects that hearing children learn; we take other languages if there is time for them.

9168. Have you had any experience in teaching any other language than the English language?—No, my pupils are all too young for that.

9169. But do you propose to do so in the event of their getting sufficiently advanced?—Yes.

9170. Have you taught in your school any accomplishments?—A little drawing, but only as an amusement.

9171. Do you think that deaf children have a particular aptitude for drawing?—Not all.

9172. I suppose they are like other children, some have aptitude for it and others have not?—Yes. There are two of my children who draw fairly well, but the others do not.

9173. With regard to the inquiry that was made about the school board, do you think it possible that that answer was given to you in consequence of a good many deaf children being classed among imbeciles?—I do not know about that. I went to visit the head of one of the board schools, the Norwood School, and he said that there were no deaf children at all in the school, and no imbeciles; nothing except ordinary children.

Miss M. Hare.

25 Mar. 1886.

9174. Did he say that there were no imbeciles in the district, or that there were none in the school?—In the school. He said that he knew nothing about the children in the district.

9175. You do not know whether he had made inquiries or not in his district respecting it?—No. The other one I did not see; I only wrote to him, and he told me that he had no knowledge of there being any deaf children.

9176. Have you in your experience ever come across any child who might be classed as an imbecile, but which probably was only deaf, and not imbecile if it had been trained properly?—No, I think not. I have come across one the other way, a child who was really imbecile, but who was thought to be deaf. That was a child who was brought to me at the Health Exhibition.

The witness withdrew.

Dr. David Buxton, F.R.S.L., examined.

Dr. D. Buxton, F.R.S.L.

9177. (*Chairman.*) You have had great experience in the education of the deaf and dumb for a great number of years, have you not?—My experience dates from the beginning of the year 1841 officially, and as the work of my daily life until the end of September 1884. My connexion with the subject continues still, but not in an official capacity.

9178. Did your connexion with the deaf and dumb begin in Liverpool?—No, in London, in the Old Kent Road. I was on the staff of the Old Kent Road Asylum from the date I named, January 1841, until I succeeded to the head mastership of the Liverpool School in October 1851.

9179. At that time the teaching was entirely upon the sign system, was it not?—What was commonly called the combined system. My own special duty at the Old Kent Road was to teach the first class; I taught all to speak as it was called then, teaching them articulation.

9180. What is the difference between that and the pure oral system?—The pure oral system teaches by speech alone; that teaches speech and signs at the same time. You teach a child a word and give him the sign for that word, and you teach him how to speak that word at the same time. He writes the word, he pronounces the word as well as he can, and he signs the word; but practically the ultimate form of that child's conversation is by the sign that he learned and not by the word that he learned.

9181. Then the sign system crowded out the oral system?—Unquestionably.

9182. Because it was so much easier?—Exactly so.

9183. Have you become a convert to any other system, or are you still of the same opinion?—I think I am as devoted to and I hope I have been as successful in promoting the oral system as any one living.

9184. Will you tell us when and in consequence of what you changed your opinions?—As is pretty well known to those who know me I was always of the advanced school; I never was satisfied with the things that were already attained; but was always anxious to press on to something that was before. I made myself acquainted with what had been done both in this country and in other countries, and consequently as an Englishman I was desirous that Englishmen should stand in the foreground, and not lag behind anybody. A good many years ago I had the good fortune to make the acquaintance of Mr. Ackers; and Mr. Ackers' plans were, through his kindness to me and his confidence in me (I think I may venture to say in his presence), made known to me. At the meeting at which the society at Ealing was originated I was invited to be present but my duties did not permit me to be there. When the society became really organised and established, I was about to leave Liverpool. In the steps I then took I was aided by the advice and counsel of Mr. Ackers, which I was very glad to follow, and it led to my appointment as first secretary to the Ealing society, which then bore the title of the "Society for the training of teachers of the deaf and the diffusion of the German system in the United Kingdom." In that position I had nothing to do with the education of the deaf, but was secretary, in London, conducting the business of the office, making the subject known, diffusing it by reports, by writing, by attending meetings, and by reading papers. In that capacity I read several papers at various societies, and attended the Milan conference as the English member of the committee of organisation; and though perhaps this should be said *sub silentio*, I was the "Times" correspondent who communicated the results of that remarkable gathering to the English-speaking race in this country and elsewhere.

9185. You have paid a good deal of attention to the statistics of the deaf and dumb population of all ages, have you not?—I have.

9186. Do you think that the statistics are more accurate in the last census than they were, say, in the census of 1851?—I am sorry to say that I think the statistics fall very far short of accuracy in every respect.

9187. I see from your paper which you read last year, that in 1851 the deaf and dumb in England, Wales, Scotland, Ireland, and the islands of the British seas were 17,300, and that in 1881 they were 20,661, is that so?—Yes, and there was a remarkable increase in the first decennial period.

9188. Do you think that that increase was owing to a real increase of the deaf and dumb population, or only to more having been included in that census than were included before?—As I have already stated elsewhere, I think the increase in that decade was mainly due to the attention which had been called to the obvious and transparent blunders that were made in the enumeration of 1851. They were not much to be wondered at. I pointed them out myself in a paper that I read to the British Association at Liverpool. That paper was published in the Statistical Society's Journal, and the disparity between the two returns on the same subject which appeared in the enumeration tables and the educational tables were so ridiculous that they amused everybody. That being so, additional care was taken in the compilation of the next census returns, and that no doubt produced as one of its fruits the fact of the 17,300 having become 20,311. But in order to assure the Commission that special care was given to that subject, I may say that I was in communication with the Census Commissioners at Somerset House, and before the next returns were published they asked me to revise them for them, and I did so. I do not mention that to intimate any merit of my own, but only to show that the officials were aware that certain omissions had taken place in the previous enumeration, and that they were desirous of amending them in the

Dr. D. Buxton, F.R.S.L.

25 Mar. 1886.

second, hence the great apparent increase of 3,000 in 10 years.

9189. With regard to the deaf and dumb children of school age, that is to say, between the ages of 5 and 15, do you think that it is an accurate statement which puts them at 5,129 at the last census?—It is a mere estimate; it is not an enumeration. It is taking a supposititous proportion to be deaf and dumb out of a given number that are returned to the census officers as being between the ages of 5 and 15; that is to say, between the ages of 5 and 15 there is a certain ascertained number of children, and the supposed proportion between the deaf and dumb and the whole population is so and so; therefore, if you divide that you get the result.

9190. (*Mr. Johnson.*) It is an assumed result?—It is.

9191. (*Chairman.*) Are you quoting those figures from the census or from your own calculations?—I quote them from the memorial that was presented, I think, by your Lordship's own hands to Lord Carlingford and Mr. Mundella. May I venture to mention a fact which has come to my knowledge? I think that in the same memorial (and I know Mr. Ackers quoted the statement in a paper that I have read of his addressed to the conference at which your Lordship and Mr. Ackers were both present) the estimated number of places in school was stated at 1,760. Now the returns that have reached some gentlemen, of whom I am one, charged with the publication of the conference report, of which your Lordship will remember the occasion, show that at the time when it was represented that there were only 1,700 places in school, there were absolutely 1,971 children in those nominally 1,700 places.

9192. Then is this calculation in the proceedings of the conference of head masters held in July 1885, of the number of deaf and dumb children under instruction in England, Wales, Scotland, and Ireland inaccurate?—I am now speaking of England and Wales only. I have an omitted return to add to that.

9193. You say that 1,971 were in schools, and the estimate in England and Wales would be 1,891?—I am speaking of the figures in the table opposite an interlined line. "Total England and Wales, 1,941." The schools of England and Wales are given under one heading.

9194. (*Mr. Johnson.*) Are those the numbers at school?—Yes. In 1874 the school at Derby was established, but that has by some mischance been omitted, and it raises the number of 1,941 into 1,971. So that in the same year in which 1,700 places were reported as the total accommodation 1,971 children were in those places.

9195. (*Chairman.*) It shows that there is great inaccuracy as to numbers?—It shows that it is impossible to depend upon the figures as presented to us.

9196. Do you think that the education of deaf and dumb children should be made compulsory by the State as well as the education of other children?—Unquestionably. My principle is this: that whatever you do for other children you must do for the deaf and dumb. They require more, and why should they have less.

9197. They ought to continue at school quite as long as other children, ought they not?—Longer.

9198. How much longer?—We have the example of Milan before us, which gives the time for them to be at school as eight years. Ten years is not a day too long, because deaf children come to school knowing little or nothing; but I am afraid the English public will not stand 10 years. Other children come to school with language, which is their means of instruction, already acquired, and with a good deal of information which they have picked up, so to speak, and which even persons who are not educated at all pick up by means of the speech which is their mother tongue; but deaf children have to get all that knowledge at school.

9199. Do you think that the schools under Government should be day schools or boarding schools, or both?—That is a very wide question; there are advantages and disadvantages which are common to both.

9200. As you are acquainted both with London and the provinces how would you deal with both cases?—My opportunities of judging of that subject are unique. The Liverpool school exists as a school on the condition that it shall be for ever a day school, that is to say, that it shall receive day scholars; but not that it is to be a day school and nothing else. I went to Liverpool with all my previous experience derived from a boarding school; and when I got there I discovered that the Corporation of Liverpool had granted the site upon which the Institution stands, and a considerable sum of money to start it, on the condition that all deaf children living in Liverpool, on presenting themselves at that school, should be received into the Institution free, as day scholars.

9201. But as a matter of fact do they not now have boarders there as well?—Certainly; and the necessity of having a boarding school engrafted upon the day school asserted itself long before I became head master, I think in the first two years of its existence. A boarding house was the first extension of the original school. Then when that building was given up the present building was erected; but it has been added to from time to time, twice during my own incumbency of the head mastership. It was built as a boarding school. The condition on which the land was given was that deaf and dumb children living in Liverpool who presented themselves for admission should be admitted free of charge, and should have free dinners as well, after having been pronounced eligible by the head master and surgeon. I found that arrangement was in existence, and I was loyal to it; but I never was convinced that it was the best arrangement, and I never heard of anybody else that was. We used to consider that five years' instruction as a day scholar was not more than equivalent to one half of the same time spent as a boarder in the school. Supervision, continuous attendance, and extra discipline were absolutely lost under the day school system; while they were made subservient to the advantage of the children under the boarding school system.

9202. If you were to collect together the deaf and dumb children scattered in various parts of England into one school, it must necessarily be a boarding school, and the maintenance must, to a certain extent, be provided for from some public source, must it not?—I think that is indispensable. If you could take the education to the doors of the children, or nearly so, it might not be necessary to have boarding schools.

9203. In London, of course, it is different; there a day school is possible?—It is possible in all large towns, but it is not possible in a sparsely populated district, that is to say, if you have the schools where the children cannot come daily, you must have, either on the spot or in some conveniently adjacent place, a home in which the children can be taken care of.

9204. Are you familiar with the London School Board classes for the deaf?—I am, so far as residence in London must necessarily make one acquainted with the subject. Besides this my personal connexion with Mr. Stainer, as a friend of 40 years' standing, of course makes me pretty conversant with his work.

9205. That work is entirely dependent, is it not, upon his voluntary efforts, so far as the homes are concerned?—Yes.

9206. Do you think it is desirable that so necessary an adjunct to these schools should be entirely dependent upon voluntary efforts?—I do not think I am in a position to give an answer to that question; I have not considered it sufficiently to give authority to my opinion.

9207. But you can speak as to the provinces with authority on the subject?—I think that boarding schools are really necessary. I think that education would fly over their heads, or by their sides, unless it was brought to bear upon them in that particular way. There is one advantage in day schools which I found to be conspicuously an advantage. It is an evil for children to be kept within the four walls of an institution, or a playground, for year after year; their minds are expanding, but their observation is not expanding one bit. But if you have a day school the day scholars come up from town; they live in their own homes, they go to church, and they go down to the landing stage and see the steamers going across, and they bring into the school a lot of outside ideas.

9208. You are speaking of Liverpool?—Yes, but it would be the same in Manchester and the same in London. The day scholar between his school hours would go for instance and see the Queen pass along the Embankment, and then he would go and tell everybody what he had seen. The opening, widening, and invigorating effect of the outside world upon the deaf is larger than any of you gentlemen are at all likely to have considered. The comical side of the thing is this: I remember a boy coming up during a contested election after walking through the town of Liverpool to school; he saw the placards on the walls, and he was very anxious to know who "the electors" were, and what "independent" meant, and who Mr. T. B. Horsfall was (who was at that time standing for Liverpool), for he had seen his name at every corner of the street. That shows that the children go about with their eyes open, and that what they see is food for thought and food for inquiry; and that feeling of isolation which is the effect of living in an asylum is so far got rid of.

Dr. D. Buxton, F.R.S.L.

25 Mar. 1886.

9209. Would it not be possible to have the children under individual training and inspection for the first two or three years of their school life as boarders, and then that they should go home to their friends after they have made some progress in oral instruction?—The principle is a very good one, but anybody who knows the poor of London, and Liverpool, and Manchester as I do, knows that the success of the after part would depend entirely upon the kind of influences that they were placed under.

9210. Do you think that it would be possible to board these children out with people other than their own parents, but of the same class as their parents; for instance, when a child comes up from the country and goes to a day school in the town, would it be possible to board that child out in the town itself?—I can only give a speculative opinion upon that subject; I have had no experience of it.

9211. Do you think it would be likely to succeed?—If the question were asked of me, in order that I might give information to a parent, I should at once go to Mr. Van Praagh, or to somebody else, and ask him how it had answered with him, because I have no knowledge of my own on the subject.

9212. The question never arose in Liverpool, for instance?—Never.

9213. The State has already recognised a certain amount of liability for the maintenance of children in industrial institutions; do you think that it ought to do the same for deaf and dumb children?—I decidedly think so.

9214. The principle is not altogether a new one, is it?—No, I think that principle was first enunciated at the conference before last or at the one before that. Mr. Walsh, who was connected with the education of the deaf at the Roman Catholic institution in Dublin, brought up that subject in a paper which was published in the proceedings, but which I think was not read, in which he showed that the same principle which led the Government to do that in the one case was open to them as pointing out the way in which it could be done in the other.

9215. Now that there are two colleges for the training of teachers in London, and also an examining college, do you think that the present system of training teachers is efficient, and established on a satisfactory footing?—When you consider that seven years is only a very small proportion of the extent of my own experience, it limits my observation to a comparatively short time. I was connected with Ealing from the first; and I must say that having had, as secretary, and as being an older man than others connected with it, the opportunity of obtaining the confidence and of observing the work of the students there, Ealing has turned out some most admirable teachers, both for private families and for public instruction.

9216. Have the salaries which have in the immediate past been given to the teachers been adequate to secure good teachers?—In my early career the salaries paid to teachers were absolutely inadequate to obtain anything like decent service; but more recently, and very largely, I must say, in consequence of the action of the Ealing Society, and (I say this with less familiar knowledge of the facts) of the Fitzroy Square Society, the salaries have gone up. I hear now of junior teachers receiving a salary which is as much as senior teachers received in my earlier days.

9217. Do you know what the salaries are?—I have a fair knowledge of what the salaries have been from first to last.

9218. What would you call a fair salary for a teacher in an institution?—I think the London School Board has established a precedent which others would scarcely be able to depart from. Of course when 70*l.*, 80*l.*, or 100*l.* are given by a school board, it means payment for service with freedom in the evenings and on Sunday, which some people prize very highly, perhaps more highly than it deserves), but it means the necessity of providing for themselves. Now in an institution you give a young man 30*l.* or 40*l.* a year, but you provide him with board and lodging, which to him, though perhaps not in cost to the institution, is as good as 50*l.* more.

9219. Do you think that they are pretty well paid?—I am perfectly certain that they are not, in some of the provincial institutions; but I believe that in the chief institutions the standard has been raised and will never go lower, but will, as the status and qualifications of the teachers improve, go higher. Then comes the question of the necessary addition to the expenditure of every institution, in providing better qualified teachers for a smaller number of pupils.

9220. You are aware that boards of guardians have now the power to contribute towards the maintenance of deaf and dumb children in institutions?—Boards of guardians can contribute for maintenance. The conditions on which a deaf and dumb child can be educated are two: one that education will be given, and the other that maintenance must be given. We may sometimes look with advantage to the examples that are set us by other countries. In Sweden (and in Norway I believe it is the same) the maintenance of the deaf children in the schools is paid for by one public body, and the education by another. We have two kindred bodies in this country, and if the board of guardians would pay for the maintenance, and the school board for the education, the difficulty would be met.

9221. We have three systems of teaching the deaf and dumb: the sign system, the combined system, and the oral system. Do you think that any one of those is so superior to the others that the State ought to insist that that only should be taught; or do you think that there must be two or more systems recognised side by side by the State?—I am so thoroughly in earnest in my advocacy of the superiority of the oral system, that I should be very glad to see every other extinguished; but I know that that must be a matter of time. The oral system is incomparably the best; it is not open to question at all, because it assimilates the deaf to the class with whom they live. If I want to communicate by signs to a deaf child I have to descend to his level; but by the oral system I endeavour to raise him to my level. For a time perhaps the combined system may struggle on: I think that is very probable; but that the sign system in itself will last I have not the slightest expectation. I think it will die out.

9222. When they are fairly competing one with the other the oral system must, you think, in the long run drive the other out of the field?—I think so, if it is applied by skilful and conscientious teachers and fair play is given to it, and if it has none of the drawbacks that it has had to encounter during the last 8 or 10 years, some of which are very considerable, though far less than 10 years ago I should have said it might expect. It has been singularly fortunate and successful, but it has had drawbacks. One of the drawbacks is this: I do not cast any reflection upon anybody, but there are persons who join what seems to be a winning cause without having their hearts thoroughly in the winning cause, and who, like the Israelites, march through the wilderness to the promised land, though their hearts are in Egypt I am afraid for a great portion of the time. But when, as will be the case, the majority of the teachers, and far and away the best qualified teachers, will be teachers of the oral system, they will necessarily take the place of those unfortunate pilgrims who are never destined to see the promised land, but will die in the wilderness. It is one of those things that will work itself out in a natural way. It is like the sun shining; the sun shines and the darkness disappears, but the sun does not trouble itself about the darkness.

9223. Have you much experience of the occupations of the adult deaf and dumb after they leave the schools?—I have seen a good deal of that.

9224. Will you tell us what you think about their occupations?—When I was one of the staff at the Old Kent Road it devolved upon me at one stage of my employment there to be the visitor of the apprentices on behalf of the committee. I was a witness to their binding, and I went to see how they got on. I was sometimes the agent of the secretary in paying the second instalment of the apprentice fee, and so forth, and I was familiar with the whole thing. In Liverpool we had also an apprentice fund, but it was very small, and did very little, and it devolved upon me very often to find employment for the children when they left school. In one stage

Dr. D. Buxton, F.R.S.L.

25 Mar. 1886.

of my residence there I, with the co-operation of an old pupil and friend, a deaf gentleman living there, established a benevolent society for the aid of the deaf, and we took oversight of the adult persons who had gone out to employment. The apprenticeship system in London was far from perfect when I knew it; that is 30 years ago, and I fancy it is weaker still now. Many persons availed themselves of the apprentice fee given by an opulent and highly respectable body like the asylum in the Old Kent Road. The first instalment of the fee was received when the boy went, and we were pretty sure to have a most satisfactory account of the first year's proceedings at the end of the first year, in order that the second instalment might be forthcoming. But the complaints always broke out after that; the boy did not get there at his time in the morning, or he was careless, and spoilt this and broke that and the other thing. I went down to Woolwich on one occasion to ascertain a cause of complaint; a very grave complaint was supposed to lie at the door of one poor lad. He had a long way to go and it was in the depth of winter, and his immaculate master complained that whereas a boy was due at his work at six o'clock in the morning it was three minutes past when he got there! I have frequently had to bring masters before the magistrates for not fulfilling their duties satisfactorily. On one occasion I was remonstrating with a man who had been summoned before Mr. Arnold at Worship Street. I intimated to him that I had said my say, and that I was not going to hold any further parley with him, and I made for the door. But he got before me and turned the key. I made for the window and threw the sash up to let him see that if that was his game this was mine; and he came down very suddenly and began to talk reasonably. But in the long run it was evident that the master and the lad could not get on together, and the indentures were cancelled, as was frequently the result in cases of that sort.

9225. As a rule did you find that they got on pretty well?—Fairly well. Provided that the master conscientiously does his duty by the apprentice, I do not think that being deaf and dumb is any barrier to their acquiring such trades as deafness itself is not an insuperable barrier to the acquirement of.

9226. Are there many trades in which the deaf and dumb can succeed well?—Everything that is imitative they can succeed well in.

9227. Such as drawing and painting?—Yes, pupils of mine have pursued imitative arts of various kinds. One of the old pupils at the Old Kent Road was a pupil of Mr. Behnes's, and is the artist of the bust of the Prince of Wales that now stands in the institution at Margate. Their employments go from that down to tailoring and shoemaking, and the simplest handicrafts, which involve the imitation of what they see somebody else do. At the same time, if your question points in another direction, whether workshops should be combined with schools, I am decidedly opposed to that.

9228. You think that there is quite enough to do in the schools in teaching the children general knowledge?—Quite. You must have a separate staff to begin with; look at the cost of that. Then again you must divide the attention of the children between one thing and another; look at the distraction of that. When I was at Brussels I learned a good deal of what was being done in continental schools where the apprenticeship system does not prevail as it does here, and where the trades union system is not a barrier to the admission of deaf persons as it is here.

9229. Is the trades union system against the deaf?—Yes, trades unionism has, as its principle, the keeping of everything for everybody except those people who can be left out. Now the deaf and dumb can be readily left out. I have found amongst my correspondence a letter which I wrote many years ago to a relative of my own. The matter was brought before one of the trades union meetings, as to whether deaf and dumb people should be admitted to the benefits which in its first form trades unionism was intended to confer. I think the feeling was that deaf persons would be more exposed to accident, and therefore more likely to be a burden upon the funds of the society. I put the claim so strongly that it was conceded. Whether it was because my plea was strong or because my representative at head-quarters was influential I do not know, but the result was that what was threatened adversely to the deaf was obviated, and the benefit we pleaded for was conceded. That is one individual case. The idea of teaching the elder boys and girls, as the case may be, the use of tools in school, is I think most valuable; but I would let that teaching come in in the later stages of their education. Everybody knows that boys, and especially deaf boys, must have something to interest them, and engage the eye, especially in the latter part of their school instruction on the sign or the combined system. It will be well understood that where communication is readily possible by the oral system the same thing does not prevail to the same extent; but it is certain that in the later years of the education of deaf boys in the classes of the older schools, they got tired of the monotony of their lessons, and they would rather go to work than stick at school. If you can avail yourself of that predilection and give them something to do with their hands, and something to occupy their eyes, and something to bring out their skill and develop their taste, you can keep them at school, and keep them from breaking off school prematurely, and at the same time give them something of real advantage.

9230. Has any attempt ever been made to teach them carving?—Yes, I have seen some fretwork and some wood carving within the last month in deaf and dumb institutions, not worked on any trade system at all, not as Mr. Stainer proposes to do it by the employment of competent foremen and teachers.

9231. Learning this by their own genius?—Yes, or from the master having a taste of that sort of his own. I saw it at the Doncaster Institution not a month ago. I would let them get into the way of doing something lest they get into mischief. In respect to the teaching of trades in the early days of the education of the deaf and dumb, it was considered that teaching and working must go together. The first teachers, like the blind man, "saw men as trees walking" they were groping into the practicable through the comparatively impracticable. The original Old Kent Road workshop was a part of the institution, but the dissatisfaction, the utter break up of discipline, and the waste of money and energy led to the suppression of the thing in a very short time; and that same result has followed I think wherever it was tried.

9232. Have you any opinion as to the intermarriage of the deaf and dumb?—I have a very strong opinion against it. I have written a pamphlet on the subject which I have here. It was written a long time ago, I am sorry to say, but nothing that I have seen since has led me to alter my opinion in the matter.

9233. I suppose your objection is against the intermarriage of those who are born deaf and dumb, and not of those who may be accidentally deaf and dumb from illness in childhood?—I never had the opportunity of going so closely into the matter as to be able to analyse the facts as between the one class of cases and the other.

9234. Then what is the basis of your opinion against the intermarriage of the deaf and dumb?—Its fruitfulness in congenital deafness on the part of the offspring.

9235. Is that proved to be the case where the parents are not congenitally deaf and dumb?—I could not at this moment charge myself with an opinion one way or another in that respect; but I may tell you that I knew an instance (it may have been referable to another cause) in which an eldest child was not born deaf, but became deaf in very early infancy, and the next child was born deaf; both the children were pupils of mine. A very singular illustration bearing upon this subject has come to my knowledge quite recently, and that is this: I know that at the Margate Institution, and in some of Mr. Stainer's classes, there are children at this moment who bear the same names as pupils who were at school when I was there. That shows that deaf fathers have deaf children. Of course the mother loses her maiden name. If the father's name was Smith, or Brown, or Robinson, or Jones, it would not convey much, but when it is such a name as George Burling it is a different thing. Mr. Elliott mentioned the case of George Burling the other day, and I said "Why, George Burling was a pupil of mine." He said, "His father may have been." Mr. Stainer lately mentioned the name of Dearlove, and he said "You remember his name, do you not"? That was the name of a former pupil of mine, and there is sufficient in the name to fasten one's recollection. So it is that many of the children under education are the sons or daughters of persons who were pupils in my time.

9236. We have had evidence that deafness and dumbness arises nearly as much from the intermarriage of blood relations as from any other cause, is that your opinion?—Not so much as from any other cause, but it is a most fruitful cause. The conclusion which I drew, if I may venture to read anything of my own on the marriage and intermarriage of the deaf and dumb, is set forth in a paper that I read before the Medical Society at Liverpool a good many years ago. I say there:—"Assuming "then, for the purpose of arriving now at a definite, "practical conclusion, that the estimate of Dr. Peet, "given above, is as nearly correct as the nature of the "case and the present state of our knowledge will "admit of, we find that the probability of congenital "deafness in the offspring is *nearly seven times greater "when both parents are deaf than when only one is so.* "In the latter case one child in 135, less than three-"quarters per cent., proves to be deaf; but in the "former, out of 140 children, seven, *i.e.*, five per cent., "are found to be deaf; the proportion of one in 20 "being to one in 135 as 6¾ to one. In other words, if "we suppose a given number of children (540) the issue "of mixed marriages between the deaf and the hearing, "and an equal number sprung from the intermarriage "of the deaf, there would be 27 deaf mutes among the "children of the latter, while there would only be four "in the families of the former." Those facts are derived from Hartford in Connecticut, New York, Paris, Groningen, London, Liverpool, Manchester, and from Ireland.

9237. You think that that is substantially accurate up to the present time?—All that I have seen since that time confirms me in the impression that that computation is not very far from right. I have another pamphlet here which I wrote, entitled, "An Inquiry into the "causes of Deaf-dumbness, congenital and acquired." This was read at a meeting of the Social Science Association in Liverpool in 1857, and it was afterwards read before the Medical Society of Liverpool. The medical men there asked me if I could throw any light upon a question which had exercised them, viz., the effect of impressions upon the mind of a mother during gestation in producing deafness in her offspring. There is a postscript upon that subject.

9238. I suppose that various accidental causes produce it?—Yes, frights and other causes. I say here:—"As regards the marriage of blood relations, there can "be no question now as to the great influence which "this cause exercises in the production of congenital "deafness, as of almost every other physical and mental "defect. In an inquiry which I made some time ago, "from a large number of persons, I found that about "every tenth case of deafness resulted from the inter-"marriage of first cousins." May I venture to mention that one of the most valuable statistical tables in existence anywhere is the Irish census return for 1871, entitled, "The Status of Disease, &c.," which was ascribed to Sir William Wilde, one of the Commissioners. I do not know whether it is out of print now. I go on to say in the pamphlet beforementioned, "The Irish "Returns" (that is to say the returns that I have just spoken of) "make known 170 instances in which the parents were related in the degrees of first, second, or "third cousins. In 109 cases" (that is to say 109 cases out of 170) "only one child was deaf; in 38 two were "deaf," (and here there were four cases of deaf-mute twins); "in 17 families three children were deaf and "dumb; in three families four were so; and there were "instances of the occurrence of six, seven, and eight "deaf-mute children in three distinct families, the "heads of which were connected by blood-relationship "before their marriage. In America the subject has "not, until within the last few years, excited much at-"tention, but Dr. Peet gives it as his impression," (that is the late Dr. Peet, the father of the present principal of the New York Institution,) "that there is "one such case out of about every ten congenital cases "in which the inquiry has been made;" an opinion which exactly agrees with the result of my own investigations in the two fields of inquiry, London and Liverpool, to which I have had access. That the results of inquiry at New York, should coincide with the results of inquiry in London, and at Liverpool, of course is somewhat extraordinary. It has to do with the English race in both countries.

9239. Is your opinion the same now as when you wrote that pamphlet?—It is; I have seen no reason whatever to change it; and that it occurs in successive generations, and sometimes alternately, is also a proved fact.

9240. Have you formed any opinion as to the advantages of the oral system for the religious instruction of the deaf and dumb?—The advantage of the oral system is so wide and so large that it covers that question I think.

9241. We have had witnesses before us who said that those who had been taught on the oral system attend the services at St. Saviour's, in London, which are entirely conducted on the sign and manual system?—I am aware of that, but it is certainly not necessarily for the reason suggested; the reason is the clannishness that there is amongst deaf and dumb persons everywhere. A deaf and dumb man will go into the next street and talk to another deaf and dumb man, whether he has been educated in the same school or in the same system with himself or not. I am not going to speak disparagingly of St. Saviour's, because I was present when the foundation stone was laid, and I have officiated there myself, and conducted a service for the deaf and dumb on the sign system for many years. I established the society in Liverpool, and conducted the services there until I removed to London.

9242. I suppose there must be a great number of persons who being adults cannot learn the oral system, and who have no other system by which to obtain instruction?—All those who are educated on the sign system must, if they are to be ministered to at all, be ministered to in the sign language.

9243. Is it the case that there are at present a large proportion of deaf and dumb people for whom that provision must be made, and for whom it will have to be made for some long time?—Yes, that is to say there will be a *raison d'être* for the maintenance of such services and such churches so long as all, or a considerable portion of, the deaf can only be reached by that means.

9244. But you anticipate a time when, the sign system having died out, such special services will no longer be necessary?—The oral system, if it is carried out, as I hope it will be (perhaps not in my time) will make such services unnecessary. They came in from necessity to the aid of an incomplete system.

9245. Do you think it would be possible even for those who had been taught under the oral system to go into an ordinary church and listen to the preacher, and understand what he says?—I am not prepared to assent to that. I think I must say, with all deference, that that is rather an extravagant way of stating the matter.

9246. How would you meet, then, the case of those who, under the oral system, would wish to have services, or lectures, or sermons given to them?—They must be given by those persons who are aware of their peculiar need, and who do their best to meet that need.

9247. And, I suppose, that the room must be under favourable conditions as to light, and the congregation must not be too large?—Exactly so, every person present must be able readily to see the face of the speaker; the light must be directed upon the speaker, and he must speak with due regard to the fact that all the persons there will depend upon the motion of his lips, and of his face, and not upon anything else.

9248. Have any services of that nature been started?—I know that there is a Sunday school class in which worship, so far as it is proper to children (they are only young people of school age or just beyond it) is conducted by one of the staff of the Fitzroy Square Institution every Sunday in a vestry near Hampstead Road. I had the opportunity of reading an account of it the other day, and I was very much impressed, indeed, by it; and I could see clearly in that the possible germ of regular religious services.

9249. Can you speak about the adult societies for the deaf?—Yes, I founded one in Liverpool myself.

9250. What does that do for the adult deaf and dumb?—There are services on the Sunday; there are lectures every Saturday night; there is a newsroom with illustrated papers; there is a penny bank, a temperance society, and a benevolent organization for rendering assistance to those who need it, for visiting them in sickness, and interring them at death; we had three graves there when I left in which the old pupils were buried.

9251. What is there corresponding to that in London?—The society in Oxford Street connected with St. Saviour's church.

9252. Is that of a similar character?—Yes, it is.

9253. (*Mr. Johnson.*) They have not a reading room at St. Saviour's, have they?—I do not think so. There

Dr. D. Buxton, F.R.S.L.

25 Mar. 1886.

Dr. D. Buxton, F.R.S.L.

25 Mar. 1886.

is a lecture room, for I have both lectured there myself, and interpreted the lectures of others.

9254. And there is no penny bank, is there?—I am not sure whether there is or not. In reference to one question which I answered, speaking of the trades that can be taught to deaf children, I may say that it was always a principle of mine in dealing with young deaf people never to let them think that deafness was a barrier to their doing anything, that such a thing should never creep into their minds as, "I could do that if I "was not deaf and dumb; I cannot do it because I am "deaf and dumb." When I was in Liverpool we used to allow the girls to employ themselves with fancy needlework, and the like. Some people either felt or assumed a degree of indignation at this, and said, "These poor "children are only paupers, had they not better learn to "make flannel petticoats, and to make their frocks and "so forth?" I said, "Yes, one is done, and the other is "not left undone; but it is very desirable indeed that "these children should have as many of the graces "of life afforded to them as possible, and that they "should be taught to think that their being deaf, does "not exclude them from doing that which other children "do."

9255. For that reason would you encourage games at school, such as cricket and football, and amusements of that kind?—Yes. After I left Liverpool my then assistant started a swimming class, and a deaf boy took a good many prizes in the swimming class. One of my pupils at Liverpool came from Chester; he came to Liverpool to school to save himself from being drowned in the Chester Canal, I expect, for they could not keep the fellow out of the canal; he was in all day long on a summer's day. As a matter of fact, there is a deaf and dumb man in London now, who has taken a great number of prizes for swimming; and in Scotland there is a man who has taken a great many prizes for rescuing persons who were in danger of drowning. I have never been at the Brighton school, but I know that they have a cricket club, and a football club, too, I believe, and I know the boys at Brighton and at Doncaster play matches, and bear themselves very creditably.

9256. Is there any other point upon which you would like to speak to the Commission?—I do not know whether the Commission have had before them the remarkable spread of the education of the deaf and dumb. I remember that I was in the habit years ago of commencing a lecture or statement on the subject by saying: "At the present time there are 200 institutions "for the deaf and dumb in various parts of the world, "and 100 years ago there was not one." I met only yesterday in a French publication a statement that the first statistical return which came into the possession of the National Institution of Paris on the inquiry of the Baron Degerando, a very well-known writer on the subject, was dated 1829; and he ascertained that at that time there were 88 institutions in various parts of the world, but not even the largest of them contained as many as 200 pupils. At the present time there are more than 500 institutions.

9257. (*Mr. Johnson.*) Do you mean that there are 500 institutions where the pupils reside?—There are 500 institutions of all classes throughout the world.

9258. That includes day schools?—Yes, wherever a school was open for the reception of deaf children and instruction was given that would count for one.

9259. (*Chairman.*) Are you speaking from personal knowledge of the schools for the deaf and dumb on the continent and in America?—No, my knowledge of the schools in America is derived from correspondence and literature only. The two schools on the continent that I have seen are Rotterdam, which I visited a good many years ago, and Milan, which I visited at the time of the conference.

9260. Is the school at Milan on the best system?—I think so; the results were most surprising even to me, who went expecting to see a great deal that I had never seen before. The whole thing was entirely beyond what I expected.

9261. Was the system of instruction more perfect than we have in England?—We, as visitors, only saw the results of it; we did not see the processes, or at least I did not. I was otherwise employed whilst I was there. Some years before I was connected with the Ealing Institution, and when I was still at Liverpool, I went to the continent (two of my daughters were at school there) and I stayed a day at Rotterdam; but unfortunately I pitched upon the fête day of the venerable head master, Mr. Hirsch. All the communication there was oral. I was astonished to find what I did find there. The freest oral communication I have ever seen anywhere in this country is at the school at Doncaster. I happened to be in Derbyshire on business a few weeks ago, and I went over and stayed from Saturday to Monday with Mr. Howard, whose name may probably have come before you; and the communication there was freely oral to a degree that I had never seen before in this country. It must be borne in mind that the oral system lifts a child out of a low level, and places it on a high level; the child becomes more like yourself, whereas the deaf child is unlike yourself. There is one point that I should like to mention and gentlemen connected with institutions will know its importance; I refer to the age of admission and the time of continuance at school. Another point which requires very carefully dealing with is periodical admissions, not admissions every week, every month, or any day. When I was at Old Kent Road new pupils came to me every six months; I do not think that was the best plan. The old class went up, whether it was in a position to go up or not; but it had to go up to make room for the new comers. In Liverpool, where there was no admission by the votes of subscribers, which I very strongly object to, but where the admission was by the committee, who were the best judges of the need of the children, the committee could admit the children at any meeting, every month.

9262. That means a great additional trouble to the teachers, does it not?—It means breaking into the continuity of the class every few weeks. The training of teachers is the thing that I have been longing for, and striving for all my life, and I am very glad that it is accomplished. Another point is that when I first became a teacher the very large proportion of those who taught in the institutions were deaf teachers.

9263. That is objectionable, is it not?—Most objectionable. When I went into the Old Kent Road Asylum, I think the staff was 12; I was the third who could hear, and all the other nine were deaf. They were very good specimens of what the combined system could do; most of them could speak; they all made signs to their pupils and to one another, but nearly all spoke to us, the hearing staff. Now I think deaf teachers are almost obsolete. but I can give you one very curious instance of a deaf and dumb teacher. At the Melbourne Institution in Australia the head master, an old pupil of the Old Kent Road, is deaf and dumb; and in that very institution the oral system is taught by a gentleman who is himself deaf.

9264. That surely cannot be so advantageous?—I am told that the results are very successful, but he has a helpmeet. He teaches his deaf children as he was himself taught by Mr. Van Asch, who is now in New Zealand The father of Mr. Hutchinson, the gentleman I speak of, is rector of a parish in Staffordshire, and his son was a pupil of Mr. Van Asch. He is now married; he teaches the oral system to the deaf children in that institution, and his wife stands by and gives the necessary correction which only a hearing person can give. With regard to the deaf, dumb, and blind, I have had curious experience. I have never had a deaf, dumb, and blind pupil; but the first case I had ever seen was a case that was brought before the British Association a good many years ago by Dr. Fowler, a physician of Salisbury. This woman was in the Rotherhithe workhouse. Then I knew Mary Bradley and Joseph Hague in the Manchester Institution.

9265. There is a deaf, dumb, and blind person now being taught there, is there not?—If so, that is more recent. Mary Bradley must have grown into mature age now, if, indeed, she is living. Joseph Hague was the deaf and dumb child of a deaf and dumb mother, and he became blind by disease when he was about 12 months old. I knew him from a boy and up to his death. The last letter that he ever pricked in his peculiar way of communication was on his death-bed, and was addressed to me.

9266. I suppose it is possible with a great deal of pains to teach such a person?—A man of indomitable energy, great ingenuity, marvellous zeal, and the highest type of man, such as my dear friend Mr. Patterson was, might succeed where others would fail. The most extraordinary case that I ever had to do with was making the will of a lady who was deaf, dumb, and blind, and proving it in Westminster Hall before Sir Cresswell Cresswell. Ten thousand pounds were placed under her absolute control in consequence of an affidavit that I made after having an interview with her in her own house in Shropshire. But I must say that I think the oral system would have been at fault there. I do not mean to say that the communication I had with her could not have been made by the oral system, but I could not have made it.

Dr. D. Buxton, F.R.S.L.

25 Mar. 1886.

9267. Was it entirely by signs?—It was by the using of my right hand on her left hand, and communicating with her in that way by manual communication.

9268. Of course in the case of the blind the oral system could not be carried on?—I believe Dr. Howe thought it could, and he is a very high authority. When Dr. Howe was in London, he saw me at the Old Kent Road; I never spoke to him, but he asked Mr. Watson, upon whose staff I was, if he would spare me to go over with him to America, and help him to teach, that I might become one of his staff and teach Laura Bridgman.

9269. Fortunately the cases of which you are speaking are comparatively rare?—Very rare indeed. Mr. Ackers just reminds me of the most extraordinary case in Brussels that I ever saw in my life, where communication was made by one of the Sisters taking hold of the deaf, dumb, and blind person's hands and moving them about, they having a language of signs mutually understood. That same person had not been born deaf or blind, but she could speak and delivered an oral address of congratulation to Monsignor de Haerne on the occasion of which I am speaking. In respect of the case of proving the will of Miss Poole it is unique. First of all I saw her with a view to ascertain whether she was a person competent to understand the value of money, the nature of business, and to exercise her own will with regard to her affairs. I did see her, and with me was united in the same affidavit a clergyman whose mother, along with this lady, had been a private pupil at Mr. Braidwood's at Hackney, where Dr. Watson was assistant, before the London Asylum was ever started. This lady had moved in the respectable circles of her own neighbourhood all her life, until at the age of 60 she became blind. Her over careful friends withheld from her 7,000*l.* which a relative had left her, representing that her condition was such that she did not know how to manage it. So we saw her, and reduced the whole of our inquiries and the answers thereto to an affidavit drawn up by a London lawyer, who was present, and this was sent up to the Court of Chancery, and through it the whole of her property was placed under her sole control. Subsequently I was informed, in a letter from the solicitor in Gray's Inn, that it was very desirable that she should make her will, that he would take instructions for the purpose, and I was to go down to explain its provisions to her, and to witness it. I will describe the scene. She sat at one end of the table, and at the other end were the chief official persons of the place, Ludlow in Shropshire, the mayor, the rector, the principal medical men, and other principal persons, not as experts, but in order to see that the whole thing was done above board. When she was told I was there, she rose to receive me, and a seat was provided for me on her left hand. The lady on her right was a sister of the clergyman, who joined me in the affidavit, who, therefore, had known this lady from her childhood as being her mother's friend. A copy of the will lay before the deaf, blind lady and myself, and another copy was before the gentleman sitting in the seat corresponding with your Lordship's. I began spelling on her hand with perfect silence one sentence. She turned to the lady on her right and spelt on both her hands the sentence that I had just repeated to her. That lady, having nothing before her, repeated aloud what presumably I had said to the blind lady, and what certainly the blind lady had said to the her; and the official gentlemen at the other end saw that they were actually the very words in the will before them. So it went on. She stopped me in one place and said: "Not a thousand, a hundred," showing that she knew the value of numerals; and she willed away the whole of her property with perfect accuracy. She left a portion of it, and a very substantial portion of it, to the very persons who had wronged her by desiring to keep it from her, and they were her blood relations. She left 100*l.* to the institution whose headmaster helped her to make such a will. That was the last time I saw her. Then when the will came to be proved the relations contested it. They said that nobody in such a condition as that could possibly make a will. We fought the battle out at the Probate Court in Westminster Hall the whole of one day, and on the following morning the other side gave in, and the will was proved. This was on May 3, 1861.

9270. (*Mr. Johnson.*) What was the lady's name?—Jane Poole. I have before me a note as to the question of state aid, but I think your Lordship has asked me all that you desire to ask me on that subject. I think that a capitation grant is very necessary.

9271. (*Chairman.*) Have you seen the resolution that was passed by the Manchester School Board?—Yes.

9272. Are you in favour of that generally?—It seems to me to point out a way in which the thing could be done, which I think is so necessary to be done.

9273. (*Admiral Sir E. Sotheby.*) Do you know what is the universal system of teaching on the continent; is the oral system universal?—It is not universal, but I think I may say that in every country it is used in the large majority of schools.

9274. You are not aware that it is universal in France?—No, but it is spreading very rapidly. Since the congress at Milan the system has marvellously spread in France. It was at once introduced into all the national institutions in France, of which there are three.

9275. You have spoken about the marvellous results at Milan; in what way were those results superior to what you have seen or known in this country?—I have here a copy of the letters which I wrote to the "Times," which record impressions then fresh in my mind. One is dated the 25th of September 1880, and with the permission of the Commission I will read a passage from it: "By "these resolutions and by direct evidence in other ways "the most emphatic contradiction was given to many of "the assertions and pleas which have been so persistently repeated in this country against the method "of teaching the deaf by speech. The arguments of "speakers were strong, and, to an open mind, convincing; the avowals of men who declared that the "work they had performed before a certain date, in all "conscientiousness and zeal, was done under a mistake, "that they were convinced of their error, and renounced "it, this had still greater weight; but the indisputable "and unanswerable facts which proved the triumph of "the system were what was witnessed in the schools. "These were the speaking and lip reading of the "pupils, the conversations among themselves, with "their teachers and with strangers, the acting of "written drama, not pantomime, the printed copies in "our hands enabling us to test their pronunciation and "their accuracy, the answering in examination, the "catching up of a correction and proceeding on the "instant with the sentence, the fluent command of "language, the copiousness in composition, the "absolutely perfect ease and certainty with which they "understood the speaker, whether he spoke audibly or "without emitting sound at all, whether he spoke to "them in the pure Italian they had learnt at school, or "in the *patois* which the old pupils had learnt in their "homes and workshops after leaving school, from their "companions and work-fellows; in all these ways, in "every possible way, and in ways which seemed im-"possible, these deaf children at school, and deaf men "and women who had left school and were winning "their way in life, appeared before us, spoke to us, "answered us, spoke to each other, answered each "other, gossiped with each other, in such a manner as "made their deafness a thing practically non-existent. "They knew what was going on as well as we did. It "was in the schools that the victory was won. In the "Congress Hall it was simply recorded."

9276. You do not see why deaf and dumb children should not swim equally as well as hearing people?—I cannot see why they should not swim.

9277. In the sea or anywhere else?—Anywhere. The only thing that would deter them from doing it would be fear, and they are fearless. You cannot frighten them by telling them to take care because there is a boat ahead there, or because there is a rock out of sight; they are like Nelson, who, when he was asked whether he had any fear of the bear, said, "Fear, fear! I do not know what fear is." That is their case exactly.

9278. Would it be better to have a special college for the educated classes, or allow them to matriculate at the universities?—I should prefer their matriculating at the universities. If the oral system performs what it is intended to perform, it will enable them to do that, and as a matter of fact, the Rev. Mr. Syle, the first deaf gentleman anywhere who ever received Episcopal Or-

Dr. D. Buxton, F.R.S.L.

25 Mar. 1886.

dination, entered himself at St. John's College, Cambridge, deaf man as he was, and only omitted to proceed to the ordinary examination as any other man would do because, his health gave way, and he was obliged to go home to America.

9279. Is that the only instance that you have known of a deaf and dumb person going to the university?—I cannot remember another at this moment. There is a pupil of Mr. Arnold's of Northampton, a Mr. Farrar, a very able man indeed; he is by this time, I suppose, a graduate of the London University; he matriculated there two or three years ago.

9280. You have visited the board schools, I suppose, have you not?—I am not a stranger to the buildings, but I have never been in them during class-time or school time.

9281. (*Mr. St. John Ackers.*) Speaking of the university, do you not know a Mr. Ibbetson, who lost his hearing when he was about 15, and who has taken his degree at Cambridge?—No.

9282. You have known a great many sign system schools become pure oral system schools, have you not?—Yes.

9283. Have you known any oral schools which have become sign schools?—Never. Not one.

9284. It has been stated that the International Congress at Milan was a packed meeting; you have already told the Commission that you were one of the executive committee of that International Congress; were you not also the organising secretary, or one of the organising secretaries, for this country?—I was the only one.

9285. Will you tell the Commission what were your instructions, and what steps you took in order to get persons to attend that International Congress?—I communicated with the head masters of every institution in the kingdom, and though it is a long time ago since I saw the answers I am familiar with the purport of the answers which I received from all. Mr. Patterson was one, Mr. Elliott was another, Mr. Howard was another, Mr. Van Praagh, Mr. Schöntheil, all answered me. Perhaps others did not answer, but all those I have named answered to this effect: that they would be very glad to go there, but that on the ground of expense it was quite out of their own power to do it, and they did not think that their committees would consent to it.

9286. But every single institution had an invitation?—Yes.

9287. From your knowledge, as being a member of the executive committee, was the same done in the case of the other countries?—Yes, I was the only member of the committee, so far as this country was concerned, but there were three members representing the United States for instance. The committee was made as representative as it possibly could be, in order that those who were interested in the subject and connected with the subject should be brought in.

9288. Did the head masters or the authorities of each of the institutions in other countries receive a similar invitation; was it part of the scheme of the executive committee that each institution throughout the known world should receive an invitation to that International Congress?—I take it that it was with that view that the representatives on the committee were appointed for different countries, and I naturally inferred that what I did as part of my duty as regards this country would be done by my colleagues as regard their own countries.

9289. As a teacher of great experience, and as one who went to this International Congress, at Milan, should you say that the majority of those who attended that International Congress, outside Italy (of course, naturally whenever there is an International Congress the majority of the people come from that particular country) were in favour of the sign system or in favour of the pure oral system when they arrived at Milan?—My impression is that the majority were not in favour of the pure oral system previously to their arrival at Milan.

9290. Were not a great number of them from France?—There were a great many from France.

9291. Can you give us the numbers which arrived at the conclusion which you have already alluded to?—160 against four. I know who the four were, but I do not know who the 160 were.

9292. How many out of the 160 came from Germany?—One only.

9293. Then if Germany had been represented in the same proportion that other countries were the natural conclusion is that the number would have been still greater?—Far greater.

9294. So that really without the country from which this system got its name, and where it is universal, being represented by more than one person, the numbers remain 160 to four?—Yes.

9295. Then can it in any possible way be honestly called a packed meeting?—I think not. I wrote an article about it afterwards (but did not send it, because others were writing on the same subject, and I thought it would be redundant), to prove that it could not be packed; and I take great exception to the taste of those who going there in good faith expecting to find a certain decision in conformity with their own views, on finding that it was not in such conformity turned round and blamed the very authority that had invited them. If they had taken exception to the organisation of the body from the outset I could have understood it, but to assent to the organisation, to accept the invitation, to take part in the proceedings, and to go to the vote, and then to exclaim against the authority when a vote was arrived at adversely, I thought was a piece of bad taste. I think I have mentioned in this letter the fact of the Germans not being there.

9296. Do you happen to know the reason why they were not there?—One obvious reason was that their expenses were not paid, and they are poorly remunerated. Another reason that we all arrived at was this: that they were not in a tremor about their system; they knew it was the best, and therefore they let it fight its own way, and gain its own victory.

9297. You have, in answer to his Lordship, given evidence about the training of teachers; you were, I think, the first person in this country to really advocate strongly and practically the training and improvement of the status of the assistant teachers?—That was always very near to my heart, not only from my desire to do all I could for the deaf, that their education should be improved, and that the status of the teachers should be improved, but because I felt the enormous difficulty of one man having the responsibility of teaching 100 children or more, and being very insufficiently supported to the extent of one half of his school.

9298. Was it possible in those days to get efficient teachers?—You might sometimes get them without experience and without any efficiency and train them up to a certain point; but then they were promoted and you were left to start again.

9299. You have spoken of the great advance which has taken place since the Ealing Society was founded; but do you consider that the training of teachers, even now, is sufficient, seeing that we have it in evidence that the teachers who have been trained are nearly all ladies, and that at the present time hardly any male teachers have been trained?—When I was secretary of the Ealing Society I entirely agreed with the anxiety of the committee upon the subject. We felt that we were working at a great disadvantage when we were not able to get male teachers.

9300. Do you think it would be possible to get a supply of male teachers properly trained without Government assistance to the training colleges?—I do not.

9301. Do you consider that the assistance of the Government to training colleges for teachers of the deaf should be at least equal to what is given to training colleges for teachers of the hearing, provided that the training colleges for the deaf train the same class of persons, that is to say, teachers of elementary education, not for the rich, of course?—Yes. For simplicity of argument, and in order to give additional cogency to the argument, I am prepared to say in so many words that what you do for the hearing you should do for the deaf.

9302. And you would insist upon as long and full training for the teachers of the deaf as for the teachers of the hearing?—Longer if possible.

9303. Though much has been done you are still dissatisfied, because you think we ought to have a great deal further training of teachers for the deaf?—We have, perhaps, got half way to the point we are aiming at, but I should like to see the whole ground covered.

9304. You have had great experience of different systems; will you kindly tell the Commission in the shortest possible way the different manner in which you would give a short sentence in signs, and the same sentence in the ordinary English language?—I might say, "I saw the Queen pass from Buckingham Palace to the "Thames Embankment." Now, Buckingham Palace, unless the person that I was speaking to knew Buckingham Palace by a general sign, I should have to spell; and so I should have to spell Thames Embankment (*the witness gave the signs*).

Dr. D. Buxton, F.R.S.L.

25 Mar. 1886.

9305-6. Will you kindly take one short sentence which you would be able to give entirely in signs without the manual alphabet?—"The Queen went to see "her son's wife, who had just had a baby" (*giving the signs*).

9307. In the one case you have given it us in English; will you translate literally the order of the signs in the particular sentence?—"Queen's son's wife baby "have. Queen went in bedroom baby see." That is simple signing.

9308. You do not give it in the order of the English language?—Sometimes the very reverse.

9309. Do you believe that those who have been taught upon the sign system rarely think as a rule in the order of the English language, or do they not think in the order of the signs, and then translate from that to the English language?—That depends upon the stage of their attainments.

9310. Take for instance the first half of the education at school?—I should think that during almost the whole of the time they are at school they think in signs. But when they go into the world and improve their knowledge of language they sometimes lose their knowledge of signs altogether, as I have known them to do. They communicate only in the manual alphabet; then they think in language, and they employ language only; but that comes afterwards. All these systems aim at the communication of language, the oral system by means of speech, the combined system by means of speech and signs, and the sign system by means of signs only.

9311. We have had it in evidence that in the sermons at St. Saviour's, Oxford Street, the signs are given in the order of the English language; has that been your experience when you have been there?—No, nor is it my experience when I gave sermons in signs myself. I know it is in their Rules, because it strikes me that the originators of that society were conscious of the necessity of keeping as close as possible the connexion between signs and language.

9312. But to a great extent it is not done?—I do not think it is done. I never affected to do it. Perhaps it is vain in me to say so, but I suppose Mr. Stainer and I are the two best signers in England, and we could communicate a religious service in the language of signs, if anybody can. But signs communicate to the mind of an educated deaf person that which the language in his mind enables him to recognise.

9313. You do not then agree with the late Dr. Howe, who expressed to me his distinct opinion that if he had again to teach Laura Bridgman and Oliver Caswell he would have used the oral system?—I do not agree with that, only because I am not in a position to give an opinion. He having practically succeeded in doing this or that thing, might see his way to doing something beyond that; but as I never got to that point I am not in a position to give an opinion.

9314. (*Mr Johnson.*) I think you mentioned just now that the greatest proficiency in the oral system that you had witnessed in England was at Doncaster?—I said that I saw speech more freely used amongst the pupils at Doncaster the other day than I ever saw before.

9315. How was that result obtained; was it through trained masters and mistresses, or who were the people that instructed those pupils?—Mr. Howard has had (though for a less time) just the same practical experience that I have had; he has had to acquire it in institutions.

9316. He was not at any training college?—He was not. I remember at this moment that one of his teachers is the daughter of an old head master of an institution, so that it is possible that amongst his other teachers there may be some who had antecedent knowledge of the deaf and dumb.

The witness withdrew.

Adjourned to to-morrow at 12 o'clock.

32, Abingdon Street, Westminster.

Friday, 26th March 1886.

PRESENT:

LORD EGERTON OF TATTON IN THE CHAIR.

THE RIGHT HON. SIR HENRY SELWIN-IBBETSON, BART., M.P.
ADMIRAL SIR E. SOTHEBY, K.C.B.
W. TINDAL ROBERTSON, ESQ., M.D.
E. C. JOHNSON, ESQ.
CHARLES FEW, ESQ.
CHARLES E. D. BLACK, ESQ., *Secretary.*

DR. DAVID BUXTON, F.R.S.L., further examined.

Dr. D. Buxton, F.R.S.L.

26 Mar. 1886.

9317. (*Mr. Johnson.*) With regard to the statistics relating to deaf and dumb children in the census of 1881, have you anything further to state?—The first paragraph of the memorial presented in 1885 to Mr. Mundella, the Vice-President of the Committee of Council of Education, by the members of the governing bodies and head masters engaged in the education of the deaf and dumb, is as follows:—"The Census "Returns of 1881 showing that there are over 3,500 "deaf and dumb children of school age in England and "Wales, although there is only school accommodation "for about 1,700, prove that the existing means for the "education of this section of the population is inade-"quate." Lord Egerton of Tatton in introducing the deputation said, "Since the last deputation which Mr. "Mundella received in 1881, we find from the census of "that year that in England and Wales there are between "the ages of five and 15 years, 3,508 deaf and dumb "children, and school accommodation for about 1,700 "I believe that at the present time the school accom-"modation is somewhat larger; the Secretary has "gone into the figures, and I believe that in 1884 it is "rather more than that. (*Lord Carlingford.*) Is that "in Great Britain?—(*Lord Egerton of Tatton.*) No, "these figures refer only to England and Wales, "although, of course, we have here representatives from "Ireland and Scotland. At the time this memorial "was prepared the 1881 census returns for Scotland "and Ireland were not issued; the figures only relate "to England and Wales." Then, Mr. Lunt, who is the Secretary to the Manchester School for the Deaf and Dumb, laid a table before his Lordship in which these figures were given:—Total deaf and dumb population in England and Wales, 13,295; children of school age, 3,508; children under instruction 1,891. The total deaf and dumb population is taken from the census, but the number of children of school age is an assumed number. We have the number of all children between one age and another in Her Majesty's dominions, and then an assumed proportion of that number is taken as the number of deaf and dumb children; how far that assumption is well or ill founded is a matter which

Dr. D. Buxton, F.R.S.L.

25 Mar. 1886.

further, careful, more systematic, and better managed inquiries may bring more fully to light.

9318-19. On whose authority do you suppose that that assumed number was arrived at?—It was arrived at amongst experts. The late Mr. Baker, of Doncaster, told me that he thought it might be presumed that 16 per cent. of the number of the deaf and dumb are children of school age. Another way of putting the same formula is to say that one-sixth of the deaf and dumb population of the United Kingdom of all ages should be at school.

9320. The fact is, that the number of deaf and dumb children of school age you give is not an actual number returned, but an assumed number?—That is so.

9321. (*Chairman.*) Are there strong grounds for presuming that there are a great many more than that table of Mr. Lunt's gives as being the assumed number?—Yes, undoubtedly. The deafness of most children under five years old cannot be known.

9322. (*Mr. Johnson.*) You said yesterday that you and Mr. Stainer were great adepts in the sign system?—Yes.

9323. We have had it stated in evidence that Mr. Stainer became converted rather suddenly from an advocate of the sign and manual system to an advocate of the oral system at the Congress at Milan; might I ask you whether your conversion was more sudden or less sudden than Mr. Stainer's?—Men have to adapt themselves to the circumstances in which they find themselves placed. Whilst I was the head master of a combined system school I was bound to be loyal to my committee and I did not see my way to proceeding further towards the adoption of the oral system than I at that moment saw I was at liberty to go; but at the Social Science meeting in 1875 in Liverpool I read a paper in which I said that we were on the threshold, I thought, of a great change. I had made Mr. Ackers' acquaintance and I knew what he was endeavouring to carry out, and I said I should have been very glad if Mr. Ackers had been there himself to describe his own plans, but I thought, looking back upon the past and anticipating the future, the next few years would see very striking changes indeed. Then in the summer of 1877 we held a conference (the first of the conferences of which the third was held last summer), of which I was vice-president, and one of the questions proposed to those who constituted that conference was whether the representatives of the German system were to be admitted or not. I said unless they were admitted I could not be a member myself. I considered that the thing must be thrown open to everybody. Mr. Ackers, Miss Hull, Mr. Kinsey, Mr. Schöntheil, and Mr. Van Asch were present, and the impression that they made upon the minds of those who were present, whether it bore fruit immediately or not, certainly told marvellously upon the progress of the oral system. While we were in conference here in London we were all asked to go and see the system in operation, and we went to the Jews' Deaf and Dumb Home at Notting Hill and there saw what certainly I, with all my experience, had never seen before. Though I was committed to one system I hope I am not so thickheaded or blind as to resist the power of evidence when brought before my own eyes. The teaching was on the oral system, and its methods and results, as then exhibited to some of us for the first time, won our complete approval. Mr. Patterson, who was the oldest headmaster on the sign system in England, was present, with his son, and on leaving the home, the son said to the father, "There is more done there on that system than "we can do on ours." The favourable impression produced by that visit has been frequently referred to since. It was a "moving of the waters," the starting point of a new era in the teaching of the deaf in England. A few months after that Mr. Ackers, knowing that I was about to leave Liverpool, and presumably knowing that my feeling towards the oral system was not so adverse as that if I should join his institution I should try to upset his scheme, offered me the secretaryship of the Ealing College, which I accepted, and from that time I have been a hearty advocate of the oral system, but I never devoted myself to it with such a willing heart as after I had been at Milan and seen results such as I described yesterday.

9324. What you heard and saw at Milan confirmed your previous impressions?—Yes; and also what I had seen sometime before at Rotterdam as a mere casual traveller showed me what satisfactory results were to be obtained from the system. Rotterdam was supposed to be the radiating point of the oral system until some of us had been to Italy and others of us had been to Germany. I was staying at a hotel at Rotterdam and told the commissionaire that I wanted to go to the deaf and dumb institution the next day. He said, "In "the house opposite there lives a little girl who goes to "the school." I thought this would be a good chance for me, taking a child as it were at random in that way, to find out the merits or defects of the oral system. So I said, "I should like to see her." The commissionaire said, "I saw her a minute ago, but I do not see her now." I said, "If you see her again call me out." By and by he called me out and I found the little girl there. She was a child of 11 or 12. Of course she talked Dutch and so the commissionaire had to interpret. He had none of the practice of an expert, he was simply the commissionaire to the hotel. I said, "Tell her I want to go and "see her school to-morrow." I may have added something more, and then the commissionaire said to me, "She says "it is a bad day for you to go to-morrow, you will not see "the children in school." I then asked him to enquire "How is that?" and her reply to him was, "It is fête "day, it is Mr. Hirsch's birthday, a grand holiday"; and the conversation was continued for some time between the interpreter, myself, and the child. When I got there the next day I found what she had said to be perfectly accurate in every point. Here was a child picked up in the streets, so to speak, accidentally, not a selected child but an ordinary pupil, who communicated to a stranger through a stranger with as much freedom as a hearing child could have done.

9325. From your great experience amongst the deaf and dumb, will you tell us what is the opinion amongst the deaf and dumb themselves as regards the oral system?—The deaf and dumb themselves are not competent witnesses.

9326. (*Chairman.*) Not all of them?—I mean that not all of them are competent witnesses.

9327. (*Mr. Johnson.*) But what is the feeling of the deaf and dumb themselves with regard to the oral system as compared with the sign and manual system?—I should say that the answer they would give to the question "Which of the systems do you prefer?" might almost be made a test of the standard of their attainments. I should say that those who appreciate all the advantages which a knowledge of speech gives by bringing them into communication with the world would be friends of the oral system. On the other hand, those who have lived in a cage all their lives are so much attached to their cage that they have no desire to fly outside. Some of the best educated persons I know have made efforts of their own, after their school training was over, in order that they might gain as much instruction as the oral system could give them. I know one deaf gentleman who is a most ardent advocate of the oral system, and I have been present when he has spoken in three languages. He has addressed me in English, he has addressed a lady, who was formerly a student at Ealing College, in French, and he spoke to a friend in Norwegian.

9328. If the oral system were introduced generally into England, of course it would entirely supersede all other systems for the instruction of the deaf and dumb; do you suppose that it would be possible to introduce the oral system so gradually at the existing institutions as to allow the old system to die out and the new one to be established in the same institution?—I cannot conceive that possible under the same roof unless such complete isolation were possible under a very extensive roof as would be equivalent to a separate building.

9329. (*Chairman.*) As at Manchester?—Yes, and as is the case at Margate; there they have the schools for the two systems some 4 or 5 miles apart. We have an example in what was done by the Abbé Tarra. He had two houses, one for the sign and manual system, and one for the oral system; all the new comers were placed in the house devoted to oral teaching, in which at first there was but a small number, but the day came when the maximum number became the minimum, and the minimum became the maximum; they changed places, and finally, when the oral system had become universal, the sign and manual house was no longer used.

9330. Do you find that those that have been taught on the oral system lapse into the sign system after they leave school?—I do not think the oral system has been sufficiently long in practice to justify one in giving any definite opinion upon that subject. Let it be borne in mind that since the new régime I have not been a teacher at all; I have been acting as secretary to the Ealing College. I am speaking of my former experience as a teacher, adding my experience since as secretary of a society; but altogether I have given 40 years' attention to the subject.

Dr. D. Buxton, F.R.S.L.

25 Mar. 1886.

9331. (*Dr. Tindal Robertson.*) Can you tell us whether the oral system was ever practised in this country before it was introduced from Germany?—Originally those who had to do with the teaching of the deaf turned all their efforts in the direction of teaching them speech. The thing which struck everybody was the thing obviously wanting, speech, and to supply that was the aim of all effort till the time of the Abbé de l'Epée. The Abbé de l'Epée, having collected a certain number of deaf and dumb children into one school, found that when you group a number of children together into a class they begin to make signs; so it occurred to somebody, I do not know who it was, that this use of signs which was so ready amongst themselves might be made a very useful instrument of instruction, and that led to the adoption of signs as a mode of teaching in place of the better system previously practised by means of speech. The French system has been till lately a system of signs, and it originated undoubtedly in the Abbé de l'Epée's school, where, when the children were assembled together, they made signs among themselves, and the means which the children adopted for communicating with one another were adopted by the teacher as a means of instruction. But, as I have said, previously to that the aim of all teaching of the deaf was to give them speech. It was so in this country in early times; it was so in Spain, it was so in Holland, and it was so in Germany, and the mode of teaching by signs was originated in the latter end of the 18th century in the school of the Abbé de l'Epée, in the neighbourhood of Paris. We know that the Americans took their system from that school; they adopted first the sign system, but latterly the combined system, though the oral system is now making very considerable progress in America.

9332. With regard to your conversion to the pure oral system, you saw the working of it at Ealing College?—Yes, and I had had previous experience of it. I had taught pupils orally at Old Kent Road and in Liverpool. My earliest work as a teacher was to teach the first class of boys for the first six months how to articulate sounds and pronounce simple words.

9333. Where did you acquire the knowledge and experience which enabled you to do that?—On the ground on which I stood; I had to pick it up as I went along.

9334. Then the oral system was taught in a modified form even then?—It was called the articulation system, all the children were taught to articulate, and many of them spoke very well. I was one of three hearing teachers, the whole of the rest of the staff being deaf, and the deaf teachers, most of them, spoke with an ease and with an intelligibility that rendered it unnecessary for them to communicate by signs with us, and this they never did.

9335. With regard to the statistics that you have been speaking of, you say that the figures are not altogether reliable; I do not know if you imagine that the number of deaf and dumb children not in schools would be rather above than under the number given. Could you suggest any system by which reliable statistics could be got with regard to the deaf and dumb?—I said yesterday, the very best statistical inquiries ever instituted in Her Majesty's dominions are those made by the Census Commissioners in Ireland; whether they have less to do than the corresponding authorities here, and so are able to do it better, I do not know, but they have an agency of verification there which does not exist in any other part of the kingdom; the Irish Constabulary is at their beck and call, and they send back the documents for further investigation if they find anything in them which strikes them as requiring explanation. Of the misleading character of the statistics of the deaf, which are sometimes returned to the Census Commissioners, an amusing instance may be given. In a district in Ireland the number of the "deaf and dumb" returned to the Census Commissioners was so wildly at variance with the ordinary proportion, that the official documents were sent back again for a further investigation. It was then found that the sapient enumerator had returned as "deaf and dumb," not only those inhabitants who were old enough for their condition to be properly ascertained, but every infant child in the district too young to be able to speak, or indeed to perform any other act of volition of any kind. In answer to your question I would say that until our inquiries are made on a better system, with a larger scope, and with reference to points selected and settled beforehand, and are then submitted to a competent verifying authority, the investigator of these facts, however earnest in his inquiries and philanthropic in his purpose, will frequently find himself in a fog.

9336. If some similar system to that which is carried out by the Irish Census Commissioners for collecting statistics with regard to the deaf and dumb (that is to say, the number of deaf and dumb, the causes of deafness, and so on) were adopted in England, would that meet your views?—I would say that the Irish Census Commissioners' programme is the best one to be followed.

9337. You have given us some information about the causes of deafness; have you formed any idea whether any means might be adopted of preventing deafness in some of those cases?—I think an Englishman's love of liberty would not permit us to go so far as to prohibit consanguineous marriages.

9338. You would prohibit them if you could see your way to do so?—Yes. Then I think that the intermarriage of the deaf and dumb is extremely undesirable. I have seen most painful proof of that.

9339. With regard to State aid, which you think very advisable, would you say that State aid should be given to institutions where deaf and dumb children were boarded and educated, or to day schools, or to both?—I should say it should be given wherever good work was done, where the institution was obviously and clearly benefiting the class for whom it was intended, no matter what system of teaching was adopted.

9340. I think you said that you could not see any objection to State aid being given for maintenance?—There have lately been issued the reports of three Government inspectors who were asked to visit the schools in London, Manchester, and South Wales, and the two inspectors who visited the Manchester and the South Wales districts, who go more fully into the subject than the inspector who reported upon the metropolitan district, agree in representing it as their opinion that 10*l.* per head in the way of a capitation grant for deaf and dumb children would be a very desirable and a very beneficial thing if the State would give it, in addition to the funds already at the command of the governing bodies of the institutions.

9341. Then if that was the form of grant, in what way would you propose that it should be expended, entirely for educational purposes or for other purposes as well?—If it went into the treasurer's hands it should be available for the current expenses of the institution, for all purposes.

9342. Would the 10*l.* be paid at the commencement of the pupil's education or when he finished it?—As soon as the institution began to spend money on the child it should have a fund to look to from which it could be recouped.

9343. Under those circumstances you would expect that there would be inspection?—Undoubtedly.

9344. Have you any suggestion to make as to the character of that inspection?—It should not be taken for granted that anybody is capable of understanding the idiosyncrasies of the deaf and dumb.

9345. (*Chairman.*) It should be skilled inspection?—Yes, undoubtedly.

9346. Would you, in addition to a grant for children, make any grant for the education of teachers?—Yes, I would.

9347. In what form?—I would follow the existing arrangement with regard to the training of teachers of hearing children.

9348. How long a time do you think a teacher who was a fairly intelligent man ought to be under training as a teacher of the oral system?—A minimum of 12 months, during which his entire attention should be given to college training. In the case of pupil teachers under the school board their two years are divided between teaching in classes and receiving instruction at the college. That is little enough. I think certainly two years should be given, and if a third year were given it should be combined with practice in classes. It should not be poring over lessons and listening to lectures only, it should be combined with actual practice, reducing into daily practice the lessons taught by the lecturer.

9349. (*Dr. Tindal Robertson.*) Have you any experience of the higher education of the deaf and dumb?—I have had pupils of my own who have spoken more than one language, some who have become good

Dr. D. Buxton, F.R.S.L.

26 Mar. 1886.

mathematicians, and so on, who have left me to carry on higher education under an ordinary private tutor.

9350. Is there any public institution for the deaf and dumb where classics and branches of higher education are taught?—I am not aware of any.

9351. You do not know of any institution for the deaf and dumb analogous to the Worcester College for the blind sons of gentlemen?—No; the only such college that I know for the deaf and dumb is the one at Washington.

9352. Do you know whether from that college there are any exhibitions to any of the universities in America?—That college has university status and grants degrees. I hold its diploma myself, signed by the late President Grant. I may say that a highly educated deaf and dumb person who was first a pupil and then a teacher at the Margate Institution has gone over to that college at Washington, to carry forward his higher education, I presume from the fact that he could not get such higher education in his own country.

9353. Do not you think it would be a very desirable thing if by some means or other exhibitions to universities could be founded available for deaf and dumb persons who might be thereby encouraged to fit themselves for entering one of the liberal professions?—They must first have the necessary preparatory training to lead up to the steps of the university.

9354. I am supposing that they have first gone through that preparatory training?—The number of those requiring such higher education would be very few. I doubt whether there would be a sufficient number to justify founding exhibitions for that purpose. Those who desired to go in for higher education would do what such persons have done hitherto, continue their course of instruction under competent private tutors.

9355. One question as to the teaching of handicrafts to the deaf and dumb; do you think such technical teaching might be better given in central places where they might be associated together, or do you think it better that they should be apprenticed?—The system of apprenticeship does not now seem to be so much in favour as it used to be; I do not know whether there has been any improvement in the system of apprenticeship since I left Old Kent Road, but in many instances when I was there it failed of the desired success. I should be disposed to think that it is still less successful now; that is only what I assume. There is undoubtedly an advantage in a few deaf persons being associated together for the purpose of learning trades, but not in such numbers as to constitute a workshop rather than a school. I would have the school element predominate. Mr. Stainer has suggested that we should adopt the system which is followed in Russia and some other continental countries, that the boys during the latter part of their school time should have their intelligence quickened and their interest in their school work kept alive, by accustoming themselves to handicraft work and knowledge of tools, construction, and so forth, but not that trades should be taught, before they left school. That I think is a very valuable suggestion.

9356. Do you know whether there are any pension societies for the deaf and dumb?—There is one, the Charitable and Provident Society, of which I think Mr. Stainer is honorary secretary.

9357. Have you any knowledge of that society yourself?—I have been cognisant of the fact that such a society existed during the whole of the time of my connexion with the deaf and dumb. I know that it was originally established as the Watson Society; it was established in memory of Dr. Joseph Watson, who was the first teacher at the asylum for the deaf and dumb in the Old Kent Road and who died in 1829.

9358. Are you aware that the Cordwainers' Company give pensions to the deaf and dumb?—I believe that Christ's Hospital or some of the City Companies are trustees for certain limited funds for the deaf and dumb, and also for the blind.

9359. I presume, compared with the pensions that there are for the blind, they are very small?—Infinitesimally small, I should say.

9360. If by any means the small number of pensions for the deaf and dumb now existing could be increased, so that those who were very poor might receive the advantage of pensions in their declining years, do you think that that would be very desirable?—I think it would be very desirable indeed. There is a bequest in Liverpool left by a gentleman whom I formerly knew, which is distributed to several respectable aged persons who have got past the age of working and who might be driven to the workhouse if they did not receive some such assistance. I think I saw in the last report that over 70*l.* out of that fund had been distributed to deaf and dumb persons during the year.

9361. Have you any experience with regard to charities for the deaf and dumb at Bristol?—No.

9362. I have been told that for every blind child there 1,000*l.* can be found. I do not know whether you know of any provision whatever in that city for the adult deaf and dumb?—I do not. The head master of the local school for the deaf and dumb is an old assistant of mine, but I do not know anything about Bristol except from passing through it. But on the general question, comparing blindness with deafness, the attractiveness of blindness to the philanthropic and benevolent mind as compared with deafness is I should say as 100 to 1. The affliction of blindness is a visible affliction, it is an affliction that anybody can realise far better than they can deafness, it is very widely spread, and it is one of the concomitants of old age. Most people can realise failure of sight and the utter extinction of it; it is the ability to realise the condition of people who are deprived of their sight that makes people so quick to respond to calls on them on behalf of the blind.

9363. It would be an advantage if something similar to what is done for the blind who are past work in the way of pensions could be done for the deaf and dumb?—I should hail such a thing as one of the greatest boons that could be conferred on the deaf and dumb.

9364. (*Mr. Few.*) Do I rightly understand that you have not been a teacher of the deaf and dumb since the oral system was introduced?—No. I have never taught the oral system since the new régime, so to speak. I have been a secretary and not a teacher.

9365. Therefore your opinion with regard to the advantages and results of the oral system is formed upon observation and not on actual practice as a teacher of the oral system?—I had some experience in teaching articulation at the Old Kent Road. I have heard from eye witnesses what has been done elsewhere, and I have read about what has been done elsewhere; I saw the results of the system at Rotterdam and also at Mr. Schöntheil's school, and then in 1878 I became connected with the New College at Ealing, and saw it from its early development; but at Milan I saw its later development, which carried conviction to most of those who saw it.

9366. Your opinion appears to be that deaf and dumb children are not competent of themselves to judge as to the value of the oral system?—I do not think they are. I would rather take the judgment of the parents, the children are *in statu pupillari*.

9367. Do you consider that all deaf and dumb children can be taught by the oral system?—The Italian authorities say they can.

9368. What is your own opinion?—I am not a teacher. I have not taught the oral system so as to acquire the means of giving an opinion of my own.

9369. As regards the question of State aid, would you contemplate that grants should be made to all schools where the deaf and dumb are taught, irrespective of the status in life of the children taught in those schools?—I would give State aid to all schools in which the deaf and dumb were taught, whether private schools or public ones. There is as much labour, as much responsibility, as much anxiety, as much of that which deserves guerdon and reward, in the one case as in the other. I cannot see any necessity for separation myself.

9370. Would you propose that a capitation fee should be given in respect of every child in a deaf and dumb school, asylum, or institution, whether the parents of the child were in good circumstances, or medium circumstances, or in poverty?—I think that the exceptions would be so few in which the parents were in good circumstances that the simpler way would be to make no distinction.

9371. That would be in some cases a grant of State aid where the parent ought to provide for the child's education himself?—If it were practicable to make a separation I would do so; but the per-centage of those children whose parents were well-to-do would be very small; in 100 you might have six that would come under that category.

9372. It might be more or less?—I do not think you would have more than 5 or 6 per cent.

Dr. David Buxton, F.R.S.L.

26 Mar. 1886.

9373. As regards State aid in respect of teachers, would you propose that that aid should be granted to colleges giving instruction to teachers irrespective of the status in life of those who were being taught or their power to maintain themselves outside State aid altogether?—That is a very large question; it is a question of management.

9374. It is a question of finance in one sense?—The difficulty of getting competent persons to undergo the requisite training arises partly from the fact that they are absolutely surrendering their income for twelve months and paying out of their own pockets their tuition fees in addition; therefore if State aid would enable competent persons to undergo the training, and if their valuable services could be by that means utilised for the benefit of the deaf and dumb, I would say let the colleges that are training such people receive State aid irrespective of whether they are people who have to earn their own living, or whether their friends are well-to-do. I would aim at that which was for the advantage of the deaf and dumb, and I think more good would be done by passing over the difficulty at which you hint than by regarding it.

9375. But if a person trained in such a college earned his living afterwards as an ordinary teacher (or governess) State aid would have contributed to his or her education, and the object with which such aid was given would not have been attained?—That may be so; if it were possible to get such persons to repay the amount contributed by the Government in their particular case I would make them do so. Besides, the difficulty is not new; all those that are trained in training colleges receive a certain amount of very valuable education at the cost of the State, and as soon as they have completed their education, instead of going into the schools for which they were trained, they sometimes take higher remunerative employment in the Civil Service or in mercantile or other employments by means of the very qualifications that the State's aid has helped to develop. If you could meet that evil in one case by all means meet it in the other, but if you swallow the big fish you may as well swallow the minnow. I am afraid it is one of the inevitable disadvantages of a system, the clear advantages of which are beyond dispute.

9376. A person who went in for training, say as a governess, under the oral system would be taught by State aid, whereas a person who wanted to be taught as an ordinary governess by the ordinary means would have to rely on her own pocket for her education?—I think it is a question whether persons when they first go into the college exactly know what their future is likely to be. I do not quite see how they could come under an obligation their capability of performing which would depend on contingencies, but certainly if anybody went to a training college with a view to avail himself of State aid in order to put money into his pocket by becoming a private teacher, I would compel that person to pay back again what the State had given, if I could.

9377. There would be no legal power to bind persons who entered the training college to become teachers of poor deaf and dumb children?—No, if there were such a power I should use it to the fullest extent of its applicability. If the State enables you to arrive at a standard of proficiency with a view of its being utilised for the benefit of the State your services ought to be devoted to the State.

9378. (*Chairman.*) To follow up that remark, as I understand, you only wish the education of the deaf and dumb to be placed in the same position as the education of other children, that is to say, that they should have the same claim to grants from the State *cæteris paribus*, due allowance being made for the difference in their position; and in the same way with the training colleges, you think that they should get the same advantages of having trained teachers as the elementary schools have now in getting theirs and no more?—I should like them to have more, because I think their position is exceptional; but I would be content with the same advantages. I would say, at any rate, they ought to have the same advantages. At present they require more and they receive less; that is the anomaly that I want to put an end to.

9379. You spoke of teaching the first class at Old Kent Road; was it the head or the bottom class?—It was the class into which children were put on their first coming into the asylum. In speaking of my work in that class I am reminded of a little incident to which perhaps I may be permitted to refer. I was present at the funeral of the late Rev. Mr. Smith, the first chaplain of St. Saviour's, who was a very old friend of mine, and a gentleman near to me asked me my name, and I told him, upon which I asked him his name, and he told me. Then I said, "Your brother was one of my first pupils in the Old Kent Road, Is he here." His answer was "Yes." I said, "I should like to see him." He said, "I will go and fetch him." I said, "Do not tell him who I am, he has not seen me for 40 years. He went and fetched his brother to me, whom I had not seen since his boyhood, and I said to him, "Do you know me?" He said, by speech, "Yes, Dr. Buxton, of course. and then he added, extending his hand to me, "I thank you for teaching me to speak."

9380. (*Mr. Johnson.*) He had been taught by what you called the combined system?—Yes; he learnt signs at the same time.

9381. (*Chairman.*) Have you anything to add to the evidence you gave yesterday?—Mr. Ackers asked me yesterday whether I was aware that of those who attended the Milan Congress some went there with their minds not made up, but who were open to conviction, and who went away convinced. I wish to refer to one instance. One of the speakers at the Congress, a French ecclesiastic, expressed himself thus. He spoke in French, and this is my translation: "I came to Italy strongly "prejudiced against the teaching of the pure oral "system. I did not believe that anyone could instruct "deaf-mutes without signs, but on visiting the schools "and seeing the pupils, seeing that all the pupils talk "and all read the movements of the lips, not only of "their teachers but of their schoolfellows, seeing also "that there was an intelligent exchange of ideas "between them, my prejudices are overcome, and I "return to France converted."

The witness withdrew.

Mr. Isaac Thomas Price examined.

Mr. I. T. Price

9382. (*Chairman.*) You represent the United Kingdom Association for the Blind?—Yes. I was for some time the honorary secretary of the London branch of that association; I am not the secretary at present, but I am on the committee of management, and I have been deputed by the London branch of the association to come before the Commission.

9383. When did you cease to be secretary?—In January.

9384. You are familiar with the objects of the association?—To some extent.

9385. Can you state when it was founded?—The original branch was founded in Sunderland, in the autumn of 1884.

9386. What led to the institution being formed at Sunderland?—I believe a number of blind men at Sunderland thought it might be a good thing to hold meetings to consider their condition, and to see if it could be in any way improved.

9387. Were you at Sunderland at the time?—No.

9388. When did you personally first join this movement?—In December 1884.

9389. Were you then resident in London?—I was.

9390. Was the London branch formed at that time?—The London branch was formed at that time.

9391. The objects of the association, I understand, are to improve the present state of the education of the blind?—That is one of the objects.

9392. Another object is to consider the various trades, pursuits, and professions now followed by the blind, and the possible introduction of new ones?—Yes.

9393. And a third object is to take into consideration the amount of success and the causes of failure hitherto attending the efforts made to ameliorate the condition of the blind?—Yes.

9394. What is there in the present system of education that you think especially requires improving?—In the

Mr. I. T. Price.

26 Mar. 1886.

first place I think all blind schools should be under Government inspection and, of course, that Government inspection should be accompanied by the usual Government grants, and I think, ultimately, it might be desirable to educate all blind children in company with seeing children.

9395. In the first instance?—In the first instance; while blind schools continue to exist I think they should be under Government inspection.

9396. Then would you propose that a blind child should be at once placed in a school with seeing children?—I should send him to an ordinary board school or any other school which the parents might think best.

9397. What provision would there be in an ordinary board school for the education of the blind; a blind child would not be able to read if sent to an ordinary school?—There are teachers whose business it is to visit the board shools and teach the blind children.

9398. I understood you to say that you advocated blind children being sent at once to school with seeing children. I ask you how can you ensure those children receiving proper education with the others if they have not been taught previously to read on some system by which the blind are taught?—They might learn to read while under the teacher whose business it would be to teach them to read in the schools.

9399. But he could not possibly teach them at the same time as the other children. I understand you to mean that they must have some previous special teaching before they can be placed in a class with seeing children?—I am not sure that it is necessary that they should have previous special teaching.

9400. How are children who are blind, who do not know how to read, to be trained in the same class as seeing children?—I think it would be necessary in the first place that they should attend a blind class, but it should be in connexion with the school for the seeing.

9401. Then you must have a previous training for the children before they are placed with the seeing children?—Yes, I think so, but that previous training should not be given in an isolated institution, that is what I mean.

9402. In that case you must pre-suppose that in certain centres there must be special classes formed for blind children in connexion with the ordinary elementary schools, and when those children have been so far trained that they can be taught with other children that then they should come into the general classes. Am I right in supposing that that is what you mean?—Yes.

9403. In the first instance of course they must be taught some special type; what type do you recommend?—I should very strongly recommend the universal adoption of the Braille system.

9404. The ordinary school books by which children are taught in the elementary schools are not used for the education of the blind at present, would you recommend that the same elementary books should be used by the blind as by the seeing?—Yes, I should certainly say that was quite desirable, and I should also like to say in connexion with that that the embossed books for the first three standards of education should be quite uncontracted. There is a system of contractions in general use in Braille's system, but those contractions ought not to be introduced in the books for the first three standards.

9405. With a view of simplifying the instruction?—With a view of simplifying it partly; and it would hold out an inducement to the seeing teachers to make themselves familiar with Braille's type, so that if a blind child were reading with a class of seeing children the teacher might be perhaps of more assistance to him.

9406. Do you think it is very likely that you would be able to get ordinary teachers who would be familiar with Braille's system?—I think it is quite likely; Braille's system uncontracted is very easily learnt.

9407. It would mean that you would have to give an extra payment to those teachers who qualified in that as an extra subject?—Yes.

9408. You are speaking now of large towns; it would not apply to country districts where perhaps there was only one blind child?—Of course there would be much more difficulty in such a case; some special means, no doubt, would have to be devised for instructing a single child in Braille's system.

9409. In schools in county districts you would have to have a teacher who probably would not be able to give a child the time to teach Braille's system; it would have to be taught outside the school?—I think most likely that would be necessary.

9410. You state that certain things ought to be done, but you have not stated how they are to be practically carried out; I do not know whether you have thought of these things thoroughly. You are aware of the difficulties I have pointed out?—Yes; I think they might be overcome.

9411. With a full knowledge of those difficulties that there must be in teaching blind children with the seeing, you still think that, as a general rule, all blind children should, as far as possible, be taught with the seeing?—Yes.

9412. And not at any special institution?—Not at any special institution.

9413. What are the grounds upon which you come to that conclusion?—One of the great advantages of blind children being taught with seeing children is that by mixing more freely with them they get more like them, and they acquire habits of independence more readily. In institutions which are established for the education of blind children exclusively they simply mix with each other, and lose a great many opportunities of obtaining information which they would have by being educated with seeing children; and they are taken away from their homes, which I consider is a great disadvantage. In every way they are brought up in a different atmosphere to what they otherwise would be, and they are less fitted for contact with the world when they leave the institution than they would be if they were brought up in the usual and natural manner.

9414. Has it struck you that there very often would be a difficulty in regard to the age of the children. Blind children would naturally be more backward than the seeing children, and in most cases you would have a blind child in a class with seeing children of a much younger age?—I think, as a rule, a blind child would not be more backward than a seeing child.

9415. That is assuming that he has somebody to teach him the Braille type in addition to what is ordinarily learnt by seeing children?—Yes.

9416. Would not it take more time for a child to learn to read if he was blind than if he could see?—I think not.

9417. Have you any experience that justifies you in giving that opinion?—I have very little experience, except experience of the disadvantages I have felt myself in having being educated in an isolated institution. I have reason to believe that there are children at present being educated in the board schools who can read and write Braille's type with great facility.

9418. At what age?—I cannot speak positively as to that; about 10 or 12 or 13.

9419. Do you mean that you know of blind children who are of the same age and in the same standard as seeing children?—I have heard of such; I do not know them myself.

9420. Where were you educated yourself?—In the school at St. John's Wood. I was not educated in Braille's type for reading.

9421. Were you educated in Moon's?—No; in Lucas's.

9422. You are familiar with Moon's?—Yes.

9423. Is there any other type you are familiar with?—I am familiar with the ordinary print in use by the seeing. I can recognise it when it is embossed.

9424. You prefer the Braille?—I prefer the Braille infinitely; chiefly because of the facilities with which books can be produced and written.

9425. They are not nearly so bulky as books written in the Roman or Moon type?—Not so bulky as books written in the Roman or the Moon type; nearly as bulky as those written in Lucas, perhaps.

9426. Have you any knowledge of the industrial training of the blind?—I can only say that at some institutions it has been very inefficiently carried on, because a sufficient amount of time has not been devoted to it.

9427. How long were you at St. John's Wood?—I was at St. John's Wood for about 10 or 11 years; during that time I studied music as a profession.

Mr. I. T. Price.

26 Mar. 1886.

9428. Were you taught any other trade?—No.

9429. Did you evince any particular disposition to learn music, or were you made to learn it whether you liked it or not?—I had rather a liking for music.

9430. You did not ask to learn any other trade or occupation?—I did not.

9431. Do you say that in your case you were or were not turned out well trained?—I consider that I might have been very much better trained. The training was not particularly bad, but it might have been very much better.

9432. I suppose you could hardly be aware, so far as the other trades that your companions were taught were concerned, whether they were successfully trained or not?—It was the custom after the boys were about 14 or 15 years of age to let them go into the workshop for two or three hours a day to learn a trade, letting them spend the other two or three hours a day in the schoolroom. Now a sighted boy is expected to devote several years to learning a particular trade, and he is supposed to be at it all day long, and I think that a blind child should certainly devote quite as much time, and perhaps a little more time, to the acquisition of a trade. I think it is obvious that they could not have been thoroughly well taught under that system.

9433. Do you know what became of any of those who left the school at the same time as yourself; did any of them earn their livelihood by a trade that they had been taught in the institution, or did they fail?—I have known one or two who have earned an indifferent livelihood, who have been able to earn a little; and in several instances those who had learnt tuning at the St. John's Wood school were afterwards sent to factories, and of course have been able to earn a good living in consequence.

9434. How many do you know from St. John's Wood who have become tuners?—I know about five or six.

9435. What education did you receive in music; did you learn anything beyond tuning?—I did not learn tuning; I simply learnt the profession of music; that is to say, I learnt pianoforte and organ playing, and the theory of harmony, a general knowledge of music.

9436. When you left the institution what was your first step?—I lived at home for a few months trying to obtain a position as organist, but I invariably failed.

9437. Why did you fail?—It was a great deal due to the fact that I was not allowed to compete. There is a great deal of prejudice on the part of the public which induces them to refuse blind persons leave to compete. But after a few months a vacancy occurred on the staff of teachers at St. John's Wood school, and I was appointed to fill it.

9438. Then the music which you had been taught failed you as a profession?—Up to a certain time it did; but at present I am engaged in teaching music.

9439. At the school?—No, at home.

9440. How long were you a teacher at the St. John's Wood school?—About six years; but I was not a teacher of music there.

9441. But did you use the opportunity of being a teacher there to improve your knowledge of music?—Yes, certainly.

9442. Were you at the end of the six years better qualified to earn your livelihood than you were before?—No doubt.

9443. Therefore, if you have succeeded now your case is not the case of one who has succeeded after leaving an institution; you have had the advantage of additional training at the institution?—I had no additional training, because I took no lessons.

9444. You had a certain amount of knowledge, and you had leisure, I suppose, and opportunities of acquiring an additional knowledge of music?—Yes, and, of course, as I grew older I gained more experience generally.

9445. What was your next step, after being six years at St. John's Wood?—I was then appointed music master and assistant teacher in the general educational department of the school for the blind at Plymouth.

9446. At what salary?—At a salary of 30*l.* a year, including board and lodging.

9447. How long were you there?—About 18 months.

9448. What number of pupils had you there?—I had about 18 music pupils, and I had to conduct small classes of children in the latter part of the day, in which there were about seven or eight children.

9449. Were you successful in teaching them during the limited time that you were there?—I was not very successful, because the system was not at all satisfactory.

9450. You mean that you had not enough time to give to music?—I had not enough time to give, either to the music, or to the education of the children, because I was expected to fill two offices.

9451. You had to educate the children as well?—Yes, in general education.

9452. You mean that the training was imperfect generally?—It was generally imperfect.

9453. Did you leave that institution for that reason?—Partly for that reason. The fact of the general training being imperfect led to some misunderstanding between the committee and myself, and I thought it best to resign.

9454. You asked, I suppose, that greater time should be given to music, in order to enable you to teach your pupils successfully, and the committee differed from you?—I gave a sort of report, in which I stated that the training was imperfect, as it must necessarily be, in consequence of the limited time devoted to it; and I was given to understand that there was a good deal of dissatisfaction felt with the work that I had done, and so I resigned accordingly.

9455. Since that time how have you been employed?—I have been living at home and giving private lessons in music. I have been able to obtain a considerable number of pupils, though my time is not at all fully occupied; and I may say that if I could obtain a sufficient teaching connection to occupy my time fully I should be earning a tolerably good livelihood.

9456. What class of people do you give lessons to? What do they pay for your lessons?—I generally get about a guinea a quarter for 13 lessons, one lesson a week. That may represent the class of people that I teach.

9457. Are your pupils ordinary sighted pupils?—Yes, with one exception; I have one blind pupil, but the rest are sighted pupils.

9458. Do you get more for teaching the blind than for teaching the others?—In that one instance I get paid less.

9459. What are your actual earnings, if I may ask the question, because we want to test how far a person in your position is likely to gain his livelihood?—My present earnings might be stated at about 13*s.* a week, or about 36*l.* a year.

9460. Have you any pension?—I have no pension. I have a little income besides what I earn by teaching.

9461. You think that the blind should be taught professions in the same thorough way as seeing people are taught?—Certainly; if they are to compete with anything like success with the seeing they should be taught quite as thoroughly.

9462. Are you yourself proficient in any of the trades of the blind?—Not at all.

9463. You only speak from knowledge of others?—Exactly.

9464. Is it your experience with regard to the blind after they have left these institutions that they generally fail to get their livelihood?—Generally; I think they fail to a great extent.

9465. Do they fail because they are inefficient workers in the trades which they adopt, or because there is a prejudice generally against the blind?—I think for both reasons.

9466. Do you think that if they were good workers that prejudice would be overcome?—To a very great extent.

9467. There is a reason for the prejudice, because the work of the blind, who are inefficiently taught, is not so good as that of the seeing?—I should hardly like to put it in that way, because the prejudice often prevents seeing people from actually testing the work done by the blind.

9468. The prejudice against the blind goes even further than the prejudice caused by inefficient work; you say that there is actually a prejudice against

Mr. I. T. Price.

26 Mar. 1886.

the employment of the blind at all, whether they work well or not?—I know that to be so, so far as my professional experience in music is concerned.

9469. Can you suggest any remedy for such a state of things?—I think that if blind children were allowed to mix more freely with their seeing companions as they grew up that prejudice would be partly removed. Then I think while institutions exist, those who promote the institutions might do a very great deal more towards obtaining employment for those who have left the institutions. Then, of course, we come back to the question of efficiency. The more efficient you can make a blind person the more likely he is to compete successfully with others.

9470. Do you think that there ought to be organised by these different institutions some system of supervision or inspection of those who have left the institutions?—To some extent I think a plan of that sort might answer. I think they should make it their business to see how their pupils succeed, and to help them to succeed.

9471. Can anything be done in the direction of having depôts for the sale of the work of the blind, or any plan of that kind?—I think that a great deal might be done in that direction. It would be a very great advantage if blind persons knew where they might take their work and stand a fair chance of disposing of it.

9472. I suppose that now they take it to a retail shop, and it is accepted or not according as it is well or badly done?—The general rule is that blind people obtain work in shops established for their employment. In some cases they may do work at home which they get from private connexions, but I do not think it often happens that they take their work to retail shops and offer it for sale. I have not had any experience of that.

9473. Do you think that the application of the pensions to the blind is the best that can be devised, or have you any objection to the present system of pensions?—That would be a matter of detail, I think. For instance, I should say that the pensions given by the Gardner Trust ought not to be held under quite the conditions under which they are given. Parochial relief ought not to debar an applicant from receiving a pension.

9474. Have you known many blind persons prevented from receiving such a pension from that cause?—I have not, but I have understood that that is one of their regulations, that any person applying for relief from the Gardner Fund must not have received parochial relief; and I think that is most unjust.

9475. What steps has your association taken to further its objects?—It is very young at present, and there are difficulties in the way. The steps which it has taken have simply been to hold meetings and to consider the questions; and one of the steps was to forward a resolution to this Royal Commission, asking them to insist upon the placing of blind schools under Government inspection. A resolution was forwarded some two or three weeks ago from the London branch of our association, saying that we had adopted certain principles laid down in a book written by Dr. Armitage respecting Government inspection of schools, and that we wished to call the attention of the Commission to those principles.

9476. Do you think that music is the best profession for a blind person to learn?—As far as my experience goes tuning is the best. Blind persons are able to earn a better livelihood at tuning than at anything I know of at present. Music would be the best, only that the general competition is so very keen in the musical profession. As I have said before, if there were not so many music teachers in my neighbourhood, and I could get the work to do, I could earn a pretty good livelihood; but the competition is so very keen.

9477. Do you require someone to lead you when you are walking about the streets?—I generally find my own way.

9478. Of course one of the reasons why the blind are placed at a disadvantage is that they cannot get about so readily as seeing people?—But the blind as a rule do not allow that to stand in their way. One of the objects of our association is to make that very prominent, that the blind wish to be and ought to be as independent as possible. One of the disadvantages of their being educated in blind institutions is that they are not allowed sufficient freedom of action; they are kept in too much; if they were allowed to go out more they would obtain more independence.

9479. And they would gain greater confidence?—Yes, if they had to go to school with their seeing sisters and brothers they would gain a great deal of confidence. There is too much restriction in blind institutions as to that.

9480. How many meetings have your society held in London; do they hold them every week?—They hold them every month, and we have had one or two special meetings. The first few meetings were taken up in drawing up a code of rules and various things, so that we really have not been able to do so much as we could have wished. We have had about twenty meetings, I should think, and of course there has been a great deal of conflicting opinion upon some subjects, and the time has been taken up in that way.

9481. What are the burning questions among the blind which lead to those conflicts of opinion?—The difference of opinion that I referred to then was not so much about the burning questions as with reference to the details of management. The burning questions among the blind I think are, that they feel that they are not sufficiently recognised, that they ought to be more independent; and another thing is that some of those who work very hard earn very little, and that they ought by some means or other to be able to earn more. A blind man who works for 10 or 12 hours a day ought to get as the reward of his labour something more than 10*s.* or 12*s.* a week.

9482. Must not the remuneration for a man's labour depend upon his skill?—Yes, certainly, but of course the blind labourer might be made more skilful. But even then it would very frequently be desirable to supplement his earnings, so that he should have sufficient to live on in something like comfort.

9483. Do you think that private charity then fails to supplement those earnings sufficiently, and that there is any further call for assistance from any public source?—Yes, I think that a great deal more might be done in that direction.

9484. You have told us what might be done with regard to assisting the education of the blind children; but after the blind have grown up, what further can the State do for them?—I am not commissioned to speak definitely on that subject.

9485. I thought you hinted that something more needed to be done?—Not so much by the State. I think that the funds already raised for the institution of the blind (supposing the education of the blind to devolve principally upon the State) would be better spent in thoroughly training blind apprentices; and in some cases it might be desirable to offer larger premiums to employers to induce them to take blind apprentices.

9486. Your resolution is really founded upon Dr. Armitage's work on the blind, is it not?—Yes, it refers to Government inspection, and to the double grants which should be awarded, and also to the fact that the grants should depend upon the pupils' after success.

9487. I see that Dr. Armitage goes on to say that the Government might greatly assist blind workshops in certain ways by giving them large Government contracts for work which the blind are capable of doing; is that what you approve of?—We did not go quite as far as that; I should be inclined to think that that would be a very desirable thing, but I do not say that as from the association. I referred more particularly to the grants given to the schools, and to the fact that the grants should depend upon the success attending the pupils after leaving those schools, so as to induce the schools to try harder to make them successful.

9488. Is Mr. Allan the secretary of your association?—Mr. Allan is the present secretary.

9489. Is there anything further which you wish to state on the part of your association?—I believe that I have expressed the views of the association.

9490. (*Mr. Johnson.*) You got all your information about the education of the blind at the St. John's Wood school, did you not?—Not quite all. Of course I had a little experience at the school at Plymouth.

9491. But you began at the St. John's Wood school?—Yes.

9492. And you were under Mr. Barnes, were you not?—Yes.

9493. Were you not considered a very fair musical pupil?—As things went I was considered a very fair pupil.

9494. And you were recommended to Plymouth, were you not, as a master on account of your being a very fair pupil?—Yes.

9495. And you were also a master at the St. John's Wood school, were you not?—I was an assistant teacher there.

9496. In music?—Not in music.

9497. In what way do you think your musical education in that school was deficient?—I cannot play as well as I ought, and therefore I cannot take a position upon the platform. A great deal of my present knowledge of music as used by the sighted has been obtained by experience since I have left both the schools. I was certainly not fitted to teach seeing people as I ought to have been fitted to teach when I left either of the schools.

9498. You think that your education was deficient at the St. John's Wood School?—Yes.

9499. And you think that the musical training at that school is deficient generally?—I do.

9500. Then you think that you are an ordinary specimen of an intelligent pupil, do you?—If I may say so. I have known others who have done better than I have.

9501. I gather that you do not think that the musical profession is, at the present time, a very profitable one for the blind?—It has not proved so to me, and to some others.

9502. Has it proved in your knowledge to a great many others a very profitable employment?—I do not know anyone to whom it has proved a very profitable employment; I know one or two who have done a little better than I have.

9503. What do you suppose is the rate of earnings of what you call the best musical blind person that you know of, as a teacher or as an organist; what do you think is the highest salary than an organist gets, and what is the highest that a teacher gets?—Speaking of the highest salary which an organist gets, of whom I have any knowledge, I know an organist who does, or did, get about 80*l.* or 90*l.* a year.

9504. Where was he from?—He was from St. John's Wood.

9505. Then the teaching at St. John's Wood was sufficiently good to turn out an organist who could obtain 80*l.* or 90*l.* a year?—Yes.

9506. Are there more than one or two who have been turned out from that school earning 80*l.* or 90*l.* a year?—As organist, I do not know any other. I know one other who earns 50*l.* a year.

9507. Is not 80*l.* a year a large salary to give to an organist?—It is quite exceptional.

9508. Therefore, that would prove that the education that was given at that particular school in music was fairly good, or else you could not have had such a result as an organist getting 80*l.* or 90*l.* a year?—I do not think it proves that, because the particular organist of whom I am speaking happens to have had, not through his St. John's Wood training, but through his home associations, great experience in extremely High Church work; and I think it is his thorough knowledge of extremely High Church work that has helped him. I can play as well as he can, and therefore, from that point of view, I am quite as capable of obtaining an organist's place as he is.

9509. You have been rather leading the Commission to suppose that the musical training at St. John's Wood is not a very good one?—I should still wish them to suppose that.

9510. But you have been instancing cases of success. Now your own success was so great that you were recommended to go to Plymouth as a teacher from the St. John's Wood school?—Yes, but may I be allowed to point out that I was recommended to go from one blind school to another, which is a very different thing from going to teach sighted people.

9511. But you did go to Plymouth?—Yes.

9512. And you were there 18 months?—I was.

9513. Do you think that the profession of music is a very profitable one generally for blind people?—That is a very broad and general question. I think that most seeing people are rather ready to admit that it is not a particularly profitable occupation, because the competition is now so very keen. What I mean to say is this, that by working a fair number of hours during the week I could earn a very good living, but I cannot get the work to do.

Mr. I. T. Price.

26 Mar. 1886.

9514. That would apply of course to sighted people in the same way?—Quite so, only that of course the blind are under a certain disadvantage because they are blind.

9515. If you had sufficient work to do you might of course be able to earn more than 13*s.* a week?—I should earn three times that amount.

9516. The Commission only want to know about the relative advantages of the different trades and professions for the blind; and that is the reason why I ask you these questions. Do you think that the superior training of the blind in music as it is carried out in some of the other institutions is a great advantage to the blind?—The superior training I believe has enabled blind persons to do something better.

9517. In what degree has it enabled them to do better?—I should think that it may have enabled them to charge a higher price say for their lessons; and undoubtedly it has made them better performers, so that they stand a better chance of playing at concerts and so forth.

9518. You mention concerts; that leads me to ask whether blind people are employed at concerts profitably?—I am not aware of their being employed profitably to any great extent.

9519. Do you know blind people who make their living by singing at concerts?—No, I do not.

9520. What do you suppose they earn by singing or playing at concerts?—I really have not much information upon that subject. I cannot speak with any degree of certainty as to the pupils of the Normal College who have been so thoroughly well educated; but speaking generally, so far as I know, the blind only get the ordinary half guinea or guinea perhaps by way of expenses.

9521. Do you know of any cases in which they get as much as a guinea for playing or singing at a concert?—I could not give you an instance at the present moment. I believe I have heard of their occasionally getting that, but very rarely. I cannot say from personal experience that I know that.

9522. Do you think that it would be a desirable thing to train a great many blind persons for the musical profession?—No, I do not.

9523. You are an expert in music, are you not?—I am not a great expert in music, but I have sufficient knowledge to teach for a guinea a quarter, and to give very good lessons for that money.

9524. Taking 100 blind persons trained to music, what do you think would be the per-centage of those of ordinary capacity that would turn out to be fairly good musicians so as to earn as much as you do?—If you ask me what would be the per-centage of those who would turn out fairly good musicians that is rather a distinct question from whether they earn a good living or not. Of 100 blind persons who were thoroughly trained in music, I should say the per-centage who would make good musicians would be rather large.

9525. Would you say that half of them would earn a fairly good living?—No, because it is not only musical ability which is required; there is a good deal of natural capacity which is quite as necessary. There are semi-idiots who are not capable of being taught music thoroughly, but yet they have got what is understood as a good musical ear, though they have not the requisite abilities to fit them for competing with the seeing.

9526. Has your society considered the question of supplemental aids to the blind in their trades or professions?—In many branches of industry many blind people after having worked very hard all the week are only able to earn a certain amount, and if they have been well trained they will increase that by a little of course. We think that in such cases their earnings should certainly be supplemented.

9527. I do not know whether you are aware that there is a system in Scotland of supplementing the wages of handicraftsmen who are blind; has your society taken that system into consideration?—Not exactly, or in detail. As I say, we are only young, and we have not been able to do as much as we could have wished.

9528. I think you said that there ought to be something done by the State so as to enable a good blind workman to earn more than he already earns by his

Mr. I. T. Price.

26 Mar. 1886.

common labour; how would you propose that assistance should be given in the case of a common basket maker, for instance?—If you will pardon me, I do not think I said that the State ought directly to supplement the earnings of any blind workman. I believe what I said was this: that, supposing blind children to be educated with the seeing, the State should then bear a considerable proportion of the educational expenses; and I went on to say that the funds which are now contributed for the instruction of the blind might be better spent in apprenticing blind persons to sighted employers of labour.

9529. Then you are against their having an addition to their wages?—No, I do not say that. What I said was that I had not specifically stated that the State ought to supplement the earnings of a blind workman. I have not considered the question sufficiently. I should personally think that it might be desirable, but of course it is more a political question how far you can call upon the State to supplement the wages of blind workmen.

9530. What is the number of members of your association in London?—Of the London branch there are about 22 or 23.

9531. Where do those gentlemen who compose your association mostly come from?—A great many of them have been educated in the St. John's Wood School, and some of them have not. Some of them have been at St. John's Wood for a short time.

9532. Then this branch emanates, does it, from what you call the St. John's Wood School? — Certainly; several of the members are or have been connected with the St. John's Wood School, but the association is in no way connected with that institution.

9533. And they are mostly old pupils who were there under the old *régime* of the school, and not under the present altered management?—A good many of them are old pupils.

9534. Is the general impression amongst the members of your society that the musical education, not in St. John's Wood in particular, but in institutions generally, is badly conducted; is it your opinion that in the existing institutions throughout the country music is not taught sufficiently well?—Yes, speaking generally of institutions, that is our impression, though there may be exceptions.

9535. How would your society deal with the third portion of your suggestion, to take into consideration the amount of success and the causes of failure hitherto attending the efforts made to ameliorate the general condition of the blind?—I am not in a position to say very much upon that point. I have not been able to get very much information; I can only say that it is one of the objects of the society to try and find out by the experience of the blind themselves, because there is no doubt that one of the causes of failure has been the fact that the blind have not themselves been sufficiently consulted as to what is best for them.

9536. I think you told us that there were five or six tuners turned out from the school where you were educated; what are the ordinary wages which they receive for tuning?—They average from 1*l.* to 25*s.* a week, and if they had their sight they would earn about half as much again, perhaps. One of them gets 30*s.* a week now; but he has been in a factory for a long time.

9537. Are all of those five or six tuners of whom you have spoken employed in factories?—They are all in factories, and they do a little private work as well.

9538. Do you know what wages they get in factories?—The wages that I have already quoted. Their total earnings would be more than that. I can hardly say what they earn privately as well. They earn the same as a sighted man would get; they get 2*s.* 6*d.* or 3*s.* 6*d.* for tuning a piano, and of course that supplements their wages considerably. I have quoted their earnings in the factories.

9539. I suppose the authorities at Plymouth who employed you as a master considered that you were likely to be a good master?—I was a sort of music master and school master combined; a most unfortunate position to be in.

9540. Were you lodged in the house or not?—In the house.

9541. Then they must have thought you a very good master?—I do not know what they thought of me; I am afraid they did not have a very high opinion of me when I left. If I may be allowed to say anything in connexion with that particular school at Plymouth I should like to say this; that of course the education is very much neglected, because the children only have two or three hours a day, instead of five or six; and I consider that if that school were under Government inspection that sort of thing would not be possible. Blind children have no right to be on half time throughout the whole of their educational period, in fact they want rather more time than seeing children than less time. When I went there I introduced the Braille system of reading and writing, and I also introduced the arithmetic board, which I ought, perhaps, to have mentioned before, Taylor's arithmetic board with the octagonal hole; and I consider, and the association agrees with me there, that that is the very best arithmetic board yet invented. I also introduced the maps published by the British and Foreign Blind Association, accompanied by the Braille code; and I consider those maps far the best. I should like to recommend very strongly the general, or universal use, I may say, of Taylor's arithmetic board and the maps.

9542. In recommending the introduction of Braille's system you would recommend the Braille without the contractions, I suppose?—For the first three standards, but not beyond those.

9543. At what age do you think a child will arrive at the third standard?—Taking the educational standard I should think that a child would arrive at the third standard at about 10 years of age.

9544. After it had been under school instruction for two or three years?—Yes.

9545. I understood you also to say that you lived at home, having failed, because you could not compete with the sighted, is that so?—Not exactly.

9546. After you left Plymouth you came home, and you failed, because you could not compete with the sighted; that is to say, you were handicapped with the sighted, and they got employed before you could; is that the general feeling of the blind, that the sighted are preferred to them?—Yes, certainly.

9547. And you think that the blind are very much handicapped in that way?—They must of necessity be very much handicapped of course.

9548. Do you think that they are more handicapped in the case of music than they are in the case of trades?—I should say less so, because, as I have said before, if I could only get a sufficient amount of work I could earn a good living, whereas many basket makers and chair caners, and men who are engaged in other industrial pursuits after working all day long the whole week, get, in many cases, less than I am able to earn.

9549. Then they must be inferior workers, I suppose, because we had evidence before the Commission that the average is about 15*s.* a week, taking good, bad, and indifferent?—That is higher than I should have thought it to be. Still 15*s.* a week is not very much when a man has been working the whole week long for eight hours a day.

9550. At the same time it is more than the 13*s.* which you tell us is your maximum?—Quite so.

9551. (*Dr. Tindal Robertson.*) Were you born blind?—I lost my sight in infancy, when I was a few weeks old.

9552. I am not going to ask you about the opinions of your society, but only upon one point with which you are practically acquainted. In the first place you say that you advocate the universal use of the Braille system?—I advocate its universal adoption for children.

9553. Speaking from your experience what system would you advocate for the use of older people whose hands have become hardened, and who could not use Braille's?—I think that Moon's is undoubtedly the best for such people.

9554. With regard to the music, upon what system were you taught music in the St. John's Wood School?—I hardly know how to answer that question.

9555. Have you any experience of the system practised at Norwood?—No personal experience; I have known one or two who have been at Norwood.

9556. Have they given you any information about the method which is pursued there?—Yes; they say that they have superior masters, that they are given a great deal of technical study, which is most important, and

that they have to practice a good many hours a day. Neither of those things is true of the musical education at St. John's Wood.

9557. Whereas by the Braille system, as I am informed, you can learn by notation as a sighted person would learn by looking at the notes, by the ordinary system which was probably in use when you were at the St. John's Wood School, there was no chance of doing anything of that kind, and you were obliged to rely, I presume, entirely upon playing over the different tunes and committing them to memory?—On the old system we were obliged to commit the music to memory, and, indeed, on the Braille system one has to do that. The difference is that in the one instance one reads it oneself directly from the copy, whereas in the other case it has to be read through the medium of someone else.

9558. On what system do you teach music now; by the old system on which you were taught yourself, or by the new system which is so much better?—I use both. Perhaps I may be allowed to explain that if I am going to give lessons in a new piece of music the plan which I generally adopt is to have that piece of music thoroughly and carefully read through to me, so that I commit it to memory; and not only do I commit it to memory, but I know what sort of appearance it will present to a seeing pupil. Anyone who is musical will understand what I mean about the ledger lines and the clefs, and the various things that occur. I familiarise myself with that, so that I have a mental idea of what the copy is like, and what difficulties it may present to a seeing pupil. I know how to read printed music, and therefore I give the copy to the seeing pupil, and he plays it, and if he plays it incorrectly I can follow it.

9559. You can follow it, yourself?—I can follow it with my ear exactly.

9560. Do you confine yourself exclusively to notation?—I do not, as a matter of fact, take a Braille copy of the music with me; I depend upon my general knowledge and my memory, because if a pupil makes a mistake that will not make the thing sound any better; and not only that, but I make a point of becoming accurately acquainted with the copy.

9561. Supposing that you had to be taught music again yourself, would you prefer to be taught on the system on which you were taught at the St. John's Wood school, or on the system which I understand is practised at Norwood under the Braille system of notation?—Under the Braille system undoubtedly.

9562. You think that there are great advantages in that which cannot be obtained under any other system which is in use at the present time?—I am sure of it, because although I do not use the Braille system directly, or take Braille copies with me, I use it very extensively in copying the voice parts of songs, and so forth; indeed, I could not do without it now.

9563. Therefore, your opinion is not only that the Braille system is the best, so far as reading and writing are concerned, but that it is infinitely the best, and in fact the only one which is adapted for a correct method of learning and teaching music?—Exactly so.

9564. (*Mr. Few.*) Do I correctly gather that it is your opinion that as a whole music is the best thing for a blind person to be taught?—I can hardly say that, because, as I have said before, music generally speaking amongst the seeing is such a very precarious occupation to follow. It is one of the things that can be most successfully taught by a blind person, and that a blind person can most thoroughly know. Whether it is the most remunerative employment or not I am hardly prepared to say. As far as my experience goes tuning has proved to be the m[illegible] remunerative.

9565. Then either the knowledge of music or the knowledge of tuning is the best thing that a blind person can be taught, with a view of providing him with an occupation?—I should say so, as far as I know.

9566. As regards your Plymouth School, were the children there day scholars?—Most of them resided in the house. There were one or two day scholars.

9567. You say that they were only taught for two or three hours in the day; what became of them during the rest of the day?—They amused themselves in the workshop, generally, among the men and elder boys.

9568. Were they taught on a proper system of learning work, or in a mere half-play system?—When they reached a certain age they were taught work tolerably well. I believe that the industrial department of the Plymouth School is fairly well managed, but it is the educational part that is so extremely defective there.

Mr. I. T. Price

26 Mar. 1886

9569. Your opinion appears to be that blind people, as a class, fail to earn a tidy livelihood?—Yes, I think that, generally speaking, they do.

9570. Do you know many old blind people?—I do not know many; I have met with a few.

9571. You have no knowledge, then, how they manage to get their living?—May I ask whether you mean those who have lost their sight later in life, or those who have been educated?

9572. I will take those who have been educated as blind, having been blind throughout the greater part of their life?—So far as I can say, their earnings, if any, are generally supplemented by some form of pension.

9573. From friends? — From friends or from a society.

9574. (*Admiral Sir E. Sotheby.*) From your experience, would you recommend the blind children of poor persons to learn music or to learn a handicraft?—That is rather a difficult question to answer, because it would greatly depend upon the aptitude of the children. I should say that the same laws ought to regulate the education of the blind children of poor persons in professions as regulate that of the children of poor-sighted parents.

9575. You do not think, then, that blind people have a special aptitude to learn music?—Not necessarily so at all.

9576. Do you think that they are on a par with sighted people in that respect?—I believe so. I should not say at all that they were necessarily more gifted because they have lost their sight.

9577. You said something about supplementing the wages of blind workpeople; would you prefer that they should get so much a day, or that they should be paid by piecework?—That would rather depend upon how the wages were supplemented.

9578. If the wages were supplemented upon the amount of the piece-work they performed, would that meet your ideas?—I think that on the whole I am inclined to agree with paying them by piece-work; but then I think the payment should be supplemented in order to enable them to live in something like comfort; because when a blind person goes to work, the work that he does is a greater tax upon him than it is upon a seeing person. I think that ought to be taken into consideration. If a blind man works for 10 hours a day, at the end of the week he has done a harder week's work than a sighted man employed at the same occupation.

9579. Do you know any blind persons who work 10 hours a day?—In the Association for Promoting the General Welfare of the Blind, where there are workshops, and where people go regularly to work, I do not know the exact number of hours that they work, but it is a good day's work that they do.

9580. You say that you know two or three people who have been educated in music at the Norwood College?—I know several who have left St. John's Wood and gone to Norwood to complete their musical education, but they have not actually left.

9581. With regard to general education, if there were proper instructors at the board schools, would you send all the blind children there?—I think so. I believe that it would be possible to work that sort of thing satisfactorily.

9582. Do you think that most of the blind children are instructed in schools now, so far as your knowledge goes?—May I ask whether you mean at both blind and seeing schools?

9583. Do you think that most of the blind children are sent to school now?—I think so, only I think that in some blind schools, for instance at Plymouth, their general education is very much neglected, although it is taken for granted that because they are at school they are being educated.

9584. Do you know anything of an industrial school at Devonport?—A little.

9585. How many are employed at that industrial school?—I believe about 20.

9586. Do you know what wages they earn?—No, I do not exactly.

9587. Are the tuners as a rule obliged to take assistants with them?—As a rule they are not, though they

Mr. I. T. Price.

26 Mar. 1886.

may in exceptional cases. There are many seeing tuners who, if a pianoforte requires repairing, say, "We "will send someone," and the blind tuner is only in the same position.

9588. Do you know whether they teach in the school at Plymouth on the Braille system or on the Lucas system?—They teach both Braille and Lucas, and also Moon's; but they have only taught Braille within the last four or five years.

9589. Do they teach all three systems together?—Not exactly. They teach the girls, whose fingers are supposed to be softer, to read Lucas, and I suppose they give them some sort of elementary instruction in Braille; and the boys are also taught Lucas. The adults who have lost their sight perhaps as youths or young men, and whose fingers have become hardened by manual labour, are taught Moon's.

9590. Did you introduce the Braille system?—Yes.

9591. And you think that was a great improvement?—I considered it a very great improvement, though of course there was not much time for any great result to be produced.

9592. Who is the chairman of your London branch of the United Kingdom Association of the Blind?—The chairman of the London branch is Mr. Finchard.

9593. Is he blind?—Yes.

9594. Are all the members blind?—Yes, all the members are blind; that is one of the rules of the association.

The witness withdrew.

Mrs. Huth examined.

Mrs. Huth.

9595. (*Chairman.*) You represent the Committee of the Huddersfield Deaf and Dumb Association, do you not?—Yes.

9596. What is the object of that association?—The association in Huddersfield was originally established for the purpose of improving the condition of the deaf and dumb adults in Huddersfield. We have an agent there and he amuses them, and sometimes preaches to them on Sunday and also on some days in the week. The object is to provide them, I may say, with some general amusements. Another object of the association is to look after the deaf and dumb children who are of school age.

9597. To what school are those children sent when they are of school age?—Principally to the school at Doncaster; there are one or two at the school at Manchester.

9598. You send them as far as Manchester?—Yes. Manchester is not farther from Huddersfield than Doncaster is; it is not more than an hour by rail.

9599. Will you state what your association is doing with regard to the instruction or recreation of the adult deaf and dumb in Huddersfield itself?—In the rooms that the association have we have games for their amusement; then there is also a small library of books for the adults to recreate themselves with; and also the general intercourse with each other is perhaps as much a reason for their meeting together as anything else. All of those who attend there are not educated; the more educated ones have the more rational amusements.

9600. Are those whom you say are educated able to understand lectures by means of signs?—Some of them can follow, but in a very grotesque signing; it is almost a signing of their own, and not the ordinary signing that you would see carried on in schools.

9601. What is the number of which you are speaking?—About 50.

9602. With regard to the young, does your association show any preference for sending them to schools in which the oral system or the sign system is taught, or both?—Up to quite a recent period the feeling of the association has been rather in favour of the sign system; but if I may speak of my own individual opinion, I am so very strong an advocate of the oral system, that at my instigation, and perhaps through my persuasion, one child of six years old has been sent from Huddersfield to Mr. Van Praagh's Institution in Fitzroy Square, and he has now been there for about four months.

9603. Have you seen that child since it has been at the Fitzroy Square Institution?—Yes, I was there yesterday.

9604. Are you satisfied with the improvement that the child has made?—I am satisfied that already there is a very extraordinary improvement in the intelligence of the child, and at dictation he is able to write down some two or three letters. That information about him I got simply for his mother's benefit, not knowing that I should appear here to-day.

9605. Was he wholly uneducated on the oral system before he went to the Fitzroy Square Institution?—Entirely so. He has a deaf and dumb brother and a deaf and dumb sister, who were educated at Manchester; the brother is now at Manchester, but the sister has finished her education; and neither of those two have been taught to speak at all, but they have only been taught on the sign system.

9606. They have lately begun to teach the oral system at the Manchester Institution, have they not?—They have both systems in Manchester. This child of whom I was speaking, the brother of the little deaf and dumb boy who is now at Fitzroy Square, has been in the Manchester school for nearly six years, so that he was in the school before it was thoroughly constituted as it is now. The mother was not at first willing that the younger child should come up here and learn the oral system, but at last she yielded to persuasion, and allowed him to come. There is, or has been until lately, a great prejudice in our neighbourhood against the oral system, and it is in order to show the advantages of it that I have been working so very hard for this child to come to Fitzroy Square. Through the interest which I have taken in a number of institutions I have been very often to visit Mr. Van Praagh, and I have seen the excellent work that is done under him, so that I was very anxious for the child to go there. This is, I may say, a tentative proceeding.

9607. Then you think that the oral system is making way in Yorkshire?—I think it is. Even the head master of the institution in Doncaster is beginning to think that there is some good in it; but he has been such a long time making up his mind about it, that it is not yet thoroughly introduced in the institution. Both systems are taught there, and I may perhaps be allowed to quote the words of Mr. Van Praagh, who said, when I told him that the other system was adopted there to a considerable extent, "Fatal to the oral system."

9608. You have done your best, as I understand, to bring the deaf and dumb children of school age in Huddersfield to school?—We have.

9609. Have you found many cases which had previously escaped notice?—We have found some such cases. It is exceedingly difficult for us to make the children attend. In Brighouse, which is five or six miles from Huddersfield, there is one family as to which there has been considerable trouble in getting the children to attend school. Both father and mother are deaf and dumb, and there are four or five children in that family who are deaf and dumb. Two of the children are in the institution at Doncaster free of expense, because the mother was educated there. That family has given the agent more trouble than any other. I have myself been over to see them, but it is very difficult to make them understand.

9610. How do they gain their livelihood?—The father is a joiner by trade; I think he is not a very steady man, so that he is not always at work; but he is a good workman when he will work. He has been a long time out of work and in great difficulties.

9611. Do you think that the education of the deaf and dumb should be made compulsory, as in the case of other children?—I do think so very strongly. My feeling is very much in favour of instituting class rooms in the ordinary elementary schools, where the children would have the advantage of mixing with other children during the play hours, and of following their speaking, if they learn on the oral system, so that they would be able in that way to learn to communicate with other children, which I think would be infinitely to their benefit. Under the present system the deaf and dumb are an isolated class, and I think it would be very much to their advantage to mix more with others.

9612. There would be some little difficulty, would there not, in country districts, in getting a class together to be specially taught on the oral system?—That would be the case no doubt in rural and outlying districts; but in towns of moderate size I should say that there would be no such difficulty.

9613. What is the number of deaf and dumb children of school age in Huddersfield?—There are 31 of school age which, of course, is a much larger number than any one class of deaf and dumb children ought to be composed of.

9614. And they are scattered about, I understand, in different institutions?—They are principally at Doncaster.

9615. And you think that they should be taught at Huddersfield itself in special classes in the different elementary schools?—Yes.

9616. Of course that would involve the necessity of having, in these elementary schools, teachers specially trained for the purpose?—Yes, certainly.

9617. And that, of course, would entail additional expense?—No doubt.

9618. And the ordinary grant which the elementary schools receive for children who are trained in them would not be sufficient for the education of deaf and dumb children, because the teaching of the deaf and dumb is more expensive than the teaching of ordinary children, and therefore more teaching power and longer time in school would be requisite?—Yes, certainly.

9619. All those things you have considered?—Quite so. That is the reason, I think, why our school board has not undertaken the teaching of the deaf and dumb children. In some of the neighbouring towns, Leeds, Sheffield, and Bradford, the school boards have instituted classes for the deaf and dumb children; but in Huddersfield that has not been done. The necessity of doing it has been represented to the school board, and I might perhaps add that I was myself a member of the school board for 12 years, and during that time, more than once, I and others brought the subject forward, hoping that those classes might be established. But it has never been done yet; there has always been a feeling that there were too few deaf and dumb children for the great expense that would be involved.

9620. But I suppose that if they could get a grant of 10*l.* per child, such as the Manchester School Board, I think, asked for, that objection would be met?—I should think it would, certainly, to a great extent. I feel almost sure that they would accept the duty of educating the deaf and dumb children with such a grant.

9621. Do you know what is the expense of educating and maintaining deaf and dumb children?—The expense of each child in the Doncaster School is about 15*l.* per annum, including the sending to and fro and the education of the child.

9622. Is that exclusive or inclusive of board?—I suppose that that includes the board at Doncaster. The school boards now educate the deaf and dumb in Bradford, Leeds, and Sheffield. I have here letters from the different clerks, which I may put in (*handing in the letters*). We tried to prevail upon the Huddersfield School Board to educate the deaf and dumb children as those other towns were doing.

9623. In Bradford the pure oral system has been adopted, has it not?—It has.

9624. What system is adopted in Sheffield?—I think there they have both systems; it is a combined system.

9625. And at Leeds?—At Leeds they use the sign system.

9626. Do you not think that if children taught upon the oral system went home to their parents, instead of remaining in an institution, they would lose a good deal of the knowledge which they had acquired at school?—They would, I think, to a certain extent; but at the same time those who have had the smallest experience, as I have no doubt you have learnt from Mr. Van Praagh, think it an advantage for them to mix with those at home instead of associating merely with those who are at the schools. Their home life is an assistance to them if their parents would only continue to talk to them; but that is a very important "if."

9627. Of course a good deal depends upon the homes to which the children go?—It does. The mother of this little fellow, of whom I spoke just now as being at present in the Fitzroy Square Institution, is quite prepared to do her very utmost when he comes home for the holidays, to continue to talk to him and not to make signs.

Mrs. Huth.

26 Mar. 1886.

9628. Supposing that a child was taken from that family of five deaf and dumb children, of whom you spoke, and taught upon the oral system, the mother having been taught upon the sign system, would it not prejudice the teaching of the child in the oral system if it went back to that family?—He would, of course, not continue to be able to speak to her.

9629. In a case in which the parents are deaf and dumb and have not learnt the oral system, would you think it advisable that a child who had been taught on the oral system should go back to a home in which its parents were unable to communicate with it, except by signs?—I should not think it at all advisable.

9630. In such a case, would it not be desirable that the child should be sent to such an institution rather than that it should be kept at home?—Yes, certainly.

9631. Of course there may be isolated cases of that kind which are exceptions to the rule?—They are isolated cases, because, though I know at least four or five cases where the parents are deaf and dumb, this family where there are the five deaf and dumb children is the only one that I know where the deafness and dumbness has gone down to another generation.

9632. Where the children are scattered about in country districts it would be difficult, would it not, to provide for deaf and dumb children in each village school?—Certainly.

9633. Would it not be more convenient to have a central school to which the children should be sent, such school being of course under the control of some local authority?—Yes; and that system might be carried on to some extent in the small towns. For instance, in a town of the size of ours which has a population of perhaps 70,000 or 80,000, you might have a central school, because children from a distance could be brought there, and arrangements might be made for them to remain on the premises during the time intervening between the morning school hours and the afternoon school hours. If such an arrangement were not made, a great number of teachers would be required, and it would be a very expensive system to have teaching for the deaf and dumb in each separate school.

9634. Have you any suggestion to make with regard to the following up of the apprenticeship or training of those who have left the schools?—Of course there is a difficulty; but still the deaf and dumb children of our neighbourhood do find employment in the mills and other places. As soon as they have left school the agent of the association generally tries to find employment for them, and though there has been difficulty about it, they have eventually succeeded in finding it. In some mills they are exceedingly good and have even liked to have deaf and dumb children, especially if they are intelligent. There have been two or three thoroughly ignorant ones who have not done so well as some others; but those who have been educated and who seem to be bright, have always given great satisfaction to their employers.

9635. In cases of that kind do their employers or superiors communicate with them in signs or by writing?—I think, generally, by writing, but I am not quite sure. I know there are some who have been so totally ignorant that they could not read and could not write; but in the case of those who can read the orders are written.

9636. Has there ever been any question of their being apprenticed?—Yes, they have been apprenticed to some trades.

9637. Have they been apprenticed by the guardians?—I think by their parents. Where the parents have been in a position to apprentice their children they have done so. One was apprenticed to a cabinet maker; and others have been apprenticed to other trades. I do not think I know any family in which there has been such poverty that they have been unable to apprentice their children.

9638. Are they good draughtsmen, or have they any special aptitude for drawing?—Not especially so.

9639. Is there anything further that you would wish to say to the Commission on behalf of the association which you represent?—We thought that the establishment of night schools for the adults would be a very good thing for those who had not received education, and per-

Mrs. Huth.

26 Mar. 1886.

haps a higher class for those who had received some education; as the Mechanics' Institute answers for those who have passed through the elementary schools, so perhaps a higher class of school might be established where the deaf and dumb could acquire some further information under the system which we hope is going to be given to them.

9640. For instance, you might have classes for drawing?—Yes, and especially in our neighbourhood, which is a manufacturing district, and where designing is so essential. They are very fond of drawing.

9641. (*Admiral Sir E. Sotheby.*) Do you find that the deaf and dumb have any aptitude for drawing?—I think that generally they have a very decided taste and aptitude for it. Some that I have known have drawn extremely well. I know, perhaps, more of Mr. Van Praagh's school than of that at Doncaster, though I have seen some of the productions of the children at Doncaster; but I do not know so much of the working of that school. Some of the children do go to the Doncaster institution, but that is some distance from Huddersfield, and I have never been there. I have been at the institution at Manchester, but that is some years ago.

9642. Do any of the children come from Lepton?—Yes, and from further even than that. We have some from Kirkburton. Our district extends much further than Lepton.

9643. (*Dr. Tindal Robertson.*) I think you said that the child in Mr. Van Praagh's institution, of whom you have spoken, had a deaf and dumb brother and sister. Are the parents deaf and dumb in that case?—No. I have inquired into that case, and I cannot in any way ascertain the cause of the deafness. But of course my questioning of the mother was quite unprofessional. There has been no deafness or dumbness in the family that the parents are aware of; the father is a remarkably steady man, and has led a very steady life, and there is no relationship between the parents.

9644. But in the other case where there are four or five deaf and dumb children, you say that the parents are deaf and dumb?—Yes, and the mother is also the child of deaf and dumb parents.

9645. Have you ascertained whether in those cases the parents themselves were deaf mutes, that is to say, whether they were born deaf and dumb, or whether they became deaf afterwards?—Both the father and the mother of those four or five children were born deaf, so far as I have been able to ascertain. It is very difficult to ascertain anything from them, though the mother, who has been at the Doncaster School, does understand a little, and if you write questions down she can answer them; but I think she has not had a very good education. They do not, I think, always come away from Doncaster with a very great amount of learning. It was known at the time of the birth of all those children that they were deaf mutes, because they were tried by the doctor almost on their birth, and they never turned at any noises that were made. I am myself a little interested in the baby; the mother says that it is a deaf mute, but I do not think it is. It is either a mere coincidence that the child has turned round when I have given a sudden knock on the table, or else it is not a deaf mute; but it is still so juvenile that I have not yet been able to ascertain whether it can hear or not. If it should turn out that it can hear, there will be four deaf mutes in that family, and not five; but I have stated what the parents have told me.

9646. Do you know any deaf and dumb children in your locality who are the offspring of blood relations?—No, I do not. I know several cases where the parents are deaf and dumb, and where the children are hearing and talking children just like others. There is one such family in the immediate neighbourhood of Brighouse where this sadly deaf family of seven exists. There are two cases in which both the parents were deaf and have had four or five children, and in each case every one of those children hears and talks and goes to ordinary elementary schools.

9647. Is there any form of application for admission to your institution?—They are invited to attend, and there is no formal application at all needed; those who come are made welcome.

9648. Are any inquiries made of them as to their circumstances, or as to the cause of their deafness, or are any statistics of any kind obtained about them and kept in the association?—No. We began, I may say, merely as a class for adults. Perhaps with children one would go more into their parentage, but one does not go into those details so much with adults.

9649. Do you think that if it were part of your agent's duty to collect as much statistical information as he can with regard to those who come under his care, such information would be useful?—Hitherto I do not think we have felt it to be a want, and it had not occurred to us to obtain such information; but under the present circumstances I think the information would be valuable if I could have given it.

9650. May I ask who provides the funds for sending these children away to Doncaster and elsewhere?—There are subscriptions to the institution. Huddersfield subscribes a good sum and so do all the neighbouring Yorkshire towns. It is considered an institution for the various towns of Yorkshire and I know by looking through the lists of subscriptions that the various towns are the supporters of it.

9651. Then do the children from other towns get advantage from this institution as well as the children of your own town?—Yes, I am speaking of the school at Doncaster and not of our own association. The Doncaster school is attended by children from Bradford, Sheffield, and other towns.

9652. But who provides the funds to send the children to Doncaster?—The parents of the children generally provide the necessary funds and sometimes the guardians have supplemented the sums which our association gives for the purpose. In the case of this little boy who is at Mr. Van Praagh's, the association give a certain sum, and that is supplemented by the guardians, and the parents also give a small sum per annum for the maintenance of the child. From the guardians I think we get 10*l.* a year for him. What the guardians give or the other children who do not go to Doncaster I do not know, because that does not go through our association; that is the private concern of the parents.

9653. Are your funds entirely supplied by subscriptions, or have you any property?—Our funds are entirely derived from subscriptions. It is not a very large association, and our annual expenditure is not very great.

9654. Do you receive donations or bequests?—No, it has not been on such a large scale as that would imply; our income is simply from annual subscriptions.

9655. Has the association been long in existence?—Yes, since 1872, when it was commenced as a branch of the Yorkshire Adult Deaf and Dumb Association, and it has been extended very considerably in the last three or four years. The class for preaching to the adults has been established in the town for a long time. There was one man who was for about three years appointed by the Leeds branch, and he merely had to preach to the deaf and dumb on the Sunday, and he got so much from the Leeds branch. Subsequently the Huddersfield branch became a separate association, and the present superintendent, Mr. John Thorpe, was then permanently appointed; and it is since he has been in office that we have found out the number of deaf and dumb children there are who ought to attend school, and the number who are neglected and not sent to school. Statistics were taken at the time when the question came before the Huddersfield School Board of the number of children in the district, both deaf and dumb and blind. They did not consider that they ought to institute the classes that were required; but now I think, since Mr. Thorpe's appointment, he has looked up the various districts, and so many more deaf and dumb children have been found than were believed to exist, that I think that is one reason why our association has taken it up more warmly, and urged that classes ought to be instituted in the various schools, or that centres ought to be provided.

9656. Supposing that the school board at Huddersfield provided proper education for those children, would the association be inclined to send them through the school board to day schools or to those institutions?—They would very considerably prefer sending them to day schools. There are many advantages in that. First of all, the institution at Doncaster is often so full that there have been cases in which, when the children have arrived at the school, they have not been able to take them in, because there was not accommodation for them.

9657. Have you any idea what trades, generally speaking, the adults who attend these classes follow?—They prefer employment in artistic pursuits.

9658. Do you find that, as a rule, the deaf and dumb have as great mental aptitude as other people?—Yes; I think they have quite as great aptitude as other people. In fact, not being able to talk to their neighbours, they very frequently can concentrate their minds more upon their employments, and they often give greater satisfaction to their employers in consequence. I have often heard that said by those who have employed them. When it is mechanical work they are able to do it; when it is work that requires some talking they cannot do so well, and therefore they are not employed in those occupations.

9659. Do you think that if some plan were adopted (as was suggested by his Lordship) of provincial centres for the better education of deaf and dumb children, even better results would be attained subsequently when they followed their trade pursuits?—I quite think so.

9660. Do you find that, practically, those adults for whom you have provided these amusements and recreations take advantage of them, that when they once come to you they continue to come or that they fall off, and cease to come?—They continue to come; but as I have said already those are the ones who have not had any education, so that books or anything of an intellectual kind are not attractive to them, and they are only attracted by games such as the bagatelle board and other games that we have in the rooms (we do not give it so dignified a name as an "institution"), and which are perhaps more suited to their capabilities.

9661. I presume that some of them have been well educated?—Some few of them have, but only a few; the greater number have not.

9662. Has there been any kind of petition on the part of those few to be supplied with intellectual food?—Not much; but I think that even among the hearing classes you do not always have such applications made.

9663. (*Mr. Johnson.*) I suppose that the principal mode of communication between those persons that you do so much good to is by signs?—It is by signs.

9664. Those rooms, as I understand, are entirely for the purposes of amusements and lectures, and they have no educational object?—No; there are newspapers and books; there are no classes. There is religious teaching.

9665. Are the services which are performed those of the Church of England?—No, it is the preaching of this one man. He is a layman, and has not had any theological training at all, and his preaching is only through signs; and even when you see the Lord's Prayer said by signs, it has almost a grotesque appearance.

9666. Nevertheless, he appeals to the intellect of those people and produces a certain impression?—He does.

9667. Do you think that deaf and dumb persons educated in that way, or without education, can be made to realise the principal truths of Christianity?—Certainly not the ignorant ones. They may be spoken to and preached at for a length of time, and very frequently the only results to be seen is, perhaps, rather a solemn look which they put on for the occasion. But that is merely a passing remark that I have made. I am simply giving my own views of the impression that it has made upon me; when I have been present and noticed it, it has had that appearance, and I do not think it is very much more. They do not take things in quickly.

Mrs. Huth.

26 Mar. 1886.

9668. At this Doncaster institution, to which a great number of your people are sent, they make use, as I understand, to a certain extent of the pure oral system?—They do not use the pure oral system. I have seen children who have been in the institution for four or five years, and seldom been able to understand them, I have spoken to them; and I know that on one occasion when one child, a girl of 14, who was thought to be the best talker in the place, was told to say grace before some tea that she was sitting down to, I did not understand one syllable that the child said.

9669. I suppose she had been taught on what may be called the combined system, half signs and half oral?—She had.

9670. Do you find that those children who have been educated on the oral system, when they go to their own homes fall back on the signs?—I do not know many children who have been educated on the pure oral system, and who have then gone home. When this little fellow, who is now being educated at Mr. Van Praagh's, has finished his term of education, he will be almost the first of whom we shall have had experience in that direction.

9671. When they have been taught the combined system, do they make more use of signs when they go back home?—I should decidedly think that they make use of signs. Signing is easier for them; they are not sufficiently at home in talking.

9672. The prejudices against the oral system you think are dying away in Huddersfield?—I will not say that they have died away, and I cannot even say that they are dying away. Those who are most interested, the parents of the deaf and dumb children, do not believe, or have not hitherto believed in the oral system. Through persuasion the father and the mother of the child, who is now in London, have consented to his coming here; but there has been a kind of feeling almost of distrust; they did not know what the result would be, and they had a doubt whether it would be for the child's advantage; but at length they were persuaded, I think, that it would be so; and it is being tried.

9673. Is there any attempt to observe the Sabbath amongst the deaf and dumb?—Yes.

9674. Does your preacher or agent frequently attempt to give religious instruction on the Sunday?—Yes.

9675. Is that done in these rooms which you have?—Yes, and classes of a similar character are sometimes carried on on Saturday evenings.

The witness withdrew.

Adjourned to Wednesday next at 12 o'clock.

32, Abingdon Street, Westminster.

Friday, 2nd April 1886.

PRESENT:

THE RIGHT HON. LORD EGERTON OF TATTON IN THE CHAIR.

THE RIGHT HON. SIR HENRY SELWIN-IBBETSON, BART., M.P.
ADMIRAL SIR E. SOTHEBY, K.C.B.
W. TINDAL ROBERTSON, ESQ., M.D.
B. ST. JOHN ACKERS, ESQ.
T. R. ARMITAGE, ESQ., M.D.
W. AUCHINCLOSS ARBOL, ESQ.
F. J. CAMPBELL, ESQ., M.D.
E. C. JOHNSON, ESQ.
ROBERT MCDONNELL, ESQ., M.D., F.R.S.
CHARLES FEW, ESQ.

C. E. D. BLACK, ESQ., *Secretary.*

JOHN STAINER, ESQ., MUS. DOC., M.A., R.A.M., examined.

John Stainer, Esq., Mus. Doc., M.A., R.A.M.

2 April 1886.

9676. (*Chairman.*) You are organist to St. Paul's Cathedral, and you are also inspector of music in training colleges and elementary schools under the Education Department?—Yes.

9677. Your attention has been much called to the education of the blind in music?—It has in various ways; I have occasionally had to examine students at colleges and institutions for the blind, and I have a

John Stainer, Esq., Mus. Doc. M.A., R.A.M.

2 April 1886.

great many blind musical friends, and in many other ways I have given a great deal of attention to it.

9678. Do you think the blind can gain their livelihood by music in competition with seeing people?—The income of a professional musician is obtained from three sources, separately or conjointly: (1) Public performance; (2) Teaching; (3) Composition. With regard to the first of these, I see no reason why a blind man or woman should not be able to gain a livelihood from vocal or instrumental performance, provided of course that he or she is possessed of a very high order of talent. I do not think the public would care to listen to second rate blind performers, but a fine oratorio or concert singer, a fine violinist or pianist would be as acceptable to the public if blind as if blest with sight. I will speak separately of the organ as an instrument suited to the blind, by-and-by. It must be borne in mind that very few musicians (compared to the large number in the profession) obtain their living by public performances only. As to the second source of income, teaching, I think the blind are under special disadvantages; it is a serious thing for a teacher not to be able to see the position of a child's hand when it is having a lesson on the pianoforte, equally serious not to be able to see how a young violinist is holding the bow and fiddle, still more serious not to be able to teach a pupil a new or unknown piece which it is suddenly called on to prepare. One other consideration is of great importance, namely, that concurrently with the greater attention given to the musical education of the blind a great impetus has been given to the study of music generally, and numerous institutions give a musical training, not previously obtainable in this country, at a most moderate cost; hence it is a popular profession and is now entered by ladies and gentlemen of good birth and education as well as by those of the middle or lower classes on whom nature by some mysterious process of selection has dropped her mantle of genius. Excellent teaching can now be had from musical graduates, licentiates, medallists, and holders of diplomas, on very low terms. In this keen competition amongst qualified seeing musicians, I think blind musicians stand but a poor chance of earning their bread. Their best chance would, I think, be as teachers of solo singing, their quick ear would be of great value in teaching voice production, an art not commonly understood, and when mastered one of great pecuniary value to a teacher. Then with regard to the third source of income, as composers, I do not think the blind (or at all events those born blind or blinded early in life) have done much, but they might do so. Here again it must be noted that very few musicians get their living by composition only. I should say not a score in this country. But assuming that a blind person has sufficient talent to compose well and has had the rare luck of catching and tickling the public ear, a good living could be earned by it. Of course most musicians earn money by a combination of public performances, teaching and composition; but to master the work and training required thus to become what we call a good "all round" musician requires all the quickness and aptitude which the senses of seeing and hearing can give; it involves the power of reading music rapidly at sight; studying a full orchestral score at a short notice; conducting orchestras and choirs; setting and examining papers in harmony, counterpoint, and history; in contributing to the musical press and literature of music; in short it involves the rapid exercise of the ordinary as well as the highest faculties. In such a vast and wide region of work as this I conceive the progress of a blind musician would be heavily retarded.

9679. You say that among teachers of music there is such keen competition now that blind teachers would have a poor chance of earning their livelihood; do you mean even though they should offer to teach on lower terms than seeing teachers?—I think so; our market of teaching is very much overstocked; heaps of people come to me to recommend them to various institutions as teachers of music, so that I know from experience that the supply of teachers of music is in excess of the demand. Though the teaching of music is more thoroughgoing now than it used to be, it is now to be got at lower prices than 25 years ago. I know cases in which highly qualified teachers have offered to give lessons at 7*s.* 6*d.* a quarter, which would come to about 6*d.* or 8*d.* a lesson. The reason why they give lessons on such low terms is this; they find they may just as well be getting 6*d.* an hour by giving a lesson as sitting idle in their rooms waiting for people to come and give them 5*s.* a lesson. At the present moment the competition among teachers of music makes it excessively difficult for any large quantity of blind teachers to make their way.

9680. You think they would have a better chance as teachers of solo singing?—Yes, in teaching voice-production, a good teacher of which art can get a handsome income.

9681. That is to say there are a great number of people whose voices are not naturally adapted for singing, but who are capable of being trained to be comparatively successful singers by skilful education?—Yes, it is a special branch of teaching.

9682. With regard to the chance of a blind person earning a living by musical composition, I suppose we must start with more or less genius?—Yes; I am not aware that any composer ever existed who was born blind, but I do not see why talent for composition should not exhibit itself in persons who were born blind, if so it might be cultivated.

9683. In acquiring the knowledge necessary to enable a man to become a composer are the blind at a very great disadvantage?—I should think not at a serious disadvantage under the present improved system of teaching them.

9684. Is it absolutely indispensable that the Braille system should be adopted for musical notation?—I am not qualified to answer that question, never having taught any blind persons myself, but I should think so; it is the only system of notation invented yet by which music can be read by a blind person.

9685. A blind composer must have some medium by which he can readily put down his thoughts:—Yes.

9686. If a blind person wishes to compose, is the Braille system of notation almost a necessity to him?—I should say yes, or some system of the same sort. I very much hope that some day a genius wil appear who will invent a system of musical notation for the blind; it still has to be done; but at the present moment I should answer your question in the affirmative. I think the Braille system is necessary for a blind person who wishes to become a really sound composer, because he wants some means of putting down his ideas as rapidly as they come into his mind when he is sitting by himself; he cannot always command the services of an amanuensis.

9687. Can you tell us what success the blind have or are likely to have as performers at concerts or at theatres in comparison with seeing performers?—I think one can hardly give an opinion upon that, because it is only comparatively lately that the blind have been thoroughly taught music.

9688. Do you know any who are gaining their livelihood in that branch of the profession?—I have heard of a few, not many; on the other hand I have known cases where blind musicians have not been able to earn a livelihood at all. Some years ago I, in conjunction with some others, examined a blind musician at the College of Organists; he passed in organ playing and counterpoint and harmony, and he was thoroughly qualified as a teacher, so far qualified that he wrote a music tutor for his pupils, but if it were not for private charity and small gifts from public charities he would be at the present moment in the workhouse. I know that he has done his very best to earn a livelihood, he is a man of unblamenable character, and a man in good position. His mother was a public singer. He became blind at the age of nine years, after an attack of scarlet fever.

9689. He inherited, I suppose, a love of music?—He is a thoroughly good musician in every way; he has done his best to get a living year after year, and at the present moment, if it were not for a few shillings from various charities and friends, musicians like myself, he would be in the workhouse. Of the three sources of income to which I have referred, the one in which I see the best opening for the blind is first-rate instrumental performances or solo singing. If a lady came before us and sang a ballad, we should not care whether she was blind or seeing.

9690. Blindness would prevent her acting?—Yes. First-rate singing and first-rate instrumental performances, whether on the violin or on the pianoforte, are equally acceptable to the public whether the performer or singer is blind or seeing.

9691. Have the blind a good chance now-a-days of earning a livelihood as organists?—35 or 40 years ago there were a great many blind organists in this country who obtained a comfortable living. But in those days

it was only necessary for an organist to be able to play a limited number of in-going and out-going voluntaries and interludes, and also a comparatively small number of psalm-chants and hymn-tunes, in which the congregation joined heartily under the leadership of a select quartet of ladies and gentlemen in the west gallery of the church. In these days nearly every church has its organised choir generally of boys and men; in fact, there has been such a violent reaction against the old style, that our choirs are founded too rapidly and are often too ambitious in their selection of music, often taxing the good nature and patience of parochial congregations, on whom silence is imposed, and who are compelled to listen to very unsatisfactory musical flights. The post of organist, therefore, is now surrounded by complex duties, the training of young and sometimes mischievously disposed boys, the handling with tact a lot of voluntary amateur singers, the preparation of a great deal of new church music, &c. I cannot say that I consider a blind organist quite suited to such work.

9692. A blind organist could not train a choir in the same way as a seeing one could; he could not correct musical defects so well as a seeing organist could?—He could correct musical defects, but the difficulty would be in training the boys: the boys of a cathedral choir are generally gentlemen's sons; at St. Paul's we have, perhaps 35 or 38 boys who are gentlemen's sons, and who are easily taught, but in an ordinary church choir, where the boys are perhaps taken from the parish school, a blind organist would have serious difficulty to encounter. I know the boys of a choir give people who can see a great deal of trouble. Also, there is an immense addition to the literature of the music used in churches of late years. When I was a boy a few popular hymns were supposed to be quite enough, but some time since, when I was on the Hymns Ancient and Modern Committee, we had complaints that the 400 hymns were not sufficient. I know in St. Paul's in the course of a twelvemonth we have sung 500 different anthems.

9693. Then you think, as organists, the blind must be at a disadvantage compared with those who can see?—Yes, and especially in these days when we have such large choirs consisting of boys and men, in managing whom a great deal of tact is required. In nearly every church there is a large number of volunteers in the choir, and it requires not only a good deal of tact, but a good deal of administrative ability to keep the amateur choir together, and train a lot of little boys selected from an elementary school.

9694. Have you known blind persons who have been systematically taught to sing choruses giving performances together in public?—Yes. I have formed the very highest opinion of their capabilities. Some years ago I had the pleasure of examining students at the Normal College, at Norwood, in conjunction with Mr. Manns, the conductor at the Crystal Palace concerts.

9695. In what year was that?—It was some years ago. I was very much struck with the ability displayed; but I venture to say, Dr. Campbell is here, and he will correct me if I am wrong, I should assume, from the striking exhibition I saw there, that that institution has certainly the pick of the blind. Some feats done by the scholars there perfectly astounded me. One young lady was about to play one of Bach's fugues, rather a complicated one. The teacher said to me, "To show how thoroughly well she knows it, ask her to "play any two parts or three parts separately, and "leave out the other parts, and she will do it." I said, "Play the alto and the bass parts," and she played them, not touching the treble and tenor, which is a thing that not one in ten thousand practical musicians could do. I tested the students there to ascertain whether their knowledge was merely by ear or whether they thoroughly understood the art, and in every case I found they thoroughly understood it. One remarkable case I well remember. A very clever organist (I think he has since taken several diplomas, in fact, I had the honour of giving him one diploma from the College of Organists as an Associate or Fellow of the College) wanted to play a certain fugue of Bach's, and he got his book, which was written in Braille. I tried to find it out for him by the index, but he said, "If you give "it me I will find it quicker," and after turning over several pages, he said, "I think this feels like it." It seemed to me an extraordinary thing that a person running his finger over a lot of embossed marks in a large volume could say that the characters felt like a particular fugue of Bach's. But it turned out that he was quite right. Then, at St. George's, Southwark, though the class there is not so select as at Norwood (I am only giving my own impression), it is wonderful the ability the pupils show in mastering the details of music, in all cases in which any individual teaching is given. I asked questions which they answered perfectly intelligently; the organ playing was good, and the singing in the class was excellent; they sang anthems admirably. Of course, whether they could get a livelihood from the practice of what they had been taught is another question; but as regards their ability and attainments in music I formed the highest opinion. I was once appointed examiner in music by the Senate of Cambridge when a blind man came up for his Doctor's degree, and I saw the blind man examined by the blind professor for the degree of Doctor of Music, and speaking of a certain piece of music, Sir George Macfarren said to him, "Did you observe any-"thing on page so and so of that work." He said "Yes, I noticed the bassoon had a very difficult passage," and so on; the blind man passed with flying colours.

John Stainer, Esq., Mus. Doc., M.A., R.A.M.

2 April 1886.

9696. Those you are speaking of, of course are more or less exceptional cases?—Yes, except at St. George's; it seemed to me that they were of a different class there to what they were at the Normal College at Norwood. I consider that at Norwood they have the pick, from all I have heard, but at St. George's I fancy there is a fair average set of cases.

9697. I take it that if the blind are to be given a musical education to enable them to earn their own livelihood, in the case of the poorer classes more especially, they must be trained at institutions or colleges for the instruction and training of the blind in music?—They could get their training in a college for the blind, in which other things were taught besides music; for instance, at St. George's they have a blind man who teaches music who is a most excellent teacher; he has taught the whole of the orchestra to play, and he showed his ability as a musician by playing the pianoforte accompaniment to Beethoven's Sonata in A admirably. The teaching of the blind in an institution specially established to teach the blind music would, I dare say, be more thoroughgoing, but I do not think it is a necessity for the present, assuming the excellent state of teaching music to the blind in the institutions I have mentioned is maintained.

9698. Are those institutions able to instruct the majority of those of the blind who have a proper capacity for music, or do you think there are many who have capacity who are at present not taught music?—I can hardly say; that is more a question of statistics. I am afraid the old fashioned system of teaching music in blind schools, especially those very fairly endowed, was to teach them entirely by ear, as an amusement. That is a system which would tend to bring blind musicians into very bad repute, because the moment they were asked any searching question upon the subject they would break down. That system I am afraid is still pursued in a few institutions in different parts of the country; that I only give as a matter of opinion, but speaking generally I think it is a system which is dying out, and what is taught now is thoroughly well taught.

9699-9700. Is there any good musical training for the blind in provincial institutions?—I do not know much about the institutions in the provinces. I have been over one at York, and one or two others, but I have not been in a sufficient number of provincial institutions to enable me to speak to the character of the instruction given in them generally.

9701. I suppose the musical profession is one which has developed largely of late years?—Enormously. That raises an additional difficulty in the way of blind musicians. There are a large number of institutions which really teach music thoroughly well. I think there are five or six or more such institutions. There are 700 or 800 students at the Royal Academy of Music; there are 250 at the Royal College, and 1,500 to 2,000 at the Guildhall School of Music, and there are various other institutions of a similar kind. A large number of students who enter those institutions enter them simply with the intention of taking up music as an accomplishment, but the large majority of them have the intention of following music as a profession.

9702. I suppose in the last 25 years music has been very much more generally taught to boys in ordinary private schools and colleges?—Yes, that is so.

9703. Therefore there is an opening for a larger number of teachers than there used to be, say, 20 years ago?—Yes; but this would be to a limited extent.

John Stainer, Esq., Mus. Doc., M.A., R.A.M.

2 April 1886.

9704. But you think that opening is already filled?—Yes, more than filled; we are overstocked. My address "St. Paul's, London" is very easily remembered, and the consequence is I get no end of applications from people who want advice with regard to getting employment as teachers of music. The competition is so great that I have known men of great talent unable to get a breakfast.

9705. Is it wise then do you think to go on indefinitely overstocking the profession by teaching the blind music as a profession?—I should say certainly not. My general impression on the whole subject is that singers or instrumentalists of exceptional talent may earn a good living, but those who fall into the second or third grade cannot compete with the second or third grade of seeing musicians. I think all exceptional musical talent might be picked out and receive the highest training for professional work; but all blind as a rule should be carefully taught sufficient music to give them the great pleasure and intellectual refreshment which it provides so abundantly. If a blind person has a rare gift of composition of songs or a rare gift as an instrumentalist or a vocalist, I think he would get a livelihood.

9706. (*Sir Henry Selwin Ibbetson.*) Practically, what you have said amounts to this, that whilst you would teach the blind music, as a rule you would only encourage the few that were exceptionally gifted to look to it as a profession?—Quite so; the blind suffer disadvantages in a great many ways. An enormous number of musicians get their living by playing in the orchestras at theatres, but very few conductors would like to go to the extra trouble that a blind member of their orchestra would put them to. Suppose an orchestra were rehearsing a new work, and suppose the conductor told them to begin again at page three or to go back to where there was a * or some other sign, the conductor would find his time so taken up by the necessary explanations to the blind performer that he would decline to have such a man in his orchestra.

9707. (*Mr. Few*). Therefore in your opinion, it would only be first class blind musicians that would be able to earn their livelihood?—Yes; that is the conclusion I have come to after careful consideration.

9708. Have you at all thought what occupation other than music would be suitable for blind persons to take up?—There are two occupations in connexion with music for which I think the blind are well adapted, and which I have not mentioned, viz., pianoforte tuning and pianoforte making. I see nothing to prevent the blind following those occupations. Occasionally of course a blind tuner would come across a pianoforte of a different type of construction to that to which he had been accustomed, but he would quickly get over that difficulty. I do not see why blind persons should not become excellent tuners, and I do not see why they should not take part in putting pianofortes together. I do not think a blind person could very well undertake organ tuning; he would be heavily handicapped in comparison with a seeing person; he would be likely to break his neck in going up and down ladders; one has to be half a monkey to look after an organ even under the most advantageous circumstances. I think a blind person might take part in tuning harmoniums which require a very delicate manipulation and a very correct ear; and, if trained for it, he might get a living by adjusting the relative positions of the bridges and the sound posts in valuable fiddles, a work which requires immense patience; a man may be hours and hours a day for several weeks with a Straduarius trying the effect of the tone by altering the adjustment of the bridge and the sound post. I should think the blind would be very well adapted for that work if trained to it.

9709. We have it in evidence that pianoforte tuning is the most profitable occupation for an ordinary blind person to take to?—Perhaps it is; the only difficulty attending it is that in the country a tuner has to do a great deal more than in London or the large towns; in the country the tuner has often to mend a smashed hammer which involves going about the house and getting a glue pot. I should say that the tuning work for which the blind are best adapted is that which is done in the pianoforte manufactories; in all the large manufactories they have tuners constantly at work getting pianos into tune that are intended for the show rooms or that are going out on loan. A blind person could very well do the tuning at the manufactories, because if anything required to be mended it would be taken to another workman in the manufactory to be repaired; but in the country the tuner has to mend broken pedals and mend broken hammers, and put fresh leather on the hammers where necessary. I daresay he could do it, but he would not be able to do it so easily as a seeing person.

9710. Therefore do I rightly understand you to say that a blind tuner, except in London or the large provincial towns, would not be likely to earn his livelihood?—I would not say that; I should think he very likely might be able to earn his livelihood as a tuner in country places as well as in London and the large towns, but cases in which he might find himself in an awkward situation might occasionally occur. I should think also the blind if trained to it might get employment from organ builders in performing the operation of pipe voicing, an operation which requires a fine ear. A row of pipes is put upon a sounding board, with a little bellows underneath, and the man has delicately to open the lips of the pipes to make the whole series of the same quality of tone. I should think that the quick perception which the blind have of different qualities of tone would make them admirably fitted for that work.

9711. (*Mr. Arrol.*) If I rightly understand you, you consider that the musical profession is one of the worst that the blind can turn their attention to as a means of earning their livelihood?—I do not feel qualified to give any opinion whether there are other professions for which the blind are more adapted, but I think it very important that those of the blind who are launched into the profession of music should be of the best. I am hardly qualified to say what other things they can do.

9712. Would you feel disposed to recommend that those who showed that they had exceptional gifts should be trained to the profession of music?—I should recommend that every blind woman with a very fine voice, and that every blind man with a very fine voice, should be trained as a singer. I do not think there would be any prejudice against a first-rate singer or pianoforte or violin-player because he or she was blind, but I think when you come to the second or third-class singers orperformers public feeling runs in favour of people possessed of sight.

9713. That being so, do you think that anything could be done in the way of recommending people who are blessed with sight, who have other fields open to them in which they can earn a livelihood, to turn their attention to those fields so as to leave the field of music open to the blind?—Looking at the revolution which has taken place in this country in the last 20 years in regard to music and the musical profession, I think we cannot hope that the blind would ever have much chance in the musical profession in competition with seeing people. Twenty-five years ago a musician or singer was just tolerated; he was treated kindly enough no doubt, and allowed to be a respectable fellow, but that was all. I remember when I was a boy it was considered quite an extraordinary thing for a lady of high position or a man of high position to play a pianoforte solo in a drawing room; it was thought to be a little bit undignified; but I have lived to see a large choir like the Bach choir sing not only in private, but at public concerts, that choir comprising people of title, and amongst the sopranos there has been an English princess. When I was a boy I know in choirs they generally sang from memory, but in the Bach choir, when I was conducting during the temporary illness of the conductor, Otto Goldschmidt, I have known a work which had only just been sent in to be unpacked and distributed to the choir, and they have sung it straight off by sight admirably. That represents the great revolution that has taken place as regards the estimation in which music is held by the upper and middle classes, and in like manner the profession stands in a much higher estimation than it used to do. A very large number of Oxford and Cambridge undergraduates who have taken their degree of M.A. have taken to music as a profession. Hubert Parry, for instance, who is a B.C.L. and an M.A., and is a hard-working professional musician now, he is a man of a high position. Then there is Charles Lloyd, the organist of Christ Church, Oxford; he is a double graduate, in arts and music, and he is making a good living out of music. Then there is Sir Herbert Oakeley, Charles Stanford, of Trinity, Cambridge, and Rendle, the organist of Dulwich College. Then there is Selby, who came up to Oxford with the intention of going into one of the liberal professions, but he abandoned that idea and went to Leipsic, and is now a working musician in London, and Alan Gray, teacher of music at Wellington College, and many others. The fact of people of that class taking to music as a profession is very much against the chance of people of the class who ordinarily become musicians among the blind getting a living, because if people in the upper or middle classes can get a man or woman of refinement and of good social position to come and be their music teacher, the others do not stand a chance.

John Stainer Esq. Mus. Doc., M.A., R.A.M.,

2 April 1886.

9714. All these instances that you refer to are first-class men and not second or third-rate men?—A very large number of second-rate men have done the same. There are a large number of gentlemen and ladies who are second-rate musicians at the present moment working hard as teachers and taking their fees in the ordinary way as professional musicians. I know from practical experience in that respect that the profession of music has absolutely undergone a revolution in the last quarter of a century.

9715. You made reference to the disadvantages that a blind organist or conductor would labour under in training the choir; would they arise simply from the boys manifesting a levity which he might not be able to see and suppress?—That is one thing; another thing is this: at the present moment there is rather a rush on new music *versus* old, and on the arrival of a new anthem, say on Friday, the choir may be immediately called on to rehearse it, with a view to its being sung on the following Sunday. In such a case as that we cut the leaves of the music and set to work. I play the anthem at sight and instruct the choir how to give the proper rendering of it, but a blind man would be useless; he would require to take it home and instruct himself in it.

9716. Though what you have just referred to is likely to occur in cathedrals, in country churches it would not be likely to occur?—I am constantly asked to recommend clergymen where to put the organ and so on, and they all like to get the organist somewhere near the choir. The clergyman wants to have the power of saying to the organist I wish to make an alteration in the music; instead of the hymn on the paper let me have so and so. Of course that might be one that the blind organist would know, but it might be one that he did not know, and in many cases it would lead to serious difficulty. In answering all these questions I am putting charity out of the question. If you ask me whether the clergyman would be likely to give way and show a little consideration that is another question.

9717. I do not know whether I am correct in supposing that you are examiner of music for St. George's?—I acted once in that capacity, and as examiner I went into the results of the musical instruction there very carefully, and I sent a report which I believe was printed.

9718. Does that institution profess to give its pupils such a knowledge of music that they can come out of the institution as professional musicians?—I think that that institution is quite prepared to do it if it found a case of exceptional talent; as I said just now, the teacher they have selected is a man of great ability from any point of view, and I have no doubt if there should be any case in the institution of exceptional talent that man, though blind, would be able to bring that pupil on to a point at which you might say that he had very nearly got the finishing touch to his musical education, but I consider that it would be wise of that institution, looking to the intellectual and social character of the class of persons that it takes in, not to give undue importance to music as a profession, not to attempt to flood the market with a lot of second-rate or third-rate blind musicians.

9719. (*Admiral Sir E. Sotheby.*) Do I rightly understand you to say that you would not advise any blind person to take up music as a profession, but only as an amusement?—In all cases where there was special talent I should recommend him to take it up as a profession; anybody with an exceptionally good voice, or anybody who was an exceptionally good performer on an instrument, or with exceptional power of composition, I say by all means should have the very finest training that could be had, and I think a living is attainable for such a person.

9720. You think the blind may compete with the sighted as tuners?—Yes, at all events tuning is a very good field of occupation for the blind.

9721. How much would a blind tuner be likely to make a week?—A good tuner would rarely make less than 35*s.* a week, and I should think under favourable circumstances, if he were a tuner on his own account, he might make sometimes two or three guineas a week.

9722. He must be well known to get that?—Yes. I may explain that the system adopted in the large pianoforte manufactories with regard to tuners is this: they take a certain number of lads at the age of 14 or 15, and they put them either through what they call the general department, which means pianoforte making in general, or they put them to tuning, and if they show that they are competent for their work they gradually rise and are retained on the staff of tuners, which is not recruited at the bottom unless one goes away from the top. They do not take in more boys than they can employ, consequently they are never overstocked. A tuner on the staff would earn, I should think, 30*s.* to 35*s.* a week, but of course every now and then a tuner says, I find there is an opening in such a part of England, a tuner is very much wanted there, and he resigns his position and goes away to the country, and there he settles. What his income there would be it would be difficult for me to tell you; he might be unlucky or he might be lucky; if he were lucky he might get as much as two or three guineas a week.

9723. As a rule are there more blind tuners out of employment than sighted?—I should think not. I do not think the market is very much overstocked with tuners; the tuning of pianofortes has not suffered I fancy so much as other branches of trade, because there has been an enormous impetus to music in the last few years.

9724. You said you knew the case of a blind person, a thorough musician, who could not get any employment at all?—His name is ——— ———; he is a man who passed his examination, and is actually at this moment a Fellow of the College of Organists, which is a very honourable diploma to hold. I happened to be one of the examiners when he got his diploma; he got his living fairly well for some little time after he got his diploma by giving cheap lessons, charging 2*s.* a lesson and so on, but he found himself crowded out by the enormous number of people entering the teaching professions from the various institutions that I have spoken of, and he had to reduce his terms to 1*s.*; then he was glad to get 6*d.* He had to give up as an organist; they told him they wanted a person who could learn a larger number of tunes. At one time when he had the post of organist offered to him at Bath or Bristol, or some other place, I and a few of my friends got a little money together to help to send him down to this place and set him up in his house. I think we got together 50*l.* or 60*l.*, and he seemed to be going on pretty comfortably for a time, but he could not compete against the seeing teachers; and at last he has not been able to earn his livelihood, but owing to his good social position he has got the benefit of some small gifts amounting to about 10*s.* a week.

9725. What age is he?—He is quite a young man, 43 or 44. His wife, who was a lady, died a little while ago, her death being accelerated by the anxieties with which she had to contend, and this man, I am afraid, is likely to be one of the large army of blind pensioners.

9726. Do you think that his knowledge of music is as good as that of those who have been taught at the Normal College at Norwood, for instance?—Yes, I do. I mentioned his case because if there was any blind person who could have earned a good living at music I should have thought it would have been that man, because he was able to compose and write his own harmony; he had passed the preliminary examination for an Oxford degree of music, and had written a pianoforte tutor.

9727. (*Dr. Campbell.*) You would not consider that a man, whether blind or seeing, who might have great musical gifts either as a composer, or as a performer, would necessarily be a competent teacher?—No, that is one reason why I mentioned the fact of his having written a pianoforte tutor; he was a man taking a sufficient interest in the work of teaching to think out his own system of instruction and write it in a book; such a man ought *primâ facie* to be a good teacher. I have no reason to suppose that he would be a wonderful teacher, but certainly he would be a very sound music teacher.

9728. In teaching music, and I believe we may say the same of all other subjects, the teacher must have not only a gift for the special subject, but he must have mental power and tact to apply himself to individuals, and that is more especially the case with regard to the blind?—I quite agree with you, and that bears out what

John Stainer, Esq., Mus. Doc., M.A., R.A.M.

2 April 1886.

I say; a man to have all the qualities that you name must be an uncommonly clever fellow, and I say only the very cleverest of the blind should attempt to get their livelihood by teaching. I have been an educationalist, I may say, all my life, and I think I know what is required in a teacher; I think a teacher requires a number of qualifications which are rarely met with.

9729. A blind person might not be a very great artist as a performer or a composer, but he might make a better teacher than one who was a good performer or composer?—No doubt.

9730. Therefore, supposing an institution of the blind should educate its pupils so as to draw out their mental faculties and develop all the qualifications required in a teacher of music, do not you suppose that when they went out into the market they would be far better able to give lessons than men who had not had that preparation?—Yes, but I must go into the question whether the public would think so. I cannot imagine any system more admirable than your system of preparing blind persons to become teachers of music, but if you were to go to Mr. A. or Mr. B. and say, Here is a blind person who would be a first-rate music teacher for your family, and on the other hand here is so-and-so, a seeing man, who is said not to be so good a teacher, I am afraid Mr. A. or Mr. B. would go to the seeing man.

9731. You referred to the Normal College a short time since, and you said the pupils appeared to you to be picked pupils; is it your opinion that the pupils are selected with regard to their musical ability?—No; I have not asked anybody from what class the pupils at Norwood College come, but from the extraordinary good results which I and my coadjutor, Mr. Manns, found, I should have said that you had pupils with a superior intellectual aptitude, or in other words pupils of pretty good social position

9732. You referred to the case of a young lady who was able to play two parts separately of a fugue of Bach's, leaving out the other two parts, the boys could have done the same thing; would you have supposed that that girl was originally not only in poverty, but a poor pauper child who in the first instance showed no talent whatever?—No, I certainly should not. There is one man named Hollins, who was educated at Norwood College, who has shown very great talent. I do not know whether he belongs to the lower order of society.

9733. His father was in the Post Office Department?—I believe Hollins is likely to be a distinguished musician; perhaps he may have inherited his aptness from his ancestors.

9734. (*Chairman.*) Do you think the results which you find at the Norwood College are due to the special system of teaching there, or do you think that they arise from the pupils being selected cases, that is to say, from the pupils having rather more than the usual ability?—I cannot speak to the second part of your question, but as regards teaching there can be no doubt about the thoroughness of it; I should say that the teaching staff at Norwood is about the strongest that was ever got together to bear upon the blind.

9735. Do you think that the satisfactory state of things that you found at Norwood is so much the result of the teaching as the result of a number of pupils of unusual ability being gathered together there?—I should have said that both influences were at work: first of all they have got a most remarkably able staff, and in the next place I should have said that Dr. Campbell had rather a superior type of pupil; but I say that subject to correction.

9736. (*Dr. Campbell.*) If I tell you that out of the 180 pupils now under instruction at Norwood only a dozen are able to pay for themselves, does not that show that they are drawn from the poorer class?—I should have preferred you telling me their social position, because that involves the question of hereditary intellectual capabilities.

9737. Of the 180, 120 are drawn from the poorest possible classes, and about 40 of them come from the workhouses?—I have said all along that I was open to correction as to what class they came from.

9738. With regard to the case of —— ——, who you said is unable to earn his livelihood as a musician, can he read and write Braille?—I do not know, but I know he is dependent on an amanuensis; when he passed his examination he had a boy to write for him.

9739. You say that the blind are at great disadvantage not only as teachers but as composers; take the case of Sir George Macfarren, who is Professor of Music at Cambridge, and Principal of the Royal Academy of Music, and who writes such works as "The Lady of the Lake," or "Joseph," or "John the Baptist," by means of an amanuensis and not by Braille, he is an instance of what can be done by cultivation?—I must say that I draw a very broad distinction between people who have gone blind in later life and people who were born blind; but I should say that Sir George Macfarren is placed under serious disadvantages as Principal of the Royal Academy of Music from being blind.

9740. But as regards composing, Sir George Macfarren has been able to compose great works like those to which I have referred, though he is blind and does not use any system of musical notation for the blind?—Yes.

9741. And Henry Smart was another celebrated composer who was also blind, and who also had no musical notation?—Yes, but it must be remembered that in both those cases the blindness came on late in life, which makes all the difference. Take my own case. I practically began to be a professional musician at seven years old. I was admitted a chorister at St. Paul's when I was that age. If at 45 I were not able to think out a long piece of music I should be ashamed of myself. I do not profess to be a composer, but I have composed some cantatas and other works, and I should have been able to dictate the whole of the last cantata I wrote for one of the provincial festivals if I had been blind. I thought it out so completely that I sat down and wrote the full score page after page for so many hours a day till it was finished. I think it took me 132 hours, and not a note had to be altered. The rough copy was sent to the printers, and the engraved plates for the orchestra were copied from that score. If I can do that with my eyes open I could do it equally well with my eyes shut, if I had an amanuensis.

9742. Which of the two would be more likely to succeed in life, a blind person who was born blind, and was trained when young, or a person who became blind in after life?—If I had been blind from a boy I think I could not have possibly got the valuable experience that I have had during my life, which happens to have been very varied; I could not have got it as a blind man.

9743. (*Mr. Johnson.*) Do you know whether any blind persons are employed in organ factories?—No.

9744. In the manufacture of organs there are no blind persons employed, so far as you know?—I think not.

9745. Do you know of many blind tuners being employed by pianoforte manufacturers?—I think in nearly all the large manufactories they have a few; they have some at Broadwood's and at Kirkman's, and so on. I do not think they are very anxious to have a majority of blind persons.

9746. Do they give the blind tuners the same advantages they give the sighted tuners?—I think they do. It is not quite my sphere. I should prefer that you should have an expert from a pianoforte manufactory and ask him these questions. I think they do. I think they give blind tuners a fair chance.

9747. Do you think sighted teachers teach better than blind teachers?—Yes; I think they do.

9748. You mentioned having visited St. George's; will you give us your opinion with regard to the instrumental portion of the education; do you think that the blind who were being taught there might become performers on ordinary instruments other than the pianoforte and organ?—The impression I formed there strengthened very much my impression with regard to the extraordinary capabilities of the blind; I remember I heard a whole orchestral overture, and various pieces. I was very much struck with that; there were cornets and trombones, and all sorts of stringed instruments, the performers on which had been all taught by their blind teacher; but that did not shake my opinion that it would be a very unwise thing to turn all those out into the world as professional musicians. I was delighted to see them do what they did, and whenever I asked questions, which I did freely, I found that they all had an intelligent notion of what they were doing, but still I consider that only those of first rate ability ought to be launched into the musical profession as such.

9749. When you visited that institution did you understand that the directors of the institution only had

John Stainer, Esq., Mus. Dr., M.A., R.A.M.

2 April 1886.

the orchestra as a refining influence and means of amusement for the pupils, and not as a means of getting their livelihood?—I think I did understand that.

9750. Turning to the report you made I find you said this, "I venture to express my entire concurrence with "the action of the committee in not training too many "pupils for the musical profession. Of course there "can be no doubt that many blind persons have a "special aptitude for the acquirement of music, but on "the other hand no amount of careful study and "training can remove the sad fact that blind musicians "must largely get their knowledge of musical works "second-hand, from some one who has sight. It may "be urged that several distinguished musicians have "been afflicted with blindness, but no analogy can, in "my opinion, be drawn between the career of an ex-"perienced musician whose eyesight has failed, and "one whose whole life, or the chief portion of whose "life, has been clouded by this affliction. At the "present time there is also an additional reason why "great caution should be exercised in recommending "blind persons to become professional musicians; it is "this, the musical profession is in every branch over-"stocked; our large institutions of musical education "have never been so crowded with zealous and talented "pupils as now, and these young people are annually "leaving these institutions to swell the ranks of public "performers and private teachers." Do you still hold that opinion?—Yes, that coincides with all that I have said to-day.

9751. You have told us something about the results at the institution at Norwood; do you know whether their pupils have been educated solely at that institution, or have some of them been selected from other schools?—That I cannot tell. I went there as an outside examiner; I had not to report upon any ratio of progress, but I had to give a report upon the condition of the music as I found it.

9752. In the report of the Congress held at York, which is published and circulated very freely through the country, I find one of the principal performers who showed extraordinary talent is Mr. Hollins, whom they claim credit for as having been previously educated at York; have you any knowledge of that?—I have no knowledge of that.

9753. They seem to imply that at Norwood he had the polish put upon him?—I do not know that.

9754. Have you heard Hollins play?—I am not sure, he is a friend of several men I know; I have heard from thoroughly reliable sources that his talent is very great.

9755. Is a person possessed of such talent as he possesses able when he goes into the world to make a fair living?—Yes, I think he will, because he comes among the class I specially mentioned as being endowed with exceptional talent.

9756. In the case of second-rate and third-rate blind people you think it a doubtful thing?—More than doubtful; they cannot compete with second-rate and third-rate sighted people.

9757. Take the case of a school where you are educating 30 or 40 blind persons, and you teach them a certain amount of music, one may exhibit a particular talent for music who you would say ought to be specially trained; do you think such a person ought to be trained in an institution where others are learning trades, or if they are learning music are only learning it as an amusement and not as a trade?—I take it that what you put to me is this: suppose an institution, not specially formed for teaching music, and a case of remarkable talent occurs, what ought to be done with it. I should say that case should be sent to a special institution where teaching of a very high order could be found.

9758. Do you think that that high order of teaching could be found in a college for sighted people, or must the blind person be trained amongst blind people?—I should say he ought to go to a college specially for blind people. I give all these opinions with great diffidence; I am only speaking from personal opinions which I have formed in the last 20 years or so.

The witness withdrew.

Sir GEORGE A. MACFARREN, Mus. Doc., examined.

Sir G. A. Macfarran, Mus. Dr.

9759. You are a Professor of Music at Cambridge and Principal of the Royal Academy of Music?—I am.

9760. Have you been blind long?—A little less than 20 years, but my sight began to fail when I was 10½ years old, and only resulted in blindness at the time I tell you.

9761. Had you made any preparation against becoming totally blind by learning any system of type?—No, I used to perform my duties unaided for a long while, and it was not until about 1860 that I was obliged to be entirely dependent on an amanuensis.

9762. Have you had any experience in teaching the blind?—No, not in teaching the blind; in teaching generally I have, but I never had but one blind pupil.

9763. We have had evidence that the musical profession is rather overstocked at the present time; is that the case in your opinion?—I am afraid that that is the case.

9764. If it is overstocked for the seeing, of course the blind must be at a greater disadvantage than the seeing?—For that matter I believe that persons of merit will always come to the front whether they see or do not see.

9765. I am rather speaking of those who have only ordinary musical talents; do you think there is much opening for the blind with ordinary musical talents?—I think that for some time they will be working against the prejudice of the world. The world has a great disbelief in any person with infirmities, and it is only by good work that that disbelief can be turned into belief.

9766. Have you examined the college at Norwood?—No; I have yearly examined the pupils in the blind school in the Avenue Road.

9767. Are they well taught there?—Yes, very satisfactorily indeed, and the work of their own blind teachers I have found very meritorious, that is to say, persons who have been trained in the school and promoted to the position of preceptors.

9768. Do you think that for teaching the blind a blind teacher is equally as good as a seeing teacher?—No, I think it of great importance in the teaching of music that the teacher should be able to watch the position of the hands of the players and indicate to them how to hold the hands and arms, and how to avoid gesticulation and so on.

9769. Does that apply also to singing?—No; I have no reason to think that a blind person would sing under any greater disadvantage than one with all the eyes of a peacock.

9770. But do you think that the blind are sufficiently able to teach singing to those whose voices require careful and special education?—I can form no notion of that since I have no experience on the subject, but I can see no reason why a sighted person should have any advantage in that particular.

9771. But the reasons you have mentioned must militate against the employment of the blind as teachers in the instrumental department of music?—It must militate against it.

9772. Do you think it desirable that the blind should be taught music in an institution specially devoted to the teaching of the blind, or do you think it possible that they might gain a thorough knowledge of music in any ordinary college or academy where the seeing were taught music?—I think a special college or school for the blind is desirable, because it wants in the teacher a special experience to enable him to communicate with the blind, and a person who takes casually a blind pupil cannot do either himself or his pupil the same justice that a person can who has formed a plan of imparting his instruction and of making himself understood, and therefore I believe a blind pupil has a greater advantage where the staff is organized for his special training.

9773. Do you know many blind persons who are earning their livelihood by the profession of music?—I do not personally know many; I know a few.

9774. I suppose in the case of those who have had the advantage of their sight up to a certain age, and who then become blind, their blindness does not interfere so much with their profession of music as if they had been blind all their lives?—I think the persons who with

Sir G. A. Macfarren, Mus. Dr.

2 April 1886.

their eyes open have acquired the knowledge necessary to enable them to carry on a profession are at a great advantage as compared with those who have entirely to acquire it by dictation.

9775. You are acquainted with the Braille system of musical notation?—Yes.

9776. Is that pre-eminently the best?—It is the best I have any knowledge of certainly, and I have ample proof that to a great extent it does away with the necessity of a reader when a blind person wants to execute a particular piece of music.

9777. Did it take you long to acquire a knowledge of it?—It did, but I am rather clumsy in touch. Doubtless those persons who from very early age have exercised their touch and perfected their sensitiveness to a great extent would be more expert at it; I was already 60 years old before I attempted to feel over the embossed paper, and it took me a long while indeed to acquire anything like a fluency in reading it, and I found it much easier to forget it than to learn it.

9778. I suppose you have depended very largely on your well stored memory. You have an advantage of course over those who have been blind for the greater portion of their lives?—With regard to that matter of memory, and with regard to the matter of ear, I have often heard it said that persons in losing one sense quickened the others. I disbelieve that wholly. Any faculty that is greatly exercised of course is strengthened whether it is the sense of taste, or the sense of sight, or the sense of smell; a person who makes it the business of his life to exercise that faculty acquires a sensibility that ordinary persons do not possess, but it is not through losing his sight that a man is able to hear or able to remember any better than others, but from the habit of trying to remember or listening carefully.

9779. Are there any general observations that you would like to make with regard to teaching music to the blind?—I have not had experience in teaching the blind music. I have only noted the results of teaching in the examinations I have held, and I have but to say that it seems to me highly desirable to encourage the study of this Braille system of notation, which to a great extent helps to give independence to the student, and it is of great consequence to make every person self-reliant and not dependent on another to teach him what he is to do.

9780. Would you advise that the blind who have only ordinary gifts for music should be taught music as a profession or only as a recreation?—I think it is a mistake to appropriate so very much of the lifetime of blind persons to working at industrial occupations, which tends to stiffen their faculties, physical and mental. I believe that a very large majority of blind persons are capable of mental exercise, and that if they have the opportunity of good training they may do highly respectable intellectual work; and I have been sorry to find in the blind institutions I have visited that the average work is in mat making and brush making and such matters, and that the persons who work at those occupations are stolid, hard in their manner, and dull in their apprehension, whereas those who are taught music generally have far finer intelligence than their companions. On that account I believe that they might in the musical profession hold a very fair status, that is to say, if they all had the opportunity of developing what gifts they have received from nature. In an institution for the blind every pupil might be made to pass through some kind of probation to show his musical capabilities, and only those should be relegated to manual labour who proved decidedly dull of intellect, and I believe they would be very few in proportion.

9781. Do you think all the blind should be taught music to a certain extent, even though they should not be able to earn their livelihood by it?—I think that would be highly desirable, because I think the study of music not only improves the ear but improves the general intelligence; and it would be a means of happiness to them and enable them to give pleasure to others.

9782. But of course in recommending that music should be taught to the blind you do not say that it is your absolute belief that they would be able to earn their livelihood by that profession, looking to the fact that the musical profession is already overstocked by those who can see?—It is always difficult for a beginner in the musical profession to make a position; it can only be by the exertion of his own personal friends that he can step on the first rung of the ladder of a professional career, but whether seeing or not seeing, if he can gain such an introduction, and if he can do credit to the persons who recommend him by the good work he performs, I believe he will find an opening. It is always a lottery, in entering into the musical profession, how much or how little employment a person may have; it depends greatly upon his own personal connexion to create the opportunities for him, but I believe the multiplication of those opportunities depends on his acquitting himself satisfactorily in the profession he has chosen.

9783. Do you think the success of a teacher of music depends first upon his natural ability to teach, and secondly on the particular method by which he is trained to teach?—I think it depends upon both those points.

9784. Do you think that a person of ordinary musical ability can be taught, by a special method of training, to be as good a teacher to others as a person of higher musical ability who had not had a similar training for a life of teaching?—I think very strong evidence of what may be done in the way of training blind persons to be teachers is to be found in the blind school to which I have referred. I have found very good work to result from the teaching of the blind teachers who have been reared in that school, and who hold the rank of monitors or sub-professors in the school.

9785. (*Mr. Johnson.*) You are speaking of the St. John's Wood School?—Yes.

9786. Were you satisfied with the mode in which the musical education was carried on in that institution?—Generally speaking, yes; certainly.

9787. Under the superintendence of Mr. Barnes?—Yes, I had occasion to regret that sufficient time was not allowed there for the study of music, a thorough knowledge of which can only be satisfactorily obtained by devoting a very large amount of time daily to its practice; but so far as the instruction went there was the highest reason to be satisfied.

9788. As far as your experience goes of institutions for the blind in which music is taught throughout the country, do you think music is taught efficiently in them?—My experience of such institutions is very small indeed. I visited a school in Liverpool and one in York where the result of the teaching was highly satisfactory, and I have heard the performances of the pupils at the Normal College at Sydenham, and those of the pupils at the Avenue Road School. I know of no others.

9789. I think you said you knew a few blind persons who were earning their living by music; can you give us any idea what their earnings are?—No.

9790. Do you think that the blind are at a disadvantage in any way in competition with the seeing?—I think at present they are, but I believe that the prejudice against the blind as musicians is beginning to give way, and I have some hope that the good work which is being done by blind musicians may convince the public generally of the ability of the blind to compete satisfactorily with seeing persons.

9791. It has been stated that out of 100 blind pupils that might be got together about 30 would be capable of being well instructed in music; does that accord with your experience?—I have no experience on the subject.

9792. With regard to musical notation, Braille's notation I believe is the only one which is used at all in this country; there is no other musical notation?—I know of no other.

9793. After all, I suppose any musical notation is but an aid to the memory, because in performing for instance a piece upon the organ the man's fingers cannot be upon the raised type and the instrument at the same time?—Certainly not; in the matter of singing where the hands are not wanted for the performance, it may help the person to join in a choral performance.

9794. But in the case of any instrument the type can only be used as a means of teaching the performer the music, which he retains in his memory?—Quite so.

9795. You have some experience with regard to music being communicated to the blind orally?—Yes.

9796. That is another mode of aiding the memory?—Certainly, of course that necessitates the aid of a second person, whereas the value of any musical notation that can express itself to the touch is that it makes the reader independent. For my own part I am entirely dependent upon the help of a second person either to write music for me or to read music to me. I can only take it through other people's eyes and other people's lips. If I had a sufficient familiarity with the Braille system to enable me to read it fluently, I might be saved dependence upon other people which would give me an advantage.

Sir G. A. Macfarren, Mus. Dr.

2 April 1886.

9797. Then your great musical talent and your great musical experience has been gained through other people's eyes?—Yes, in my latter years.

9798. And you have resorted very little to the help of tangible notation?—Very little indeed.

9799. Do you think that there is any difficulty in a blind person who has been properly instructed, and who is a fair organist getting employment now?—I think there is far less difficulty than there was, but still there prevails a strong prejudice upon the subject. I remember not many years back to have met with more than one advertisement for an organist with the appendage, "No ladies nor blind need apply." That has not appeared lately.

9800. We have been told in evidence that the difficulty of blind organists getting employment arises from the fact of there being so much more church music required now than formerly?—That is very likely to be the case.

9801. Do you know of any impediment in the way of management of the choir or the selection of music in churches being a hindrance to the employment of the blind?—I am quite sure that some blind persons have made very good choir masters and church organists. I think there would be much difficulty in a blind person fulfilling the duties of a cathedral organist, where there are 14 different services in the week, which would be beyond the grasp of ordinary memory, and there would be insufficient time for most blind persons to give the necessary amount of preparatory study for those 14 services, but I am quite sure that a blind person could very efficiently discharge the duty that he would be required to perform in an ordinary parish church.

9802. For the ordinary services in a church in a country district you think a blind organist would be able to fulfil all the requirements of his situation?—I think where there is but one day's service in the week there can be no question upon the subject.

9803. Have you any idea what the ordinary average earnings of a blind organist are?—I have no idea that an organist earns more or less according to whether he can see or cannot see; it depends, I think, on the riches of the church whether he gets his 12*l.* or 20*l.*, or his 200*l.* a year.

9804. As a rule I suppose the blind do not get very large salaries as organists?—I think if they get small salaries it is not because of their blindness. A very eminent blind musician, the organist of St. Pancras, who died six years ago, Henry Smart, and who from his remarkable ability was regarded as the very head of his profession, received a very large stipend for the duties he fulfilled, to such admiration that the church was thronged by people who came to hear his own organ performances and the singing under his direction. He was for many years entirely blind.

9805. His case was an exceptional case?—All distinguished talent is exceptional.

9806. Do you think there is any market for what you may term mediocre blind musicians in teaching persons of a class who cannot afford to pay very much for their musical instruction?—I have had no opportunity to judge.

9807. I suppose it is your opinion that it is only those who are specially educated, and who display talent, and who rise above the surface, who would be able to gain a competence in their profession?—I would not go so far as to say yes to that question. I believe persons of steady habits and perseverance will gain, if not affluence, certainly a competence, if they do their work fairly well.

9808. I suppose you are looking forward to the future rather than speaking to what is the case at present?—Yes.

9809. Have any cases of blind musicians gaining what you may call a fair living come under your notice?—Yes, there are certainly are some.

9810. Very few?—My experience has not given me means of giving you any statistics of such cases.

9811. Do you think that education to a certain extent in music in an institution for the blind, whether the pupils are able to attain any great proficiency in music or not, is very advantageous for them?—Yes, I think a sharpening of any of the senses must do much towards refining the intelligence generally. If a person acquires a habit of watching nice distinctions of tone in an instrument or in the singing voice, it will lead him to observations of the speaking voice; it will help him to perceptions of niceties in general matters, which must, I am sure, quicken all his sensibility.

9812. Have you any experience with regard to blind persons who are teaching music as a means of earning their livelihood?—No.

9813. Do you think that they would labour under any disadvantage as compared with the sighted?—They would be under this disadvantage that they cannot see whether the hands of the pupil are too much or too little raised, whether the fingers move properly; it is impossible to feel the hands of the player in the process of manipulation, and though doubtless a bad position will give a bad tone, this cannot be so accurately perceived by the ear as it can by sight.

9814. We have been told that the market for teaching is rather overstocked even amongst the sighted; is that your opinion?—I think with the large stocking of the market there is also a very large increase of the marketers. At the present time there are hundreds learn music where only tens learnt it in my youth, and I believe that the great augmentation which has taken place in the ranks of the musical profession either is induced by, or itself stimulates, a desire to study music in the community at large. I believe the more teachers there are the more pupils will come to them.

9815. Have you any experience with regard to public performers amongst the blind? Have you known any cases of blind persons getting their livelihood as musicians?—I have known some such cases, decidedly. There was a remarkably good pianist, Herr Labor, who came here from Hanover a few years ago, who certainly was very well received. I have spoken already of the case of Henry Smart. Then there was a young man of the name of James Lea Summers who was a pupil of my own, who lately died, who played in public with very good effect. I could cite other cases within my own experience, but to go to cases before my time I may refer to Handel, who used to play the organ, after he lost his sight, at the public performances of his oratorios. Bach also played after he had lost his sight, and both of those dictated compositions to amanuenses. Then after Handel's death John Stanley directed the oratorios at Drury Lane, he being blind. Then there was Theresa Paradies, a girl of remarkable merit, who sang in public, who composed operas, and who played so well upon the pianoforte that Mozart wrote a concerto for her. Then there was Mercadante, who was Director of the Conservatorio in Naples many years, and who carried on all the duties of his office and produced several musical works though he was blind.

9816. I suppose in the case of all the persons that you have last quoted they became blind late in life, and had therefore the advantage of previous sighted education?—That is so with respect to all the cases except the lady I named.

9817. Can you tell us what Summers made by his performances?—I cannot.

9818. You have never heard that his performances were not a pecuniary success?—I have never heard that.

9819. What is your opinion with regard to tuning as an occupation for the blind?—I have reason to know that blind persons can carry on the occupations of tuning pianofortes and voicing harmoniums with complete success.

9820. Are there any establishments which employ blind men in tuning harmoniums now?—I know there are several.

The witness withdrew.

Adjourned.

32, Abingdon Street, Westminster.

Wednesday, 5th May 1886.

PRESENT:

LORD EGERTON OF TATTON IN THE CHAIR.

ADMIRAL SIR E. SOTHEBY, K.C.B.
W. TINDAL ROBERTSON, ESQ., M.D.
B. ST. JOHN ACKERS, ESQ.
T. R. ARMITAGE, ESQ., M.D.
W. AUCHINCLOSS ARROL, ESQ.

E. C. JOHNSON, ESQ.
ROBERT MCDONNELL, ESQ., M.D., F.R.S.
THE REV. W. BLOMEFIELD SLEIGHT, M.A.
CHARLES FEW, ESQ.
CHARLES D. BLACK, ESQ., *Secretary*.

WILLIAM T. HILLYER, ESQ., examined.

W. T. Hillyer, Esq.
5 May 1886.

9821. (*Chairman.*) You are the secretary of the British Asylum for Deaf and Dumb Females at Lower Clapton?—Yes.

9822. How long have you been in that office?—About six or seven years, since September 1879.

9823. Will you state the objects of the institution?—The objects of our institution are threefold. It is an institution I should mention, in the first instance, for adults, and we take in inmates who are supposed to be excluded from the other purely educational institutions. We have lowered the age at which we receive them from 13, as it was formerly, to 10; finding that the other educational institutions refuse now to undertake them over ten as a rule, from the difficulty I suppose in teaching the oral system. We consequently take them when they are beyond the age for admission to other educational institutions, consequently our first object is to educate; that is one distinct object of the institution, to educate or to carry on and extend the education, both secular and religious, of those who are admitted to the institution, whether they have been at other institutions or not. Another object we have is to give them manual and technical instruction to enable them, if possible, to gain a livelihood. They are taught needlework and laundry work and the work of domestic service; and where we can we provide them with situations with people who apply for deaf and dumb servants; and also we sometimes apprentice them to dressmakers, when there is some prospect of their doing something to help themselves hereafter. The third object of the institution is to provide a home for the aged and infirm and the unprotected, and those who can do nothing to help themselves. Those are the three objects of the institution.

9824. There are limits of age to that last class, I suppose?—There are limits of age, there are no limits of age as to the class who are admitted to the home, *i.e.*, to the institution as a home; but there is a limit of age with regard to those who are elected free. I should explain that there are two modes of admission; it is a charity it must be remembered.

9825. To the institution or to the home do you mean?—The institution is one; it is not very large, but it is one, and there are two modes of admission to the institution. The one is by an annual payment; we should of course be glad to receive them all free if the public provided us with funds enabling us to do so, but that we cannot do, we can only admit as many free as our funds will allow us; and those who are admitted free are admitted annually according to the number of vacancies. Perhaps half our number are free. There are three or four vacancies for the year, and to those vacancies inmates are elected by the votes of the subscribers and benefactors of the institution. What leads me to mention this is your question with regard to the age of the inmates. Now the age is limited with regard to those who are elected; they are not eligible for election after 30 years of age, because the object, as your Lordship will understand, in being admitted for purely educational purposes would be defeated if we were to admit those who are beyond the age at which any advantage would be derived from educational instruction. We find from experience that those under 30 are capable of instruction, and up to that age they are eligible for election.

9826. Do you find that there are any of middle age, that is to say between 20 and 30, who have not had any education?—We have had inmates come to us who had had no education whatever.

9827. Not able to communicate except by natural signs. I mean persons who have had no education, and could not read or write?—Quite so. We have had inmates as old as 17 who have had no education.

9828. And could only communicate with you by natural signs?—Yes, the signs that they have amongst themselves. I suppose they vary; perhaps the educational master will be able to give you more information on that point, but as far as I know the deaf and dumb seem to have a natural mode of communicating with one another apart from any system of the sign language.

9829. Would he be able to inform the Commission what number and at what ages those whom you have mentioned as totally uneducated have entered?—I doubt whether we have any statistical returns showing that.

9830. Have you any printed list that is filled up when they enter as to age and as to whether they are uneducated or not?—Yes, the age is invariably given.

9831. And their state of education when they enter?—Yes. This question is put on the form of application for admission.

9832. Have you any column where you would enter "can read and write imperfectly"?—I am afraid not. I do not think that is a record which has been kept, but the educational master would probably be able to answer the question from his long experience. The institution was established in 1851, and I think he has been connected with it from the very beginning, and he would be able to state, from his own personal experience, what the age has been of those who have been admitted uneducated. I do not know whether I should mention a subject which is very much in my mind, and that is that I feel very convinced that there are a great many adult deaf and dumb in the country who have lived without any education, and who are hidden away in workhouses and country districts, and they are very difficult to get at. A short time before the notice came to me to give evidence here I applied, myself, to the Local Government Board with a view to obtain from them some return with regard to all the deaf and dumb at present in unions, with the view, if possible, to induce guardians to send them to us; because I should mention that we are the only institution in the country for adults, that there is no other institution which meets the need of adult female deaf mutes, and I think there is none for males either; but I failed to get any information from the Local Government Board with regard to obtaining a return as to the number of the deaf and dumb in the different unions, even in the Metropolitan district. Our object was to induce the guardians, if possible, to send them that they might be placed under proper care and education, both secular and religious. We have a good many from different unions. Marylebone, Bedford, Lewisham, Holborn, and other unions, send inmates to us. Under the Amended Poor Law Act of 1879 the guardians of the poor are authorised to contribute towards the maintenance of the deaf and dumb, which they were not previously. Before the Act, we did, as a matter of charity, what we could to induce people to send them from unions, and the guardians sometimes contributed a small sum. Our cost of maintenance is 22*l.* a year, and when it was represented to those guardians that the actual cost was 22*l.* a year and that we did not think it right to relieve the rates at the expense of the charity,

they invariably, with one exception I think, agreed to this, and in cases where they were paying less than 22*l.* a year raised the sum which they paid from 13*l.* or 14*l.* to 22*l.*, which we considered the actual cost of maintaining the inmates and giving them the advantages of education.

9833. Are you speaking of adults?—All over 10; we deal with none under 10.

9834. What is the difference of expense between maintaining an adult and a child?—Taking it all round, we find, upon the average, that that 22*l.* is the average cost of maintenance for each inmate.

9835. From how many boards of guardians have you received 22*l.* a year?—From all.

9836. I mean, are there any exceptions?—No exceptions. There was one exception; I do not know whether I ought to mention what it was.

9837. We should be glad if you would?—I may mention this instance perhaps. We had an inmate who had been a great many years in the institution, an old woman, and the guardians of the parish of St. George's, Hanover Square, which is not, I suppose, the poorest board of guardians, contributed, I think it was 13*l.* a year towards the maintenance of this inmate, who had been in our institution, I think, almost from the beginning. She was one of the oldest inmates. I wrote to the guardians and applied to them in the usual way. I had previously applied to Marylebone, who at once acceded to what was proposed and raised the sum from 13*l.* to 22*l.*; but in the case of St. George's, Hanover Square, whether it arose from any misunderstanding or not I do not know, at any rate the result was that this poor old woman was removed from our institution and placed back in the workhouse; after enjoying the protection and care and moral and religious instruction for years in our institution, she was removed and is in the union now, the guardians having declined to pay this additional amount of some 9*l.* I saw the chairman of the guardians, Mr. Seymour, and he was very kind and said he would do all he could; however nothing has been done. I merely mention the fact as a fact.

9838. Do the guardians find the clothing as well?—They do.

9839. Does the 22*l.* include clothing?—No, the 22*l.* does not include clothing.

9840. Then the guardians find 22*l.*, and in cases, where necessary, they find clothing besides?—In cases where necessary. In one instance, in Bedford I think, some lady provides clothing for one of the inmates, and in Marylebone I think they pay a small sum.

9841. What education do you give to the girls besides reading, writing, and sewing?—They are educated generally.

9842. When they leave your school what occupations do they adopt?—Some have gone into domestic service; one is employed as a laundry woman at another deaf and dumb institution in Wales; another has been apprenticed to a dressmaker, with a view of being taught dress making. They are taught needlework. I do not know whether your Lordship noticed the exhibit at the Health Exhibition, but we had an exhibit there, showing both what is done with regard to their educational progress and also with regard to needlework.

9843. Do you find any difficulty in getting them places?—Yes; we do not profess to seek places for them; it is not one of the distinct objects of the institution to seek places for them. We occasionally have applications.

9844. You would not turn them out of the institution without knowing that they were going to have some definite means of livelihood, I suppose?—We should not turn any out.

9845. I mean, is there any hard and fast line as to the time they must leave after so many years?—Not those who are paid for; those who are elected free are elected for three years.

9846. For three years only?—For three years only.

9847. Are they re-elected then?—They may be re-elected. In June we shall re-elect, I think, one.

9848. Do you think that you can give them sufficient education in three years?—We can teach them a great deal in that time.

9849. Do you consider that they ought to remain longer in order to get a sufficient education?—Yes, I do, most distinctly.

9850. Many of those who come at 10, I suppose, come without any previous knowledge; could you teach them in three years to read and write by a sign and manual system?—We have not had any so young as 10; I think 13 is about the youngest age. I think I have an application now for a child of 10 years of age. Many of the inmates we receive have been educated at other institutions. *W. T. Hillyer, Esq.* 5 May 1886.

9851. In those cases the three years would be sufficient, would it not?—They come for religious and moral and technical training principally, in order, if possible, to fit them for doing something for themselves in life. The progress that is made in education is remarkable with some of them; but I must say that the majority of those who come to us appear to be very infirm and not capable of a great deal of education.

9852. Of the children or of the grown up persons do you mean?—Of all of them, in fact. As a class the deaf and dumb, at all events those who come to us, are more or less infirm; whether it is on that account that they have been uneducated I cannot say.

9853. Have you any blind?—Yes, we have two old women who are blind as well. There is a great deal of difficulty in inducing parents who are poor people to send their children to the institution.

9854. You said that you had reason to believe that there were in different parts of the country a great number of deaf and dumb who are left more or less uncared for; what reason have you for thinking that; what opportunities have you had of coming to that conclusion?—I will give one illustration, which probably will be enough. I think it was in Norfolk, a year or two ago, considerable interest was taken in a deaf and dumb girl, the child of poor parents, to bring her forward for election, and everything was done and her friends went to some expense in order to get her elected, and she would have been elected, in fact there was no question as to her election; she would have had a sufficient number of votes to be elected, but at the last moment the parents declined to part with her. This is one instance in which poor parents of a deaf and dumb child declined to allow her to come into the institution; although she would have been elected and admitted free to the institution for three years, and would have had the opportunity of being trained and educated, they declined to let her go.

9855. Do you think that the education of the deaf and dumb should be made compulsory as that of other classes is?—I think it would be a very good thing if it could be made compulsory.

9856. Do you think that the deaf and dumb should receive some assistance from the State?—Yes, I do.

9857. In the way of education, I mean?—In the way of education. I do think so.

9858. Have you any definite views as to the way in which the Government should interfere in the inspection of the instruction in deaf and dumb schools?—It might do something to induce people to send them to educational institutions.

9859. I mean, have you any definite views as to the way in which it should be done?—No, I cannot say that I have.

9860. With regard to the adults, those who come at a certain age, do you employ them in the institution itself; do they earn a livelihood for themselves?—They earn a livelihood so far as the sale of the needlework goes; needlework is done by the inmates.

9861. Are those cases which you keep in the institution of mature years cases of persons that are more or less infirm, and would be unable to look after themselves outside the institution?—Yes, I suppose the majority are old people.

9862. All those, I suppose, who could get their livelihood outside the institution you do not keep in the institution?—They come in for a certain time. If they come in by payment they may remain any time; if they come in by election at the end of three years In the ordinary course of things they are returned to their friends, having derived as much benefit as we can give them.

9863. Are there many cases of re-election?—Yes, I think a fair number. You know it is a small institution.

9864. What is your present number?—About 30, I think we have

W. T. Hillyer, Esq.

5 May 1886.

9865. Have you any capitalised funds?—Yes, we have capitalised funds.

9866. To what extent?—Something like 10,000*l.*, I should think.

9867. I see there are various legacies you have got; I want to know whether those have been expended or used?—We invest where we can.

9868. Then your capitalised funds, I may take it, are 10,000*l.* I should like to know the exact sum?—I cannot give you the exact sum. I refer to the published accounts of the Report, 1885.

9869. Your accounts would show it, would they not?—I do not think so, except that they would tell what the interest derived from funded property is. In the 10,000*l.* I was including the freehold house and ground where the institution is. You see the different items of interest would represent the capital.

9870. Are the investments in the funds?—In various securities. When I say 10,000*l.* I include the freehold. I suppose 7,000*l.* is about the capital invested. The actual amount of invested property is 8,600*l.* at the present time.

9871. Is there anything you wish to say to the Commission as to the education of the deaf and dumb, or the condition of the deaf and dumb?—My views with reference to education are simply these: I believe the oral system to be the best system and the true system of educating the deaf and dumb, provided certain conditions are given; that is to say, if you take a young child and begin from the beginning, and carefully train the child. Some advocates of the oral system are very strongly in favour of isolating a child in order to give it the instruction. Then after considerable pains and training and care for five or six years (I do not exactly know what length of time is required, but I know it is a considerable time) you may teach a child to speak and to understand lip reading; but when a child has attained the age of 10 years, and its education has been neglected, I suppose, unless the child is of unusual intelligence, it would be almost useless to apply the oral system. We find practically that most of the inmates who are admitted to our institution are incapable of being taught upon the oral system.

9872. On account of their age?—On account of their age and infirmity probably; at all events, I take the inmates as we have them. A year or two ago, with a view to endeavour, if possible, to introduce the oral system, we had a meeting of the oral teachers, and Mr. Van Praagh, of Fitzroy Square, and Mr. Stainer, were there, and they found that for our inmates, the class that we admit, oral teaching was almost, in fact quite, a hopeless thing; and we find that to be the case. A certain amount of lip reading might be taught, and they might, and they do to a certain extent, understand what you say, many of them, from observation; I suppose the faculty of observation is quickened in deaf mutes, and they learn to understand what you say from watching your lips very naturally; but probably lip reading might be taught to a greater extent by a very persistent effort. Wherever the inmates can speak we, of course, encourage it.

9873. Have you any that have not been born deaf—any who have the remains of speech?—Yes, some who have the remains of speech.

9874. Have you any cases where they, without having been taught lip reading, have the remains of speech and make use of speech to a certain extent, as an auxiliary?—Yes, a few words; perhaps they may say one or two words, not more. I think those are points on which you will get more information from the educational master who is much with them. I merely wish to mention, as regards the oral system and the sign system, that we are anxious to adopt any and every system by which we can teach and instruct and improve them, and, if possible, render practicable for these poor things the gaining a livelihood for themselves.

9875. You think the oral system is worth a trial, but that it is not applicable in all cases; that is what I gather from you?—I do not think, with regard to our inmates, that the oral system would do anything, certainly not in three years; even if we had a very promising case I understand that would not be sufficient time.

9876. I asked you before, with regard to the children who come at 10 years old, supposing they come without any previous knowledge, could you teach them to read and write by a sign and manual system in three years?—Yes, I think so. That is a question on which the educational master will be able to give better evidence than I can.

9877. (*Mr. Johnson.*) Do you think that your pupils or inmates are different from the inmates of other institutions?—There is no other institution like ours. We are not purely an educational institution, our institution being for adults, and the educational institutions are purely educational; they are for children who are admitted early.

9878. Then, as I understand, your institution is more in the nature of an asylum than an educational institution?—It is called an asylum.

9879. Then you merely put the educational portion of it as an addendum to the asylum?—It is one of the objects. At the time the institution was established, in 1851, very little was done for education. We do what we can as regards education, and especially moral education, for the deaf and dumb are singularly wanting in moral perception.

9880. In 1851 when your institution was established, was it established for adults and what you call middle aged people or did you take children?—We took them as low as 13 years of age.

9881. And the larger number of people that you had at first were young?—No, I think not.

9882. That is what I wanted to ascertain?—I think not; they were principally above 13.

9883. The instruction that was given at that time was on what you call the sign and manual system?—Undoubtedly; in fact I do not think the oral system was then used at all in England.

9884. Do you think that the oral system might be adopted with advantage if you get the cases young enough?—Yes, but then we should be becoming a purely educational institution, which we are not now. We aim at relieving a class who are excluded by all other institutions.

9885. You mentioned about the guardians just now; the ordinary sum you say is 22*l.* per inmate yearly that you get from them, and that one board of guardians refused to give that sum. How many inmates have you got for whom you receive relief from the guardians?—About seven or eight, I should think, actually at the present time. Nine inmates sent by guardians.

9886. And all those, with the exception of that one case, pay 22*l.*?—I rather think that that same board of guardians sent us an inmate afterwards, paying the full 22*l.*, but she was so infirm that we could not keep her.

9887. What do you charge those who are not sent to you by the guardians?—That is regulated according to the means. If the case is a very urgent one, and the people cannot afford to pay the sum that we name, we endeavour to relax the rule. We have some admitted as low as 13*l.*; we should be glad to admit them free if our funds allowed.

9888. How many inmates have you at present?—Thirty.

9889. Are many of them permanent?—Many of them are permanent cases, paid for by their friends; one or two are supported by annuities of their own; there are three who have small annuities.

9890. Are those annuities that have been granted to deaf and dumb people, as such?—They are annuities granted to them; one is the daughter of an officer in the Navy, and she has an annuity from the Compassionate Fund.

9891. They are not annuities given to the deaf and dumb specially?—No, Government annuities; the Compassionate Fund, &c.

9892. It is not a trust for the deaf and dumb?—We have one for whom a sum of money, some hundreds of pounds, was left, which was invested in the form of an annuity.

9893. I am asking whether any of your inmates have any annuity from a trust for the deaf and dumb?—No, I am not aware of any such trust existing.

9894. (*Dr. Robertson.*) You said that the number of your present inmates was 30; can you give us the relative proportion as to the number of them who are not under an educational process, the older ones, and the number of the younger ones?—They are all more or less under educational instruction. I can hardly tell you the number of old women incapable of education; for instance, the two blind women are quite incapable of any education.

W. T. Hillyer, Esq.

5 May 1886.

9895. I mean those who come to you for asylum purposes, and those who come to you for educational purposes?—I suppose the majority come for asylum purposes.

9896. Can you give us the proportion?—No, I think the educational master would be able to give you that.

9897. Do you think it an advantage to have the two classes under one roof?—No, I do not, and it is a thing which we are endeavouring to do to separate the classes; and when a house fell vacant a short time ago, I was very anxious that we should have bought it if we could have had the funds to do so, in order to effect the separation between the different classes. The old and the young ought to be separated; the infirm, and those incapable of instruction, ought to be separated; and that is what we are endeavouring to do.

9898. You stated, in your evidence in chief, that you thought there was a great deal of physical ailments amongst the deaf and dumb; can you tell us what those are from your experience?—You mean the nature of the infirmity? It is a medical question.

9899. I mean besides their deprivation of the senses of speaking or hearing?—Generally speaking they would be wanting in intelligence; many of them are very infirm of body, many of them are scrofulous. We do not profess to be an infirmary or hospital, though we are glad to do what we can to help the infirm. When I was at the asylum the other day the matron informed me that the recent cases admitted were more or less infirm.

9900. We have it in evidence that the health generally of the deaf and dumb is as good as that of ordinary persons?—I should doubt it myself. I think the very fact of their being deaf and dumb indicates infirmity.

9901. Have you ascertained whether any of those who have been brought to you are the offspring of blood relations?—Yes, that is one of the inquiries which we invariably make.

9902. What has been the result of those inquiries?—The result of the inquiries may be said to be this, that we find most of the deaf mutes are the children of those who have married cousins. The deaf and dumb, I believe, intermarry a good deal, and that is a fruitful source of increase in the number of the deaf and dumb.

9903. With regard to the children who are suffering from scrofula and other ailments, do you take any means of improving their physical condition?—We have a medical attendant.

9904. What physical means do you take to improve their condition?—It must be borne in mind that we are not a hospital.

9905. Have you any playground, for instance?—Yes, a very good playground; they have good food, and every care is taken of them.

9906. Are they encouraged to spend part of their time in games out of school hours?—Yes.

9907. Have you any experience of the education of the deaf and dumb in board schools?—Not personally. I may mention that we have had an inmate who had been educated in a board school.

9908. What was the condition of that inmate as far as her education was concerned?—She had been very poorly educated.

9909. With regard to the education of the deaf and dumb, would it be better, do you think, that they should be educated in separated places, or that they should be taken together with other children in board schools as they are in the board schools of London?—I am inclined to think that they would be better separated.

9910. Would you give us your reasons for that opinion?—For the oral system separation seems to be a condition essential to success; but that is a point that I am not prepared to speak about positively; that is an educational question.

9911. I suppose unless you had board schools everywhere there would be a difficulty in providing for the deaf and dumb, whereas if you had institutions in certain places they might be sent to those institutions from all parts of the country.—Yes.

9912-13. You have stated that you think it advisable that State aid should be given to institutions for the deaf and dumb; would you recommend that that State aid should be given to such institutions as your own, for instance?—I would say that State aid should be given to those institutions which were properly certified. Ours is a mixed institution, and it is a unique one, inasmuch as there is no other institution in the country which meets the case of deaf and dumb adults.

9914. When you say that you would recommend that State aid should be given to institutions for the deaf and dumb, would you restrict it simply to institutions for the education of deaf and dumb children, or would you you extend it to institutions for the maintenance of old people?—I think State aid would be desirable for all deaf and dumb persons who were aged and infirm.

9915. You would wish State aid to be applied in both cases?—Yes.

9916. In what way do you think it would be best applied in the two cases?—I should claim State aid for our institution, for instance, which aims at the relief of the deaf and dumb everywhere. How that State aid should be given I am not prepared to say, unless it were in a form of a capitation grant. We might perhaps claim certain assistance from the State according to the numbers we had. I think there are some 20,000 deaf mutes in the country, and there are only a small proportion under care. There must be a great number of deaf and dumb adults, especially women, who are unprovided for, and if that class could be reached and could be placed in an institution like ours it would be a very desirable thing to attain, and I think it an object well worthy of the notice of the State.

9917. If a certificate was given in the case of the old people, and an education test applied in the case of the younger ones, do you think that that would cover the question of State aid?—An educational test could hardly be applied in our case; they come to us as adults.

9918. When I say educational test, I mean a system of inspection after a certain amount of instruction had been given in the case of your younger inmates?—We should have no objection to that. Taking the class that we receive of adults and infirm I do not think an educational test could be applied.

9919. Putting aside the aged and infirm, and taking the case of the younger ones, you would have no objection to an inspector seeing after them?—No.

9920. You could not expect State aid unless the State could see what the results of the State aid were?—No, certainly not.

9921. (*Mr. St. John Ackers.*) Do you follow up those who have left your institution?—Yes, that is one of our objects.

9922. Are most of those who have left your institution doing well?—Some of them are doing extremely well, none of them are doing badly, as far as I know.

9923. You have not heard of any of them being in destitution?—No.

9924. You mentioned that you had 30 inmates; do you mean 30 in all?—Yes.

9925. In answer to a question by the Chairman you said that you considered that only certain of the deaf could be taught on the oral system; do you mean that only those under 10 years of age can be taught by the oral system except in cases of exceptional ability?—I have my opinion upon what is done by educational institutions; educational institutions, I believe, now decline to take them over 10 years of age.

9926. You said you were not aware of any pension fund for the deaf and dumb; by your saying that I suppose you have not received any money from any pension fund in London?—No, I was not aware that there was any pension fund for the feaf and dumb.

9927. Do you know how long the board school pupil of whom you spoke had been at a board school?—No.

9928. Was it a case you had sometime ago?—No, it was a case we had recently.

9929. With regard to the guardians of St. George's, did your institution refuse to keep the inmate unless the 22*l.* was paid?—They simply removed her; we applied to them for the 22*l.*

9930. Did your institution express its willingness to keep her on at the old amount?—No, I think not.

9931. (*Mr. Arrol.*) You have mentioned that the annual cost of maintenance is 22*l.*; that does not include any expenses in connexion with the officers and staff, does it?—It includes every item of the cost of maintenance.

W. T. Hillyer, Esq.

5 May 1886.

9932. The 22*l.* is the average cost of maintaining an inmate?—Yes.

9933. (*Chairman.*) I understood you to say that the 22*l.* did not include the clothing. You mean that the 22*l.* includes what is called cost of living?—Yes; we calculate that the 22*l.* covers the cost of maintenance, and then we add 5*l.* for the cost of clothing; but in exceptional cases we take inmates in at 22*l.*

9934. (*Mr. Arrol.*) Can you tell the Commission what the additional cost of the staff would be?—That will appear in the report.

9935. (*Mr. Few.*) How many on the average do you apprentice each year?—Very few; we apprenticed one last year, but we do not do very much in the way of apprenticing, simply from the want of opportunity.

9936. From a paucity in the number of young inmates?—Yes; we have very few young inmates. We apprenticed a girl lately; she was sent to us by one of the unions, and an opening for her occurred in the neighbourhood. A respectable dressmaker, known to the ladies' committee, expressed her willingness to take this girl and endeavour to teach her for a year or two years; we thought the opportunity was a good one, and she was sent to that dressmaker with a view to being taught dressmaking, so that her teaching might be as complete as possible before she leaves the institution.

9937. Do you exercise any supervision over an apprentice?—We do in this case; the girl lives at the institution.

9938. But you do not exercise any such supervision as a general rule?—We have not hitherto apprenticed any others. Where we can do so, we make inquiries about them after they leave the institution.

9939. As I understand, according to your mode of election, every three years a child or grown-up person has to run the risk of not being re-elected?—It depends on whether their friends bring them forward for re-election.

9940. But it is by the votes of the subscribers that they are re-elected?—Yes.

9941. Therefore a child or grown-up person under the age of 30 might be elected for three years and then lose the subsequent election?—Such a case would be an exception.

9942. But it is dependent upon the votes of the electors?—Quite so.

9943. You seem rather in favour of institutions being scattered up and down the country?—No, I am not aware that I expressed such an opinion.

9944. I gathered that you thought that that was preferable to concentrating deaf and dumb persons in large establishments?—No, I am not aware that I expressed that opinion. I would put such institutions in the most central position possible.

9945. As regards the question of State aid, is it your opinion that it should be *per capiti* independent of whether the child taught was succeeding well or was defective in intellect?—I have no data upon which to go to enable me to answer that question.

9946. (*Admiral Sir E. Sotheby.*) You have an annual election?—Yes.

9947. What is the number of candidates in proportion to vacancies?—It varies; we have three vacancies.

9948. What becomes of those who are not elected?—They may come forward for re-election in the following year; the votes obtained at one election would be available for the next election. We find in some instances that friends who may have taken great interest in the case drop the case altogether.

9949. Do you experience great difficulty in finding employment for adults?—We do not seek employment for them and we do not receive many applications.

9950. Do your deaf and dumb adults do the household work?—No, they are very old. You may imagine the condition of an old deaf mute who is also blind. We have two who are blind as well as deaf and dumb.

9951. You have 28 others?—Yes

9952. Do not they do the household work of the institution?—We have servants as well.

9953. How many servants have you?—Three.

9954. What is your staff?—The matron, two female teachers, then there is the superintendent teacher, the master, who will be before you presently; then there are two or three servants and a laundry maid, and we have a nurse where it is necessary.

9955. (*Rev. Mr. Sleight.*) Do you train any of your inmates as dressmakers or laundresses?—Yes.

9956. You have no difficulty in finding places for those, I presume?—We do not seek it, but there would be a great difficulty. I do not think, as a rule, people would like to employ deaf and dumb people as servants. Where we have the opportunity of putting them in situations we are very glad to do so.

9957. You admit inmates after they have been educated at other institutions?—Yes.

9958. They are admitted for three years?—Those admitted by election are admitted for three years.

9959. After they leave you at the end of three years do you think they have a difficulty in finding places?—I expect they have; it is not one of the objects of the institution to find them places; they return to their friends, and we constantly receive letters from their friends stating how grateful they are for the help they have had.

9960. I understand you to say that there are a great many intermarriages among the deaf and dumb?—Yes.

9961. Do you say that their children are generally deaf and dumb?—Mr. Murray was informing me that that was so; he said he believed that that was one great cause of deaf mutism.

The witness withdrew.

Mr. Daniel Murray examined.

Mr. D. Murray.

9962. (*Chairman.*) You are connected with the British Asylum for Deaf and Dumb Females at Lower Clapton as master?—Yes.

9963. And have been for a great number of years?—I think about 30 years.

9964. We have heard generally about the character of the institution from the previous witness, but we would like you to tell us what is the course of instruction that is pursued there, beginning with girls of 10 years old?—We have none of 10 years of age.

9965. We understand that you do not take them under the age of 10?—That is so.

9966. Supposing they come to you at 10 years of age, have you found that they have been educated to a certain extent or not?—None of those that come to us over 10 years of age have been instructed; the reason that we take them in is simply because all the other institutions shut their doors to them at 10 years of age.

9967. There are a great number of deaf and dumb girls who reach the age of 10 without any education whatever?—That is so.

9968. Have you any idea whether there are many others without education besides those who enter your institution?—I am quite sure there are.

9969. What are your grounds for thinking so?—Because I have met with some at the Brentford Workhouse, and in some other workhouses.

9970. Having been placed there as paupers without any opportunity of being educated?—Yes.

9971. You keep those uneducated girls for three years only?—Those that are elected are kept for three years, but they are eligible for re-election.

9972. Do you find that at the end of three years you have taught them on the sign system enough reading and writing——?—I object to the word "sign;" it is manual principally; the best teachers of the deaf and dumb use signs only as a means.

9973. I use the word "sign" for "sign and manual." After they had been with you for three years, after they had been taught on the sign and manual system for three years, would they be sufficiently educated in reading and writing to go out in the world and get their livelihood?—The answer to that question would entirely depend upon the capacity of the child; some of them would, and some of them would not.

9974. Some of them do go out in the world and get their livelihood, I suppose?—Yes.

9975. With regard to those that do not, are they re-elected invariably?—Not invariably re-elected, but generally.

9976. What occupations do they go to mostly? Do you follow them after they leave your institution?—As far as we can we do, but we get them from all parts of the Kingdom, including Ireland and Scotland, and consequently we cannot follow them.

9977. You send them back at the end of three years to their homes?—Yes, to their own people.

9978. Besides the ordinary education that you give them, do you teach them sewing and different kinds of work?—They are taught needlework of all kinds.

9979. Are they taught any housework, such as washing and mangling?—Yes; there is a place in which they are taught mangling, washing, and ironing, and all that sort of thing, and some of them have got very good situations in consequence. We have in the Exeter institution now a forewoman who was originally in our asylum; she is over the laundry department.

9980. As a teacher?—As a teacher of laundry work; she is one of those whose education is really not very perfect; she would be about 40 years of age when she came to us, and she left us at the age of 45 or thereabouts.

9981. In previous years of course a large number of the older women who came to you were totally uneducated?—Yes.

9982. Is there any improvement at the present time in the way of the education of deaf mutes as compared to what it was 20 years ago; are those who come to you now more educated than those who used to come to you formerly, taking them generally?—There is no difference whatever.

9983. You think that the education of the deaf and dumb has not proceeded as the education of the rest of the population has done?—Certainly not.

9984. Comparing them with the rest of the population, you would admit that the education of speaking and hearing persons has proceeded enormously in the last 20 years?—Yes.

9985. You do not think there has been a corresponding progress in the deaf and dumb class?—I do not think there has.

9986. You say that from your experience?—Yes.

9987. Then do you think that there ought to be the same education given to deaf and dumb children as there is to every other child now, by compulsion?—Yes, there ought to be more facility for the deaf and dumb on account of their affliction.

9988. Therefore I presume you think that they ought to receive Government aid in the same way as other children receive Government aid whose parents are unable to pay for them themselves?—I think so. One thing I might say in respect to that, if Government aid was given, and not sufficiently given, it might have the effect of crippling the institutions by causing charitable people to withdraw their support from them.

9989. Would you imagine that your committee would have any objection to such an institution as yours, which is partially educational, being inspected by a Government inspector?—I think not.

9990. Do you think that it would be an advantage?—We would have no objection.

9991. Would it be an advantage if the inspection was properly conducted by a well qualified inspector who was able to judge of the work that the deaf and dumb can do?—I think that it would be an advantage rather than otherwise.

9992. And you think that with Government inspection the Government should contribute something towards the education, and therefore indirectly towards the maintenance of the children at your institution?—Yes.

9993. How would you propose that that Government aid should be given; should it be given by way of a fixed sum per head for each child educated in your institution?—I have not given that subject any thought, but it occurs to me at the present moment that ours is a sort of mongrel institution; we are not purely educational. There are some of the inmates who are totally infirm.

Mr. D. Murray.

5 May 1886.

9994. The education grants would not apply to them, but so far as you are an educational institution you think that you would be worthy to receive Government assistance?—Yes, certainly, there must be some margin of course allowed in applying a test to old pupils compared with those of younger age; an older person does not receive education so quickly as a younger one.

9995. Will you give us your experience as to the education of deaf and dumb adults; is it attended with great difficulty?—Yes.

9996. The older they are the more difficult they are to teach?—That is the case.

9997. Have you had any experience with the oral system?—The only experience that I have of it is from visiting some of the oral schools.

9998. Have you ever tried to introduce it into your institution?—Yes, as far as we can; where there is a child, say of 14 years of age, we try to give it as much oral teaching as we can. If I want to teach a child what a table is I spell the word "table" or write the word "table" upon a table, there is no necessity there for a sign.

9999. Do you speak the word "table"?—Yes.

10,000. Where did you receive any special training yourself?—I received my first training in the Claremont Institution in Dublin.

10,001. How many years ago are you speaking of?—40 years ago. Then I was at the Bristol Institution. I have also been connected with an institution in London for many years where my experience among the adult deaf and dumb has been very considerable.

10,002. Which institution is that?—What is called now the Royal Institution in Aid of the Deaf and Dumb.

10,003. Do you think that if you have only a limited period for the education of a deaf and dumb child, that it is an advantage to the child to teach it on the sign and manual system rather than on the oral system; would you, if you had only three years to give to a child, recommend that it should be taught the sign and manual system or the oral system suppose it to be a child which might profit by the oral teaching?—If it were a child that could profit by oral teaching I do not believe that in three years you could give it any instruction that would be of any use to it.

10,004. Does that guide the institution with which you are connected to the conclusion that they come to with regard to the mode of instruction to be adopted in any particular case?—To a very great extent.

10,005. In the case of children who come for three years and who are not likely to be able to stay longer, you think it better that they should be taught the sign and manual system, because you can teach them more in that time under that system?—That is so.

10,006. In the case of children of ordinary intelligence, supposing they come to you at an early age, say at 10 or 12, how long is it after they come to you that they are able to read and write with fair facility?—They will write with facility very quickly, but to read so as to understand what they read will take a longer time, that is to say, to read any book it will take a much longer time than three years. They can be taught how to answer ordinary questions in type in three years, but to enable them to read consecutively they would require to be under tuition for 10 years, or more than that.

10,007. It is very difficult to convey abstract ideas to the mind of a deaf and dumb child?—Yes.

10,008. It has to be done step by step and gradually?—Yes. A lady once asked me how I would give a deaf and dumb child an idea of God, for instance. I said it is very difficult, even for hearing people, to get an idea of God. We cannot give it except by leading the child gradually from natural things to the Creator. I told this lady I myself had very little idea of infinity, or omniscience, or eternity, and it is a very difficult thing to give those ideas to the deaf and dumb, or to a little boy or girl endowed with all their senses.

10,009. What religious services are conducted in connexion with your institution?—We have the Church of England service.

10,010. Are there services daily or weekly?—There is a daily scripture lesson to all.

10,011. Have you ever had any children prepared for confirmation at your institution?—Yes.

Mr. D. Murray.

5 May 1886.

10,012. And confirmed from there?—Yes, confirmed at St. James's Church after being examined by the clergyman of the parish.

10,013. Who undertakes that duty of preparing the girls for confirmation?—I do, but then I have the clergyman of the parish to examine them.

10,014. Does the clergyman of the parish give them written questions to which they give written answers?—Yes, and he comes there by himself when I am not there.

10,015. And upon those written answers he judges of their fitness for confirmation?—That is so.

10,016. Can you give us any opinion as to the general condition of the deaf and dumb in London, and the causes which tend to prevent a diminution in their number?—With regard to the latter part of the question, it would be very difficult for me to give an answer. As to the condition of the deaf and dumb in London generally, it is a very wretched one.

10,017. Is it the case that deaf mutism is increasing or diminishing?—Most decidedly increasing.

10,018. What are the causes which tend to that increase, in your opinion?—I think the intermarriage of deaf and dumb men and women is one chief cause.

10,019. Is that brought about from the deaf and dumb being associated together in institutions, or is it from the natural tendency of those similarly afflicted to gravitate together?—I believe it is from the natural tendency you mention. Deaf and dumb persons of both sexes meet, for instance, at tea meetings, and so on, and form friendships, and that leads on to marriage, and if it does not lead on to marriage, unfortunately it leads on to what is worse, and I think facilities should not be afforded for bringing them together.

10,020. Is there much concubinage among the deaf and dumb?—To my knowledge there is a considerable number of unfortunate women who fall in that way. I have a little book in which I take notes of all deaf and dumb cases that come before me, because I am secretary as well to the Royal Association in Aid of the Deaf and Dumb, and in that book I have some notes of cases of deaf and dumb intermarriages. "Martha Jones "Hayes, deaf and dumb; parents both deaf and dumb." They wanted to get this child into the Margate Institution in 1885. Then there is another here, a man I know very well, named "Deerlove; parents deaf and dumb, "and several children deaf and dumb, and wife's brother "deaf and dumb." Then there is the case of a deaf and dumb woman now unmarried, but who has two children, one deaf and dumb. Those are samples of a number of cases that I have.

10,021. Could you supplement that by saying whether the intermarriage of near relatives, first cousins, for instance, leads also, in your experience, to the children being deaf and dumb?—When I first became interested in the deaf and dumb I met with a very intelligent man, Dr. Roberts, who was very anxious to find out the causes of deaf mutism, and he and I both set to work to endeavour to find out those causes. We were three years at work and we found that these were the three principal causes:—The first was syphilis, not primarily, but secondarily; the second was the intermarriage of near relations; and the third was decidedly and emphatically the intermarriage of deaf and dumb persons, and I do not think there is anything strange in that, because we know that all diseases are transmitted. I have noticed the gait even of a father repeated in the son. I do not think there can be the slightest doubt that the intermarriage of deaf and dumb persons is a cause of deaf mutism.

10,022. Have you had many cases of girls who have become deaf after they have once been able to speak?—Yes, we have.

10,023. What happens to them; do they lose their speech altogether in consequence of their deafness, or are you able to keep up what knowledge of speech they may have had, though they are quite deaf at the time they come to you?—It would depend entirely upon the age at which they become deaf; we have some cases of that kind.

10,024. Do you attempt to speak to them, or do you write to them?—We speak to them and write to them.

10,025. Have they sufficient recollection of language to be able to speak intelligibly to you?—It is always very difficult to understand them.

10,026. Their utterance is harsh or unpleasant?—Not so unpleasant, perhaps, but it is either too high or too low. Speaking of a person who has lost his or her hearing, say at seven years of age, there would be some retention of language, but a child that has lost hearing at two, or three, or four, I think has entirely lost any knowledge of language.

10,027. Do you think a case of that kind a fit object for the oral system?—Yes, more than the other perhaps, but as I am not thoroughly indoctrinated with the oral system, though I think if what it aims at was achieved it would be of the greatest possible benefit to the deaf and dumb, I do not know that I could give a positive answer to that question in the affirmative.

10,028. When you have a case of that kind do you do all that you can to assist the child in keeping up a knowledge of language in preference to resorting to the use of signs constantly?—Yes, we use signs as little as we possibly can, only when it is absolutely necessary, only as a means to an end.

10,029. In the school, when you ask a question of a child, do you ask it on the slate, or do you ask it by signs?—We write on the board the name of a natural object, and point to the object.

10,030. When you ask the child questions about it, you write them down?—Yes. You compare, for instance, this table and that table; you would say this is a larger table than that one, and they could see the difference for themselves.

10,031. (*Rev. Mr. Sleight.*) You said just now that you use signs as little as you possibly can; the children use signs amongst themselves, do they not?—Yes, they cannot help it; that is their natural language.

10,032. They do not trouble to write to each other?—No, not in the playground.

10,033. I am speaking of those who have some remembrance of language. When they were communicating with hearing persons would they communicate with them by signs, or would they speak to them?—If they had an intelligent knowledge of language they would not communicate with the outside world by signs, because they would know that people outside could not understand their signs.

10,034. Would they speak to outsiders or would they write to them?—They would write.

10,035. They would prefer writing to speaking?—If the person with whom they were holding communication could not understand them by speaking they would communicate by writing. I came across a semi deaf mute woman in an omnibus yesterday who could not make herself intelligible to me by her speaking and so I adopted the finger language.

10,036. You understand the finger language?—Yes.

10,037. If you had not understood her by the fingers she would have written?—Yes, she would have been obliged to adopt that means of making herself understood.

10,038. In your asylum how many are being educated in reading and writing, and so on?—They are all under a certain amount of education. I give the very old a lecture once or twice or three times a week perhaps on various subjects, but the younger ones are under education the whole time.

10,039. Do you find that some of those who come to you at the age of say 30 or 40 are a little imbecile as well as deaf and dumb?—Some of them, but it is difficult very often to draw the line between imbecility and deaf mutism. When a deaf and dumb person is allowed to grow up in his dumbness until he is 30 or 40 without any attempt to educate him it leads to almost imbecility at the end.

10,040. With regard to the time you give to the education of a child you would not expect a child to be able to write a grammatical letter after only three years' instruction?—No, but it would acquire sufficient knowledge to be able to make its wants known to hearing and speaking people; the knowledge it would gain would help it through the world.

10,041. Supposing you admitted a child at the age of 10 who had received no education, in how many years do you think that child would be able to write a good English letter?—It would depend entirely upon the capacity of the child.

10,042. Take a fair average child?—About 10 years.

10,043. (*Admiral Sir E. Sotheby.*) You have two children who have been taught on the oral system?—Yes.

Mr. D. Murray.

5 May 1886.

10,044. How far are they advanced?—Unfortunately they came to us when they had only just been initiated into the oral system.

10,045. How long have they been with you?—They have only been with us about a year.

10,046. Who teaches them?—A lady teaches them under my direction; we have two teachers, and I superintend them.

10,047. Where were those ladies trained to teach?—I think one was trained at Brighton.

10,048. Do you consider them fully able to teach on the oral system?—No.

10,049. They have only partially learnt the system?—That is all. The children that I refer to really know little or nothing of the oral system; they would have been with Mr. Stainer perhaps six months, and in that six months of course they would get little or no knowledge.

10,050. Then after they come to you you continued instructing them on the oral system?—As far as we could follow it up.

10,051. Have any of the old people who have left your institution gone to the workhouse?—That is a question the secretary could give an answer to better than I could.

10,052. Do the inmates do the household work?—Yes; there is a hearing servant to attend to the bell and so on. We have a laundry in which a hearing women teaches the inmates washing and ironing and so on.

10,053. And there is a woman who teaches them to sew?—Yes.

10,054. Do you call those servants?—I would not call the lady who teaches them dressmaking and that sort of thing a servant.

10,055. What is your staff altogether inclusive of servants?—There is the laundry woman, then there is the hearing woman to whom I just referred, then there is a work mistress, then there are two teachers, the matron, myself, and the secretary, making eight altogether.

10,056. You have a staff of eight for 30 inmates?—Whatever the number is now.

10,057. (*Mr. Few.*) Have you long taught on the oral system?—No.

10,058. Have you had any special instruction on training in the oral system?—No.

10,059. You have not been to any college for instruction in the oral system?—No; you must understand the inmates of our institution are outside the pale of the oral system as a general rule.

10,060. When a new pupil gets elected do you adopt any different system of teaching in the case of that pupil as compared with that which you adopt in the case of those who have been in the house for a long time?—Yes, we have to begin at the beginning.

10,061. Do you begin with that child by instructing it on the oral system if it can be instructed on the oral system?—No, not as a general rule.

10,062. (*Mr. St. John Ackers.*) Can the deaf and dumb persons who are wholly untaught be instructed in ordinary workhouses?—No.

10,063. Do you consider it desirable that the present voluntary power of boards of guardians to send adult deaf and dumb persons to institutions should be made compulsory?—Most decidedly.

10,064. And that the boards of guardians should pay for the total cost in such institutions?—Yes, I think so.

10,065. Also that the board of guardians should pay for deaf children in special institutions?—Certainly.

10,066. You consider that there should be an alteration in the law with regard to this matter to make the present voluntary power compulsory?—I do.

10,067. You have mentioned that there are three special causes of deafness in your opinion; namely, syphilis, the intermarriage of blood relations, and the intermarriages of deaf and dumb persons, how would you range those three causes as regards power to cause deafness?—I think I would put intermarriages of deaf and dumb persons first.

10,068. Which second?—I think the other two would be equal.

10,069. Have you any statistics in your institution showing the causes of the deafness and dumbness of each inmate under those and other heads?—We have not. In the form for application into the asylum, a question is required to be answered on this head.

10,070. Do you consider that it would be desirable that all institutions and schools and societies for the deaf in the Kingdom should keep accurate statistics as to the causes of deafness?—Certainly. It is most difficult to get accurate information upon that head.

10,071. Do you think that the census returns give the whole number of the deaf in the Kingdom?—I am afraid they do not.

10,072. Do you know what is the amount of income on invested property in the metropolis that is devoted to pensions for the deaf and dumb, if any?—There are only two societies which give pensions, the Cordwainers' Company and the Charitable and Provident.

10,073. Do you know what the total income is that is given in pensions to the deaf and dumb?—The Charitable and Provident never exceeds 50*l.*

10,074. With regard to persons who have lost their hearing after having once been able to speak, are you aware that if a child lost its hearing at seven years of age, that child would retain the power of speech, and would be able to speak like any ordinary person if its speech were not allowed to fall into disuse?—Yes.

10,075. In your opinion, therefore, is it desirable that all those who have lost their hearing after having acquired the power of speech should at once be taught the oral system?—Certainly.

10,076. Because, I take it, if they are not so aught, they relapse into the condition of dumb persons?—Yes.

10,077. Do you find in your experience that persons who are deaf and unable to speak have very considerable difficulty in obtaining employment?—Yes.

10,078. (*Dr. Armitage.*) Can you tell us whether there are any statistics published on the subject of the hereditary tendency of deaf mutism?—There are not any such statistics.

10,079. Have you yourself collected any statistics on the subject?—I did years ago, but in removing from one place to the other I have lost the book in which they were registered. I am referring to the time when I was making investigations on the subject in connexion with Dr. Roberts.

10,080. (*Dr. Tindal Robertson.*) Is Dr. Roberts alive?—Dr. Roberts has been dead a considerable time.

10,081. You put the intermarriage of deaf and dumb persons as one of the principal causes of deaf mutism. The evidence we have had, especially the medical evidence, has been to the effect that intermarriage of deaf and dumb persons does not produce deafness and dumbness so much as the marriage of persons who are nearly related to each other?—I am very much surprised to hear that, because I am almost sure that any good physiologist would say that the intermarriage of deaf and dumb persons would be most likely to produce deaf mutism in the offspring.

10,082. Have you any statistics to show that?—In the book from which I read a little time ago, I have a few notes of cases which I have taken within the last three years.

10,083. Are those notes of cases which have come before you among the deaf and dumb generally, or of cases which have come under your observation at the Clapton Institution?—Not at the Clapton Institution, at the Royal Association.

10,084. With regard to those cases of deaf mutism where the parents were deaf and dumb, were they all cases of congenital deafness, or cases in which the child became deaf and dumb sometime after birth?—Those were cases of congenital deafness?

10,085. One question about education. You have a large experience on the subject of the education of the deaf and dumb; do you think that the education of the deaf and dumb should be conducted in board schools, we will say, or in institutions for their special instruction?—I think it is a very difficult thing to educate them unless you bring them together.

10,086. You think it would be better to have them in institutions established for the special purpose of training deaf and dumb children?—I think it would be better to have them in institutions for the special training of that class.

10,087. (*Mr. Johnson.*) Why do you think it would be better to have them in institutions?—First and fore-

Mr. D. Murray.

5 May 1886.

most, if they are going backwards and forwards to their homes they lose to a great extent what they have learnt in the school, and then, as a general rule, their parents are very poor and very ignorant, and they cannot communicate with them. Then, as a matter of economy, I think you cannot carry on their education so economically if you deal with them separately, as if they are altogether in a school or institution.

10,088. In teaching on the oral system it would be impossible for them to be amalgamated with any other pupils but those who were under instruction?—There must be total separation, I think, under that system.

10,089. Have you any experience with regard to what those persons who are instructed on the oral system do when they get to their homes?—No.

10,090. Do they make use of signs when they are away from school, do you think?—Perhaps the oral system is not developed sufficiently yet, but I know that some of those who are being taught on the oral system when they come out of school do resort to the finger language.

10,091. And therefore when they were being taught on the oral system it would be necessary to keep them isolated, and entirely confined to the oral system either at home or at school?—Yes. I may say that I wish the oral system every possible success; it would be my desire that deaf and dumb children should be so instructed that when they grew up they should be able to go into an ordinary lecture room or an ordinary church, and be able to follow the lecturer or the minister.

10,092. Have you any experience of teaching the oral system except in your own institution?—Yes, I have visited other institutions in which the oral system is taught.

10,093. You have two mistresses?—Yes.

10,094. Have they a certificate from any one of the colleges?—I cannot say; the one who has been educated at Brighton would have a testimonial from Mr. Bright, I suppose.

10,095. You are aware that there are two or three institutions which grant certificates?—Yes.

10,096. Is either of your mistresses certificated?—That I cannot tell you; we are about getting a new one, whether she has a certificate I do not know.

10,097. Who gives the instruction in the oral system in your institution?—This lady that came from Brighton, but we do not profess to teach the oral system.

10,098. With regard to those pupils who are not instructed in the oral system, what do you teach them?—Writing and spelling.

10,099. The sign and manual system?—You may call it that.

10,100. Where did you get your statistics from which you arrived at the conclusion that syphilis was one of the causes of deaf mutism?—Dr. Roberts as a medical man would know from certain indications in the cases that he examined that syphilis had been the cause of the deafness and dumbness in those cases, and then I made inquiries.

10,101. You got the previous history of the case from the parents?—Yes.

10,102. You said that the Charitable and Provident gave about 50*l.* in pensions?—The amount they give does not exceed 45*l.* or 50*l.*

10,103. Are you aware what the Cordwainers' Company give?—Not precisely, but their pensions are 5*l.* a year, and the recipient, whether a deaf and dumb person or anybody else, must supplement that himself by at least 20*l.*, or they will not give the pension.

10,104. Those persons that come to your institution, if they are not re-elected at the end of three years can do very little in the oral system?—Very little.

10,105. Are they almost always re-elected?—As a general rule I think they are.

10,106. We have it in evidence that some of the persons that have been discharged from your institution have returned to the workhouse; will you try and remember whether you have had any case of that sort?—I cannot remember any such case. I since learn that Jane Salt was sent back to St. George's, Hanover Square.

10,107. Can you give the Commission any information as regards the guardians who have refused to send paupers to your institution?—I could not give you information upon that point. I think some statement with regard to the matter was made by several gentlemen at the conference held at Doncaster, at the conference at Exeter which I attended.

10,108. (*Chairman.*) Have you attended any of the conferences with regard to the education of the deaf and dumb, both abroad and at home?—In England, not abroad.

10,109. Would there be any objection to inspection by a Government inspector of the school under your care?—Not at all.

10,110. (*Mr. Johnston*). Would you think it desirable to have Government inspection?—Certainly.

10,111. In all schools?—Yes, provided the Government at the same time supplemented at any rate the income of the institution.

10,112. You would have Government supervision provided you got a Government grant?—Yes.

The witness withdrew.

Mr. James Hampton examined.

Mr. J. Hampton.

10,113. (*Chairman.*) You are the founder of a mission and home for the blind?—Yes.

10,114. Where is that home now located?—In Webber Row, Southwark, close against the Blind School.

10,115. You have had great experience in dealing with the blind among the poorer classes?—I have been at work amongst them for 15 years, and I think I know their requirements pretty well both in the middle and lower classes, and among the young and the old.

10,116. Did you find before you started this home that there were a great number of blind in London who had no home to go to, and who wandered about the streets begging?—A great number.

10,117. Was it with the object of taking them out of the streets and giving them a comfortable home that you started this institution?—So many poor blind persons came to me asking if I could furnish me them with a bed or give then enough money for a night's lodging, that I thought of starting this home. Numbers of the blind have no home and no friends. The blind school and the workshops are capital things for the blind, in their way, but when blind people come out of those institutions they have to return to their families who are poor, and what they have learnt in the institutions is to a great extent thrown away; they have no opportunity to extend the knowledge they have acquired in those institutions or to work at a trade that they may have been taught in them, and when they come out they find that they are a burden to their relatives who turn them out on the streets. A young man named Vowles, who was one of the best musicians that ever took an instrument in hand, who was brought up at St. George's, and who was one of my little boys before he went to St. George's, came to me and said, "Mr. Hampton, my "mother thought when I came out of St. George's I "was going to make her a fortune, but I cannot get any "employment."

10,118. What was he taught at St. George's?—Music; he was a splendid performer on the piano and the organ.

10,119. Did he endeavour to earn his livelihood by giving lessons?—He could not get any pupils to enable him to earn his livelihood, and so he used to go into the park and lie there. His mother said if he did not work he should have no food, so he had to go into the park and lie there, and there I found him. I said to him, "Harry, my boy, how is it that you have come to this?" He said, "Mr. Hampton, my mother thought she was "going to do great things by me after I came out of "school, but I cannot get any pupils to teach, and I "cannot get any food at all." I said, "My boy, you "shall come with me;" and I had him day after day and gave him food; and one of the gentlemen who was there said, "Mr. Hampton, you had better have him "in altogether;" and I had him three years in the home.

10,120. Could not you get him any employment?—I could not get him any employment. Afterwards, as soon as his parents found that he could earn a good bit of money by playing the piano, they took him out of the home, and now he is at Brighton.

10,121. Does he earn his livelihood by music now?—Yes, he gets a good many engagements there, and he gets a guinea a night for playing.

10,122. Does he play at concerts?—Yes.

10,123. By what fund is your institution supported?—Voluntary contributions. I have found it very hard this winter to get subscriptions amongst the poor; it is the poor who support the work. The neighbours around, seeing the work that is done, have supported me nobly.

10,124. Did you start the home without any funds of your own, depending entirely on what contributions you could collect?—When I began the work I was working for Mr. Sykes in Essex Street for a number of years. I used to earn good money with him as a painter. I worked with him for 18 years, but I found that working at my trade and the mission together was too much, and the doctor told me I should have to give up the mission or my work, and I said I would sooner give up working at my trade, because my heart was so much in this work for the blind.

10,125. Have you had much experience with regard to the means that the blind have of earning a livelihood in such occupations, for instance, as brush making and mat making?—In music and brush making, mat making. As regards mat making, the blind cannot compete with the sighted, and the sighted cannot compete with the convict labour, because mats, the product of convict labour, are sold so very cheap.

10,126. Have you ever heard that the basket trade is very much prejudiced by the importation of German baskets?—Yes.

10,127. In the higher class basket work the foreigners' goods keep the English made goods out of the market?—Yes, you can go and buy a most beautiful basket in Tavistock Street for a mere nothing, a basket which a blind man could not possibly make.

10,127*a*. In what direction would you suggest that anything might be done for ameliorating the condition of the blind or providing them with employment after they leave the institutions in which they have been educated and trained?—I would suggest that the country should establish a home for the indigent blind, into which blind persons when they came out of these institutions could be taken, and where the knowledge which they had gained in those institutions could be extended and developed, instead of their going into the workhouse or going upon the streets. It would be a very great advantage for them to have a home to come to when they leave these institutions. In such a home you would have good musicians, you would have brass bands and everything to encourage friends to come and visit the institution. Blind persons learn music at school, and if a man plays the cornopean he is one by himself, but when a number who have learnt to play on different instruments go together it is a band. And attached to such a home there might be a depôt where goods manufactured by the blind might be sold, the same as at the Home for Incurables. Ladies go there and buy different things made by the inmates.

10,128. I suppose even with that the blind could not earn by their own labour enough to support themselves; their earnings would have to be supplemented by charity?—By voluntary contributions. I do not think you would find one out of 20 that could support himself.

10,129. Can you tell us anything about those who take to the streets for a livelihood. We are told that sometimes it is a very profitable thing; is that so?—I am afraid that is the case.

10,130. I suppose there is a great temptation, if that is so, for the blind to go on the streets and beg rather than attempt to earn their livelihood in some other way?—Blind people have said this to me: "If we had a place "of our own, if we could say we had got a home instead "of the workhouse, we would rather be in it than be on "the streets." They have a great dread of the workhouse, and their repugnance to the workhouse is quite justifiable, considering how they are treated there. I think their blindness is a sad affliction in itself without their being mixed with all classes. When they go into the workhouse they become mutes, because they are put in the company of men who have not the feeling for the blind that they ought to have, and by aggravating them and one thing and the other they become completely mutes. They keep themselves to themselves and become complete imbeciles.

Mr. J. Hampton.

5 May 1886.

10,131. Has that been the case in your own knowledge?—Yes. One Christmas I gave a Christmas dinner to the men in the home, as we do every Christmas, and I invited the blind workhouse men to see what I could make of those who were in the house, and out of the seven or eight men I think I only found one man to speak or to move about; the others were complete mutes.

10,132. Quite dull?—Yes. I believe if they were brought together it would enable them to bear one another's burdens and cheer one another. There is a young man now in the home named Gillies, who when he came into the home was quite dull, but a little urging and cheering him on the way has made quite a different man of him.

10,133. Do you read to your inmates in the home?—Yes, we read the papers to them and different books, and sometimes I will say, Now, my boys, let us have a tune on the harmonium. I am like one of them, I play with them, and cheer them up along the road as well as I can.

10,134. Have you any library of embossed books, either in the Braille type or the Moon type?—We have books on Moon's system.

10,135. You have not any Braille books?—No.

10,136. You find that Moon is more readily read by the uneducated?—Yes, by a man that has been at work. If a man has been at work his fingers become hard.

10,137. Can you read the characters yourself?—I have never tried it. With my work I have enough to do. I have teachers to teach it; one blind man teaches another. I find from being amongst the blind that my eyes are going.

10,138. How long do your inmates remain in the home?—A man named Carver has been with me four years. He came from the Peckham Institute; he used to be traveller for them, and he found he could not make a do of it. He was formerly a clown and he lost his sight by the bursting of a soda-water bottle.

10,139. Have you ever tried to get any pensions for the blind for the inmates of your institution?—Not for any in the home, but I have tried to help the blind outside. I get them the painters' and the clothworkers' and different London pensions to help them as much as I can in their own homes.

10,140. Do you think from your experience of pensions for the blind that they are well administered; do you think that they are given to deserving persons, or do you think that sometimes too many pensions are given to one individual?—My experience amongst the blind leads me to say that I think that if the pension was given weekly instead of in a lump it would do them more good, because a poor blind man not usually having the handling of so much money is over rejoiced when he receives it and he and the guide who must necessarily go with him spend the money in a way which one must lament. Instead of doing good with the money I am very sorry to say a good deal of it is spent in the public-house.

10,141. Do you think if the pension could be administered through some responsible person or persons, say through either the overseers of the parish or the clergyman of the parish in which the man lived, so that it could be given weekly, do you think the advantage of it would be doubled?—It would be doubled. I may refer to the case of a man named Rideout, who is now in the Lambeth Workhouse. I found him in Herbert's Buildings, he is 92 years of age; he had a pension and then he flew off to the drink and he would not give any of the pension towards his support in the home, so his friends had him out to look after him, and his friends placed him in a lodging house and he got terribly filthy and had to be removed to St. Saviour's Workhouse. Then he was brought to my place again by a constable who said to me "Mr. Hampton will you take him in the home?" I said "I will freely take him in the home, but "the money makes the mischief." I could manage him while he had no money, but as soon as he got the money there was no holding him.

10,142. If those societies which give pensions gave the money to you to distribute, the recipients of those pensions would get more benefit from them than if they were given directly to the recipients themselves?—Yes.

Mr. J. Hampton.

5 May 1886.

10,143. In your institution have you any sent by the guardians and paid for by the guardians?—No.

10,144. Is your institution qualified to receive persons sent by the guardians?—My institution is not big enough; I should like to receive inmates on payment if I could get them. Gillies' father pays 20*l.* a year.

10,145. We have one of your reports before us dated 1884; do you publish annual reports?—Not every year, but there is a balance sheet printed every year. It takes a good deal of money to print the report and sometimes I have not the means to print a report, and so I print a balance sheet.

10,146. In this balance sheet do you charge the cost of your own living in the home?—I used to have the pence. I take no wages myself. I have got a wife and she is afflicted, and I have given up all my work and thrown myself into this, and I allow her a little every day, I think it is about 1*s.* or 1*s.* 6*d.* a day. Sometimes I get that given to me.

10,147. Do you include in your accounts so much for your own maintenance?—Yes, lately one of the gentlemen that is on the Committee said, "What will you have "Mr. Hampton; we will give you a salary if you like." I said "I will take no salary at all, because I will not be "a paid servant. I would rather go back to my brush "and work with my hands."

10,148. You get your maintenance free in the home?—Yes.

10,149. Are these accounts audited annually?—Yes, I am getting the last year's balance sheet up now. Every year I print a balance sheet which is audited by one or two auditors.

10,150. Do you get any support from the friends of any of these blind people?—Only in the case of Gillies.

10,151. They are all of the poorest class, are they?—Yes.

10,152. Have any of those besides the one you have mentioned come out of the workhouse to you?—One of the name of Ryder.

10,153. Did he leave the workhouse to come to you?—Yes, he used to come on Sunday. He used to say, "Mr. Hampton, will you let me come to dinner on Sunday," and I used to let him come, and he begged me to take him out of the workhouse.

10,154. Do you set them all to work at something in your home?—One has to look after the household work, one does the needle work, and they peel the potatoes, and so on.

10,155. Do they make any baskets or mats?—No.

10,156. How many have you altogether in your home?—I have seven beds; I have six inmates.

10,157. There is not more for them to do than just the household work?—That is all; there is not room for anything else.

10,158. You have no workshop of any kind?—We do a little chair caning.

10,159. Have you a common dining room and a common sleeping room?—There are two sleeping rooms, and then there is the hall where we gather the Friday class together, in which the inmates have their dinner in the day time; it is a small place, but it is clean and comfortable.

10,160. Have you had anything to do with the deaf and dumb as well as the blind?—I did know a little girl that was both blind and deaf and dumb; that was some years ago.

10,161. Do you think that all poor persons that are afflicted either with blindness or deafness, and who cannot avail themselves of the ordinary means of education, should all be educated more or less at the expense of the State, compulsorily?—I think myself that the State ought to take it up.

10,162. In saying that do you express the opinion of the poor blind with whom you come in contact?—I speak on their behalf, and when I told them that I should bring before you the subject of the establishment of a home for the blind to which they might go instead of having to go to the workhouse, they seemed very much pleased.

10,163. You think that the State ought to establish such a home or homes for the blind; you do not think that you could rely upon private effort to provide such institutions?—I do not think voluntary effort could do it. I think the State ought to establish homes for the indigent blind. I think it would be a great thing for the country to do.

10,164. (*Mr. Johnson.*) How many people have you in your institution now?—There are six inmates and 51 members.

10,165. Do those members pay anything?—No, the members have free teas and 3*d.* a week. On Thursday there is a mothers' meeting, when blind mothers are taught to make and mend their own and their children's clothes; on Friday there is a class gathered together and a book read, and through the winter coffee and bread and butter is provided, and 3*d.* is given; and on Sunday a free tea is provided for all blind who like to come.

10,166. I see there is an item in the balance sheet of 37*l.* 11*s.* for guides?—That is guide money for guides to bring them to the mission and to take them back to their homes.

10,167. Is that guide money given to the blind persons themselves?—The guide money is given to them, and then they pay their guides themselves.

10,168. Are you aware that three or four of them are guided by one person?—I know that, but each blind person receives the 3*d.*

10,169. But one person very often guides three or four blind people?—Yes.

10,170. Suppose five of them were guided by one person, they would get 1*s.* 3*d.* between them?—For themselves, and perhaps they would pay 3*d.* to their guide to bring them.

10,171. Is not that rather an inducement for them to come to the meetings, the few pence that they get over what is paid to the guides?—A great many of them have their own children for their guides.

10,172. In that case the whole of the guide money goes to them?—Yes; then a penny a month is stopped for the sick fund.

10,173. What are they paid when they are sick?—Four shillings.

10,174. Per week?—No; they are given out of the sick fund 4*s.*; then if they remain ill we give them bread, or anything that we can get for them. Every one who is sick has 4*s.* by bringing a doctor's certificate.

10,175. The inmates pay nothing, except in the case of Gillies?—No.

10,176. What do you calculate that the inmates cost per head?—I reckon it costs about 7*s.* 6*d.* per week for their food; some cost rather more.

10,177. You allow your six inmates to get work if they can outside, and come and sleep in the institution at night?—If they were able to get work. There is one named Feltham, who used to go about with an organ; he has a white swelling on his knee; he can only peel the potatoes. Then there is Carver, who was in the Peckham Institution, where they tried to teach him chair-caning, and they could not teach him chair-caning, so he used to go out to solicit orders, but he found it was not enough to support him.

10,178. Is your institution visited by any one from the Home Teaching Society for the Blind?—Yes; I think it is Mr. Barrett who visits it and brings books.

10,179. Is there any other institution or association or society that sends any representative to visit your home?—No other.

10,180. Has anybody applied to teach your inmates any of the other systems?—No.

10,181. What is the average age of the six inmates that you have now?—They are over 30.

10,182. Have they all been in schools?—Only Gillies.

10,183. Carver has not been in a school?—No.

10,184. You say he could not earn enough at the travelling to make a living by it?—He could not make a do of it; he could not keep at it continuously; he was one day up, and one day abed.

10,185. Have you any experience with regard to travellers for orders for the blind?—I know two or three blind travellers; I know a blind traveller in the tea line who is doing very well indeed. If they have got the abilities for travelling and soliciting orders, it is a good occupation for them.

10,186. Have you any experience of blind persons acting as travellers for articles made by the blind; this man Carver was a traveller for the Peckham Institution, you say?—To sell goods for the Peckham Institution.

10,187. Did you know anything of the traveller who travelled for the school for the indigent blind?—No.

10,188. Your home is not very far from that school?—Not a very great way. Mr. Johns has visited us.

10,189. What rent is paid for your house?—11*s.* a week.

10,190. What does it consist of?—There is a large place at the back which I have turned into a hall; I matchboarded the ceiling and put flooring down and made a hall of it.

10,191. Was the expense of that paid by your committee?—I did it myself. I went and begged the stuff from friends of mine and did the work myself. I do all the carpentering and painting and so on.

10,192. You tell us that a man of the name of Vowles makes a guinea a night by music, what instrument does he play?—The piano.

10,193. He was taught at St. George's School?—He was taught at the St. George's School.

10,194. Does he do anything else?—No.

10,195. Was not he taught a trade?—I think he was put to basket making, but he did not do anything in it.

10,196. For how long has he been getting a guinea a night as a musician?—Some little time.

10,197. Where?—In Brighton. He goes out to parties and he gets a guinea a night, and I believe some ladies and gentlemen are going to purchase a piano for him to play on the parade.

10,198. Do you know how long he has been making this guinea a night?—He has left me now two years; I do not suppose he makes it every night, but when he gets an engagement he gets a guinea a night.

10,199. (*Dr. Tindal Robertson.*) You have had a large experience amongst what one may call the out-door blind?—Yes.

10,200. You have known a very large number of such people in your life?—Yes.

10,201. Can you give us an idea of the number that you may have known of the indigent blind in London?—About 400.

10,202. Could you separate those into three classes and say how many of those would be persons who would be getting their living at some kind of occupation, how many would be getting their living on the streets, playing music and so on, and how many would be doing nothing at all?—I could not without looking over my books; but I will look over them and furnish the Commission with a statement of the number in those three classes.

10,203. Dealing in the first place with persons in the first of those classes, that is persons who get a living by ordinary work of any kind, what would be the average amount per week that a blind man could make?—I have known a man get over 22*s.* a week at basket making.

10,204. That would be an exception, probably. I want the average?—About 8*s.* or 9*s.*

10,205. With regard to street beggars, can you give us any idea what the average of their earnings might be?—That would be rather hard for me to get at. I do not think I could give that, because you know it is very hard to get at the earnings of those who are in the streets.

10,206. Have you ever been told by any of them what they do earn?—Sometimes they have been talking to one another, and I have overheard what they have said. I have heard one say he has got perhaps 8*s.* or 9*s.* in a night, that is by playing music in the streets or singing.

10,207. Do you find, as a general rule, the respectable part of them prefer to get their living in that way, or if they had the opportunity do you think they would prefer to get it in a more legitimate way?—I believe they would rather get it in some other way.

10,208. Do you think if the plan you suggested just now could be carried out; that is to say, if some large public institution could be established where blind persons could go, and where their work could be purchased by the public, such an institution would supply the blind with a means of earning a livelihood which they would gladly avail themselves of?—I believe such an institution would meet the wants of the blind. Every one of the existing institutions for the blind is doing its work nobly, but I think there is one thing wanting, that is a home for the blind, where they may be taken in and looked after.

Mr. J. Hampton.

5 May 1886.

10,209. Suppose the different institutions which now exist were to keep up a kind of record of the blind after they left the institutions, and followed them up and provided, as far as possible, some kind of work for them, would not that meet the requirement?—I think it would be impossible for the institutions to do that.

10,210. Why do you think so?—One thing is this: when they come out from the institutions and go back to their families, who are very poor, they go right away from everybody's notice, because if I thought I was becoming a burden to my friends and relatives I would go right away.

10,211. Suppose that in connexion with the existing institutions there were committees consisting of people who were willing to undertake this duty of looking after the blind after they had left the institutions in which they had been educated and trained to some occupation, the blind would not be likely to run away from those who were trying to do them service, would they?—I think it would be impossible for the institutions to do that.

10,212. Have you any other reason for that opinion than that which you have just given?—I do not know that I have.

10,213. (*Dr. Armitage.*) How long has this home been established?—Nine years.

10,214. What were you working at before you established it?—Painting.

10,215. What is your annual income for the home?—It varies; sometimes it amounts to 200*l.*, sometimes 400*l.* I think it was 400*l.* last year.

10,216. Have you any reports?—The reports are before you.

10,217. What staff have you at the home?—I have no staff. I have a secretary, Mrs. Richard; she goes out visiting and does the writing and the reading to the blind.

10,218. Does she live in the home?—No, no one lives in the home with the blind. I used to sleep with them; now I go to my own place to sleep. I am at the home from eight in the morning till half-past 10 at night.

10,219. Is anyone there at night to keep order?—Yes; I have one sighted young man to look after them. He is an imbecile; his mother used to take the character of the deaf and dumb boy at Drury Lane. It would cost more than we could afford to have anyone else.

10,220. You have no one at night who is responsible?—Only that one man.

10,221. You do not consider an imbecile personally responsible?—He is a sighted person and he can see that things are going on all right; the blind can look after themselves in the night. I see everything closed up and all lights put out.

10,222. Do you appoint any of the blind to superintend at night?—I have none of the blind to superintend; if any of them are ill I stop there myself all night.

10,223. Then there is no responsible person there at night except this imbecile person, if you may call him a responsible person?—That is all.

10,224. You have only one person whose friends pay for him?—Only one.

10,225. How much do they pay?—His father pays 20*l.* a year for him.

10,226. How are the others supported?—By the voluntary contributions which are collected.

10,227. You keep as many as you can afford to keep out of the subscriptions that you get?—I keep as many as I can.

10,228. How many bedrooms have you?—Two bedrooms in Webber Row, and at Dulwich there are two beds for females.

10,229. Do you include those two at Dulwich in your number of six?—Yes, I have six inmates and the imbecile, making seven; I have one empty bed.

10,230. (*Mr. St. John Ackers.*) You spoke of the blind that are kept in the workhouse as becoming mutes; do you mean by that that they become really speechless, or that they become stupid?—They become stupid, by keeping silent; they become imbeciles.

Mr. J. Hampton.

5 May 1886.

10,231. You spoke of the institutions not providing any means of enabling the blind to get their living in after life; do you consider that any alteration might be made in the management of the institutions with the view of providing those means?—I do not see that they could do more than they do at present. I think St. George's do their best to send their pupils out with a capacity for earning their living.

10232. (*Admiral Sir E. Sotheby*). Do you think there is a prejudice on the part of the public against work made by the blind?—No.

10,233. You never heard blind people say so?—No.

10,234. Do not you think blind people can compete with foreigners in strong baskets, such as builder's rubbish baskets?—They may do that.

10,235. But in fancy work they cannot compete wit foreigners?—No.

10,236. Do not you think that a blind basket maker in the country, for instance, could make a very good livelihood?—He might out in the country.

10,237. Do you think there is an advantage in blind people working together?—I think it is very beneficial to them to work together, because they help one another.

10,238. And they are in better spirits?—Yes.

10,239. Have you more applications than you can take in?—Yes, I have five applications now that I cannot take in for want of room.

10,240. You have one vacant bed?—That is for females.

10,241. You say one of the teachers from the Home Teaching Society for the Blind comes to visit your home; how often does he come?—Once a month.

10,242. How long does he remain?—About 20 minutes; he has a little talk with the inmates and changes the books.

10,243. What is the best trade a blind person can learn?—Basket making, because he can finish the job himself.

The witness withdrew.

Adjourned to Friday next at 12 o'clock.

32, Abingdon Street, Westminster.

Friday, 7th May 1886.

PRESENT:

LORD EGERTON OF TATTON IN THE CHAIR.

ADMIRAL SIR E. SOTHEBY, K.C.B.
W. TINDAL ROBERTSON, ESQ., M.D.
B. ST. JOHN ACKERS, ESQ.
W. AUCHINCLOSS ARROL, ESQ.
F. J. CAMPBELL, ESQ., LL.D.
E. C. JOHNSON, ESQ.
ROBERT MCDONNELL, ESQ., M.D., F.R.S.
THE REV. W. BLOMEFIELD SLEIGHT, ESQ., M.A.
CHARLES FEW, ESQ.

CHARLES E. D. BLACK, ESQ., *Secretary*.

JAMES A. CAMPBELL, ESQ., LL.D., M.P., examined.

J. A. Campbell, Esq., LL.D., M.P.

7 May 1886.

10,244. (*Chairman.*) You are member for the Glasgow and Aberdeen Universities?—Yes.

10,245. Will you shortly state what your connexion is with the Normal College at Norwood?—I am a member of the committee of the college at Norwood, but having many other engagements in London I cannot say that I am qualified to speak very particularly as to the arrangements at Norwood; but I have been for many years one of the honorary treasurers of a committee in Glasgow in connexion with the college. I have been for many years a director of the Glasgow Asylum for the Blind, in which we have a school for blind children. About the year 1872 we had a visit from a gentleman who was intimate with Dr. Campbell, and knew his system, and from what we heard from him, and afterwards from a visit we had from Dr. Campbell, we were persuaded that it would be an advantage to send promising pupils to the Norwood College, which was then about to be started. We accordingly formed a committee in Glasgow to raise funds for the purpose of sending up selected pupils to Norwood for a better education than we were able to give them in Glasgow. That committee has continued in operation since that time; we have had from six to eight pupils generally at Norwood; at this moment I believe we have five. I may mention that my colleague in the treasurership of this committee is my friend Mr. Arrol.

10,246. Have you had the means of ascertaining how these pupils whom you have sent up have succeeded in the avocations they have taken up?—We have naturally followed with interest the career of the pupils, and we have every year presented to our subscribers an account of how they were getting on. I may say, speaking generally, that we are highly satisfied with the result of this educational experiment. I had no expectation of being called to give evidence before the Commission to-day, and therefore I have not prepared myself with particulars. I can only speak from my own knowledge and impressions.

10,247. If you have any statistics as to the different professions which your late pupils are getting their living by, perhaps you might put them in a tabular form?—Yes. In the meantime I may say that before we sent pupils to Norwood we did not aim at much more than giving them a general education, and to a certain number of them a certain very small knowledge of music; but it never entered into our minds to qualify them to become self-supporting. That never dawned upon us as a thing that we could reasonably aim at. Now we feel that the pupils whom we send to Norwood are failures if they do not turn out to be self-supporting, and we have many interesting examples of the good effect of the training that they get there. For instance, there are two young men in Glasgow in the music business as piano tuners and music sellers, Ewing and M'Intosh. They have been in business now a good many years, and they have a very good standing as piano tuners.

10,248. Are both Mr. Ewing and Mr. M'Intosh blind?—Yes; they were both pupils at Norwood.

10,249. Of course they have seeing clerks under them, but is there any member of the firm who can see?—I do not know that there is a seeing partner. Then a well-known music firm in Glasgow, Messrs. Paterson, Sons, and Co., have a piano tuner, another of our pupils, who supports himself; and another firm, Messrs. Adams and Co., have another. Then another young man is supporting himself as a piano tuner in Dumfries. Then we have in Glasgow an organist in one of the churches, who has a good salary and does some music teaching, supporting himself comfortably. Another is in Dundee, in the same kind of situation, acting as organist in a church and teaching music. Another lives in Greenock, who supports himself as a music teacher and has charge of the organ in a church across the Clyde at Row. Then in our blind school in Glasgow our music teacher is a blind young woman, who was trained at Norwood. She is the second that we have had. Her predecessor

failed in health and was obliged to resign, and the directors of the Asylum were so much pleased with her that they applied for another from Norwood. Then we know of another of our pupils, a girl, who is now supporting herself as a teacher. Those are results that we never thought of before we came into connexion with Dr. Campbell's system. I may mention too that we have all been struck with the improvement generally, physically as well as intellectually, of the pupils that we have sent up to Norwood, after they had been there six months or a year; the system at Norwood seemed to improve them in every way. Before they went there there was always an air of depression and languor and lethargy about them. That entirely disappeared.

10,250. Do you send them up to Norwood with a view of improving their general education or specially with a view of their being trained in music?—Mostly with a view to their being trained in music.

10,251. Have the pupils that you have sent up been those who have shown some proficiency in music at your institution?—No. We found that Dr. Campbell did not look for that; he wanted intelligent pupils who had a good grounding in general education, he did not seem to make it an essential point that they should have displayed any particular talent for music.

10,252. I suppose you would not say that the pupils in your asylum or in Scotland generally have any very special turn for music?—Not by any means.

10,253. In Scotland generally there are not very many who devote themselves to music professionally, and therefore Scotland perhaps affords a more favourable field for the employment of blind persons who devote themselves to music in after life than England would be; I mean assuming that Scotland is not specially given to music, if you introduced into Scotland those who had been specially trained they would have an advantage over a similar class in England where more attention is given to musical education?—I do not think that there can be much difference between Scotland and England in respect of employment for young people who have been trained at Norwood except in one particular. There is a movement now in Scotland for the introduction of instrumental music into churches, and there is perhaps more new employment to be found in that way in Scotland than in England.

10,254. Organs are more used in the churches in Scotland than used to be the case?—Yes; but I have also to state that there is a strong prejudice against the employment of blind organists; that is a prejudice which we have had to contend against.

10,255. Has that prejudice been overcome?—It has not disappeared, but we have found that those who have made the experiment of employing a blind organist have in a very short time been able to recommend their neighbours to have blind organists; they have been able to say that there is no disadvantge in having a blind organist.

10,256. You would say that the material which you send up from Scotland to Norwood was not of a specially promising character in a musical point of view, except from the general natural intelligence of the pupil?—Those we have sent up from the school have had a good general education.

10,257. Were they the most intelligent that you could pick out, or the most naturally gifted?—I believe Dr. Campbell had a good deal to do with picking them out. I do not suppose that he would take the worst.

10,258. Does Dr. Campbell select them?—Yes, we never send one up without his sanction.

10,259. He virtually has the choice?—Virtually he has the choice. I think one great advantage of the Normal College over the blind schools that we have in the country generally is that the whole attention of the establishment is directed to the training of the pupils. The pupils are looked after day and night, and in every respect, whereas the blind pupils in an ordinary blind school are left a good deal to themselves without much guidance during a great part of the day, and they herd together and fall into dull ways.

10,260. Have you had in your school any teachers who had been trained at Norwood?—We had one American lady from Norwood as a teacher at the Glasgow school for a year and a half. She gave us a great many new ideas as to the teaching of the blind, and when she was not able to remain any longer we selected a female teacher in Glasgow who had done very well in an ordinary school, and placed her under this lady for a month or so to learn the system, and we have continued her as teacher since.

J. A. Campbell, Esq., LL.D., M.P.

7 May 1886.

10,261. I suppose it would be rather your opinion that the training of the blind has suffered from a deficiency of good intelligent teachers?—Certainly.

10,262. And that one great object and one great use of this Normal College has been to train teachers for teaching the blind throughout the country?—Yes, I think it certainly gave us in Glasgow new ideas as to the general teaching of the blind. Before we opened relations with the Normal College we had an idea that blind children were semi-paupers and were never to get out of the semi-pauper class; that the most we could do for them would be to help them a little. After they passed from the school they went into a basket factory, or weaving shop, or rope yard, and there they were able to do a little towards their support, but they were not self-sustaining; and they never rose, as it were, in social position at all.

10,263. Can you tell us whether any of those who have come back from Norwood have relapsed into the state you say the blind generally were in before you began to send pupils to Norwood, that is to say, taking up some not very profitable occupation?—No, I do not think so.

10,264. When a child is selected to go up to Norwood, is there any report made from time to time, say at the end of the first year, as to whether that child is going on satisfactorily, and is likely to make a promising pupil?—Yes, we get a report every year.

10,265. Suppose that report is unfavourable, what do you do?—We give warning to the parents that we do not think the child should be continued longer at the college.

10,266. Then you select some one to take his place?—Yes.

10,267. Do the parents contribute towards the maintenance of the child?—Sometimes they do. We take what we can get.

10,268. You supplement from your funds what the parents give?—Yes.

10,269. In many cases they are really children of parents who are quite of the lower class?—Quite so. Where the relatives are not able to do much for them we very often find that there are benevolentpeople who are willing to take interest in a particular child, and give us something towards its education.

10,270. Have you both boys and girls in your school?—Yes.

10,271. Do you send up an equal proportion of boys and girls?—We have no rule with regard to that.

10,272. Do you find that the girls you send are equally successful with the boys in earning a livelihood by music, or in any other way?—Yes; I do not know that it is quite as easy to get situations for them, but we have had some very satisfactory cases. Some have become teachers.

10,273. Is there any other point with regard to your school in Glasgow, or with regard to the general industrial training of the blind in Glasgow, to which you would wish to draw the attention of the Commission?—I may say that our intercourse with Dr. Campbell, and our coming to know what the Normal College is capable of doing, has had the effect of raising the standard of education in the Blind School in Glasgow. We have been very much indebted to our connexion with the Normal College for the improvement in our own school.

10,274. Has it acted as a stimulus to the blind pupils in your school? Are they anxious to go up to Norwood?—Yes.

10,275. They regard it as a thing to be aimed at?—Yes; and we find that the pupils whom we send up to Norwood are very glad to come back to visit the school at Glasgow, and that their visits have a very good effect; the pupils are very anxious to know all about Norwood, and our having this connexion with Norwood has a stimulating effect.

10,276. Have you had any difficulty in raising funds for sending children to Norwood?—We have had our difficulties occasionally.

10,277. Have you always been able to get sufficient contributions to send up any promising blind child?—Yes, I do not think we have ever failed to send up a promising pupil.

J. A. Campbell, Esq., LL.D., M.P.

7 May 1886.

10,278. Is your number limited in any way?—No, we have always sent as many as we could afford to send. We felt that 60*l.* was a good deal of money for each pupil, but we were satisfied that they could not get the same advantages elsewhere, and we have always represented to our friends that though it was a good deal of money to spend, it was spending money to prevent a good deal more having to be spent afterwards—that we spent the money in making these young people independent.

10,279. Do you consider that Norwood is sufficient as a college for the higher education of the blind, especially in music, or would you recommend that the existing blind schools in the country should follow the example of Norwood, your own, for instance?—I am quite satisfied that we could not attempt to reproduce in Glasgow a little Norwood; we are quite satisfied that there are advantages at Norwood which we could not find in the provinces, not only as regards the teachers and the general equipments of the college, but as regards facilities for taking pupils to concerts and so on, not to speak of the workshops in which technical instruction is given on piano construction. Then among so many engaged in the same kind of work, learning music and piano tuning, you have an *esprit de corps* among the pupils which is of great benefit to them. You have advantages in an establishment like that at Norwood which you cannot have in establishment on a small scale.

10,280. We have had evidence that the great difficulty is how to provide for the blind after they leave the institutions; has it ever been contemplated by the Glasgow Institution to follow them up in after life?—We find considerable difficulty in getting employment for our blind pupils who have not been to Norwood.

10,281. Have you any suggestion to make with regard to the sale of work or the employment of the adult blind after they have been trained in institutions?—I scarcely feel qualified to give an opinion upon that. My attention has not been much directed to it of late years.

10,282. Do you think that there always must be a residuum of blind persons who are unable to support themselves who must depend on charity; do you find that that is the case in Scotland?—I think so.

10,283. Is there any provision in Scotland for that class, in Glasgow, for instance?—We have an asylum for the blind where they have workshops, and we have also a mission to the outdoor blind, by means of which encouragement is given to industry in their own houses. They are visited in their own houses and encouragement is given to them to do knitting and work of that kind.

10,284. In Scotland do they prefer living in their own houses to being in a public institution?—Yes.

10,285. There has been no movement, either on the part of the blind or those taking interest in the blind, to secure a public home for the blind?—No.

10,285*a*. Has the experiment been tried in Glasgow of giving instruction to blind children in ordinary schools?—We have had a very successful experiment in sending blind children to ordinary schools. It seems to be necessary that the teacher should have rather a taste for teaching the blind, or be willing to put himself a little about for them. If the teacher has not a sympathy for the blind the system does not answer, but where he is sympathetic the blind children get on very well in an ordinary school. Some years ago, when I was a member of the Glasgow School Board, we had in one of our schools a teacher whose brother was blind, and in that way he had sympathy for the blind; he had several blind children in his school, both boys and girls. The blind children had a different means of working their sums, but they took their place in the classes with the others; and the teacher found the blind children did good to the school, that they were objects of sympathy, and awakened sympathy and kindness on the part of the other scholars; instead of being, as I should have been afraid they might have been, pecked at and put aside by the other scholars, they were rather favourites than otherwise. The same experiment has bee tried with success in Greenock.

10,286. (*Mr. Johnson.*) I believe in your institution industrial work is given a very prominent place?—Yes.

10,287. Do all the people who work in your institution live at their own homes?—They do, all the men.

10,288. The women are lodged in the home?—There are some women who have been in the institution a good many years who live in the institution entirely, and do knitting and work of that kind in the institution.

10,289. The object of the institution is more industrial training than education?—It was originally.

10,290. I believe now you have a certificated sighted schoolmistress?—Yes.

10,291. Certificated from one of Her Majesty's training colleges?—Yes; she is the lady whom we had for about a month under Miss Dawson, the American lady, to learn anything as to special methods.

10,292. I understand you get an educational grant for your school?—Yes, it is inspected by the Government.

10,293. Do you find that answer?—Yes; I think it is a great security that you have good teaching.

10,294. Could you tell us the number of persons that have been sent up from your institution to Norwood for special musical education?—I will furnish the Commission with that information.

10,295. The cost of each pupil sent up is 60*l.* a year?—Yes.

10,296. How is that money usually got?—By subscriptions. We get what we can from the parents or guardians or relations of the pupil, and then we have subscriptions for the balance.

10,297. Have you any idea of the number of pupils that have been returned on your hands from Norwood as not capable of being specially trained?—I do not think any have been returned on our hands in that way. We have withdrawn one or two for good reasons.

10,298. Reasons of incapacity, or because you had no means?—Because it was represented to us that they were not exerting themselves as they might do. They seemed indifferent, and Dr. Campbell thought the high training was being thrown away upon them. There have been not many cases of that kind, but one or two.

10,299. What do you suppose is the largest amount of money which any one of these 10 men, to whom you referred in the early part of your evidence, so far as you know, earns by music?—One gets 80*l.* a year as an organist in a church, with private teaching in addition. I do not know what Ewing and M'Intosh make, but at any rate the 10 support themselves respectably.

10,300. Is not it a part of your system to supplement the wages of the workers by a subsidy?—Yes, in the asylum; what they make is not enough to support them.

10,301. You have told us that you have had a great deal of experience in this blind school; have you seen any of the other blind schools in Scotland; have you seen the Edinburgh one?—No.

10,302. Or any of the northern ones?—No.

10,303. You have not compared the working of the other institutions with the results you have got either at Glasgow or Norwood?—No.

10,304. I understand you have a band at Glasgow?—Yes, that is an old institution.

10,305. Do you find that that answers financially?—No; there is a subscription paper every three or four years for new uniforms and instruments.

10,306. But that band goes out to different places to fulfil engagements?—Yes.

10,307. And they get as much as 6*l.* a day, do they not?—Sometimes.

10,308. That is entirely a brass band?—Yes, and not scientifically trained.

10,309. You allow it to go out for public entertainments?—Yes.

10,310. Have you any idea what they realise in the year?—No.

10,311. They are not very often employed, I suppose?—Quite irregularly, not very often. I do not think there is a Norwood pupil among them.

10,312. Could you give me the approximate number of the people you have got in the institution now?—About 150.

10,313. Are you aware what the average wages of the workers are in the institution, putting aside music altogether?—I know the directors for years have had a great practical difficulty in avoiding serious loss on the work produced. We had these men working, some of them weaving, others making baskets, others mattresses and brushes, and so on; and we felt it necessary, in order to enable them to live and support their families, to raise their wages to a certain amount; the result was that we were often landed with a great stock of goods on hand, which we had great difficulty in disposing of. There has always been a loss on the goods made at the institution.

J. A. Campbell, Esq., LL.D., M.P.

7 May 1886.

10,314. Do not you think it is one of the objections to the system that the wages are supplemented to such a large extent as to be a great drain upon your charitable resources? As I understand, the wages are supplemented up to 14*s.* a week. For instance, suppose a woman makes 7*s.* you give her another 7*s.* as a supplement, but if a man makes 15*s.* you do not give him anything?—That is so.

10,315. Do not you think as a principle that it is undesirable to subsidise them if you can make them self-supporting?—It certainly is if it can be avoided.

10,316. Are you aware whether throughout Scotland that is the system?—Yes, I think it is the general system.

10,317. That is one cause, I suppose, in your institution of the ways and means not being sufficient for the demand?—Yes.

10,318. Do you approve of sighted supervision, or entirely blind supervision in workshops?—I cannot speak with any authority upon that, but I should say sighted supervision is necessary.

10,319. (*Dr. Tindal Robertson.*) I suppose the asylum and the school of which you have been speaking are two separate institutions?—No, it is one institution; the school and the workshops are two separate departments.

10,320. Are those departments kept entirely separate?—They are in connected buildings; the old pupils, for instance, after school hours, are sent off to the workshops.

10,321. Practically it is like the St. George's School?—Yes.

10,322. Can you give an idea of how many there are in the school?—About 30.

10,323. How many of those are sent to Norwood on the average?—I should think on the average one a year, not more, because we are never able to have more than six or eight at Norwood, and they are there for some years.

10,324. What do you do with the children who are not sent to Norwood; are they taught trades?—Yes.

10,325. With regard to the blind children of the higher class of people in Scotland, is there anything in Scotland analogous to the college at Worcester?—No, we have no special school of that kind; we have one or two better class pupils occasionally at our school, who are sent there for the sake of the teaching.

10,326. What was the system of teaching before Dr. Campbell visited your school; was it on the Braille system?—No, just what you would find in any ordinary school in Scotland, with this addition, that we had the raised Roman type. The Roman type was introduced by Mr. Alston, who was treasurer of our school a good many years ago.

10,327. After Dr. Campbell's visit was the Braille system introduced?—Yes, it was introduced by the American lady whom we had from Norwood.

10,328. Is that system taught exclusively or is it combined with any other system?—It is not taught exclusively.

10,329. Can you tell me whether music is taught on that system at your school?—The music teacher at our school now is a pupil of Dr. Campbell's, and I have no doubt she teaches by the Braille system.

10,330. You said in answer to the Chairman that you thought such a college as Norwood was a necessity for other schools to send their better pupils to; do you think that the Norwood College should be made into a sort of what I may call a blind university; is it your idea that the selected pupils from all the schools in the country should be sent there, or that it should be made into a sort of college where a higher education might be given only?—I can only say that we have found the need for it for higher education and for a musical education.

10,331. I suppose the general education is of the highest class there as well as the musical education?—Yes.

10,332. Of the very best class and given in the very best way?—Yes.

10,333. Therefore do you think it would be an advantage that it should be regarded as a sort of blind university, and that the best scholars from all the blind schools in the country should have a chance, by means of scholarships or otherwise, of getting the advantage of higher education there?—I think that is a very important function of it; it is to a certain extent fulfilling that function now.

10,334. (*Dr. Campbell.*) I should like to ask you whether it is not the fact that the interest which was created in the general subject of the blind by the advocacy of the principles which we brought forward in Glasgow in 1872, and in following years, helped the committee there to increase their means very much for buildings and otherwise?—Very much; it gave a new start to the interest in the education of the blind, and has been the means of greatly improving the teaching in our own school.

10,335. (*Mr. St. John Ackers.*) Do you consider it possible so to conduct blind institutions that the majority of the pupils should be self-supporting in after life?—I think through music they seem able to reach that desirable position.

10,336. Do you think it would be possible in other branches of industry besides music?—That I cannot say; we have not been able to fall upon any other branch of industry that would enable our pupils to be self-supporting.

10,337. Are you aware that in certain countries abroad the majority do become self-supporting in other ways than by music?—I was not aware of that.

10,338. Do you know of any blind persons that have been taught in Glasgow that are wholly self-supporting, other than those who have been at Norwood, or are they all subsidised more or less?—I do not know of any pupil of the blind school in Glasgow who is self-supporting except those who have come from Norwood.

10,339. (*Mr. Arrol.*) Can you state what class these young people are drawn from who have been sent to Norwood?—Most of them are very poor.

10,340. Have many of them come from the workhouse originally?—One or two perhaps, not many.

10,341. Can you tell the Commission whether in any case in which you have sent up pupils to Norwood so much as half the expense has been contributed through the assistance of friends?—We have sent up some pupils to Norwood whose parents are not absolutely poor people. I know one case, for instance, where what we had to complain of was that they took away the pupil too soon, before he got the full advantage of the Norwood training.

10,342. You do not wish it to be understood that all those who have been sent to the Norwood College from Glasgow are drawn from your institution?—No; the Glasgow committee have sent up pupils from other places than Glasgow, places in the west of Scotland, and pupils who have not been in the Glasgow school.

10,343. Among others pupils who have been selected by the school board?—Yes, pupils who have been selected as intelligent and hopeful pupils.

10,344. (*Chairman.*) Would those come under the category of those selected by Dr. Campbell?—Yes.

10,345. (*Mr. Arrol.*) Can you inform the Commission what Dr. Campbell's impression is of those who have come from the school boards?—I understand that Dr. Campbell is well pleased with the pupils he has received through our committee, and he finds them better grounded than most of those that he receives at Norwood.

10,346-7. Probably better grounded than those who have been taught in your institution?—It is quite possible.

10,348. Would that induce you to recommend that the youthful blind should be sent to board schools for their education up to 13 years of age?—Wherever a teacher was willing to take blind pupils I would recommend that blind pupils should be sent to an ordinary school.

10,349. Are you aware that we have 22 blind children at board schools in Glasgow?—I was not aware of the number, but I am not surprised to hear it.

J. A. Campbell, Esq., LL.D., M.P.

7 May 1886.

10,350. Can you state what the nature of the competition was that the organist you alluded to had to pass through to gain his post?—I understand that he had to compete with others, and that the competition involved his being able to play any of a certain number of tunes which were not familiar to him, and that in the course of a very short time he had transferred to his type all the tunes he was required to get up, and was in that way able to compete with the others.

10,351. Can you state the number of tunes he had to acquire in the course of the day?—It was a very large number.

10,352. Are you aware that the competition took place during the course of two evenings, and that as the result of that competition he obtained the appointment?—I take it from you that that was so.

10,353. You have mentioned that in your institution there are two sub-divisions, a school and a workshop; may we not also say that there is a third for the women?—Yes.

10,354. Because they remain in the institution?—Yes.

10,355. What is the objection on the part of Scotch people to living in an institution?—I do not think they like to have their freedom restricted.

10,356. (*Mr. Few.*) I suppose the subsidies you speak of are limited to workers in the asylum?—Yes.

10,357. And their continuing in the asylum is dependent on their observing the rules, and their good behaviour?—Yes.

10,358. (*Chairman.*) Did I rightly understand you to say that you had a certain number of workers outside the institution?—There is another organisation which is called the Mission to the Out-door Blind, a separate charity.

10,359. (*Mr. Few.*) If through failure to observe the rules any worker had to be turned out he or she would cease to have any subsidy?—Yes, that is the rule.

10,360. Are there several who come under that category?—I think the directors are very merciful in that respect.

10,361. (*Admiral Sir E. Sotheby.*) With regard to subsidies you say the workers are all subsidised?—I fancy that most of them are to some extent.

10,362. I see if the workers do not earn 14*s.* the difference is made up to them?—Yes.

10,363. Do you think amongst your friends there is a prejudice against buying work done by the blind?—No, I do not think there is.

10,364. The general impression is that the work done by the blind is not so good to look at, but that it is really better made?—Yes.

10,365. That it lasts longer?—Yes, but it is not so sightly.

10,366. Do you think there is the same prejudice against employing the blind, especially organists, in Scotland, that there is in England?—I am not qualified to give an opinion as to that.

10,367. What number of pupils have you sent up to Norwood altogether?—I believe the number we have sent altogether from the beginning is 27.

10,368. You said that Dr. Campbell made a selection; from how many persons would that selection be?—We have 30 to 40 pupils of all stages, and we have sent up about two every year, not exclusively from the school.

10,369. There are two selected every year?—Yes, from the school and from the west of Scotland as well.

10,370. At what age are they selected?—We have no rigid rule with regard to age; we have sent one to the primary school at 10; we have sent them young, and we have sent them when they only required finishing.

10,371. Have you any difficulty in getting the guardians to pay for sending up pupils to Norwood?—We have not sent many from the parochial board, which corresponds with the guardians in England; they pay 12*l.* 12*s.* a year and 5*l.* towards clothing; that has been their contribution, and we have had to make up the balance from our subscriptions.

10,372. Who clothes the children that are sent from your school?—The parents, as far as they can.

10,373. (*Rev. Mr. Sleight.*) Have any of those who have completed their education at Norwood been unable to earn their livelihood afterwards?—We have had one or two cases of that sort, and we have been able to give a reason for the failure, in the disposition of the pupil or the circumstances.

10,374. As a rule they are able to gain their livelihood without any assistance?—As a rule they do.

10,375. You are aware that it is a very great matter in the case of all afflicted persons that they should be employed as far possible. By granting subsidies to them, do you find that it tends to make them indolent?—We have them so superintended that we endeavour to prevent their wasting time in any way; but we believe that the subsidies are necessary, on account of the men's inability to earn as much as is required for their support.

The witness withdrew.

ALFRED WASHINGTON GUEST RANGER, Esq., M.A., D.C.L., examined.

A. W. G. Ranger, Esq., M.A., D.C.L.

10,376. (*Chairman.*) You are practising as solicitor in London?—Yes.

10,377. When where you admitted?—In November, 1879.

10,378. Notwithstanding your blindness have you succeeded in establishing a good practice?—Yes, I commenced practicing immediately after my articles had expired. I did not buy a practice, I simply took offices and started with one clerk who had read for me a great deal at Oxford, and also while I was articled, and who was thoroughly accustomed to my habits.

10,379. What staff have you now?—I have 10 clerks.

10,380. You have a partner, have you not?—I have a partner, but he does not take any part in the business at all, he is a man of ample means.

10,381. You are also honorary secretary to the trustees of the fund called the Scholarship Fund for the Blind Sons of Gentlemen?—Yes.

10,382. What is that scholarship fund?—It was originally started by various friends connected particularly with Worcester College, and latterly sundry friends have come forward with various donations; we have had a legacy of 300*l.*, and a Miss Warrington gave the sum of 1,000*l.* I have a copy of the deed of trust if the Commissioners would like to see it.

10,383. Those scholarships are given to students at Worcester College?—Yes, we have two scholarships of 20*l.*, one of 40*l.*, and we have nearly sufficient to create another of 20*l.* a year.

10,384. When did you lose your sight?—When I was 14 years of age. I had a very long illness, about eight months.

10,385. Were you at school at the time?—I left school at the commencement of my illness. I was at a private school at Clifton and I came home, and after I lost my sight till I arrived at the age of 21 or 22 I did absolutely nothing.

10,386. Did you then go to Worcester College?—Yes, I was there two years, not quite two years. I heard of the college through a friend quite by accident, and I went there.

10,387. What was the amount of your attainments when you became blind; were you a good classical scholar?—No; I began again when I went to Worcester College. I had done a little Latin and a little Greek, but I absolutely began again at the very commencement at Worcester. At that time there were scarcely any embossed Latin or Greek books at all, there were absolutely no Greek books at all, and just one or two in Latin. I think I was the first to put any Greek book in Braille type; the Hecuba of Euripides, I think, was the first Greek book ever put into Braille, and I arranged the Braille to the Greek myself.

10,388. Did you matriculate at Oxford directly from Worcester?—Yes. I had the long vacation, during which I prepared myself privately and went up in September.

10,389. And you found you had a sufficient classical knowledge to pass the examinations?—Yes, I passed all the examinations the first time, I was not ploughed all through.

A. W. G. Ranger, Esq., M.A., D.C.L.

7 May 1886.

10,390. And you then went in for law?—Yes, jurisprudence for the B.A., and I got that at the end of three and a half years, then I had six months remaining of the four years free in which I qualified myself for the B.C.L. degree, so as to get a doctor's degree ultimately.

10,391. Then you obtained the doctor's degree?—Yes, I took it in December 1884.

10,392. And you also tried for the Vinerian Law Scholarship?—Yes, I was *proximo accessit* for that.

10,393. You were articled for three years?—Yes, I was articled for three years to Messrs. Allen and Edwards, 8, Old Jewry, E.C.

10,394. Do you practice in any of the courts or do you confine yourself to chamber practice?—I practically do no advocacy, I have done a little, but I do not now, my time is entirely occupied in the office. I have a good managing clerk, and I retain counsel for any advocacy I want done. I do all the conveyancing myself, except the very simplest, I do that by dictation, my drafts being read to me.

10,395. In drawing a conveyance do you write in Braille or do you dictate?—I dictate to a shorthand clerk and he makes a fair copy which I go over carefully and note points that I want to refer to authorities about, and finally settle it. I do write Braille, but I am not very proficient at it.

10,396. Have you gained most of your knowledge by memory; that is by having classics and other educational books read to you?—Yes.

10,397. Have you been able to acquire any of your information by means of books printed in the Braille type?—I have made use of the Braille type in this way, between the years 1870 and 1874, when I knew very little Braille, I copied thousands of pages from various classical and law books in a Braille which I constructed myself, and which I then gave to a child to put into Braille sheets and then had bound up.

10,398. Do you think the Braille and the Roman type should exist side by side?—I will put it in this way, for enabling a persevering pushing boy or girl to get his or her education I think there is nothing like Braille; you can get any information with it; but on the other hand the Roman type, especially the American type, is more generally applicable. It is rather severe work to get over it first of all, I suffered very much in my head in managing it, but ultimately when I mastered it I found it very nice to read, it is more soft and pleasant to the hand than anything else I have ever read. There is one peculiarity about it which I think of the utmost importance. I have never seen any paper in England that gives such a sharpness and such a lasting character to the type as the American paper does, it is capable of giving a sharper and thinner line without cracking than any English paper. The American paper will enable the type to retain its clearness in a way that no English paper that I have ever seen will do.

10,399. It is rather in the sharpness of the printing than the quality of the paper that the American Roman type is different from the English Roman type?—Yes.

10,400. Is that type much used in England?—I do not think it is. The English Roman type is very fair, some of it; it has been better the last few years, they have improved it rather, but it is not so good as the American.

10,401. What was the course of education at Worcester College when you were there?—The style of education there was hardly sufficiently definite to call it a course; there were about 16 or 18 pupils at that time, they were roughly classed as they could work together, and you followed the course of your attainments, those who were brighter and quicker got on faster; there was no definite course, I mean from class to class.

10,402. A great deal depended on individual attainments, and the teachers looked after each individual more than would be possible in a larger college?—Yes; I think it would be strict justice to say that the result was in a very great measure in those early days depended on the pupils themselves; there were eight or 10 very persevering able students there, and they worked very hard.

10,403. When you went in for your degree at Oxford, how did you give your answers to the questions put to you?—One of the Proctors of the University or other approved person wrote for me, and I was put in the same room with the others a little way out of earshot of them, and he read the ordinary questions as they stood on the paper, and I dictated the answers to him; he wrote them for me in ordinary writing. I may just explain how I managed the heavy books at the University. I mean some of the books I read of four or five volumes each. The system that I adopted was to have those books read through to me, and then to mark the first time I went through them with an ordinary pencil the parts which I thought important; then I would have those marked portions read through to me, and I would mark in blue those which I thought more important; then I would go again through those portions marked in blue, and mark the more important passages in red; so that at the end I had a certain portion of the books marked in those three colours, which in an hour, perhaps, an ordinary boy of 15 or 16 could run through to me, and by that means I was able to make myself master of the scheme of the writer and the drift of the whole thing, which made me much more ready in reproducing the information than perhaps a sighted man would be, and I worked all my books on that system.

10,404. You analysed them very closely?—Yes, I got the analysis down ultimately to a very small compass, and then I had the essence of the book at my disposal.

10,405. Did you commit any of that to memory?—Not verbal memory. I mastered the principles of the book sufficiently well to be able to reproduce them in my mind. I have not a good verbal memory. I have a great difficulty in committing anything to memory with much verbal accuracy; I can do it, but only with great labour.

10,406. Can you give the Commission any information with regard to the present state of things at Worcester College?—I know its present state tolerably well. I think, perhaps, I ought to state that it is not at present in the same prosperity that it was in some few years ago.

10,407. Has not it been made use of latterly as much as it was formerly?—No. I think the number of pupils now is only 12 or 13; it does not seem to work with the efficiency which it did formerly; its scholarships are at the present moment in very ample proportion to the scholars there.

10,408. Are any of the pupils the sons of poor parents, or are they all sons of people of independent means?—McNeille was the son of a dean; Marston the son of a clergyman; Marsh was the son of a doctor; my own father was amerchant; Leighton was son of a baronet, also Hart Dyke, and Sandford of a bishop; but there were some poorer ones.

10,409. Of the lower middle class?—Yes, there were one or two.

10,410. At the present time is there an opening for students of that class supported by scholarships?—Yes; I think that out of the 13 boys there are as many as nine or 10 scholarships held there now.

10,411. Would one of those scholarships enable a boy to be educated gratis, or nearly so?—Yes, nearly so.

10,412. Is the present head master the same as when you were there?—Yes, the same head master is there now who was head master during part of the time that I was there, Mr. Forster.

10,413. Therefore it is not from any fault of the master that the school is not so flourishing as it was?—There is not, if I may so express it, the general push and spirit in the college that there was. I do not think that the prospect of the college is as good as it was.

10,414. Have you known any others who have gone out in liberal professions like yourself who were educated there while you were there?—Yes, there is the Rev. N. F. McNeile, the vicar of Brafferton in Yorkshire; there is the Rev. H. J. R. Marston, the rector of Icomb, in Gloucestershire; and there is the Rev. J. J. Beresford, who has a chaplaincy in South Wales.

10,415. Did all those go out in the usual way, with an academic degree?—Yes, all of them, and there are, I should think, 10 or 12 more besides; I should think that there are 13 or 14, perhaps even 16, who have done so.

10,416. Was the system at Worcester to treat the blind pupils, as far as possible, just the same as if they were seeing?—Yes, certainly.

A. W. G. Ranger, Esq., M.A., D.C.L.

7 May 1886.

10,417. You had no seeing pupils mixed up with you?—Not when we were there. There are a few now. One or two of those can see slightly.

10,418. Do you think it is an advantage to mix the two classes together?—No, I should not suggest it.

10,419. Had you any considerable amount of athletic training at Worcester?—No, very little indeed.

10,420. Had you not games or gymnastic exercises?—No; we had drilling once or twice a week, and there is a gymnasium, though not a very good one; but practically there was very little athletic training.

10,421. Do you think it of advantage that the blind should be taught gymnastic exercises as much as possible?—Yes, I think so. The tendency is not to get sufficient exercise; I did not get sufficient myself, and others did not, and my health suffered from it, but it was my own fault; I do not mean that I was in the least prevented from taking exercise.

10,422. Were you taught music at Worcester?—Yes; I began, and I was very successful to start with; but I became quite convinced that I should never make a success in music, and so I would not go on with it; but for nine months I think I learned music there, and I was told that I was a most promising pupil; but I did not think so really myself. I cannot play anything now whatever, not a note.

10,423. Do you think that the liberal professions are as good or better for the blind to take up than the musical profession?—Yes, certainly. I think that there is practically no limit to the degree in which the blind can take up professions, but each blind man must decide for himself; you cannot lay down a rule for him beforehand.

10,424. I suppose you will admit that a blind man must have more energy than other people to succeed in whatever profession it may be?—Yes; he must pay a higher price in effort, and he must spend a longer time in preparation. I worked for a very much longer time than most men do, and I do so even now.

10,425. It depends a great deal upon the will of the individual to surmount the difficulties before him?—Most distinctly; but if he continually uses the power he has, the increase in accuracy and power will come.

10,426. Do you find in your own profession that your power of retaining cases in your memory is greater than it was?—Yes, I think it is; and I do not think that my blindness stands very much in my way. I have lost only one or two important things because I was blind; clients sometimes have not sufficient confidence where the results are of very great importance; but still I have had some very important cases.

10,427. Do you conduct all your work by correspondence, or have you much personal interview?—I have a great deal of personal interview. I like to see my clients as much as I can get them to see me. I do correspond a good deal; I have two shorthand clerks, and I dictate to them a good deal.

10,428. Have you considered the question of the education of the blind generally, both boys and girls?—Yes, I have to some extent; but I have not taken much part in the general education of the blind, and I am not sufficiently master of the matter, I consider, to be able to give very important opinions about it; but I should very much like to see the various charities and funds for the blind which there are in the country brought together and worked more in harmony. I think that the blind suffer very much from the different ideas of those who are interested in their welfare.

10,429. You mean different ideas of educating them?—Yes, different modes of educating them; and the questions of type, for instance, and institutions competing one against the other.

10,430. I presume that in your case your friends always gave you every advantage in the way of education that you could wish for, and that you were not dependent upon others?—The terms when I went to the college were 120*l.* a year. I only paid 70*l.* a year, that being all that I could afford. Then I had a little money, but I ultimately used it up, so that in the last year, when I commenced to practise, I absolutely commenced with only 200*l.*, which I had to borrow. I have now paid all that back, and I have made considerable headway since. I had altogether, I think, between 400*l.* and 500*l.* during my university course, from the Fishmongers' Company, from the Grocers' Company, and from the Goldsmiths' Company; but for those scholarships I could not have got through Oxford; I should have had to throw it up. Then the college itself, after I got my first class, helped me; they gave me my tuition fees, and they gave me rooms.

10,431. Did they help you exceptionally, or were those open scholarships that you competed for?—For the Goldsmiths' Scholarship I went in for an examination in the usual way; but the Goldsmiths' Company have the right to appoint irrespectively of the results of the examination, and I do not think I got the scholarship on the result of the examination; in fact I am practically sure that I did not. Still I went in for the examination. The Grocers' Company did not give me a scholarship, but they made me three separate grants at different times, without any examination at all. With regard to the Fishmongers' Scholarship, I think that the late Mr. George Moore nominated me to that. That is how I got those three scholarships. Then the college gave me those things that I have mentioned, tuition fees and rent, I think in recognition of my doing well at first; I had no examination for that.

10,432. Do you know anyone who has gone through the same career as yourself in your profession?—No, not anyone.

10,433. Do you think that there are many who might follow your example?—There are some, I think, who might.

10,434. Do you think that the education of the blind should be in the direction of the liberal professions rather than in the direction of any other profession?—This is my own view: I would give a blind man or a blind girl as thorough an education as is possible; and then the blind person will himself or herself decide what line of life they will take up afterwards. A good education is of the same value to a blind man or girl as it is to a sighted one. The first result of blindness when it happens, as it did in my case for instance, at the age of 14, is for the blind person and his immediate friends to see what sort of provision they can make for him. My parents never thought for a moment that I should do anything, nor did I for six or seven years; and but for hearing of the college I do not suppose that I should have tried. But when you are a little educated your ambition is aroused, and you are capable of doing what you were not able to do before. I do not think that the law was the only thing that I could have done; in fact I am sure it was not. I selected it because I thought I could make it the most remunerative; but I feel that if I went out of the law to-morrow I could go into a business and manage it when I had learnt the technicalities and a few other things connected with it. Or I would make an opening for myself in something, I cannot exactly say what. That I feel is purely the result of education, and education I think would have the same effect upon others. I do not think that a blind man or girl should be directed in the first three parts of his or her education towards any particular thing. It is not so with sighted people, and I do not think it ought to be so with blind people.

10,435. Then you think that the funds which are now spent on the blind might be better employed?—Yes, I think so.

10,436. Have you taken interest in the technical education of such of the blind as have no turn for the higher education?—No, I have not; I really do not know anything about it.

10,437. Can you speak at all as to the employment or education of women or girls?—My feeling about blindness in girls is that blindness is altogether a much more severe visitation for a girl than it is for a man, and that therefore the better her mind can be trained and stored the greater is the alleviation to her. Then the result is very much greater in proportion, I think, to a girl than even to a man; and I would rather see more money spent in the effort to train girls thoroughly well, and to educate them thoroughly well, than to educate and train men.

10,438. I suppose you think that music is the best training for blind girls?—Yes, I think it is very good.

10,439. Is there any other means of earning their livelihood which you could suggest as being better than that? Needlework is of course a very poorly remunerated employment, except in the higher classes of needlework?—Yes, that is so. I do not know that I could suggest any other; but I do not think the onus, so to speak, is on the advocate of advanced education for a blind girl to point out how she is thereby going to earn her living, as if in default of his being able to do so the conclusion were to be drawn that she will not be able to earn her living as the result of an advanced education. I think that a thoroughly educated blind girl herself would find out ways and means of getting her living. There are numbers of ladies to-day who are earning their living with no particular profession, but in various ways connected with charitable work, and in organising or secretarial work. For instance, a thoroughly educated blind girl might very well be a secretary with another girl to help her who has nothing like her capacity, and power, and ingenuity, and business-like talent, and efficiency, and so on.

A. W. G. Ranger, Esq., M.A., D.C.L.

7 May 1886.

10,440. Do you think then that the blind are not sufficiently taught to help themselves?—Yes, that is exactly what I do think.

10,441. The tendency of your remarks, as I understand, is that the blind are not sufficiently self-reliant, and that too much very often is done for them which causes an absence of self-reliance?—Yes, quite so. They want helping a great deal more in point of education, to get the right ideas and notions into them, and they want helping very much less in matters of detail, as it were.

10,442. Then you think that they ought not to be told, "You must earn a livelihood by music," but "You must "get a good education, and after that you must decide "for yourself what your occupation shall be"?—Yes, that is very much my position. I am obliged to illustrate what I mean by myself, though it is rather egotistical; but for instance, in my own office I do not think there is any one who is my own equal; they are all sighted people, but I control and manage the whole thing and keep it going; and exactly in the same way a blind girl might well, with a good manager such as I have, take the oversight of very different work altogether, and might most efficiently contribute to the well-being of those around her and deal with the subject matter that she has in hand, if only she is educated and trained sufficiently.

10,443. Do you think that there is a want of charitable assistance for persons who, like yourself, wish for a higher education, but who for want of sufficient means are unable to obtain it?—Yes, I think there is a great lack of such assistance, and the parents of those who would like to have a good education, and who practically would not have any other, are not disposed to make the necessary extra effort, and very often are not even able, if they would, to make the extra effort which is required to give the extra money to that particular child; and what that child wants is some external help, so that he may be enabled to obtain the education which will put him more or less on a level with his brothers and sisters.

10,444. But you have told us that there is not much competition for these scholarships at Worcester, which does not look as if there was very great need for assistance of that kind?—That is so in fact, I must say; but I do not think it need be so.

10,445. Do you think that the want of competition for those scholarships and the little interest that you say is shown at the present time among the present pupils at the Worcester College is owing to the want of knowledge of these institutions or from any other cause?—It is peculiar to the Worcester College in its present condition. It is owing to the peculiarities which at the moment are inseparable from the Worcester College as it now stands. Worcester might under certain other conditions be made very different, and might under other circumstances fulfil what I think was its original intention.

10,446. At present, as I understand, it is the only institution of that particular class?—Yes, I think it is the only one in the world.

10,447. And you would wish rather to see other institutions like that started, so that there might be the usual competition between them, and if one failed the other would probably succeed?—Yes, quite so. There is not, of course, a necessity for a number of such institutions, but if at least one of them was really flourishing and efficient and thoroughly good I think it would be a great boon to the blind and would in indirect ways help the whole question of the education of the blind throughout the English speaking people and foreigners too.

10,448. I suppose you have no especial acquaintance with what has been done in America or on the Continent for the blind?—No, I have not.

10,449. (*Mr. Fox.*) I suppose you gathered your knowledge of law by the books being read to you?—Yes, and by lectures at the university, which I attended very regularly.

10,450. That was before you were articled?—Yes, and of course I had the ordinary statutory examinations here for admission as a solicitor, and then during the three years that I was articled I did a great deal of work for my employers, Messrs. Allen and Edwards.

10,451. Then of course your legal examination was done by dictation to somebody else?—Partly by dictation to somebody else and partly *viva voce*. I should say that as an articled clerk in doing the routine work at Somerset House and at all the official places I had the greatest possible assistance from the officials. If I took up a bundle of papers I could almost always get mine looked at first, even if there were 10 of us waiting. The officials would take them and run through them for me, and hand them back, or do what was necessary for me.

10,452. I suppose you always had a clerk with you?—Yes, for the actual locomotion from place to place I always had a junior clerk with me.

10,453. And for routine work?—Yes, but I never took with me a clerk who was able to do the work; I simply had a clerk with me to take me from place to place. Very frequently I had to find a place myself by inquiries at various offices and rooms that I did not understand.

10,454. (*Mr. Arrol.*) I think that, in answer to a question put by his Lordship, you indicated that you were averse to the blind studying alongside with the sighted, especially having the sighted with you at Worcester?—Yes, but I should not stress that very much. If the sighted were unquestionably in the minority I do not think there would be any real harm in it. I am not very strong upon that.

10,455. What may your objections be to the sighted being associated with the blind?—There would be, I think, a tendency on the part of the teachers to give prominence to the sighted pupils, and leave the blind to get their information from the sighted pupils. The blind would not get that direct, peculiar detailed, personal education which they really want; they would be left to the sighted pupils to help them through as it were; and to some extent, of course, the help they get from the sighted pupils is of use to them; but still the point and purpose of their own education is, so far as I have been able to notice, in a measure lost.

10,456. Do you not think that it is for the benefit of a blind youth that he should be associated with the sighted, and be stimulated by the superior advantages which the sighted have over the blind, so that the blind would be aroused to greater activity?—No, it does not strike me so.

10,457. In your career at Oxford did you find any difficulty in competing with your associates?—No, none whatever.

10,458. You did not find that the professors had any objection to dealing with you?—No, on the contrary, they were exceptionally attentive to me. Professor Holland, Professor Bryce, Sir William Anson, and Mr. Pottinger took a great deal of almost exceptional trouble with me.

10,459. Did you pass through any mathematical classes at Oxford?—No, I did very little mathematics, just two books of Euclid and some elementary arithmetic. I avoided all the mathematics I could, because I am not at home in mathematics at all; and I only did what I was absolutely obliged to do.

10,460. I infer that you desire the Commission to understand that if a blind man is sufficiently educated he is quite able to cope with the sighted in the commercial world?—To the extent of getting his own living and carrying on properly the particular business that he decides on. I do not mean to say that he is really as good as a sighted man, I do not think that he is.

10,461. Do you consider that the deprivation of sight has much to do with the carrying on of a large establishment where the principals do not write at all, and where it is all done by dictation?—Yes, because he cannot thoroughly get about and look at the details so well. Of course if he was a thoroughly good organizer and got his work reduced to a proper method, with a good system of checking, what he might do is without limit. I have had no personal experience in managing a commercial business, but I would not like to put any limit upon what he might do; but still there is a great pre-

A. W. G. Ranger, Esq., M.A., D.C.L.

7 May 1886.

judice against him. The worst part of my business is the finance part of it. To this day my bankers, though I have demonstrated to them over and over again the satisfactory nature of the business that I am doing, and of my account with them, are nervous about my business with them.

10,462. I do no suppose they would be nervous if the bank account is always kept on the right side. It may be a matter of the signature of the cheques?—The signature of the cheques is the chief thing that they are nervous about. In fact they once seriously considered the question whether they would not ask me to close the account upon those very grounds, that my signature was so irregular and unsatisfactory, that sometimes they did not know whether to honour it, especially when it came to heavy cheques; and I finally made an arrangement with them, and I now have all my cheques countersigned by my own private clerk, who is with me in my own private room; so that they really trust more to his signature, unless I go to the bank and present my cheque myself in person, so as to keep myself independent, and then of course they will honour my signature. But if I send a cheque out into the country then it is countersigned by my own secretary. I ought to explain that the bank cannot imagine and not understand how it is that I do my business. I cannot make them understand, and the prejudice is so strong that they will not understand how I do it. The slightest little hitch brings out such an obvious want of confidence that it makes it very difficult. If all my clients had met me with similar nervousness, although the bank is extremely obliging and kind, I never could have earned my living at all, the difficulties would have been tenfold.

10,463. (*Dr. Campbell.*) Do you use a type writer in your work?—No, none whatever.

10,464. Have you ever tried type writers?—Only just a very little.

10,465. You were speaking of the American type; is it your opinion that that type can be read by the large majority of the blind?—Yes, it could I think if they would make sufficient effort. It is very painful to commence with.

10,466. Would you suppose for instance that a boy who had been thoroughly educated in that type and read it with great facility would after a few years not be able to read it with facility?—Yes, after a while he would fall back to some degree, but he could pick it up again.

10,467. But though he might keep using it all the time, do you not find that the American type, or what we will call the Howe type, requires such a delicate touch, that after he arrives at a certain age, or when his touch is not so fine as it was when he was young, unless he keeps his hands very delicate, it would be difficult for him to read it?—No, I cannot say that it is so.

10,468. Have you had great experience, excepting in your own case, in this regard?—No, not very great. I know one or two very good readers in the type.

10,469. It is only with a few exceptional cases that you are acquainted; yours is not a general experience?—No, perhaps I ought to say that my experience is not sufficiently varied to make it very general. For instance, Marston and McNeille, both of them, read it beautifully, McNeille especially.

10,470. In America we are largely relinquishing the type, and i is an important thing for us to determine whether it is readable or not. You were speaking of the pleasantness of it; do you think that that type is more pleasant to the touch than the line types?—Yes, certainly it is by far the most pleasant and grateful to the fingers in my experience of any type I have ever touched.

10,471. Is that owing to the quality of the paper or to the peculiar formation of the lines?—Partly both, and partly owing to the fact of the type not going below the line. I think that that greatly contributes to the pleasantness of it. But there is a great deal in the paper which is wonderful; I cannot at all understand how it is that we do not get anything like it that I have seen in this country.

10,472. I suppose you would not be surprised if you were told that the Americans when they print have special paper made for them, with new rags for instance?—No, I should not be surprised to learn that.

10,473. You say that you do not write the Braille system very well, but I suppose that having so many books copied you read it with facility?—I do not now; I have not read it for years much, scarcely at all.

10,474. Do you know what proportion of these 14 or 16 young men who have gone through the University are earning good incomes?—No.

10,475. (*Chairman.*) The clergy you spoke of?—Yes, they earn good incomes.

10,476. (*Dr. Campbell.*) McNeile and Marston are, but does Beresford earn a good income?—I am under the impression that he does not, but I really do not know as a matter of fact. My impression is that about 120*l.* a year would be the most that he is earning. He is a curate in charge, I think.

10,477. Can you give me the number that you think are earning what you would say are fair incomes?—I should think perhaps that about ten out of the 14 or 16; that would be half.

10,478. Do you think that that proves conclusively that while a liberal profession is a grand thing for specialists like yourself, and Marston and McNeille, and others, it would apply to the blind at large?—Yes, because I do not think that any of those men, with the exception of McNeille, had a good education for the purpose of making them clergymen, or myself for the purpose of making me a lawyer. We were educated and then allowed so to speak to do what we liked.

10,479. But do you not think that in the case of those who have had this grand success (and it is a grand success), it is their strong individuality which has carried them through?—Yes, I think it is quite fair to say that it is so.

10,480. (*Dr. Tindal Robertson.*) With reference to the type of which you have just been speaking in answer to Dr. Campbell, I suppose there is no means of writing with this American type?—No, not that I know, none whatever.

10,481. Supposing that you take all the types with which you are acquainted, whether you are acquainted with them practically or theoretically, is there any type which in your opinion can bear the slightest comparison as to the general advantage of it to the blind with the Braille type?—No, none.

10,482. When you first went to Worcester were you taught there by the Braille system?—No, only very slightly. At Worcester, at that time they were very strong advocates of the Roman and only the Roman type, but Braille was used there *in subsidium*, as it were.

10,483. Were you taught music by the Braille system of notation?—No.

10,484. What is the system pursued at Worcester now, either for music or for general education; do they use the Braille type?—Yes, I think they use the Braille type a good deal there.

10,485. Do they use any other?—Yes, the Roman.

10,486. Do you think it is an advantage having the Roman?—Yes, I think it is; I think it works very well. A sighted person can see in a moment what the blind student is doing, and it enables a blind student to get hold of a sighted person anywhere and get him to give him a helping hand.

10,487. But so far as the general mass of the public are concerned, I suppose you would not expect the unlettered public, the poorer blind people, to ever take up this delicate Roman type which you speak of as being so useful?—Some of the poorer classes I do not think ever could do so.

10,488. Therefore, on the whole, I suppose if the whole of the systems were put together and you were asked to choose one you would choose the Braille type?—If I had to choose one and annihilate all the rest and absolutely blot them out, I would certainly take the Braille.

10,489. Is there any suggestion which you are able to make with regard to rendering Worcester more advantageous, not only to children of the upper classes, but to those who may be distinguished in other ways, as from the lower classes, so that those scholarships might be utilised to a greater extent than they seem to be now?—Of course they cannot be utilised any further than that somebody should hold them all, and nine or ten of them I think are held at the moment. But I think that Worcester could be made much more available, not only for the better class of blind, but also for talented boys of perhaps not quite the better class.

A. W. G. Ranger, Esq., M.A., D.C.L.

7 May 1886.

10,490. Have you any suggestion to make as to the way in which that could be done?—My difficulty in answering that question is, that I am so very greatly indebted to Worcester myself that I hardly like to suggest alterations which might have the appearance of ungrateful criticism.

10,491. Do you think that we could get such information as that from the head master of the college, Mr. Forster?—Mr. Forster I am quite sure would give the fullest possible information about it.

10,492. Have you any experience with regard to children who have been taught at the blind schools in London?—No, none.

10,493. I think you said that you had experience of some who had been taught at other than blind schools?—Yes, McNeille is one; the early part of McNeille's education was entirely in sighted schools.

10,494. Do you think that the education which you received yourself in early life before you became blind at the age of 14 was of great advantage to you in your afterwork?—No, I do not think it was.

10,495. Then almost the whole of your education was obtained after you went to Worcester?—Yes, practically. Of course I had a great amount of general information. I had brothers and sisters who were all well educated, and so on, and I had done a certain amount of school work; but I had seven or eight years between the time that I left school at Clifton and the time when I went to the blind college; and I think that my prior education contributed very little indeed, though I cannot say that it contributed absolutely nothing towards my after education.

10,496. Have you any knowledge of the Norwood College?—Not very much; I have been there on one occasion only.

10,497. Do you know that at Norwood they make a very great point of physical education?—Yes.

10,498. Do you think that is an important point with regard to the education of the blind?—Yes, I think it is important, but my own private opinion is that it is over done at Norwood.

10,499. In what way?—I am speaking now more from hearsay; but I think that the pupils are strained and fatigued by it more than is good for them. That is the impression which I have on my mind, and I think the physical education is too prominent in the curriculum of their work. I have seen them doing the exercises when I was there.

10,500. I understood that at Worcester there was very little physical training of any kind?—Very little.

10,501. You being an experienced man in these matters, I wanted you to compare as far as you could what you have seen at Norwood with what you have remembered at Worcester?—What I saw at Norwood was very superior to anything that there was at Worcester; but I still have the opinion that while there is too little at Worcester, there is too much at Norwood.

10,502. (*Mr Johnson.*) I believe that you got the principal part of your education from Mr. Blair in the time of his presidency?—I think my time was divided as evenly as can be between Mr. Blair and Mr. Forster.

10,503. At the time Mr. Blair was there, there were 16 blind gentlemen there, were there not?—I think there were.

10,504. Do you know the number of blind gentlemen that are there now?—Yes, 13. And that reminds me that not long since Mr. Forster told me that it had come now to the number at which Mr. Blair handed it over; but still when I went to Worcester I think there were 16.

10,505. You are quite indebted to the college, you consider, for your education?—I am mainly indebted to the college for the ideas of the possibility of becoming thoroughly well educated, if I cared to make the effort to be educated.

10,506. And you do not think that you could have got that education anywhere else so effectually as you did at the Worcester College?—I owe the education much more to the ideas which Worcester gave me than to what I actually got from Worcester. I think that is the fairest statement that I can make.

10,507-8. I suppose you owe to Worcester the grants which the Goldsmiths', the Grocers', and the Fishmongers' Companies were good enough to make to you; I suppose it was on an application from the college that you got those grants?—No, not any one of them. I made the applications entirely privately, without any connexion whatever with the Worcester College.

10,509. They gave them to you personally?—Quite so.

10,510. Have they subsidised anyone else from the college?—Not that I know of.

10,511. Therefore Messrs. McNeile, and Marston, and Marsh did not get any subsidy at all from anybody except from their friends?—Mr. McNeile got something, I do not quite know what, from Trinity College, Dublin.

10,512. It was a scholarship, was it not?—Yes, I think it was. It was a very small one, but it was a theological scholarship, I think. Mr. Marston got an open classical scholarship at Durham, and also one or two Hollenistic Greek prizes, and one or two things of that kind, but nothing from any company or from any other charity.

10,513. And in your time there were no grants I suppose from the Gardiner Trust?—None whatever.

10,514. Are you aware that now the Worcester College has a certain number of scholarships given by that trust?—Yes. There was no scholarship whatever when I was at Worcester, and there were very few embossed books.

10,515. Then the embossed books which you used when you went to Worcester were the American books, and such books as were printed in the Roman type, and the Braille, which was beginning to be used?—Yes, and some volumes in Moon's type which Sir Charles Lowther gave to the college, and books which we made ourselves. I think that the most important books for the best men in the college were books which those men made for themselves, and which they did not even send to be bound, but stitched them themselves.

10,516. In what type did they make them?—In Braille. They were loose sheets, short epitomes, and things of that kind.

10,517. Was the society for printing books at Worcester in existence in your time?—Yes.

10,518. Did they make use of those books at the college?—Yes; not very much at first, but they began to use them more and more, and they have been used very much more since I left.

10,519. In what type were those books printed?—In the Roman type.

10,520. Lower case and capital?—Yes.

10,521. Do you find any difference between that and the Roman case and capital?—Yes, the small type is very much better; I like it very much better.

10,522. I suppose you like it better because you are able to read the Howe American type?—Of course that has some connexion with it; but in the case of the smaller type, your finger covers the whole letter at the same time; and I think that, even for an untrained hard hand the smaller type is better than the large. I never thought the large Roman type easy, and I do not think so now; in fact, I cannot read it myself, or scarcely.

10,523. Then this American type, which we call Howe's, is a lower case?—Yes.

10,524. With an occasional capital?—It has no capitals.

10,525. (*Dr. Campbell.*) They have printed it with capitals recently?—I have no books with capitals.

10,526. (*Mr. Johnson.*) Have you any experience of what they call the Philadelphia type, which are capital letters, printed in America?—No; I have never read it.

10,527. Do you think that if those books which are printed at Worcester by the Worcester Society were well known many persons would use them as educational appliances?—Yes, I do. You are referring to the small type principally?

10,528. Yes; for instance, such a type as one of the Greek plays is embossed in; have you seen that?—No, but that is in Greek type. I know it is done, but I have not read it. I cannot read it; I never tried to.

10,529. That is in the ordinary Greek type, is it not, and not in the Braille adaptation of the Greek type?—No; my Greek I always did with a Braille adaptation.

10,530. Do you think there is a sufficient number of the sons of gentlemen to fill the college if it were conducted on a broader and larger principle?—Yes, I do.

A. W. G. Ranger, Esq., M.A., D.C.L.

7 May 1886.

10,531. Then why do you think it is that hitherto all the scholarships in the Worcester College have not been filled?—Partly because it is not known.

10,532. What other professions do you think are open to the thoroughly educated blind men and women besides the liberal professions which you have told us of and the profession of music; do you think there is any other profession or occupation to which persons charged with the education of the blind should direct the attention of blind persons?—Yes; all employments which involve organisation and superintendence; of course, not that superintendence which directly involves the use of sight, but all things partaking of a secretarial character.

10,533. (*Chairman.*) I do not quite see that employments of a secretarial nature are particularly adapted for the blind, because for all writing you would be obliged to have a clerk?—Yes, but besides the principal secretary there are subordinate secretaries; and for the principal secretary it is really essentially necessary that you should have an intelligent man who can dictate a good letter, and interview people, and arrange and give instructions to subordinates, and see that they are carried out. For instance, I think that a blind man might be at the head of a cashier's department, and if he be a suitable man in himself I should think he might manage it very well indeed. I think, for instance, I could.

10,534. (*Mr. Johnson.*) That is to say, given a special talent for that particular occupation?—You must maintain the same conditions as with a sighted man.

10,535. What is your opinion with regard to the musical profession as an occupation for the blind from a remunerative point of view?—I should think it is very good.

10,536. Have you any experience with regard to blind persons who have succeeded in making a good living as musicians?—No; but I have an opinion drawn from what I know of the Normal College, which distinctly makes me feel that it is a splendid profession for the blind, and that numbers can go into it most advantageously.

10,537. You have no personal experience as regards blind persons who have succeeded in the musical profession?—No, none.

10,538. It is entirely hearsay, so far as you have gone?—I have just a very little experience, but it principally rests upon hearsay.

10,539. You do not know any blind person who has succeeded and become a great musician, doyou?—No.

10,540. I understand that you draw comparisons between the institution at Worcester, where you say that there are no physical exercises, and another institution, are you not aware that at Worcester they play cricket?—Yes, I believe they do; they have done so since I left, but I do not think they did so when I was there; I never did, any way.

10,541. You suggest that the college should be endowed; could you tell us how it exists now?—It is entirely private, with the exception of the organ and a certain amount of furniture, and this trust of which I am the honorary secretary, of scholarships for blind sons of gentlemen. As long as Worcester exists the Worcester pupils have the preference over any other in that trust; but in the event of Worcester not continuing, the trustees have the power to award the scholarships to pupils of other institutions.

10,542. Then it is carried on by the principal as his private enterprise, supervised by a certain number of visitors, of whom I have the honour to be one?—Yes, I think you are one.

10,543. (*Dr. Campbell, through the Chairman.*) In regard to physical training, do you know that the matter of how much the pupils do in the Normal College in the way of exercise depends altogether upon the medical officer of the college and that it may be discontinued altogether under medical advice?—I did not know that the practices were dependent upon the approval of the medical attendant.

10,544. (*Chairman.*) You did not intend that to apply to music?—I think the mistake on the musical point is the too ready assumption that every blind man must of necessity be a musician, and that if he is not one he can be made one.

The witness withdrew.

F. J. Campbell, Esq., Ll.D. (a member of the Commission), examined.

F. J. Campbell, Esq., Ll.D.

10,545. I believe you are the founder and first principal of the Normal College at Norwood?—Yes, I was one of the founders, and was its first principal.

10,546. Can you tell the Commission what were the grounds which induced you to establish it; what were the wants which you thought necessary to be filled up by the establishment of that college?—My own experience as a blind boy, and my requirements and efforts to obtain an education gave me certain experiences. Finally, I went abroad to Germany to study, and when I was on my way to America, I stopped in London, as other Americans do, to see the sights. It so happened that on the very first evening after my arrival in London I was invited to a blind tea meeting. This blind tea meeting produced a very great impression upon me. Some 300 or 400 blind men and women came to it, led in various ways, and during the evening I mingled and conversed with them freely on their condition, and as to what they were doing, and so forth; and after spending a sleepless night I determined to look farther into the question of the blind in London. I had a letter of introduction to Dr. Armitage; I delivered that letter, and in company with Dr. Armitage I visited all the blind schools and shops in London, and I became convinced that great improvement might be made, and I was very anxious to induce some one of the existing blind schools to adopt certain changes, which I believed might produce a great improvement in regard to the training of the blind. I was quite prepared to remain in London for some time to promote these changes and improvements; and Dr. Armitage and other friends with whom I had then become acquainted were prepared to help in regard to money. But after discussing the subject in various ways, and particularly with the Committee of the Upper Avenue Road School (although I did visit also St. George's School, and discussed the subject with Mr. Johnson and others), by the advice of the late Mr. Hornsby Wright and other members of the Committee we came to the conclusion that we should accomplish a great deal more for the blind if we opened an experimental school; and we finally decided to open an experimental school with reference to the points which I urged particularly; and we did raise money, and began a school with the plan of carrying it on for two years, in order to show the principles and methods of instruction that we wished to have introduced. Before those two years were up the college had been organised, and on June the 24th, 1873, we bought the property on which the college now stands.

10,547. Were the methods of instruction which you advocated original, so far as the teaching of the blind was concerned, or were they derived from your experience and practice, either in America or abroad?—I certainly have availed myself of all the experiences that I could come in contact with either in Europe or in America. I had taken counsel with all the leading educators of the blind. I had my own theories based upon my own trials as a blind boy, and I had my own opinions in regard to the great cause of failure of many of the blind who are educated in the blind schools, especially in America. I think it will perhaps be interesting to the Commission for me to point out one experience of the causes of failure. In 1857 I was a visitor in Boston, and I called at the Perkins Institute for the Blind, of which the celebrated Dr. Howe was the director, and it was with some difficulty that I was allowed the privilege of spending a day in the institution. The doctor was rather decided in his opinions about having visitors upon any other day than a fixed public day, but he allowed me finally to spend the day there. As I was going out at about 5 o'clock I happened to meet the doctor at the door, and he asked me what I thought of the school. I said, "Doctor, I do not like it." "Why?" he asked. I said, "Because you are not training the blind here "to make them independent." He said, "Well, that "is plainly spoken; will you come to my office with "me?" I went to his office, and we talked together for an hour, and the result was that he invited me to go home with him and dine, and after my pointing out to him why I thought especially the musical department was conducted on entirely wrong principles, and that the wrong pupils were selected to study music, giving my reasons for it, he at once expressed a wish that he could see more of me, and in the course of three months he made a direct proposition to me that I should become connected with the institution and should be an assistant teacher under the director of the musical department. This I refused, but I offered to take one part of the school in order to introduce the method which I proposed with regard to the musical training.

F. J. Campbell, Esq., Ll.D.

7 May 1886.

10,548. So that you should be independent?—Quite so, and I carried out my purpose. The doctor said that I was right, and so he made the proposition to the musical director that he should take either the boys' or the girls' school and that I should take the other. He refused to do so, so the doctor dismissed him and offered me the appointment. I proposed to the doctor that I should be allowed to select 20 pupils of the school as a test class, and that those boys and girls should be trained exactly in accordance with my wishes, not only in music, but in all branches and in all particulars. The doctor thought that 20 would be a fair test. Finally, I was to choose this class, and I quite remember that when the boys and girls were sent up to be examined they began sending up what they considered their special musical pupils, and if I clapped my hands some of them would tell me whether it was C sharp or D natural, or whatever it might be; but they could not tell me that the half of four is two, and that sort of training is of no use. A blind man must be able to use his brains. Consequently whenever I undertake to make a blind person successful as a teacher of music he must have the power of analysis, he must be able to carry a composition in all its parts in his head, and if he is not trained to do that he may play, but he will not be a successful man professionally. I entirely refused those so-called musical pupils, and selected most of them from some of the most successful pupils in mathematics. I chose my 20 boys and girls, and I began at once by making them give great attention to physical exercises. My reason for this is that you must give energy, pluck, and determination. In the winter there we had ice for three months of the year, and I had them all out skating at 5 o'clock in the morning, and I would go myself with them and skate. The result was that when those boys and girls were trained 19 out of the 20 were not only successes, but very brilliant successes, and some of them now occupy very important positions in America. I know that one whom I visited a few months since is earning 500*l.* a year, and others have been filling prominent positions in different parts of the country. There was one girl who was not an entire success. She did earn a bare living, but I must say that it was not an independent living. But the other 19 were highly successful in every sense of the word. The success of this class gave a new impetus to the whole training of the blind in the Perkins Institute.

10,549. Your class, you say, was composed of boys and girls?—It was composed of boys and girls, I think, about equally; there may have been nine of one and 11 of the other, but they were about equal.

10,550. That was not your first experience in training the blind, was it.—No.

10,551. We should like to have on record your previous training which enabled you at once to arrive at these successful results when you had the opportunity of putting your ideas into operation unimpeded by others?—As a blind boy I entered the Tennessee Blind School at Nashville in 1844 at 10 years of age. I was thought to have no musical talent whatever, and when I was examined with regard to music I was refused music lessons. I had no ear, and I could not sing, and it was thought to be an impossibility for me to learn music. I confess that it aroused my indignation that it should be supposed that there was anything that I could not learn, and by various arrangements and contrivances I induced one of my boy companions to give me music lessons secretly. The teacher was blind, and consequently I used often to practise without his knowing who it was that was practising; he supposed that it was some other boy. But six months later he came in one day while I was playing, and he said, "Who is there." I slipped away and got off into the corner, but it was of no use; he came after me, and finally found out that it was his boy Joseph that could not learn music. He insisted upon my playing what I had been learning, and I then began to study music, but I had no great love for music. My great talent was for mathematics, and I was very anxious to have a special mathematical education. I was very desirous to go to the university, and I only pursued music at intervals for the first three or four years of my education, because I knew that by it I could earn a certain amount of money to help me to pay my way through college. That was my object as a student of music in the first instance. Our music teaching was upon the lines that have been followed in so many institutions; we did not study it from what I term the mathematical point of view. I believe that every piece of music can be reduced, as it were, to a mathematical problem, and that we must carry the whole thing in the mind. I can take one of Beethoven's symphonies and read it through and commit it to memory, and then write it all out on a piece of paper, and put in all the parts for the different instruments. This I could not do but for my knowledge of mathematics. I quite well remember the first lesson that I went out to give when at the age of 16 I began to teach music for the purpose of helping to pay my expenses at the university. When I reached the house in which the young ladies who were to be my pupils lived, I asked them to play. I could play difficult pieces, but I found that I was perfectly at a loss how to teach seeing people to read music, or anything about it, because I had not studied it from that point of view. However, I had tact enough to say to those young ladies, "Well, I did not come to give you a lesson to-"day; I only wanted to hear you play, and see what "you knew; I shall come again next week, and then I "will give you a lesson." I went away, I confess, very much discouraged, for I saw my great difficulty, that I did not really know my business. At that time there was in Nashville a very celebrated musician, a pupil of Moscheles and of Mendelssohn, who had been unfortunate in his marriage, and who was a misanthropic and discontented man, and had retired, as you may say, into the backwoods of Tennessee. I went up into his room, and I told him my trouble; I said, "I have been "taught badly; I have no money with which to pay "you for lessons, but will you give me private lessons "and trust to me for paying you afterwards?" It was all arranged, and the next evening I had my first lesson. I began at 7 o'clock, and I left the music stool at a quarter past 11, so that that first lesson lasted four hours and a quarter. That one lesson laid the foundation of all my future work. He was a very talented man, and a gifted teacher, and his answers to my questions solved many difficulties and pointed out what I had to do. I went on the following Monday, and gave my first music lesson, and within the next 12 months I earned 1,100 dollars. This was my beginning, and after studying with him I pursued my studies when I went north for the purpose of studying at Harvard. I also took some private music lessons in Boston, selecting my teachers according to what I wanted; and then knowing or realising what had led to the failures in all the various blind schools in America, I, as I have explained to you, induced Dr. Howe to allow me to try this experiment, which I believe has caused the various blind schools of America to very greatly increase their expenditure in regard to the musical education of the blind.

10,552. Then you began teaching the theory of music on mathematical principles?—I not only taught the theory of music, but I taught my pupils to analyse a musical composition exactly as you would analyse a poem, and I taught them the art of phrasing. Then I have methods of enabling a blind person to bring the music before his seeing pupils in such a way that I can teach a seeing pupil with as much success I think as any seeing person can. I have some little inventions of my own with which I always equip our pupils when they go out to teach. One of the most difficult problems is how to get an organist's appointment, because as you know an organist is very often required to teach the Sunday scholars to sing. You have a class of little girls and boys eight, nine, and ten years old who have never been taught to read music, and the difficulty is how is the blind teacher to instruct those children in the notes, and to teach them what is called the staff. I began in the first instance without the line staff. I had what I term a musical ladder; it is made with little steps exactly in the form of a ladder, and from the first step of the ladder to the second, and from the second to the third is twice the distance that it is from the third to the fourth step of the ladder, exactly as it is in the musical scale; and again from the fourth step to the fifth, and from the fifth step to the sixth, and from the sixth step to the seventh the distance is the same as it is from the first to the second and from the second to the third, and from the seventh to the eighth it is only half the distance

F. J. Campbell, Esq., LL.D.

7 May 1886.

again. I have little holes in each of the steps, and I have figures which I can put into those strips on the ladder; and so I begin by teaching those children to sing first the figures, and I can also use the letters. Then I can take a pointer, and I have this ladder so constructed that by moving my finger up and down I can tell where the figures or letters are. Supposing that I want a child to sing 1, 3, 5, 8 my pointer goes exactly as a sighted person's would to those different figures, because I keep my finger at the back of it to enable me to point directly to the figures. And so I can keep those children singing any numbers I like, 1, 4, 6, 8—3, 5, 8, 6, or anything else. That enables me to teach the first steps. Of course it depends upon how young the children are that I am going to teach, and how many of them there are, and so on; but I generally begin by making a line. I say nothing about the staff, but I say, "we write music on lines; here "is my first line," and I put my line down on the table. Then by-and-bye I will have a note that I can put on this line. "Now," I say, "this is so and "so," and I tell them what it is. I tell them that by changing the form of that note we get a different rhythm, showing that whether the sound is long or short depends upon the shape of the note. I tell them that if I put the note above the line or under the line it has a different name. I want to establish first in the children's minds that if the note is upon the line it is one thing, that if it is above the line it is another, and that if it is below the line it is another. I have cards prepared in regular sets, some with one line, some with two lines, and so on, and I can mark those cards with Braille figures, so that I can feel the corners of them, and I know which card it is. First, I put before the children a card with one line on it, then I take up a card with two lines and explain that. I show the children the notes below the first line, on the first line, in the space between the first two lines, on the second line, in the space above the second line, and so I go on until I get the five lines and the four spaces. Then I say to the children, "Here I have five lines and "four spaces; we call this in music the 'staff.'" You may say that this is a long way of teaching the children to read, but the result is that I keep up the children's interest, and I carry them on rapidly. The moment I begin to teach them to read and put exercises before them I teach them to number the bars. When I have heard them read, say, the first exercises of eight bars then I explain which is the first bar, which is the second, which is the third, which is the fourth, and so on. If I was teaching a child to play the piano, and you came into the room, the child would without doubt look up. The seeing teacher would take his pencil and say, "Begin there," pointing perhaps to the fifth bar. I could not do that, but I should say, "Begin at the fifth bar," or at whatever bar the child had left off; and I have so trained my seeing child that he or she is able to find any bar that I tell her or him to find. I have made the child think far more than a teacher makes him think who simply points with his pencil to a particular place and says, "Begin there." This explains my principle of training a blind man. My great object is to teach the children to think. Therefore I must train my blind teacher, in such a way that he or she brings the power of thought to bear upon music teaching exactly as in teaching Greek, or Latin, or mathematics. The great fault in all teaching of music is that music teachers teach with too little thought. My success in training blind teachers in music lies in the fact that I give them the power of training children to develop more thought in regard to it than the ordinary teachers give them.

10,553. Would you say that the special theory of your system of educating the blind is that you first of all educate them and then use that education as a means of teaching them music?—Yes.

10,554. Do you first direct your efforts to giving them the power to appreciate mathematical figures and ideas with a view to teaching them music afterwards?—We do not limit them to music.

10,555. But you think that for the blind mathematical training is the best?—I use the word "mathematical" as expressing the power of analysis. I consider, for instance, that geometry is perhaps the best of all subjects for developing the power of analysis. But we carry this system into everything. We always try to teach them to reason about an object, and to develop their power of analysis or reasoning. It is not necessary merely to make the child play. I can make any blind man or woman or child play without developing this power of analysis, but their playing would be only for their own pleasure, or for the pleasure of their friends, and they will not be able to take up music as a profession without this analytical training of the mind. We recognise, and I think all who are labouring for the blind ought to recognise, that the blind as a class have certainly less vitality than the seeing. Dr. Howe made most careful investigations extending over a number of years, and covering a very large number of cases, in regard to the longevity, the health, and the vigour of the blind, and he came to the conclusion that the blind as a class have at least 25 per cent. less vitality than seeing persons, not that many blind persons may not have as much vitality as seeing persons, but as a class the blind have less vitality than seeing persons. If this is correct, certainly it ought to be the first duty of every blind school to overcome this defect as far as possible. Therefore every arrangement which we make is based upon the fact that we believe there is a necessity not only for gymnastic training, not only for the training that would be given in a gymnasium, but for developing the activity of the blind children; and we have lawns for them to play on, and games such as "puss-in-the-corner," "blind-man's-buff," and so on. For instance, I often have our children up to my house, one evening the little girls and another evening the little boys; and I have all kinds of games and diversions for them. This is not only for their pleasure but for their health. I try to make those games a part of their education, and wherever I am I try to learn new games which I can teach to my blind children. In this way I very soon awaken in the blind children new aspirations, new thoughts, and new enjoyments. If you go into our little primary school on a rainy afternoon you will find them in their play-room playing house, hospital, representing doctors, patients, nurses, &c., and their play becomes as interesting and as valuable as any part of their work. Our first step is the healthy development of their bodies. All those who are acquainted with the condition of the blind I am sure will agree with me that one of the most difficult things that we have to do is to overcome the awkward habits of the blind. Many of them learn almost from infancy a certain motion of the head or a habit of putting their fingers in their eyes. This requires almost constant attention. I am often asked why I do not employ more blind teachers. I may explain that it is because I think that the blind ought to be trained under the most favourable circumstances; and although I believe the blind can often give instruction to the blind better than seeing persons, yet it is so important to improve their deportment, to improve their facial expression, and to improve them in many other ways, that we need at any rate a certain number of seeing persons. I know that that point has been raised; I will say, however, that if I were myself a sighted man I would employ a greater number of blind assistants, but being myself a blind man I must avail myself of a greater number of eyes than it would otherwise be necessary for me to make use of.

10,556. Do you think that in the teaching of music the blind can teach as well as the sighted, so far as the teaching in the earlier stages goes?—My belief is that our most successful teachers of music amongst the blind are far superior to what you might term ordinary teachers amongst the seeing. I believe they give far better instruction because they have been carefully trained for that purpose. Of course if the seeing teachers had the same training as the blind teachers have the seeing teachers would have the advantage. But my belief is that by our course of training we change the position and make the blind teachers superior to the seeing teachers. Of course there are many notable exceptions amongst seeing teachers, but as a rule the ordinary seeing music teachers are not a thinking class; they are not taught to think. Many of them take up music as a profession because they cannot do anything else; they have learnt to play and so they take it up, and there is more bad work in teaching music than in any other line that I know of; and that is to the advantage of the trained blind music teachers.

10,557. I suppose that your system of teaching music to the blind does not really differ at all from the best teaching of music by seeing teachers, but your contention is that there is so much bad teaching amongst the seeing teachers of music that you have by reason of your better training a superiority over the ordinary teaching, but not over the best teaching?—Quite so. I do not contend that our musical training is at all better, I only contend that by our special training

F. J. Campbell, Esq., LL.D.

7 May 1886.

in the art of teaching we are superior. It is not that our musical training is better than that of sighted persons, though I believe it is as good. For instance, I believe that the instruction at Norwood to-day is as good as the instruction at the Royal College of Music or at the Royal Academy of Music either. I do not say that it is better, but I say that it is as good. But what we do is to give much greater attention to the development of the mind and of the powers of thought than is given in the case of ordinary seeing teachers.

10,558. Given that the musical profession is more or less crowded, there must be a certain amount of competition, and in order to make up for the disadvantages under which the blind labour, you give them such a training as leads the public to feel confidence in them, and secures their being employed, when if they had not been so well trained they would not have been employed?—Certainly. Of course there is great competition, and I do not say that there is not difficulty in getting employment. I do say, however, that where all the circumstances have been favourable, I mean to say where a young lady or young gentleman has been refined and gentle in manner, where their appearance is as it should be, and is not objectionable, where they are pleasant and intelligent, and can converse agreeably, and are thoroughly prepared, I have never in a single instance failed to get employment for them. I attach to that statement, however, these conditions which I have laid down: that all these things must be as they should be. I do not quite like telling my secrets out of school, but I think it will help you to appreciate my principle of action in regard to getting employment for the blind if I go back now to my original class at Boston, and show you how I began getting employment for them. The name of my first pupil who was ready to go out was Reeves. He was a young Irish boy who came over to Boston when he was nine years old, and who became blind by sleeping in the moonlight as he crossed the Atlantic. He was one of the boys whom, as I have mentioned, I had selected. When he was ready to go I had been looking out for various places; in fact it is always a principle with me when I take a holiday, whatever village I go into, to find out everything that is going on there. I find out whether there is any possible chance of my placing there an organist or a pianoforte tuner or whatever it may be. I never wake up or go to sleep without having in my mind where I can find employment for my blind boys and girls. Now I had been the previous summer to Bangor, in Maine, and I had made up my mind that it was a wideawake town, and that it was all right. I went to Dr. Howe and I said to him: "Now, doctor, this boy is trained, but "the work is only half done. Here is one pupil that "I want to get employment for. If we say to him, 'Well, "'Thomas, we are very glad that you are so well pre-"'pared, and we shall be delighted to hear good things "'of you, be sure you write and tell us how you get on,' "and do nothing more, it is nine chances to one that "he will fail. What we must do is to give him the "benefit of the influences of this institution. Here is an "influential board of directors; here is the governor of "the commonwealth who is nominally at the head of "the institution; here is the great influence which you "yourself can bring to bear. We must establish this "boy, we must have a certain amount of money, and "we must really start him." The doctor said: "I have "no money, either public or private, which I can use "in such a way." The fact is that the doctor refused to help me in the business. I then went to a friend of mine, an English gentlemen, a Mr. Lyman, and told him what I wanted. He very cordially said: "Well, I "believe you are right; I believe it is the right prin-"ciple, and at any rate if you will undertake it I will "share half the loss if there is any loss. Try and see if "you can start your young man." I wrote to my friend at Bangor, and I received a reply to this effect: "My "dear sir, we have only so many thousand people "here" (it is not a very large place, about half as large as Leicester), "and we have 16 music teachers here "already. I advise you to go to some small place "where a blind teacher would not have to encounter "competition, and where he would have a much better "chance of success." I wrote back to say that the very fact that there were 16 teachers there showed that there was a good deal of teaching, and that we were coming and expected to get our share of it. Consequently we arrived at Bangor, and I had a letter of introduction to Mr. Hamlyn, who was Vice-President under President Lincoln's first administration, and letters of introduction to a number of other people. My friend who had written to me first in regard to the number of teachers that there were in Bangor, and pointed out that there was such competition and advised us to go elsewhere, called the next morning. There had been a very heavy snowstorm, and he came in while we were at breakfast at the hotel, and he said to me, "What can I do for you?" "I want you to go "with me to the mayor." "To the mayor," he said, "the mayor does not know anything about music." "Never mind," said I, "you do not mind going with "me to the mayor and introducing me to him." "Certainly not," was the reply. We called on the mayor, whose name was Dale, and he said, "What can "I do for you?" I said, "Mr. Dale, I want to get you "to give a party, and to invite my young friend Reeves "and myself to come to it, and to invite also as many "of your influential ladies and gentlemen of the place "as you possibly can, and let me see what can be "done." The mayor agreed. I said, "We will play "and do a variety of things, and towards the latter "part of the evening I want you to ask me to ex-"plain how a blind man can teach seeing children "music." He had the party, and I did explain the whole subject; and I at once got a committee appointed, a very influential committee, of which Mr. Hamlyn was the chairman, to arrange for a large public meeting. Mr. Hamlyn wanted me to take a small hall that would seat about 150 people, but greatly against his wish I insisted upon taking the largest hall there was in Bangor, which seated about 1,500 people. Then I got the invitations out in the hands of 40 ladies, and of course I kept those ladies going, and when Mr. Hamlyn came to the hall the place was so full that he could not get in at the door, and he had to come in at the artistes' door, and we gave him an armchair on the platform near the piano. The sixteen music teachers that there were in Bangor were all seated in front to see what these innovators were going to propose. We gave a very spirited performance, in which I myself took part. We played on two pianos, and Reeves played the organ, and I showed how he could teach, and I explained the different theories, and then I said, "Now if any lady or "gentleman here have any children who are willing to "be taught, and to try an experiment for three months, "we are quite prepared to take such children on this "condition: that if you are not thoroughly satisfied at "the end of the three months with the manner in which "the instruction has been given, and with its results, "there shall be no charge whatever; but if it is satis-"factory the charge is to be so-and-so;" and I named a price entirely above that of every teacher in Bangor. Before I left the platform I had all the teaching that I wanted for that young man. He began with a very large class, and within less than six months nine out of the 16 teachers in that very place were taking lessons of him, and in that first year he earned 1,200 dollars. He remained there until I went abroad for my health, and then I got him to come to Boston to take my place, and as I remained abroad he became permanent director of the musical department of the blind institution at Boston, and he holds that position to-day.

Adjourned to Wednesday next, at 12 o'clock.

32, Abingdon Street, Westminster.

Wednesday, 12th May 1886.

PRESENT:

LORD EGERTON OF TATTON IN THE CHAIR.

ADMIRAL SIR E. SOTHEBY, K.C.B.
W. TINDAL ROBERTSON, ESQ., M.D.
B. ST. JOHN ACKERS, ESQ.
T. R. ARMITAGE, ESQ., M.D.
F. J. CAMPBELL, ESQ., LL.D.
E. C. JOHNSON, ESQ.

CHARLES E. D. BLACK, ESQ., *Secretary.*

F. J. CAMPBELL, ESQ., LL.D. (a member of the Commission), further examined.

F. J. Campbell, Esq., LL.D

12 May 1886.

10,559. (*Chairman.*) Before going into the foundation and constitution of the college at Norwood, are there any other points bearing on general questions that you would like to say anything about?—First, in regard to my own experience, of which we were speaking the other day, I think it might interest the Commission to know that I went to Germany expressly to give myself a very broad culture for musical training. I studied at the Conservatoires of Berlin and Leipsic, with Küllak and Tausig. That is all that I want to say in regard to that. But now there is one other point to which, if you lordship will allow me, I will refer, because it is one of the greatest difficulties that underlies our whole work; and I come to it with some diffidence because I think that among many of those engaged in work for the blind the extent of the evil is not appreciated. I refer to the habit of self-abuse among the blind as a class. It is very general, and is working very great evil; and I am sorry to say that judging from the pupils that I have had from many of the different schools throughout the country it is very general. I have had pupils from Scotland and Ireland, England and Wales, and the great majority of them are subject to the habit of self-abuse. And this leads to more failures than any other cause we have had to do with, than all other causes put together; and I am simply referring to it now, because you will be better able to appreciate by-and-bye why we lay such stress upon certain points at the Normal College, in consequence of appreciating this enormous evil, and the importance of knowing how to deal with it. My opinion is that it is due to the fact that blind children are left so much to themselves, and do not have so much to occupy them as seeing children. A seeing child runs and chases a hoop and does many things, but blind children are left very much to themselves; and they are more likely to fall into this dreadful habit than seeing children. My great reason for urging upon our Committee that we should have a primary school, was that we should get the children before they had learned this dreadful habit; but to my utter horror, when we opened our primary school with 32 children, the large majority of these 32 children already had this habit of self-abuse.

10,560. What age were they?—They came to us from the ages of 8 to 10, some of them at 11. I had one very striking case; a little girl only eight years old was very subject to this habit. I only wanted to refer to that subject here, because perhaps, by-and-by, when you are examining me on different arrangements of the college, you will see why we place so much stress upon certain points.

10,561. Is it on those grounds especially that you advocate the physical exercise of the blind as strongly as you do?—That is the foundation. We are trying to overcome this evil, and it is useless without that aid. There is no amount of punishment or discipline that will ever enable a child to overcome this habit in my opinion; you must assist them by physical means, and moral influence. It is by personal effort mainly that I have hope of reaching them; and we also treat them medically. There is just one point I should like to mention while on this subject. I am not at all clear that it ought to go in as a statement, because I do not want to make any statement with regard to any particular school; it is a common evil which we all want to unite to overcome; but I know that in some of the blind schools where they have both workmen and children, and where the children are allowed to intermingle with the workmen, the children are often taught these habits by the blind workmen; I know this to be so in a number of cases.

10,562. You mean in institutions where there are grown up blind persons and young ones together?—Yes, they have sometimes a work department and a school department combined, and the children often intermingle very much with the workmen. Now, within a fortnight I have been to examine a blind school (I am an examiner for several of the schools), and when I went out to see the children at play the only little playground they had was not much larger than this room, and the workmen were crossing this little yard and intermingling with the children in various ways. One of the worst cases I ever had to deal with came from a blind school in the country. I talked with the boy until I had his confidence, and he told me everything. We had him treated medically, and did everything we could to save him. I think if the Commission could make any recommendation to cause the separation of the work department and the educational department, we should do a great service to the young blind. That is the only point I want to impress upon your lordship.

10,563. Do you think it would be possible for the blind and the deaf and dumb to mix together with advantage rather than that the blind should be kept entirely apart?—I think the blind have much greater differences between themselves and the deaf and dumb than there are between the blind and the seeing, or the deaf and dumb and the seeing; and I think that where we have a defective class it is a very great mistake to take another class with a great defect, and put the two together.

10,564. I suppose it would not be possible to teach seeing children and blind children all together in the same class, would it?—With arrangements, with proper plant it could be done.

10,565. It has been done, I understand, at Glasgow, but after a certain amount of preparatory training in the first instance, I suppose?—I think the best illustration is the London School Board; it is better here than it is in Glasgow. The arrangements in the London School Board are the best that have been contrived in my opinion; at least the London School Board has attained most excellent results with young children.

10,566. And the teachers in the London School Board have, all of them, been trained in your institution, have they not?—Yes.

10,567. Would you now tell us what is the object you had in view in recommending the formation of, and assisting in founding, this Normal College. I gather from your published report that you have a preparatory school, a grammar and high school, a technical school, and an academy of music?—Yes.

10,568. Would you tell us how you work those different branches together in one institution; would you give us the general policy of your institution and the ways by which you are able to make the teachers in one class useful in the other classes, so as all to work harmoniously together?—The great advantage in having a preparatory school in connexion with the college is that it affords us a most excellent opportunity to give experience to our blind teachers whom we are preparing to go out. We give them experience in teaching in connexion with the teachers in the preparatory school. Our plan is this: each teacher in the primary school has a

certain number of teachers who come down to the class. Pupil teachers you would call them, that is your expression, I think.

10,569. That is to say the older pupils, in fact?—The last year of their school career we give the older pupils before they go out for teaching a year in what we term our preparatory teaching department. Suppose we take any teacher, Miss A.; I give her two classes to teach, one in one room and the other in another. She has under her a pupil teacher, she will spend a certain amount of time laying out the work of one class, and then she leaves the pupil teacher with that class, while she, herself, goes to the other class. She gives the pupil teachers the experience they need in the management of the classes and developing them, and then she has these pupil teachers to prepare if they are not already prepared. They often have to review the lessons they are to give; so that in that way we get a very great advantage so far as the older pupils are concerned. So far as the younger pupils are concerned, these primary children we have them every day up to the college whenever we have anything that is suitable for them, for instance, if we have a fine performance of music, and I do have such performances and the first artistes that come to London, for instance, Hans von Bülow, Saint Saens, Pachmann, Guilmant, Madame Schumann, and Madame Menter. I have them come down to play, sing, and lecture in the school. Whenever it is suitable, whenever it is anything that would benefit these children they enjoy the advantage. They breathe in with the rest the general spirit of progress, and information which they derive from it, so that I believe it is a mutual advantage. Without building a separate gymnasium for these primary children, there are certain hours in the day when our gymnasium is not used for the older pupils, and we arrange that the primary pupils shall have it then. Our playground has been planned so that there is a separate part for pupils of different ages; when the young men are out they are not out with these children, and the children are not allowed to go into that part of the ground which specially belongs to the young men. Then in regard to the technical school there is a very important consideration. To make a good pianoforte tuner you must do very much more than teaching him simply to manage his tuning hammer. If we only put them to tuning a piano we would fail probably in two-thirds of all the cases we take, because many of them come to us without any cultivation whatever. They have no ear, perhaps, I have had them not able to sing a scale; and yet after we have put them in our musical atmosphere for a year they are ready to move on and do succeed. We do this by giving great attention to singing. We specially make our pupils in the technical school, that is the pianoforte tuners, give great attention to singing, and singing in the best way. I mean we teach them to discriminate between good and bad tones, we teach them to make a good tone, and that educates their ear, so that when they become efficient pianoforte tuners they will do it in the best and most efficient way. The fact of having this technical school in connexion with the college gives the opportunity of affording them this cultivation without a special staff for the purpose.

10,570. Then it is not by any means an accurate view of your institution if the public imagine that music is the only or principal thing taught there?—By no means.

10,571. Music is laid on a foundation of the best general education?—Yes; music in its various branches, I consider, to afford the best employment for the blind; but at the same time music without a very excellent training as a foundation, I mean general education and physical training, is almost worthless to the blind. And there I believe I may say is where many schools for the blind have failed to make music a success; they have given too much time to the music without the general culture which is necessary to make music a success.

10,572. By "worthless" you mean worthless as a profession?—Yes. Of course you may learn music, and it may give you pleasure; you may sing a song or play the piano or organ and it may give you pleasure; but if a blind man is going to use it as a profession he must have something more than the mere music.

10,573. What is your regular course of instruction. As I understand, what you call the complete college course is six years, but at the end of four years they will have gone through the ordinary education. If that is the case then with regard to the remaining two years, is there a special scientific musical training, or is that not given to all?—At the end of the four years we expect to divide them; I mean to say those who wish to attain a higher general education. Some of them want a classical education. Those who wish to go in that line give much more time to scientific subjects, and those who intend to make music a profession very much restrict or, perhaps, give up their general education altogether.

F. J. Campbell Esq. LL.D.

12 May 1886.

10,574. What do you mean by a "scientific" training, scientific in music or general science?—I mean in general education. We have two young men now who are very ambitious to take a university course. We have had a number come to us who intended to take a university course, but by the time they have been with us for four years the large majority of them, I think I am safe in saying 95 out of 100, decide to go in for music rather than take any higher course in literature.

10,575. Could you furnish the Commission with the after career of all the pupils whom you have passed through the college, that is to say, how many have gone out as teachers, how many as tuners, how many have failed to earn their livelihood, and how many have succeeded in different branches. Have you anything like a record of those things kept at the college?—I can give you full particulars. I began preparing a paper but I have not finished it. If you will allow me I will send you that paper; it is not completed yet.

10,576. That is a statement which would be very valuable as an appendix. I have got before me here one that has been sent to me from Glasgow, of the number of pupils sent to the college for the blind at Norwood by the Glasgow Scholarships Committee, from 1872 to the present date. I have before me the names of 27 who have been sent to Norwood?—Of that 27, five did not take a course of training.

10,577. I see here that five of them have been recalled for general incapacity?—For want of health, inclination, and other reasons.

10,578. For various causes?—For various causes.

10,579. I do not mean "incapacity" in an offensive sense, but from various causes they were unable to stay?—Yes. Of the five, one was sent away for misconduct; one was only with me a short time, did not enter on regular work, she was homesick, and did not wish to remain; one had fits and became partly paralysed; one was only a child, was very helpless, and it was thought better his parents should teach him at home for a time; one for special reasons completed his training with one of our old pupils.

10,580. Still of course they must be considered as having been selected for the purpose of having a training and for some cause or other having failed. There must be black sheep and failures in every class?—I cannot admit that they are failures as subjects who have been trained in the Normal College; they did not have a course of training sufficient to make them self-sustaining, and the higher education of the blind can can only be truly tested by considering those who have been properly trained.

10,581. We must take that into consideration?—They had never been through a course of training in the college, in that sense they have not failed.

10,582. Taking those sent from Glasgow as a sample perhaps of the rest, I suppose I may take those as a fair sample or a good sample of those generally sent to you?—I think they are a fair sample.

10,583. Taking them I find that one is now studying at Glasgow University; 11 of them are getting their livelihood in various ways; as to two there is no information about them?—With regard to those two you have not got information about, one of them is one of the teachers under the London School Board at the present moment, one of the best successes we ever sent out.

10,584. Is that Eliza Mayne?—Yes.

10,585. So that is 12 out of 13, about one half of the whole are now earning their livelihood as teachers in various ways, teachers of music and tuners and in various ways connected with music?—No, I cannot admit one half.

10,586. It is 13 out of 27, then I have deducted of course five; that is 13 out of 22. I have got the figures before me, and I only say there are 13 out of the 27 who are not what I described?—Out of the 27 names which you have before you five, as I have explained, cannot be considered persons who have been trained in the college; five are still under

F. J. Campbell, Esq., Lt.D.

12 May 1886.

instruction. Of the remaining 17, two are deceased, and of one we have lost all trace; he was formerly a successful pianoforte tuner; one is in Glasgow University. The remaining 13 can all be accounted for, and can all give a good account of themselves, except one; she has been teaching in an orphan school, where she had her board and clothes for her services. Of course we must not acknowledge failures that we never had; I mean to say we can only acknowledge a failure where we have had a fair opportunity of training them.

10,587. You must be given that hypothesis, that you get suitable subjects?—If we had taken a bad subject and kept the person and trained him, and he had then failed, I should call that a failure. One little boy is about 11 years old at this moment, and he was only sent to us for a few months, and I reported to the committee that his parents could teach him better at home; he could not dress himself or feed himself. That child is at home now. That cannot be put down as a failure to the Normal College.

10,588. The five that you say were not selected by you were Grace Ewing, Jennie Jack, James Macdonald, Charles Brown, and George McCulloch?—I knew something of all these children, but they were sent for special reasons, because parties were interested in them, and we were glad to see if it was possible to do anything for them.

10,589. James Macdonald was subject to epileptic fits?—He was discontinued by medical advice.

10,590. Charles Brown is now in a board school?—I think he is in a board school at present. He is a young boy; and when they sent him to us he could not dress himself, or do anything at all; and I insisted that his people at home, as he had parents in fairly good circumstances, ought to teach him. Then you come to George McCulloch; I selected that boy.

10,591. He is doing well as a tuner, is he not, now?—He came to us for a time, and for various reasons was unsatisfactory, and it was arranged that he went home, and was trained by one of our young men who had been through the college, and he is a success.

10,592. He is now a tuner?—He is now a tuner.

10,593. Now can you say, with regard to the advanced course of two years, what per-centage or how many of the pupils stay the whole time, the six years or longer?—I could not answer that off hand.

10,594. Could you tell us, roughly speaking?—Very few ever go through the higher literary course, but a large number aim at the higher musical course.

10,595. What per-centage stay six years, remaining for the high musical course all those who wish to be teachers in music, I suppose?—Yes, all those who wish to be teachers or organists. Those who merely aim at pianoforte tuning get through in three to five years, the average is about four, and often we can make a pianoforte tuner in a much shorter time; we have accomplished it in two years, but that is exceptional; three years is the time that we think the shortest that it can be done in.

10,596. Now do you teach them any other language besides English?—We give special attention to French and German, and certain of them learn Italian; that is in connexion with the singing. If they are going to teach singing especially, that is of great use to them. You heard a class the other day in French.

10,597. What number of pupils have you had from other colleges, say from Henshaw at Manchester?—I could not answer immediately, but I think we have had seven or eight from Manchester.

10,598. I rather want to ask you how, how do you find them trained when they come to you?—In several of the schools very good general instruction is given; for instance, York, St. John's Wood, Birmingham, Edinburgh, Glasgow, and now Manchester has improved very much to what it was formerly; formerly they were not so good. In those the elements of an English education are well laid, and that is good. So far as the musical instruction is concerned (and I say this with great regret) it is very bad, as a rule.

10,599. You mean the grounding is not good?—The grounding is very bad, and as a rule the instruction which they have had is so bad that we never get them out of all the bad habits which they have formed, I mean their management of their hands and fingers; the training has been such that it is very difficult to undo it, and unless we get them young from some of the schools, we never entirely undo the effects of the bad instruction.

10,600. Then for musical purposes you prefer to have them practically untaught rather than that having acquired habits they should have to unlearn them?—I certainly do. I ought by way of explanation to say that most of the schools teach the organ better than they do the piano. The organ often is not well taught, but it is better taught than the piano.

10,601. Has the playing of the organ been more generally resorted to by the blind than pianoforte playing?—It has. I think the very general feeling is that there is more chance of employment for an organist than for a pianoforte player.

10,602. I suppose there is not the same prejudice against employing a blind man in a church as there might be against employing a blind teacher to give instruction in general music lessons?—I think it is very much the same. I think it has been unfortunate in this country that so many organists have attempted to get positions who, though they may be very talented musically have been trained simply for the organ without the accompanying culture which would give them a chance of success; and I think that there is a very strong prejudice in the minds of many persons against the blind for that very reason. They often will say "Oh, yes, I know "they can play," but then they will urge various objections, and I think it will take some years to entirely overcome that difficulty. Our plan is to prepare our organists so thoroughly that we go in for the competitions wherever we see them advertised. Whenever we apply and put our candidate in with others (we shall put one in soon for an organist's position) he will have to take his chance and obtain the appointment if he can by his own merits. One of the greatest difficulties is the training of the choir and the training of the Sunday school children; they often want the Sunday school children taught by the organist, and it is often very difficult for a seeing person to understand how a blind person can do it. Now I have in my mind a very important position that we competed for about 15 months since in Scotland, at Alloa; as it was very important, when I found that the decision was coming on I took the night train, went to Alloa, and met the church committee and clergymen, and after two hours of illustrating how a blind man could train a choir and teach seeing children, they let him compete. They refused, absolutely, to let him compete in the first instance; but after thoroughly understanding that, with proper training, a blind man could do it, he was allowed to try, and he won the position and holds it to this day.

10,603. Now, with regard to lectures to pupils, what amount of instruction is given in that way; are there lectures given so many days a week and to the higher classes only?—It depends what the subject is. We have musical lectures, for instance, regularly; once a fortnight always. To-day I was to have had a special musical lecture at 2 o'clock, if I had not been here, and so on. Then we have lectures regularly in English literature; that goes on all the time. For instance we had a lecture on Monday night on Milton, and the previous one was Shakespeare.

10,604. How many of the pupils attend those lectures?—Large numbers; I should say out of the whole number, 130, all except the primary school. Then other lectures come in courses sometimes; it depends upon how I can arrange for them.

10,605. Are those lectures given to supplement the course of instruction, or are they given rather to stimulate the intellectual faculties of the pupils. I mean are they part of the course of instruction, and has any preparation to be made on the subject of the lecture, or are they, as I said before, supplementary?—It is both. For instance, one lecture on natural history is a part of our course, and it always comes in connexion with our object lessons. Mr. Wood, the naturalist, has given us a great many lectures on natural history; he works very nicely and kindly with our teachers. Then with regard to our course of literature, we are very fortunate in our lecturer, and we arrange our courses of reading (we have regular courses of reading with the pupils) so as to make them tally with his lectures. But then we often have independent courses of lectures that have nothing whatever to do with the course of instruction. For instance, I am going to have a lecture next week on John Knox; but that has nothing to do with our regular course.

10,606. You give the pupils the advantage of the Crystal Palace concerts, do you not?—It is a part of

our arrangements; we take about 150 pupils every Saturday during the concert season.

10,607. With regard to the training of the touch of the pupils you lay great stress upon that, do you not, by teaching them to model and to feel everything about which they are instructed?—Yes, for instance, in textures, in cloth, for one of our object lessons, I get silk in all stages from the cocoon to the different manufactured goods; we have samples of all these things, and in our object lessons the pupils are taught to choose their own clothes. Parents often ask us to get their clothes. Supposing I am going to get a dress for a girl, I make whoever attends to it absolutely submit the patterns to this girl to examine and give her all the details; it forms a lesson to her in regard to the value of the things.

10,608. In fact, in order to enable them to make their purchasers in after life with some degree of judgment—Yes, it is simply to educate their general faculties. Then also I ought to say that it is of the greatest importance, not only that we should distinguish letters, for instance, by the touch, or that we should have a delicate appreciation in the ends of the fingers, by manipulation of the fingers, but that we have the most suitable management of the wrists and joints of the fingers. That comes in in so many ways; it does in pianoforte tuning and pianoforte playing, and organ playing; and, therefore, I have so many contrivances to bring that about. For instance, exercise with Indian clubs is one of the very best exercises for pianoforte players. It may sound strange, but it really is one of the most useful things that they can do. There has been an invention within a year by Mr. Brotherhood, an Anglo-American. He has invented a wonderful machine called the Technicon, for the exercise of the hands and the fingers, and so forth, and I have already adopted it, and it is going to prove of great use to the blind. He is the gentleman who was coming to lecture to us at 2 o'clock this afternoon on the use of this machine.

10,609. Have any of your pupils been successful in modelling; have they shown any ability in the plastic art?—We have never carried it beyond the earlier stages, just during the childhood of our pupils; some of them get to make beautiful things, but we have never looked upon that as anything more than a cultivation, an education. There are those who do something more. I think Dr. Armitage will be able to tell you more about it in Paris; he will give you more particulars than I can.

10,610. Now with regard to the general question of the blind, could you give us your views with regard for instance to any of the cost of their education being borne by the State; is that in your opinion desirable?—I certainly think it is. The blind as a class, I regret to say, are a class of paupers. It is my class, and therefore I speak of it with great tenderness, but that has been our position for ages, that the blind have been looked upon as a class depending on charity. It is one of the greatest burdens which we have to bear. No one is to blame for it in my opinion; but the very fact that in London, the emporium of the world, such an enormous proportion of all the blind depend upon charitable relief shows, I think, that my statement is correct, that the blind as a class are a class depending upon charity. The great point is how can this be overcome? If the blind can be made a self-sustaining class then it must be the duty of any Government to look into it. Now then I should put it this way. The young blind are capable by suitable training and education of being made entirely self-sustaining. Of course there will be failures; let us imagine, for the sake of argument, that a third of them would be failures. Taking the young blind, of course I do not take idiots, but taking ordinary children, one with another, certainly I think two-thirds of them can be made self-sustaining by proper training and culture. I think that charitable help for the blind works badly for the blind in various ways. In the first place if their education is considered a charity, and not a part of the action of the State, it confirms the views of the public that the blind are a class dependent on charity. Now if we wish to make them a self-sustaining class, I think their education ought to be placed on a different footing, and that we ought, so far as possible, to lift the education and training of the blind out of the charitable atmosphere.

10,611. And do you think that the only way of doing that is by establishing at various centres in the country training colleges for the blind, perhaps not of so high a character as that at Norwood, but still working some-

what on the same lines?—I think if it were possible (of course you have asked me my opinion, and I must tell you what I believe is the best thing for the blind) for all the friends of the blind in this country to co-operate and work upon one general plan, and not simply have each committee, and each person who became interested wanting to make one special thing, but all going on the same line, then what I think we should do would be to have special schools which would give the very best training possible for certain classes. When I say "classes" I do not mean rich and poor, but I mean according to that which is best for the child's ability; and we would then send the children that would be adapted to it to that special place; and I would if I could have separate schools entirely for girls and boys. That would be my first division. And in the next place I would have them trained either in connexion with the school boards or in primary schools up to a certain point, up to a point where it would be determined with considerable accuracy what the child was going to be best adapted to. If it is suitable for such a training as we give at Norwood, then let it be sent to Norwood, or a similar institution. On the other hand it may be adapted for some other training. Some of the blind must always depend upon handicrafts; handicrafts must always occupy an important place in the treatment of the blind, not only with the adult blind, there are certain young blind who will grow up and never be fit to cope with other things, and they should have mechanical training for their employment afterwards; and if these children are trained properly in a preparatory school, and the use of their hands and fingers is carefully studied, and their physique is developed, they will then become far better mechanics than if we allow them to drift, and they fall into training just as it happens.

F. J. Campbell Esq., Lt.D.

12 May 1886.

10,612. Now would you prefer that the blind should be congregated together in considerable numbers in large institutions, or do you think that all over the country the blind might be gathered together in small centres, so as to form classes in some of the provisional board schools or other schools rather than bring them together in one large central institution?—I think both.

10,613. One as auxiliary to the other?—It depends upon what they are going to do. Supposing there is a certain blind child, boy or girl, who will be able to make music a profession, then music will with that child become the first thing. Proper musical instruction is very expensive, and that is why we are so often thought to be very extravagant at Norwood; we spend much upon our instruction; we have the best teachers we can possibly have. I mean to say that that is our first care, giving first-class instruction; it is very expensive, but by having a large establishment one works with the other, and you are able to make it less expensive. Then, more than all that, to make music successful you must have your students of music in a musical atmosphere. They must hear music; it is more essential with the blind than with others; it is utterly impossible for any blind person to commit all the music ever written to memory, but he can absolutely know it all if he is in such circumstances as will afford him opportunity. We have regular pianoforte recitals by our professors every week; it goes on year after year; and there is no pupil who goes through the whole course at Norwood who has not heard all the classical music ever written for the piano.

10,614. Do you think that the Government, the State, would be justified in incurring a considerable expense for the education, say, of the blind pauper children or those who are taken from the workhouses, or from the lowest class, in order to enable them to earn their livelihood. I only want to ask your opinion; I am of course not expressing an opinion myself?—I think the State cannot afford not to do it, and I will tell you why these children are the children of the nation, and the nation ought to afford to give its children the best practical education which they are capable of receiving. I mean from a practical point of view; I do not mean any superfluities. If you take a poor child it has to be sustained in the workhouse or elsewhere; if you estimate over a period of 40 or 50 years what that child will cost the State, it seems to me quite evident that it will be cheaper for the State, to say nothing of the humanity at all, to educate rather than pauperise.

10,615. It has been suggested for the deaf and dumb that 10*l.* a year would be a fair subsidy, taken all round, for children who would pass a certain standard, not according to the Education Code, but a certain standard

F. J. Campbell, Esq., Ll.D.

12 May 1886.

which might be fixed, and under proper Governmental inspection. Do you think that a higher figure than that would be required for the blind?—My belief is that there ought to be a regular scale on the principle of scholarships; and according to what the blind person was studying at the time, what he was doing at certain periods, it would cost much more than in the case of the others; and, according to circumstances, the Government ought to do more or less.

10,616. According to the ability rather of that child?—According to what they are doing. I mean to say that supposing a child should come to a school like our preparatory school, the Government ought to pay much less to assist it than that it should pay for that child four or five years later when it was taking a high course of musical training. It ought not to be one continuous rate, but the Government, I think, ought to pay in proportion to the advantages which the child receives

10,617. Do you think that the funds which are now spent on the blind are well and economically spent, both in public institutions and in pensions; or do you think that a re-arrangement of those funds would be desirable?—I believe that if the money spent for the blind were spent in the wisest way, the blind as a class would be 100 per cent. better off than they are at present.

10,618. You said that you think the money which is spent in pensions would be much better spent in instruction, to enable them to do without the necessity of having pensions?—I think I must give an explanation there. I should be sorry to be misunderstood. The old blind we must take care of, and God forbid that I should say a word to take a penny from any old blind man; but my view is that the public, rather than charitable funds, ought to take care of them in a kind and proper way; but still that is neither here nor there; I say that the old blind must be taken care of. Then the adult blind who are in middle life, and who can be trained to earn a part of their livelihood by the labour of their hands ought to be made to do it. Then when you come to the young blind, I am quite clear that the more we can spend on education, and the better the education is, the broader and more general the culture is, the more independent the blind man will become; and, I believe, that if we train the blind properly, beginning when they are young children, they will, as a class, be good, active and useful citizens, rather than a burden upon the public.

10,619. Then, in fact, the prime cost of the education of the blind is money well laid out, you think, by the State, because it prevents the blind person when he grows up being a burden on the community?—Yes, that is my opinion.

10,620. Have you considered whether any existing London charities would supply funds for these scholarships you were speaking of; have you any proposals to make with regard to that; it has been mentioned as desirable; of course, I do not mean that it can be done without an Act, but I want to know whether you have any scheme in your own mind for a re-arrangement of some of the London charities, especially with regard to scholarships?—If the managers of the charities could be brought to allow a certain sum of money for the blind, I think it would be of great use to establish scholarships.

10,621. Scholarships are what I wan to get your opinion upon, because that is a definite proposal?—By all means. I think they should have scholarships rather than give them large sums of money.

10,622. You mean that you would prefer the money being given in scholarships rather than the institutions being subsidised by a capital sum?—My belief is this, that institutions the moment they become rich get into ruts, and if you have scholarships which can be withdrawn whenever the instruction or work is not satisfactory, which depend upon the work done, the institution will be kept in a healthier state.

10,623. I should like to ask you some questions about the existing scholarships. You have now a considerable number of scholarships founded by the Gardner trustees, have you not?—We have.

10,624. Can you give us the number at the present time?——

10,625. Are these scholarships in music or musical instruction?—Not entirely, some of them are; some are for the technical school, some for the primary school; in fact some of them cannot be for music.

10,626. I see the guardians have in some cases found the scholarships, or have they given them annually?—It is when they have a blind person that they want trained. Perhaps that statement there may be misleading. It is rather difficult for me to know how to put it. I am often asked by the guardians what they shall do with a certain blind person in their charge. I see and examine the person and advise the guardians according to my best judgment. Of course the guardians never pay the whole, but they generally say, "We can do so much"; or if they ask me, I say, "If you can do so much we "will try to help you and raise the rest of the money."

10,627. I see some of the guardians subscribe 20*l.* and others only 10*l.*?—Yes, it depends upon what the pupils are doing, whether it is in the primary school or in the college.

10,628. If the guardians only give 10*l.* or 20*l.*, who pays for the remainder of the instruction; does it come out of the general funds of the college?—No; it is done by our great activity in various ways. For instance, if I may give you an illustration, we had an application for a pupil from Dartford. The guardians wrote to me about the case very earnestly. I told them to send him up and let me see him. The lad was sent up and I found he had been six years at St. George's; he could neither read nor write, he could not spell his own name, he did not know the multiplication table. He had been taught to make sash line and play the piccolo flute. There are various friends who always help; for instance, Mrs. Armitage. I wrote Mrs. Armitage all about this case, and after considering it fully, Mrs. Armitage offered to give three-fourths of the sum, if the guardians paid the other fourth and found the clothing. This was done. It was a difficult case; he was already 18 years of age. Our teachers regarded the case as hopeless, but I am glad to say that the young man is now employed in a good shop as a pianoforte tuner; he has a wage of 1*l.* per week, and engagements for singing. That happens to be a special case; and nearly all these cases are special.

10,629. Those which are described in this report, as open scholarships, are really not scholarships in the ordinary sense of the word, that is to say, a sum given to provide a certain maintenance year by year, but only a sum subscribed for the maintenance of a particular pupil during the time of his residence with you?—Yes; at the same time those scholarships often continue.

10,630. That is what I want to know; are there any that are promised for any definite number of years. For instance, take the Duke of Westminster or Lord Bute; are those which they give simply for the individual?—In the case of the Duke of Westminster it is not for individuals. When a pupil goes out who has been assisted by the Duke I inform him of the fact and report upon other cases, but the Duke's wish is, if there is one child poorer than another, poverty should have the preference. There is Mrs. Winkworth; she has four or five pupils out now earning their own living; and it still goes on. Dr. Armitage, as a rule, keeps something like half a dozen in the college.

10,631. The Gardner scholarships are the interest of capital which is granted for that purpose?—That goes on.

10,632. Are there examinations for those scholarships or are the holders of them selected by yourself?—No, there are examinations.

10,633. Open examinations?—Open.

10,634. Is there much competition for them, or are you able, generally, to take in all who apply?—No, we never are able to take all of them. There are always more than can be accommodated.

10,635. What qualifications do you require of those candidates; is it a requirement, that they should be able to read and write Braille with facility and correctness?—Not in the primary school.

10,636. Will you tell us what the qualifications are in the various grades. Perhaps it would be important to know, because unless they could read and write Braille they would be prevented from coming into the primary school as far as I understand from this report?—We say that that is a very great assistance; if they read and write Braille well, that goes far in their examination; that is a great preparation; but supposing we have 15 scholarships to give and 31 candidates, supposing that there are only seven that can read and write Braille, then eight more must be chosen out of the remainder who cannot read and write Braille.

F. J. Campbell Esq., Ll.D.

12 May 1886.

10,637. But have you an upper and a lower class of scholarships, that is to say, that you admit a certain number at the age which you mentioned, eight or ten (of course you would not expect them to be able to read and write Braille), and a certain number of older pupils?—There are three classes of scholarships: for the primary school, the technical school, and the college proper.

10,638. Then are there separate examinations for all those?—For all those.

10,639. Do you divide them equally between them, or in what proportion are these scholarships divided?—The Gardner trustees arrange that they give so much for scholarships for the technical school, so much for the primary school, and the remainder for the college proper.

10,640. Have you paid off any of your debts,—the mortgage on the college?—Not recently; it stands the same now as it has done for a number of years In one way we are in a different relation, because we have bought more property for which we have paid.

10,641. Then you are in a better position?—In a much better position. We have bought more houses and extra ground, and that is all paid for.

10,642. You have not increased the amount due?—No, we have not increased the amount due, but we have very much increased the value of our property.

10,643. I suppose the value of the buildings has increased since you came there?—When we came there there was only the one building where the domestic arrangements were, where you saw the kitchen, that is the old house, everything else on the property we built.

10,644. Have you a balance sheet showing the expenses of last year; have you anything later than 1884, which is the date of the report before me?—Our balance sheet is prepared, but it is not in print yet, it will be presented on the 22nd of June. I think very likely if your lordship wishes, in the first week in June, the committee will allow me to give them a copy of the balance sheet for the past year, but I would not like to say so without asking the committee. It is all prepared and passed by the auditor.

10,645. Can you give us the salaries of the different teachers?—We have so many classes of teachers; you mean now the school teachers, probably?

10,646. Yes. Beginning with the school teachers, I see educational salaries, 2,494*l.* in 1884; we should like to know how that is made up?—Our teachers vary in their salaries from 60*l.* to 100*l.*

10,647. We should like to have it in detail if you could give it to us?—I should not like to give it for 1884; I could give it you as it stands at this minute in the college, but not from memory.

10,648. We should like to have a statement showing the salaries of the different officers and teachers, everything in fact included in salaries?—That I will prepare.

10,649. Including your own salary. We should like to have a tabular statement of the whole?—Yes, you shall have the whole.

10,650. What is the cost you put down for each class of pupils?—35*l.* for the preparatory school, then 50*l.* for the next grade pupils under 13 years of age, and the highest is 60*l.* for pupils in the college. And I should like to have it understood also that we reckon in expenses our interest on our mortgage. Of course, if that mortgage was paid off our cost would be less.

10,651. Does that represent the actual cost of each class, as far as you can say?—Taking that as the average.

10,652. Including, you say, all the expenses with interest on mortgage?—We have never separated our expenses, we run them together. And, of course, there is this to be taken into consideration; we have been a growing institution, we vary so in our numbers that within the last five years it has been almost impossible to say just how it has been. It certainly is costing us less now than it did four years ago for pupils, and we have not estimated it with our present numbers, the exact cost per pupil, I mean.

10,653. Because, as I gather, your fees for pupils are supplemented largely by private subscriptions and donations, are they not?—I think if you will examine our balance sheet you will see that our private subscriptions and donations, except for special pupils, are very small. You see these things are for special pupils, so that our actual general fund is very small.

10,654. I see donations to the general fund, 6,573*l.*; does that go to a capital account?—That goes to special things. When our swimming bath was built, Dr. Armitage gave us 1,000 guineas to build that swimming bath, and things in connexion with it.

10,655. Some go to capital, and some to the current account?—I do not think you could separate it according to that statement in the report.

10,656. Do you keep your teachers for a considerable time, or do you have to make many changes?—Some of our teachers we have had with us 10 years; others we have had since last October. Of those we have had since last October three will leave us at the end of the present term; that is a secret, however; we are obliged to give them three months' notice, and our year ends the 1st of October and we shall give them notice the 1st of July.

10,657. And do you always select your teachers in America, or how do you get them?—It depends what we want the teachers for.

10,658. I should like to ask you about that, because the Commission observed that there were a large number of Americans there. Perhaps you will tell us for what reason you select them?—For the same grade of teachers I believe we get a better grade of teachers from those prepared in the American schools than in England. It is changing very much, and doubtless we will now begin to have more English teachers in our school department. But there is this, when we want teachers of the grade of our lady teachers at Norwood, if we get them from England those teachers will want far more waiting upon, and they will do far less than the American teachers. The American teacher never stops to think whether it is somebody else's businesss or whether she must ring the bell for the servant. Supposing a boy comes in with dirty hands she is ready to go for soap and water and attend to him then and there, or whatever the case may be; you will see the thing over and over again. Whereas if it was an English teacher I think she would be much more likely to ring for a servant to attend to it. On the general principle I think we get far more help from the teachers outside the schoolroom than we would otherwise. Much of our work has to be individual. I can go into a schoolroom and the moment I hear a teacher giving a lesson, I can say, "That teacher knows how to "teach this subject"; but I cannot tell what the outside influence of that teacher will be. Perhaps I get a very naughty child, boy or girl; I may try to influence that boy or girl, I fail; then I go to Miss A. or B. or F., I can generally tell which the child would be suited to, I go to Miss B. and say, "Here is a boy you can do "so and so," and she will make a special thing of it and look after that boy and trace it out. In that way I think I get far greater personality from our teachers than if we took them from the ordinary run of teachers. It is only a certain grade of teachers you will find in our school that are Americans.

10,659. You never select by competition?—No.

10,660. You act upon your own responsibility and make your own selection?—We make our own selection entirely. I have not the power of appointing the teachers myself.

10,661. But I suppose you submit their names?—Yes; I nominate the teachers and the committee elect them; that is our rule.

10,662. I suppose that up to a late period the teaching of the blind in England was inferior to what it ought to be, is that your opinion?—I think it is very inferior at the present moment to what it ought to be.

10,663. And you look upon your institution as a means of training teachers for the blind?—Our great hope has been in regard to the Normal College that it would be a centre of activity, which would not only influence the blind themselves but the friends of the blind, would call out a higher conception of what the blind could do. Our great hope has been, not only to affect the pupils that come inside the Normal College, but to affect the administration of the whole of the blind throughout the country. We have regarded it as a model to bring about a complete revolution in the treatment of the young blind throughout the country.

10,664. (*Admiral Sir E. Sotheby.*) I did not exactly understand about the instructors. In the upper school does the same instructor take the same pupils up right through the school or merely teach one?—The

F. J. Campbell, Esq., LL.D.

12 May 1886.

instructors have their classes assigned without any reference to any special class; I mean the same teachers may teach in different grades; all the time may not be spent upon one grade. For instance, suppose I have a good teacher of mathematics, I use that teacher in teaching in the various grades, rather than giving him two or three classes in other subjects which he will not teach well.

10,665. Would that teacher in mathematics take the pupil up through all the different grades of mathematics?—There is no rule.

10,666. Then a pupil might go from one instructor to another in mathematics?—It might be so.

10,667. There is one school which you call a technical school; is that entirely for music?—On the contrary it is not for music as a profession. It applies to all the mechanical things in connexion with pianoforte tuning and repairing. We have regular shops there, and we have a thorough mechanical training for the hands and fingers and so on.

10,668. But would you not put that under the head of music?—No, it is a branch of course of music; but still, supposing you go to Broadwood's and find a man who tunes a piano, you do not call him a musician.

10,669. No, but he must understand something of music?—Yes certainly; but in studying music, if you study it for a profession, you understand it very differently from what you do in the case of a man who simply studies it in order to be a pianoforte tuner.

10,670. Do you consider that your college is a college for general education, or is it one for music, or both?—I consider it is for both.

10,671. Why is it called the Royal College of Music?—It is not. It is called the Royal Normal College and Academy of Music for the Blind. That word "Normal" means, you know, a place where we prepare teachers.

10,672. You propose to send, or have sent, some pupils up to the universities, have you not; did you not say so?—No, the question was not asked. I said that we had two young men who were preparing.

10,673. (*Chairman.*) You said that your pupils might go, but that they did not go?—As a rule they do not go. We have two young men now who are feeling very ambitious about it.

10,674. (*Admiral Sir E. Sotheby.*) Mr. Campbell has told us that on an average two pupils are sent from the Glasgow Institution to your college; out of how many are those two selected?—In the first place there are not two every year; it just depends upon what vacancies occur. He said on an average there have been so many; this year there have not been any sent at all, because it was all full. In October there will probably be three sent.

10,675. The last time there were pupils sent how many were there?—I cannot say; I was not in Glasgow at all. As I said the pupil that was sent was Charles Brown, he was sent down by the committee to me because they thought he had great musical talent; but when we got him we found he could not dress himself or feed himself. We were quite willing to teach him, but he made so little exertion that I wrote to the committee that it did seem a pity to pay so much money when the child had parents who could teach him at home; and I recommended that he should be sent to the school board at Glasgow, and that they should train him to a certain extent before he came to us.

10,676. When you have gone down there out of how many have you made a selection?—It varies. Sometimes there have been a very few, sometimes a large number. I remember the first time I went down they had to send 10. I should think they had 100 pupils first and last; they had all those that were under instruction in the institution, the school board at Glasgow and Greenock, and other children who were taught by the Out-door Mission. The scholarships are open to all the blind of Scotland, and everyone can apply if they like.

10,677. But you make your selection, do you not, independent of the scholarships?—They give notice to the blind that there are a certain number of scholarships to given; all can compete for them, and all who apply, whether bright or not bright, are examined.

10,678. And why do you go down there?—Because the committee ask me.

10,679. It is with the desire to make a selection?—I go down to make an examination of these pupils, and report to them. I make an examination of all the children that they have to be examined far and wide, and then I make a report to the scholarship committee, and they have the power of choosing who it shall be.

10,680. They go by your recommendation?—I mark all these pupils and what they know, and what they are. The idea is simply this: that they wish to create a desire among the blind of Scotland to improve, and by having these open scholarships, which any of them may attain to, they work harder to improve. I am the honorary musical examiner of the Glasgow school. I go down once or twice a year to examine the school for the committee of the Glasgow school, independent of the scholarship committee. I shall be going there in a short time.

10,681. Are the lectures purely voluntary at your college?—Voluntary on whose part do you mean?

10,682. Do the pupils go or not, as they think proper?—We never have anything in that way in the college.

10,683. The pupils are obliged to go to attend the lectures?—I do not require every pupil to attend every lecture, but if a pupil is entered to attend a lecture, he certainly does, or else he must give a reason for not doing so.

10,684. After your teachers leave do you know what becomes of them at all; you say that several teachers will leave soon. Are they going to be teachers elsewhere, do you know?—They are entirely independent people, they go and do what they like, we have nothing to do with them.

10,685. And how many teachers have you sent to the board school?—Five to the London School Board; we have sent one to the Bradford School Board, and also one to the Cardiff, beside these.

10,686. Have you any blind teachers at all?—We have several blind teachers. Now, for instance, in the technical school we have three people employed, one is a sighted man, two are blind.

10,687. And you find it an advantage, on account of their knowledge of the touch, to employ blind teachers?—It just depends upon what a man is, he may be a blind man or a sighted man. I mean, whether a man can see or whether he is blind, if he has the qualifications of a good teacher then they will come out. We do not employ him simply because he is a blind man, but because he is able to do the work that we want.

10,688. Have you any corporal punishment amongst the boys?—Very seldom.

10,689. Do you consider that you can get on without it?—We try very hard to. We do not allow any corporal punishment whatever by the teachers. That only occurred once, and it was a serious business then. A boy must be reported, and it is a very serious business if a boy has to be reported. I do not remember when the last time was, it was so long ago, and I hope it will be a long time before another is punished by corporal punishment.

10,690. You have mentioned that there has been a great deal of juvenile crime; have you discharged any boy in consequence?—I do not want to admit "a great "deal of juvenile crime;" I said a great deal of juvenile self-abuse.

10,691. That is crime, is it not?—No; the children were innocent, but they have fallen into a dreadful habit. Many of them are anxious to overcome it when they understand it.

10,692. You have not discharged any in consequence?—Some have been so hopeless that we had to give them up.

10,693. You have not stated what the nature of Divine Service is in your college; how is Divine Service carried on?—Do you refer to the services on Sunday?

10,694. Yes?—We have not any whatever. We have all our pupils go to whatever place of worship their parents select, and we take them. We see that they do attend the church or chapel that their parents select. We are a purely non-sectarian school, and any parent can choose where his child shall go to worship; but, on the other hand, we require that all the pupils shall attend at our morning and evening services, which are simply what you call family prayers.

10,695. And is the Bible taught in any way?—We have what we call Bible lessons. We have Sunday school ourselves, for it is difficult for many of them to get to Sunday schools; but any parents who prefer can make their own arrangements to have them go for special instruction in connexion with the religious society to which they belong.

F. J. Campbell Esq., LL.D.

12 May 1886.

10,696. Then you allow these children to go out on Sundays to the different places of worship that their parents belong to?—We not only allow them, but require them.

10,697. Do they all go?—All, every one.

10,698. Under what supervision?—Under the supervision of a teacher or some official in connexion with the place.

10,699. Have you any Scriptural classes during the week?—No, not during the week.

10,700. And there is no minister of any persuasion who comes in to give any lecture or any instruction?—Not as specific instruction; I mean to say we do not have any clergyman come in for that purpose.

10,701. Would you decline if anyone appeared?—It would depend upon how it was. If he wanted to come and deliver a sermon or lecture, and if it could be arranged, provided we felt that he was a man who would do our people good, we should be glad to have him.

10,702. How do you obtain your provisions, by contract or by open competition?—Both. Some of the things we have by contract or by purchase in the ordinary way, and for some of the things we send direct to the London market.

10,703. How was money procured to make the purchase of land which you lately purchased, by donations or by loan?—By getting people to give the money.

10,704. You obtained it in that way?—Yes; and from money which we had had given us but which we had been keeping in reserve for such a purpose.

10,705. Do you know what becomes of your pupils when they leave?—Yes.

10,706. All?—Everyone.

10,707. Do you procure situations for them?—When we possibly can. I make it a principal portion of my business.

10,708. What is the proportion of those who do not obtain any employment?—Of those who go through the course of training and complete their certificates certainly four-fifths get employment, and I think the proportion is larger.

10,709. And you do not know what becomes of the other fifth, 20 per cent.?—Yes, I think I do. I keep up my interest in them as long as I can. All the pupils that have been at the college I know where they are; I have some in Tasmania, Australia, India, Canada, and all parts of the United Kingdom.

10,710. Are there any of them that do not get employment?—I know generally where they are.

10,711. Do they ever go on the streets?—I know one who came to us from another institution and who went from us to go on the streets; he disliked our hard work and said he would rather play the accordion. He was only with us a few weeks. Another boy who was expelled for theft plays an accordion; he left as a boy. A little girl who had epileptic fits and was afterwards trained by her father is begging.

10,712. As to those that you get employment for as musicians, or otherwise, do you provide them with instruments or money to purchase them?—No.

10,713. Has that been mooted?—Do you mean provide them with pianos?

10,714. Or something towards buying a piano; do you assist them?—We often, as individuals, but not as a committee, do assist them in getting pianos; and we always in someway or other, provide them with the necessary tuning implements; for instance, if a pianoforte tuner is going out, we see that he is provided at the start, and if possible we know where and how he is going to start.

11,715. You do not provide them unless you find that he has got an opportunity of getting employment?—We do not as a college. From the funds of the college we do not vote any money whatever for this purpose. I mean to say that we have, perhaps I may call them reserve things, which we do individually, and in that way we get them started. For instance, if a deserving boy, perhaps we give him, as a prize, his pianoforte tuning outfit; it cost about 35s. to 50s.

10,716. You say that the Gardner trustees give scholarships to the amount of 3,000*l.* a year towards your college?—I think it is more than that. I was not asked the question, so I did not answer it, but it is in print there.

10,717. Do you consider the lower classes are more suited to gain a livelihood by handicraft or by music?—My opinion is that because a boy or girl is born in the lower classes it does not necessarily follow that he or she should work at a handicraft, if educated and trained for other things. Our best pupils, our most successful musicians, are absolutely of the very poorest classes.

10,718. But then you make a point of their learning music; every pupil is obliged to learn music?—No.

10,719. What proportion learn music?—A very large majority. For instance, you were there the other day; that young lady who sang is a very successful singer, and a beautiful teacher; she was a poor miserable little creature from a workhouse.

10,720. And you cannot answer the question whether you think that the lower classes are more suited to gain their livelihood by a handicraft or by music?—I think if the young blind are well trained the large majority of them can do better than working at handicrafts.

10,721. But you say many are obliged to work at handicrafts, do you not?—Yes.

10,722. Is that a large number of the blind, do you think?—If we take the blind, as a whole, there are a very large number of young blind persons. What I say is that I believe the majority of them, if properly trained, can do something better than working at a handicraft.

10,723. Are the salaries of your teachers increased as they remain on, from time to time, or have you got a regular fixed salary for them?—Within the last year we have adopted this plan: after a teacher has stayed so long we increase his salary by 5*l.*, and in the following year another 5*l.*

10,724. Then 100*l.* is the maximum?—100*l.* is the maximum.

10,725. (*Dr. Robertson.*) With reference to the last question but one or two, I presume that you would take it in this way, that if any of the lower classes showed a decided taste and preference and capacity for music, you think they are quite as fit as any other persons in any of the higher classes to be taught music?—I think there is as much talent and ability in the lower classes naturally as in others. I know there is something in hereditary influences which are very valuable; but so far as the blind are concerned, my belief is that if the very poorest are taken at the proper time, (by that I mean at the proper age,) and are put under proper influences, they stand just as good a chance to succeed in other ways than handicrafts as other classes.

10,726. But I mean in your selection, if you had to select between music and handicraft, you would not make it so much a matter as to whether they belonged to a particular class, but whether they had capacity for either one or the other?—We would not consider what the class is from which they came at all.

10,727. Would you briefly tell us what is the curriculum as regards the three grades you have in the school?—The full curriculum is given in print.

10,728. That will be sufficient. Then, with regard to the State aid which the Chairman asked you about, I suppose you would not say that you would take State aid for educating these poorer people to a very high class position in music; that is to say, you would not take a large amount of money from the State in order to educate a poor child to a high position as musical professor, or anything of that kind?—My belief is that the State will be better off if she raises her very poor children to as high position as she can.

10,729. But I mean you would not, I presume, go beyond a certain amount to do that; what amount would you limit yourself to with regard to State aid?—As I say, my plan would be to have a system of scholarships, and that the State should give a certain proportion, and that that should be increased as the pupil went up through a regular training. I should want that training to be sufficient to prepare the pupil for self-independence. After the pupil has got to that, I think the Government has done all they ought for him; but the instruction during that time ought to be the very best; and, as the cost of instruction increases as the education continues, the scholarships ought to be more in proportion.

10,730. But you would not, I suppose, expect that the State would give anything like the amount which is

F. J. Campbell, Esq., LL.D.

12 May 1886.

required, that you could have 60*l.* a year or anything like that?—Other Governments do.

10,731. I want to know what is your opinion on the point?—I put it very strongly that my opinion is that these children are the children of the nation, and that their education is due from the nation. I believe that other Governments are right; I believe that the French and American Governments, for instance, are right.

10,732. That is to say, that is your idea, not only with regard to your particular college, but with regard to education generally?—I did not apply it to our college at all; I was simply answering in a general sense.

10,733. And not with regard to the blind only?—Yes, I am speaking with reference to the blind.

10,734. Would you apply the same with regard to the public generally?—I believe that the so-called helpless classes, the defective classes, are far more helpless, and require the help of the Government far more than other classes. I think that the other classes do have their education, they are educated at the public expense.

10,735. To a limited extent?—After all it is growing more and more. I know there is a nominal fee, but even that can be forgiven. If parents can show that they are not able to pay it it is remitted. My belief is this, that the State ought to pay enough to educate a blind child on an equal footing with seeing children. When they have done that they have done their whole duty.

10,736. (*Mr. St. John Ackers.*) I understand your position to be that you consider that England is behind many other foreign nations in the education of the blind, and the deaf, and such like persons; that is, in the amount of support which the Government gives to the education of these classes?—Certainly so far as the Government is concerned; but I know of no country in the world where there is so much ready help from the people of the country as in England.

10,737. Is it your opinion, from your experience in England, that with all that ready help the blind and the deaf (I suppose I may put the classes together for this purpose), those that we are inquiring about, speaking of them not as individuals but as a class, will not be properly educated until the Government take the matter up?—I do not want to say that. What I want to say is this, that I think we ought to have a uniform system of action in regard to the class, and my belief is that until the Government comes into the field it will never be done. I think much money is wasted now for the want of co-operation. I do not want to destroy existing agencies at all; I did not want to be understood to say that I thought the Government ought to pay all the money; what I think is that the Government ought to take the general direction, and according to the results which are produced the Government ought to pay more or less; and that if the Government would organise the whole systems of institutions throughout the country, put them under a proper inspection, and give assistance according to the results that are obtained, I believe that we would get the finest result for these classes that we can in any way.

10,738. And that you believe would in the end be an economic benefit to the whole community?—I think so.

10,739. It is also your opinion, I take it, that more money ought to be spent, and largely more, for these classes, than for seeing children, because their education requires more?—It requires more. Every seeing child, I mean with all its senses, has a school house within walking distance, whereas the blind or the deaf and dumb must have special arrangements. I would rather leave out the deaf and dumb, because I am not an authority with regard to them. The blind, while they are able to have a part of their instruction with seeing children, and under ordinary circumstances, as, for instance, under the London School Board, must, before they are prepared for self-maintenance as a class have special instruction, either in a special institution, or by special arrangements in connexion with the public schools. In some form special instruction must be provided for them in order to prepare them for self independence.

10,740. And that special instruction is necessarily expensive?—Yes.

10,741. And that expense you consider is a right and proper expense to be borne by the community?—Certainly. But may I draw an illustration upon this point from America. I mean to say this: My belief is that although the Western States in the United States pay most liberally for the education of the defective classes, almost without limit, yet those institutions are not so well managed as the few institutions which are partly under the Government and partly under private corporations. The reason is this, that the private institutions that are united with the Government always have a certain number of the directors who are unaffected by political changes. Unfortunately in America our State institutions, which are purely supported by the Government, are subject to all the political changes, and that is very bad for an institution, and of course if that were so in this country it would be calamitous. It is so in America. Any arrangement which would lead to constant changes, with every fluctuation of politics, would be very bad for a school or institution.

10,742. With this State aid, of course you would expect State inspection?—Certainly.

10,743. And you would welcome it?—Certainly.

10,744. Even if the inspectors were ordinary persons who had no experience at all of the blind?—I think that when inspection comes we ought to insist that we would have a proper inspector; and if we can get the Government to take it under inspection at all I believe the Government could do it thoroughly, and I believe we ought never to be satisfied with an inspector who is not thoroughly up to his business.

10,745. To go back to your former evidence, is there some overlooker or person responsible in each bed room?—The great majority of our bed rooms only have two persons in them. I think you meant to ask whether in each corridor we have provision for oversight.

10,746. I meant what I said; but at the same time I am quite ready to get your answer in a modified form. How do you manage the supervision of your pupils at night; I will put it in that way?—We have an official on every corridor in the building.

10,747. And is it the duty of that official to visit the different rooms, or only to go in if he hears any disturbance?—The last thing he does at night is to open every door, of every room opening into the corridor the door is open, so that if anything should occur the whole place is under his or her supervision, as the case may be.

10,748. And is that overlooker within easy hearing of the most distant rooms?—Yes.

10,749. Are the pupils allowed to be by themselves without supervision, that is to say, without any responsible person, during any portion of the daytime?—Yes; though I cannot imagine such a thing as our place being under supervision at every moment. I mean there are always officials, and in all the places the pupils are under supervision; but a boy goes to practise the piano or goes to his work, or after dinner they are out in the grounds, all about everywhere, and there is not special supervision. In the beginning, for practising and so forth, we have monitors and so on; but after they have passed that stage, when the boy goes to his practise or his study, we take the result of his hour's work to give us evidence whether he has spent it well or not.

10,750. I am speaking rather with regard to the evil you were mentioning in the early part of your evidence, that is the drift of my questions?—That sort of supervision it is excessively difficult to give. Of course the time of great evil is when these children go to bed or when they go to the closets.

10,751. Is it possible for them to be alone with one another at that time or alone without any person?—It is possible when they go to the closet.

10,752. Can two go into a closet at the same time, or is there such supervision that it would be impossible?—It could not occur without very soon becoming known. Of course two boys might happen to go together, but still that could not occur often without the fact becoming known.

10,753. In your opinion, is the best possible day school equal to the best institution for the blind?—No.

10,754. Are all the teachers who are trained at the Normal College to teach the blind in other institutions or schools themselves blind?—Yes.

10,755. Would you take any seeing persons to train them to become teachers of the blind, if desired?—We often have teachers come to us to spend a certain amount of time; but to take them for a course of training is a thing we never do.

10,756. You spoke of three years as the minimum time in which you might train a pianoforte tuner; does that mean three years after the general education has been given or from the time they first come?—That refers to a young man who comes to us old. He does not pass through all the studies in the school. We may have a young man who has been through a blind school, or may have learnt to read and write; if he is not already taught and cannot read and write, and has not sufficient education to do ordinary business, we require him to go to school to that extent.

10,757. Is any organ tuning taught?—Not as a regular business. We have had some; we have given some attention to it. I suppose you mean by organs what we call church organs.

10,758. I meant this: We have had in evidence that general organ tuning is practically impossible to the blind, but that certain branches, for instance, the selection of the pipes for a special organ might be very well managed by a blind person; and I did not know whether in fact it is sufficiently practical for the purpose of gaining a livelihood to make it worth while your devoting your attention to it at Norwood?—I think that is just the point. My opinion is that it is not sufficiently practical; it cannot be done. There are blind tuners who could be as good organ tuners as anyone. I am perfectly certain that supposing it had been desirable for me, for instance, to have been an organ tuner I could have done it, and I have seen other blind men who could have done it; but to undertake to open that as a branch of employment for the blind I think would be a mistake.

10,759. Are all your lecturers paid?—Not all.

10,760. How far are you able to get free help in your instruction?—Our free help is what I should call miscellaneous. We have a great many lecturers. Sometimes we have a course of lectures, such as we have had on the constitutional history of England; we have had three courses of those lectures, and all have been voluntary. Then Mr. Wood's natural history lectures are always paid for. Our literary lectures we have never paid for at all; we expected to, and intended to, but our lecturer has always given his services.

10,761. Is that the only instance of lectures without cost?—No. I mentioned those on the constitutional history of England. One of our musical professors gives us a regular course of lectures year by year through the whole history and science of music, and for those lectures we never pay him a penny. He is one of our professors, and we pay him for his other instruction but not for his lectures. Sir George Macfarren, Mr. Pauer, and others have given lectures without pay. Dr. Carpenter's lectures were partly paid by the Gilchrist Trustees.

10,762. Are all these other lecturers you mention your own professors?—Often not, more often not than otherwise.

10,763. What is the largest sum that has ever been given by a board of guardians towards any blind child or blind young person with you?—30*l.* a year.

10,764. Had the American teachers at Norwood been in schools for the blind before they came to this country?—The teachers that we employed when we first opened the college were all specially selected from American blind schools, so as to have experienced teachers to begin with; but now since we have got a corps of teachers, in selecting teachers we rather prefer not to have them from any blind school, we would rather take a thoroughly prepared teacher who had gone through a regular normal course of training, we would rather do the preparing ourselves.

10,765. And is that the case with those we saw the other day at the Normal College; have they all been trained by yourself?—Yes.

10,766. (*Dr. Armitage.*) In speaking of the primary school you said you attach great importance to those occupations which train the hand and the fingers, is that so?—Yes.

10,767. Do you think also that the methods of education of the blind ought to be selected with the same object?—I do not quite follow the question.

10,768. I will put it in another way: Do you consider that the training of the hand of the blind is of primary importance in education?—Most certainly.

10,769. Do you think that all training, intellectual as well as technical, of the blind ought, when possible, to be a training of the hand as well as a training of the brain?—Certainly. I think whenever it is possible to bring the hand into play it should be done.

F. J. Campbell. Esq., LL.D.

12 May 1886.

10,770. Do you think it desirable that the blind in school should read out their exercises just as seeing children do in school?—I think it is of more importance to the blind than it is to the seeing for this reason, the sighted child in going along the street in every sign that it sees is learning how to spell; a blind child has great difficulty in learning to spell, and if it uses writing a very great deal that to a certain extent makes up for its deficiency.

10,771. Do you think that the mere act of writing is in itself a good hand training for the blind?—Up to a certain point I think it is very valuable.

10,772. (*Chairman.*) You are speaking of Braille writing?—Yes, Braille writing. We find that some of our elementary children are unable to hold the dot in their hand and therefore it becomes a matter of instruction to teach them to grasp it. Therefore I say, "up to "a certain point;" but now and then it occurs that where pupils have a great deal of writing to do, and have to write a great deal of music and other things, they lame the hand; they do it so much that they lame the muscles of the hand.

10,773. (*Dr. Armitage.*) Do you know the disease of the muscles of the hand which is called Scrivener's palsy?—I have had no experience of it.

10,774. It is partial paralysis in the muscles of the hand; do you find a tendency to a similar form of paralysis in those who write much in Braille?—I have never thought of it in that way.

10,775. Do you think you could tell us, on consideration and referring to your notes, which particular muscles of the hand are liable to paralysis?—I doubt if it is paralysis; I think it is simply overtaxing. I think the moment they leave off and rest the difficulty is removed. I have never known one to go to such an extent. It is a thing which we have to guard against. Our piano practice is very severe upon the muscles of the hand and wrist; certainly modern piano practice with all its varieties, is a great tax upon the muscles of the hand and arm and when you add the Braille writing to it the hand becomes overtaxed. I say where it is carried to excess we have had to give careful attention to it. I mean to say this, I have known that in cases where girls had to write three or four hours a day in different subjects, and this with piano practice, the hand became overtaxed; therefore we have to exercise a certain amount of care.

10,776. That is very interesting, but my question referred rather to primary work, to bringing children into the proper use of their hands, and I wanted to ask you whether you considered that Braille writing in such cases is a valuable adjunct to hand training?—Decidedly so.

10,777. Would you also on the same account recommend the blind as far as possible to construct their own problems in geometry, for instance, arrange their wires, do they do that at the college?—Partly. We do both ways; we prepare them sometimes, and sometimes we have the pupils prepare them. We have a black board, so that we can with a certain amount of twine and little points draw them on the black board.

10,778. Do you consider that the mere placing of the wires to form diagrams is good hand training?—Certainly.

10,779. And, similarly, do you consider that the following of maps by the blind is not only good training for the intellect but good hand training?—Good hand training, most certainly.

10,780. You were speaking of Government inspection. Do you consider it desirable that the curriculum required for blind children should be the same as that for the seeing, that the standard should be the same?—Do you mean in the case of those who go to the board schools?

10,781. No, I mean in ordinary schools?—No, I should most decidedly object to the red tape standard.

10,782. Do you think that the Government inspection ought to have special reference to this hand training that we have been speaking of?—I should give the same preference to it as you give in the case of seeing children with reference to perspective and mechanical drawing, and so forth, even more. I think that the blind are so dependent upon their hands that whenever it is

F. J. Campbell, Esq., LL.D.

12 May 1886.

possible to bring any influence to bear upon the skilful use of the hand it should be used.

10,783. Speaking of the supervision of the pupils when they are alone, and practising, and so on, is there any means by which the officials connected with the college can see into the room without going in?—We have a small piece of glass set into every door, so that in passing along, simply by looking in without going into the room at all you can see what a pupil is doing at the piano or in the room.

10,784. Are you satisfied with this arrangement?—I think it is a great deal better than without it. I think it is a great advantage.

10,785. (*Mr. Johnson.*) What is the constitution of the college. I see that you have got a general council and that you have got an executive committee. Have you any published rules and regulations. All other institutions have rules and regulations. I do not see any in your report; have you got any?—We have none that are published. We drew up our regulations in the first instance, but we have never published them. Our constitution is simply this: We have a general council, from which our executive committee is selected, and the fact is that in order to become a member of the executive committee you must first become a member of the general council.

10,786. And they select from the general council on to the executive committee. It is not done by the general body of subscribers?—No.

10,787. Then you do not have any annual meetings or gatherings of your subscribers at all; it is left entirely in the hands of the executive committee and general council. What I mean is this: you do not have any annual meeting of your subscribers or any public discussion with regard to the management of the institution, otherwise than between the executive committee and the general council?—It is between the general council and the executive committee.

10,788. What advantages have the subscribers; when persons subscribe any money, what advantage do they have; do they leave it entirely to the guidance of the general council and executive committee without reference to any vote or any recommendation. They subscribe their money, and those two committees do what they like; is not that it?—Quite so.

10,789. Would you tell us how the executive committee is appointed?—It was chosen in the first instance, as I say, by the general council; and if vacancies occur, when the general council is not meeting, and so on, they have the power of filling these vacancies, and then the whole subject, I mean to say the management and so forth, comes up. In June, for instance, we have a meeting of our general council: what will be done I do not know at all.

10,790. Then you have no published rules by which the public may judge of the internal management of the institution?—We publish all that we do.

10,791. But you do not publish the rules that guide yourselves?—No.

10,792. And they are not accessible except to members of the executive committee or general council?—I have never known them to be applied for. I do not know what the committee would say; that is not a question for me; my opinion is that the committee would give full information in regard to anything that might be wanted on that point.

10,793. It is not published to the public, is it?—I have told you, no.

10,794. Have any of your pupils ever taken any prizes at the Royal College of Music or from any other public musical body, such as the Academy of Music, have they ever been up for examinations?—They have, at the Royal Academy of Music and the Royal College of Organists.

10,795. Have many taken prizes there?—No; very few have ever gone up.

10,796. How many have gone up?—I think only two.

10,797. You have had a good many public concerts; do they answer financially?—If you ask me just the outcome of the concert, whether we turn it into a financial success, I should say, No.

10,798. Do they answer financially?—Yes, a hundredfold.

10,799. Taking into account the cost of journeys?—The cost of everything.

10,800. And those concerts that you have given abroad, I do not know whether that has been a part of the college, has it?—Not in any instance; the college has never spent a penny on concerts abroad.

10,801. It has been a private undertaking entirely?—Entirely.

10,802. Have you given many concerts in towns in England where there was not any association for the blind?—Certainly, often.

10,803. Could you tell us in what towns you have given concerts where there is no association for the blind?—Windsor.

10,804. And any other; that was almost a private one, was it not?—We have given several concerts at Windsor at different times. We give a great many of these performances in connexion with temperance movements. Lately I gave one down at Newbury, for instance, in Berkshire.

10,805. And you have given concerts, then, in towns where there are no associations for the blind?—Often.

10,806. Have you ever given a concert more than once in any one of these towns excepting Windsor; for instance, take Leicester; I know you went to Leicester; have you ever given a second one at Leicester?—Yes, but there are workshops there.

10,807. I am not talking about workshops; this is as to concerts?—But you want to know if there is any association for the blind in the place.

10,808. That was the former question. I ask you now whether you have ever given a concert in any place a second time?—Yes, certainly.

10,809. Will you tell us where, for instance?—In Leicester.

10,810. You have given two concerts in Leicester?—Yes, for the benefit of the workshops in Leicester.

10,811. That is a town where there is an association?—Yes; we gave it both times for the benefit of the workshops.

10,812. How many pupils have passed altogether through the college since it has been started?—I think we have had 99 who have passed the whole course of study. Three have gone away before they completed it, because they thought they could get on without, and they left us before they got their certificates; but I think 102 have really gone out to do for themselves. I am preparing a statement of that kind, giving the whole, and I think it is 102.

10,813. 102 who have passed successfully through your college?—I gave you a qualification about three of them.

10,814. Then your experience, as far as relates to the success of the blind, is only formed at the present time upon about 100; you have formed your experience upon the success of 100; we may take it as 100?—Did you hear my evidence the other day in regard to America?

10,815. No, I was not here?—I am very sorry that you were not.

10,816. I want to know your experience with your own college?—You mean since I came to England?

10,817. At your own college at Norwood you have trained 100 people who have passed through your college; now I want to know what is the experience you have gained of that 100 with regard to the percentage that have succeeded, and the per-centage that have not succeeded?—I thought you were referring to my personal experience.

10,818. We know that that is very large; I only wish to know what it is with regard to the experience of your own college, looking at it as a great experimental question which is to influence a great deal the decision of people who take an interest in the blind?—I say, in round numbers, 100.

10,819. The per-centage of those that have really succeeded, as you say, is what?—I will try and have the table showing that fully prepared on Friday.

10,820. How many blind teachers have you got at the college, and how many that can see; can you tell me offhand?—In answering that question I must just be sure of what you mean. You do not refer in that, do you, to those who are what we term pupil teachers?

10,821. My definition of the teachers is this: persons who are employed in the ordinary education of the ordinary three schools?—Before we send out the teachers, these teachers we are educating to send out elsewhere, we always employ them to a certain extent.

10,822. How many sighted teachers do you employ at the college now, and how many blind teachers have you, not including pupil teachers?—We have five blind persons who are receiving salaries.

10,823. Are they English or Americans?—They are English and Scotch.

10,824. And then, how many sighted teachers; I think you said six?—Of course I apply the term "teachers" to all my outside teachers and everybody. You mean simply the resident teachers?

10,825. I mean absolutely in the college excluding professors?—Excluding professors we have eight.

10,826. And five of those are American, are they not?—They are all American.

10,827. All those eight are American?—Yes, all the seeing school teachers are American.

10,828. In your college there are a great many poor, are there not, very poor?—There are.

10,829. Are the majority of them poor?—If you will allow me, I should like to put this in evidence with regard to the condition of the pupils. This (*producing a paper*) is an affidavit which I prepared when we had 146 pupils in the college. This is an extract from it, where I give all the particulars in regard to what is paid for each pupil, where the friends or parents are able to pay anything.

10,830. I only want you to kindly answer my question if the majority of them are not poor, of the very indigent class?—They are, and here are the figures if you like them.

10,831. No, I do not want the figures; I will take your word for it. Then a large proportion of them are poor; and looking at the accounts I find that on the average, taking the whole number of pupils, the ordinary expenditure comes to about 60*l.* a head. Now, how do those poor people get the 60*l.* a year unless they have got scholarships. Who finds the sum; is it their own family, or is it out of the subscriptions that they are paid?—In a large majority of cases it is by special subscription.

10,832. Their friends subscribe?—No, not their friends particularly, but I mean we have always found it easier to obtain money for special cases than in any other way. All, or nearly all of our subscriptions are constituted of what you may call scholarships for individuals.

18,833. And if they do not get the same advantage from Gardner, or Dr. Armitage, or any one kind enough to found these scholarships, then the friends of the institution get the money together to pay for these scholarships?—Yes, or we work on the locality. Supposing I have an application from Brighton, I immediately find out who the people are there who would be interested in such an object, and I take it up and get the subscriptions specially for that case.

10,834. Then every case is selected by you that comes into the school, is it not, whether it is paid for by scholarships or whether it comes under any other circumstances, you select the case to see whether it is a proper one, do you not?—All of our scholarships are by examination.

10,835. But I mean every person who comes into the school, whether by scholarship or otherwise, comes under your approval?—It is under our approval. We have the power to refuse a pupil.

10,836. I ask whether it is under your approval?—I say we have the power; the committee can refuse to take any pupil or any applicant; but on the other hand, supposing the people can afford, however dull the child may be, to send it to the college, we tell them "This child will only do so much;" we can bear all the cost: "Never mind that," is the reply, "I should "like to pay for the child; I will pay so much."

10,863*a*. Then if the child was stupid you would still keep it on?—Certainly.

10,837. But if it was a case subscribed for in another way than by a scholarship, you would return the child?—In that case we would simply say, "What we could "do for this child will not give you a return for your "money."

10,838. Have you ever returned children that have been sent by a board of guardians as being unable to do anything with them, as inapplicable in your school?—Yes, I remember one case particularly now that came down from Lincolnshire, a dreadful case of this self-abuse that I was speaking of this morning.

F. J. Campbell, Esq., LL.D.

12 May 1886.

10,839. You sent that child away?—Yes.

13,840. That was only a case of gross misconduct, and not a question of not being able to teach him, of course?—I do not think we ought to call it gross misconduct.

10,841. We will not dispute about what it is to be called. Now, when these poor people come into your establishment, of course you train them up very well indeed, and you make them very musical members of society, and you put them as it were into a different class of life from that to which they formerly belonged, that is to say, you elevate them in every way. Provided they do not get employment, do these people go back to their own original homes when you discharge them?—I think that would be the result; we have had very few to do so.

10,842. I mean supposing such a thing, they would go back?—Supposing the case to be so, they would.

10,843. Then there is an intermediate condition. Supposing a person has six years with you, and is a very fair pianist or musician, or a very fair tuner, there may be a time that intervenes between the time at which he can get employment and the time of his leaving, during which he remains idle. Where do they go to then; do they go back to their homes, or do you find employment for them before they leave your institution?—We are always on the look out for it.

10,844. But do you find it?—As a rule we do find it; as a rule, our people do find employment.

10,845. On visiting the school the other day myself, I was struck with what I should call the superior class of people; whether it is the great credit to you of having elevated them from the lowest class, and put them in the middle class, still the impression left on my mind was that you had got a very superior class of pupils; and I attribute it to the power that you have of selection. I want to know whether you can tell me if you follow your pupils after they leave you, if they do not get employment, into their homes, to ascertain whether they are not educated above their social position?—Well, I never sought the information from that point of view. I mean we never lose our interest in any blind person that comes under our administration, nor do I remember a single instance where I have not been able to get assistance in some form or other. We have often pupils unable to get employment from ill health or from various causes, and I rarely remember an instance where something has not been able to be accomplished.

10,846. In visiting Norwood for the first time (I had never seen it before), I was very much struck on the question of the tuition. The first class I saw was a class being taught in French; the second one in physiology and anatomy; the third one in natural philosophy. Now I only ask you whether you think that that sort of training is applicable to the large mass of the poor uneducated blind in England; or whether you do not think it ought to be more reserved for the special class of normal teachers; because looking at it as a question of Government support or subsidy I doubt whether any government would contribute sufficient means to educate blind children to the high excellence to which you do?—My opinion is that if you would make the blind self-sustaining, you must lift them into a different atmosphere altogether. I think it is fatal to the blind if you educate them with the idea that they are a poor indigent class. You must give them a different air and atmosphere. The whole tone and feeling on the subject must change; and if you do not give them sufficient education and intelligence to bring them into relation with ordinary society your education of them is worthless, and then they must go back to handicrafts only.

10,847. Then in what class of life are they likely to find their future employment, only by music as pianists; do they give up entirely handicrafts?—They by no means give up handicrafts; I believe that is a very important part.

10,848. In what class of life do they find further employment and what sort of employment; they are not all capable of appreciating music, how would you suggest, if they are not to go into handicrafts, that they are to be employed?—For instance, I have one young man in Belfast who has gone into the coal business; he is doing an excellent business; he said that he owed it to the training he had at the Normal College; that gave

F. J. Campbell, Esq., LL.D.
12 May 1886.

him the power of taking up business, and he has become an excellent success from a business point of view. Now, I think that is far better for that young man than if he had depende upon a handicraft, and yet if he had not come to the college he certainly would have depended upon it, he was expecting to devote himself to handicraft. Now I certainly think he has very much improved his condition in life.

10,849. Do you not think those are exceptional cases where people can succeed in outside business; can you tell me any other instance of that; that is only one; can you give me instances of men succeeding, I will not say as pianoforte tuners and sellers, but outside that?—If the man deals in selling pianos, if he conducts a large shop, that is business. Well, two of our young men have a shop that they pay 330*l.* a year for in Glasgow.

10,850. Have you evidence of success of that kind in London?—Not where they have opened a shop for pianos. We have several young men who make a great deal of money by selling pianos, but what they do is to get the commission.

10,851. With your experience do you know of any other openings that might be considered good openings for blind persons who are well trained, other than music and what we have already been speaking of; are there any other occupations that you think blind people might advantageously apply themselves to, with a prospect of pecuniary success, I mean?—One of our old pupils is farming. We have one remarkable instance of a sugar refiner who is managing a large business in Whitechapel. I have known several. I do not know why they have gone into that line of business particularly, but a number of my old pupils in America have gone into the book business.

10,852. But we are not going to America; I want you to tell us what is adapted to this country?—I do not see why a man should not sell books in this country as well as in America. I have known a number of blind men who have done so in America, and they are carrying on their business with great success as book vendors.

10,853. The 60*l.* a year which is paid to the college, or rather which the college receives, does not include any clothing, does it?—No.

10,854. Nor any travelling expenses?—No.

10,855. I see you have got some private pupils, too; at least, you say you take private pupils; have you any now?—16.

10,856. Who do not belong to the college, who do not come into the charitable portion of the college, if I may so?—No; they board in the college and live there, and have their instruction there, but their own parents are able to pay for them.

10,857. What is the usual price?—Of these 16, one pays 80*l.*, two 70*l.*, and I forget how many are at 60*l.* and 50*l.*

10,858. Do they mix with the other pupils entirely, with these pauper pupils?—We have no pauper pupils. After they come to the college they are no longer paupers, it is analagous to a destitute child being adopted by a practical family. The child is placed under good influences, trained for useful activity, and becomes an independent member of society.

10,859. Some of them are taken from the workhouse, you told me?—Yes.

10,860. Do these private paying pupils associate with those children that you get from the unions?—Most decidedly.

10,861. Then they pay the money and become ordinary pupils like any other pupils?—Yes.

10,862. No difference is made?—Unless they pay for a private room; they can have a private room.

10,863. (*Chairman.*) In this paper before me you say one pays 100*l.* a year; is that the case now?—No.

10,864. The figures in that paper are the figures up to 1883; we will not take that in evidence, if you please, we want the last edition?—That gives it exactly as it existed at that time.

10,865. (*Mr. Johnson.*) If all the pupils are selected, as they are more or less selected, how is it you have had 20 per cent. of failures. I only take it from your own report, you know; about 20 per cent. do not succeed. Is it from physical inability, or is it from want of intelligence. I do not suppose for a moment that it is for want of instruction, but I want to know the reason why when you have got such a large field of selection 20 per cent. fail to get their own living?—In the first place they are not all selected. I will give you an illustration which will exactly explain your point. One of our failures, and one of the most marked failures we ever had, was a young man of the name of MacGowan; he was a very intelligent young man; he was in Her Majesty's Service in India; he lost his sight and came home. He interested Dr. Armitage very much, and the doctor wanted him trained very particularly. I pointed out to the doctor that I felt it would be a very great uncertainty; he was then 32; I told him I had never known a case that had been made successful at that age; still the doctor was willing to put some money in to it, and did put some money in to it and had him trained; but that young man was a failure. He certainly was a very intelligent young man, but being so old failed; if we had had him 10 years younger, we should have made him a success beyond all question. I am inclined to think now that if he had been continued one or two years more he would have become a success, as it was.

10,866. Then your position is this, that 80 per cent. of your people do succeed so far as to make a good living?—At least 80 per cent.

10,867. At least 80 per cent. succeed in making a good living?—Yes.

10,868. Taking that 80 per cent., can you dissect it for me in any way to tell me in what they succeed, about how many as musicians, and about how many as tuners, and about how many in other ways?—The paper which I am preparing for the Chairman now will give every instance.

10,869. Have you any idea what becomes of the people who do not succeed; what trade they attempt to follow?—We endeavour to get them into the best manufacturing place we can, or if they do not want to go into manufacture whatever they can do, we endeavour to find some suitable place for them, the best that can be done under the circumstances.

10,870. You put great stress, I see, upon physical exercises and upon athletic sports, and also upon the cold bath; do you oblige all your pupils to take the bath?—If they are in ordinary health. There are some who never go into the swimming bath, because it is the opinion of our doctor that it is better for them to have their bathing in some other way. That is a question settled by our physician.

10,871. Then every one of your pupils are submitted to medical opinion, I suppose, whether you shall put them to athletics or bathing?—In the case of any pupil we have any doubt about, or if the pupils or their friends raise any question, we always make it a medical question at once; but if a strong athletic well formed young man comes there, we do not send him to the doctor.

10,872. The doctor, I see, is a member of your committee?—No, that is his uncle.

10,873. Frederick Hetley, Esq., is one of the executive committee, and Frederick Hetley, Esq., is honorary medical officer?—He used to be our honorary medical officer; he is not now; it is the young man.

10,874. Is your executive committee quite full now?—We have no treasurer; our treasurer died as I explained the other day, Mr. Jones Lloyd, he was a great loss to us.

10,875. Have you had any opportunity of ascertaining the number of blind organists employed in this country; has that come to your knowledge at all?—No.

10,876. I suppose you are aware that there are a great many of the institutions in England which do supply organists?—I think they nearly all train organists.

10,877. Some of your pupils go to public entertainments, I see; is that part of the curriculum of education; does the college pay the expenses of their going to public entertainments?—Do you mean the Crystal Palace concerts, for instance?

10,878. Yes, and other entertainments. They sang the other night over at some place in Lambeth?—You mean that they give public entertainments. The expenses are always paid if they go.

10,879. Not by the college?—No. We sing, for instance, to-night at the Metropolitan Tabernacle, Mr. Spurgeon's; that will all be paid for, not out of the college.

10,880. And I understand you to say that the same thing is true when they go to foreign countries. It is very important that I should ask you this, because it settles opinions outside; we get the information now from the fountain head and we get the real truth, and it is quite right that I should ask you these questions in the most friendly spirit possible. When you take them to foreign countries the expenses are not paid by the college either?—No, not a penny.

10,881. Are they paid by private enterprise?—Yes.

10,882. And it has nothing to do with the college whatever except getting the permission of the committee to allow them go; is that so?—I am often helped by individual members of the committee in these things.

10,883. But not as a college?—No, not as a college.

10,884. All your expenses are paid without coming upon the funds of the college; never mind how you get the funds?—The college has never paid a penny for that purpose.

10,885. Do you ever retain your pupils in the college beyond the six years?—It is not limited to six.

10,886. It is at the pleasure of the committee?—It is at the pleasure of the committee.

10,887. And when you do retain them, what do you retain them for, to perfect their education or to make them pupil teachers?—Supposing they cannot pass the necessary examination to get their certificate, supposing they fail in their examination?

10,888. Before the college authorities, do you mean?—Before our examiner. Now our pinnoforte tuners are examined by Mr. Hipkins, of Broadwood's; he is our official examiner. There will be 24 for examination this year. We have also an assistant examiner. Now these 24 people will be examined, and my opinion is that 14 out of the 24 will fail in the examination. I have examined them three times since Christmas myself.

10,889. You retain them and see whether they cannot get a little more knowledge from you?—It must be carried on.

10,890. Who pays for that; the scholarship would still go on?—It is a matter of arrangement with these people. Not one of those going to be examined has been there six years. If they can they pass the examination before the six years are up, and many of them do.

10,891. Then you keep some of your own pupils, too, who pass your examamination, and are proficient as pupil teachers, do you not, and you employ them in the instruction of the other pupils?—We use them; and we have some of our pupils who were educated in our School whom we are absolutely employing now.

10,892. That is the question I asked you; when the time is up and they have completed their education, and satisfied you or the examining body of their proficiency, do you employ any of those old pupils of yours in your institution to teach your other children?—We do most decidedly.

10,893. (*Chairman.*) As paid teachers?—As paid teachers.

10,894. Therefore they would come under the head of paid teachers?—Yes. I want to give an illustration. You know Miss Inskip at Glasgow; you saw her. We educated her for a teacher for ourselves, but the Glasgow people applied to us, and she being the most practical young woman we had we sent her. That is the practice we go upon. If a good opportunity comes for one of them to be employed elsewhere we let her go: we think we can work up some one else to take her place in our own institution.

F. J. Campbell, Esq., LL.D.
12 May 1886.

10,895. (*Mr. Johnson.*) In the examination of Mr. Wilson, the secretary of the Gardner trust, he says that the Normal College receives (is this a correct statement) 4,100*l.* from the funds of the Gardner Trust, 3,000*l.* being for music, and the residue for the technical and other schools?—I have no hesitation in endorsing Mr. Wilson's figures, but the 3,000*l.* which you say is for music is for general education, physical training, &c., as well as music.

10,896. What you receive from the Gardner trustees will be part of the balance sheet?—But I should like to say something about one statement that you quoted; that, I think, is not strictly true. You say 3,000*l.* is paid to music. Now, those pupils that come under those scholarships were not only educated in music but in all the branches in the school.

10,897. I asked you whether you received at the Normal College 4,100*l.* from the Gardner trustees, that is my only question?—I want to show you that you are under a misapprehension there.

10,898. (*Chairman.*) I understand you do not say anything about the figures, but you deny that 3,000*l.* has been paid for music, meaning by that, as I understand, that it is not applied for music solely, but that it is for general education in connexion with the musical education that is given in the college; is not that so?—You are quite right. That is exactly as I meant to explain it.

10,899. The financial part you have undertaken to give in a balance sheet?—Our balance sheet is not printed yet, but I will undertake to get it for you as soon as I can. I will give these particulars on Friday.

10,900. (*Mr. Johnson.*) Would large, open dormitories answer your purpose better, do you think, than small rooms where there are only two pupils in each room?—If I were planning an institution for the blind to-day, after my experience in reference to this dreadful habit I have spoken of, I should have large dormitories and never have the pupils there without having a vigorous supervision.

10,901. (*Chairman.*) Who undertakes the management of the institution when you are in America. You were recently away some three months, were you not?—I was away two months. During that time my wife was the principal. I mean she really was the executive officer of the establishment. We have, of course, a number of other people.

10,902. There was the same staff of teachers during your absence?—Yes.

The witness withdrew.

Adjourned to Friday next at 12 o'clock.

32, Abingdon Street, Westminster.

Friday, 14th May 1886.

PRESENT:

THE RIGHT HON. THE LORD EGERTON OF TATTON IN THE CHAIR.

W. TINDAL ROBERTSON, ESQ., M.D., M.P.
B. ST. JOHN ACKERS, ESQ.
T. R. ARMITAGE, ESQ., M.D.
F. J. CAMPBELL, ESQ., LL.D.
E. C. JOHNSON, ESQ.
THE REV. W. BLOMEFIELD SLEIGHT, M.A.
CHARLES FEW, ESQ.

CHARLES E. D. BLACK, ESQ., *Secretary*,

T. R. ARMITAGE, Esq., M.D., examined.

T. R. Armitage, Esq., M.D.
14 May 1886.

10,903. (*Chairman.*) I do not propose to ask you many questions which I might ask you with regard to the blind, because you will of course have an opportunity as one of the members of the Commission of taking a part in the preparation of the Report, and of giving expression to your opinions generally when the Report is drawn up; but as I understand you have been requested by the Executive Committee of the Royal Normal Col-

T.R. Armitage, Esq., M.D.

14 May 1886.

lege to give evidence on that college, and of course on all questions incidentally relating to it. I will ask you some questions with regard to that college. In the first place I will ask you, as one of the founders of that college and one who has so liberally contributed towards it, what your views were in taking the steps which you did to found the college in order that the Commission may know exactly the object that you had in view, and whether that object has been fully carried out?—Your Lordship will allow me, perhaps, to make a very short preface. I think what I am going to say will be better understood if I put the Commission in possession of the way in which I came to study this question, of how to improve the condition of the blind. My sight had been failing for a great many years, and in 1860 it got so much worse that I finally determined to give up my profession. Then for six years I went to a country seat in Ireland and tried to recover my health. In 1866 I was asked by the Committee of the Indigent Blind Visiting Society to join that Committee, and I did so. For some couple of years I think I spent several hours every day in visiting the blind of London at their own homes in connexion with some of our visitors, and it was that that revealed to me the fact that the pupils who had learnt at one school could not use the systems of reading that were in use at others, and in short the whole thing was a perfect chaos. I also then found out that the blind, whether trained in institutions or untrained, had scarcely anything to do, that they were to a very great extent idle mendicants, or depending on charitable relief in some form, either from the guardians or from private societies or individuals, that in fact they were not earning their own living. It was those two facts that induced me in 1868 to found the British and Foreign Blind Association for improving the education and promoting the employment of the blind, and it was during our investigations in that society that I found that music was the best employment to the blind, at least so it appeared from the experience of Paris, and to a less extent in some institutions in America. On inquiry we found that a very small proportion indeed of the former pupils in institutions of the United Kingdom who had been trained in music were able to succeed as musicians. It was very difficult to get at the proportion, but as far as we could get at it only one-half per cent., 1 in 200, of all the pupils trained in institutions seemed to be able to support themselves fully by the profession of music. When on the other hand we observed that 30 per cent. of those trained in Paris were able fully to support themselves by music, we felt that there must be something very wrong in our English system. I went over to Paris and investigated the question very carefully there, and I came to the conclusion that the education of the blind as musicians in Paris was infinitely superior to anything that we had in England. That conviction resulted in the foundation of the Normal College. We had been agitating the question for some 18 months or so at the Society of Arts and elsewhere, but the difficulty was to find the right man to superintend the institution; and when we were almost in despair Dr. Campbell happened to come over to England, and in the first half hour's conversation that I had with him I found we had the right man, and he found that he had the right cause, a cause that he should like to work in, and we commenced at once. Dr. Campbell having the go ahead principles of the Americans went a great deal faster, and a great deal further than I was at first inclined to go, but I am quite sure he was right. That resulted in the formation of the Royal Normal College in 1871. We worked the thing up privately at first and then formed a committee, and we have been going on increasing our sphere of operations ever since.

10,904. Is the Normal College in your opinion intended to be simply for the teaching of music, or is it intended to be a model college which all institutions in your opinion in this country and elsewhere ought to follow?—The main object of the college is to train musicians to make the blind self supporting in the profession of music, but it is impossible to do that without giving them also a thoroughly good general education.

10,905. Will there not always be a certain number of the blind who are unsuited or incapacitated, from the want of musical taste, for musical instruction, and for whom some employment of another character must be found?—We have a certain number at the college who are in that position, and by reason of the good general education which they receive, they are made fit for other walks of life; a good many of them, especially of the girls, go out as teachers, teachers to the blind, and teachers to the seeing. Then, as Dr. Campbell said in his evidence, one man has established himself at Belfast as a coal merchant. I might add that another man is a large sugar baker in the east of London, another man is a successful farmer, which is a good deal to say in these depressed days.

10,906. In your opinion ought every blind child to have the sort of education that is given at Norwood, or will there always be a certain number for whom training in some industrial occupation will be necessary?—There are no doubt a large number of blind children who ought to be trained in manual trades, there always will be many who for various reasons are not suited for the profession of music, and besides that there would be this very great danger if we trained all the blind as musicians, we should overstock the profession, and there would be no work for them to do. It is necessary to train a great many of the blind in manual trades, or in professions not musical. I believe that to enable the blind to compete successfully with the seeing in any walk of life it is necessary for them to receive as good an elementary education as they are now receiving at the Normal College. That elementary education, I think, is necessary for all; when those intended for the profession of music got to a certain age their special musical training should commence, and those intended for manual trades should be trained specially for the particular trade for which they were destined. I am quite sure that the blind will not be successful as a rule even in manual trades unless their primary and elementary education is at least as good as it is at the Normal College.

10,907. That leads me to ask you this question. In your opinion, as you are well acquainted with the schools for the blind and the institutions for the blind all over England and over a great part of the world, do you think that the existing institutions other than the Normal College at Norwood ought to be re-modelled?—Some of them have re-modelled themselves already.

10,908. There might be an ideal standard of a normal college which all ought to come up to. As a practical man, do you think that the Commission ought to recommend that a re-modelling of all the institutions of the country should take place?—I think it would not be wise for the Commission to hold out the Normal College as the model which the other schools ought to aim at in primary education; there is a good deal of jealousy among blind institutions as there is amongst other institutions, and I think we should rather defeat our object if we were to hold out one particular school or college as a model to be imitated by all others. I think it would be better for us to lay down in general terms that the education of the blind ought to begin with the Kindergarten with object lessons, and should go on with reading, writing, arithmetic, and geography, according to the best methods, and that the blind children should receive the same kind of good elementary education that seeing children receive.

10,909. For that object am I right in supposing that you would not think it necessary that all blind children should be placed in public or private institutions for the blind, but that they should be taught as far as possible with the ordinary youth of the country, as is done to some extent in some of the school board schools?—A good residential school for the blind is far better than any day school that I am acquainted with that has been started yet; at the same time a great many of the day schools, most of the board schools in fact throughout the country are better than a great many of our present residential schools, but a time must come in the life of every blind child when it is absolutely necessary for him to receive technical education.

10,910. Before it goes to other schools it must receive some special instruction, that of course must be understood?—Either before or during the period of its attendance at the school; where a board school is exceptionally situated, it can train the children perfectly well without their ever going to a residential school; for instance, at Sunderland and Bradford, at Sunderland especially, the school is held in a room adjoining the workshop; the children go through their ordinary education in the board school, and as soon as they are fitted for the special technical training, they have only to go into the workshop to receive it. The only practical difficulty experienced there is that a good many of the children live at considerable distances from the school, so that their attendance is not regular in wet weather, for instance.

10,911. That would be the case in some of the large towns?—Yes.

10,912. That would involve perhaps a system of boarding out of children if they were not in any institution; do you think that that would be advisable?—I think as soon as you come to boarding children in special centres, as is done with the deaf and dumb in London, it would probably be better to have them in an institution where they would be boarded. There is this disadvantage which is very frequently felt in the case of these blind children who are attending the board schools, that they are not sufficiently looked after at home; if the parents or if the children's brothers or sisters help them in preparing their lessons for the next day they can get on very well, but if they have no help whatever at home they do not do well at school and such children of course are better in a residential school.

10,913. With regard to the education of the blind in relation to the State, I understand that you are of opinion that institutions for the blind should receive some assistance from the State?—I think it is most essential that they should.

10,914. Do you think that the best way of giving that State aid would be for the State to give a fixed sum per head such as has been mentioned, say 10*l.* or more, as the case may be, for the education of each child, due inspection of course being provided by the State, and leave private liberality to find the remaining cost of the education of each child?—I do not think that that would be the best way of giving State assistance.

10,915. Do you think it would be likely that the State would give as large a sum as 60*l.* per head, or a sum varying from 40*l.* to 60*l.* per head, for the education of blind children, which would practically mean their being educated free at the expense of the State?—If that was done of course it would at once strike off all private assistance.

10,916. Do you think it desirable that that should be the case?—I think most undesirable.

10,917. Then I come back to the proposal that I put to you before, that a certain proportion should be found by the State, and a certain proportion found by individuals interested in the child?—I think a much better way in which State aid might be given would be this: that the State should not pay any fixed capitation grant at all, but that it should pay by results, that any school wishing to avail itself of State aid should put itself under Government inspection, that the inspector should examine the pupils just as is done in ordinary schools which receive State aid, and that a grant should be made according to the standard which the pupils had reached; that grant I think with regard to the blind ought to be considerably larger than with regard to seeing children, perhaps double or treble the grant earned in the case of seeing children, because the expenses of the education of the blind are very much greater than those of the education of the seeing, but I think it would be best for the State to pay by results. With regard to State inspection, I assume that the inspector would have a knowledge of the right methods of education of the blind and that the inspection should not be exactly according to the standards that are applied in the schools for the seeing.

10,918. Do you think that the State should make any difference with regard to blind children as compared with seeing children, in the way of payment by results, which would allow of blind children receiving an education which is at present only given in the higher middle or upper grammar schools, instead of receiving the elementary education which is now provided in the national elementary schools?—In what I have just been stating with regard to payment by results, I was speaking of payment by results for elementary education, reading, writing, arithmetic, and geography.

10,919. You would not include foreign languages?—I do not think that the State ought to pay for the teaching of foreign languages. It does not do so at present. Then, again, I think there should be a payment by the State according to results arrived at by the pupils after they have left the school. The education and training given in the residential schools, whether teaching trades or music, or the liberal professions, as soon as they begin to teach what we may call technical work, by which the blind after leaving are expecting to become self supporting, is much too complicated to be gauged by a Government inspector inspecting the school. The success in life of the pupil depends on a great many circumstances that cannot be tested by examination. One very essential point is the moral condition of the pupils, which is brought about by the moral discipline of the school. Then the physical training of the pupils is a most important factor in the question whether they become self supporting in after life. If the blind are turned out weakly they cannot succeed unless they have *mens sana in corpore sano* they will not succeed, and with the blind, unless we have all the elements of success combined, we shall not succeed, because we may say what we like, but the struggle in competition with the seeing is so keen in every branch that a blind man can take up, that unless he is fully equipped for the struggle he will not succeed. The only way we can know with certainty that the technical education of any particular school has been what it ought to be is by the number of its former pupils who become self supporting, and according to those results I would give State aid.

T.R. Armitage, Esq., M.D.

14 May 1886.

19,920. Then that would not be the ordinary principle of payment by results. How would you propose that those results should be arrived at?—I should propose that every school should keep a register of its former pupils who had passed the school in order that they should know, as far as possible, where they lived, what they were doing, whether they were supporting themselves, and so forth; and that from this register they should select those former pupils who were self supporting, and that the State should pay so much per head to the school for each of its former pupils who could be proved to be self supporting.

10,921. That is not payment by results in the ordinary sense of the word?—I would have payment by results in the ordinary sense of the word, in the first case that I referred to, that is to say, in the case of the schools where elementary education is being given. The two should go together. In the one case the ordinary payment by results should go to all schools, whether day schools or residential schools, in the other case the payment by results in the way of self support of former pupils would probably only go to residential schools.

10,922. In the second case to which you refer the test would be previous success rather than the success of the ordinary training of the individuals then in the school?—Yes, my argument is that it is scarcely possible to judge of the education given in any school for the blind except by seeing what the pupils after they leave the school do for themselves; if they succeed then the school is good, if they do not succeed the school is bad, and the Government ought to take that into consideration in payment.

10,923. In order to test your proposition by an example, it would work in this way:—Let us take the Normal College at Norwood. You would propose the pupils should be examined in the ordinary elementary education, and that certain grants should be made on the results of that education, and then that the college should receive payment for the higher education it gives in modern languages, physiology, mathematics, and natural philosophy, by a grant founded upon the results gained by pupils who have gone through the school and been successful in after life?—Yes; the state therefore would only pay for the education in those higher branches if the pupils by their education in those higher branches have become self supporting.

10,924. Going from that, you have had great experience of what has been done on the continent with regard to watching the after career, and assisting those who have passed through any training, whether educational or technical; could you, from your experience abroad, suggest what ought to be done in this country?—I think the same system should be followed in this country.

10,925. That is followed in Germany?—Yes, and in France, in Paris.

10,926. Will you tell us what that system is?—The system which in Germany goes by the name of "fürsorge" was introduced in Dresden about 50 years ago; it has been slowly developed, and it consists mainly in the institution keeping touch with all its former pupils. A register is kept, there being a pigeon hole for each pupil, and the papers relating to that pupil from the time of his first entering the school up to his death are kept all together; so that whenever any question arises about a particular pupil the director simply has to refer to his *dossier* and finds everything recorded about him, the grants he has received, his conduct in the school, and everything else that can be possibly wanted to form a judgment. Then these former pupils are looked after by a society, of which the director of the institution is always the president, which administers a fund for

T.R.Armitage, Esq., M.D.

14 May 1886.

former pupils. The State has really nothing at all to do with that society; it is a private organisation; the only aid that the State gives is this: the pupils in the institution who are educated at the expense of the State are allowed to keep part of their earnings while in the institution, and the remainder is paid into the fund for former pupils. The State of course has the right, as it pays for the pupils, to the work of the pupils while in the institution, but it foregoes its right in favour of this fund; and that is all that the State does with regard to the society and the fund it administers. The fund for former pupils has been gradually accumulating for the last 50 years by subscriptions, and by the sale of the work of the pupils while in the institution, that is their subscription to the fund, and it now amounts to about 1,500*l.* a year.

10,927. Over what area would that be spread, over all Germany?—No, Saxony only. The number of former pupils is about 300, and at Dresden it is considered well that each former pupil should have something from the fund every year. Those who do not really require it receive very little; simply just a sort of acknowledgment, and those who require more receive a good deal.

10,928. Those who fail to earn enough to keep themselves?—Those who are sickly among the men, and many of the women.

10,929. Does it extend to old age as well?—Yes; and there are a great many old people within the scope of the fund, of course, because the fund has been going on for 50 years.

10,930. To some extent the fund is founded on the savings of successive generations of pupils?—Yes.

10,931. Subsidised indirectly by the Government through its giving up to the fund part of the earnings of the pupils to which it is entitled?—Yes, but it is principally supplemented by private benevolence.

10,932. Is that the fund from which pupils who take up any handicraft or trade receive something to start them in life in the way of grants for tools and so on?—Suppose A has gone through the school as a basket maker, he first leaves the central institution at Dresden, and goes to a special workshop that they have in the country, where he works at his trade generally for 18 months or two years, he works continuously as he would have to work at home; the product of this workshop is sent to Dresden to be sold at the institution. As soon as the director believes that A is sufficiently master of his trade to be able to support himself, he looks out for some suitable opening for him in his own village, unless there are any special reasons why he should not go home, he goes home. If his parents are drunken or dissipated or immoral, then some other place is found for him, and he is settled then as a basket maker, and the fund gives him the greater part of his outfit. I think for a basket maker it is about 7*l.* 5*s.* for an outfit, and for the outfit of a ropemaker 18*l.* 5*s.*, that would include material as well as tools. This outfit comes partly from the savings of the pupil during his stay in the institution, and partly from this fund for former pupils. Then the director before establishing the pupil looks out for some respectable and influential man in the village who will become a sort of godfather to the blind man to look after him, give him advice whenever he requires it, help him to get orders, and keep the institution informed as to his circumstances, and as to his conduct. The pupil is also expected to write to the institution at stated times—several times during the year—saying how he is getting on and giving full particulars about himself. Then as long as the pupils conduct themselves properly, and do not receive parish assistance, or do not beg in the streets, or do anything else that is disreputable, they are sure to be assisted from the fund to whatever extent is absolutely necessary. For instance, if a basket maker is at a place where there is no water handy, and a well has to be sunk for him, the fund will provide the money for sinking a well, it may cost 12*l.*, or 15*l.*, or 20*l.*; but the society takes care that he has a sufficient supply of water for soaking his willows. Suppose a ropemaker falls ill and cannot stand the severe German winter, a covered or partially covered rope walk will be put up for him, in fact the society assists in anything that is really required. With this assistance, from 80 to 90 per cent. of all the former pupils, male or female, are able to get on without receiving any parish assistance. The basket makers and rope makers invariably support themselves fully, except in the case of sickness. Where the fund is principally required is amongst the old and sickly and the women. Very few of the blind women of Saxony are able fully to support themselves.

10,933. It would seem that handicraft training is so successful at Dresden, that notwithstanding the fact that Dresden is a very musical town, they do not seem to attach much importance to teaching music as means of obtaining a livelihood?—They are beginning to teach music at Dresden as they are everywhere else; their eyes are beginning to be opened as to the necessity of musical training; they are beginning to find that musical training pays the blind better than the best of these handicrafts. They have just established tuning, for instance.

10,934. Would there not in Germany be more competition in the musical profession among the seeing than there is in England; do not a larger number of people in Germany take to music as a profession than in England?—That is the case; but on the other hand a much larger number of the population are musicians, and they have pianos and various instruments that require tuning and keeping in order.

10,935. Are there any blind teachers of music in Germany?—I know that they succeed very well in many parts of Germany but not at Dresden. I should like to add something to what I have been saying about Germany. I think if the system of the State paying according to the after success of former pupils was adopted in this country, it would be a great stimulus to schools to adopt the system of looking after their former pupils; that I have not the smallest doubt would be the greatest reform that could be introduced into our schools here. The reform would involve a good deal of expense. The director of the institution would have to be a man who was rather superior to the ordinary run of our directors and superintendents, he would have to be a man with an iron constitution and full of zeal for the cause. The work would be very much harder than the work at present put upon our superintendents and directors, consequently the institution would have to pay more. The director if he looked after the former pupils would require to have a good deal of the teaching and the work in the school done by deputy, for his most important work would become the looking after the former pupils, and all that means expense. Therefore, I think it would be perfectly fair for the Government to assist those schools that were doing this work by a pretty liberal annual grant for every pupil whom they could prove to be self supporting.

10,936. Is that the principle followed in America also?—No, not at all, and the great cause of the failure in the American institutions is that they do not follow that principle; there are one or two institutions in America where that system is adopted privately, and those institutions show a much better average result than those where that system is not adopted.

10,937. Do you think that the State would undertake to follow up the pupils who have left the school and provide them with materials and tools, do not you think that must be left to private effort?—I do not think the State ought to interfere with that at all.

10,938. You would propose that to a school where that system was followed the State should give a liberal grant, in order that that system might be carried out, leaving it to private effort to carry out the details of the system?—Yes. The institution would make a return, for instance, saying, "We find that 60 of our former pupils are supporting themselves by a trade or a profession which they learned in the institution, therefore we claim a grant for 60 pupils." Then the duty of the State inspector would certainly be to visit at least some of the pupils and ascertain that the returns made by the institution were true.

10,939. That would involve a Government inspection not only of the schools but of every person who had ever been trained in the schools?—It would require Government inspection of those pupils who were said by the institution to be self-supporting.

10,940. That might be a large number?—I do not think all would have to be visited; the State might, instead of visiting every pupil, take a couple of dozen at hazard, see that the returns were correct there, and if they were correct there the probability would be that they were correct all through; and if the institution knew that any one of the pupils might be visited it would take good care to furnish correct returns.

10,941. You would give that payment by results not only in the case of schools which gave a higher class education, but also in the case of those schools where technical trade instruction was given?—Yes, and I would graduate that payment according to the amount that can be earned in any particular trade. I would fix a minimum; I would say a mat maker ought as a minimum to earn 8*s.* a week; a brush maker 10*s.* (I am merely speaking at hazard); a wood chopper 9*s.* perhaps; a basket maker 1*l.* or 15*s.*, as the case may be; a ship's fender maker about the same, say 15*s.* I would fix those sums as the minimum which former pupils working at those trades should earn in order to be considered self-supporting; and any pupil who came up to that minimum would pass the Government standard and the school would have the right to payment for that pupil, but the State payment would be less in the case of the mat maker who earns 8*s.* than in the case of the basket maker who earns 15*s.*

10,942. Would you make the payment by the State proportioned to the amount of the earnings of the individual who has passed through the school. Say for instance a man earns 100*l.* a year as a musician, would you give a higher grant to that school in respect of the man who was earning 100*l.* than in respect of a man who was earning 50*l.* a year as a musician?—It would be difficult to do that. The best way would be to lay down a minimum earning for each trade and give the same Government grant in respect of the workers in each trade, whether they earned 50*l.* or 30*l.* a year in the particular trade, it would be much more easily managed in that way, and that would apply to trades, and to music, or any other profession. If the college at Worcester, for instance, could show that a certain number of their former pupils were earning good incomes in various ways (I think there are about nine who are earning good incomes), they would earn the grant that was fixed as the minimum grant for the liberal professions.

10,943. You propose that a different system should be carried out in the case of schools for the blind than that which would be applicable to schools generally, though no doubt in the case of schools for the seeing there are a certain number of failures among their former pupils, and a certain number of those who earn their livelihood?—The difficulty of making the blind self-supporting is so infinitely greater than in the case of the seeing that you ought to offer special advantages in the case of the blind.

10,944. You think the case of the blind so exceptional that you would give this additional grant in order to stimulate the higher and better education of the blind?—I think so; I think that is the better way of giving Government assistance than giving a capitation grant for every pupil. I may say that in America, especially in many of the Western States, where the State gives a capitation grant, a grant amounting to about 40*l.* or 50*l.* for each pupil, I found the education and the after results in the employment of pupils in many cases quite as bad as they are in the worst English institutions; so that State aid, even liberal State aid, is not a panacea for all the evils which we complain of, but I think payments by results would be the much better way.

10,945. You told us that in the Dresden Institution, where blind persons are taught certain trades and earn something in the institution by working at that trade, a part of their earnings, which belong to the Government, is given up by the Government and forms a fund to supply them with means in their after career, so that practically the workmen themselves contribute to a certain extent to the fund. There would be no parallel to that in England except in training colleges; for instance, take Norwood, it would not be a parallel case, unless those who were earning a livelihood by music were to contribute a part of their earnings towards forming such a fund?—In Paris the pupils do contribute themselves to such a fund, and I think that is a most desirable arrangement. In Paris they begin their subscriptions while they are at school, and it is also a very good thing in another respect, because it knits the former pupils together and produces an *esprit de corps* among them which has a good effect.

10,946. Do you not think that in order to make a scheme of that kind successful in England it should depend far more on the contributions of the members themselves than on any State aid?—I hardly think so.

10,947. You think that the State would require to intervene?—I think it is most desirable that the State should intervene. I am perfectly sure that we shall be years and years before this system of looking after former pupils is adopted in England unless we get a fillip from the State. I might refer, as an illustration of the great advantage of looking after former pupils, to what occurred in the case of the smaller States surrounding Saxony a few years ago. Pupils were sent to the institution at Dresden from the smaller States adjoining Saxony, at the expense of those States, and it was found that those pupils on returning home almost invariably failed, although they had had precisely the same education and technical advantages that their Saxon fellow sufferers enjoyed. About 10 years ago it was decided to introduce the system of looking after former pupils in the smaller States which had not been done before, and since this system has been in operation the success of the blind in the States has been quite as great as those in Saxony proper.

T.R.Armitage Esq., M.D.

14 May 1886.

10,948. (*Mr. Few.*) As regards such of the blind as are imbecile, do you make any provision for them at Norwood?—They are not received at all, they go to idiot asylums.

10,949. So that the system that you have been mentioning applies to those who have all their faculties except sight?—Yes, it applies to those who are capable of being trained.

10,950. (*Mr. St. John Ackers.*) You were the founder of the Normal College of Norwood; is it now carried on according to what you consider the very best possible method?—I think we are always making little improvements.

10,951. But at the present time is it to your mind an absolutely perfect model school of its kind as far as your knowledge goes?—The only important change that I should like to be made at Norwood, and which is one which I think we shall make before long, is that the looking up of our former pupils shall be systematically done, that the system shall rest on a permanent basis instead of resting as it at present does almost entirely upon Dr. Campbell.

10,952. You stated that some of your female pupils go out as teachers of seeing persons; can you tell me how how many have gone out as ordinary teachers?—I do not remember any who have gone out as teachers of the seeing except those who have gone out as teachers of music. I can remember some who have become governesses in private families, bu that has been with blind children.

10,953. What would be the average earning of those who have gone out into seeing families as teachers of music?—I could not say off-hand.

10,954. Is the Dresden school a State school?—Yes.

10,955. How is it supported, is it supported wholly out of public funds and the earnings of the pupils, or are there any private subscriptions?—The system in Saxony and in most parts of Germany is this, the education of the blind is compulsory, every blind child in Saxony has to go to school at Dresden, and if the parents are not able to support him the State does, if the parents can do it partially the State supplements the payment of the parents, and besides that there are communes which by subscribing to this institution have the right to send pupils, if they have a blind child among them he will be sent up by the communes.

10,956. Then the State does not supply gratuitous education to the blind except in those cases where it is impossible for the relations or parents of the children to find any portion of the expense?—That is so.

10,957. (*Dr. Campbell.*) You were speaking of the difficulty which you anticipated there would be in introducing this Saxony system and you were speaking also of your experience in 1866, in regard to the state of things then existing with respect to the teaching of music and the confusion of types. When you went to Paris did you find that the musical education there was on a very different basis on account of their having a musical notation there by which the blind could read and write music?—Yes, I found that was one of the greatest causes of the superiority of the musical education of the blind in Paris, just as it would be very difficult to train the seeing as professional musical artists without a musical notation to it, so it is very difficult to train the blind to be professional music artists without a musical notation, the two things run exactly parallel.

10,958. We know that you exerted yourself a good deal in trying to introduce that system into this country, did you find great difficulty in inducing schools to take it up?—Before attempting to introduce the Braille musical notation into a school it is absolutely necessary

T.R Armitage, Esq., M.D.

14 May 1886.

to introduce the ordinary Braille system, because if we do not do that we are attempting to introduce what is difficult before the pupils have mastered what is easy.

10,959. I regard the mastering of the musical notation as the climax. Of course if you are going to introduce the musical notation you must first introduce the ordinary Braille system. Did you find much difficulty in inducing schools to take up the Braille system with that view?—I found the greatest opposition, it has only been adopted within a comparatively few years.

10,960. You referred to the great failure of some of the schools in the Western States of America; is it your opinion that that failure is owing to the liberality of the government grant or to the great confusion which is thrown into those institutions from the fact that they are constantly subject to political changes?—I think with regard to those political changes the system under which the directors and the teachers are liable to be changed with a change of parties works as badly as anything possibly could, but I think the great reason of the failure of some of the schools in America is just what it is here, that the management is incapable. I do not wish to specify any particular school, but if the superintendent is not zealous and not capable, the school of course will be bad, and it will not be any better for a large government grant.

10,961. Is not the case sometimes in America that on a political change a broken down politician may be put over a school instead of a suitable man?—I know a case in the Western States in which one of the very best directors of the blind, a man who knew more about the subject than almost any one else in America, was displaced in consequence of one of these political changes, and the result was that the school from being a first class school under his direction dwindled down to a third or fourth rate school.

10,962. I should like to ask you a few questions with regard to Norwood; is it not the case that in selecting pupils for admission into the institution, or for scholarships, we do not make it a condition that they shall show that they have musical talent?—That is so; what we look to rather is the capability of a pupil to be trained not only in music but in other things; if a candidate for admission is of sufficient general intelligence to make it likely that he can be properly trained in other branches, and if his physical health is satisfactory, I think we never inquire whether he is musical or not, except in the case of older pupils; if pupils come at 15, 16, or 17, or up to 20, in all probability nothing can be done with them except to train them as tuners, and such pupils enter the technical school almost at once. There of course we find out whether they have sufficient musical ear to make it worth while to train them as tuners, but my experience of the blind is that in nine cases out of ten the musical faculty, if it does not appear on the surface, is latent and can be brought out by cultivation.

10,963. (*Dr. Tindal Robertson.*) You are aware that there are many blind schools in this country which are also called asylums?—Yes.

10,964. Do you think that it would be better if that name could be altered, do you think that it is an inappropriate term for them?—The name should be altered. I think it would be better not only to change the name, but to change the thing where it exists.

10,965. In what way do you think that would be best done?—I think the only way that I could suggest in which it could be done would be by the Government giving that kind of payment which I have already suggested, in which of course the asylums would not participate as far as they were asylums.

10,966. Do not you think it would be better that there should be three separate establishments, in the first place for education, in the second place for technical education, and in the third place for keeping the old and infirm people who are not susceptible either of education or training?—I think that would be very difficult to carry out, if not impossible.

10,967. If it could be carried out do not you think there would be an advantage in having such a separation?—No. A time comes in the educational course of a blind child in which it is very desirable to bring him by degrees into technical work; and although in the case of children of perhaps 12 or 13 or 14, it is very undesirable to put them into a workshop and let them work all day at a trade, still it is extremely desirable that they should go in for a short time, that they should be put upon light work, and that the hand and wrist should be gradually strengthened and exercised for the trade they are likely to have to follow and that that should go on concurrently and contemporaneously with the education.

10,968. Do you think there ought to be any admixture of the old and infirm in these establishments?—No, certainly not.

10,969. Those ought to be separated, you think?—As a general rule the old and infirm are much better looked after by being allowed to live at home, receiving a pension than by being congregated in an asylum.

10,970. Do you think that the system, which you probably know exists in some towns, of having a small cottage or perhaps two together occupied by one or more blind people, is better than having a large asylum where there would be perhaps 50 of them altogether?—I thiuk it much better, the nearer you can make a home of the place in which you lodge your old and infirm blind the better, and where it is possible I would always leave a blind person with his other relations.

10,971. You said in answer to the chairman that you would not recommend that Norwood should be a model school for other schools for the blind; do you think it is possible that in other parts of the country, in provincial towns for instance, and especially the small towns, that anything like the education given at Norwood could possibly be given?—I think it is not only possible, but it is being done as far as elementary education is concerned.

10,972. I speak of the whole curriculum at Norwood; do you think it would be possible to establish such an institution with such small curriculum in small towns?—No; a large musical school must be situated in the metropolis, or in some great musical centre.

10,973. We were told by Dr. Campbell that the college was necessarily carried on at a large expense, and, therefore, I suppose that such a college could not be established in small places. You could not have schools or colleges established exactly on that system in small places?—I referred, in my answer to the Chairman, to primary and elementary education rather than to music.

10,974. That leads me to ask you another question with regard to Norwood. Do you think that Norwood itself might fairly stand in the place of a great musical university for the blind, that is, that children from other schools who showed a certain amount of proficiency in music might there obtain the higher training necessary to give them perfection in the art?—Norwood might perform that function undoubtedly, and it would be a great advantage provided the schools which sent up their pupils gave them a thoroughly good elementary musical education. Our trouble at Norwood with regard to pupils coming from other schools is that their general elementary musical education has been so bad that it all has to be done over again. If the elementary musical education of the school was conducted on thoroughly good principles then I think it would be a great advantage. That is already done at Glasgow. Glasgow has adopted the plan of affiliating their elementary musical school to the Norwood College, and the pupils they will send up from there will no doubt be very well trained.

10,975. Do you think if the musical education which was given in other schools was as good as it is in Glasgow it would be an advantage to affiliate those schools more or less to Norwood College, so as to provide promising pupils with the highest musical education?—Yes, a very great advantage. I have advocated that from the first.

10,976. I suppose, in your opinion, the best system of education generally for the blind is one pretty much on the same lines as that for sighted children?—*Mutatis mutandis* just the same, only there is this to be considered, that the hand is to the blind what the eye and hand combined are to the seeing; therefore the training of the hand is immensely more important with the blind than it is with the seeing, and any proper education of the blind ought to be very much hand education.

10,977. But putting aside trade purposes for the moment do you think there is any possible system than that of Braille for giving a good and perfect education to blind children?—I think that reading and writing forms the basis of the education of the blind just as it does for the seeing, and the only system of reading and writing that is worthy of the name is the Braille system.

10,978. You were asked whether when you wished to introduce the Braille system in the first instance you

found much opposition to that, was the opposition which you encountered with regard to the introduction of it as a means of acquiring a knowledge of music, or generally to the system itself?—There were a great many seeing managers and seeing people generally at that time who could not shake themselves loose from the idea that because the Roman system was the best for the seeing therefore it must be the best for the blind. That was the principal difficulty in introducing the Braille system.

10,979. Is that the only reason you can give us for the difficulty that you experience in introducing the Braille system, or do you think there was any other?—There was the usual dislike to innovations, and there were jealousies and so on, but I think the principal difficulty was that to which I have referred; and it continued down to a very recent time. I could mention schools in which the Braille system has only just been officially adopted, and some in which it has not been adopted at all. There was also a fear among seeing teachers that the adoption of the Braille system would give them more trouble, and they did not at all appreciate the enormous advance to blind education that the introduction of a good system like Braille would cause.

10,980. We have been told that the idea of teaching the Roman type *pari passu* with Braille is that it enables blind children to communicate with their relations in the outside world, do you think that that is a good and valid reason for giving the trouble of teaching that system as well as the Braille system?—No, I do not think so, wherever pupils commence with the Roman type and learn it before they learn the Braille, with the view to communicate with the outside world, you will always find that the managers or the principal directors are seeing that they adopt the system which is in accordance with their prejudices as seeing persons. You will not find a single school for the blind throughout the world, where blind directors or teachers have the arrangement of the education, where the Roman type is taught except as a writing system. You will always find where the blind have the choice that the Roman system is not taught, it has been discontinued in all such schools in which it was formerly taught.

10,981. With regard to the Saxon system of looking after pupils after they have left the school, do you anticipate that there would be a somewhat similar opposition to the introduction of that system into this country which you experienced when there was a wish to introduce the Braille system?—I think the opposition would be far greater; the introduction of the Saxon system throws a great deal of trouble on the directors and on all those connected with the school, and human nature always recoils from responsibility and trouble, and therefore I think the difficulty would be very great in introducing that system into this country.

10,982. On the principle of *quieta non movere*?—Then a great many of the present directors in respect of age, intellectual powers, and energy and zeal are totally unfit to undertake any such work, and of course all such men would object strongly to a system which may end in their being superannuated. The principal difficulty is the trouble that it would cause.

10,983. Do you think that the public would be likely to become gradually more convinced of the advantage of the system that you have been explaining, and that time would smooth over those difficulties to which you have just been referring, and that the system will be ultimately adopted?—I think very little doubt that the system would be adopted ultimately, but I think State aid to former pupils who have become self-supporting would be a very powerful lever to move the different institutions to adopt the system, as such State aid would at once meet the difficulty caused by the increased expense involved in the adoption of this plan.

10,984. Seeing that the State does not do anything in the way of supplementing the cost of the higher education amongst the sighted, do you think that it is likely to do it with regard to the blind?—I see no reason why it should not. I take it from the very fact of this Commission being appointed that the State has shown that it is inclined to assist the blind and the deaf and dumb, and if the Commission were to report in favour of a particular mode of assistance which without being any more expensive to the State than a capitation grant, would be far more efficacious, I think the State would be only too glad to adopt it.

10,985. But do you think that the State would be likely to draw a distinction between its blind children and its sighted children, and that whilst it would not give any subsidy in the case of the higher education of ordinary children it would be likely to give it in the case of blind ones?—I think the very fact of the Commission being appointed to inquire into this subject shows that the State considers that the blind are an exceptional class and require exceptional legislation.

T.R. Armitage, Esq., M.D.

14 May 1886.

10,986. Would you propose that the same advantage should be extended to deaf and dumb children, and that they also should be looked after in their career after leaving school, and that the State should in their case give grants according to the results achieved after leaving school by pupils who had been trained in deaf and dumb institutions?—I do not know so much about the deaf and dumb as I do about the blind, but the difficulties with regard to the deaf and dumb are entirely different from those that we have to contend with with regard to the blind. I understand from the evidence which we have had before us from gentlemen who have a knowledge of the subject that there is not at all the same difficulty in finding work for the deaf and dumb after leaving institutions, provided they have been properly trained, that there is in finding work for the blind; with the blind the great difficulty begins after they have left the school and are launched upon the world; with the deaf and dumb the great difficulty is the training in the institution; therefore I think the two classes stand on a different footing in that respect.

10,987. They stand on the same footing in this respect, namely, that according to the evidence which we have had before us the expense of training deaf and dumb children is much larger than that of training ordinary children, and that therefore under those circumstances the State might very properly be asked to assist in the case of the deaf and dumb as well as in the case of the blind?—I suppose the outcome of the Commission will be some form of State aid for the deaf and dumb, but my knowledge of the deaf and dumb is not sufficient to enable me to say whether the particular form of aid that is best suited to the blind is also that which is best suited to the deaf and dumb.

10,988. (*Mr. Johnson.*) I believe you began to turn your attention to the means by which the blind read in the year 1868, when you established the British and Foreign Blind Association?—Yes.

10,989. Are you aware that long before that the Braille system had not only been introduced in schools in England, but had also been recommended in a report published by the House of Commons?—I know that individuals used it; so far as I know the number of individuals that used it was between 15 and 20.

10,990. Had you any means of ascertaining by statistics the number of people who used it in England at that time?—Yes.

10,991. How did you arrive at those statistics?—By correspondence and communication. I think I knew pretty well every one in England who used the Braille type at that time.

10,992. Between 1866 and 1868?—Yes.

10,993. You lost your sight in 1860, and you were six years in Ireland trying to recruit your health; in 1866 you joined the Indigent Blind Visiting Society, and in 1868 you formed the British and Foreign Blind Association?—Yes.

10,994. Before 1868, that is to say, between 1866 and 1868, you say you only knew of from 15 to 20 people who used the Braille system?—Yes.

10,995. Was not it used at all in the schools?—The schools did not use it at all; there was not a single school that used it.

10,996. Did you ever see a report presented to the House of Commons in 1867 on the systems pursued on the continent, and published by authority?—I think I saw it; I do not remember it very clearly.

10,997. I believe that at the congress at York two or three years ago, the proceedings at which congress I believe have been put in, you stated that 30 per cent. of the blind persons who had been taught music did not succeed; is that so?—I could not say what I said at York without referring to the report.

10,998. Do you think that 30 per cent. of those trained in music do not succeed?—I think a very much larger proportion do not succeed, and the proportion varies in a great measure according to the excellence of the teaching they receive at the institution in which they are educated. I believe that there are many schools for the

T.R.Armitage, Esq., M.D.

14 May 1886.

blind which profess to teach music, in which the proportion of successful pupils is extremely small.

10,999. With regard to the constitution and administration of the Royal Normal College, have they got any printed rules?—We have no printed rules; we have written rules.

11,000. You have no public meetings of your subscribers?—Subscribers come to the annual meeting.

11,001. When is the annual meeting held?—It varies.

11,002. At the annual meeting does any discussion take place with regard to the whole management, financial and otherwise, of the institution?—No.

11,003. There is no report given to that annual meeting?—No, the college is managed by the general council and an executive committee.

11,004. Do the general council appoint the executive committeee?—The executive committee is self-elective, subject to ratification by the general council.

11,005. As I understand it the general council is appointed, and then the executive committee is selected from the general council?—Yes.

11,006. The Gardner trustees, we have been told in evidence, give over 4,000*l.* a year to the college?—I cannot tell you the exact sum that they give; it is very likely as you state.

11,007. Do the Gardner trustees have any power or voice in the administration of the establisment after giving so large a sum, or is it given entirely to the executive committee or the general council, and do they distribute it without reference to the Gardner trustees at all?—The Gardiner trustees give it as long as the results are satisfactory.

11,008. As long as in their judgment it is necessary to give it?—As long as in their judgment they are getting a good equivalent for their money.

11,009. They have no representative upon the executive committee or upon the council, have they?—No. They decline. They were asked to have representatives, but they thought it better not.

11,010. Would you be good enough to give the Commission the salaries of all the officers from the principal downwards, as has been done in the case of other institutions?—I could not do so. Dr. Campbell has already promised to do so.

11,011. Taking the last year's balance sheet I see that 15,874*l.* was received, and the subscriptions for pupils amounted to 6,085*l.*; where do those subscriptions usually come from; are they paid from the general fund or are they subscriptions from friends, or parents, for the help of distinct cases?—"Subscriptions for pupils" means subscriptions for individual pupils.

11,012. Supposing that the Government were to agree to give a grant for educational results, and for the pecuniary results from a trade, how do you think such information could be gained as would enable the Government to give such a grant?—As I have already explained I think that all institutions ought to adopt the system of looking after their former pupils. If they did that then every institution would know which of their former pupils were self-supporting and which were not. They would claim the grant for those pupils who were self-supporting, and the Government must see that the return which they make is correct, by inspecting some or all of those former pupils.

11,013. Then, as I understand, you would suggest the appointment of an inspector of the results of work?—Yes, among outside pupils.

11,014. Then of course you would recommend the same mode of Government grant on the educational results as is now adopted in the case of the Government training colleges?—Yes.

11,015. By, I suppose, having especially trained inspectors appointed for the purpose?—An inspector who knows the subject and who knows what he is about, and who would examine the pupils and report what progress they have made, would classify them in standards, and the school would be paid so much for every pupil who had passed a certain standard.

11,016. Do you think it is likely that the Government would consent to make so large a grant as would be required to give such a general primary education as you give at Norwood?—I am not in the secrets of the Government, and I cannot tell.

11,017. But do you think it is possible that the State would give so large a grant as would be requisite?—I think it is very undesirable that they should do so; I should be very sorry to recommend it.

11,018. Do you think it is absolutely necessary that all the blind children and all the coming blind should be educated primarily up to the extent to which they are educated at Norwood?—Yes, I think that the primary and elementary education ought to be equal to that which is given at Norwood.

11,019. Should they be taught French?—I do not think that French can be considered either primary or elementary. I think that the primary or elementary education ought to be, at least, as good as it is at Norwood if we want to get a good per-centage of success.

11,020. Do you think that all the pupils educated in blind schools or in blind asylums or colleges for the blind should be educated in the higher branches of education, such as French, natural philosophy, &c., such as we saw at Norwood?—No; I do not think that a basket maker or a mat maker has any call for French or natural philosophy.

11,021. But I understood you to say that in order to make a blind man or woman self-supporting, it was absolutely necessary that they should have a very superior form of education, and that when they were once thoroughly educated, then they were ready to turn their hand to almost any trade or profession which they might select?—I certainly said no such thing.

11,022. But I suppose that the pupils whom we saw at Norwood the other day, who were so very highly educated, were the ordinary class of educated children that you receive, and that that was the ordinary curriculum of education which you give to every blind person who comes to Norwood?—Norwood is not a school for teaching basket making and mat making.

11,023. Do you think it is necessary to educate every blind person that comes under your knowledge as highly as the pupils of Norwood?—There are a great many blind children who never come to Norwood.

11,024. But do you think it is necessary to educate the whole of the blind children in the country up to the same standard of education that you educate them up to at Norwood?—Certainly not.

11,025. Then where would you draw the line?—All the blind children in the country are not going to be musical artists, or to follow some liberal profession.

10,026. Then all the pupils at Norwood are going to be artists?—They are either going to be artists, or to follow some liberal profession, or some superior calling.

11,027. Then you consider Norwood a superior school altogether to what you would like to establish as an ordinary school?—I consider that the objects which are followed at Norwood are entirely different from those of most of the blind institutions throughout the country.

11,028. And, therefore, you would not require the other institutions to take Norwood as their sole model?—I have already stated that I should not.

11,029. Do you know of any blind person who has been trained as a first-class musician who is now making anything like a large income?—Yes, a good many.

11,030. Could you give us any instances?—You will find a number of them in the Report of the Normal College, with their addresses, and all about them. I can give you others who have been trained at other schools; I can give you instances at Birmingham, and at York too.

11,031. How long do you think it takes to make a first-rate tuner?—Do you mean from the time that a blind person begins in the tuning school, or do you include the elementary teaching?

11,032. I mean the teaching, elementary and otherwise, which is necessary to make a man a tuner. I do not mean the education in reading and writing, and that sort of thing; I mean the education in a technical school?—The shortest time that I can call to mind, in which a man who without any previous knowledge entered the tuning school, went out as a successful tuner, is two years. It generally takes longer.

11,033. Does it take a longer time to make a blind tuner than a sighted one?—I do not think so. I may add, what is rather an important point, that the blind tuners, in order to be successful, must as a rule be better

workmen with a better knowledge of music than their seeing competitors.

11,034. Then they have had some training in music before they begin their training as tuners?—It is very often contemporary.

11,035. Then when they have had instruction in music to a certain extent you put them to the special technical work of tuners?—Yes, generally.

11,036. Do the eight blind teachers at Norwood include the technical teachers as well, or merely those engaged in ordinary education?—That I cannot tell you. Dr. Campbell will draw up a report for the Commissioners in which no doubt that will be contained.

11,037. Could you tell us how many pupils who have entered the college have been paid for entirely or in part by the boards of guardians?—I could not tell you from memory.

11,038. A considerable number?—Yes, a considerable number have been paid for in part; I doubt whether any have been paid for entirely.

11,039. Do you think that blind musicians or tuners compete with the sighted musicians or tuners?—I know that they can if they are properly trained.

11,040. Have you many instances where they have competed with the sighted?—Yes, many.

11,040a. In what particulars have they competed with the sighted as tuners, or as organists, or as pianists?—We will take tuners first. We have large numbers of tuners throughout the country who are holding their own perfectly well in competition with the seeing tuners of the place. Then as organists we have a large number of pupils who have left the college and who have entered into public competition with the seeing, sometimes with very large numbers of seeing competitors, and who as a general rule have beaten all the seeing people and got good appointments. I think that is successful competition with the seeing. There are also a number of our former pupils who are holding their own with the seeing as teachers of music and are making fair incomes. Of course they are in competition with the seeing teachers of music.

11,041. Can you ascertain, and do you ascertain where all your former pupils have settled?—As far as possible; we know most of them.

11,042. You have no register of them, I suppose?—I do not know that there is any special book.

11,043. (*Dr. Campbell.*) There is. I have in my hand the addresses of nearly all of them, and the information will all be completed in a very short time. I think there are only two whose addresses I cannot give.

11,044. (*Mr. Johnson.*) Have you ever ascertained the number of blind organists who are employed in this country?—I have tried to ascertain it, but it is very difficult.

11,045. Have you any idea as to the number?—I have not sufficient statistics to make my answer of any value.

11,046. Do you think that there are more blind employed as organists in England than there are in France, or that there are more in France?—I am sure that there are many more in France than in England.

11,047. Does the State help any of the musical pupils when they leave the institutions in France?—No.

11,048. The French Government take no care of them, do they, after they once leave the institutions?—The French Government does not, but the institution does.

11,049. What is the scriptural education at Norwood; do you have any visits from clergymen?—We have already had that in evidence; but I will answer it again if it is necessary.

11,050. I think what we had in evidence was that they went to a church or other place of worship wherever their friends selected that they should go. I ask whether there is any course of religious instruction given in the College at Norwood?—There is religious instruction certainly in the College.

11,051. Religion is part of the education?—No doubt it is.

11,052. Are there prayers night and morning?—They have evening prayer at 7 o'clock, and they have morning prayer at a quarter to seven.

11,053. Are the majority of your pupils members of the Church of England, or Nonconformists?—A little less than one half of the entire number are members of the Church of England.

T.R.Armitage, Esq., M.D.

14 May 1886.

11,054. Are there any Roman Catholics?—There have been; I am not quite sure whether there are any now.

11,055. Are there any Jews?—There have been Jews.

11,056. Is not sending those different people to their respective places of worship attended with great difficulty?—No, they are sent with either a teacher, or a servant, or some guides.

11,057. Do all the Church of England pupils go to one church, and do the dissenters go to another, or do they go wherever they have a fancy to go?—They go to different churches, wherever their friends wish them to go.

11,058. But does it not entail a great deal of difficulty in a large institution sending half a dozen pupils to one place of worship, half a dozen to another, and half a dozen to a third?—I do not know that it is so difficult. In the first place there are a large number of Presbyterians from Scotland in the college, and there is a Presbyterian church opposite the door. Then there are Church of England places of worship, and places of other denominations which are very near. There is no difficulty in that respect.

11,059. I suppose you have no chapel in the establishment?—The music hall is used as a chapel.

11,060. There is no Sunday service in the chapel, is there?—There is a short afternoon service at 5 o'clock on Sundays.

11,061. I suppose it is for those who could not go to church on account of its being wet or for any reason of that kind?—No, it is always so.

11,062. Is there any examination in religious subjects by your examiners.—I do not think so at the college. That we leave to the religious bodies, and the Sunday schools, and so on which they attend.

11,063. There is no rule that the pupils of the institution should be examined as regards their religious knowledge?—I think not.

11,064. The school is perfectly unsectarian?—It is quite unsectarian.

12,065. We have heard that the pupils of the Norwood College give a certain number of performances at St. James's Hall and elsewhere and that they give very excellent performances; does that succeed financially?—Some of them do and some of them do not. We give concerts on behalf of a great many different societies, whether blind or otherwise. Those concerts are got up by the society for which they are given, and as a rule they prove fairly remunerative. The Normal College has given an annual concert for the Indigent Blind Visiting Society for a great many years and we always derive some 16*l.* or 20*l.* from it.

11,066. Do you deduct the expenses of those public performances from the payments?—The college simply furnishes performers for the concert. All the arrangements have to be made by the society for which the concert is given.

11,067. And the society pays the expenses?—The society pays it.

11,068. That is to say that they would pay the travelling expenses of the pupils?—I mean that after all the expenses are paid the Indigent Blind Visiting Society nett somewhere about 16*l.* or 20*l.* by the annual concert that the Normal College gives.

11,069. Do the concerts in which there is a certain assistance by sighted musicians mixed with the blind prove a financial success?—If the expenses are heavy such a concert may not be, and very often is not, a direct financial success; but now, I think, you are alluding to quite a different kind of concert.

11,070. I asked, first, whether these concerts succeeded financially, and you told me that in the case of those concerts which are got up for the benefit of these charities the charity pays the expenses, and there is something over for the charity. Now I ask whether the concerts which have been held at St. James's Hall, and at which I have myself been present, where there have been a very large number of sighted orchestral musicians who performed part of the concert with the blind are a financial success?—My answer to that is that the two classes of concerts are entirely of a different kind. The concerts that we give at St. James's Hall are college concerts, concerts which are organised by the college,

T.R Armitage, Esq., M.D.

14 May 1886.

and which are not given with a view of obtaining money for another society.

11,071. But if you get anything out of it it is for yourself?—Exactly.

11,072. Are those concerts a success which are on foot and carried out by the college and for the college, if there be any profit upon them?—If we have to pay a large orchestra of seeing musicians it generally happens that it is not a direct financial success, that is to say, the immediate proceeds of the concert do not generally cover the expenses. But those concerts are most valuable, as enabling the public to form an opinion of what blind musicians are, and if you ask me whether they are an indirect success I answer that they pay themselves over and over and over again indirectly.

11,073. In your opinion is it necessary that sighted musicians should be added to blind musicians to make a concert effective?—That entirely depends upon what the concert is.

11,074. I am talking about those concerts which you give with the assistance of sighted people. Do you think it is necessary in such concerts as you have given at St. James's Hall to associate sighted performers with the blind performers?—I think it very often draws the public, which is what we want to do; we want to draw a large audience.

11,075. And you think that the public would not be drawn by an orchestra of blind people alone, but that they must have some sighted people as an adjunct to their attractiveness?—That is quite another question.

11,076. But that is a very vital question. Do you think that the blind performers alone would be as attractive as they would be when associated with very first-class sighted musicians?—It is scarcely possible to answer the question in that form. We decide to give a certain piece, an orchestral symphony of Beethoven's for example; we can furnish all the voice, piano, and organ parts, but we cannot furnish the orchestral part, that is to say we can supply the highest class of performers for the voice, piano, and organ parts, but we cannot furnish the highest class of performers for the orchestral parts. Therefore if we want to have the whole concert uniform, we take seeing orchestral performers.

11,077. Then you think that adding the seeing performers to the blind performers makes the concert more effective and more paying than it otherwise would be?—I think so as a rule; but the principal object of combining our blind pupils with first class seeing musicians is not to raise money, but to overcome the prejudice that exists in the mind of the public against the blind, whom we wish to be considered as standing on exactly the same footing as seeing musicians, to be judged of by the merits of their performance without any reference to the accident of their blindness. When a blind musician takes the piano part of a concerto with such eminent artists as Joachim and Piati as his coadjutors, and acquits himself as well as any seeing musical artist of high standing would do, then the musical profession acknowledges him as taking high rank in the profession and the public will follow. This will lead to profitable professional engagements as a pianist, organist, or vocalist, as the case may be, and good teaching engagements will follow as a matter of course. It will not only be of use to Mr. Hollins that musical critics cordially admitted the excellence of his performance in St. James's Hall lately, but every such performance makes it more easy for other blind musicians of high talent to obtain a hearing from a London audience in a first class concert.

The witness withdrew.

Professor WILLIAM H. CUMMINGS, Esq., examined.

Prof. W. H. Cummings, Esq.

11,078. (*Chairman.*) You are professor of singing at the Norwood College?—Yes, I am.

11,079. Have you been there since its formation?—I have been there nearly five years.

11,080. How many lectures a week do you give?—I attend there two days in the week.

11,081. To how many classes do you give instruction?—I have a large number of classes, from the most juvenile to the most advanced.

11,082. The entire training of the pupils in singing then is confided to your charge with others under you?—Yes.

11,083. Have those who train the children under you been themselves taught by you originally?—Some of them. There are pupils who teach, and they have all of them been under me.

11,084. So that the whole system of the school is under your control?—Yes, so far as the singing is concerned.

11,085. Do you find that the blind pupils under your charge are, as compared with other pupils that you have, equally intelligent and equally gifted?—Quite so.

11,086. Have you met with any exceptional musical ability and power of voice amongst the blind people?—With exceptional musical ability, Yes, but not with exceptional power of voice. I think that the power of voice depends very much upon physical training, and that is just one of the things in which very often the blind are deficient.

11,087. You mean that power of voice depends upon robustness of constitution?—Yes.

11,088. And of course the blind labour under great difficulties in maintaining or attaining that robustness?—Quite so.

11,089. Do you think that there will always be that difficulty in their way with regard to singing?—Not if they are taken in hand early in youth, and their constitutions well trained; then, of course I should expect the voice to progress in proportion.

11,090. Do you think that the constitution of blind children can be strengthened by physical exercise, so as to put them on a level with other children?—Yes, quite. I would supplement that by saying that amongst my blind pupils I have some young men who have good constitutions and their voices are exceptionally good, quite beyond the ordinary run of sighted people, comparing age with age.

11,091. Do you believe that everyone has a voice if it is properly trained?—Yes, but I would not like to say that the result would justify the training of every voice.

11,092. It would not be worth the expense or trouble?—That would be a question for the parents or guardians to decide.

11,093. Do you think with regard to those at Norwood that their voices are sufficiently good to justify the pains that are spent upon them?—Yes, I think so in this way: that the cultivation of the voice in their case assists their general training; that whether they sing or whether they become pianoforte tuners, in any case the ear must be trained, and that the learning to sing is the very best means of cultivating the ear.

11,094. Therefore, looking at it from a purely musical point of view, the very fact of giving them that training is good for them as blind people?—I think it is indispensable.

11,095. Would you therefore advocate that all blind persons should be taught singing?—We have sometimes found a child when it first came apparently without ear, and by assiduous cultivation it has soon attained the power of ear sufficiently to be able to sing a scale. So that I am sure it is right.

11,096. Is each child taught individually, either by yourself or by those under you?—Yes.

11,097. As well as being taught to sing in chorus?—Quite so. I test all the voices separately, and then I take them collectively, but I teach chiefly individually.

11,098. Do you think that by the time they leave school many of them have voices which would be good, commercially speaking?—Certainly.

11,099. Sufficiently good to enable them to earn some sort of livelihood, either by singing in public or by singing in choirs in churches?—Yes, and also if they become organists they are able to teach the choirs, which of course they could not undertake unless they themselves sang.

11,100. Is the music also under your instruction in connexion with the singing?—Only the vocal parts.

11,101. Have you followed the success of any of those who have been your pupils after they have left the institution?—Yes.

11,102. Have you found some who have succeeded?—Admirably.

11,103. Either as teachers, or as gaining their livelihood in other ways?—Yes, as teachers and as organists. There are several such instances.

11,104. Are there any who have become permanently attached to choirs, or who are in any such way earning their livelihood?—I cannot mention any at present, and for this reason: I think that they have all of them learnt the organ, and they get a better position as organists because they are able to teach as well.

11,105. Are you speaking of both girls and men?—Yes.

11,106. Do you think that the position of organist is a position for which the blind are more suited than any other in regard to music?—My experience is that the concentration of the faculty enables them certainly to distinguish sounds where they are cultivated with a greater nicety than any sighted person.

11,107. But I asked you whether they were more fitted for organists than for any other branch of the profession?—I would not say that, because I think they are admirably qualified to sing in choirs.

11,108. But you say that there is not so much demand for singers as for organists?—Because at present there is a very great prejudice against blind people.

11,109. Have you in your experience in London known any blind persons get situations as members of a chorus in a theatre or opera house, or any similar institution?—Better than that. I can mention instances of some of the pupils who sing solos in oratorios. Mr. West has made a very distinct mark in singing in oratorio in different parts of London; and I saw only this very week the announcement of one of the old pupils singing as the chief solo singer in the Messiah.

11,110. Was that at the Crystal Palace?— No, it was in the neighbourhood of the Crystal Palace, but it was not connected with the Crystal Palace at all.

11,111. The pupils under your charge visit the Crystal Palace whenever there is any good singing, do they not?—Yes.

11,112–13. And you consider that a valuable assistance to your work?—Most important.

11,114. I suppose that hearing good singing is almost as important as good teaching?—Certainly. You imbibe music, there is no doubt about that. I do not think that at present we have got anything like the result out of the school that will probably come by-and-by, for this reason: that so many of the pupils who have come under my observation have come there at rather an advanced age. I look for a greater result by-and-by when the little ones who have come in as tiny children have grown up.

11,115. At what age do you think that they ought to begin to learn to sing?—Certainly not later than six or seven. I commenced in St. Paul's Cathedral at the age of six and a half as a choir boy.

11,116. You do not think that under proper tuition there is any fear of the voice being over strained?—Of course it all depends upon the tuition being proper.

11,117. But with regard to the blind you think it is of primary importance that they should begin to learn to sing young?—As soon as possible; just as soon as they begin to learn to read.

11,118. You think it has a good moral effect in giving them confidence, and making them feel that they can do what other people can do, and as successfully as other people can?—Yes.

11,119. Do you think it is of great importance in brightening and stimulating the character generally?—Not only their character, but also their very faces improve under the training.

11,120. Is there anything that you can say with regard to the general curriculum at Norwood bearing upon singing or music?—The only thing that strikes me is that we are undermanned. I am there only two days in the week, and I go there greatly from the love of the thing, indeed I make a large sacrifice in going there as compared with any other work; but I do it because I like it, and am interested in the work. What they really want is not me, but somebody like me or a dozen like me every day in the week. They want more teaching. They want it constantly, every day in the week, all the year round. Of course with the immense number of pupils we have, it is impossible to do for them all that one would wish.

Prof. W. H. Cummings, Esq.

14 May 1886.

11,121. What are the hours in which you give instruction?—On Wednesdays from 9 till 6, and on Saturdays from 9 till 1; and occasionally at extra times, when there is something special going on, I am only too glad when I can find time to run up and do something.

11,122. (*Dr. Tindal Robertson.*) You said something with regard to taking them young; is that in consequence of the advantage of getting the vocal cords of the larynx, when they are still in a flexible state, into a condition to render them more open for singing?—I do not regard it so much in respect of the voice as generally with respect to the musical education. That is very important. Amongst other pupils I have had Mr. West, whom I mentioned just now. He was a little late in beginning, and, therefore, he has not done what he might have done with his magnificent voice. If he had begun as a youth, and had been prepared musically before I took him in hand, I could have made him ten times as good.

11,123. Was Mr. West at any other institution before he came to the college?—I am not sure; I think he was. Then I can mention another instance: a man in the school of the name of Fairchild. He has a superb voice, but he came from some other school, where I imagine that he had not been taught at all. Of course it is very uphill work when you take a man at 22 or 23 years of age, when he has not learnt even the ordinary reading and writing, and begin to teach him.

11,124. Excluding the fact that it is necessary that they should have longer musical training, do you not think that a person beginning at that age has lost a certain amount of flexibility, so far as the organs of speech or voice are concerned, and that that would render the person less likely to be a good singer afterwards?—That would be so to a certain extent, but not so much so in the case of a male voice, because the voice changes at the age of 14, or 15, or 16. With a female voice of course it would be better to have early training with the voice also.

11,125. I suppose you do get children at Norwood at times from other institutions?—Yes.

11,126. What kind of training do you find they have had, so far as singing is concerned?—In all cases I have found that they have had practically no training at all They have sung hymn tunes, and so on, in chorus, but they have had no individual training whatever.

11,127. Has there been any attempt to train them scientifically?—Not the least, so far as I discovered

11,128. Do you make any use of the musical notation by the Braille system in your teaching?—Yes.

11,129. Have you found that that is advantageous?—I could not possibly do without it; I would not undertake to teach without it. My complaint of the ordinary teaching is, that people teach by ear, whereas we teach, as you would learn yourself, by sight.

11,130. Then you attach importance to the taking up of the Braille system generally as a means of musical education for the blind?—Yes, I cannot conceive any musical education of the blind without it; it would be impossible.

11,131. Do you think that there would be an advantage gained to blind children generally if that system were taught even in a smaller degree in the blind schools in the country, and that then the children should be sent to Norwood to get the higher musical education there?—I think it would be a very great advantage for all schools to adopt and use it. It would be an advantage to the children wherever they went.

11,132. And would it not facilitate very much the higher teaching which you give at Norwood if that was done?—Yes, certainly.

11,133. (*Dr. Campbell.*) Pursuing this subject of the Braille system of musical notation, the facilities of musical education have increased, have they not, within the last three or four years from the publication of the various volumes of studies and songs, and other works that have increased very rapidly, so that musical education is now far more feasible than it was even five years ago?—Certainly.

11,134. In your teaching classes, and as you know also in regard to other classes in the institution, if we

Prof. W. H. Cummings, Esq.

4 May 1886.

have any music to learn which has not been printed in Braille, the pupils write it first and then study it?—Always.

11,135. So that the pupils at the College are trained to all intents and purposes as thoroughly in regard to reading music as the pupils at the Royal Academy of Music, or at any other good school of music?—Precisely in the same way.

11,136. Do you consider that taking our musical work on the average it compares favourably with that at the best musical schools, such as the Royal College of Music, the Royal Academy of Music, and so forth?—Certainly, it compares very favourably indeed.

11,137. In regard to those people who you said were singing in oratorios, you gave Mr. West as an illustration; I think that in the course of a few months we have had Mr. Wilmot, Miss Samuels at Melbourne, Mr. Moncur, and several others who have taken part in a number of oratorios as solo singers?—I did not mention the name of Mr. Wilmot just now; it did not occur to me, but he does make his living entirely by solo singing and teaching.

11,138. Are you aware that his income last year was over 200*l.*?—I should imagine that it was a little more than that; I should think it is a little under stated at that; I should have put it at 300*l.*

11,139. We every year give large and important classical concerts with first-class orchestras and first-class musicians; do you consider that the whole course of our business in that respect has helped to raise in the estimation of the musical profession the abilities of the blind to cope with musical problems and to make music a true profession for the blind?—Certainly; I am sure that it has done so.

11,140. Do you think that we could in any other way have raised the appreciation of the talent of the blind; would it have been possible to have brought out the appreciation of what the talent of the blind can be developed to without adopting some such course as that?—No, not at all. The prejudice against the blind was very strong a few years ago, and advertisements used to be inserted in the musical papers when an organist was required: "No blind men need apply." I myself have many opportunities of bringing vocalists before the public as conductor of the Sacred Harmonic Society and otherwise; but there is an objection to blind singers simply from prejudice; concert givers are afraid that people will not like to see them, or that there will be too much pity. All that will have to be overcome. The only way to overcome that is to enable the Normal College, or some such institution, to perpetually give concerts of a high class until the public and the profession are forced to recognise that blindness is not an obstacle.

11,141. Are you aware that after our recent tour to America, in the course of which we gave several important classical concerts with orchestras, one of our artists, Mr. Hollams, had so many engagements offered to him that it would pay him very handsomely to go on a tour for that purpose?—I saw that mentioned in one of the American papers.

11,142. Taking an organist that you know, one of your pupils at Norwood, Mr. Schweier, are you aware that when he went to compete for the situation of organist they refused in the first instance to allow him to compete with 59 competitors because he was blind; but that afterwards they let him play as the sixtieth competitor, and that after they had heard him, he won the the competition over the 59 seeing competitors?—Yes.

11,143. And that since that time he has formed a large musical society and conducts both chorus and orchestra?—Yes, I have been present, and have sung the solos at one of his performances and admirably he has conducted it.

11,144. You find in your teaching that one of the greatest difficulties in enabling the blind to come forward as artists is not so much the want of training of the voice itself, which can be easily done, but the facial expression, and the management of the body, in other words what we should term the graces?—Yes, what is called deportment; that is the most difficult part.

11,145. Therefore, if we begin with young children in the primary training of music we shall have far greater chance of success?—Yes.

11,146. So that is why you look forward when we get our primary children through the college to a time when our chances of success will be far greater than with any of those who have previously gone out?—Certainly. I may mention that Mr. Schweier has only recently taken the highest honours at the Royal Academy of Music and at the College of Organists in competition with sighted people; while they have failed he has succeeded. He has passed the most difficult examinations at the Royal Academy.

11,147. Did you see the notices that we had sent from Melbourne a short time since, in which Miss Samuels, one of your former pupils, was spoken of after she had taken part in several performances in some of the principal oratorios, the Messiah, the Creation, and so forth, as the leading contralto of Melbourne?—Yes.

11,148. (*Dr. Armitage.*) You say that you think that a much better result than we have hitherto achieved would be brought about as soon as our younger pupils complete their course?—Yes.

11,149. Do you think it is desirable that in other schools for the blind the elementary teaching of children should be conducted on the same lines as ours, that they should receive thoroughly good training as children, in order that they may have a better chance of success when they come into a higher college like the Normal College?—It follows of necessity that it must be so; there cannot be a doubt about that. There would be time saved if they began in the proper method; they would then have nothing to unlearn, and they would simply progress immediately they came in.

11,150. Do you know the plan that the school at Glasgow has adopted in that respect?—No, I do not.

11,151. That is under the management of one of our former pupils, Miss Inskip; have you had any opportunity of forming a judgment whether she is doing her work well?—I have not.

11,152. Do you think that is a plan that is likely to be successful in other schools?—The reports that I have are very favourable, indeed, that she is doing very well. I am quite sure that it would be a very good thing, indeed, to take a thoroughly efficient blind teacher for the small children in other schools.

11,153. There is a difficulty, is there not, in the employment of blind women?—Yes, as to finding sufficient employment for them.

11,154. Do you think it would be a good plan to train blind girls specially with the object of bringing on the blind pupils in other schools?—Yes, and I would say also that the blind girls are extremely well able to teach the pianoforte and singing to sighted people. I myself recommend them occasionally, and I find that sighted pupils get on very well when they are taught by the blind. I recommended the daughter of Sir James Douglas recently to one of the blind pupils at the Norwood College, Miss Campbell, and she has made most admirable progress under her.

11,155. My question referred rather to raising the musical education of the blind throughout the country by the employment of pupils trained at the Normal College to take the elementary musical teaching; do you think that would be a good plan?—That would be the best plan, I think.

11,156. (*Chairman.*) Are you speaking of music or of singing?—I was speaking of singing in that case, but I can also mention instances where I have recommended the pupils for teaching the pianoforte. I should not hesitate to put my own children under them; I consider the teaching very good.

11,157. I think you have a son who is studying music?—Yes, he is in Leipzig.

11,158. What school did you choose for him?—I preferred sending him to the Royal Normal College, because I knew that he would have thoroughly good training there.

11,159. Is your son sighted?—Yes.

11,160. Was he educated there?—He did all his pianoforte and harmony commencement there; he is now continuing his studies in Leipzig, but I sent him first to the Royal Normal College, because I knew the teaching was good. I had, of course, the choice of the Guildhall School of Music, the Royal Academy of Music, and other places.

11,161. Were you satisfied with the progress that he made at the Normal College?—Thoroughly.

11,162. Do you think that it would be a good plan to extend the system, which I believe is already adopted, of taking in seeing pupils at the college, and letting the girls who have nearly finished their education teach them?—Yes, I would go even further, and add that if to a certain extent sighted pupils could be mixed with the blind pupils at the Normal College, in order that that the blind might come more in contact with sighted people, and become like them in their manners and ways, I think it would be a great gain.

11,163. (*Chairman.*) You mean for general education as well as for music?—I am referring particularly to music. I cannot speak about the general education. I know from my own knowledge that it would be good both for the sighted and for the blind.

11,164. You are alluding, I suppose, to day scholars coming in?—Yes, certainly; I think it would be a very good plan musically.

11,165. (*Dr. Armitage.*) You think it would be an advantage to the seeing pupils?—Yes, quite so.

11,166. Then I judge from your answer that you consider that it is a scheme that is practicable?—Quite so. I should say about the singing of the blind in chorus that I have a good deal to do with chorus singing, and when the blind have once learned their music, as they do by reading it, they never make a mistake. Sighted people will learn it very well indeed, but they are given to looking about at the audience, or something of that kind, and I find they make a great many mistakes which they should not make.

11,167. Do you find any difficulty in conducting a blind choir?—Not the least in the world.

11,168. Do you find it necessary to beat audibly?—Not audibly to the ordinary person, but the blind understand the beat. It needs nothing more than a tap no louder than a fly touching a window; that is quite sufficient. It must be audible, but no one would hear it who was not in the secret.

11,169. (*Mr. St. John Ackers.*) Have there been any sighted pupils with the blind except your own son at the Normal College?—Yes.

11,170. About how many?—Very few. I give once a week what we call a lecture, but what is more an exemplification of the art of breathing and voice production; I can do that with a large class collected together in the hall, and I frequently see sighted people who come as a special privilege to get some few hints how to manage the voice.

11,171. Is that on the Wednesday?—On the Wednesday.

Prof. W. H. Cummings, Esq.

14 May 1886.

11,172. (*Rev. Mr. Sleight.*) Have you had much experience in teaching the blind singing, apart from Norwood?—None at all.

11,173. Taking them as a class throughout then, you cannot say whether they have always voices that can be trained for singing, so that they might be able afterwards to get a livelihood by it?—I have been to many blind schools all over over the kingdom, and the continent too, and I can say that they have the same facilities of voice as sighted people. I have not taught in those other schools, but I have heard.

11,174. You spoke about the prejudice against blind people's singing; is it not a fact that in some cases great sympathy is shown to them, and that it is rather from the fact of people showing this sympathy that good attendances are attracted to concerts?—Yes.

11,175. I know a blind young woman in my district, and if I was to have her to sing at one of my parochial concerts she would attract an audience from the very fact of her being blind?—Sympathy probably in such cases degenerates very often into pity. But the question just now put to me referred to church choirs chiefly, and I was speaking of those. I can give an instance from my own neighbourhood at Dulwich. We wanted to improve our choir in a church which I am very much interested in, and I proposed that the very defective element of the choir boys should be supplemented by boys from the Norwood College. The thing was carried apparently by the committee, but the clergyman stopped it immediately by saying that it was contrary to the usages of the Church of England to have blind people singing in the choir.

11,176. I knew a church at Brighton in which the choir used to be supplied entirely by blind children from the blind school?—It ought, I should think, to be very good. I can give you an instance of a blind clergyman. The Dean of St. Asaph was a blind man, and he was one of the best readers and preachers I ever heard.

11,177. (*Mr. Johnson, through the Chairman.*) Have any of the blind pupils taught under you been employed by the Sacred Harmonic Society to sing in public?—No, but I am hoping that they will be by-and-by. I am conductor, not director. The direction is really in the hands of the committee, and they have the control of the engagements.

The witness withdrew.

Adjourned to Wednesday next at 11 o'clock.

32, Abingdon Street, Westminster.

Wednesday, 19th May 1886.

PRESENT:

THE RIGHT HON. LORD EGERTON OF TATTON IN THE CHAIR.

ADMIRAL SIR E. SOTHEBY, K.C.B.
W. TINDAL ROBERTSON, ESQ., M.D.
B. ST. JOHN ACKERS, ESQ.
T. R. ARMITAGE, ESQ., M.D.
W. AUCHINCLOSS ARROL, ESQ.
F. C. CAMPBELL, ESQ., LL.D.
E. C. JOHNSON, ESQ.
THE REV. W. BLOMEFIELD SLEIGHT, M.A.

CHARLES E. D. BLACK, ESQ., *Secretary.*

MR. ANTHONY BUCKLE, B.A., examined.

Mr. A. Buckle, B.A.

19 May 1869.

11,178. (*Chairman.*) You are the manager of the Wilberforce School for the Blind at York?—I am superintendent.

11,179. For how many years have you been so?—Sixteen.

11,180. You took an active part in the getting up of the conference that took place at York in the jubilee year 1883?—I was the secretary to the conference.

11,181. Did any special results follow from that conference with regard to the education of the blind; were any valuable results obtained?—I think probably we helped forward the Grosvenor meeting, which passed a resolution requesting the Government to cause an inquiry to be made.

11,182. You led up to the meeting at Grosvenor House, you mean?—I think we helped to forward it.

11,183. What is the character of the education at the York School?—I should call it a good sound elementary education.

11,184. Do you use a variety of types?—Our pupils begin by Moon's type, and then go to Braille, which is used throughout the whole school; and those with the

Mr. A. Buckle, B.A.

19 May 1886.

finest touch are able to read some of the Roman type as well.

11,185. Do you find the Roman type useful for writing in order to make them correspond with their friends?—We write it in lead pencil type. I have got some samples which I should like to put before the Commission, written by the Guldberg apparatus (*producing the samples*). I consider that a blind pupil who is able to write Braille and this Guldberg lead pencil type is thoroughly well fitted for all writing purposes; he can use the Guldberg type for corresponding with seeing people, and the Braille type for corresponding with the blind.

11,186. Have you a machine for writing the Guldberg type?—This is the machine (*producing it*). I may say with regard to the Guldberg machine that I teach a class myself with it; I have simply taken a class as I have found it, consisting of the dull boys and the quick boys and the girls too, and I have not yet found a pupil who could not learn to write with it. I have a remarkable case in my mind of one boy who came to us out of Wales; the poor lad was wretchedly dull and slow with his fingers, and he learnt to be one of the best writers in the school. So that I can say distinctly that this apparatus is one that can be used by all blind persons.

11,187. Does it take a long time to teach it?—In about six months, with an hour's lesson per week, an ordinary pupil will learn to write the whole of the small letters of the alphabet. By this apparatus we can make not only the small letters but the capitals and all the figures.

11,188. Is it entirely by moving these little slides that it is done?—Yes, entirely. I could show your Lordship how to make a letter if you would like me to do so.

11,189. Afterwards we will ask you to do that. What are the ages at which you take pupils?—Our limit is from 10 to the end of the 16th year, and we do not keep them beyond 20.

11,190. And what portion of that time is devoted to education proper and what to industrial training?—They never give up their education proper, and that is one great advantage, I think, of our system of special blind schools.

11,191. Is half the time given to industrial training?—Not half the time. On a boy's admission to school, and for two or two and a half years, or even for three years, he remains entirely in the schoolroom. Then he begins work, and works for half the day and is in school half the day; afterwards for the last part of his time he works the whole of the day in the workshops, with the exception perhaps of an hour in the school; so that the mental education of the boy never ceases; and I have no hesitation myself in saying that the education of a blind boy in a special school like our own is better than the education of his seeing brother at home.

11,192. When do you begin to give them an industrial training, at what age?—At about 13 or 14.

11,193. And are the workmen that you turn out successful in obtaining their livelihood in after life?—They have been, a good many of them.

11,194. Have you any list of the successes and failures in that way?—In 1883, when we were celebrating the jubilee of the school, I went through the names of 456 pupils of the school, but I must premise my remarks with regard to the numbers by saying that perhaps the statistics are not entirely to be depended upon; that is to say, I had to gather the information from others who knew the old pupils and knew how they had done, not in every case from the pupil himself; but I think it would furnish a tolerable estimate of the success of these 456. Fifty of them I found had been successful in music; 45 as basket makers; 26 at other occupations not learnt at the school.

11,195. Is begging included in that?—Certainly not.

11,196. You do not call that an occupation?—We do not call it an occupation at York. Then I found that 18 had been successful in brushmaking; and 44 females were employed in various ways at home, and some of them in institutions. That makes 183. Then I found 58 were dead, and I could not get any account of them; 57 I could get no account of at all; 36 I put down as failures, that I knew distinctly to be failures; which makes 334 out of the 456. Then 122 of the pupils I ascertained had left the school before their education had been completed for various reasons. So that really I think there were 183 successes out of 334, which is about 50 per cent.

11,197. Were those that made their livelihood by music making it as teachers or as tuners?—As tuners and organists and teachers of music. In the report for that year, 1883, which I should like to call the attention of the Commission to, I have put the names of about 50. It begins at page 20.

11,198. Have you been able to ascertain whether any of your pupils have gone on the streets?—I think I have heard of one or two instances.

11,199. Not more than one or two; there is a large number in your list that you cannot account for?—Yes, that is to say I have no information about them. I have put down the 36 failures; they will be down amongst the failures if there are any of that character; and the 57 not known I have really no information at all about.

11,200. Do you teach all your pupils music?—They all learn to sing the hymns that we have at our morning and evening prayer. Then those who have any musical ability are instructed in part singing, solo singing, the pianoforte, and the organ, and of course in the theory of music. We sing the whole of the choruses of the Messiah, and a large number of glees and part songs and other music. I have furnished in the paper before you the statistics relating to our music.

11,201. You have 24 pupils now receiving instruction in music?—Yes.

11,202. In the higher class of music?—Of course they begin with simple things on the pianoforte and organ, and then, if they show any ability, they go on to the higher class. For instance, we have one boy now, whom I have mentioned there, who plays to the satisfaction of Dr. Naylor, who is the organist of York Minster, a very well known musician. This boy plays six of Mendelssohn's sonatas on the organ quite to Dr. Naylor's satisfaction; he plays 40 of Mendelssohn's songs without words, some of Beethoven's sonatas, some of Mendelssohn's fantasias, and a large quantity of other music.

11,203. You state that the capital is 46,858*l.*; that is including everything?—Everything; but the expenditure for the last official year is asked for on that paper, and ours was an extraordinary year. I have made a note about that.

11,204. In your expenditure you have spent a special sum of 3,854*l.* for the purchase of property?—Of the Manor House.

11,205. Is that adjoining property?—No, it is the place where the school is held; it was Crown property, and we accomplished the purchase of it last year; so that that makes the expenditure for the last financial year an extraordinary one.

11,206. Are your teachers principally sighted?—Principally; our head teachers in all cases; we have some blind assistants, except as to the teaching of tuning, which is managed entirely by Mr. Strickland, who is a former pupil.

11,207. Have you generally obtained situations at once for those whom you have trained in music in your institution, or do you send them up to London for any further musical education?—I think I may say we have not considered it our duty to find situations for them; we have usually left it to their friends.

11,208. And, as a matter of fact, have they been successful in finding situations for them?—They have, as a rule. There are cases where they have had to wait for some time, but as a rule they have found something to do, and from small have got on to greater success.

11,209. Although it would add to the trouble, would it not be a very great advantage to the blind that the institution where they have been brought up should endeavour to find situations for them?—Quite so. I feel myself, and I should like to express it to the Commission, that one of the great things needed in the present day is that blind institutions should take a more active interest in their former pupils after they have left them. I think that much more should be done in that way. We are endeavouring to do a little more just now.

11,210. Have you sent up any pupils to the Norwood College?—They have not been sent directly by us, but some have gone. I can only remember five, I think, just now.

Mr. A. Buckle, B.A.

19 May 1886.

11,211. Those were sent entirely independent of the institution?—Yes, they were sent by their friends entirely.

11,212. Had they any special musical ability?—Considerable. One of them, Stericker, had received instruction in music with us for five years, I think; Dr. Campbell would tell you, he was really a very nice organist when he went; he could play pieces from Mendelssohn and Mozart, and other difficult music. Then another boy, Hollins, who had been with us three years, had received a tolerably good grounding in music.

11,213. Are you acquainted with the character of the musical education given at Norwood?—Yes, I know the Norwood College very well indeed.

11,214. Is the education at your school conducted on somewhat the same lines, of course allowing for differences of situation?—The only difference between the musical education of our school and the musical education of Norwood, I think, would be that Norwood spends a larger amount of money in getting a higher class of teachers. The pupil I have mentioned, for instance, on the paper before your Lordship, is a boy whose proficiency will be evidence of what our system produces. Dr. Naylor told me he was perfectly astonished at the way in which the boy executed his organ pieces, and he has learnt them all at the school.

11,215. Do you have teachers from the outside to give lessons?—Our head music-master is Mr. Barnby, who is a teacher of music in the city. He teaches four afternoons per week in the school; his assistant is Mr. Strickland, an old pupil of his, who is blind, and who has been in the school for 50 years. Mr. Barnby also has taught 50 years. Then we have a reader, who spends on an average about an hour a day; he reads to the pupils who have made most progress.

11,216. Are you speaking of reading music?—Reading music.

11,217. Do you train the voice as well?—Yes, we rather pride ourselves on our singing.

11,218. And do you teach by note, not by ear?—Nothing by ear, all by note. They use the Braille music that is published by the British and Foreign Blind Association.

11,219. Are you of opinion that it is worth while teaching all the blind music?—Certainly not. ..

11,220. What proportion, in your experience, do you think could properly be taught music?—I was going to call the attention of the Commission to some statistics I made with a view of bringing them before the Commission. I went through the list of our pupils in 1869, in 1876, and in 1883, that is at periods of seven years; and as the pupils usually stay about seven years in the school, that gave me a list of entirely fresh pupils, and I found that the pupils who had shown musical ability and had been more or less successful in music in 1869 were 18 out of 75, in 1876 were 16 out of 84, and in 1883 were 11 out of 70; making a total of 45 out of 229, or short of 20 per cent. I think that would be about the number of pupils who had, say, a musical ear and had sufficient force of character to be persevering in the practice of music and who would be successful, and who have been successful more or less.

11,221. But do you include in that tuning?—Tuning has not been a part of our regular routine until within the last 10 years.

11,222. But I suppose a great many go out as tuners who could not go out as musicians?—I should think it would not be a large number. Then some of our successful pupils in music who went out in the earliest history of the school, when tuning was not taught in the school, have taken up tuning since.

11,223. Then would you not rather have a larger per-centage, say, in the last seven years, then you had previously?—I do not think so. I have here copied from a report of the Perkins' Institution (at Boston in the United States) in 1876 a list of their old pupils. I wanted to call attention to the per-centages there as confirming what I have said. I find there, that out of 711 pupils, about whose success they have ascertained facts, 52 are teachers of music and pianoforte tuners; 17 organists in churches; 11 vocalists and teachers of singing, making a total of 80, which is 11 per cent., a less per-centage than ours. Probably some member of the Commission may explain that; Dr. Campbell knows something about the Perkins' Institution; but I am simply speaking from the figures there. Their per-centage is lower than ours, but I think 20 per cent. would be an average of the blind who would make music a profession.

11,224. Then with regard to the handicrafts of the blind, have you been successful in enabling them to earn their livelihood by teaching them handicrafts?—Yes, we have.

11,225. What is the most suitable trade?—From my experience at York I should say that basket making is.

11,226. Have you a demand for the common class of baskets?—A very fair demand.

11,227. I suppose you cannot compete with the foreign baskets in the higher class?—I should think, perhaps, we suffer in the common clothes baskets from the foreign competition.

11,228. Even there?—Yes. We have gone in rather largely for fancy articles. I have here some little descriptions of some of our work, tables and chairs, and things of that sort. We have been very successful in that respect, and as far as foreign competition has affected us it has rather been in things like common clothes baskets.

11,229. I was thinking rather of small fancy baskets?—We have not gone into that much at all.

11,230. But, of course, these large chairs would be too bulky to import?—Very likely; I should think that is the case.

11,231. And you have got a good trade in them?—Yes, we have a fairly good trade. Perhaps I may be permitted to say, with regard to basket making, that you want a boy with clever fingers to carry it on, and a boy of pretty good intellect, too; the matter of shaping a basket and a certain amount of basket work can be done by means of models or frames to fit the basket to, but there are certain baskets which cannot be done that way, and you want really a clever, sharp lad to do them; and those are the boys who have succeeded. We find the dull fingered boys, and boys of dull intellect, never succeed with baskets; we are obliged to put them to brushmaking. Basket work has this advantage, that there is no fear of machinery interfering with it; they cannot make baskets by machinery. They are making brushes now by machinery, I am sorry to say.

11,232. Do you make mats?—We do not make mats in the ordinary sense of blind institutions, that is the cocoa fibre mats, but in the case of the boys intended for basket making we begin them with a simple mat with a sort of prairie grass, something like straw, it is simply plaited and then woven into a mat. We find it a good preparation for the basket makers to teach them to use their fingers. It is a useful little mat, that you put into the bottom of a dog cart or at the back of a kitchen door.

11,233. Is it woven by hand?—It is woven by hand entirely. Then our basket makers all learn to do re-seating of chairs, both willow work and rush bottom chairs and cane chairs.

11,234. Do you employ outdoor workers?—No, we do not; but we employ blind workers whom we call "out-mates," who live outside, but work at the school.

11,235. Do the workers after they have passed through your institution go home and settle in their villages or towns, or do they still linger about York?—No, they go home. I have mentioned an instance that I met with the other day in the report for this year which the Commission asked for. The paragraph is at page 10:—"A "few days ago I was in Whitby, in whose streets were "listlessly wandering a number of unemployed men and "youths. I stepped into a cottage, where I found a "former pupil of ours busy repairing a chair, and on my "inquiring of his mother how he was getting on, she replied in cheerful tones, 'Oh, George has always plenty "'of work.' I could not help remarking that many outside told a different story. A nice looking boy of about "twelve, who was standing by in the clean tidy room of "the cottage, was pointed out to me as a motherless "nephew of George, who had been deserted by his father "and whom they had charge of, but, said the old woman, "'George does not mind.' And so George working "away, keeping himself, his widowed mother, and "orphan nephew, is blessed with the success which his "industry and his own good heart deserve." Another old pupil of ours whom I visited not long ago I found employing three seeing workmen and an apprentice, and on asking him the question, "Do you work much yourself?" he said, "Well, the truth is I have not "time; I spend my time in getting orders and in "getting my money in." He is at Batley, and the sort of baskets he makes are large baskets that are used in

Mr. A. Buckle, B.A.

19 May 1886.

the woollen trade. I strongly urge, on all occasions where it is possible and where there is any likelihood at all of success, letting the pupils leave the institution and go to their own homes and work there, in preference to congregating them together in large institutions; but at the same time I am strongly of opinion that there are a large number of blind who come from small villages who are dull fingered, and perhaps somewhat dull in intellect, for whom you must and ought to provide large workshops. I think that is one of the needs of the present day, a larger number of large workshops in towns.

11,236. Then do you think there is no desire on the part of the blind to be congregated in large workshops?—I do not think so.

11,237. They prefer going to their homes?—Where there is any probability of success I should say certainly they do.

11,238. Do you think there is any necessity for starting them with an outfit in the first instance?—I think so. We do that a little. We have a fund at the school; it is referred to in the report of last year at page 10; it is a fund of 800*l.* invested capital. Last year we assisted out of it 26 of our former pupils to the amount of 67*l.* 13*s.* 2*d.* For instance, the two boys that are mentioned are two basket makers who left us recently, J. Broadhead and H. Briggs; we fitted them out with tools and gave them 5*l.* each, which was spent in willows and other things necessary to them to begin their trade with; and we made little grants out of this Markham fund for the purpose of buying former female pupils suits of clothes and helping boys to purchase willows, &c. In every case we send the money to some lady or gentleman interested in the neighbourhood, who sees that it is spent as the trustees of this fund desire.

11,239. Do you think that the blind should be educated as far as possible in the ordinary elementary schools?—In the first place you may have the education in the ordinary elementary school either as a special class, such as I saw the other day at Bradford, where you have all the blind together taught by a teacher (a blind teacher in that case), or you may have them spread amongst the seeing pupils. I think if they are taught in the same classes with the seeing pupils a great deal of time will be lost to the blind pupils, but that is very much better than letting them sit at home doing nothing, and as a preparation for the special school it would be of use in both instances. We urge that. In our annual reports we have a page devoted to advice to parents about their children, "Suggestions to the Parents and "Friends of Blind Children." It is to be found at page 25 of this year's report, and we have had it in for many years, advising them to send their children to the ordinary seeing schools, and giving other advice which we think useful. I have found it taken advantage of in some cases, not in all, I am sorry to say.

11,240. Do you find that many children come to you without any education at all?—Some of them frightfully neglected, not only without education, but with habits and in a condition that really are almost worse than blindness in some cases to surmount.

11,241. Would it not be a great advantage to them to go to the national schools, even if they only consorted with other children and were taught habits of obedience and habits of regularity?—Certainly.

11,242. Even without having a large amount of instruction?—I am quite of that opinion.

11,243. I suppose in the country districts a great deal would depend upon the interest that the teacher took in any one so afflicted and the pains he would take in trying to teach that child?—Of course. I may say that previous to my being at the school for the blind I was assistant to Mr. Watkins, the inspector of schools, and I distinctly remember examining blind children in one school according to the Government form, and passing a boy in reading and in arithmetic.

11,244. What sort of reading?—He had Moon's book. I passed him in mental arithmetic. I examined him mentally.

11,245. I suppose that was not done very strictly; it probably was in the days before they were so strict as they are now?—It was not under the present code, but it was under the first code, where we could be a little more indulgent than I think they can be now.

11,246. Do you find maintenance of the physical health of the blind greatly helped by exercises?—Certainly.

11,247. Does that form part of your system?—It does; gymnastic exercises, dumb-bell practice, practice with poles and regular marching drill; and lately we have set a room apart in a new building which we have erected for the purpose of gymnastics, and had further gymnastic appliances.

11,248. Do you think it would be desirable that the guardians should circulate some suggestions such as you have drawn up in any district where there are known to be blind children?—I think it would. Does it come within the range of the Commission to go into the question of causes of blindness?

11,249. We have heard some medical testimony on causes of blindness, therefore I shall not ask you any questions of that kind beyond this: Do you think it is desirable that information should be given of preventible causes of blindness with young children, especially with regard to infants?—I do.

11,250. You are aware of the causes?—Yes.

11,251. And it has been suggested that the guardians should circulate information with regard to treatment of blind infants?—Yes. Of course you have been informed that such is done in Holland and in Denmark by the registrars of births. In Holland and in Denmark when the birth of a child is registered, the parent or the person registering receives suggestions or information with regard to this in every case.

11,252. That is from the registrar of births?—Yes.

11,253. But it would be better in this country to circulate that information through the boards of guardians?—I should doubt that. I should think that a registrar would do it more effectually; then directly the child's birth is registered the paper goes to the house; and that is what is done in Holland, and I believe in Denmark too, but in Holland certainly.

11,254. But my point would be that a great number of children go blind when they are a few years old, and it is in cases of that kind that I would suggest whether it is advisable to circulate suggestions through the guardians with regard to the treatment of blind children by their parents and friends?—I understand that, but I think in the first instance it would be very effective to do it through the registrar when the birth is registered. I should like to call the atttention of the Commission to an interesting table that we have in our report for 1884, at page 18, a table "showing the number of blind and "proportion to the whole population."

11,255. Do you believe that the census returns are accurate with regard to the blind?—I should think on the whole they will be as to the number of blind. Taking this table, you will see that in the first place I have ascertained, comparing 1871 with 1881, the number of blind to every seeing person in the population in England and Wales; and in Yorkshire; and in the York sub-district, which is our own immediate district. We have a decrease in every case. Then table No. II. shows where the decrease has taken place; and in this respect I think it is most important. "We know, as "a matter of fact, that blindness in the country is due "mainly to three causes, infantile inflammation, accidents, and disease. We are constantly told by medical "authorities that the first cause produces blindness in "most cases only through the ignorance and gross "neglect of careless mothers and nurses; and with "the increase of medical skill and the improved health "of the people, diseases of the eye in more advanced "life should be less frequent." Accidents I think we may very fairly say will vary only according to the number of the population. "Hence with increased "intelligence of mothers and nurses, and improved "health among the people, we should find infantile "blindness gradually decrease, and blindness at the "other extreme, in old age, also decrease. What we "should expect *à priori*, we find from these statistics "to be the fact." I was delighted with that when I made it out; I made it out very carefully from the two census reports.

11,256. Have you any acquaintance with the pensions that have been given to the blind by various charities in London and elsewhere?—No, none whatever.

11,257. You have no knowledge then whether in Yorkshire there are many pensions that are given?—I believe there are; I have met with cases of blind who have pensions in Yorkshire.

11,258. Are there no local pensions of that kind?—At York itself, we have a charity which gives pensions of 10*l.* per year each to numbers of blind persons. I

should think the number of recipients will not be above half a dozen.

11,259. (*Mr. Johnson.*) What is that called?—I do not know the exact name, but it is administered by the trustees of Dorothy Wilson's Charity.

11,260. (*Chairman.*) I suppose you think that there will always be a necessity for some means of assisting the aged poor blind by way of pensions or private charity?—I quite think so.

11,261. Now with regard to the assistance from the State, in what way do you think that should be given?—With regard to the education of the young blind, I think the first thing that is desirable is Government inspection and grants in aid of education. There are only 33 blind schools in the country, and I think one inspector could do the work very well; so that it would not be a great expense to the Government. And then I think the cost of producing books for the blind is so large that one might fairly ask Government to help in the production of books for the blind.

11,262. Has not private charity done a great deal in that direction?—It has, indeed.

11,263. And is doing more every day?—Yes, but my point is this; that if Government were to spend a considerable amount of money in the education of the blind and in the producing of books, the money from private charity that is now being spent on those two objects would be released for other purposes equally necessary in the country. For instance, I do think some sort of work asylums for blind females up and down the country would be desirable, that is to say, asylums where they would have to work, and that would sell their work.

11,264. Why should you call it an asylum?—Because they would be elected there and stay there for life.

11,265. You mean where they would be maintained?—Yes, maintained, and work to help to pay for their maintenance. You see blind females are not like blind men. I mean in the case of such blind females who have no friends with whom they can live, they want a certain amount of protection and looking after. And then for men in the country I think we want more workshops in large towns, for two purposes; first of all, for employing the blind in that particular town who are unable perhaps to succeed working alone and who would find it a good plan to work in an institution; and then for teaching other blind men in the country who have lost their sight late in life who would come to the institution and be taught basket making or some occupation that they could follow in the country; they would leave the institution and go back to their own place and work. We are endeavouring now in York to do that. We have built a new wing to our institution. We are at present employing four blind men who have lost their sight late in life; we intend that they should work with us for two years or three years, as the case may be, until we think they could go out to their own places and work for themselves in their own homes. And I think in large towns, if we could have institutions of that sort, they would be very valuable, because the proportion of those who lose their sight after school age is very large; in Yorkshire at least it is, with our mines and smelting furnaces.

11,266. What do they learn to do best, those who become blind at that age?—We are trying basket making. We have already had one man who could do the rougher sort of baskets and mending and things of that sort; and I think if a man could go into a small market town and could make common baskets, hampers for game, and sell a few better baskets, he might do pretty well for himself. Then, too, they can hawk. We had one man who was a pupil in our school who has a small shop in York, who mends and hawks and makes a fair living for himself and his wife and a child. So that I think if Government spent a considerable sum of money in the education of the blind and in this producing of books, you would have so much more money free to expend on these other objects.

11,267. In what way would you recommend a payment by Government in aid of schools; by a grant of so much a head?—I suppose an average attendance grant as in ordinary schools, and a result grant; but I think the result grant ought to be based upon the knowledge of the fact that you get the children in a very neglected condition, and you ought to have a larger grant per result or you ought to lower the standard.

11,268. In what way would you subsidise the printing of books; have you ever thought in what way it could be done?—I do not see why Government should not do as they once did, with regard to books supplied to the training colleges. I was in a training college for two years, and I remember distinctly we could get books from the Government at 50 per cent. of the cost price; in fact I believe drawing apparatus, models, &c., are supplied at the present time to schools of art at this reduced rate.

Mr. A. Buckle, B.A.

19 May 1886.

11,269. Would you ask the Government to supply books to the blind at cost price?—At cost price, or at a considerably reduced price. It need not interfere with the present printing societies. You could have Moon's books supplied, or books in Braille's type or in the Worcester type. The Government might leave the local committees to choose what sort of books they would use, only they should be able to get them very much cheaper. Even taking the cheapest books it is a very considerable expense to get a decent library for a blind school together.

11,270. You are speaking with regard to the books for schools, not for individuals?—I think for individuals you might have them supplied through the school. I do not think you could expect Government to supply them to individuals in that way, but they might supply them through the various institutions.

11,271. Do you think there ought to be a training college, or a grant given by Government for the training of the blind teachers?—I have really not thought about that at all.

11,272. In the same way I mean as there is a grant given for training teachers for the elementary schools?—I do not think it is necessary. My experience is that if you get a schoolmaster, educated in the ordinary way, and put him into a blind school, he will make quite an efficient teacher in the blind school. I do not think there is any need for urging that at all. I have had experience now of five different schoolmasters in our own institution, and I know the best one was a certificated schoolmaster; he was a good certificated schoolmaster and made us a good one too.

11,273. Then is it a fact that a large number of the teachers in the blind schools are certificated teachers?—I really have no means of saying; I have only an experience of my own institution.

11,274. But if they are not certificated teachers, then probably they are inferior to certificated teachers?—Probably; I think you might say they would be.

11,275. Do you think that the standard for teachers in the blind schools requires raising?—I should not like to express an opinion about other blind institutions.

11,276. I want to know your opinion?—I do not know sufficiently to speak about them at all.

11,277. Is the salary of the teachers in blind schools higher than the salaries of the teachers in the board schools,—the National schools?—There again I have no information beyond our own institution.

11,278. What is your experience; can you get them for less or more?—We give 50*l.* a year, and board and lodging, and I think we get a good certificated master for that. Of course he would not be an experienced certificated master; still he would make us a very good teacher.

11,279. You train your teachers yourselves?—We do.

11,280. Is there any other point which you would like to bring before the Commission with regard to the training of the blind or their welfare in after life?—Your Lordship asked me a question about our pupils who had come to Norwood, and I think there has been some discussion as to whether it would not be an advantage to send all the musical pupils from the various local institutions to a place like Norwood.

11,281. Yes, to finish?—Not merely to finish, but to begin their work there and go through it thoroughly. The suggestion has been, as soon as you find you have a musical pupil to send him to Norwood at once. I think you would find the local institutions, several of them, object to that in the present condition of things very strongly.

11,282. Why would they object to that?—The musical training of pupils in blind institutions gives considerable interest to the work of the institution, it attaches friends to us, and it really is in the way of giving a good advertisement for us, and we could hardly afford to give it up in that respect. Then several of the local institutions have provided expensive appliances for music, in valuable organs and pianos, and they would not like to let

Mr. A. Buckle, B.A.

19 May 1886.

these go for nothing. But as to coming up for a year or two to finish I do not see much objection to that at all.

11,283. But if the system followed at Norwood in the teaching of music is a good one, surely it would be good for other institutions to follow it as far as they go?—Yes, but I do not know myself that there is in Norwood anything different from other institutions in regard to the teaching.

11,284. That is what I want to know?—I do not know that there is.

11,285. I gather from your evidence rather that you work on the same lines as far as your advantages go; you have not the advantages of being near London and having more highly paid teachers, that is what I gather from you?—Yes, that is my opinion.

11,286. Have you any other point?—My opinion with regard to the musical education is that it ought to be a thoroughly sound one in all respects, but I should rather deprecate its being an expensive one.

11,287. On what ground?—On the ground that it really is not needed; that is my experience, judging from the success of our own pupils.

11,288. Do I gather from you that you think it is waste of money to train everybody in music, because there are a certain number who will never turn out well?—Yes, I should deal in that respect just as you would with the seeing. There is a certain proportion of the seeing that could do well in music, and there is a certain proportion that would never do anything in music at all.

11,289. And you think that it ought not to go forth to the world that it is necessary to go to very great expense in training the blind in music sufficiently to enable them to earn their livelihood?—That is my opinion.

11,290. (*Mr. Johnson.*) As we are on the subject of music, I should like to ask you whether you coincide with the opinion expressed by Mr. Humphries in the report of the jubilee celebration at page 62. I will read what he says: "Dr. Armitage says that they may go "out of course trained, and fully equal in many instances "to earn their living in a respectable way, but cannot "find it. If 30 per cent., as Dr. Armitage states, do "earn their own living, it would give us every "encouragement to support a musical line as a means "of livelihood for the blind. I know several who are "supposed to earn their living by public houses, but "who are dependent to a great extent on other people. "They are going about getting assistance where they "can, and that is not the style of living which we are "desirous the blind should secure." Do you agree with that opinion?—Well, it is certainly not desirable that the blind should be going to public houses, and I have my doubts, which I have expressed to our good friend Dr. Campbell here, as to the advisability of sending out so large a proportion of the blind taught in music without anything else. All our pupils learn to do something with their hands, even the best musical pupil, besides the music; so that we think they have something to hold on by, until they can finally make music their profession entirely. That is the plan that we adopt. And it must be remembered, that home conditions enter very much into a boy's career. I had a very sad example the other day of a boy, who had had a fairly good musical education with us; his parents promised me (and he promised too), that they would take care when his time was finished that he did not go into a public-house. I wanted to get him away from his parents; I offered to find him lodgings and to help him in other ways, but they forgot all the promises; they wanted him at home; and I am afraid now he will develop into public-house playing in spite of all we can do. You cannot prevent cases of that sort occurring by any institution whatever; it occurs amongst the seeing as well as the blind.

11,291. And I suppose you think that the competition of the seeing musicians rather interferes with the good success of the blind musicians?—I do not think it is greater than between one seeing person and another, in fact I should say of two cases many people would prefer a blind man, feeling in fact that they were doing a charitable thing in employing a blind man.

11,292. Charity would come in to affect the balance?—It would in some cases, and I have known some cases where blindness has acted as a prejudice against the man.

11,293. In the same report I see, on page 113, Mr. Martin says: "Much as has been said recently about "music as an employment for the blind, I cannot but feel "that to the great mass of the blind that department must "be pronounced impracticable." Do you agree with that?—If my statistics are true that only 20 per cent. are capable of education, it is perfectly true that the other 80 per cent. are the great majority of the blind.

11,294. You have some experience, have you not, in regard to the working of continental institutions?—Yes, I have.

11,295. Are you aware that taking Paris a large number of organists and pianoforte players left the Paris Institution, and no occupation could be found for them. That is at page 64 of that same report. Have you any experience with regard to that?—No, I could not speak of former pupils of the Paris Institution. I do not think that the Paris Institution is the best in Europe by any means.

11,296. As you have had great experience on the continent, in what way do you think that the Paris Institution is not by any means the best in Europe; is it by reason of its method of education?—My opinion is that they make music too exclusively their profession. I do not think they are successful in the teaching of handicrafts. I think Dr. Armitage would agree with me there.

11,297. Then I will go back, if you please, to ask you a question with reference to the certificated masters. You think that the ordinary certificated masters trained in the ordinary training colleges make good teachers of the blind, as a rule?—Yes, I should think so.

11,298. You mentioned the Worcester type; is the Worcester type at all used in your school?—Yes.

11,299. To any advantage?—In some cases; it is another book for them to read.

11,300. But they do read it?—Yes.

11,301. Can they read Moon?—Yes.

11,302. Can they use Braille?—Yes, for all purposes.

11,303. Do you think it would be an advisable thing to adopt one type absolutely to the exclusion of the rest?—No, certainly not; there is no need to do so.

11,304. Are the value of Moon's type and the value of Braille's type equal in your view?—No; there is no type for educational purposes which comes any where near Braille, in my opinion.

11,305. But at the same time you would not adopt Braille to the exclusion of the other?—No.

11,306. You would adopt the two or three?—Yes.

11,307. What are your views in regard to the standards that should be adopted for the blind; do you think that our ordinary standards in the sighted schools should be adopted in the blind schools?—I think they would be too high.

11,308. And therefore if you have Government inspection, you think there ought to be modified standards?—Yes. You see children in seeing schools begin their education at five years of age; ours come to us at 10, many with no education at all.

11,309. But supposing the Government felt disposed to take into the primary schools all the blind children to be educated with sighted ones, would you think the standards ought to be modified, supposing they go to them at the age of five years, the same as they do the seeing?—I really should not like to say, because I can hardly tell what could be done in an ordinary seeing school with the blind.

11,310. If the Government gave a grant to your school, do you think that your directors would modify the age of admission?—To take them younger do you mean?

11,311. Yes?—I should not advise them to do it.

11,312. That would be a question for the consideration of your committee?—Yes, it would of course.

11,313. I see that you have begun outworkers?—We have had outworkers a long time.

11,314. But you have got out pupils?—Yes.

11,315. Do not you think that that is an assistance for the blind that ought to be developed more?—Yes, I have said so already.

11,316. In all institutions?—I think so.

11,317. Is there any payment made for the out pupils?—None. We simply teach them without any cost to themselves.

11,318. And no cost to their friends either?—Their friends have to maintain them in lodging; we charge nothing for the teaching.

11,319. Do you supplement the wages at all of your workpeople?—No.

11,320. Then you pay the result of their work by the scale of journeymen's wages?—Yes.

11,321. What are the average earnings of your blind workers, the basket makers; give us an example of those who are very good workers, what they earn, and what those who are inferior workers earn?—We have some who can earn 1*l.* a week; we have some inferior ones who will earn perhaps 10*s.*.

11,322. And you have some who do not earn so much, I suppose?—No, I think we have none that earn less than 10*s.*

11,323. These are pupils that you are now speaking of, are they?—No, they are out-mates; they live outside and come to work.

11,324. And they are mostly old pupils, I suppose?—Yes, mostly old pupils.

11,325. Do your pupils earn anything for your institution?—As to absolute profit, I should think there is not much profit on their work.

11,326. Do you give them any per-centage?—We give them a little as rewards, which is held in hand until they leave the school, and then it is 2*l.* or 3*l.* for them towards starting in life.

11,327. You have instanced two people who have been educated in your institution who have succeeded well, one of them being a man who has workmen under him; do you know of any other instances where they are doing fairly well?—Yes, have done and are doing well. I could give more if I had the time. I have mentioned in the report for 1883 some other instances at page 22, "Basket makers, brush makers and other "occupations: R. W., a steady, hard working man, "maintaining himself pretty comfortably. J. B., has a "small shop for the sale of baskets and brushes, repairs "and hawks, and supporting himself and family. S. L., "conducts a successful workshop at B. When I was "last at B. he had three seeing journeymen and a boy "at work. His time is fully employed in seeking "orders and collecting his accounts. He is doing re-"markably well. W. H. S. maintains himself and "family at P.; usually has one journeyman and an "apprentice at work. G. Groves, at W., has his time "fully employed, and entirely maintains himself." I have mentioned also some 25 others that I ascertained, before I put the numbers down in this way, were doing well in these handicrafts.

11,328. Have you made the same *resumé* with reference to the successes in music?—Yes, I have mentioned 25 on page 20 of the same report, and I have said that 50 of our old pupils have done well in music.

11,329. What do you think is the average return of those musical successes, the earnings per week?—I should not like to mention a sum as an average.

11,330. But what would you say would be the ordinary degree of success of a musical pupil turned out from your institution?—From 1*l.* per week up to 3*l.*, probably.

11,331. The 3*l.* would be an exception, I suppose?—Yes.

11,332. And the 1*l.* would be the ordinary thing?—Yes, very likely.

11,333. What was the amount of your sales last year?—You have that in the form, which I have filed up.

11,334. Did you not sell goods to the amount of 2,481*l.* last year?—Yes.

11,335. Do you think that there may be any means taken to develop the market for blind manufactures?—My impression is that it must be left to the individual institutions.

11,336. To the different local organisations?—Yes, to do the best they can in the neighbourhood.

11,337. Do you think there can be any means adopted by which you might improve the sale of articles made by the blind: is there anything that you can suggest to the Commission?—No, I cannot suggest anything that I think would be practicable.

11,338. It must be left to the local interests?—That is my opinion.

Mr. A. Buckle, B.A.

19 May 1886.

11,339. Do you think it would be desirable to have central depôts in different counties or different towns for the sale of blind manufactures?—It would be desirable if it were practicable. I doubt the practicability of it.

11,340. But, in short, you think that the locality should get rid of the production of its local blind?—I do.

11,341. (*Dr. Robertson.*) You have got the number of the pupils and the average cost of the pupils stated in your report, I suppose?—The average cost, I think, is about 40*l.* per head.

11,342. Is the building your own property?—The building is now our own property, but that included the rent when we paid rent.

11,343. I want to know whether the cost per head of the pupils included the income which is derived from the capital of these buildings?—It includes the payment of rent for the institution. I do not understand that the cost per head has anything to do with the income of the institution; the cost per head is a question of expenditure; it includes everything expended on the maintenance and education of the pupils.

11,344. Then you were asked about different systems of reading. Supposing you were obliged to give up all but one system, which would you retain?—Braille, certainly.

11,345. And is there any other system which you could read and write by, for educational purposes I mean?—I think there is none worth mentioning that I know of besides Braille.

11,346. And is there any other system by which they can be taught music efficiently?—Not any except Braille that I am aware of.

11,347. Speaking of the causes of blindness, you did not in your list of the three main causes include hereditary causes; have you had any experience with regard to causes of blindness that are hereditary?—We have instances in the school, but I think the proportion of hereditary blindness is very small.

11,348. Have you any instances in which blind children have been born from blind parents?—We have had one whose father was blind.

11,349. And no other case in which the parents, to your knowledge, were blind?—No.

11,350. So that you do not look upon that as a common cause?—By no means.

11,351. With regard to the preventible causes, are you aware that in some of the Midland Counties the mothers have instructions that at certain stages alum or something of that kind should be given to them as a prevention of this infantile ophthalmia of which you spoke?—I have not heard such a fact stated.

11,352. Do you think if measures were taken to supply that information to these people, and to inform them at the same time of certain places where it could be got, it would be a great advantage?—Undoubtedly.

11,353. And that it would lessen the causes of blindness?—I think so. Every method of spreading information with regard to infantile inflammation must do good, I think.

11,354. With regard to the work, it has been suggested to the Commission that it would be an advantage that in the large provincial towns, the provincial centres of each district, a sort of central depôt should be established, where the raw material could be sold cheaply to the blind persons who applied for it, and where a sort of supervision of these blind people could be kept, a register in fact of them kept, and where, when they had done their work, they might be able to bring it for sale without without having the difficulty of hawking it round and finding purchasers for it. Do you think that if such a thing could be done it would be a great advantage to the blind?—I think to isolated cases it would. At the present time we supply several of our old pupils with materials at the cost price to us, they simply have to pay the carriage additional; and I think if there was a central institution that could buy very largely in that sort of way and supply the blind, it would be an advantage But my impression is that the institutions could do it.

11,355. Then practically to a certain extent you do carry out at York the principle which I have been speaking of?—Yes.

11,356. What I wanted to know was this: If such a principle was carried out to its full extent and practised

Mr. A. Buckle, B.A.

19 May 1886.

in the different districts of the country in large centres, would it not be a great advantage; I am not speaking of the difficulty of doing it, but asking you whether you do not think in the first place it would be a great advantage?—I have already said that I think it would be an advantage if it were practicable, but I should like to point out this in reply to that question, that supposing you had a depôt in London for the purchase of materials, and the school at York by its committee was ordered to purchase its materials of this depôt in London——

11,357. That is not the kind of thing that I was alluding to. I say suppose one of these depôts to be established in each of the large provincial centres of population?—Only for the scattered blind?

11,358. For those belonging to that particular district?—That would be merely enlarging the work that we are doing now. That would be of advantage and it would, most likely, be practicable.

11,359. That is the very point I was going to elicit?—I was speaking of another thing.

11,360. I suppose you are aware that in other places, more or less, the same kind of thing has been done?—I am not aware from positive information; I should think probably that is the case. I should think every institution would do very much what we are doing.

11,361. With regard to the aid which this blind literature should have given to it, are you aware whether the books for the blind wear out more rapidly than those for sighted people?—My opinion is that they do not.

11,362. That they last really well?—I think they last as well as books for seeing persons.

11,363. (*Dr. Campbell.*) In your arrangements do the children in your school come into contact with your workmen except when they are sent to the shop to learn a trade, for that portion of the day during which they are learning their trade?—They do not come in contact with the grown-up workmen at any time that we can prevent; they do not work in the same room with the grown-up workmen.

11,364. You say "that we can prevent?"—They come in contact to this amount: a boy will have to go into the workroom where the grown-up workmen are at work, for a few willows or something of that sort, for a few minutes; but as a rule we, as far as possible, prevent contact with them. But we do not absolutely prevent it, and it would not be possible to absolutely prevent it in our institution.

11,365. For instance, when the work hour is over do the workmen leave or have they the opportunity of remaining on the premises for a certain time?—No, they leave the place.

11,366. So that out of work hours there is no possible opportunity for the children coming in contact with them?—No.

11,367. As to this estimate which you have had made in regard to the number of pupils who have been successful and who have been failures in the York School, how many years does that cover?—Since the foundation of the school, 50 years.

11,368. You have given it as your opinion that the musical education of the blind ought not to be costly. If it is effective, and if the blind are to compete with the seeing in the open market as professional musicians, is it not your opinion that it will be at least as costly for the blind as for the seeing?—I should say quite.

11,369. And we ought not to expect to get a good education for the blind for less money than we get it for for seeing people?—Certainly not.

11,370. In making your estimate in regard to the proportion of the blind who are capable of learning music, did you take into consideration that the great majority of blind children are not subject beforehand to favourable influences under which they can be well taught, and that they ought to be brought under proper influences. I mean in this way: supposing that we could have the blind at an early age brought into proper primary schools under proper supervision and proper training, and we brought them under the very best possible influences, and that they, amongst other things, should have musical influences about them, do you not suppose that the proportion of those succeeding in music would very much increase?—I should have no hesitation whatever in saying that if those of whom I have given statistics connected with our own school had been in the institution from the age of five years the proportion would have been larger, whether it would have been materially larger is to my mind doubtful. Probably it might have raised the number from 20 to 25 per cent.; I do not think it would have been more than that, because I have made my statistics, not from the pupils as they came into the place but from the pupils whom I have known during the six or seven years, and whom I have had an opportunity of seeing; and we have so much music about the school in our ordinary singing and in other ways, that I can hardly fancy a boy could possibly have any musical ability in him without our finding it out in seven years.

11,371. Supposing a blind person from an early age, say from five, were under the best influences, I mean that from this early age he was under what we should call favourable circumstances, and supposing he had a proper training up to a certain point, say 10 or 12 years old, in a proper primary school, and that then it was determined on his leaving the primary school whether he had better begin by handicraft or by music, do you not agree that the musical proportion would be very much increased?—It would be increased, there is no doubt, but I do not think it would be very much.

11,372. How much time do your pupils give to their mental culture at the beginning?—The whole of the day, that is to say six hours per day; and in addition they are read to one hour every evening.

11,373. How much absolute instruction, I do not mean in the choir, or what you would call for producing effect in music, but how much actual instruction do your musical pupils have from their music master, piano, organ, or vocal music?—The pianoforte pupils have two half hours per week, and the organ pupils (they go on with the pianoforte at the same time) have half an hour additional, and in vocal music the instruction in class will average from two to three hours per week, solo singing variable.

11,374. Do you mean instruction or practice?—I mean instruction.

11,375. Does Mr. Barnby give, for instance, two hours' tuition on the piano and one on the organ every week to the same pupil?—No, not Mr. Barnby, but Mr. Strickland does.

11,376. He is the reader of music; I mean a teacher?—The reader of music is also a teacher of music, who, if a boy played a piece wrongly which he had read out to him, would correct the boy; so that it is, to a certain extent, teaching.

11,377. You include in this amount of instruction what you call music reading as well as direct teaching?—Yes.

11,378. (*Dr. Armitage.*) I understood you that out of 456 old pupils about 50 were successful in music?—Yes, about 50. The 456 included the 122 who left without their terms being completed; it is really 50 out of the 334 who stayed the full period in the school.

11,379. Then did I understand you to say that you considered any old pupil who made 50*l.* a year and upwards in music as a success?—Yes, successful in point of maintaining himself and his wife and family.

11,380. One has to place a minimum; what would you consider to be success as a minimum in music; you would consider 50*l.* a year so?—I should. If a man could maintain himself for 30*l.* a year, I should consider 30*l.* a success. I make success in music as success in everything else taught in the institution, mean being able to maintain himself.

11,381. You went on to say that you considered that about 20 per cent. of the pupils who have been passing through the school for the last few years have been maintaining themselves by their music when they leave?—No; I said that about 20 per cent. seemed to me capable of musical instruction.

11,382. But can you tell us what per-centage of the pupils, taking the last 15 years since you have been there, have actually succeeded in music to the extent of earning 1*l.* a week or more?—No; I could not give you that information.

11,383. Could you ascertain it for the Commission?—Yes, I think I could. Of the 45 mentioned as capable of musical instruction, 9 are supporting themselves entirely by music, 12 are using music as a supplementary means of livelihood, 5 are still pupils in the school, 4 are dead, and 14 have either given it up or are not known of.

11,384. You said Mr. Barnby teaches, you think, for four afternoons in the week?—Yes.

11,385. How long on each afternoon?—From an hour to an hour and a half.

11,386. And what does he teach?—He teaches the theory of music; he teaches the part singing, solo singing and other vocal music, and he what I may call overhauls the pianoforte music and the organ music.

11,387. Does he actually teach the piano or the organ?—No; Mr. Strickland or the reader teaches them the pieces. Then Mr. Barnby hears them; so that it is a sort of finishing process that they have with Mr. Barnby.

11,388. Does Mr. Barnby teach the part singing himself?—Yes; for instance, Wednesday afternoon is mostly spent in their rehearsal for the Thursday's concert; or when they are learning a new piece, he will perhaps teach them part of it on the Monday, and come again on the Wednesday and hear them.

11,389. Is that done by Mr. Barnby himself?—Yes, by Mr. Barnby himself; or if one of the principals is learning a new song, Mr. Barnby teaches them the new song.

11,390. Does he take any of the part singing on any day besides Wednesdays?—Yes, Fridays too.

11,391. At what time?—From 2 to sometimes about 4 o'clock on the Friday. If they are learning any new piece he stays longer. The committee, in regard to Mr. Barnby, do not say to him, "You must teach "absolutely two hours every afternoon." He is an old servant, and has been there 50 years, and the committee are somewhat indulgent towards him in that respect; but whatever is necessary for the learning of new pieces in the school by the choir, or in the way of hearing the boys rehearse their pieces over, Mr. Barnby does it.

11,392. Do I understand you to say, then, that as a rule Mr. Barnby occupies the greater part of two days in the week in training the choir?—Of two afternoons, you mean? He trains the choir sometimes three afternoons, sometimes four afternoons, including the concert. It depends upon what Mr. Barnby wants them to do. Supposing they are learning a new piece, and he wants it by a particular time, he will probably spend the whole of the four afternoons in practising this new piece.

11,393. So that Mr. Barnby's principal occupation is to train the choir to sing new pieces?—Yes, to train the choir and to supervise the other work.

11,394. But his principal occupation is training the choir?—Yes.

11,395. In singing?—We have a pianoforte piece and organ piece every concert. He hears the pianoforte piece and the organ piece played over.

11,396. Do you say you have a concert every Thursday?—Every Thursday.

11,397. A public concert?—Yes.

11,398. And Mr. Barnby's principal training of the choir is in preparing for this concert?—Yes, preparing for that concert.

11,399. You said that you did not think it desirable that a school should give a higher class musical education to the blind than you do at York?—Yes.

11,400. And you tell us that only a certain proportion of your blind are able to support themselves by music?—Yes.

11,401. If it was possible to double or treble that proportion of after success, do you think that a school might be justified in giving the education which would be necessary to ensure it?—Do you mean the cost per head; that if it required a greater cost per head the school would be justified in spending whatever was necessary to produce such success in that respect?

11,402. I meant taking it as a supposition that out of the pupils who leave you now, 15 per cent. are able to earn from 50*l.* and upwards by their music after they leave; if by improving the general and musical education that proportion could be raised to 40 or 50 per cent., do you think it would be desirable to incur that additional expense?—I should say there could be no objection to that; I should certainly say yes, that an institution would be justified in doing it.

11,403. But you told us before that you thought that an institution was not justified in spending more upon a musical education?—No, under correction, I submit that I did not put it that way. My experience of the success of the musical pupils of a school for the blind I think warrants me in saying that a sound musical education in theory and practice, which need not be a costly one, is sufficient to enable them to maintain themselves when they leave the school.

Mr. A. Buckle, B.A.

19 May 1886.

11,404. What are the means by which your musical pupils generally maintain themselves?—Playing the organ and teaching music and tuning.

11,405. Not by singing?—Yes, some of them. I should have said singing as well.

11,406. Part singing?—Yes.

11,407. Do they club together?—Yes.

11,408. Your old pupils club together and sing?—Yes, and go out to concert parties.

11,409. Do they make much by it?—I could not say what they make; not very much, I should think.

11,410. Then you think that what a blind musician has principally to depend upon for his living in music is the piano, the organ, and tuning?—Yes.

11,411. But I think you said that the teaching of the piano and the organ was left to your blind teacher and to your readers?—Yes.

11,412. That your head musical teacher occupies himself principally with the part singing?—Yes.

11,413. Which is the department of your musical education which pays least?—I said that he overhauled the other work too. There is no pianoforte or organ pupil in the place that Mr. Barnby does not hear play their pieces.

11,414. Now to pass to another subject. Can you tell us in the handicraft trades what are the minimum earnings of basket makers, former pupils, which you would consider a success?—Do you mean outside?

11,415. Yes, outside; those who have left the school?—No, I really could not say.

11,416. You gave us a proportion of success. I want to know what is the minimum earning of a blind basket maker working at home, which you would consider constituted a success?—I could not give it in figures.

11,417. Could you look at your notes and give it to the Commission?—No, I have no means of giving you information as to figures in pounds, shillings, and pence in that matter.

11,418. When you were taking these statistics had you any fixed standard in your mind?—The only fixed standard I had was that he was able to maintain himself. You see one man can maintain himself on 15*s.* a week, where another man would require 25*s.*

11,419. But there was no fixed standard?—No, there was no fixed standard as to money.

14,420. You have told us that you use forms for making baskets at York?—Yes.

14,421. Are you satisfied with that?—Yes, quite.

14,422. Do you think it is a help to blind people?—Yes, considerable. Some baskets could be made nicely without them; they can work the skein work with them, but they cannot work the rod work.

11,423. Is the form of some kinds of baskets one of the principal difficulties that a blind man has to contend with?—Undoubtedly.

11,424. And in those baskets that can be made upon forms that is completely got over, I understand you, by using a form?—Exactly.

14,425. Then you say that there is certain basket work for which forms cannot be used?—Yes, they have been tried and failed.

11,426. Can you tell us what they are?—Such a thing as a large basket, as you see used at the present time by the Post Office for the parcel post, baskets of that description; in fact all baskets made with rods. The reason is that the workman if he has a model inside his basket cannot get his finger round to do his work; he must get his finger inside the basket; and if you fit the basket tight to the model you cannot get your finger inside to do the work. The skein can be slipped inside without the finger going inside.

11,427. Do you know the basket work with which bottles of chemical manufactures are covered?—Yes.

11,428. Are those made with rods?—I think probably they are; I do not know the chemical bottles. We

Mr. A. Buckle, B.A.

19 May 1886.

cover the spirit bottles with rods; but chemical bottles and spirit jars are covered with slewed work, which is much more open and looser work than the post office baskets referred to; but even here the basket maker finds it easier to make his basket about three quarters its height, then put in his jar or bottle, and finish it.

11,429. But that in point of fact is working on a mould?—Yes, but there again you have not to take your mould out of the thing itself; the basket work is fitted to it and left upon it.

11,430. Is the difficulty then the taking the mould out?—That would be one difficulty.

11,431. What is the exact difference you make between the skein and the rod?—The skein is the split rod.

11,432. You do not know that baskets for chemical work are made on a very large scale indeed by the blind with rods?—I do not know that they are, but I should think very likely they could be.

11,433. You told us that one of the great difficulties you have to contend with is the dullness of fingers and the dullness of intellect of children when they come to you, in all your work?—Yes.

11,434. Have you any primary school?—No.

11,435. Do you think that a very important point in the education of blind children is to overcome that dullness of fingers and that dullness of intellect by Froebel work and Kinder-Garten work?—It would be considerably reduced by it; of course dullness of intellect could not be altogether taken away by it.

11,436. Have you any experience of Kinder-Garten work among the seeing?—No; undoubtedly it would reduce the work of preparation, and I think in regard to preparatory schools, it would be very valuable if they were founded and well carried out.

11,437. Do you keep a register of all your pupils?—Yes.

11,438. From the time they come in?—Yes, from the time they come in.

11,439. And do you keep up a correspondence with them after they leave you?—More or less.

11,440. Do they write to you in Guldberg?—Yes, they write in Guldberg and in Braille. I have an old pupil who writes constantly for cane, for instance, in Guldberg.

11,441. If I wanted to know the history of any particular pupil, could you put you finger upon a pigeon hole in which all his papers are contained?—I have a register paged and indexed, and the name of every pupil entered since I have been in connexion with the school; but several of them I have no information about since they have left.

11,442. (*Mr. St. John Ackers.*) Do you keep accurate statistics of the cause of blindness?—Yes; the statistics that I have given in the report for 1883 are from the certificates of the doctors certifying the cases.

11,443. How long has that been the case in your institution?—Ever since it was founded.

11,444. Do you know whether that is general in other institutions of the kind?—That I could not say.

11,445. You consider that it is desirable that such certificates should be kept?—Yes, certainly.

11,446. (*Mr. Arrol.*) You were asked whether, generally speaking, you think that a blind child should be educated at a sighted school until it passes into an asylum; and in answer to a question of his Lordship's you said that one objection you had to a blind child being educated in a sighted school was because of losing a certain amount of time; would you explain that?—I was speaking there of his losing time. Supposing a boy was being educated in a seeing school instead of in a special school, I meant that, as compared with being educated in a special school, he would lose a great amount of time. As a preparatory means for the special school he would be very much better there than sitting at home in the corner. That is the opinion I wished to convey.

11,447. If the blind child had the benefit given to it by the London School Board, do you not think it would be a great advantage to the blind child?—Is your question pointed to this, whether I think the fact of mingling with the sighted children would be a great advantage?

11,448. I refer to the special training that he gets from special masters; the London School Board have had so many masters set apart to teach the blind?—And they are taught in special classes by themselves?

11,449. Yes?—In fact, you mean whether I think it would be a good thing for children to be taught in an ordinary seeing school, but in a special class with a special master, and then passed into the ordinary seeing classes with the ordinary masters. That is a system that I should not feel inclined to recommend.

11,450. For what reason?—That in the ordinary classes with seeing pupils, as I said, a great deal of time would be lost as compared with being taught in a special school.

11,451. Have you any experience to found that upon?—My experience is the experience of blind education generally, what blind education requires. For instance, take a lesson; there is a teacher who has got a class with 15 or 16 seeing boys and two blind boys in it; he is giving them a lesson upon the history of the reign of Queen Elizabeth, and he says to the boys, "Now for "your home lessons to night you will produce me this "history of the reign of Queen Elizabeth," to show how far they have carried it home in their minds. The boys produce it next morning, but the blind boy has no means of producing his except in Braille type. But you are not to suppose that the teacher of every class in a national school is able to read Braille type.

11,452. We have had information that any ordinary intelligent master can acquire it in the course of a few minutes?—Sufficient to read it next morning with as little trouble as he would read the seeing exercises? There is no practical teacher of Braille who would ever say so.

11,453. You have referred to 50, I think, as the number of those who have had success in music attending them, who have been trained in your institution since its commencement. Are we to understand that the 45 you mentioned in 1869, 1876, and 1883 are not included in the 50?—The 45 were the numbers who were capable of music, who seemed to me capable of a musical education, but I did not say that those 45 had been successful after they had left the school in a musical profession. I was judging of the capacities and abilities of the pupils.

11,454. In the 50 do you embrace these 45; I suppose not?—No, I do not.

11,455. The 50 that have been successful are in relation to 334?—Yes.

11,456. That is about 14½ per cent.?—Yes.

11,457. I think the basket makers during this period were 45 to 46?—Yes, 45.

11,458. Thirteen per cent.?—Yes.

11,459. So that the basket makers are not so successful as those who have been trained to music?—That would not follow; that was the number who had succeeded; it was not a per-centage.

11,460. But I have converted it into a per-centage, and it shows that the basket makers are not so successful as the musical pupils?—No, it shows that so many have not followed basket making as have followed music. It is not a proportion of success; it is the number of those who have been educated in basket making.

11,461. I understood your evidence to mean that you were desirous of conveying to us that out of those who have been trained 50 succeeded in music, and 45 in basket making. You did not say how many had actually been trained as basket makers, but that 45 were the successes?—Yes.

11,462. Then perhaps you will be able to state how many were sent to basket making as well as to music?—That I cannot do; at least, I have not the figure at hand to do that.

11,463. You recommend that there should not be much expense incurred in musical education. Supposing that a blind person is handicapped because he has lost one faculty, is not that a reason why he should be more thoroughly trained to make up as much as possible for the disadvantage he labours under?—I think in any case the blind would require a more costly education than the seeing.

11,464. Still you recommend not a costly education?—No; I do not think the case requires a costly one; but that it would be more expensive than the seeing I admit.

11,465. You do not feel disposed to allow that it is necessary that the blind should be more thoroughly educated than the sighted?—Do you mean as to the general education of the blind?

11,466. No; for any special branches they may desire to pursue?—I think if you have the opportunity you ought to do the very best that you possibly can to produce success.

11,467. You say that your institution is conducted on the same lines as Norwood as far as you can. But one master seems in your case to control the whole of the musical training and teaching; are you aware that at Norwood there are masters for special branches, for the organ, for singing, for the piano, and for harmony?—Yes, I say that is the difference, that is, that where we employ one, Norwood employs three or four; but I am not aware that Norwood has any special system of teaching the blind music beyond what is pursued in ordinary institutions. You may have a larger number of teachers, instead of having one teacher taking three branches, you may have three teachers, each one to take one branch; but it seems to me that it is not a difference of system, but a difference in the number of teachers.

11,468. I suppose specialists are more likely to turn out good pupils than one man undertaking to look after several branches?—Yes, I should think so.

11,469. (*Admiral Sir E. Sotheby.*) Your receipts from brushes in 1882 are 1,400*l.*; is that entirely from brushes made by the pupils?—No.

11,470. How is it received.—We purchase some brushes, for instance tooth brushes are only made in London; no one in the country makes them.

11,471. Are those the only ones you purchase?—A few other varieties. Our brush trade is worked in this way: we sell floor cloth, we sell sponges.

11,472. Is that all included in brushes?—Yes, it belongs to the brush department.

11,473. It is "brushes" here; could you say what proportion of the 1,400*l.* in the brush department is made by the pupils?—I could work it out.

11,474. Do you think one half are?—Certainly, one half are not made by the seeing.

11,475. Then perhaps three-fourths are made by the blind?—I should think at least three-fourths.

11,476. There are 769*l.* which you receive for baskets; were they made by pupils and outmates together?—Pupils and outmates together.

11,477. And you have a ready sale for baskets?—Tolerably ready sale.

11,478. Will you say what religious education you give your pupils?—They have a portion of Scripture, say the book of Genesis, which they have instruction in during the half year, and one book of the New Testament. They commit to memory four or five Psalms, prayer book Psalms (we all go to church,) and we have a short religious service in the school every Sunday evening in the winter. In the summer they go to church both morning and evening.

11,479. Then they are brought up on the Church system?—Yes, with the proviso that if the parents wish to take them to any other place on the Sundays, they can do so if they will make provision for it.

11,480. And do you think it most essential for your children to have a religious education?—Certainly, I do not believe in education at all that is not religious.

11,481. (*Chairman.*) I presume from the name it is distinctly a Church of England school; it is called the Wilberforce School?—Yes.

11,482. (*Admiral Sir E. Sotheby.*) Do you find your female pupils well adapted to make hair brushes, to draw the bristles of the hair brushes?—We have taught a few from time to time the finer sort of hair-brush work, but we have given it up since we began to teach them the re-seating of chairs.

11,483. You do not make hair brushes at all?—Yes, the boys do, not the girls. The handicraft that the girls are employed in is the re-seating of chairs and the ordinary wool work and knitting, and things of that sort.

11,484. Have you sufficient employment with regard to the re-seating of chairs?—Yes, we have a large quantity of chairs to re-seat.

11,485. If you had Government aid would not that very likely lessen private assistance?—Well, it is a difficult point to express an opinion upon.

Mr. A. Buckle, B.A.

19 May 1886.

11,486. Have you got open dormitories for your children; large dormitories for your children to sleep in?—Yes, our largest room, perhaps, 30 pupils sleep in, each in one bed.

11,487. And you consider that a better system than having two or three or four in small rooms. I suppose you have adopted those large dormitories for some cause or other?—Simply that our place is an old place; we had large rooms and we put the beds in; and I do not know that the committee think that any benefit would accrue by dividing them up into threes or fours.

11,488. Is there any benefit in that large dormitory system?—They can be better overlooked by anyone at night.

11,489. (*Chairman.*) Does anyone sleep in the ward with them?—No, but some one passes through it on his way to bed.

11,490. (*Admiral Sir E. Sotheby.*) You have no instructor to overlook them from a window?—No.

11,491. Would not that be a good plan?—It might be, but we have not found any inconvenience from the present system.

11,492. We have had it in evidence that there is a great deal of juvenile crime amongst the blind; have you found that to be the case?—You mean self-abuse? not more than amongst the seeing I should say.

11,493. You say you consider that not more than 25 per cent. of the pupils that are brought up under musical influences at the institution are suited to learn music?—That is my experience.

11,494. And do you consider that the other 75 per cent. are suited to learn handicrafts?—Yes, more or less. But I ought to say that with regard to those that are capable of learning a handicraft, you have always a certain number that from weak physical health or from weak intellect will never be able to earn the whole of their livelihood.

11,495. What proportion of that 75 per cent. do you think would be able to earn a livelihood?—At the same time that I was getting the statistics for the music, I got out the statistics of those that I thought were physically incapable of earning a whole livelihood, and of those who were mentally incapable; and I found that for the three years the total came to 39 out of 229 physically incapable, and 19 out of 229 mentally incapable; making in one case 17 per cent. and in the other case 8 per cent., or about 25 per cent. altogether. That is to say, they could do something towards earning a livelihood, but you never would expect them to earn the whole of their livelihood.

11,496. Then I see that your expenditure in the year 1882 is 510*l.* for the blind outmates; how is that expended?—That is paid in wages.

11,497. What is your stipend as superintendent?—My own stipend is 300*l.* a year.

11,498. And has Mrs. Buckle got a stipend also?—Mrs. Buckle I am sorry to say is dead. She had when she was living a stipend also. We have a matron now, who receives 40*l.* a year.

11,499. And all your masters are put together; can you tell me what the teachers are paid. There is a blind teacher, an assistant, you say; therefore I presume all the rest are sighted?—Yes.

11,500. (*Chairman.*) I think you told us you paid your teacher 50*l.* a year and board and lodging?—Yes. At the present time he is married and living out, and has 100*l.* a year.

11,501. (*Admiral Sir E. Sotheby.*) That is the schoolmaster?—Yes, I can tell you them all. The trade instructors there, whose salaries are put down as 175*l.*, would consist of these, I think: 80*l.* for the brush manager; one of them had 35*s.* a week and the other 32*s.* 6*d.* a week; the basket manager. Then Mr. Strickland has 1*l.* a week, and Mr. Barnby has 50*l.* a year. The reader, for the time that he spends, has 15*l.* a year. Mr. Strickland has an additional sum for each tuning pupil; we pay him two guineas for each pupil that he has.

11,502. (*Mr. Johnson.*) A capitation payment?—Yes. Then the matron has 40*l.* and board and lodging. The schoolmistress has 30*l.* and board and lodging; and then we have office people, a clerk in the office; they are included in the salaries there.

11,503. (*Admiral Sir E. Sotheby.*) Do you consider that sighted teachers are better than blind to teach the

Mr. A. Buckle, B.A.

19 May 1886.

making of baskets and brushes and such like?—We have a blind assistant teacher in the basket room, but you ought to have a seeing one to overlook and overhaul. Every department I think ought to have a seeing head in it or a seeing person intimately connected with it.

11,504. (*Rev. W. B. Sleight.*) I see that you admit your pupils at 10 years of age?—Yes.

11,505. Would it not be much better to admit them earlier, not merely from an educational point of view, but also with regard to their morality; would not seven be a much more suitable age to admit children?—I think the age was fixed on this view: So very little could be done with children from seven up to 10 years of age. The idea of the committee was that the children would be taught something at home, or in a seeing school a little preparatory, and that it was really a better age to begin with than seven; and I think you will find that age for admission prevalent throughout the country. For instance, at seven years of age you have to begin to teach them to dress themselves and wash themselves. That would be a serious thing for us to undertake it in an institution like ours where we have all the other teaching work besides. It would be a very good thing if you had a preparatory school, if you could get the children at seven and begin then it would be an excellent plan.

11,506. Do not you think that between the ages of seven and 10 they contract a good many bad habits?—Yes.

11,507. That might be avoided perhaps if they were put into a primary school?—Yes, I think it would be very valuable.

11,508. With regard to inspection, would you not have a great many pupils that would have to be excused for mental incapacity. In our school inspections now we are allowed to have certain children excused?—You would have a larger per-centage among the blind than among the seeing, undoubtedly.

11,509. The religious teaching is given in accordance with the doctrines of the Church of England, I understand?—Yes.

11,510. I notice you have a clause here that parents are allowed to withdraw their children on a Sunday. You would allow them to take them to a Nonconformist place of worship?—Yes.

11,511. Do you find any do so?—We have one boy whose parents are Wesleyans and they come for him to the school; and we have had one Roman Catholic in the school who has been taken to church. Those are all the cases within my experience in the 17 years.

11,512. Only two cases?—Yes. The only difference I find in the pupils is in the matter of confirmation: the pupils of dissenting parents are not confirmed; the pupils of church people are confirmed.

11,513. Do you employ the girls at all in house work?—In making the beds, nothing else.

11,514. Not cleaning or washing?—No. I think something more might be done, but we go upon this principle: that household work is a sort of thing you might fairly expect them to learn at home when they have left the school, and that their time could be better employed while with us in mental or industrial work.

11,515. (*Chairman.*) But do they learn the household work at home?—I find they do. It is surprising to me in the case of some of our own pupils how very helpful they are at home.

11,516. Do you teach your blind to cut up their own food?—They do very generally; they use their knife and fork.

11,517. I am not asking whether they cut the slice off the joint, but whether they cut up their own meat on their plates?—They do; I was going to say that, for instance, on two days a week they have meat and potato pie. The pupil gets a fair piece of crust with a certain amount of meat and potatoes, and has it to cut up.

11,518. The rest of the week when there is a joint, what is done?—The roast beef is cut into pieces perhaps the size of one's thumb.

11,519. But do they use a knife and fork?—They use a knife and fork.

11,520. (*Rev. W. B. Sleight.*) Do you think it at all necessary to train them or that any after good comes from training them in the higher branches of education, such as natural philosophy, or French, or botany, or geology?—Not to make it a part of a system of the school, I think not.

11,521. Do you teach any of those things in your school?—I have two or three pupils at the present time who are the best in handicraft and the best in music in the school, and I have been teaching some of them German for instance. They came to me and said, "We "should like to learn something to fill up our time." One of them, our best music pupil, has got on very nicely in Gezman.

11,522. How old is that pupil?—About 16. I do not think there is any necessity for making it a system in the school. I think the chief education required for the bulk of the blind who must be employed in handicraft is a good elementary education similar to what you give to the seeing.

11,523. After the children leave the school do you think it better that they should be congregated together in one workshop to work, or that they should be separated and do their work in their own homes?—If they are likely to succeed separated, certainly they should be separated; but I wish to convey the impression that there are a certain number for whom workshops seem to me to be absolutely necessary.

11,524. Then it becomes almost a charity?—To start workshops? Yes, and that is one direction I think in which charity could work in the future.

11,525. But where they are able to earn a sufficient livelihood you would recommend their working at home and taking their work to and from the shop?—Yes, certainly.

11,526. (*Chairman.*) May I ask do you allow any beer or intoxicating drink to be used in the school?—None by the pupils unless ordered by the medical officer. I do not believe it is at all necessary for young people in good health.

The witness withdrew.

Miss MARY V. MORSE called in and examined.

Miss M. V. Morse.

11,527. (*Chairman.*) You have been a teacher in the Royal Normal College for now about four years; have you not?—Yes.

11,528. When you first came to teach did you begin with the lower classes, or did you take charge at once of the same class as you do now?—They have been changed each year. I have some that I had then.

11,529. But you have gone through the whole curriculum of the school; that is to say, you have taught in all the classes, have you?—No, I have not. I have had almost all the pupils under my charge at one time or another.

11,530. But you have confined yourself to particular departments?—I take the classes which are assigned me.

11,531. But what I want to know is whether when you first entered the school you began teaching the smallest children?—No.

11,532. Will you tell me what you began to teach when you first entered the school?—I had geometry, algebra, physiology, arithmetic, gymnastics, a Bible class. Those are all I think for the first year.

11,533. Those you still continue to teach?—No, I do not have geometry or algebra now.

11,534. You take grammar?—Yes; I had grammar the first year. I take physiology now; I have literature and composition, and I have gymnastics.

11,535. Do you still teach the youngest pupils?—I never have taught the youngest pupils; I always have had the older ones.

11,536. The classes you speak of are those not in the primary school?—No; I only had for a few weeks a primary class; that is my only connexion with the primary school.

11,537. What age do you begin teaching physiology; is there any particular age?—No; after they are prepared for it; when they are competent to take it in and appreciate it, Dr. Campbell gives it to me and I teach it.

11,538. But from what age generally are the girls?—The class that I have now are from 14; the eldest in the class is 26, I think, but she is an exceptional case.

11,539. I suppose you learnt physiology at some school abroad, did you not, or in America?—Yes, in America. I was educated at the Bridgwater Normal School.

11,540. Was the instruction in physiology there given by a man or by a woman?—By a woman.

11,541. And you have always learnt physiology from a woman teacher?—Yes.

11,542. There are no men professors of physiology you learnt from?—No men professors.

11,543. That I suppose was a school not for the blind specially?—No; I never taught the blind till I came here.

11,544. Then you have had some experience in teaching the seeing?—Yes; I taught the sighted three years.

11,545. Do you find that you are able to teach the blind as readily as the seeing?—Yes.

11,546. After, I suppose, some difficulties are got over?—I find that they take in ideas as readily as the sighted, but I find that I have to re-adapt what I learnt before.

11,547. Of course teaching physiology to seeing people must be rather different from teaching it to the blind?—My method is the same.

11,548. You have to make them feel everything instead of see everything?—Yes; and it takes longer.

11,549. Do you think that that knowledge is valuable to the blind, the knowledge of the actual structure of things, and the structure of the human frame as far as possible?—Yes.

11,550. I do not mean merely as a means of education generally, but you think it specially useful to the blind?—Useful to them because it is useful to everyone.

11,551. Only in that way; not specially useful to them?—Not more useful to them than to a sighted person, but equally with a sighted person.

11,552. And the same thing, I suppose, with regard to athletic exercises; it is equally good for everyone?—I think that special exercise is more necessary for the blind even than for a sighted person.

11,553. Do you find that those under your charge improve in physical health and in mental capacity under that training?—Yes.

11,554. You do not teach music at all?—No.

11,555. Do all those who are under your training learn music as well?—Yes.

11,556. Do you find that those who are most intelligent in your classes also do best in music?—No, it does not always follow.

11,557. You say you have taught mathematics?—Yes.

11,558. Have you found that those who are good at mathematics are good at music or not?—Not necessarily the best performers, but they more readily take in the principles of music.

11,559. Have you a decided opinion of the desirability of training all the blind in music as well as other things?—Yes; but I am not an authority in regard to the music.

11,560. On general grounds, or do you think that music is more especially suited for them?—I do not think the blind are naturally more musical than other people; but I think music a good business for the blind.

11,561. Do you think that music is as useful to them as physiology, or more so?—It is the way that more of them can earn bread and butter. But then physiology has so much to do with their taking care of themselves, and helps to make them generally intelligent.

11,562. Do you often see any of your own pupils who have passed through the college?—Yes, they frequently return.

11,563. Have you anything special to say with reference to the teaching of children in blind schools; from your experience, is there anything you would suggest?—As regards the method of teaching, do you mean?

11,564. Yes. Do you think they ought to be taught the same as seeing children?—I believe they ought to be taught just as much as seeing children ought to be taught.

Miss M. V. Morse.

19 May 1886.

11,565. And in the same way, as far as they can?—Yes; I think they need the education as much, and are as capable of taking it.

11,566. Do you find those who come from the workhouse schools equally intelligent with the others?—As intelligent, but not as well trained.

11,567. You find no difference in the intelligence of the pupils as to where they come from?—I do not know where they all come from. I do know where many of them come from, but I never think of it, whether they are from the workhouse or where they are from. I know some special instances from the workhouse that have done well since they came.

11,568. Do you find that the earlier they are brought under your care the more easy they are to teach?—Very much; because so many times when they have reached an advanced age they have already formed so many habits which one has to break up before one can give them what it is best they should have, that it takes time which it does not take if we have them under our care when they are young.

11,569. But you say those who first come into the school have to pass through other hands before they come to you?—They are very young when they come to me, or when I know about them. Little girls 10 years old I know about, but they have already been to the primary school, and I have to go right on and teach them what has been begun. When I have a young man, say, 16 years old, come to me, sometimes I have to begin at the very bottom with him.

11,570. You teach the boys as well?—Yes; I have taught both boys and girls.

11,571. How old do you teach the boys?—My boys I have now are only about 14 years old; I should think some of them are younger than that.

11,572. They are the more difficult to teach the older they are?—The older they are when they begin, the more difficult they are to teach.

11,573. (*Mr. Arroll.*) Can you give the Commission any information as to whether the children who have been taught in board schools prior to coming to the college are more intelligent than those who have been in the ordinary blind schools?—Yes, I think they are; they are more wide awake, more capable, more ready to take in things.

11,574. Do you think in their deportment they are more independent and self-reliant?—Yes.

11,575. I suppose you would be inclined to recommend that children should be so trained if they cannot be sent to a primary class?—Yes, by all means.

11,576. (*Mr. St. John Ackers.*) How long have you been teaching the blind?—For the four years that I have been at the college.

11,577. You say that you were educated at the Bridgwater Normal School in America; is that normal college or school in America the same as our training college of teachers in this country?—As nearly like it as it is like anything you have here.

11,578. In what essential points does it differ?—I can more readily tell you what that is like than how it differs from a training college. Usually girls or young men go after they have graduated from the highest standard from the public schools; they then pass an examination, whatever is required; and having obtained admittance, go through a regular course of training for teachers. There the work consists, first, in having a lesson presented, and then in the pupil teaching that lesson.

11,579. Do you consider that it is desirable that teachers of the blind should have any special training with regard to the blind, or that any well educated teacher placed in a school for the blind can efficiently teach?—I think that a teacher can teach.

11,580. That, in fact, it is more necessary that a person should be trained to be a teacher than that he should go through any special training in regard to the blind?—Yes. There are some things, such as reading and writing, that must be specially learned.

11,581. You say that it is not always the best mathematical pupils who are the best musical pupils; but have you ever known one of the best mathematical pupils unable to learn music?—Almost all of our pupils learn music to a certain extent.

Miss M. V. Morse.

19 May 1886.

11,582. Unable, I mean, to make their music a successful profession. Perhaps your experience is hardly long enough to answer that?—No, I do not think it is.

11,583. (*Dr. Campbell.*) In regard to our teachers at Norwood, who are concerned in the school, they give very little thought or attention to the music, do they not; in other words, they are not expected to know much about it. That is a distinct department, is it not?—Yes, it is.

11,584. You were speaking of pupils that come to you in regard to the ages in any class. Unfortunately, I suppose it is the case with blind schools that we get them at all ages; you have to begin some at 11, and your work will be as advanced as taking some at 16 and 17, and we have to put the young and old in the same class?—Yes, I have one girl 26 years old in my class.

11,585. She has been in a blind school, and is anxious to become a teacher for that purpose?—Yes.

11,586. I suppose if there is a school that desires particularly to have some teacher trained, some talented blind girl or young man, we often take them at Norwood, and prepare them for them, such as this one you speak of, and some others that have gone out to teach?—Yes.

11,587. They are taken expressly for training as literary teachers, not for music teachers?—Yes.

11,588. You were speaking of your Bible class. On the Sunday we have first prayers; then what do we have immediately after?—Bible classes.

11,589. The whole school almost is divided into classes and each teacher has a class?—Yes.

11,590. Afterwards do the teachers have duties in connection with the pupils going to church?—Yes, each teacher has an allotted section with whom she goes to church.

11,591. (*Chairman.*) Are teachers told off themselves to go to any particular churches, or do they go to the church of the denomination to which they belong?—The teacher goes with the pupils irrespective of her own belief.

11,592. Suppose you were a Presbyterian, and were told to go to a Roman Catholic church, you would go?—Yes.

11,593. (*Dr. Campbell.*) In other words, it depends upon the management. I suppose if the management was arranging it, and they knew that they could give the teacher a choice, if certain sections go to the Church of England and some to a Presbyterian place, they would give the teacher the preference?—I have always had the preference.

11,594. (*Mr. Johnson.*) What is the nature of the religious instruction given, the Bible lesson; do you follow any particular system?—At the present time I am reading to my class, taking it with the Scripture, Canon Farrar's Life of Christ. I read the scriptural portion to which the story as he tells it refers.

11,595. Is there any actual religious instruction given on any system, or is it merely that you select what book you like and give a lecture on it?—I do not give a lecture.

11,596. You give an explanation, do not you?—I read the Scriptures.

11,597. (*Chairman.*) Do you select books, or are they selected for you?—They are selected for me.

11,598. (*Mr. Johnson.*) By the management or by any clergymen?—By the management.

11,599. Does any clergymen visit the classes you teach?—No.

11,600. Of no denomination?—No.

11,601. Your pupils, I see, are from 14 to 26 years of age; how long would pupils remain under your special training?—It varies. From the time they come to the time they go they are all directly or indirectly under my training.

11,602. But how long do they generally remain?—I have many who have been there the four years that I have been continually passing from a lower to a higher grade of work.

11,603. Do you know the received time, the settled time, for which the pupils remain?—No.

11,604. Do you think that every poor blind child throughout the length and breadth of the land should be as highly educated as those children who are under your care at Norwood?—Yes, for they are of that kind.

11,605. You think they ought to be as well educated as the sighted children.—Yes.

11,606. Do you know that the sighted children are not educated in geology and algebra and physiology at the board schools?—I know they are not in some of those other branches.

11,607. Are they where you were educated yourself?—Yes.

11,608. You were trained in a training college, were you not?—Yes, but I learnt them before I ever went to the training college; at the training college I learnt to teach them.

11,609. The training college is a superior institution altogether as in England?—Yes.

11,610. And you think that any one of your ladies who was trained with you there and took a good certificate would be able to instruct almost any blind pupils?—Yes.

11,611. Do you think that sighted supervision is very necessary?—Yes, there ought to be some sighted people about.

11,612. You are not averse to employing pupil teachers who might be blind under sighted people?—We have blind teachers at the college who are under supervision.

11,613. Your idea is this, that the blind can help the sighted teachers, but that the blind in the school require sighted supervision?—Yes.

11,614. Can you tell us a little about the children have come from the workhouse and done well; is it a large per-centage of your pupils that have done well?—I do not know exactly who has come from the workhouse. Occasionally I hear some one say, "That pupil came from the workhouse."

11,615 You gave in evidence just now that some of the workhouse pupils had done well?—Yes.

11,616. All I wanted to ask you was whether you can tell us the sort of proportion?—I cannot.

11,617. How many blind teachers have you got under you. You say that you teach boys and girls; have you blind help in both classes?—Not at all in my own classes.

11,618. Neither for the boys nor the girls?—No.

11,619. Your instruction is more, I suppose, with these elder ones in the shape of lectures?—I teach all of those who are there as I would teach a little child, provided it is such a subject that I am teaching. They are old because they did not come when they were young.

11,620. Have you any experience of blind schools in America?—No.

11,621. You never saw any blind school there?—I have visited the South Boston School, but I never saw any of the work.

11,622. Then you learnt entirely your admirable proficiency (which we witnessed the other day when we visited Norwood as regards the education of the blind at Norwood?—Yes, I never saw a blind child until I came here.

11,623. Have you any sighted assistant associated with you in your class?—No. They are all under Dr. Campbell just as I am.

11,624. Is there any fixed period for a pupil's remaining in the college; do you know of any fixed period?—No.

11,625. That is according to the committee's direction and the management, is it not?—Partly, and partly according to the capability of those who send them to keep them there.

11,626. There is no fixed rule; it is subject to the opinion of the committee?—Yes.

11,627. (*Chairman.*) With reference to religious teaching, have you any personal knowledge of any other religious teaching being given to pupils who are under your charge besides what you give yourself. You spoke of some being taught by the clergy of the parish?—Not to be taught; it is only when they have gone for confirmation.

11,628. Who has prepared them; have they been prepared by you?—No.

11,629. Have you any personal knowledge of who prepares them?—Yes; some of them have been prepared by a pupil teacher who is there, who teaches them the Catechism. For instance, on Sundays she has a class of English Church girls only, and teaches them the Catechism.

Miss M. V. Morse.

19 May 1886.

11,630. And is the person who teaches them herself confirmed?—Yes.

11,631. And she teaches them what she has been taught herself?—I expect so.

11,632. But you do not give any religious instruction; you merely take a text book like Canon Farrar's Life of Christ and read it to the children?—That is what I am doing now.

11,633. Do you do more that that?—I do not now; I take the Bible with it, but I do not give any remarks of my own. I have, since I have been there.

11,634. Then do you take the Bible and comment upon it yourself; you have been in the habit you say of taking the Bible and commenting?—I will tell you just what I did. I took the Gospel of St. Matthew; they read it aloud, and as they read it I asked them at each verse what they thought it meant, and what good they could get from it. That was the way I went through the Gospel. If there was anything which I knew outside which threw any light on the subject I brought it in and read it to them. At the same time I had them learn parts which seemed especially beautiful.

11,635. You say you told them what you knew on the subject yourself; may I ask did you receive in America religious teaching under any denomination?—No.

11,636. Do you belong to any denomination?—I am not a member of any church.

11,637. Then of course you have not taught them an doctrines particularly?—The college is entirely unsectarian as regards the religious instruction.

The witness withdrew.

Mr. Arthur Wilmot called in and examined.

Mr. A. Wilmot.

11,638. (*Chairman.*) You were brought up at the Norwood College, were you not?—Yes.

11,639. What age were you when you went to it?—I was 17 when I went there.

11,640. You were there seven years?—Yes, about that.

11,641. When you left it did you obtain some position as a teacher of music at once?—Yes, I got pupils at once. Of course in a profession you do not get on at once, you have got to work your way; one pupil has got to recommend another, and so on.

11,642. But you were able at the end of the first year to earn your own livelihood?—Yes.

11,643. And you have done so ever since?—Yes; and I have brought you my ledger, where all my work is booked up, and I have made a balance sheet out for a week.

11,644. Is your time pretty fully occupied in teaching throughout the year?—Yes.

11,645. And you are willing to show the Royal Commission a detailed account of a week in the year for their information?—Yes. (*The witness did so.*)

11,646. (*Dr. Campbell.*) You have a good many engagements, and although they bring you considerable payment, I suppose the great value of your singing engagements is that it makes you known, so that it increases your teaching connexion?—Yes; I use my singing more as an advertisement to make myself known.

11,647. And you get, for fulfilling engagements in singing, according to circumstances, one to four or five guineas?—Yes.

11,648. Now, for instance, taking to-day, I asked you if you would come up to-day, but otherwise you would have been engaged in teaching from about 9 in the morning until 9 in the evening?—Yes. If you look at the names for Wednesday on my paper you will see that.

The witness withdrew.

Adjourned to to-morrow at 12 o'clock.

32, Abingdon Street, Westminster.

Thursday, 20th May 1886.

Present:

LORD EGERTON OF TATTON in the Chair.

The Right Hon. Sir H. Selwin-Ibbetson, Bart., M.P.	F. J. Campbell, Esq., Ll.D.
W. Tindal Robertson, Esq., M.D.	E. C. Johnson, Esq.
B. St. John Ackers, Esq.	The Rev. W. Blomfield Sleight, M.A.
T. R. Armitage, Esq., M.D.	Charles Few, Esq.
W. Auchincloss Arrol, Esq.	

Charles E. D. Black, Esq., *Secretary.*

Lieutenant-Colonel Mansfield Turner, examined.

Lieut.-Col. M. Turner.

20 May 1886.

11,649. (*Chairman.*) You have been for a long time interested in the cause of the blind, I believe?—Yes, since 1859.

11,650. Was it at Leicester that you first took up the question?—At Leicester.

11,651. What was the institution at Leicester with which you were connected?—It was called an Association for Assisting the Blind. It was in connexion at that time with the Euston Road Institution which was under Mr. Hanks Levi.

11,652. Was the Leicester Institution a branch of the London Institution?—It was almost a branch. Mr. Hanks Levi sent down the gentleman who had charge of it, a Mr. Mackley, a blind gentleman, and he was one of the pupils of that institution.

11,653. Is there anything that you wish to point out as a comparison between what existed then and what exists now?—The state of things then was extremely unsatisfactory. There were a few workmen working under this blind manager gaining very small wages, and doing very unsatisfactory work, which could not be sold. They were obliged to resort to all sorts of expedients to get money to carry it on. For instance one of the women used to be put into the window in order to attract passers by to see her sew and thread her needle; it was an object of attraction to the people in the street. At last the thing got so bad that under my auspices a

Lieut.-Col. M. Turner.

20 May 1886.

large bazaar was got up, and 1,300*l.* was made, showing the sympathy of the public, and on that the institution lived for four or five years dragging on a miserable existence and spending about 400*l.* or 500*l.* a year more than their income out of the proceeds of this bazaar; until at last I was met in the street by the secretary and treasurer and told, "We are going to shut up," I said, "That is a great pity; I do not think there is any "necessity for it, and if the committee will allow me I "will undertake to set the institution on such a footing "that I think it can support itself." To make a long story short I was permitted to do so. I got rid of all of what I may call the charitable part of the business; I entirely eliminated the business part from the charity part. I said, "This is a charity fund and this is a business fund." We supplement the wages of the blind by giving them twopence in the shilling; we considered that they were handicapped in the race of life, and we said therefore, "For every shilling that a sighted man earns you shall have one shilling and twopence." That twopence came out of the charity fund, and the one shilling was paid out of the business fund. That was the principle upon which we went altogether. The charity was entirely confined to charity, and business to business. After the first year of this process that was carried out completely, that is to say, after having got rid of the manager, who was very difficult to get rid of, and who was a block in the way (he was a sighted manager, and there was a sighted teacher also), in the first year the thing turned out a fair experiment; it was made to pay its own expenses. There was a balance of 12*l.* against it, but I think you might fairly say that that 12*l.* was more than covered by the fact that it was an institution which had to issue a report, for instance, and had to pay many expenses which it would not have had to pay if it had not been a public institution. So that the old state of things was unsuccessful, and the state of things when it was carried on as a business matter was successful, in so far that the institution paid its own way. I am bound to say that afterwards the old story of the surplusage of stock prevented that success continuing in the same degree. We never drew upon the subscriptions to the extent of more than 30*l.* or 40*l.*, but we were never so successful as we were in the first year, because the stock began to accumulate, which is the great difficulty, and has been ever since.

11,654. What was your experience of your visits to different institutions in 1866, the result of which you published in the book which I have now before me?—In consequence of our difficulties we went round to see what we could learn that might assist us; and although we did not visit quite all the institutions in England, we visited very nearly all of them. We were not able to get to Scotland. We found pretty much the same story wherever we went. Nobody seemed to know anything about what was going on elsewhere. We went to learn and they learnt from us; but every institution seemed to be entirely on its own hook, and without any relation or relative position to any other institution.

11,655. Did you not find that certain institutions were endowed institutions?—Yes.

11,656. Were they badly managed at that time?—I could not say that they were badly managed, but they were managed contrary to our notions. I will give you an instance of one case without mentioning the name. We went to one of those institutions where pupils are taken for seven years; we were not very cordially received. At the outside of that very institution as we went into it were two blind men singing and begging, who had been in the institution only the year before. They were begging outside the same institution in which they had been. That, to my mind, was an illustration that that institution had not done its work for those two men, at any rate.

11,657. Is it not also the case at the present time that the institutions do not take much care of those who have been in them after they have left?—It is so, but not to such an extent as it was.

11,658. Still you think that there should be watchful care over those who have left the institutions, and that there should be some provision to enable them to start in life and earn a livelihood?—I think that they should not be taken in for a certain number of years and then turned out. I am not prepared to go quite so far as they go at Birmingham, for instance, which I hold to be a model institution in its way and to be beyond all praise in one or two senses. For instance, there is a lady there who has devoted her whole life to the work, and who takes a personal interest in every pupil that goes there, and never leaves them alone. Perhaps a little too much is done for them, but I feel very doubtful how far I ought to say that, and I wish to speak in the highest terms of the Birmingham Institution.

11,659. Was the success of the institution at Birmingham the result of the conference that you held there?—No, it was very good then. We held the conference there because it was central. One of our objects in visiting these places was to try, amongst other things, to induce the institutions to meet in this conference. We managed to impress a good many with the idea that it was desirable.

11,660. That has been followed by other conferences which have led to the appointment of this Commission?—Exactly.

11,661. You do not speak of the present state of the Leicester Institution, do you?—No, I have left it. I go to see it constantly, and the thing goes on very much the same. Still there is a great difficulty as to stock. When we became prosperous at Leicester the subscriptions which we did not want for the business were all employed to assist the infirm blind who were unable to work. We found that at Leicester they amounted to as many as 70 per cent.; out of every 100 blind we calculate that there are 70 who are unable to earn their living in consequence of blindness, arising to a great extent from illness.

11,662. Those are in mature life?—Yes. There was great room for assistance; we found them leading most miserable lives. We immediately started a Bible woman to find out every blind person in Leicester and visit them and there was an immense deal of misery discovered. I do not think people have much idea of how much misery there is amongst the blind in the big towns.

11,663. Were not the cases of those persons in any way touched by the operations of the guardians?—They were all receiving relief. They generally give to blind persons about 1*s.* a week more than they give to sighted people. But the difficulty is this, that 1*s.* a week presents an object to their sighted relatives. We shall hear more of that presently, because I shall speak about a cottage home which we started, and the difficulties which arose from these sighted relatives.

11,664. They were, of course, living with their relations?—Yes.

11,665. Were they not well treated by their relations?—Many of them suffered greatly; very often they were left all day.

11,666. They were not cared for?—Many of them were not cared for.

11,667. What were the steps you took in consequence of that?—Every blind person was visited; a ladies' committee was formed who assisted them out of the funds given by the institution, a library was formed for the use of all who cared to read, and they were taught to read if they wished to. In fact, every blind person in Leicester became the subject of the attention of the institution.

11,668. Had you in the library books of more than one type?—The books were in Moon's type. That library is still going on, and the books are considerably used.

11,669. There are some institutions, as you know, where the deaf and dumb and the blind are brought up together; have you had your attention at all turned to those institutions?—Yes, there are some such institutions. Having given the subject my thought I have come to the conclusion that it is a most desirable thing that the work should be united. There is an amount of work in every institution which the blind cannot do as well as sighted people; but there is a great deal that they can do as well as sighted people. We have always gone on the theory that what a blind man can do well he should be allowed to do, and that what he cannot do well should be done for him. We want to turn out good work, and we say that it is quite as good and better for a blind man that he should be constantly employed. What does it matter if I employ two sighted men to keep one blind man going who would not otherwise be employed? I do not sell the work as being made by the blind. When I first went to the Leicester Institution every brush was marked "Made by the blind"; the consequence of that was that people would not buy them. The first thing that I did when I came in was to eliminate that mark altogether.

11,670. Do you think that it is good for both classes to be mixed together, so that they can have a sort of mutual interchange of help?—I do not see why the deaf and dumb people should not do the work of the sighted; they have eyes and they can do it. Mr. Martin, of Edinburgh, says, "The deaf and dumb are employed to "dress the bristles, to bore the holes, and to finish the "brushes." Those are things which the blind find it difficult to do.

Lieut.-Col. M. Turner.

20 May 1886.

11,671. But would it not be rather a difficult thing to amalgamate all the institutions all over the country?—I do not know much about the deaf and dumb institutions, but I see no reason why we should not without any amalgamation employ adult deaf and dumb people. I should employ them in separate rooms, not in the same room.

11,672. You are contemplating a series of workshops in which to employ the blind; and as an assistance to them you would get deaf and dumb labour as being useful in many ways?—Yes, using that where we now use ordinary sighted labour. The reason I think so is this, because I should extend the sympathy of the public if I could say, that I am helping two classes of people instead of one; and I think I should extend my sales by that sympathy, because I at once interest a double *clientèle*.

11,673. Do you think that the institutions have got too much apart by themselves, and that there has been want of unity of action?—I conceive that the cause of all the want of success of the work has been what I may call separation, having separate interests.

11,674. Have you any special views with regard to the occupations for which the blind are more peculiarly fitted?—I have the largest views with regard to their capacity for work; I think there is very little that they cannot do. I have seen at York a hair bracelet beautifully made by a blind woman, and nothing can be finer than that. I contend that there is nothing that they cannot do if they get a fair chance, which I do not think they have had.

11,675. Then do you think that their physical education has been neglected?—Yes.

11,676. They ought to be taught, in your opinion, to do everything like other people, so far as they can?—Yes, so far as they can; but I do not think that they have ever had a chance, I will tell you what I mean. If I take a sighted boy to apprentice him to a trade I take him at 14 years of age and apprentice him for seven years. The habit has been that if a blind boy or man was to be taught a trade he should be taught two or three trades, and at the end of two or three years he was thought to be perfect; they are jacks of all trades. The consequence was that they have never had a fair chance of doing work well in my opinion.

11,677. You are speaking now of the existing institutions?—Yes, I speak of my own, what could we do? The guardians always assisted us by giving poor blind persons 2*s.* 6*d.* a week, or something of that sort, and we always while they were pupils gave them another 2*s.* 6*d.*, or 3*s.*, or something like that, making it up to about 6*s.* or 7*s.* per week. Of course for the first period of their pupilage they spoilt a great deal of material, and occupied a great deal of the teacher's time, and they were a dead loss. That was all charged to the charity. This poor man feels that he can do certain things, and the guardians begin to grumble, and we want to get him out of his pupilage; and as soon as he can do anything he is put to work. But that is very unfair to him, and to the institution, because the man is not at all fitted to make a good basket or any thing else. You say, Why did you do it? I say, We simply did it from the necessities of the case, and that to a certain extent has been the case all round. And so I do not think the blind have ever had a fair chance.

11,678. What extension or re-modelling of the existing industrial system with regard to the blind do you think is desirable?—That is a very large question. If I may be permitted to go to the very commencement I think we ought to begin with the blind at the very earliest age. I think that the resident schools ought to confine themselves to being schools, and ought to take the children from the earliest age at which they are capable of being taught to be useful at all; that is to say that there should be in the first instance a nursery where they should learn to be handy, to dress themselves, to play, to gain confidence, and to be ready in fact to begin their school work.

11,679. Then you would begin in infancy?—At three or four years of age.

11,680. They would be troublesome at that age, but you think it is better to begin early?—Yes, for this reason, that you will have got rid of a great deal of difficulty by the time that they go to school, because they will have learnt a great deal that would otherwise have had to be taught with great labour afterwards.

11,681. In fact they get into bad habits by constantly running wild at home?—Yes, and the parents are very injudicious. Then I would eliminate the question of resident schools altogether. I would let the blind children go to the board school, still remaining at the resident school as their home. As soon as they come to the age, say of 14, having learnt what is necessary, and what is usual at the board school, I should then apprentice them to one trade for seven years, either to a workshop attached to the institution, if it is rich enough to have one, or if not to some other workshop.

11,682. Would you find any difficulty in apprenticing them out?—I do not think we should find the least difficulty; but of course it is a matter that has not been tried.

11,683. Would you apprentice them either to a workshop or to an ordinary tradesman?—I do not say that I would apprentice them to an ordinary tradesman unless it were general. The Americans do that, I believe, speaking under correction; but I have here a report of the Indian Institute where they absolutely let out their blind men to sighted people.

11,684. What sort of masters would you find willing to take blind apprentices?—I think that the factory institutions would be only too glad to do so, if there was an adequate compensation made to them. Of course they could not be taken for nothing, but I think the factories would be only too glad to take them as apprentices.

11,685. What factories are you speaking of?—Of blind factories. I am going step by step. I hope to see some day factories for the blind really what they are called. They are called workshops now, but I do not like the name; I want it to be a factory just the same as a sighted factory.

11,686. On a large scale?—On a large scale. I want to confine them to the making one article just as we do in sighted business. If I want to make an article well I must not go and make half a dozen things in the same place with the same people, because they will be slow, and they do not become masters of it, and never attain excellence because they are never working altogether at one thing. What I want is that every institution shall take its own branch; that Leicester, for instance, shall make hair brushes, that Nottingham shall make pan brushes, that Sheffield shall make scrubbing brushes; each one having its own work to do, and that they shall supply the shops of the various institutions throughout England. For instance, we have shops in nearly all the big towns now, and I should like to see such an agreement between them that they should draw all their supplies of hair brushes, say from Leicester, and that Leicester should draw all its supplies of everything else from the other places. You will then make the factories of such importance that they will be able to take in these apprentices.

11,687. How would you get rid of the competition of the sighted workmen?—I am quite prepared to meet it.

11,688. Even foreign competition?—I do not say that I should make German baskets, but I should sell them in the shops. When we started the shop in Leicester we made a thoroughly good shop of it, selling goods that the blind could not make, and during the time that I was there that shop never subscribed less to the charitable work of the institution than 100*l.* a year.

11,689. Did that represent the profit made?—That was the profit made, which went to the work of the institution.

11,690. Then do you think that there might be some combination amongst the different institutions in order to get those markets and to supply those shops?—Certainly.

11,691. If one institution is to do one thing and another another, the articles produced must not be all sold at separate shops, but they must be sold in one shop, and you combine all the various products made at different factories?—That is my plan. I go further, and I say that there is no necessity to confine ourselves to places where there are institutions. I think that we might fairly call upon the friends of the blind (and I feel

Lieut.-Col. M. Turner.

20 May 1886.

sure that they would answer to it, because it would be a very good speculation) to set up shops for the sale of these goods in all large towns. In Derby there is no institution, nor in Torquay. I mention places far apart, where there is of course an opening for shops, and where a good profit might be made, which all might go to the benefit of the blind under a scheme which might be detailed.

11,692. Do you think it would be more economical to the ratepayers if good schools were provided which would prevent blind persons being a burden upon the rates in after life?—It is a fact that at present, supposing my statement to be correct, there are about 70 per cent. of the blind unable to work. I take the number of the blind in the United Kingdom to be about 30,000, that is in round numbers what it has always been estimated at. I find that out of the total number of blind in the United Kingdom, there were only 2,700 in 1883 being employed in any way whatever.

11,693. Where do you take that from?—I take that from the returns of the various institutions made to me when I published this book.

11,694. Not from any official returns?—They were official in so far as they came officially from each institution. Out of 30,000 30 per cent. would be about 9,000. Therefore that gives in round numbers 6,000 able bodied blind unemployed who ought to be employed and who would gladly be employed. If we take those 6,000 at the lowest rate at 2*s.* 6*d.* a week, though they generally get more, it comes in round numbers to rather more than 40,000*l.* a year, which I calculate would be saved to the ratepayers if a large scheme were devised for the employment of all the able bodied blind who were willing to work.

11,695. Do you think that as a rule the guardians subsidise existing institutions sufficiently?—They have great difficulties. I have known guardians subsidise the institutions by sending pupils to them, and a very good investment it is if the pupils are returned capable of earning their living; but if they come back again, as I have known them do on several occasions, and go on the rates again, it is a very bad investment.

11,696. And naturally there is a prejudice against that system?—Yes. We have never found any difficulty in getting them to pay for the pupils while in pupilage, because we have always taken them off the rates after they have become skilled workmen.

11,697. That has been the case with those who have passed through your institution at Leicester?—Yes, always; they are now working there, and are off the rates.

11,698. Was that invariably so?—Invariably so.

11,699. In the case of all those who could work?—Yes.

11,700. Have you no difficulty at all in Leicester with incompetent, or idle, or stupid men?—We have had difficulties of course. I cannot remember ever having to send a man away for incompetency; it may have been so, but it is very rare.

11,701. Of course one can understand that great difficulty has arisen from the want of early training of the blind, and their getting into idle habits?—Yes, a great deal.

11,702. But that would be obviated under a better system of instruction, beginning at an earlier age?—Of course they would be better workmen. The gratitude of an adult blind person at being taken in and taught, in fact being given an object in life, is very touching. There was an old soldier in my own village whom I got into the institution. He used to walk in four miles every day and four miles back again to earn 6*s.* a week; and he said to me, "Sir, it has been the life of me; it has "given me something to live for." That really is it. These poor people, when they first feel blindness coming upon them, are utterly crushed, and if you did not pay them at all, to have given them something to do is a real kindness to them; and when they begin to feel that they can earn their own living it has a wonderful effect in raising them. This man afterwards went on for two or three years getting his parish pay of about 3*s.* 6*d.* a week, the institution making it up to about 6*s.* or 7*s.* a week; and at the end of that time he was able to earn his 12*s.* a week.

11,703. Has he continued to do that?—Poor fellow, he died shortly afterwards.

11,704. What alteration of the present system do you think desirable with regard to those who, either from infirmity or from age, cannot work and have become blind when they are old?—I have said that there is a large amount of suffering, so far as my experience has gone, amongst that class, much more as I have said than I think is understood. The plan that we have adopted was tried in 1874, I think, or 1875. We took a cottage, and we engaged a poor sighted woman of good character to whom it was also a charity. We went to the guardians and said, "Now we want to do something "for these poor blind people, but in doing so we do "not want to assist the rates; we want to assist the "blind. Therefore, unless you will promise us "to give them the same pay as they now have we "will not do anything." They acceded at once. I have never had any difficulty with the guardians; they have always been most reasonable. Then we took a cottage and furnished it, and got the ladies' committee at the institution to look after it, and we endeavoured to get four aged blind women to go and live there, and the sighted woman and the blind people all had their incomes made up to 5*s.* a week each, which, to them, although it does not sound much, was riches. They had been used to live upon 3*s.* 6*d.* a week in a very wretched way; they were now put into a very comfortable cottage with a sighted person, who had nothing else to do but to look after them, and they had 5*s.* a week instead of 3*s.* 6*d.*

11,705. Were those in batches of four?—They were. We never arrived at more than one batch, because we could never get the people to give money to start another cottage. I managed to get the first one up.

11,706. You had no difficulty in making the 25*s.* a week amongst the five keep them comfortably?—They could do it perfectly well; we had no difficulty about getting it, because the institution undertook out of its charitable funds to assure it.

11,707. It did not add to the 5*s.*?—No, we did not wish to do it; we considered that 5*s.* was the right thing. You will be surprised to hear the difficulty that occurred. The difficulty that occurred was to get the people to come into it, not because those who came were not comfortable, they were very comfortable, but because the sighted people would not let them come. The sighted people cling so to the extra shilling a week which the blind relatives get from the parish, that it is with the greatest difficulty that you can ever get the blind people away from them. We did get it done, but however much the blind wish to come themselves, there is always a great difficulty in getting the sighted people to let them come. Still those who are there are exceedingly comfortable, there is no rule so long as they behave themselves, they may mess with one another or they may mess alone; they are living as in their own homes.

11,708. Did you give those old women anything to do in the way of knitting?—Nothing at all, and they were for the most part not able to do it. I do not say that all pensions ought to be employed in that way, but I think that some of the money which is spent upon pensions would be exceedingly well spent in setting up such homes as these for infirm blind people.

11,709. Are you aware of any of the evils of the pension system, such, for instance, as giving certain amounts of money in lump sums once a quarter?—I have not become aware of that evil. The evil that I feel about it is, that so much of it goes to the benefit of the sighted. The blind person gets the pension and the sighted man spends it.

11,710. What would you do with regard to the occupation of blind women generally, because we have been speaking hitherto only of men?—I have been speaking of women too.

11,711. Are you able to employ them in the same way?—Exactly in the same way. They are paid twopence in the shilling more than sighted people; they draw brushes, they cane chairs, but they do not do any knitting.

11,712. Or any fancy work?—No, it does not pay at all.

11,713. Crochet work pays better than knitting, does it not?—They are both very unremunerative indeed. The great difficulty is to find capital. Brush making, for instance, is a very expensive trade, and I may mention, with regard to brushes, that the bristles which are required for brushes are a very expensive material indeed, and it requires a great deal of capital to keep a brush trade going.

Lieut.-Col. M. Turner.

20 May 1886.

11,714. How did you meet it?—We met it by putting the money which came from donations, in the first instance partly into that work. Finding that it was very difficult to make ends meet we brought down from London a first class brush-maker, and paid him to come down and look through our brush making work, and tell us where the blot was, in order that we might remedy it. He came down and looked through it, and said, "You are making your brushes all right, there is "nothing that I can recommend; perhaps you are "paying a little too much for your material, but there "is one thing that you do, and that is the reason why "you cannot make money, you make your brushes too "good, and you lose because you cannot use up a "great deal of the material which sighted people do "use up." If they are going to draw a brush, there is a piece of bristle that doubles over, and it is drawn through by a piece of wire. If that piece of bristle is not long enough to double over the sighted man makes a little loop, but the blind person cannot do that, and he is obliged to throw it away, so that there is a great deal of material wasted. That is one of the difficulties which has to be contended with.

11,715. Is mat making of any use as an occupation for the blind?—The gaols put that entirely out of the question as regards any profits. When we made mats we did not know where to put them; they increased to that degree that the whole house was full of mats.

11,716. Is there any other point with regard to the education or the condition of the blind that you would like to call attention to?—I should like to say a little about the institutions themselves. One of the things which I should urge upon the Commission is that the accounts of the institutions should all be kept upon a form which should be supplied to them. I do not think that should be confined to blind institutions, but that it should apply to all charities; however we have only now to do with the blind.

11,717. Would you have it done under the supervision of the Charity Commissioners?—Yes, I want to see all the accounts of the blind institutions put in such a form that we can compare them. At present it is a perfect impossibility to compare one institution with another.

11,718. You mean as to the cost of the inmates?—Yes. I believe, in fact I know, that there are some institutions in England where the blind inmates cost 70*l.* a year; there are others in England where they do not cost 40*l.* a year.

11,719. Do you think that that arises from the necessary expenses in regard to the education, or from want of economy?—I am not able to answer that question, because I have not the accounts which would tell me. If I had clear accounts I could say at once, but the accounts give me no clue whatever; and I look upon it that, as regards the amelioration and reform (if there is reform needed) of the institutions for the blind, and of all charities, there is nothing so needful as uniformity in their accounts.

11,720. That you apply to the deaf and dumb institutions and other charities as well?—Yes, I do not wish to say anything about any other institutions except those for the blind on this occasion. I could say something about some others, but I have nothing to do with them here. I do not know anything about the deaf and dumb institutions.

11,721. If the same state of things exists in the accounts of other charitable institutions you would apply the same rule to them?—I would, certainly.

11,722. Is there any other point which you would like to speak upon?—Yes. There is a point which I should like to mention with regard to trade. I look upon the industrial part of the work of the blind as the foundation of all other work, because if it is properly carried out I believe that it will provide all the funds to do everything else. I believe that there is an amount of money to be made out of the industrial work of the blind of which people have no idea at present, because it has never been fairly tried or put before the world. As regards the institution at Sheffield, for three or four or five years a gentleman named Carter (whom I hope you will have before you, as one of the persons who knows about trade), worked it himself pretty much as I did without a manager. They managed to pay all their expenses and had a fairly handsome profit for three or four years, even with all the difficulties which they had to contend with, and they were very great indeed. In 1870 the sales of the shops then existing in England amounted to 33,500*l.* Those figures I take from my own book. I may say, perhaps, with some little pride in the matter, that these accounts have all been thoroughly investigated by a first-rate accountant, who has checked the results, so that the figures that I give you can be thoroughly relied upon. There were, as I say, 33,500*l.* from sales. At that time the shops were generally speaking of a very inferior class, and many of them only sold things made by the blind. They were generally in dull dark streets, and they could not expect to do much business. Between 1870 and 1883, a considerable change took place; people began to find that that would not do, and the shops were made better, and they sold other things which were not made by the blind; there was a great deal more done. In 1883, the 33,500*l.* had increased to 72,865*l.*, so that there was a very considerable stride in the returns from the things sold in the shops. You must not understand that all those things were made by the blind. In Scotland the result was perhaps not quite so striking, because the amount was not quite double, though it was nearly so. In 1870, in Scotland, the sales amounted to 21,900*l.*, and in 1883 they amount to 39,500*l.* That was only in five institutions.

11,723. (*Mr Arrol.*) There are only five institutions in Scotland —Only five, and that is a very remarkable result. If we could only manage that that 39,500*l.* should give a fair profit, as it ought to do, then I say that there is an unbounded source of wealth open to us. And why should it not? People say, "Oh, because they are "blind people." That has nothing to do with it at all. It is true that my blind man does not work as fast as sighted men, but then he gets less money. If he only earns a shilling he only gets a shilling. What I give him over and above has nothing to do with my trade; that comes out of the charity, or ought to come out of the charity. I hold as a fundamental point, that the charity should be separate from the business; if you muddle the two things up together you never know where you are. Why is not my blind worker to make me a profit as large as sighted workers. I believe that this 112,000*l.* of sales ought to have produced a profit and a very handsome profit, which I think ought to be employed by the institutions on behalf of the infirm and aged, and the blind who cannot work. It would be a very handsome amount, and I believe it will be done, because I calculate that the 112,000*l.* ought to become 500,000*l.* if it is properly worked; and I venture to say before the Commission that the blind work only wants developing with that common sense which is used in sighted work and in sighted factories to be quite as self supporting and quite as profitable as sighted work; and so far as money is concerned we do not want anything if it is properly done. We want a great deal of moral help and moral support, but so far as money is concerned I believe there it is before us. I told them at Leicester, "We do not want any assistance as regards "the trade; all we want is a little help towards these "poor people."

11,724. I suppose you have not had any experience with regard to music as a source of profitable occupation for the blind?—The experience which I have had in that respect amongst the lower orders has not been very satisfactory; there have been two or three instances in which I think music has been to them rather a difficulty than a help.

11,725. I suppose a little music is a dangerous thing?—Certainly; but in those cases of which I am thinking it was more than a little music. The persons I have in my mind had sufficient music to be organists of churches; but it was dangerous to them, and certainly did not tend to their happiness or to their good.

11,726. Do you mean that they took to playing in the streets and frequenting public houses?—That really was so.

11,727. But have you had any experience of sending persons from your institution to any first-class institution where they have been taught music thoroughly?—No, I personally have not.

11,728. (*Sir Henry Selwin-Ibbetson.*) I understand that the system which you suggest in order to attain these results financially would be almost a recasting of our present institutions throughout the country, so as to unite them together?—Yes.

11,729. With workshops attached to those institutions where the men could be apprenticed after leaving the institutions?—Yes.

Lieut.-Col. M. Turner.

20 May 1886.

11,730. The first object then is to get the institutions to unite together for this purpose?—Yes.

11,731. And you believe that the 6,000 blind who you say ought to be employed and wish to be employed would all prefer to follow an industry to leading the roving life that many of them lead?—A very large percentage of them would. A blind beggar can by simply going and holding his hat out earn 5*s.* a day at any time; and it really has come to this, that even in the place where I live only the other day a blind beggar who had made his fortune sold his berth to another blind man.

11,732. Like a street crossing?—Yes. But you must remember that the blind are tremendously handicapped. A man who can earn money so easily as that, and has been in the habit of doing so, is not often apt to take to labour.

11,733. At the same time, supposing your idea to be carried out, and an opening to be offered for all the blind, or practically all the blind, the public would not object to blind beggars being a little more stringently dealt with than they are at present?—No, I look forward to a day when you shall say to a blind able-bodied beggar, just as you say now to a sighted one, "Why "do you not work."

11,734. If workshops existed where the blind man would earn his living he would be practically forced out of the street begging to which he is now attracted?—Yes.

11,735. With the object of bringing about this result how would you suggest that the first step should be taken to get over the separatism that exists?—It is there that I think that the Royal Commission will be so useful by bringing its moral influence, and perhaps a little more than moral influence, to bear.

11,736. That centralisation of the system is the foundation of your suggestions?—Yes, certainly. There is one point which I have not mentioned which was brought forward at York, and which I ought to have mentioned, that is to say, the idea of a central bureau; by that I mean a focus in which all these associations should be, if I may so say, gathered together.

11,737. A sort of register of their work?—A register of everything. In 1866 that notion was not only set afloat at Birmingham, but it was started, and three institutions actually joined to do such a thing. Of course that number was not sufficient to enable the idea to be carried out, but it was so far accepted then that three institutions declared that they would join, and actually did join as far as they could. The idea was put forward at York, and it met with a considerable amount of approval, that all intelligence concerning blind institutions should be registered, and that there should be a ledger for every institution, which should contain all the information that is possible about that institution, as regards its trade, its stock, and everything else.

11,738. And the shops connected with it?—Yes. Even as regards the condition of things now, here is a case which did happen: An order was given at a seaport town to a blind institution for 5,000 baskets; that was more than the institution could tackle, and they were obliged to refuse it. Had there been this central bureau the work would have been saved for the blind. There was another institution, say at Leicester, where most likely they were dying for work, being overstocked, and did not know what to do. If there had been a central bureau the people in the first town would have telegraphed up to the central bureau, "We have an order "for 5,000 of such baskets, who can make them?" and the reply might have been, "Leicester can make "them for you." In that case the order would have been saved for the blind.

11,739. But the system contemplates not only that the institutions should be absolutely for the blind, but that the factories, as you call them, should also be factories purely and simply for the blind, or for the blind and deaf and dumb?—Yes.

11,740. You would not attempt what you say the Americans have attempted to apprentice the blind to open factories?—It is a very large question. I should not like to say that I would not do it, because I have never seen the system at work. It is a very grand idea, but I have never known but one blind man who could go into a sighted workshop and work and earn his living, because they are so heavily weighted. That man was a basket maker, and he could go into a sighted basket shop and earn his wages with a sighted man any day.

11,741. But you see no difficulty where the blind are kept separate, and working at one single trade, in their being able to earn a living just as well as the sighted?—Certainly not, I think that they require sighted help of some sort.

11,742. Sighted superintendence?—Sighted help. The idea of superintendence means that they want keeping up to it, and I do not mean that. A man gets into a difficulty, and he says, "Will you be good "enough to tell me what is the matter?"

11,743. There must be a sighted foreman of the works?—Yes.

11,744. (*Rev. W. B. Sleight.*) You stated that with regard to the blind you think it is advisable to have, I suppose you mean, primary schools for them?—I would rather call them nurseries.

11,745. And in those nurseries you would take them as early as three or four years of age?—Yes.

11,746. Would there not be a difficulty in getting the parents to part with the children at so early an age as that?—If necessary that is where the Commission should come in, I think. I do not think there would be a difficulty, because the advantage to them would be so very great. These poor blind children are a tremendous incubus to the parents.

11,747. Then how are those children to be paid for?—Out of the present funds of the resident schools. My proposition is that the resident schools should do very little else but keep these children; they will be spared all the cost of education.

11,748. Then up to the age of 14 you would have the blind children educated at board schools?—That is in my notion.

11,749. With the other children?—Yes.

11,750. In the same classes?—Yes.

11,751. Then up to the age of 14 they would have learnt no trade of any kind?—No trade of any kind. I would much rather they did not.

11,752. Would it not require a separate staff of teachers for the blind children to be taught with the other children in a board school?—Yes, provision is made for that in the Act, and they do so now.

11,753. But you would have the blind children taught separately?—Partly separately and partly together. In many board schools now there are classes in which the blind children are taught with the sighted.

11,754. (*Sir Henry Selwin-Ibbetson.*) The question really is whether there should not be compulsion. At present there is permission in the Act, but where the guardians find that they have only a small number of blind children they declined to exercise their power because of the cost of the teaching?—Yes, I think that they should be compelled to exercise it.

11,755. (*Rev. W. B. Sleight.*) Then at the age of 14 you would have them admitted into factories?—Yes, I would have them apprenticed.

11,756. Would you have the deaf and dumb working in those factories with the blind?—I do not feel quite competent to speak about the deaf and dumb, because I do not know their peculiarities, if they have any. Whether it would suit them or not I cannot say, but I certainly would do so if it were found suitable. I would not put a deaf and dumb child into a blind school. Whether it might be advisable to make the same factory the place where the deaf and dumb should be apprenticed as well as the blind, I have not experience enough to say.

11,757. But your proposal to have special factories for the blind arises from the fact that there is a difficulty in getting the blind apprenticed with sighted people?—I do not think that I said so. I do not know any instance of any blind lad ever having been apprenticed to a sighted person in England.

11,758. But the deaf and dumb are frequently apprenticed, are they not?—I know nothing about the deaf and dumb. I do not know any instance in England of any blind youth ever having been apprenticed to an ordinary sighted workman, but I do not say that it has not happened.

11,759. Then your proposal that deaf and dumb labour should be employed in connexion with the blind was for the purpose of assisting the blind?—Yes, for the purpose of assisting the blind and the deaf and dumb. I read in the Census of 1881 that there is great difficulty in finding

Lieut.-Col. M. Turner.

20 May 1886.

employment for the male deaf and dumb. I find that where it has been tried it has been attended with success, that the deaf and dumb should do that sighted work which the blind require for help; and I ask why should not the deaf and dumb do this sighted work?

11,760. My experience is that there is no difficulty in obtaining places for the deaf and dumb, but that the tradesmen very willingly accept them; therefore, there would not be the same need for factories for the deaf and dumb as there is for factories for the blind; but your proposal would be to enlist the deaf and dumb labour rather for the purpose of helping the blind?—Yes, and I have thought rather for the purpose of helping themselves. If you say that it will not help them I must bow to your superior knowledge. I know nothing about them, except what I am told in the Census Book.

11,761. You mentioned 70*l.* as a high figure and 40*l.* as a low figure as the annual cost of the maintenance and education of blind children; do you think that 40*l.* per head per annum is the lowest figure that the blind can be educated for?—I was speaking of it as exemplifying the great difference between various institutions, and the difficulty of ascertaining the reasons. It is possible that the 70*l.* education may be really quite as cheap as the 40*l.* education; we have no means of finding that out. At Leicester each blind person in the institution does cost altogether as the charity part of it about 6*l.* a year, or it was so when I had to do with it. But that is only a workplace.

11,762. You do not educate at Leicester at all?—No.

11,763. (*Mr. Arrol.*) In recommending homes, as you might term it, for children, you are not disposed to make any charge for board?—I have not thought of it, or I have not given it any great consideration whether the parents should be charged. I think as a matter of principle it is desirable to charge the parents where they have sufficient means; but my experience of industrial schools is that the greatest difficulty that the magistrates have to contend with is to get even 1*s.* a week out of the parents of the children who are sent to industrial schools. It is an invariable fact that they hardly ever pay unless they are compelled to do so by being brought up under a warrant for not paying. Therefore I think you must be quite sure of their ability to pay before you charged them.

11,764. Do you not think that it is injurious to a child to be removed from the control of its parents?—I should not think that under these circumstances it was at all injurious.

11,765. What are your principal reasons for recommending that blind children should be educated at board schools along with the sighted?—Because I think it is an advantage in every way to a blind child. It puts him alongside his fellows; it gives him confidence; it makes him feel that he is on an equality with them; and I think it brings out much of his power, which probably would not be brought out if he was educated solely amongst the blind.

11,766. Your institution I apprehend is entirely for work; there are no dormitories in connexion with it?—No, they live in their own houses.

11,767. You pay the workers by piece work, do you not?—Yes, list price it is called.

11,768. You think that you may pass into the charity fund a portion of the profits that have been earned after you have paid the full amount of wages?—Yes, if there is any, but that has not often been the case. The shop paid into the funds 100*l.* in one year, but I told you that one year we paid our expenses all but 12*l.*; that included the 100*l.* that was paid by the shop.

11,769. Then you paid that 100*l.* that was made in the shop to the fund?—The shop accounts are kept quite separate from what we call the warehouse accounts, and the charity accounts again are kept quite separate from both.

11,770. In the charity do you give the workers any clothing or any dinners?—No.

11,771. Should you consider that the reason why most of the institutions are not profitable is that they are good berths for a number of sighted persons?—I should not like to put it quite in that way. Of course we know that in all these institutions a vast amount of money necessarily goes to establishment charges; it is one of the inevitable disadvantages of them. Perhaps you are rather putting it as if the institutions were made for the sake of the berths.

11,772. Perhaps some of the institutions may be over weighted with sighted supervision?—I think that is quite possible.

11,773. And of course sighted supervision is more costly?—That I am not quite so sure of.

11,774. (*Chairman.*) Do you mean in the first instance, or in the long run?—In the first instance I am not quite so sure of that.

11,775. (*Mr. Arrol.*) When you were getting information as to the number of blind employed throughout the kingdom did you ascertain through the Home Teaching Society how many were employed as well as ascertaining through the blind asylums?—No, we sent a form to every institution and workshop in which we asked these questions: "What number of male and "female inmates? What industrial trades? If out-"door pupils, how many of them? How many blind "are employed in the workshops?"

11,776. Are you not aware that the blind asylums have little or no interest in the home mission societies and cannot give any information of what is being done by them?—I am not speaking of the home missions, but of the work.

11,777. It may not be so in England, but in Scotland the home mission societies get the blind employed?—Yes, but that is not in the institutions.

11,778. No, it is quite separate from the institutions?—We were not aware of that, and if there is any number employed in that way they are not included in this list.

11,779. I think your returns show that about 3,000 blind persons are employed throughout the kingdom?—2,700.

11,780. Are you aware that fully one third of that number are employed in Scotland?—The information that I have here is that there are 491 blind persons employed in the workshops of Scotland.

11,781. Then that does not refer to those employed in public works?—It does not refer to those whom you have been speaking of who are employed by the home missions.

11,782. You were good enough to mention that the Scotch sales in 1883 amounted to 39,000*l.*?—Yes.

11,783. If I inform you that it was 52,000*l.* last year, would that confirm your argument?—Certainly.

11,784. (*Mr. St. John Ackers.*) In reply to a previous question that was asked you by one of the Commissioners, I understood you to say that you think that school authorities ought to have a special teacher for the blind, even when there are very few blind pupils?—Yes.

11,785. Supposing that there were only one or two blind pupils, do you think that the Government would insist upon a special teacher; do you not think that the better way to get over the difficulty would be to enable board schools to pay for the education of those blind children elsewhere?—You are putting an extreme case. Of course extreme cases must be met by extreme means, and in such a case it would very likely be desirable to do as you suggest.

11,786. If the law were so altered that school authorities were compelled to find blind teachers for blind children when there was any considerable number of them, but not when there were very few, then those few children over a large number of areas would, of course, be uneducated; would it not, therefore, in your opinion, be necessary to supplement that alteration of the law by a further one, namely, giving school authorities power to pay for the education of blind children elsewhere when there are only very few in any one centre?—Yes, if the scheme that I propose were carried out the blind would, generally speaking, be massed in those resident schools, therefore there would always be a sufficient number to form a class of the blind.

11,787. Then it is your opinion that it would be well that isolated cases of blind children should be removed from country districts, and so forth, and congregated together, as I think you have already said, in a nursery, and that from that nursery they should go to the board school, or other public elementary school of that particular locality?—Yes, that is my idea.

11,788. You say that 70 per cent. of the blind have been unable to earn their living at Leicester; would

Lieut.-Col. M. Turner.

20 May 1886.

hat have been so if the blind had formerly been as well aught as they are now?—Yes, I think so.

11,789. You spoke of separatism as being a great evil; it might be understood in your reply to the Chairman's question that you meant separatism with regard to the societies for the blind and for the deaf. I understood you to mean, however, societies only for the blind?—Yes, I did.

11,790. You have not yet spoken about Government inspection; are you inclined to welcome Government inspection or to insist upon it?—No, except so far as education goes I think it would be an unmitigated evil.

11,791. Then you accept it so far as education is concerned, but not so far as industrial occupation is concerned?—Certainly.

11,792. Then it would stop at the age of 14?—It would stop when the education stopped.

11,793. You have said that you desired the education to stop at the age of 14?—Yes, I simply desire inspection as regards schools.

11,794. (*Chairman.*) But, of course, if there were factories they would be under an inspector of factories?—Yes, they would necessarily be so.

11,795. But you would have no special inspection?—No special inspection.

11,796. (*Mr. St. John Ackers.*) With regard to the statistics of the causes of blindness, do you consider it desirable that that should be one of the things that should be filled up in all the different schools for the blind?—I believe that the paper that was read at York by Mr. Neale on the causes of blindness, and the paper by Dr. Roath on the physical education of the blind, were most valuable, and I think those matters require to be much more thought about and attended to than they ever have been. I think that a uniform register as to the causes of the blindness of those with whom they are dealing should be considered by the committee of every institution and society for the blind, and that the subject ought to engage their sympathy and co-operation.

11,797. You spoke of the sales of work made by the blind; do you find in practice, or do you know whether other institutions find in practice a difficulty in selling their goods to ordinary traders or firms?—Do you mean in selling, or in selling all they make?

11,798. In selling?—I think not. I think that the public have now become pretty well satisfied that the goods made by the blind are generally good.

11,799. You do not, therefore, attribute the large amount of stock that is unfortunately in hand in many of the institutions to the fact that the public have not the same confidence in the work of the blind as they have in the work of the sighted?—By the public I mean the retail public. There is a great difficulty amongst the wholesale public, because there is great jealousy.

11,800. And that militates considerably against success?—Yes, very greatly. At Leicester there is an enormous demand at a particular season of the year for cheese hampers. The trade will not come to the blind institution to get them, except when they are driven. They sell immense quantities, but still they want dozens more than we can make. If we only know where they could and would make them we could supply another two institutions with work during the Stilton cheese time.

11,801. Then co-operation is your remedy for the present difficulty?—Entirely.

11,802. (*Dr. Campbell.*) In reply to a previous question in regard to how this idea of co-operation was to be carried out, you responded that you thought that was where the Royal Commission should come in; but cannot you give us some practical suggestion as to how we are to bring about this co-operation?—In point of fact you have asked me to do what your united talents are to do.

11,803. But this is the crucial point. We have been dreaming of it these many years, and I want to know what your ideas on the subject are?—My opinion is that the Royal Commission should simply say, "You "ask for help; we tell you you do not want it, and "that if you will co-operate you can do it yourselves." That is how I should say practically the Royal Commission will bring it about.

11,804. But is it not a fact that, taking one charitable institution with another, the committee and managers, and so forth, of one institution fight shy of co-operating with another institution of the same kind?—Certainly it is.

11,805. Is it not absolutely necessary that there should be some law on the subject if we are to have uniform action; and do you think there is any possible way of having a law which should set up one uniform control?—I think it would be very difficult to frame a law for that purpose. Just as it is very difficult to make people moral by Act of Parliament, so it is very difficult to make them act together by Act of Parliament.

11,806. In order to carry on our government we have to raise large sums of money, and we do that by taxation; might not the Goverment step in and say that any institution which makes use of charitable money must come under a central control?—You are now coming upon a very serious question which has, as you know, been brought forward in the House, and shelved from its very difficulty. I do not feel competent to give an opinion upon so serious a question, that is to say, upon dealing by law with charitable money. The only suggestion that I have to make I have made, and I think the Government would be perfectly justified in insisting that those charities and all charities should present to it an account of their doings on one form, so that they might be at any time inspected and compared.

11,807. Do you not think that it would improve matters if we had a central commission which should be an official board for the whole country, and that all others should be only branches of that central control?—You know that the moment you make a thing compulsory you put people's backs up as a rule; and therefore I do not think it would be desirable. I see what you mean. The central bureau might be a Government bureau, to which everybody should be bound to give the information which I say ought to be given; but I do not think it would be a good way of setting about it, because the moment you say "you shall" that moment every institution says "I would rather not."

11,808. You leave us just where we have been always?—I am afraid I do.

11,809. (*Dr. Armitage.*) You said that co-operation was tried on a small scale by three Institutions after that conference in Birmingham; was Birmingham one of them?—Yes, I think so. I speak under correction, but my impression is that Birmingham was one, Manchester another, and Leicester the third.

11,810. Are you aware that the lady at Birmingham to whom you referred in such high terms was very much dissatisfied with the working of that system?—It did not work; it never got to work.

11,811. Did she never express her dissatisfaction to you?—Never. In expressing my high opinion of her I was not speaking of her as a trade manager, and as having any knowledge of the trade.

11,812. I know her well, and she has done everything for the Birmingham Institution, and no praise can be too high for her. Could you refer to your book as to the sales in 1883 in Glasgow?—There were sales to the amount of 3,114*l.* from the warehouse and retail shops in 1883.

11,813. Was that statement sent to the Glasgow people for reference and correction?—Yes.

11,814. Are you aware that it was not correct?—No, or else it should not be there.

11,815. You are not aware that there is a very serious error in it?—I think I can show you the figures in their own writing, though I cannot do so at this moment. If there is an error it is their error and not ours.

GLASGOW.

Title and address of the charity—*Glasgow Asylum for the Blind*, 102, *Castle Street, Glasgow. Hon. Sec., Robt. Jameson, Esq.*

1. Number of blind in the town?—About 500.
2. Objects of the institution; if school, nature of education?—To provide instruction in ordinary branches of education, with music, for blind women and boys in a resident school; also to provide instruction in trades for resident and non-resident pupils.
3. When founded?—1827.
4. What system of reading in use?—Alston and Braille type.
5. What number of male and female inmates, and amount charged (if any) for each?—34 males, 38 females. 12*l.* 12*s* per annum.
6. Age of admission, and how long they may remain?—Eight to 14 years, until education and apprenticeship are completed, say, average seven years.
7. Qualification of candidates for admission?—Good character and sound constitution.
8. What industrial occupations and trades are carried on—by males, and by females?—By males, sack weaving, twine spinning, basket making, mat making, mattress and bedding, brush making, and riddle making. Females, knitting, crocheting, and mattress sewing.
9. Are pupils received for instruction in trades, and up to what age?—Yes. No fixed age, but, as a rule, not above 25.
10. How many blind employed in the workshops?—76.
11. Blind or sighted teachers? Are sighted workmen employed to assist in finishing blind work, or as journeymen?—Both. Yes.
12. Is there a retail shop?—Yes, two shops.
13. If so, are goods not made by the blind sold in it?—Yes.
14. What amount of goods were sold from the warehouse and retail shop last year, 1883?—3,114*l.* 14*s.* 9*d.*
15. When do the managing committee meet?—Second Tuesday of each month.
16. What were the subscriptions last year, 1883?—1,368*l.* 16*s.*
17. What were donations and legacies last year, 1883?—2,337*l.* 4*s.* 8*d.*
18. What income from endowments or trust funds?—539*l.* 19*s.*
19. Please give any particulars about the institution you may think interesting or useful?

11,816. Was it upon the basis of this 3,114*l.* at Glasgow that you founded your statement that the sales in Scotland were 39,000*l.*?—Yes, that would be included, certainly. Perhaps there may be a printer's error here which may have escaped notice. I am inclined to think that the sales at Glasgow did amount to more than 3,000*l.*

11,817. Are you aware that it is not the only case in which an error of that sort occurs?—It is possible that it may be a clerical error. All I know about it is that we have it in their figures, and that if this is not correct according to their figures it is a clerical error which has escaped detection in the proof.

11,818. Are you aware that the sales at Glasgow in 1885 amounted to 16,235*l.*?—I have not the figures with me.

11,819. Are you aware that a very considerable number of blind people are working at their own homes unconnected with any institutions in England?—No, I am not aware of that; it is not so in our part of the world.

11,820. I do not vouch for this figure, but as nearly as we could ascertain the old pupils in the normal college, of whose earnings you have not any return, in 1884 were making upwards of 8,000*l.* a year. All those pupils would be included in the 6,000 who are doing nothing?—I am very glad to hear that so many have been employed, but I think that we were not very far wrong in 1883.

11,821. Are you aware that those numbers that you give only apply to those who are working in connexion with institutions?—No, I am not aware of that.

11,822. Do you know that in many countries, in Germany for instance, the great majority of the blind when they leave institutions work at home unconnected with any workshops?—Yes, I know that.

11,823. Do you think that if that could be introduced into England it would be a desirable system?—No, I think it would be very undesirable.

11,824. That the blind should earn their living unconnected with an institution?—I think it would be very undesirable.

11,825. Why?—Because it is perfectly impossible, in my judgment, for any blind man working mechanically (I am not speaking of higher employments) in making baskets and brushes and such things as that to turn out good work, working at his cottage.

Lieut.-Col. M. Turner.

20 May 1886.

11,826. (*Chairman.*) You mean without some sighted assistance?—No, I will leave that out for the moment; but I say that with the environment of his cottage it is not possible to turn out good work.

11,827. (*Dr. Armitage.*) Can you explain then to us the fact that in Germany it is done?—I have not seen the work. I cannot believe that it is possible that good work can be turned out from anybody's cottage. I am not saying that I am right, I am only saying that in my opinion it is impossible.

11,828. You were speaking of hair work for the blind; do you know that it has been tried at several institutions?—I do not know about several; I think I know about two.

11,829. And do you know that it has been given up as unprofitable?—I know it has been given up. I did not speak of it as profitable work; I was merely speaking of it as showing what the blind can do.

11,830. You spoke of the Indiana Institution and of the system introduced at Indianapolis for employing the blind in sighted workshops; do you know at all how that has been going on lately?—No, I do not.

11,831. Does it not occur to you that there might be a very serious drawback to such a system from the seeing manufacturer employing the blind only in those branches of trade in which their labour would be the most remunerative to himself?—I do not know why that would be a loss to the blind man; I should have thought it would have been a gain.

11,832. It would be a gain to the manufacturer, but it would be a loss to the blind man?—It would be a gain to the blind man, I should have thought.

11,833. Take basket work for instance; a blind apprentice will very soon learn to make the bottoms of baskets, and it may pay the manufacturer much better to keep the blind man constantly making the bottoms of baskets, and letting them be built up by others, than to let the blind man finish the baskets; do you think it a desirable thing for the blind man that that should be done?—I certainly do not, but I purposely and carefully avoided saying that I thought that that system should be applied to England; perhaps I may be permitted to remark that there is an inspector specially appointed at Indianapolis by the Government on purpose to see that the blind man is fairly dealt with by the employer. That meets the case that you put.

11,834. I am afraid that the difficulty that I have mentioned has already occurred at Indianapolis?—When Mr. Harris comes home he will be able to tell you all about it, because he has just gone there on purpose to see.

11,835. (*Dr. Tindal Robertson.*) Is there any institution at Leicester for the education of blind children?—No, not specially.

11,836. Is there any one nearer than Nottingham?—No, Nottingham is the nearest.

11,837. Are you acquainted with the Nottingham Institution?—Yes, a little.

11,838. Are you aware that there they not only educate, but also instruct in trades more or less?—Yes, I was aware of that.

11,839. And we have had it in evidence before us from some witnesses that they approve of that system, and that they think it an advantage; did I correctly gather that you did not think so?—I do not think it is an advantage, on the contrary I think it is a disadvantage.

11,840. Will you give us the reasons why you think it is a disadvantage, because this is a point which has been put strongly by some other witnesses that we have had before us?—I do not think it is advisable either in the case of sighted children, or in the case of blind children, to take them and partially teach them anything. I think it is much better that they should be educated up to a certain age, and that you should then begin to educate them in a trade, they being in the meantime, in the case of the blind, made handy, as they will be by the time that they are 14, and much more easily taught than if they began to learn a trade at an earlier age, when they bungle and have to be got out of the bungle.

Lieut.-Col. M. Turner.

20 May 1886.

11,841. It has been hinted that there are disadvantages also of a moral nature in the association of young blind people with older people who may teach them things that they had better not know?—I have heard of it amongst the pupils, but I have never heard of what you speak of.

11,842. We have been told that that is a disadvantage; it has not occurred to you that it would be a disadvantage?—No, it would not occur to me.

11,843. Do you know whether they educate blind children at the board school at Leicester?—I think they do at present, but I am now out of it.

11,844. May I ask where your experience of board school education for children has been derived?—Only from inquiry.

11,845. From what you have heard of it do you think that it may be equally efficient or more efficient than the education of children who are taught in an institution?—Yes, I do.

11,846. With regard to the system of cottage homes of which you spoke, you said that you employed a missionary or a Bible woman to go round to those poor people; does she, in addition to reading to them, give them any alms of any kind?—Under the control of a ladies' committee, yes. They visit them.

11,847. Do you think that that is altogether the best plan?—No, I should not say that it was. It was the only expedient one.

11,848. What do you think would be the best plan of providing for the old and infirm blind without sending them into the workhouse which they so much object to?—I think something like the idea of the cottage home is the real way of helping them, making them comfortable without pauperizing them, or interfering with their independence, and having them in the place where their friends are and where they can see them.

11,849. Dr. Campbell has asked you with regard to the establishment of a central bureau, whether you would think it advisable to put that under Government inspection, and you said no; do you think that if this Commission were to recommend to the different institutions that such a course would be greatly advantageous to them, such a recommendation would very likely induce them to adopt some plan of that kind?—I am afraid I cannot answer for what they might think about it.

11,850. I am trying also to find a way out of the difficulty?—I do not feel that I could say that they would, and yet I should not like to say that they would not.

11,851. Could you tell us about the feeling of the institution with which you have been connected?—I am quite sure that they would be in favour of it, and that they would gladly join because it is what, for years, they have been wanting.

11,852. Do you know any other institutions in the country which you have reason to think would join?—Yes, I think I do.

11,853. Do you think that would be a possible solution of the difficulty?—I am inclined to think that if a sufficient number joined the thing to work it its advantages would be so manifest that all others would join eventually. Whether such a sufficient number might be obtained, and whether they might be able and willing to guarantee sufficient funds for carrying it out is another question. I have no doubt myself that the system as advocated by Dr. Campbell himself, and by Mr. Buckle, at the York conference, would be very much to the advantage of all the institutions as regards the purchase of material, as regards the sale of goods, and as regards the employment of workmen For instance supposing that a dishonest man is discharged from Leicester, Leicester sends up and says: "Such a man is dis- "charged." Nottingham wants a man and writes up and says: "Do you know anything about so and so?" "Yes, he was discharged from Leicester for dishonesty." But whether they might be inclined to see that just at once, and whether the Commission could bring pressure to bear upon them, is a matter upon which I cannot give an opinion.

11,854. Do you think that the different institutions might be inclined themselves to select the central board by which these matters might be controlled?—I think so. At the Birmingham conference the principle was accepted positively, and there three institutions joined together; but that was not enough to carry it on, and it had to be given up. A secretary was appointed, and the thing actually began its existence, but it failed because only three institutions joined.

11,855. Did those three institutions send their own representatives, and were they supposed to control those three only?—They were supposed to control those three only. At the committee of the Charity Organization Society the principle was accepted generally, and at the conference at York the principle was certainly accepted by the institutions there as a solution of the difficulty. Our friend, Dr. Campbell, was one of those who supported it. Therefore, I think it is reasonable to hope that a good many institutions would join and would assist it.

11,856. The question has been raised here whether it would be advisable that in each of the large districts in the country you might have a central place where the names of blind people could be registered, and where the raw material might be brought to them, and where the things would afterwards be exposed for sale if the people themselves could not get a ready sale for them; do you think it would be an advantage to have such centres in the principal districts of the country apart from all institutions, either the institutions themselves, or any blind people who might find it an advantage joining for the purpose?—That is really the bureau over again.

11,857. Only divided. It would be simply a central bureau for a large district in the country?—I do not think it would answer for individual persons to go and bring a lot of work there and say, "I want this sold."

11,858. Take the case of a man living in a village for instance and who could not get about to hawk his goods; would it not be an advantage to such a man that there should be a central place in the district in which he lived to which he might take them?—I do not think so, because I do not see how it could possibly be done to pay him. Look at the carriage; then the place that sells it must have something out of it to pay them; and what would be left for the worker, supposing that the thing is fit for sale, which I should first of all say was impossible? I think that possibly a central shop (though I should not like to commit myself to that) where institutions might send things for sale might answer; but it requires a good deal of thought, and I have never thought of it.

11,859. Taking the case of a man living in a country district, who is not able to go about and sell his things, how do you suggest that that man is to make his living?—I suggest that he should not live in the country at all, but that he should come to the factory and work there, where he could work properly. Why can he not bring his home to the town or place where the factory is? We do not want him to come to the institution and live there.

11,860. There is a good deal of nostalgia amongst blind people which would I am afraid prevent that?—With regard to their working at home, not only is it an impossibility as regards the making of the work, but it is an impossibility as regards payment. How is this poor man working at home to give up the time to go and hawk his goods? Half of his time would be taken up in selling his things. Then how is he to get his material? He must come and fetch it, or the carrier must take it out, and that costs so much more money. Then if he is not to go and hawk it and sell it it must come to the institution, and they must look at it very jealously to see that it is very good work or else they cannot take it. It is also a very convenient form of fraud. We had to stop it. There was a time when we used to allow our blind people to sell the goods of the institution; but we found that instead of selling the goods of the institution they used to buy cheap goods made by sighted people and go round and sell them as goods made by the blind; and they discredited our work by selling bad goods, and they put the difference in their own pockets. We were obliged to stop it altogether. I do not say that they would do it, but I say that it would be a very serious temptation to these men when they found that they could not sell their own work, to buy these goods and sell them as their own work.

11,861. Then I presume that, taking it altogether, you would prefer to have both the nurseries for the children and the places where they would live afterwards when they were getting their education, and also those factories which you describe under voluntary inspection and supported to a certain extent by charitable means?—Yes, certainly. I think that we might take

Lieut. Col. M. Turner

20 May 1886.

the provident dispensaries as they exist in England as a very fair example. There the money taken from the people goes for the medicines, and the doctors, and the establishment charges, that is to say the building and repairs, and the salaries of the secretaries are paid by the subscriptions of the charitable. If it were necessary that would be my idea.

11,862. (*Mr. Johnson.*) Speaking about outworkers, people working in their own homes, do any outworkers at Leicester take their orders from the Leicester institution and complete the orders in their own homes?—It was not done so, but of course now I am out of it.

11,863. I suppose you are aware that in a great number of the institutions there are a number of outworkers who live in the neighbourhood and take the work home, the institution selling it for them?—Yes, I know that that has happened, but it is not general.

11,864. That has not been the practice at Leicester?—No.

11,865. With regard to a central administration, if it was a representative one, if it took, for instance, the model of the Metropolitan Board of Works, to which each of the vestries sends a representative, do you not think it would be possible for a central committee to carry out your views, that central committee being formed of representatives from each institution?—Yes, but there would be the difficulty of getting them together.

11,866. And that would be a means of doing away with jealousy?—Possibly.

11,867. Was your Leicester Institution in any connexion with any society for teaching the blind to read, such as the Home Society or the Moon Society?—There is a Home Teaching Society, I believe, connected with it.

11,868. Have you any experience as to the number of people who read upon the different systems, whether Moon, or Braille, or the Roman type?—No, latterly I have been a good deal out of actual contact with the blind; my work has been more picking up the threads from all sorts of sources.

11,869. You have no experience with regard to the educational training and teaching of the blind?—No.

11,870. You speak more especially with regard to the tradal training?—Yes.

11,871. You have told the Commission that there is some difficulty with regard to the disposal of the goods manufactured by the blind, and that there is a little feeling in the manufacturing trade against the buying of the products of the blind; do you think that that has anything to do with trade commissions?—There was and is great difficulty in that respect. In consequence of our being a charity we are precluded from doing that which all traders do. It has constantly happened that we have gone to a hosier and said, "Why will you not "employ us and take some of our baskets?" He has said, "Oh, well I will try them, and I will send "my man down and see." The man comes down, and, perhaps, a dozen are ordered as a sample of the baskets, and they are sent up to the hosiery factory. In the course of a few days or weeks, as the case may be, we meet the hosier again, and he says, "Well I am very "sorry; we have tried your baskets, but my man says "they will not do." That is simply because we could not give him the sovereign which he would have got from an ordinary factory. On introducing the work he would receive a gratuity of a sovereign or whatever it was. It has constantly happened to myself to know instances where I have said to ladies, "Why will "you not come and buy some of our brushes? I will "guarantee that they are as good as, and they certainly "are not dearer, than other people's. Come and give "them a trial, and if they are not good we shall be only "too glad to hear your complaints and try and remedy "them." After a time I have said, "You have not "been to buy any brushes lately," and the answer which has been made has been, "No, the fact is that "my cook says they are not so good as those she gets "at Clark's." Clark gives the cook half-a-crown at Christmas; we cannot. That is a very serious drawback. I think that if once we really separated the charity from the business we must conduct our business as other businesses are conducted, and we shall have to give those gratuities. Such payments cannot appear in the charity accounts, but if we are going to undertake a business we must do it thoroughly.

11,872. Then I judge from what you say that, looking at this as a trade, we should get more trade if commissions were permissible?—Certainly.

11,873. And that is one of the great drawbacks you think to a large trade being done by the blind?—Yes, that is one of the great drawbacks.

11,874. I quite understood you to say that, in your opinion, it was not necessary to have any Government grant?—Only for educational purposes and not for trade purposes. My experience is that it will support itself, and I am borne out by others in saying so.

11,875. (*Mr. Arrol.*) I suppose I may take it that you were not aware that, for instance, in Scotland between 600 and 700 blind persons whom you assume to be unemployed have been employed on out-door work outside those institutions?—I had not heard that people are employed by the home missions and such societies; if there are any they are not included in the returns.

11,876. As I understand the contention is only that you have left out of the calculation a certain number who ought to be included as being at work?—I quite understand that in consequence of our ignorance of this work we have not included them as workers, and it would be very interesting to know what is the work that they do.

The witness withdrew.

Mr. Alfred Hollins examined.

Mr. A. Hollins.

11,877. (*Chairman.*) You are now a pupil of the Norwood College, are you not?—Yes.

11,878. For how many years have you been there?—I have been there 8½ years.

11,879. What have been the special studies to which you have devoted yourself most during that time?—I had first a general education, and now I am devoting myself entirely to music.

11,880. When did you begin your musical education?—When first I came to the college.

11,881. Had you had any musical training before?—I had some, but it really did not amount to anything; I had no practical knowledge of the technique in the slightest degree.

11,882. Where did you receive what education you had?—I had been three years at York.

11,883. Have you been out and given any lessons?—No, I do not think that I have had any sighted pupils at all.

11,884. You have not given any lessons then yet?—No, it is simply because I have not been obliged to do so; I have not been called upon to do so, as I want to devote myself more to the art of pianoforte playing, and to rise in that way.

11,885. Have you given any instruction to the pupils themselves at the institution?—Oh, yes.

11,886. In order to fit yourself for the position of a teacher of music, I presume?—Yes, to give me experience.

11,887. Do you propose to take up the teaching of music as your profession, or do you propose to apply for any post, such as that of organist?—I wish to be an organist, a teacher, and an artist, so that I can at any time accept concert engagements, or give pianoforte recitals. I wish to have sufficient music under my control to enable me to do that.

11,888. Have you learnt singing as well as instrumental music?—I have learnt the rudiments of singing; I do not sing myself because I have no voice, but I give instruction in singing.

11,889. Then have you done some work outside the institution?—I am organist of a church now.

11,890. Do you do no teaching in connexion with that?—I do not.

11,891. You are engaged entirely as a weekly organist?—Yes.

Mr. A. Hollins.

20 May 1886.

11,892. Do your duties as organist occupy you on other days than Sundays?—Sometimes they do; sometimes I have Wednesday night services.

11,893. Where is the church at which you are organist?—It is at St. John's, Redhill.

11,894. Do you also besides that take engagements to play at concerts?—Yes, the college gives me opportunities of taking any engagement that presents itself.

11,895. You have no reason to suppose that you will not be able to earn your own livelihood when you leave the college?—If I have a good organ engagement, and can sufficiently qualify myself to be a thoroughly good musician, I am sure I shall have no difficulty whatever in doing so.

11,896. Have you an annual salary now as organist?—Yes.

11,897. Would you mind telling the Commission how much it is?—I have 60*l.* a year.

11,898. Do you out of that pay for your own education at the college?—Yes, I am paying for my own education now.

11,899. Do you pay the full sum?—Yes, at least I do some teaching, for which I get some little allowance made.

11,900. But how much do you actually pay in money to the college?—40*l.* a year.

11,901. And for the rest, if there is anything over and above that, you are supposed to give some of your teaching power to the college?—Yes, I teach at the college, and for that I get the extra fee taken off.

11,902. You receive no remuneration for teaching, but it is taken into consideration as a part of your payment to the college?—Yes, that is the agreement.

11,903. Had you much experience in playing upon the organ in churches when you got the appointment?—No, that was my first appointment.

11,904. Did you get that appointment in open competition?—No, I went down the first night to take a practice for my friend who had had the appointment before me, and the vicar was so satisfied that he offered me the appointment.

11,905. Did you succeed a seeing organist?—No, I did not, but my friend from the college, Mr. Turner, before me did succeed a seeing organist.

11,906. Did your friend leave that appointment for a better one?—Yes, he has an appointment now in Glasgow.

11,907. I suppose he gets more than 60*l.* a year?—Yes. I do not know exactly what he is getting now.

11,908. Do you know what the maximum payment amongst organists is?—It just depends. A cathedral organist will get in England as a rule about 300*l.* or 350*l.* a year. The average salary for an organist is about 100*l.* a year.

11,909. You would be quite prepared I suppose to teach a choir?—Certainly. I have a knowledge of chanting as well.

11,910. (*Mr. Johnson.*) How long were you at York?—I was there three years. During that time I had nominal musical instruction, but I had no knowledge at all of the pianoforte. They taught me to play the pianofore in a way, but I should never have made an artist if I had stayed there.

11,911. I suppose you assisted at some of the concerts at York?—Only about the last half year I was there.

11,912. Who was your master at York?—The one who is supposed to be the head master is Mr. Barnby.

11,913. Were you under Mr. Barnby's instruction there?—He used to hear me play for perhaps about a quarter of an hour once a week, which did not amount to anything, I was really under the instruction of a blind gentleman there who teaches, and he does not profess to teach the pianoforte at all. You learn a few scales and exercises, and then you are taught a few hymn tunes, and then you have to pick up what you can of the organ yourself.

11,914. Then I gather from what you say that the musical education at York is very inferior?—It certainly is. I will speak with all due deference of the school, but still it is not at all an artistic education, and a blind man who remained at York would never make a thorough artist. I should never have played with an orchestra if I had remained at York.

11,915. Have you heard of anybody having got situations as organists from York?—I have heard of some getting little situations, but I do not think that one has got a situation of any standing.

11,916. You would never have played with an orchestra unless you had been further instructed?—There is not a man at York who could teach a concerto, and they do not teach you the proper position of holding the hand in the slightest degree. They teach you to commit to memory, and if you have a musical ear and are talented you may get on; but they do not teach you the technical knowledge of the organ with regard to the stops, what are 8 feet or 4 feet stops, or anything with regard to that. That I learnt under Dr. Hopkins.

11,917. I suppose you were considered one of the most efficient pupils at York?—Yes, I was. Of course I was very young at the time I left, I was only 12 years old.

10,918. Then do I rightly understand that you live at the college at Norwood now?—Yes.

11,919. And you pay 40*l.* a year for your board, and you get 60*l.* a year as an organist, so that you get 20*l.* a year for yourself?—Yes.

11,920. May I ask whether you are making anything by your public engagements?—Yes, I am making a good deal.

11,921. Could you tell the Commission anything like what you get from your public engagements?—It is uncertain, but since last summer I suppose I have made about 90*l.* or a little more, including my organ salary. By playing in public I suppose I have made about 30*l.*

11,922. Have those been engagements which you have had otherwise than in connexion with the college?—Yes; those are engagements which I have taken entirely on my own responsibility.

11,923. The profession have offered you those engagements irrespective of any institution?—Yes, and of course Dr. Campbell lets me take those engagements.

11,924. You went to America, I believe, did you not?—Yes.

11,925. There you went with the college party, did you not?—Yes.

11,926. Did you receive any remuneration for that?—I got some private engagements out there.

11,927. To play alone?—Yes.

11,928. Not in company with the other two?—No, not in company with them.

11,929. Is it your opinion then that there is a good field for pianoforte soloists making a fair income?—I think that the musical profession is very much crammed up even with sighted people; they find it a difficulty, but if a blind man has a good training and can stand his fair chance with the sighted people, I do not think he ought to find any difficulty whatever. I have not found any so far.

11,930. You do not think that there has been any prejudice?—There is a lot of prejudice which must be overcome; but the more education a blind man can get the better he is able to overcome that prejudice.

11,931. You are a great example of success yourself. The Commission would be glad to know what you think of music as a profession for the blind?—I say that it may not be every blind man that can be sufficiently well trained to be able to be an artist, and to rise to the top of the profession; but still if a blind man has had good training, and he is an intelligent fellow, that is to say, if he can go about well, and is handy, then he ought to make a decent living with music. There is an example: a pupil of the York School, who was a friend of mine, Mr. Atkinson, came to the college and he had had no better instruction at York than I had. He was too old to become an artist, but still he was very musical. Now he has settled down in Huddersfield, and he wrote to me the other day saying that he has got a good teaching connexion, and has got a good tuning situation, so that when he is not employed in tuning he uses his full time in teaching; and there are many people who can do this kind of thing.

11,932. Do you think that there is a good field for the employment of blind vocalists as well as blind instrumentalists?—Yes, I do.

Mr. A. Hollins.

20 May 1886.

11,933. As solo vocalists?—Yes, but what they must overcome is the difficulty of getting the public to recognise that blind people can do anything of the kind. They do not look upon them as artists.

11,934. Do you think that there would be a field of occupation for four or five blind musicians combined together, either in a choir, or as instrumentalists?—I am not prepared to say. I do not think that a blind man will ever succeed as an instrumentalist. He may succeed as a violinist, but it is no good at an institution of any kind teaching blind persons orchestral instruments, because they cannot use them when they leave the college, for they cannot play in an orchestra; it is impossible.

11,935. Have you never heard of any blind people playing in orchestras?—No, not at all. If there is a troupe of blind people who happen to live in the same town and who have been to the same school they might form a little orchestra for themselves; but they could not play in a sighted orchestra, because they could not read their parts, and they could only play works that they knew.

11,936. There are such things as blind men playing in orchestras, but I suppose it has not come under your knowledge?—No blind man could play in Mr. Mann's orchestra at the Palace, because when there is a new work presented to the orchestral players to play they play it at sight often at rehearsals, not ever having seen it before, and a blind man could not do that. A blind man can get a good place if he has got a good voice and can sing in a church choir. A blind man could have good employment in a cathedral.

11,937. As a solo performer, I suppose you think a blind man might succeed on the violin or the pianoforte?—Certainly, or the organ.

11,938. (*Dr. Tindal Robertson.*) You have played, I believe, with Joachim, have you not?—Yes.

11,939. Of course you would not have done that unless you had had a complete musical education; will you kindly describe as closely as you can the system on which you were taught music at Norwood?—It was not different from the way in which sighted people are taught music, except that the notes were first read to me, though not by the music teacher. That is where they make the mistake at York. There the musical teacher had to read the notes of the works, and then to give the lessons. But it is not so at Norwood; we have music readers there to read it to us, and then we take our music lesson just as a sighted person takes his with a teacher, and we are corrected on it, that is to say getting the teacher's ideas of phrasing and expression.

11,940. Do you work by any system of notation?—We have the Braille system of notation.

11,941. Then cannot you read the music yourself?—If the books are printed we do read it ourselves.

11,942. Then when you were speaking just now of music that was read to you you meant music which was not printed?—Yes.

11,943. Take the case of printed music; how do you proceed then?—For my own part I read it on the pianoforte with one hand, and commit with the other, and then I change hands and read with one hand and commit with the other. Some of our students can commit without the pianoforte at all, but simply by taking the book and studying it, and then will be able to go to the pianoforte and play it.

11,944. It is a question of memory then to a very great extent?—To the entire extent.

11,945. Is there any other system than the Braille system known to you under which blind people could possibly be taught music, scientifically, and to play as artists?—No, there certainly is not, unless, as I said before, you learn from having the sighted music read to you.

11,946. Do you think that any blind person would have attained complete success as an artist on the old system of teaching music, if it had not been for the introduction of that system?—What do you call the old system?

11,947. Teaching by ear.—I do not call that teaching music at all. They do not even now at York (I will give them credit for that) teach the blind music by ear, and now they are adopting the Braille music there. My success personally is not so much dependent upon the Braille music, because when I first came to the college the Braille music was then only in its infancy, and it is now. I am studying a lot of advanced music which is not printed in Braille; if it were printed in Braille of course that would help me a great deal. Braille music it seems to me is a boon that the blind cannot be too thankful for.

11,948. If the whole of the music which is generally written was printed in Braille, would a blind man be on equal terms with a sighted man?—Every bit.

11,949. (*Dr. Armitage.*) Do you attend the concerts at the Crystal Palace?—Yes.

11,950. Have you done so ever since you have been at the college?—Yes.

11,951. Do you attend the rehearsals?—Sometimes, not always.

11,952. Do you consider that an advantage?—It is one of the greatest advantages that we have at the college, and the one which we most enjoy. It is a great help in every way, because it enables you to converse with sighted people about the music which you have heard, and if you go out into society and you are asked, "Have you heard such and such a work; what do you "think of the first theme, or the second subject, or where "it modulates in such a place?" You are able to speak about it. As a blind man cannot manage to look over music for himself as a sighted man can the more music he can hear the better.

11,953. Do you think it desirable in training blind musicians that they should be in what is called a musical atmosphere, that is to say, that they should be surrounded with opportunities of hearing the very best music performed by the very best men?—Certainly.

11,954. Do you think that their having that at the Normal College is one of the principal reasons of the success of the college as a musical school?—Yes, I certainly do, and as regards my own personal success it has helped me enormously; it has helped me more than I can tell. There is another thing that I should like to mention with regard to that. If you go to hear, say a pianoforte or organ recital, and you hear something that is effective, and that you know will bring you success if you play it, then you can get that work and study it. It helps you to know more music and to know what to study.

11,955. Do you think it is an advantage to hear fine orchestral performances?—Certainly, the more the better. I am not speaking now from an enjoyable point of view as giving pleasure; that of course it always does; but I am taking it as you ask me as an advantage.

11,956. You consider that that part of the musical education of the blind is advantageous?—Certainly; it is just the same it seems to me as when persons are scientific men, and wish to acquire information upon any particular subject they read all the best works on that subject; if a man is a doctor he reads up all the best books and knows what is done at the present day by other men. It is just the same with us.

11,957. Had you any opportunity when you were at York of attending such concerts?—Very seldom; there are very few good concerts at York, and in the school they do not make the point of it that they do at Norwood.

11,958. Then do you think that it is a great drawback to a musical school for the blind not to have such musical opportunities?—It certainly is a great drawback.

11,959. Do you consider it an advantage in your case to have had the opportunity of being trained by such men as Dr. Hopkins, Mr. Hartvigson, Mr. Banister, and Mr. Cummings?—Yes, certainly; that is the great point of the college that it has such a good corps of professors.

11,960. But you must be aware that employing such men adds greatly to the expense of the training in the college?—Yes; but at the same time if you want to train the blind thoroughly it seems to me that that expense must be incurred. They employ the same men at the Royal Academy of Music, and why should they not employ them for the teaching of the blind? Why should not the same amount of training be given to the blind as is given to the sighted?

11,961. Do you think that the result at the college has justified the expenditure incurred in teaching?—Yes, I do, because many of the pupils now are able to

Mr. A. Hollins.

20 May 1886.

go out, and have attained success in teaching and make good organists.

11,962. Have you ever considered whether it would be desirable to have an orchestra of blind pupils at the college?—Yes, and I think it would certainly not be desirable.

11,963. Why?—Because it would be such a tremendous waste of time. As I said before the pupils can never do any good by playing in an orchestra, and the time that they would have to give to learning the instruments and to learning the works that they could perform with that orchestra would be simply wasted.

11,964. Was there a band at York when you were there?—No.

11,965. Merely a choir?—That is all.

11,966. (*Dr. Campbell.*) In regard to reading music, and so forth, when you have an important work to learn do you find it advantageous to write it down in Braille before you learn it?—If I am in a hurry generally I can learn it quicker by having it read to me; but I always like to write it out, because then I have the work to refer to afterwards if I forget any little points.

11,967. In learning important works you transcribe them?—Yes, if I have time for it.

11,968. In realty then the musical notation then gives you a backbone for the whole of your professional work?—Certainly it does.

11,969. And within the last five years we have increased so enormously the production of music in Braille that it is really giving far greater facilities to the blind than were given formerly, is it not?—Certainly it is, for this reason, of course the number of readers at the college must be limited, and as, perhaps, a pupil can only get three or four readings a week the more music has printed in Braille the better, because he can use his spare time in learning it.

11,970. Among the recitals, and so forth, that you have given, I will take one example. During your holidays last summer you gave a recital in Belfast; would you mind telling us how much you cleared by it?—I gave a recital there entirely on my own responsibility. I have friends in Belfast.

11,971. The point is how much money you made by it?—I made 24*l.*

11,972. For yourself from the recital?—Yes.

11,973. You have also had two other recitals there, have you not?—Yes.

11,974. What did you get for each?—I had five guineas for each recital, and I also had two concert engagements there as well.

11,975. With the Concert Society there?—Yes, as solo organist.

11,976. Last summer at the "Inventions" there were a great many organists employed; were you employed also as other organists were employed there, to show off the organs?—I was.

11,977. Did you have such success there that you have had an application made now from some of the organ builders in Liverpool urging that you should go to Liverpool and show off the organs at the Exhibition there?—Yes, the builder that I played for at the "Inventions" was so pleased with my success there that he said I was the only one who had been able to get any really good effects out of the organ, and he is very anxious for me to go down to Liverpool.

11,978. Was it the case that one of the organs had no mechanical stops, and that several of the organists refused on that account to show it off, and that they telegraphed to you to come and do it?—Yes, the organist who was to play was not used to that kind of organ, and they asked me if I would come up again. They engaged me for the week. The other organist said he would not play.

11,979. And they got you to take his place?—Yes, for two recitals.

11,980. And the organist whose place you took was a sighted organist?—Yes, I was the only blind organist who played.

11,981. It was the fact, was it not, that when you came and took the situation at Redhill they only gave you 40*l.* and you asked advice on the subject, and you were advised that your time would be worth more than that, and that then they increased it by another 20*l.* to get you to come?—Yes.

11,982. So that they increased it to 60*l.*?—Yes, I had a rise of salary as soon as I accepted the appointment.

11,983. With regard to the young man you spoke of as coming from York, Mr. Atkinson, he is now, as you say, teaching and tuning?—Yes.

11,984. Has he also an organist's situation?—Yes, he has a very good one.

11,985. And he is acting also as choir master?—Yes, he is.

11,986. So that he is really combining teaching, tuning, and organ playing?—Yes.

11,987. Do you know what are the highest salaries that are being received by pupils of the college at this moment?—The highest I think is 100*l.* a year.

11,988. There are others varying from 60*l.* to 70*l.* and 80*l.* are there not?—Yes.

11,989. You said that you did not sing; you were trained carefully, were you not, as a choir boy until your voice began to change?—Yes.

11,990. And the reason why you have not been singing recently is I suppose because it is not best for your voice?—Yes.

11,991. In regard to the musical instruction that you had at York, I suppose from a professional point of view all you did was simply to play in order to produce a certain amount of effect, but as to training you for an artist or a teacher you did not have any foundation for that?—No, none whatever.

11,992. When you first entered the college you were restricted and not allowed to play pieces that you had learnt, but you were simply required to confine yourself most closely to the development of your hands to get you out of the bad habits you had formed?—Yes, or else I should have never got on in the slightest degree.

11,993. Did it require at least a year to overcome those habits before you began the positive instruction?—I had to work at exercises for more than a year.

11,994. It was at least a year before you could have a clear course of instruction?—Yes.

11,995. Therefore you do not owe to the instruction that you had before coming to the college any of your present power as an artist?—No, none.

11,996. You have now played in Germany, and in America, and under various circumstances; when you were in Boston were you welcomed there by the first artists of the city?—Yes, I was certainly.

11,997. Did you and other artists from the college have various receptions from the most eminent men of the country?—Yes, for example, Mr. Lang, the best conductor in Boston is an organist, and he invited the most eminent men in the profession in Boston to come and hear me give an organ recital on the last Sunday before we left. That was in one of the principal churches.

11,998. Did you have such success in America that various leading musical societies in America are prepared to engage you to come and play?—Yes.

11,999. Such as the Peabody Institute in Baltimore and the celebrated Higgins Musical Association at Boston and others?—Yes.

12,000. Were you engaged as an independent artist to play with Theodore Thomas's celebrated orchestra in New York?—Yes.

12,001. Did you play the great Liszt concerto in E flat?—Yes.

12,002. In the course of the instruction at the college now, as it has now developed, is there more promise of music in the future than there has been hitherto?—Yes, a great deal more because we are getting a better library altogether, and there is a better course of pianoforte music printed now from the beginning.

12,003. But as the college now has a department even for young children, and as those young children are brought under the very best instruction at a very early age, will that give rise to great improvement and to the blind making music a profession?—Certainly.

12,004. So that you look forward to the pupils who will come out five years hence having very much greater advantages than those who have come out hitherto?—We have more advantages now at the college for musical training than we had when I first came, because, first of all, they have increased the number of professors, and

Mr. A. Hollins.

20 May 1886.

then they have a better library altogether, and there are better chances of teaching; and they begin young, and they have a primary school in which the children are put under musical training when they are young, so that there will be far more chances in the future than there have been in the past.

12,005. (*Mr. St. John Ackers.*) Who trains the choir where you are organist?—I and the vicar together; he is musical.

12,006. I understood you, in answer to a former question, to say that you did not train the choir?—I train it in conjunction with the vicar.

12,007. I understood you to say that if the same amount of music were printed in Braille as is printed in the ordinary type, the blind would be upon an equal footing with the seeing?—Certainly they would.

12,008. But would that enable them to play at sight in an orchestra?—No, but then they have their music that they can work at in private.

12,009. It would, in fact, put them on an equality with the sighted except for playing music at sight?—Exactly; a blind man can never play at sight.

12,010. But in every other way it would put them on an equality with the sighted?—Yes.

12,011. (*Mr. Arrol.*) Were you trained at any school before you went to York?—No.

12,012. How many years were you at York?—Three.

12,013. During that time did you study music for the whole three years?—Yes.

12,014. Are we to understand that the amount of knowledge that you acquired there, and the teaching that you got there, had to be undone when you went to Norwood?—So far as my pianoforte playing went it had to be all undone. To tell you the truth, I had not learned anything worth speaking about. I had learnt hardly any pianoforte music. I had a lot of bad habits; for instance, the habit of holding my hands badly, which I had to overcome.

12,015. What is the reason why the vicar at Redhill takes any part in the training of the choir?—One reason is, firstly, because he is very musical, and likes it for itself; and then another reason is that unfortunately my organ is very far off from the choir, and therefore I cannot have them under my control at all.

12,016. Then, owing to the position of the organ a sighted organist would be at the same disadvantage as you are?—Certainly. They always had a choir master there when the sighted organist was there.

12,017. So I suppose that when you get some one to preside at the organ you conduct the choir?—Yes, I take them sometimes. Mr. Turner has been down from Glasgow and then he takes the organ and I conduct the choir.

12,018. Are you aware that he conducts his choir himself?—Yes, he does.

12,019. Have you found any difficulty when you have been playing at subscription concerts with orchestras?—Not at all.

12,020. (*Rev. W. B. Sleight.*) You were three years at York, I understand; what was the religious training that you received there; was it given in connexion with the Church of England?—Yes, we were all obliged to go to the Church of England, to one church.

12,021. You attended the Church of England at York?—Yes.

12,022. When you came to Norwood did you continue to do so?—Yes; but we had the opportunity of attending any other church we liked.

12,023. But during the eight and a half years that you were under training at Norwood where did you usually attend?—For part of the time I attended the Church of England; but it happened that I did not care for the service at the church that I attended, and therefore I changed; but now I am a church member.

12,024. Where did you attend the other half of the time?—I attended a Congregational church.

12,025. Was that the latter half or the first half?—It was the latter half of my time before I accepted the Redhill appointment.

12,026. Have you been confirmed in the Church of England?—No, I am going to be confirmed though at our next confirmation.

12,027. Is the service of the church that you are now playing at a choral service?—Throughout; we chant the psalms; we have everything choral except choral communion.

12,028. I suppose you know the psalms throughout?—Yes, and we have the cathedral psalter printed in Braille, so that I always take my psalter down and look the psalms over before service so that I am sure of them.

12,029. Do you find any difficulty in dealing with the boys of the choir from the fact of your being blind?—The first thing in that respect is to get one of the older and more influential members of the choir, one of the basses or tenors, to keep an eye on the boys. Of course boys will always be mischievous, and a sighted man always has the same trouble with them; but I have no trouble in that regard as the vicar looks after them.

12,030. But in case of the absence of the vicar would you find a difficulty in training the choir?—No, not the slightest.

The witness withdrew.

Adjourned.

32, Abingdon Street, Westminster.

Monday, 13th September 1886.

PRESENT:

THE RIGHT HON. THE LORD EGERTON OF TATTON IN THE CHAIR.

W. TINDAL ROBERTSON, ESQ., M.D.
W. AUCHINCLOSS ARROL, ESQ.
F. J. CAMPBELL, ESQ., LL.D.
E. C. JOHNSON, ESQ.
WILLIAM WOODALL, ESQ., M.P.
THE REV. W. BLOMEFIELD SLEIGHT, M.A.
REV. CHAS. MANSFIELD OWEN, M.A.
CHARLES E. D. BLACK, ESQ., *Secretary.*

Mr. HINMON L. HALL examined.

Mr. H. L. Hall.

13 Sept. 1886.

12,031. (*Chairman.*) You have been for a great part of your life connected with various institutions in America for the teaching of the blind?—Since 1863, when I became blind.

12,032. You are the superintendent of the Pennsylvania Working Home for Blind Men in Lancaster Avenue, Philadelphia?—Yes. I organised it, and raised the funds for it, and have been the superintendent of it ever since.

12,033. Are there any other institutions in Philadelphia with which you are connected?—I am the financial agent of the Retreat for Blind Deaf Mutes, and Aged and Infirm Blind Persons, all matters are referred to me by the board with power to act. I also organised, and am now the financial agent of the Society for Providing Evangelical Religious Literature for the Free Use of the Blind, and I am also general agent of the American Printing House for the Blind.

Mr. H. L. Hall.

13 Sept. 1886.

12,034. Have you, in connexion with your Working Home for Blind Men, an industrial home for blind females?—No; our institution is exclusively for males. In Philadelphia there is an industrial home for blind women, but I am in no way connected with that institution, although I am in perfect sympathy with it.

12,035. What was the first work which you undertook in connexion with the blind in America?—I organised and obtained a charter for what was called the National Printing House for the Blind; and I was one of the board and the sole agent, and raised the funds for it. After a time we united with the American Printing House for the Blind, which had never accomplished very much, and it had in fact been idle from the time that our war broke out. I then became general agent of both, and there is really now only the American Printing House for the Blind, the National Printing House for the Blind, which was a separate organisation, being now merged in the American Printing House for the Blind. That provides school books, text books, and appliances, while the Society for Providing Evangelical Literature for the Blind is a separate corporation entirely, and deals exclusively with nonsectarian religious works.

12,036. Does the American Printing House for the Blind print works for the Society for Providing Evangelical Literature for the Blind?—Yes, by contract.

12,037. Have you come to any conclusion in America with regard to what is the best type for the blind?—I hardly know how to answer that question without making a little explanation. We have now every two years what we call a convention of the educators of the blind, and formerly we were almost exclusively in favour of what we call the line letters, but latterly the point has been gaining ground very much.

12,038. Do you think that eventually it will be adopted as the general type?—In my opinion it will, and perhaps I may be allowed to state why I think so. In my Society for Providing Evangelical Religious Literature for the Free Use of the Blind, when we put a book to press we ask every institution in the United States what kind of type they will have their quota in, and as I pay the bills I get the accounts, and I find that whereas formerly when I had editions of 500 printed there would be 300 in line and 200 in point, that proportion is now reversed, that is to say, the institutions which formerly would order all line now order half point, and some of them all point. Personally I am quite sure that in a very short time it will all be point.

12,039. Do you think that the blind who become blind after a certain age are able to read the point as well as the line; we have heard that in England he aged read the Roman type, and that it is only the young who can successfully read the Braille type, what is your experience in America with regard to that point?—I would prefer to give my own personal experience. My own experience is this: I learnt to read the Moon type, which is a line type, several years ago. I am 54 years of age, and two years ago, I learnt to read the point and read it satisfactorily to myself, and I believe that there is no one, old or young, that can read the line, but can read the point very much better; and I know this to be the experience of very many of my blind friends.

12,040. Then you think though there may be a certain prejudice in favour of the line, that prejudice ought to be and will be overcome by blind persons?—I think so, and my experience goes a little further. Since 1863 I have occasionally tried to read the line letters and have failed. I do not like to have to say that, but I cannot read the line type, except the Moon type, but I can read the point.

12,041. You speak of line type; other than Moon type in what respect does that differ from Moon's?—Moon's consists of arbitrary characters; our line letter is the capital and lower case Roman letter with capitals commencing every sentence like your newspaper prints.

12,042. Dr. Armitage speaks of Philadelphia Roman; is that what you call line type?—Yes.

12,043. Will you tell us how many men are employed at Lancaster Avenue?—We have on our list 134, but as there are always some absentees the number will average something over 100.

12,044. Are they all boarded and lodged in the institution?—We have three classes, a class that board at the house, a class that live around us and who come in the morning and bring their dinner with them and go home at night, and a class to whom we send work and who do the work at their homes.

12,045. How many board with you?—I think, out of the 134, 84 would be called inmates.

12,046. How many work in their own homes?—There are six that we send work to at their own homes, and the remainder of the 50 would be those that come to us to work.

12,047. Forty-four work by day with you but live in their own homes?—Yes.

12,048. Can you tell the Commission anything about the history of those men; have they been brought up in your institution, and then left it and then worked at home, or do they come from outside altogether?—They come from outside altogether; our institution is for adults exclusively.

12,049. Where have they been taught?—I will not say the larger proportion of them, but quite a good proportion of them are from the outside world, our mines and machine shops, and quite a large proportion of them have been educated in different institutions, principally in the Philadelphia Institution for the Instruction of the Blind.

12,050. At what age do they leave that institution?—At their graduation after a term of not exceeding eight years. Within the last two years, or within the last year, they have concluded to take only young people; there are still some adults at the institution, but they are gradually shutting their doors to them, and they now come to us from the age of 23 up to 35.

12,051. Will you tell us the age to which they kept them formerly at that institution, and the age to which they keep them now?—They were allowed to use their own judgment. I myself was a pupil there, and at that time they admitted them at almost any age. The young people were kept eight years, and sometimes longer. That period has now been reduced to six years, and they are now taking them from six years of age. and they propose to ask the legislature to allow them to keep these children till they are pleased to discharge them. So there has been no rule as to age; they preferred to take them at the age of from 12 to 15.

12,052. From your own experience how long do you think it takes to teach trades to the blind. Speaking generally, how long do you think they ought to be kept in school, and at industrial work in order to get educated and to learn some occupation by which they may earn their livelihood, beginning at the age of six, which you say is the normal age at Philadelphia?—It depends so much upon the capacity of the child, and also the way the child is taught. I do not think the blind as a class are more backward than sighted children. I think they would learn ordinarily as quickly as sighted children, though they labour under a great disadvantage of course. The trade to which they should be put should be adapted to their peculiar condition.

12,053. Before a child receives industrial education, I suppose it first of all receives a general education; that is to say in reading and so on?—In our country the education of the blind consists of music, literature, and handicrafts; they are supposed to learn a trade without interfering with their studies, and when their time is up they are supposed to have some trade. That is the case in most of our schools.

12,054. What are the trades that are taught in the blind schools, and which are those in which they most excel?—We have 33 blind schools in America, they differ very much. In Boston they differ from those in New York, and those in New York differ from those in Philadelphia. In our State (I am speaking of Pennsylvania) the schools have taught brush making up to last year, but they have abandoned it as worthless, they taught mat making for many years, perhaps 40 years, and they abandoned that as worthless. They now teach broom making, carpet weaving, cane seating, and mattress making. Those are the trades which they teach the boys. The girls are taught bead work, knitting, crocheting, and hand machine sewing.

12,055. Taking the school at Philadelphia as an example, will you tell us what proportion of those who are taught in that school take to industrial occupations, and what proportion take to a musical career?—A very large proportion follow handicraft, although nearly all study music. I should say that half of them aspire to become music teachers or performers.

12,056. Fifty per cent. of the whole school?—Yes, I would think so.

12,057-8. Can you tell us what proportion of those who aspire to become teachers of music gain a livelihood by it in after life?—A very small proportion.

12,059. What becomes of those who fail to gain a livelihood by music; do they fall back upon any other trade, and come to you to work in your workshops?—Many of them do.

12,060. Is your experience with regard to those who have failed to get a livelihood by music derived from those who come to your institution; or do you speak from general knowledge?—I speak from all the information I can get, from one end of the continent to the other.

12,061. I suppose you are prepared to admit that there must always be great difficulty in finding profitable occupation for the blind?—Undoubtedly.

12,062. And from your experience in America do you think broom making, carpet weaving, cane seating, and mattress making are those occupations in which the blind are most likely to succeed?—Yes.

12,063. Those branches of industry are carried on at your institution?—Those we are carrying on, including brush making.

12,064. At your institution you have not given up brush making?—No.

12,065. Does your institution pay its way, or does it depend on the generosity of the public?—My institution is a peculiar one, we are exclusively industrial, and every man after he is a journeyman must pay for what he gets and receive pay for what he does. Last year in round numbers my blind men earned 15,000 dollars, and our deficiency was in round numbers 6,000 dollars, and we have ever so many apprentices.

12,066. Will you be good enough to furnish us with the balance sheets of your institution for some years past?—I shall be very glad to forward to the Commissioners balance sheets for a number of years past.

12,067. Do the men who work outside your institution earn enough to get their living without any extraneous help?—Very many of them do; some of them do not.

12,068. What provision is there in America for the blind who are unable to earn their own livelihood by work?—None whatever, except our almshouses.

12,069. Does the State subsidise your institution in any way?—Our institution is a close corporation. I raised some 120,000 dollars and established the concern, and two years' ago I asked the legislature for an appropriation, and they granted 5,000 dollars; the last legislature granted us 10,000 dollars. They do not call us to an account for this, they simply appropriate the money to our board of managers.

12,070. As a gift, not as an annual grant?—No, not as an annual grant. Our legislature is changed every two years, and our appropriations have to be made every two years.

12,071. Are there any pensions for the blind in America?—No.

12,072. Are the blind treated considerately in the almshouses; are they kept apart from the other inmates?—They are treated better; they have what they call a blind ward; they are treated better than the ordinary outdoor paupers as they call them, they have better diet.

12,073. Do you know what per-centage of the blind in America are in those blind wards?—About 2½ of population.

12,074. Would it be a large or a small per-centage?—In the State of Pennsylvania there are over 4,000 blind people, and in the Philadelphia Almshouse there are to-day 23 blind persons. In the various almshouses throughout the States the proportion of blind would be a small one.

12,075. If I rightly understand you, if blind persons receive any aid from the State they must go into the almshouse, they cannot receive aid out of doors?—No; the school for the instruction of the blind, not the workshop, but the school for the instruction of the blind, is simply a school, and the State give them a grant of 300 dollars *per capite*. At the same time it is not a State institution because it is a close corporation.

12,076. They get a grant from the State of 300 dollars per head?—Yes, for a certain number, 155. With regard to the Working Home for Blind Men, which is my own institution, I ask the legislature for 5,000 or 10,000 dollars and they grant it, and on these grounds I take men out of the almshouses and I teach them a trade and give them employment; but while they are learning a trade they must have food and clothing, and I ask the legislature for an appropriation, and they grant it.

Mr. H. L. Hall.

13 Sept. 1886.

12,077. In fact you relieve the almshouses of the blind by taking them and teaching them a trade, and on that ground the State gives you assistance?—Yes, we stand between the blind and the almshouse. Probably a large proportion of my people would be in the almshouse if it were not for my institution. I have a great number who have never been in an almshouse.

12,078. How do you teach your blind to work; are they instructed by sighted persons or by blind persons?—By both. Every man in my institution is a broom maker, they are all taught broom making by blind instructors. Then as regards carpet weaving, if a man who has a wife and family meets with an accident in one of our mines and wants to learn carpet weaving he is admitted and we teach him that trade. The teacher in that department is totally blind. A blind man on being taken into that department is taught to weave carpets and he does his work at home, and with his wife and family will make his own living. Then as regards the cane seating department the teacher is totally blind also; and in the mattress making department the teacher is totally blind also. As regards brush making, I should prefer not to teach brush making, because it does not pay at all. As to broom making, as I said before, all can make brooms.

12,079. Without sighted assistance?—Yes; they could do it without sighted assistance, but it would not be economical. I have a foreman, and that foreman has an assistant, and I have a sighted man to sort the corn; no blind man could tell red corn from yellow corn, and I am obliged to have a sighted man to do that, and I have in addition a janitor and watchman; but with reference to the trade there are altogether four sighted men and two boys, one to run the machine; a blind person could run it, but he would do it too slowly to be profitable, and it might be dangerous also. If I have a large order, which I have sometimes, for the re-caning of 50 or 100 chairs, I can put a large force upon it and execute the order quickly, and then the men can go back to the broom factory again.

12,080. Do you find that you have to contend against outside competition?—Tremendous competition, machinery and all that, and the broom business is like any other business; at certain seasons of the year trade is brisk, at certain other seasons trade is dull, but in the dull season I make up a large stock to be ready for the time when trade revives.

12,081. Are those American brooms exported to this country?—To some extent; not to any large extent.

12,082. Do you consider that they are better than the English brooms?—We think so.

12,083. Have we any material in this country which corresponds to your broom corn?—I think not; but I noticed some brooms in a blind institution in Glasgow the other day made of broom corn, which I was informed were made in Italy, for which they were paying 15*s*. I should be glad to furnish a better broom for less money. I said to the superintendent of the institution (Mr. Stoddart) "Why not import the raw material and "let your men make these goods." I do not know what the duty on the raw material would be, but it strikes me that the raw material could be imported as well as the made up article.

12,084. When contracts are offered for public competition in America, is any preference shown to blind institutions?—No, the government could not show such preference if they felt disposed to do so. I never put forward the work produced by the blind as being blind work at all. I sell it upon its own merits.

12,085. Do you think it is advantageous for the blind to work in industrial institutions like yours rather than work in their own homes?—Most assuredly I do. Let us take broom making as an illustration, the success of every institution depends very much upon its management in the way of buying and selling. I will go west and I will buy say 300 tons of material, that would be about what I would use in a year, a car will carry from six to seven tons, and when you have 300 tons it takes a good many cars. I go to the headquarters of the railway and I get a rebate. On the other hand if a blind man buys only one car-load he has to pay the full

Mr. H. L. Hall. 13 Sept. 1886.

railway rate, and by buying a small quantity he does not buy it so cheaply as if he bought it in a large quantity. I can sell my ready made goods for less than the raw material would cost a man who bought his material in small quantities. The month before I sailed I had 5,000 dozen in stock, and we were making 125 dozen every day, when I sailed I had less than 500 dozen, and they were engaged. You will ask me if that pays, I answer, in one sense, yes. In my opinion a blind industrial institution can never be self-sustaining on general principles, because we have to compete not only with skilled sighted labour, but with all sorts of steam machinery. Now from my experience of 13 years at the working home, while there has been a balance against us of from 3,000 to 6,000 dollars (which is not half what it would cost to take care of these blind people in any other way), I believe that I could make the institution self-sustaining and throw the balance on the other side, but in order to do so I would have to employ some sighted labour, I would require to have what I would style a finisher's gang of skilled sighted labour to overhaul and finish the work. I would let the main part of the work be done by the blind, and let the skilled sighted men do the finishing, because when these goods go into the market of course they are compared with the same class of goods made by the sighted, and a buyer while he will give me money in charity will not pay me any more for any goods because they were made by blind men.

12,086. You think it an advantage for the blind to be units of a large institution, and you are of opinion that in that way greater economy in the purchase of material and greater profits on their labour can be obtained than in any other way?—Yes. Then there is this further advantage in taking the blind into institutions, a penny saved is worth one earned. There are two classes of blind. If you take a man who has been blind from his cradle, he is quite a different man from one who has become blind at the age of 25 or 30, one is what you may call a sighted man in the dark, and the other is a blind man. The man who has always been blind, unless he has been properly tutored, or has the right kind of parents and so on, is not economical, he is improvident, and does not know what it is to get a living. Now if by taking such a man into an institution like mine you can save the man 50 per cent. upon his living and clothing expenses, it is equivalent to giving him a chance to earn that amount of money.

12,087. You have great experience of these industrial institutions for the blind in America; can you tell us whether your institution is a fair sample of the rest?—Mine is the only one of the kind in the United States.

12,088. But the training institutions teach trades?—Yes. When I say that our institution is the only one of the kind in the States, I should add this. About a year ago the legislature of California appropriated 40,000 dollars for the establishment of an institution similar to mine; last winter the State of Ohio appropriated 10,000 dollars to do likewise, other States are moving in the same direction. Those Institutions are not old enough to have issued a report yet. The State of Illinois is moving in the same direction.

12,089. What becomes of those who are taught at the training institutions in States where there is no such institution as yours?—Their time expires, and they must leave to make room for others, and if they have no home their lot is a very sad one.

12,090. When blind lads leave the institutions in which they have been educated and trained, is it your idea that they should enter institutions such as yours, or in what way would you deal with them?—We have in the State of Pennsylvania a population of some 4,000,000, and we have some 4,000 blind people. When the census of 1880 was taken, I employed a man to go over the returns carefully, and I have the names and ages and addresses of 3,911 blind persons in my office. I find that over half of the total are 50 years of age and upwards; the number of school age, leaving out those incapacitated physically and mentally, is really smaller than the number of the class that would be fitted for an industrial institution. From that fact I believe that a very large proportion of blind people, if they earn their living at all, must do it by some handicraft. Now from my experience I believe that quite a large proportion of the adult blind could be made self-sustaining; there would be a proportion equally worthy working industriously and faithfully, but who would be naturally so very slow that try their best they could not earn their living, but they could earn so near it that it would be more economical to supply the deficiency than it would be to take care of them in any other way.

12,091. Can you tell us what is the cost per head per annum of the boarders in your institution?—130 dollars per annum.

12,092. I gather from what you have said that you think that those who pass through the institutions instead of being thrown adrift into the world to look after themselves, or to work in their own homes, ought if possible to be gathered together in some institution like yours where they would get an industrial training, which would enable them to earn their own livelihood?—I think that would be far better for them.

12,093. That want is being supplied in different States by the States themselves, providing such institutions to the extent that you have mentioned?—Yes, to that extent. I think that such institutions will be established generally eventually.

12,094. Will you state what provision you make for the aged blind?—I will tell you what we have and what I would have instead. We have in Philadelphia a school, we have a working home for blind men, we have an industrial home for blind women, and we have a retreat for blind deaf mutes, and aged blind, so that there are really four institutions for the blind. In my judgment there should be but two. I do not believe in mixing the males and females and having them working together in an industrial establishment, but I believe they might work under the supervision of one corporation, that the females could do the light work of the industrial establishment while the males might do the heavy work. Then when we take young men or young women who have no friends and no home from an institution or otherwise, and we wear them right out and they become aged and infirm, we must have an outlet for them, otherwise we would very soon become an old blind men's home. After they have worked with us a term of years and have become old or infirm, we cannot send them out on to the street or into the almshouse, we must provide for them. No old people take kindly to changes, old blind people take less kindly to them than old sighted people; if we send them away from their homes to a retreat, however nice it may be, it is not their home; and the difficulty that we find in our retreat is to know what to do with the old people from day to day, they want employment. Now if we had an annex to our industrial home to which we could retire an old man, who would thereby have the means of doing a little work in the industrial department if he liked, it would be a great improvement, he would not have to get up so early as those who were working in the industrial home, but if he liked to work for a couple of hours it would be a clear gain to him and a clear gain to us.

12,095. Do you think you could get your State to carry out that idea by giving you the funds to do so?—I am not clear that it would be politic to ask the State to do it. The retreat is a local charity, and in my judgment, judging the future by the past, in the course of 20 years it will be rich from endowments, we have already had some. When we become attached to the treasury of the State philanthropists forget us in their wills and their money runs to other institutions, but if I were going to build again I would have an annex for the old people. There are three separate institutions which should be but one, and they could be managed more economically in my judgment if they were one. I would have the annex simply a local charity, while the other department should draw its money from government. If we take these blind persons off the streets and furnish them employment instead of their being cared for in the almshouse at the expense of the different counties of the State, and if there is a deficiency after deducting what is received from the produce of the labour of the blind, the deficiency should be met by our State legislature because the tax is then *pro rata*.

12,096. With regard to the cases of those who become blind say after 50, of which there is a very large number, blind persons who have not been brought up in an institution, and who do not come under the conditions you have mentioned, who have not been taught trades when they were young, and who would probably in many cases be too old or too infirm to learn a trade, you would be still obliged to have a retreat for such as those, independently of the cases which might be met by that annex to your industrial institution which you have suggested should be provided; you would not mix those with the class for whom you would provide the annex, would you?—I see not the slightest objection;

we provide for such cases in our retreat now. I have already sent two men there from my institution, the requisites for admission are simply blindness, good character, and age, and our board selects candidates according to their discretion. Some people are older at 60 than others would be at 30.

12,097. I have been asking you as to your own Institution; can you give us any information with regard to the condition of the blind generally in the United States, and with regard to the provision made for them; you say that training schools for the young exist in every State, or are being established in every State?—We hope they will be.

12,098. They are not yet?—No, not yet.

12,099. Every blind child in America is bound to be sent to some place of instruction?—They are the wards of the State in which they live; they are entitled to education at the expense of the State, but when they are educated they are thrown upon their own resources.

12,100. What happens to them in those States where there are not training schools for them?—I attended the meetings of the organised charity in New York several times last year, and their outdoor agent made this statement, based upon facts and figures which he held in his hand, that there were 1,500 blind people in New York, 678 were receiving charity from this organisation, 300 were in the almshouse, 130 were professional beggars, and the remainder of the cases had not been properly investigated. In the city of New York the blind go to the Eye Infirmary and are there examined by the oculist, and that oculist was present at the meeting and made his statement, the blind get a certificate from this oculist, and then they go with this certificate to the party in New York who distributes the charity, and the sum thus distributed in charity to the blind amounted in the aggregate to 20,000 dollars, the amount *per capita* being 38 dollars. I do not think other cities are quite like that, New York is our London; Boston, Philadelphia, and Chicago differ. I constantly find blind men begging and playing the hand organ, the accordion, and the violin in the streets.

12,101. All over the States?—All over the States, one day a blind man, a Frenchman, who was playing the violin, was taken up, and the newspapers were on that occasion rather severe on our organised charity, which was established for the purpose of taking beggars off the streets. for when the matter was investigated it was found that that blind Frenchman had 18,000 dollars in the bank, and was waiting until he got 2,000 dollars more, when he was going to Paris. There is one fact which I may state here: that I have never had any success with any blind person that I found begging; they seem to prefer begging; they seem to have lost their manhood. I cannot get anything out of them, I cannot make them work.

12,102. (*Dr. Tindal Robertson.*) By what machinery was that information which you have just given us obtained?—It was given at a formal meeting of the organised charity, the presiding officer being Senator Robb, a member of our State legislature, and this statement was made to the meeting by the outdoor agent of the society, whoever he may be.

12,103. (*Chairman.*) Dr. Armitage says that there are two asylums for the adult blind in New York; do you know anything of them?—There is in New York City "The Home for the Aged and Destitute Blind," a private corporation; also, under the Department of Charities and Correction, what is known as the Blind Asylum, on Blackwell's Island; also the New York Institution for the Blind, a corporate school for the blind, to which the State makes appropriations; and also at Batavia, "The New York State Institution for the Blind," a State establishment and a school.

12,104. Does the town of New York give a subsidy of 20,000 dollars a year to the blind of the city?—They have been doing so.

12,105. That is what you described to us as amounting to 38 dollars each?—Yes.

12,106. Not to any institution but to the blind themselves?—Yes, the adult blind in the city.

12,107. They receive 38 dollars each in one sum?—Yes.

12,108. Is it the case, as we have been told is the case sometimes with pensions in this country, that when the recipients receive a large sum of that kind they waste it in drinking and in good living for a short time, and then there is nothing left?—Yes, it goes to an improper place, it is damaging to them.

Mr. H. L. Hall. 13 Sept. 1886.

12,109. You think that it is a misfortune to them to receive such large sums in a lump?—Yes, it has a tendency to pauperise them, and it debauches them in many cases.

12,110. Dr. Armitage mentions certain facts with regard to your institution; I should like to get from you the figures, or perhaps you will furnish the Commission with the figures if they differ from what Dr. Armitage states. Dr. Armitage is speaking of 1884; if you have anything later perhaps you will furnish it. We should like to know how many brushes, how many yards of carpet, and how many mattresses were made, how many chairs were seated, and how many brooms were made last year, 1885?—9,504 brushes; 4,185 yards carpet; 161 mattresses; 438 chairs re-caned; 361,733 brooms made.

12,111. With regard to the marriage of the blind, in your institution have you blind married men, or do they marry in your institution?—Both.

12,112. What happens when they marry, what becomes of their children?—We have had since the organisation of our institution quite a large number of marriages where blind men were chased down by sighted women unfortunately, I have had to order sighted women away from my place.

12,113. They wanted to marry blind men?—Yes, and they have done so.

12,114. Suppose a man in your institution gets married to a sighted woman, and she is not able to support him, what becomes of him?—I do not know that we could make it a rule that our blind men should not marry sighted women, but such marriages have been unfortunate in several cases because the parties were dissipated. We have several cases of a totally blind man with a totally blind wife, who are doing splendidly and are earning their living.

12,115. In your institution?—Yes.

12,116. Have they any children?—Yes, and beautiful children, and they are taking care of their families.

12,117. Are they boarding in your institution?—No, they live outside.

12,118. What provision is there for the married blind outside your institution?—If I were compelled to reduce production I should not cut down the earnings of married men. I discriminate in favour of married men.

12,119. Can you tell us what are the earnings of each individual in your institution, and what are the earnings of a man and wife together?—We have men who will earn a dollar and a half a day without any difficulty at all. No blind women are employed in our institution.

12,120. What do they pay you for their board and lodging?—Speaking of the class that board with us, whom we call inmates, two dollars and a half a week (10*s.* British money) covers and more than covers everything, board, washing, mending and medical attendance. The medical attendance costs us nothing, we have allopathists and homœopathists giving their services. As regards the class that live and board outside their cost of living depends upon themselves. We have those that live in two rooms respectably and comfortably, and save money, on their earnings; we have others who are always in debt, people who want to live in a little better style. Then in some cases where a man is married, his wife perhaps will sew or take in washing or do lots of other things that she can do. Then we have other blind men who supplement their earnings at the institution by blowing the organ on Sundays and at rehearsals, and at evening practice, though in some cases a man may earn by blowing an organ only 25 dollars annually. I have known a man to earn 150 dollars. That work does not interfere with the work in our factory at all.

12,121. With regard to the Industrial Home for Blind Women what work do the women at that institution do, do they take in washing for instance?—No, they do cane seating and make baskets, and do knitting and crochet and sewing.

12,122. What do they earn a week?—No individual account is taken, they work in common.

12,123. You say that seeing women run after some of your blind men; is there any practical objection to a blind man marrying a seeing woman?—I think it the most desirable thing in the world if the woman is made of the right kind of stuff, if a blind man can better his

Mr. H. L. Hall.

13 Sept. 1886.

condition by marry a good seeing woman I see no reason why he should not do so.

12,124. (*Mr. Woodall.*) You said just now that there are case of blind men marrying blind women, which marriages are happy and successful. I rather gathered from the way in which you made the statement that you preferred that both parties to the marriage should be blind?—No, not at all.

12,125. Why do you discourage sighted women coming to make love to your blind men?—I only spoke from what had come under my own observation in particular cases. I have cases where blind couples get on very comfortably. In one case the man is a weaver and the blind woman is a cane senter, they are both energetic and they pay their way and live comfortably. In another case the man blows an organ and works in my factory, and the woman, who is totally blind, teaches music and they support their family splendidly. When a blind man is chased down by a blind woman I take it for granted she is not quite what she ought to be.

12,126. Can you tell us anything about the American Printing House at Louisville; is it managed by any one particular State?—Before the war there was a printing house established there, and several States were pledged to give so much *per capita* to its support, a press was bought and one or two little books were printed; then the war came on and the thing died and remained dead until it was united with the National Printing Association of Philadephia, and then I became its general agent and raised a good deal of money for it and got an Act through New Jersey Delaware, and other States assisting in its support. Then it was thought proper to carry the matter to our general government on general principles. The blind necessarily must have maps and globes and books, and assistance was asked, not as alms but as our right; it was conceded by Congress and they appropriated, with only six dissenting voices in the Senate, 250,000 dollars, that money was invested in 4 per cent. bonds, the interest of which is 10,000 dollars which is paid annually on receipt of vouchers from the different States that they have received their quota. The educators of the blind control the thing, the books are printed by the American Printing House, and the general government pays for them.

12,127. Are any blind persons employed in doing any of the work of the establishment?—I think in some of the departments some who are half blind are employed, but as a general thing I think the blind are not employed. There are many things that the blind can do well, but it does not pay them to do it because they can earn so little at it. We have in Philadelphia a blind printer who can do the whole thing himself, but the progress is so slow as compared with the steam press-work that it is not worth while employing him in the work.

12,128. Have you ever in the States tried the system of combining the deaf and dumb and the blind together in an industrial institution?—Such a combination is a great drawback to both in my judgment, and that has been the opinion expressed by our educators at three different conventions.

12,129. The deaf and dumb could be employed, for instance, in printing, and in fact there are many things which the deaf and dumb could do in industrial work with the assistance of the blind?—I may say that we have three deaf and dumb and blind in my institution, and they are all splendid workers.

12,130. You have told us that you have a retreat for aged blind and for blind deaf mutes; how are they admitted?—Perhaps I may be allowed to give a little history of the formation of the institution. A certain deaf and dumb and blind boy whom I knew was taken out of the almshouse and taken to a school for the blind, where he was kept for a long while; then they found that they could not keep him any longer and some benevolent ladies raised a fund and hired a lady to take care of him; that lady died and he was transferred to another lady; that lady died and he was transferred to a third; that lady broke up keeping house and the boy had to be sent back to these benevolent ladies; they endeavoured to find a home for him in various institutions but failed, and finally they tried our institution; our managers were equally divided about admitting him. I think our institution was the proper place for him; but on one occasion he had got into a temper and drew a case knife from up his sleeve, which looked a little suspicious, and that went against him and he was refused admittance into our institution; then there was no other place for him but the almshouse, into which he was admitted and where he died. There was a sum of 4,000 dollars in the hands of these ladies, and I went immediately to one of these ladies to see if she would not let us have that money if we started a retreat, and she consulted the Honourable John Welsh, a relative, who said yes, that would be splendid; and they put that money in the bank to be drawn when the corporation was formed. I formed that corporation, and it was on one condition alone that we could get the money, namely, that blind deaf mutes must be admitted; that is what our charter says. It was named "The Retreat for Blind Deaf Mutes," and blind deaf mutes are to be admitted without reference to age, sex, or colour. Then in addition to being a retreat for blind deaf mutes it is a retreat for aged and infirm blind persons.

12,131. I assume that you do not know anything about the deaf and dumb generally in America, your only experience of them is derived from those who are admitted into this retreat, who are not only deaf and dumb but also blind?—So far as I know the deaf and dumb are taught trades. I know a clergyman who is a deaf mute. But if they were blind as well as deaf and dumb our place would be the place for them.

12,132. Dr. Armitage mentions a blind institution at St. Louis; have you personally visited it?—Yes, I may say with regard to our blind institutions generally, they are not all alike, in fact I know of no two alike. If the principal of any institution to-day should die, there would be a revolution throughout the whole concern, that is to say, the institutions are governed and ruled according to the notions of the principal; there is no general system as there is in respect to general education for the sighted.

12,133. Is it, in your opinion, a misfortune that the heads of those institutions are changed from time to time as the government changes?—In the case of a State institution proper, the State appoints the officers and foots the Bill, one party may be in power and the institution goes on prosperously for a time, and when that party goes out of power and the other party comes in, there is a general change and it is disastrous.

12,134. With each change of government there is liable to be an entire change of system of working in each institution, which may be disastrous?—Yes, it depends on who is appointed.

12,135. Are the best men generally appointed, or are they appointed on what I may call party or political grounds?—In many cases I should not say that those appointments were proper appointments, of course every one should be fitted for his business, and it requires a peculiar fitness for the position, and the men who are appointed are not always fitted for it in my judgment.

12,136. Do you know Mr. Churchman at Indianopolis?—I did know him, he is dead.

12,137. Was he the principal of an institution which he had to leave on a change of government?—Yes, he was discharged without cause and died broken hearted.

12,138. Is the Braille system generally known throughout the United States?—Yes, it is generally known.

12,139. Is it used for musical purposes?—It is used by several of the institutions.

12,140. It is not universally used for musical purposes in the States?—No, no system is universally used.

12,141. I gathered from what you said that the Braille or point system is coming into use?—Yes, but unfortunately for the blind people there are two point systems.

12,142. Which is the point system which is used for music?—Both are used for music.

12,143. Would not it be very desirable, if possible, that there should be one system for all the world?—It is a thing greatly to be desired, I know nothing more so, among the blind.

12,144. One or even two systems would be better than a multiplicity of systems?—Yes, we have four, two line and two points.

12,145. Do you know the Perkins' institution at Boston?—Yes.

12,146. Is that a private institution?—Yes.

12,147. Would that be a case where the principal would be appointed by the government?—No.

12,148. Is that a good musical school as far as you know?—It has that reputation, it has a blind professor at the head of its musical department.

12,149. Are there many blind teachers of music in the United States now?—Yes, and no.

12,150. Not many compared with the number of blind?—Not as many as there should be.

12,151. Have you visited many institutions in England?—Several of them.

12,152. Have you any suggestions which you would wish to make to the Commission with respect to them?—No. I may say I am pleased with the institutions that I have visited. I have already visited five, I believe. I might make this suggestion, that the industrial establishments should take to importing broom corn, and making the brooms instead of importing the ready made broom from Italy as they do in Glasgow. I should think they could import the raw material as well as the ready made goods.

12,153. At what price do you sell your brooms retail in the States?—We are making 18 different kinds, and they vary in price.

12,154. What is the difference between your wholesale price, and the retail price?—At my store we sell retail as well as wholesale, but the retail business does not amount to very much. I send brooms to Barbadoes, Martinique, Demerara, and South Africa, and they bring a very good price, but for the brooms that I would sell in Philadelphia, I would get a dollar and a half; for the brooms exported I have to pay a duty of a dollar per dozen plus the transportation. In your British ports the duties are very much lower.

12,155. Do you ever sell your brooms at a loss?—Yes, very frequently. Last year I bought broom corn for 60 and 70 dollars a ton delivered in Philadelphia, since then the price has been 240 dollars a ton, if you buy wrong it makes a great differencce, it is the cost of the material that makes the price fluctuate. In carrying on my trade I am governed by three business principles; in the first place I buy as cheaply as I can; in the next place I keep my men at work 10 hours a day all through the year under all circumstances; and in the third place I sell for the best price possible. The making of brooms involves selling them, and the deficiency between the cost and the sum realised on the sale of the articles is what my charity costs; but my deficiency is greater than it should be. We are working out the problem, and the end is not yet. Now let me speculate a little. I told you I believed I could throw the balance on the other side, and I say that from the experience I have derived in the past 13 years. I could double the number of my blind men without changing my fixed expenses a single cent. I could buy my material to better advantage, because I would buy larger quantities; but in addition to that I could cut down my deficiency by availing myself of the assistance of sighted finishers. The legislature has promised me 75,000 dollars for building a new factory for 250 men. Now I hold it to be perfectly legitimate to employ whatever number of sighted men it may be necessary to employ to bring this blind work up to the proper selling point; I will call them a finishing gang.

12,156. You think that an advantage would result from the employment of a certain amount of seeing superintendents?—Not so much superintendents.

12,157. For finishing certain parts of the work?—Yes; for instance, in the case of brooms, the addition of a little ornament, for which sighted assistance would be required but which would cost very little, would greatly enhance the value of the broom, and open up a greater market for the article.

12,158. Supposing the men in your industrial institution become incapacitated from illness, what becomes of them; have you any hospital in connexion with the institution?—No; if any are taken ill we are so full that we cannot isolate them, but I have only to telephone to the Episcopal, the Presbyterian, or the General Hospital, and they send down an ambulance and take away the patient free of expense; but we should have, and we propose to have, an infirmary for our sick.

12,159. You told us that you yourself became blind after you had grown up?—In 1863.

12,160. You had already gone through your own educational training; were you engaged in any business at that time?—I have been blind twice; the first time I was partially blind for 2½ years, and for 3½ years I was totally blind; then I recovered my sight by a surgical operation, and afterwards I became blind again, I was in business on the frontier when I first became blind, I was then a young man.

Mr. H. L. Hall.

13 Sept. 1886.

12,161. You told us that when you became blind you went into one of these institutions to learn what there was to be taught in them?—I applied to the institution of my native State, New York, and they refused to admit adults under any circumstances, (I brought the matter before prominent men and it was afterwards opened to adults with the restriction that they must board outside,) and I made a bargain with the Philadelphia Institution to be admitted for 300 dollars a year. While I was there the teaching was all oral; they read the Bible, but the teaching of mathematics and everything else was oral, there were no text books that I saw or knew of there, I was aiming at becoming an organist, and in the theoretical music class we had not any books. I said, "How is this, that we have no books?" The answer was, "We have no money," and when I asked whether the State did not furnish money for books the answer was "No." I knew something of the world, and I knew I could find generous hearted men who would come forward with money to supply blind people with books, and I in conjunction with others started an organisation for the purpose. I was the first president of the board, and then afterwards the agent of it.

12,162. It was your experience at Philadelphia of the want of books for the blind and also the want of any properly organised industrial training for the blind which led you to take an interest in the establishment of the American Printing House for the Blind and the Pennsylvania Working Home for Blind Men?—While begging money from one side of the country to the other for the purpose of providing books for the blind I would meet a great many blind persons and they were as much a curiosity to me as anybody. My instructions to my guide were, "If you see a blind man take me to him immediately," and I would question those blind men to get at their condition and mode of living. I found them holding their hats with a card on their breasts selling pencils, songs, and every imaginable thing. This is the sort of conversation that would take place between me and one of these blind men, "Are you blind?" "Yes," "Why do not you go to an institution; why not go to the Philadelphia Institution?" "I did go." "What did you learn?" "I learnt to make brooms," or "cane seat chairs." "Why do not you work at it?" "I tried and failed." "May be you drink whiskey?" "No, I do not." One would tell me his troubles; he would say he tried to make goods and sell them, but he found trouble in selling his goods, he had no money and no place to board, and no shop to work in, and perhaps he would say he had an account owing for his machinery. They would tell me all sorts of stories of this kind, not in one case, not in a dozen cases, but in hundreds of cases. Then I said to myself, What can be done for these men of all nationalities; some have been in institutions, some have not, some are too old for the existing institutions, some of them are men who do not drink; what can we do with these poor fellows? I find that the idea of workshops was not new, and the idea of retreats was not new. 30 years ago one of our educators in one of his reports spoke of the advisability of establishing such institutions, but to me the idea was new. I thought I would try the thing in a small way. I wanted to rent a room in the first instance, and a gentleman in Philadelphia to whom I went, and who undertook to assist me, said, "First raise your money and then go ahead." I drew up a book in which it was stated that no money was to be paid till sufficient money had been subscribed to warrant a success, and that gentleman said, "I will "head this with 500 dollars," and in a single day I got ever so many contributors of 500 dollars each. From that we bought our place and paid for it, and the result has been most satisfactory in raising the status of the blind who have been admitted into the institution. A blind man with nothing to do is of all men the most miserable, give him employment and he is happy. If you had seen these men formerly you would be surprised at the change that has taken place in them. You would touch their dignity now if you offered them anything in the way of charity. Some of my men have sittings in their churches which they attend regularly.

12,163. Have you ever had to dismiss any of your men for bad conduct or hopeless indolence or idleness?—Very frequently.

12,164. What religious instruction were the blind receiving at the time you started the society for the

Mr. H. L. Hall.

13 Sept. 1886.

spreading of Evangelical literature amongst the blind; were there any books for the religious training of the blind at that time?—Not that I am aware of, except one book in raised type; that was a Swedenborgian book printed by means of a fund left by a lady who died in Boston. On the board of this society there are three bishops, and all the rest are D.Ds., and clergy of every denomination, and no book can be published without receiving the unanimous approval of the board. The first book that we printed was the "Dairyman's Daughter," by Leigh Richmond.

12,165. Is the Bible printed and circulated by you?—No, but we propose to print it in point, I think.

12,166. The English version of the Bible is circulated in America now?—Yes; our American Bible Society has printed it in what we call the Boston letter.

12,167. (*Mr. Johnson.*) With regard to the question of type, does the American Printing House for the Blind now print in both systems?—Yes.

12,168. Does it print in the Moon type as well as in the other line type?—No; the Printing House is simply a machine in the hands of the educators, and it would print in Hottentot if a particular quota were required in that language.

12,169. Were all those large books printed on Dr. Howes' system in the Roman character, which are used to some extent in England, printed at the Printing House?—A very small proportion only. Dr. Howse printed those books for a number of years; his son-in-law, the present principal, raised a fund of 106,000 dollars, with the interest of which he set up a steam press. He prints altogether in the line letters.

12,170. Until very lately I believe the blind at Boston, Philadelphia, and New York, have had their literature printed entirely in Dr. Howes' system or in the Philadelphian system?—Altogether.

12,171. How recently has the point system been introduced into general use?—I cannot say that it would be considered in general use even now, it has been making its way for perhaps 10 years.

12,172. Are all the books printed on what you call the point system printed in Braille?—I know of no books printed in Braille in the United States except what are done by hand. In Philadelphia; hey use the Braille to teach music, but they have also within the last few months introduced what we call the New York point.

12,173. The New York point being a modification, I believe, of the Braille system?—Yes.

12,174. Then the present generation of blind people read by either the Boston type or the Philadelphia type as a rule?—Yes, as a rule, there are exceptions. There are four schools where they read nothing but point.

12,175. What books are printed in the New York point system?—Quite a long list.*

12,176. Those are the books used now for educational purposes?—In many schools.

12,177. But not in all?—Not in all.

12,178. I suppose the majority of the schools use the Roman type of some kind or other?—Yes, the majority of them.

12,179. Do any of them use the Moon system at all?—Not that I am aware of. I know several schools that have Moon but not as part of their education at all.

12,180. As I understand you, the point system, or as we call it the Braille system, is one which has only lately been brought into use for educational purposes?—Yes.

12,181. And it is not very generally employed throughout the States?—Probably one-third of them are using it; the use of it is growing.

12,182. With regard to the 10,000 dollars, the interest of the 250,000 dollars, which was appropriated by Congress for printing books, can any school that likes to ask for a certain number of printed books get them?—It is for the blind of the United States and territories; it is divided *pro rata* among the schools, and if one school wants its quota in line, if another school wants its quota in New York point, and if another school wants its quota half and half they get it.

12,183. The system in which the books are printed depends on the school from which the demand comes?—It depends very largely upon the notion of the superintendent of the particular school.

12,184. One school might employ one type and another school might employ adother type?—Yes.

12,185. And each of those schools would be supplied with the type which they might require from that

printing establishment?—Yes. Perhaps I may be allowed to add here that at the last Convention of the Board of Superintendence held on the 6th, 7th, and 8th of July last it was resolved that 20 per cent. of this 10,000 dollars may be used for purchasing works in Braille or any other system elsewhere, that is to say that the superintendent of any institution may to the extent of 20 per cent. of his quota order books not printed by the American Printing House for the Blind but printed say in Paris, and the American Printing House is bound to furnish them.

12,186. Suppose one of the institutions required a certain quantity of books in Moon type it could demand that that quantity should be supplied it?—Yes.

12,187. The books being ordered through the American Printing House?—Yes, the American Printing House would have to pay for them.

12,188. The American Printing House being really the representative of the State?—Yes.

12,189. You gave us an interesting account of your Lancaster Avenue Institution and you told us that you have 134 on the list of whom 84 are inmates; what are the ordinary earnings of those 84?—We have a good many apprentices, sometimes more and sometimes less, 822, and I would have to take the year's make in order to answer that question.

12,190. Apprentices are included in the 84?—Yes, taking the workmen altogether they earned in round numbers last year 15,000 dollars, and there was a deficiency of 6,000 dollars, in other words it cost us 6,000 dollars to give those men a chance to earn 15,000 dollars, and to develop the skill of the apprentices.

12,191. A great proportion of the 84 who board with you are earning wages?—Yes.

12,192. Does any part of their wages go towards the payment of their board?—Yes.

12,193. Does their work, as a rule, cover the expenses of their board, and is there any profit to themselves?—No, the institution is not self-sustaining.

12,194. Do you find carpet weaving a profitable thing?—Carpet weaving is a splendid trade, and the blind can make good wages at it.

12,195. What sort of carpet do you weave?—It is made of rags, and there is a wool stripe in it.

12,196. It is not the same sort of carpet that we use in England to cover our floors?—No, my rag carpet business is very small, I only keep two weavers going, but it shows a profit. I only charge 25 cents a yard, and yet I make a profit. When there are no custom orders coming in I weave stock carpet on which there may be 30 or 40 per cent. loss, but the margin of gain in the one case covers the loss in the other. At the same time it would be a perfect farce to keep 150 men at work at it, it is a small business. As a general business for any considerable number of blind it would not pay at all.

12,197. How do you pay those who weave carpets, do you pay them by piece-work?—I send the beam to the firm who makes the warp, and then it is brought up and put into the loom and a blind man weaves the carpet.

12,198. The loom is furnished by a sighted man?—Yes, it is put in order by a sighted man and the weaving is done by a blind man.

12,199. What can blind men earn a week at that?—If it is custom work I pay them 10 cents a yard for weaving, a man will weave 10, 15, or 20 yards in the day and do it easily, that is custom work, a man will earn from a dollar a day and upwards at that work. I have been speaking hitherto of custom carpet work exclusively. Now let me take what we call stock carpet, I go and buy half a ton of rags, and I pay the man seven cents for weaving a stock carpet, and this stock carpet costs (I am speaking now of last year) within a fraction 32 cents a yard, and I send it to the auction store and get only 19 to 21 cents. nett, so that you see there is a loss there. My carpet department on the whole shows a profit because the margin on the custom work covers up the loss on the stock carpet.

12,200. Have you sufficient custom work to keep a certain number of men always employed?—About three-fourths of their time, and it is increasing.

12,201. And for one quarter of their time they are engaged in what you call stock work?—Yes, about that.

Mr. H. L. Hall.

13 Sept. 1886.

12,202. With regard to mattresses, what can a man earn at mattress making?—My prices are precisely the same as outside prices.

12,203. You follow the trade price outside as a rule?—Sometimes when my men think they are getting too little I will advertise in the daily papers, "Wanted, "carpet weavers or sowers. Address" so and so; they do not know who is advertising, and I will get, perhaps, 50 answers, and I take the medium of the extreme prices, and so get at the price I pay for the work. I take not the lowest and not the highest, but half way between. Now as to mattress work, it is a delicate subject with me because I differ from many of our American institutions with regard to employing the blind at mattress making; blind men can make splendid wages, probably better wages at making mattresses than at anything else that I know of, but it is utterly worthless for any considerable number of blind to work 10 hours a day at and for this reason, that all our first-class hotels keep upholsterers constantly employed. I solicit orders for mattresses, and we execute the orders to the perfect satisfaction of those who give the orders, and the men make good wages at the work, but two mattress makers will do all the custom work that I can get in our big city, and will not be employed all the time. To keep a large number of men at mattress making requires a large capital and a big store room.

12,204. I gather from you that you do not think that mattress making is a trade that should be very much pushed amongst blind people?—If you are teaching a blind person who will hereafter go to his country home, I think he should learn all he can be taught, and then if he gets a mattress to overhaul he will be able to do the work, andif he gets a chair to cane he will be able to do it. I am speaking of a large manufacturing establishment in which the branch of industry of which we are speaking is carried on as a trade. Then there is another thing to be borne in mind; sighted establishments have machinery for dealing with the material of which the mattress is made, and they will do more in an hour by machinery than any blind man in the kingdom could do in a week. Then as regards sewing up the cases, a sighted girl will do it so much quicker than a blind person.

12,205. Have you any difficulty in finding customers for your work?—My main trade is in brooms.

12,206. You have no difficulty in that?—Yes, and no. I can sell at any time any quantity of corn brooms if they are good; the price is not always so satisfactory as it might be, it depends upon whether the market is glutted or not. As to cane seating chairs, I know that in the New York institution they recommend cane seating as well as mattress making. I asked them why they recommended that the blind should be employed in cane seating, knowing as I did that it was not profitable, and the answer I received was that they recommended it as a means of education. I know that in the largest concern in Baltimore their trade has been solicited this year at 3 cents per chair; that is to say, an ordinary dining-room chair, and I have never yet known a blind man that could cane over three a day, and that would be 9 cents of our money. I am speaking of new work. The reason why orders for cane seating are executed at so low a rate is that our houses of refuge and our gaols, and so on, do the work. I would teach the blind to re-cane old chairs, and a blind man could make a living at caning old chairs, provided he could get all that he could do at it.

12,207. I understood you to say that 6s. a day was easily earned by your men; that is 36s. a week; at what trade do you think they can earn 36s. a week?—We have men that could earn a dollar and a half a day, that is 6s. of your money, but I do not say that, taking the average, they would earn that.

12,208. What would the average earnings of your men be?—About 400 dollars per week.

12,209. What is the ordinary age at which they are admitted to your institution?—We have men from 20 to 60 years of age.

12,210. You do not have many younger than 20?—I do not know that we ever have had any younger than 20.

12,211. Do not you think it would be a desirable thing to have them at a much earlier age if you could get them?—In my judgment there should be two institutions, one which should be purely educational and they should take blind children under a certain age, and there should be another institution purely industrial

Mr. H. L. Hall.

13 Sept. 1886.

which should take all others of suitable age, one man may be able to earn his living at 60 while another may be entirely used up at 40.

12,212. With regard to the retreat for the aged blind, has any similar institution been established in any other State but yours?—No.

12,213. What is the number of aged blind persons that have been received in your retreat?—The retreat is a small affair, we have 12, less three that have died. We have a great number of applications from candidates for admission, but though there are a great number of applications we find that a great number of the candidates are not qualified, our institution is not a hospital, and a person of 75 who would seem to be in every way suited for the retreat when he comes to be examined by our physician is found to have some disease about him; then there is another class who are ineligible, we have applications to admit their old father or aunt, from parties who are abundantly able to take care of their father or aunt themselves, we do not take such cases as those. Our institution was organised to receive the blind after they get too old to work in these industrial institutions.

12,214. For how many have you accommodation?—For only 15, in the home that we have at present.

12,215. Do the friends pay anything towards their maintenance?—As a rule, no.

12,216. Does the State pay anything towards their maintenance?—No; it is a local charity.

12,217. One question with regard to music; do you think the profession of music is at all a successful one amongst the blind in the United States generally?—I think it ought to be.

12,218. Can you tell me whether there are many blind people in America who are making a good income as professors of music or as teachers of music or as tuners of the piano?—Tuning is considered to be a first class business. The best organist in Philadelphia is a totally blind man with a totally blind wife, Mr. D. D. Wood.

12,219. Of course there may be very talented men as musicians, blind or sighted, but what I ask you is whether the profession of music and the teaching of music among the blind is considered a great success commercially in America?—I do not know what proportion of them may be said to succeed in the profession of music, everything being equal the blind man must go to the wall, he must be superior to the sighted teacher to succeed. I do know a great many who are teaching music and making a good living at it. I know a great many others that have failed. I have in my institution a dozen educated musicians who have tried to get a living at music and failed, and they are now working at broom making.

12,220. (*Dr. Tindal Robertson.*) With reference to the type question, you said that there are two kinds of type in line in America and two kinds of point type; which of the two kinds of point type do you use personally?—I use the New York point.

12,221. Is that the one generally used?—I think up to quite lately the other was more used, I am speaking of the Braille; but the reason of that was that it was energetically pushed, and there are even now all sorts of musical works in Braille, and they are being multiplied rapidly and pushed in every direction. I have formed no opinion of the comparative merits of the two point systems. My oracle among blind musicians is this Mr. D D. Wood, and he gives the preference to Braille, and is using it in the Pennsylvania Institution for the Instruction of the Blind.

12,222. Do you think the New York or the Braille is making the more progress in the country at present?—I think the New York point is.

12,223. With regard to music, do you think it would be possible to teach music successfully by any other plan than by one of those systems at any rate?—No, it is not attempted in any other system.

12,224. With regard to State aid, did I rightly understand you to say that the institution in your State where the young blind are taught is not aided?—No; the State pays 300 dollars for 155 of them. The Working Home for Blind Men is aided to the extent I have mentioned, and the Industrial Home for Blind Women receives 3,000 dollars, but the Retreat is purely a local charity.

12,225. Why is basket work left out of your trade system?—It has been most thoroughly tried by some of our institutions and given up. I visited the institution at Brantford in Canada, and found it working very successfully, and I came home very much inclined to introduce it, but I went into the market and found I could get ready made baskets imported for about what the raw material would cost us.

12,226. Was it the pecuniary reason only which made the training school abandon the brush making and mat making?—The brush making in our country is largely done by machinery, and by the prisons and by the houses of refuge and so on, and they could not compete with the work so done. The New York institution issued a pamphlet showing a list of those trades which they had tried and abandoned, and broom making is included in that list.

12,227. Is mat making included in the list?—Everything I ever heard of as being worked at by the blind is given as worthless, and yet they recommend in the same book mattress making and cane seating, the most worthless of them all.

12,228. I understood you to say that you thought broom making was about the most remunerative thing, and you suggested that it was possible that the raw material might be imported into this country and manufactured here?—I do not know what the duty on the raw material may be as compared with that on the manufactured article, but I should suppose that the duty on the raw material would not be more than that on the ready made goods; but if they are coming into general use (and they are selling them largely in Glasgow), I think it would answer the purpose of the institutions here to buy the raw material and make the brooms. Those Italian brooms which I saw at Glasgow have painted handles, and they pay 15s. for them, British money. They have to import those brooms from the continent; why not import the raw material, and manufacture them instead of importing the ready made goods.

12,229. It has been suggested to this Commission that it would be a good thing to establish large central depôts in the provinces of this country for the sale of articles made by the blind; do you think such a depôt as yours would meet that kind of requirement?—I have not the slightest doubt that by the establishment of such depôts the blind themselves would be 1,000 per cent. ahead of where they are now, and the tax-payers would be a long way ahead, it would be better in every way in which you could look at it in my judgment.

12,230. Suppose such an establishment was founded at each of the large provincial centres of this country, do you think it would be a benefit if the State was to subsidise it to a certain extent?—In my judgment, yes, and for this reason, the State will meet you with this objection, If we take care of this defective class we shall have all the defective classes calling upon us to help them and there will be no end to it. But the blind are a little different from the deaf mutes, for instance, the blind have to be cared for in some way, and I see no reason why with the help of the State they should not almost have the monopoly in some trades, it is not much assistance that the blind want. A blind man is content with less earnings than if he could see, his expenses are less. A man is led into expense through his eyes many times, and he would be clear of that if blind.

12,231. Are you aware that in the training schools of this country for the blind, technical instruction is given at the same time as general education?—Yes.

12,232. Do you approve of that system or would you confine the education of blind persons entirely to general education in the first instance, up to a certain age, and then teach them the trades they have to follow afterwards?—Speaking of my own country I would rather take a man who never saw an institution. I will tell you why: Take a man who has become blind in a machine shop, he has always been used to earning his living, he is now blind, he comes to my place and has a chance to make his living, he devotes all his energy to the work, and succeeds in 99 cases out of 100. On the other hand take a boy who has been brought up in an institution, he plays the piano a little, he has received a certain amount of general education, and he has been employed half an hour now and then in the shop; it is harder to teach such a person to do some industrial work by which he may earn his living than one who had become blind late in life, but who had been accustomed to some sort of work. I would prefer to take them without any instruction at all than to take them half taught.

Mr. H. L. Hall.

13 Sept. 1886.

12,233. You prefer that up to a certain age they should be restricted to purely educational matters, and that afterwards they should receive their instruction in industrial work?—Yes.

12,234. Do you think it advisable to bring up blind children by themselves, or do you think that they should be educated amongst sighted children; suppose you had a child of your own that was blind, would you prefer that it should be taught in a school confined to the blind, or in a public school where there were sighted children as well?—I would not send it to a school where there were sighted children.

12,235. Why?—For several reasons; the blind require peculiar training, a different training from the sighted, they receive their impressions very differently. In teaching the blind you must have appliances addressed to the sense of touch, which they could not have in a sighted school.

12,236. I am supposing those appliances were provided?—If you could have a class of blind children tacked on to a class of sighted children with proper instructors, even then the blind would be likely to be neglected.

12,237. You have very large experience amongst the blind; have you formed any idea as to the comparative causes of blindness?—A very large proportion of our institutions which issue annual reports give the causes of blindness. Taking the case of children I think the proportion of those that are born blind is very small, less than three per cent., and in a large proportion of cases the blindness is due to ignorance and neglect among adults blindness has been caused in a very great proportion of cases by accident.

12,238 Is here any part of the country in which there is any special cause for blindness?—In those counties that have the most rolling mills, and machine shops or coal mines there is a far larger proportion of blindness in comparison to the population than in the agricultural counties.

12,239. Is there any general plan in the country by which preventive treatment is practised at an early age for those diseases that affect childhood?—I have never heard of any.

12,240. Do you think it would be a great advantage if some general system were adopted for the prevention of blindness in infancy caused by the neglect of the mothers to take the proper means of preventing it?—I think it would.

12,241. (*Dr. Campbell.*) With regard to evangelical literature you stated that at the time you started the society for providing evangelical literature for the blind, you only knew of one religious book being printed in America; are you familiar with all the books printed by Howes' press previous to the time you referred to?—I have read list after list, catalogue after catalogue of those issued by him; there was Milton's Paradise Lost, Bunyan's Pilgrim's Progress, and the Prayer Book, but the editions were exhausted, consequently there were not any to be had at the time that the society for providing evangelical literature for the blind was started.

12,242. From what you said one would have gathered that at the time that society was started only one book had been printed adapted for the religious education of the blind?—I should have said for the free use of the blind.

12,243-4. A very large number of books had been printed which could be had by the poor blind in various ways; such books for instance as Baxter's Call to the Unconverted?—I was referring to books for the free use of the blind.

12,245. Have you examined carefully the results at the institutions where music has been thoroughly taught, and can you give us the per-centages of successes in those institutions?—I know nothing about such statistics. I have no confidence in such statistics. I have seen statistics which I know to be faulty, and I have no confidence in statistics. I speak from information that I have received in different parts of America in which I have travelled, and I know that but a small percentage of those that have studied music are earning their living by it.

12,246. You spoke of the blind learning music as an amusement; you were not including them in your percentage, but I take it you were referring to those who had had proper musical instruction?—Yes, I was speaking of those who thoroughly studied music in the Philadelphia Institution.

12,247. Of those who receive what you call a thorough training in music, how many begin at the proper age when music can be studied successfully?—I think most of the institutions take them quite young, at all events quite young enough ordinarily, if they have the capacity to begin with six or eight years musical instruction ought to make fair musicians of them.

12,248. Is it not the fact that every State school for the blind in the United States is compelled to take blind persons up to the age of 21?—I think not, if a blind person is taken in at that age it must be because a senator, or a member of the legislature, or some strong man comes and asks as a favour that the school will take the blind person in; I know they do not admit persons of the age of 21 at several schools.

12,249. Do not they take them up to 21 at most of the schools?—They have heretofore, even to the age of 56, I know they do not take them of the age of 21 in New York city, nor will they in Philadelphia, unless it is a special case where a member of the legislature wants them to admit such a person.

12,250. As a general rule in the United States do not they take them at the age of 21?—That has been the general rule hitherto.

12,251. Up to recently, at all events, it has been the rule in Philadelphia, consequently our per-centages must be founded upon that; whatever change has been made within the last year or two does not affect the per-centages?—No.

12,252. Therefore, if in Philadelphia they have taken pupils up to that age, whatever musical instruction they may receive, they are not all of the proper age to study music successfully?—No, they are too old.

12,253. What per-centage of those who have been trained in handicrafts at the Philadelphia School have gone out and become self-sustaining by handicrafts; I am not speaking now of those who have come to your institution?—It would not be anything worth speaking about.

12,254. That is to say, the per-centage would be so small that you could not estimate it?—Yes.

12,255. I suppose you will admit that the instruction in Philadelphia in music is not what it ought to be if the person undergoing the instruction intends to follow music as a profession?—I would not say that.

12,256. You tell us that the per-centage of success from the teaching of handicrafts in the Philadelphia School is so small that you could not estimate it; is there any reason to believe that the musical education in that institution is better than the teaching of handicrafts?—I do not wish to be misunderstood. I have studied music and taught music there, and I know something about the teaching of handicrafts there. If a man does not succeed in handicraft after he has left the institution, it is not so much the fault of the institution. I do not wish to be understood as criticising any institution. It would be utterly impossible for any man, blind or sighted, to set up and carry on successfully and without money, without friends and without credit, a broom business or any other business against a large establishment like mine, or against the other large concerns in Philadelphia. The want of success in the cases we are speaking of is not due to the institution; it is simply out of the question for any man to compete with those large establishments.

12,257. Still I understood you to say that the technical instruction given in the Philadelphia institution was such that when those who had been taught there came to your institution you were obliged to re-teach them the trade which they were supposed to have been taught at the other institution before they could earn their living?—I wish to be understood in this way; a man may remain at the Philadelphia institution, or any other institution, for a term of years; he may then go out into the world, and he may try one handicraft after another and fail, and perhaps it will be some time after he leaves the institution that he will come to mine; sometimes the interval between the time he has left the other institution and the time that he comes to mine is so long, that practically he has, not to learn his trade over again, but something in that direction.

12,258. You stated that you yourself had been taught music, and had been a teacher of music in the Philadelphia institution?—Yes.

Mr. H. L. Hall.

13 Sept. 1886.

12,259. How old were you when you began to study music in the Philadelphia institution?—I was 32.

12,260. Do you believe that even a sighted person, with all the advantages that he must have as compared with a blind person, can begin to study music at 32, and then acquire such a proficiency in it as to get a living at it by following it as a profession?—No, perhaps not; but as regards teaching music, I knew a little music perhaps before I was blind, but suppose I have no knowledge of music whatever, and a skilled professor teaches me the rudiments of music, and I am told to take a class of children and teach them, I myself would be learning while I was teaching. I would transfer to them what I had been taught myself.

12,261. Is not it the fact that much of the musical instruction in the institutions in America is given by people who have been put into the position of teachers for the sake of giving them something to do rather than because they were best suited for it?—I am bound to say that I think our American institutions lack in not employing the best talent. I believe the best talent is the cheapest in the end.

12,262. (*Chairman.*) You stated that you yourself taught music in the Philadelphia institution; I take it that you did not profess to be an accomplished musician, but you only professed to teach to children the rudiments of music which you had yourself been taught?—I simply transferred to them what I had myself learnt.

12,263. (*Dr. Campbell.*) Much of the instruction in the Philadelphia institution for instance is given by people who are not capable musicians?—By proper teachers.

12,264. Not by capable musicians?—No.

12,265. Do not you think if a proper technical musical instruction was given from the earliest age in those institutions it would entirely change the per-centage of success?—I firmly believe it, my belief being based upon a large experience, that a child of ordinary intellectual calibre, brought up in the right atmosphere and properly taught, could be made a first class musician.

12,266. If those in the Philadelphia institution were so taught it would entirely change the per-centage of success, would it not?—Yes, probably the number of those who succeeded would be larger.

12,267. The failure hitherto in music, not only in Philadelphia but elsewhere, has been for the want of superior instruction, has not it?—Superior instruction and application on the part of the pupil, both.

12,268. In answer to Dr. Robertson you said you would not recommend that the children while they were in school should be taught any handicraft; do you not think it would be well, while the children were at school, not to allow them to become indolent and lazy, but to teach them how to use their hands so as to enable them to use tools properly though the special training might be left till afterwards?—I see no objection to that.

12,269. With regard to the amount given in charity to the blind in New York, New York being a great port of emigration is peculiarly circumstanced?—Yes.

12,270. There being so many foreigners brought in, blind among others, New York is an exceptional country?—Yes.

12,271. With regard to workshops there have been many efforts made in the United States to establish worshops, have there not?—Yes.

12,272. And some of them are still in existence, for instance the one at Boston?—That is not like mine.

12,273. But are there other workshops in the United States?—In connection with the Workmen's Institution governed by the workmen in almost every State.

12,274. Is not the one at Boston entirely independent of the Workmen's Institution?—They claim to be a part of the organization.

12,275. There is a workshop in Boston where they employ 25 to 40 men are there not?—They have a small number there when they have work for them.

12,276. Your working home is an institution which has my greatest admiration, but is it not the fact that great efforts have been made in Boston, New York, and other places in America to establish workshops, most of which have failed?—The one in Baltimore was run awhile and given up. One in New York was run awhile and given up, and they are now building a great home where they propose to accommodate 100 inmates.

12,277. At all events is not it the fact that workshops of a somewhat different type to yours have been established in America and that some have failed while some are still in existence?—Yes.

12,278. Returning for a moment to music, you will, I suppose, admit that where the instruction is all that it ought to be the per-centage of success must be very much higher than where the instruction is not what it ought to be?—Certainly.

12,279. Can you give me the per-centage of success following on the tuition in the musical department in the Boston Institution between 1860 and 1869?—No.

12,280. Would you be surprised to learn that they claim so high a per-centage as 75 per cent.?—I would not believe it.

12,281. That appears in Dr. Howes' Report?—I would not believe it if you ask me my opinion.

12,282. You would not be inclined to accept my figures if I showed you that there were more than 50 per cent. of successes?—I would not doubt the truth of your figures if you assured me that they were correct, but when I am asked my opinion I give it. Admitting for a moment that the Boston figures show that they turn out 50 per cent. of successes, I speak of the blind as I have found them from Boston to New Orleans. I have graduates of the Boston School making brooms in my working home to day.

12,283. (*Rev. C. M. Owen.*) You stated that the legislature votes an appropriation to your working home; what would be the sort of representation made by you on which they would vote that appropriation?—At first our deficiency was 6,000 dollars. I went personally before the appropriation committee and made a statement of facts, showing my balance sheet and showing that we had so many men and that they had done so much work and that we wanted so much.

12,284. Was no text of efficiency applied before you got the appropriation?—There is a board of State charity appointed by the legislature, and they must visit State aided institutions periodically and report. I notice in their reports from time to time that they recommend that some institutions should have the grant asked, and in some cases they cut down the amount asked for.

12,285. Before the State gave a grant to your working home was any test of efficiency applied?—Yes; the board of State charity visit the institutions that receive State aid, and they make a written report which is printed, and they visit the institutions periodically, and give the date when they visit, and state what is being done, and how many are present, and so on.

12,286. You suffer from the competition of prisons?—Yes.

12,287. Have any steps been taken to counteract it?—The government has done away with convict labour to a great extent.

12,288. Is the prison competition in mat making more than in anything else?—In all sorts of work which convicts do; work is done by the convicts in some of our gaols.

12,289. To what classes as a rule do the adult blind belong?—I should say 90 per cent. to the very poor classes.

12,290. You said that a large proportion of your men can almost earn their living, and they need only a small supplementary aid; on what principle would you estimate what aid they should have?—It would be governed by our deficiency. We need so much money, and our deficiency is according to the number of men we have and the number of apprentices we have. We encourage every man to work for himself outside.

12,291. The supplementary aid is not given on the application of a test of each man's efficiency?—No, that has nothing with it.

12,292. When your men leave your institution to carry on their work at their own homes how do you keep up your connexion with them individually?—We do not keep up any connexion with them.

12,293. How could State aid be brought to bear upon those who have lost their sight when they are too old to learn a trade to any degree of efficiency?—That would have to be left to pure charity.

12,294. How do you communicate with the blind who are also deaf and dumb?—We have one man who is called deaf and dumb and blind, he is perfectly deaf and perfectly blind but he can talk a little, you can understand him when you get used to him, one can see a little, and we communicate with him by the finger alphabet.

Mr. H. L. Hall.

13 Sept. 1885.

12,295. You say blind children are admitted into schools when they are about six years old, we find in our blind schools that they cannot dress themselves at that age. Do you have sighted labour to help them to wash and dress?—Yes.

12,296. We find it increases the expense if we take them in so young, and therefore we do not admit them till they can wash and dress themselves?—Sometimes when they come at 11 or 22 they are helpless. At one institution there are 65 paid employés. Blind children come to our schools who have parents that have not taught them to dress themselves at the age of six, and the sooner we get them away from such parents the better for the children.

12,297. (*Rev. W. B. Sleight.*) You stated that blind children in every State are entitled to education; is this education compulsory?—No.

12,298. Do you know whether the same is the case with the deaf and dumb children?—I believe it is. I was at a meeting where the representatives of the defective classes made statements; the defective classes are called wards of the State in our country, and I believe they are entitled to education at the expense of the State. I know the blind are, I know the insane are, and I think the deaf and dumb are.

12,299. You say you have 84 inmates in your industrial home; they live in the institution?—Yes.

12,300. You state that they sometimes earn as much as nine dollars a week?—Yes.

12,301. And they require 2½ dollars for their board; what do they do with the balance?—When I said they will earn as much as nine dollars a week I was giving you the outside figure; their earnings do not average that.

12,302. What do they do with the money they earn over and above what is required for their keep?—I have a savings bank, and one old Irishman has a real handsome bank account, and some of them keep their money with their friends; some squander all they can get.

12,303. Will you give us the daily routine of the industrial home?—The bell rings at 6 o'clock, when everybody gets up; they have breakfast at half-past 6, at 7 o'clock the bell rings for work which is carried on till 12; at 12 the bell rings to quit work, at 10 minutes past they have dinner, at 1 o'clock the bell rings to go to work and at 6 o'clock to stop; the bell rings 10 minutes after for supper, then comes our evening prayers, and I have a man whom I hire to read the newspapers to them, and we have books in raised type, and they read among themselves, and they play chequers and chess and dominoes, and some of them play the piano, the organ, and all sorts of musical instruments.

12,304. They spend their evenings in amusements?—We have lectures from time to time, they retire to the smoking room and smoke, and so forth, which they are at perfect liberty to do.

12,305. Is there a library provided in the institution?—In raised type, and in all kinds of type. We have the Bible in Moon's type, and in the Boston letter, and we are also getting it in the point letter.

12,306. (*Mr. Arrol.*) You stated that the population of Pennsylvania is 4,000,000, and that there are 4,000 blind, that is one per 1,000; do you know if the number of blind is increasing or diminishing in the States?—I think diminishing.

12,307. Is Pennsylvania one of the States with the greatest number of blind?—New York has the largest number of blind.

12,308. Suppose the number of blind children of school age in Pennsylvania, that is to say, between the ages of 6 and 15, to be 300, how many are attending school?—I should think about 110 or 115.

12,309. How is it that the grant which the Government gives on each child does not induce the blind institutions to get at those children?—The school has been full to overflowing for years; they have hitherto received adults, and they have a home department. The home department is gradually being done away with, and the adults are being gradually done away with, so that there will be more room. Now the idea seems to be in our State, that the adults should come to me, that will leave more room for children in the institution; and they are building another institution in our State, somebody having left a legacy of 20,000 dollars for a blind school. I understand they propose to ask the legislature for an appropriation, and that will also be an opening for them.

12,310. Do you not suppose that it would be better for the blind to be educated along with the sighted if there were the appliances necessary; do not you think that mixing the blind with the sighted in an ordinary school gives the blind greater self-reliance, and more aptitude to mix with the world?—A great many people on the other side are advocating the blind being educated with their sighted brothers.

12,311. As to apprentices who are learning trades in your working home, are their friends called on to pay anything for their board?—No; on the contrary, if there were two parties making application and one had no friends and no money at all, and the other was willing to pay any amount you might ask, the one with no friends would be taken in preference to the other.

12,312. You said that there were six of the 134 that you send material to; can you give the Commission any information as to their success?—They are old brush makers that did not learn their trade at my institution, they had learnt their trade at the other institution. As I have stated, we have never taught brush making and never shall probably, and we only carry it on in order to furnish work to these old outside people who cannot do anything else When they die and drop out that trade will probably cease with us.

12,313. I gathered from what you said when you were asked about pensions that you are generally disposed to discountenance pensions or doles, perhaps your view in that respect is founded upon what you have told us with regard to the distribution of the charity in New York, you said that in New York a blind person who wanted to receive a share of the charity had to go to the oculist and receive a certificate, but if in addition to that a certificate were required to show that the man's character was good you would probably not see so much objection to a blind man receiving such assistance, seeing how he is handicapped compared with a seeing person?—The certificate of the oculist simply vouches for the man's being blind beyond recovery, as to character I could not object to giving an old worthy man or woman 38 dollars, but taking the recipients of that charity as a class I know that a good many of them are intemperate. As a principle the giving of charity in that way tends to pauperise the recipients. One case will illustrate what I mean, I knew a strong young fellow who had some little proficiency in literature and music and I found him begging in the street with a big card round his deck. I said to him "would not you like to come into my institution and go to work"? He answered "No." I said "Surely that would be more respectable," but his answer was "I prefer begging. I make more money at it." I could not coax him there. After a man's self respect is gone you cannot get him back to an industrious life.

12,314. If they are of proper character do not you think it would be advisable to give them some assistance to enable them to cope with the disadvantages they are labouring under?—Circumstances alter cases. I am speaking as a rule. If you take any considerable number of blind, or sighted men either, in any community and you commence giving those men money without their earning it, what do you do? You ruin them, in my judgment. Instead of distributing money in that way I would build a factory and give those men a chance to earn 300 dollars instead of 38, and the men would be all the better for it and the country would reap the advantage of it also.

12,315. (*Chairman.*) Has your institution received any circular from Dr. Campbell asking you to give information with regard to your institution for the benefit of this Commission?—If I received such a circular I must have mislaid it.

12,316. Do you think if a paper of questions was sent round by this Commission to the different institutions in the United States, the managers of those institutions would be willing to furnish replies to those questions for the use of this Commission?—Yes, I think they would.

The witness withdrew.

Adjourned.

32, Abingdon Street, Westminster.

Thursday, 4th November 1886.

PRESENT:

THE RIGHT HON. THE LORD EGERTON OF TATTON IN THE CHAIR.

W. TINDAL ROBERTSON, ESQ., M.D.
B. ST. JOHN ACKERS, ESQ.
T. R. ARMITAGE, ESQ., M.D.
W. AUCHINCLOSS ARROL, ESQ.
F. J. CAMPBELL, ESQ., LL.D.
E. C. JOHNSON, ESQ.
THE REV. W. BLOMEFIELD SLEIGHT, M.A.
CHARLES FEW, ESQ.
THE REV. CHARLES MANSFIELD OWEN.
CHARLES E. D. BLACK, ESQ., *Secretary*.

Mr. JAMES MCCORMICK examined.

Mr. J. McCormick. 4 Nov. 1886.

12,317. (*Chairman.*) You are master of Henshaw's Blind School, at Old Trafford, near Manchester?—Yes.

12,318. How long have you been connected with that Institution?—Ten years.

12,319. Have you also the management of the out-door department of the Institution?—No.

12,320. The evidence you will give will have reference to the Educational Department?—Yes, but I can give the Commission some particulars of the out-door department.

12,321. You can speak more particularly with reference to the Educational Department than as to the Industrial Department?—More particularly with reference to the education and the training for the workshops.

12,322. Industrial training is not carried on in Henshaw's Blind School, except to a limited extent?—Only to the extent of preparing pupils for the workshops; they are all pupils, whether they are old or young, at Old Trafford.

12,323 When we visited your school, you said that you thought that it might be desirable to lower the age of admission to the school; have any steps been taken, by applying to the Charity Commissioners or to the Court of Chancery, to get the age lowered?—Not yet; my Board have not come to any determination upon that point.

12,324. But you think it desirable that the limit of age should be relaxed?—I do.

12,325. And that the education of blind children should begin as early as possible?—Yes.

12,326. Would you say at six years of age?—Quite as early as six years of age, because they are so apt to get into bad habits at home.

12,327. Do you think it would be possible that blind children could be taught in the ordinary board schools?—I do not think it possible, unless they could be congregated in sufficient numbers to admit of the board schools employing teachers specially for them. Unless the teacher could devote a great deal of attention to the education of the blind children, I should think it would be almost impossible for blind children to be taught in an ordinary board school.

12,328. Do you think there would always be a great number of blind children who from physical infirmity would not be able to go into an ordinary board school?—I should think that those that would be unable on account of physical infirmity to go into board schools would be ineligible for admittance into our institution.

12,329. Do you refuse any who are delicate, that is to say, any who require care?—If they are suffering from any sickness that requires constant nursing, we do not take them. We do not take any who are subject to fits, for instance, or those who are imbecile.

12,330. Is there any medical examination before you admit children into your institution?—Yes. They are examined by their own medical man, and his certificate is sent to my board.

12,331. With regard to instruction in music, I see from your published regulations that the music master attends from 9 o'clock a.m. to 12.30 p.m., and from 2 p.m. to 5 p.m. every day; has that always been so?—No.

12,332. When was the change made?—Three or four years ago. The music master wanted more money, but the Board gave him time instead, so that he only came half a day for about two years; then we found it necessary that he should give us more of his time, and since then he has given the time named in the regulations.

12,333. During the time that he only attended half the day, did the musical education fall off?—We had not so many pupils; we had altogether about 80 then, whereas in the last four or five years we have gradually increased up to 150.

12,334. Have any of your pupils gone to Norwood?—Yes.

12,335. How many have gone to Norwood?—I think six altogether. We have only sent three direct from our institution.

12,336. Do you think music is the best possible means of employment for the blind?—No.

12,337. Perhaps you will be good enough to give the Commission your reasons for that opinion?—First of all, I think it is not advisable to teach so much music in our schools, because so few of the children possess sufficient ability and energy to make anything of it. A good many of them have ability, but they have not energy enough to follow it up. Then, again, after they are educated, the difficulty is in their procuring employment.

12,338. Do you know of your own knowledge cases in which they have failed to obtain employment in music?—I know that they cannot get a living at it.

12,339. Do you know cases where blind persons who have had a good musical training have tried to get a living by music, and being unable to do so, have fallen back upon industrial employment?—No; I think they continue at music in some shape or other, either in the streets or in public-houses. I do not think they go to trade.

12,340. You think that for the general mass of the blind industrial employment is the best?—I think for the general mass it is the best employment, certainly.

12,341. Have you ever turned out any good scholars in general literature from your institution?—Those who have shown themselves proficient in general literature we are employing ourselves.

12,342. As teachers?—As teachers. I think there are greater openings for the blind in literary occupations than in music.

12,343. What literary occupations do you consider are specially fitted for the blind?—They could be employed as scripture readers, and also as readers to the blind who are engaged in daily occupations in their workshops, and if they have sufficient ability and energy, there is the Church and the Law open to them.

12,344. You think, in fact, that they should be trained to undertake the occupations of seeing people as much as possible?—Yes, I think they should be educated on the lines of the education of seeing people as far as possible, and be fitted for the occupations which they would have been fitted for if they had their sight.

12,345. Would not intercourse with children of their own age in seeing schools be the best way of fitting them for those occupations rather than putting them in a special institution?—I do not think so.

12,346. Do not you find that blind children are rather, so to speak, at sea when turned out into the world from a blind institution?—No; I may say that the blind do not like to work with seeing people in workshops; they prefer working by themselves.

Mr. J. McCormick. 4 Nov. 1886.

12,347. Is that because they think the seeing workmen are taking the bread out of their mouths?—I do not know that it is entirely that; they think, perhaps, they are taking advantage of them in some respects.

12,348. What number of those whom you educate industrially in your school pass to the out-door institution in Bloom Street, Salford, and earn a livelihood for themselves?—We have 44 people learning basket-making in our basket shops.

12,349. Do you follow the career of those who go and work outside either for themselves or in the adult workshop that you have in Bloom Street?—We do so as much as we can, but we find great difficulty in doing it.

12,350. Do you think there is a want of thoroughness in the education of the boys in handicraft? Do they remain sufficiently long with you to become good workmen?—No, that is the great difficulty that we have to contend with. As soon as a youth has been in the workshop, say, a year or two, and is able to make a bottom of a basket pretty fairly, his friends begin to think he is bringing an immense amount of money to the institution which they think should go into their own exchequer, and they bring that to bear upon the lad, and of course the lad has the same desire as a seeing lad to get from under control if he possibly can, and he goes away; and the consequence is that he is an inefficient workman, and cannot get his living.

12,351. What is the average age at which they leave you?—They do not as a rule remain more than two years in the workshops. Of 130 pupils in the Blind Asylum, between 1876 and 1886, 22 were in the institution six months, 24 were in one year, 30 were in two years, 17 were in three years, 12 were in four years, five were in five years, four were in six years, eight were in seven years, one was in eight years, four were in nine years, two were in for 10 years, and one for 37 years. The one who was in for 37 years was a basket maker. He was 37 years on the old asylum foundation; that is still in existence. The difficulty that we experience in keeping the pupils with us arises from the expense to which the parents are put. Say their child comes in at nine years of age, and he is at school till he is 16, and he then goes into the workshop for another six or seven years, they find it a long time to be bearing the expenses of that child. That is the cause of their trying so much to get him away from us.

12,352. What happens to him after they take him away?—I fear he is not an efficient workman, and he fails to get a living.

12,353. Parents, by experience, have not found that out?—No. Last year I had occasion to write to the secretary of Gardners' Trust, and I brought this point before him with this result, that they have given to my Board so much a year, on purpose to retain these young fellows a longer time.

12,354. In order to relieve the parents from the payment?—Yes, so as to induce the young men to remain.

12,355. (*Mr. Johnson.*) A sort of scholarship, in fact?—They call the grants helps in aid.

12,356. (*Chairman.*) They are of the nature of maintenance grants?—Something of that sort.

12,357. In your rules I see that the music master is to determine the propriety of admitting to or excluding any of the inmates from the practice of music; can you tell the Commission what is the number selected for tuition and practice in music out of your average number of inmates?—Some may fail on the first trial or the second trial, then some are put on as probationers, and from those probationers are selected the permanent ones.

12,358. How many have you now under instruction in music?—33.

12,359. Do you think it would be desirable in large towns to establish and support workshops in which the blind could practice their handicraft trades?—Decidedly, I think it is one of the things required more than almost anything else.

12,360. Do you find that your out-door department is successful?—It is successful so far as the place will allow; it is a very poor place. I do not see any reason why it should not be a success. The blind cannot compete with the seeing world. A great many basket makers will not employ them, and under the Trades Union Laws seeing workmen will not work in the shops with them; then if they get work they cannot do it at home. Everything is against them; they have to buy the material at a loss, and so on.

12,361. You think what is most wanted for the improvement of the condition of the blind after they leave school is that there should be some place where work should be found for them, and where they should be able to work with materials supplied to them at the cheapest rate?—With materials found for them, and where they could work on piece-work

12,362. Under some management which would provide the raw material to the blind workmen at the cheapest cost?—No; the place should find the material and employ the workmen and then take the produce and sell it. It should not sell the material to the workmen but should employ the workmen to work up the material and then sell the articles produced.

12,363. Would you think it necessary that the wages of the workmen should be subsidised?—No.

12,364. You would give them exactly what they earned?—I would give them exactly what they earned. We do not give any subsidy at all. What I think should be done in the case of the blind, so as to put them more nearly on equal terms with seeing people is that they should work longer hours than seeing workmen. If seeing men worked eight hours they should work 10 hours. That is what our men are doing now at their own request.

12,365. Are they under the control of the Trades Union in that respect?—No, the Trades Union cannot interfere with us. We can do what we like. By working longer hours they are able to earn good wages.

12,366. Do you think it is desirable to have boarding houses connected with these workshops?—Yes, for young men. I do not mean for married men.

12,367. Married men would live outside?—Yes; but there should be boarding houses either in the same establishment or somewhere near, so that young men would have somewhere where they could board and lodge by payment.

12,368. Some place that would be a home for them when they left the educational institution?—Yes, they would have somewhere to go. In large places like Manchester it is very bad for them not to know where to go.

12,369. Do you think that in the technical instruction of the blind there is a want of some guide book specially for the blind?—Yes. There is what we know by the name of a trade book among the seeing workmen, but it is not a good one; and each county has its own trade book. What is wanted is a good one in Braille. In fact we are writing out one in Braille ourselves—the workmen are writing it out at nights—they spend one hour in the evening writing it out. If it could be published in Braille it would be a great advantage.

12,370. Is there a guide book also wanted for the instruction of the blind as music teachers and tuners?—There is for the earlier stages of instruction on piano and organ.

12,371. Is there any deficiency in the school books and apparatus for educational purposes?—We want a larger supply.

12,372. Who is to give it?—I do not know. I think Dr. Armitage ought to be relieved now. He has done a great deal, and it is a great expense, and will be greater. We want more school books and apparatus than he ought to be called on to provide.

12,373. Where are the funds to come from?—That I must leave to somebody else to say. I understand that educational books for seeing people are published at the expense of the State.

12,374. Do you think that the State should give a grant for these blind schools?—Yes; because the books for the blind are so very expensive. Take the Bible as an instance. In Braille it costs 5*l.* (that is the cheapest Bible for the blind that we have; in Moon it costs 10*l.*) If you get a class of 12 the expense would be 60*l.* In a seeing school you would get the 12 Bibles for 10*s.*

12,375. It does not cost 5*l.* to print a Bible in Braille, does it?—That is what you have to pay for it. If you take Moon's type it costs 10*l.* Braille's is 5*l.*, and you buy a Bible for a seeing school for 10*d.* That gives you a very fair idea of the cost of our work.

Mr. J. McCormick.

4 Nov. 1886.

12,376. Have you ever applied to the Bible Society for Bibles?—Yes, we have applied to the Bible Society, but with no effect so far as the Henshaw Institution is concerned. We had some from them for some time, on the application of our chaplain for presentation to all blind persons who were leaving our institution, but they stopped it some time ago because we were rich, and they said we did not need it.

12,377. Do you think that the type for the blind should be limited to Braille and Moon?—Braille and Moon, certainly. I think by-and-bye we may almost entirely come to Braille. I think as our young children become educated in Braille they will retain the touch. We have not a large experience at present, but what experience we have is tending that way. Several of my pupils who were taught Braille ten years ago, and who have gone into the workshop, have not lost the touch after working for two or three years; but for the aged blind, Moon's is very useful.

12,378. Do you think that education for the blind should be as compulsory as for other children?—Yes.

12,379. You think that the blind should receive in some way or other a grant from the State for their education?—Yes. They get into such a bad state at home, and at present if the school board officer goes into a house where there are any blind, he leaves them there as he would a chair or a table, and he does not make any more inquiry about them.

12,380. I suppose your institution would have no objection to inspection by the Government in such a case?—It ought not to have; but that, of course, would be a matter for the board.

12,381. You have no reason to suppose that they would object?—I do not think they would object.

12,382. (*Dr. Tindal Robertson.*) You said you did not think that blind children could be taught equally well with sighted children in schools in which sighted children were. But supposing that blind children can be taught fairly well in schools with sighted children, do you still think that it would be advisable that there should be certain places where blind children could live under one roof, and could be kept together, instead of going to a dirty home after receiving instruction in a board school?—I think so. I think the children would succeed better in boarding institutions.

12,383. In that case you would let them be taught with sighted children, and simply boarded in those institutions?—I think their education would progress better if they were educated alone away from sighted children.

12,384. I am supposing it were proved to the Commission that they could be educated satisfactorily with sighted children, in that case you still think it would be an advantage that they should live under superintendence in boarding houses?—I do not know about that; if they were taught with sighted children in board schools near their own homes, I think the children should be left at home.

12,385. You were asked about inspection, I suppose you would take it for granted that if you had a Government grant it would be necessary to have Government inspection?—Quite so, if we took the grant we should expect the inspection.

12,386. With regard to the places where these depôts that you were speaking of should be established, do you think that they should be established in all the large districts of England?—I think they should be established in all large places where there are any large numbers of blind.

12,387. Do you mean in every large town, or that there should be a certain centre for each district?—I think they should be in every town where there are any number of blind people, say 20 or 30 blind people, who could go to work at those places; there ought to be some places where they could go and work.

12,388. In what way should they be managed?—In the same way as our workshops are now managed, by different societies who would take them up.

12,389. By a committee of charitable people in the district who took an interest in the matter?—Yes.

12,390. Do you think that any grants should be made to them by the State?—I think that they ought to be self-supporting after the buildings were established; if a grant could be made towards the building, then, I think, the institutions ought to be self-supporting.

12,391. When you talked about State aid, did you mean Imperial aid, or simply aid from the local rates?—I meant State aid.

12,392. You would have the buildings erected by Imperial funds?—Yes, or a grant made to assist in erecting the buildings. If the State would do it, so much the better.

12,393. (*Rev. W. Blomefield Sleight.*) Are any children admitted free into your institution?—No.

12,394. Why is it that some are retained for as short a time as six months?—They leave of their own accord. They are taken away by their friends at the vacations at Midsummer and Christmas. Some of those who go away for the holidays do not return, and though I write to inquire, I cannot get at the reason why they do not come back. Some make one excuse, and some another.

12,395. Are they removed from the institution because their friends are not able to find the means to keep them in it?—No; they are not sent back in most cases, because they are not considered sufficiently talented for music. That is the chief reason.

12,396. Of those who have left the institution, and who follow the profession of music, can you tell us whether many are doing well or are able to earn their own living?—The 18 who have gone out of the institution since 1868 have been earning the whole or a portion of their livelihood as music teachers.

12,397. You said that you would give no subsidies to workshops; what is to be done with those who are not able to earn enough money to keep themselves?—I would prefer paying them so much a week not to do anything.

12,398. You would not employ them in piece-work?—No, I would keep those who were not able to earn a sufficient living to keep themselves, those who were not able to earn 10*s.* a week, say, or who were not able to do any work that was saleable, and only spoiled what they attempted to do. I think that a subsidy tends to pauperise; it takes away the self-reliance of the blind.

12,399. Do you think that the blind generally would be willing to work the longer time than you spoke of. We found some cases where they not only came very irregularly, but where they apparently worked short hours?—In the case of the blind people working in our workshop, it was their suggestion that they should be allowed to work longer hours.

12,400. Would you have boarding houses for young women as well as for young men?—Yes, if they are working in out-shops.

12,401. (*Mr. Few.*) Is it your opinion that blind boys should be continuously maintained in boarding houses, although they were earning nothing?—They should get a living somewhere. There is the workhouse for those who are not able to get a living.

12,402. You would not keep them if they earned nothing?—As I say, I think those who are not capable of earning 10*s.* a week are not capable of doing any kind of work that would be profitable to the institution; they would be only spoiling the work. Therefore they would be adding to the expense of the institution by the destruction of the material.

12,403. I rather gathered from a previous answer of yours that you proposed to keep them?—I said I would prefer paying them a certain amount of money merely to keep them from work, so that they should not come to work at all.

12,404. Would not that be a sort of premium to those who were lazy?—It might have a tendency that way. I only threw it out as a suggestion. I would rather not have them in the shop. We have had several instances in which people, on the withdrawal of a supplement to their earnings, have got good wages. One, for example, had his earnings supplemented for some time, because he did not make 10*s.* a week, and at last the Board decided not to supplement his earnings any longer, and he then made 12*s.* or 14*s.* a week very quickly.

12,405. At what age do you put a child first into the workshop?—16.

12,406. What is your reason for waiting so long?—To enable his literary education to be completed. We do not get them until they are nine years old.

12,407. Could not a child of nine or ten years of age do an hour or two hours' work every day?—In my experience it is better not to put a child to industrial training too early, but to treat a child as a child as long as he is a child, and then when he becomes a man put him to work; they make better scholars by not being put to work too early, and the better scholars they are the better men they are in the workshop.

12,408. Does not that work rather hardly upon poor parents who want to see their child earning something for the bread and cheese at home?—I do not think it does in the long run, because the child becomes a better workman hereafter.

12,409. (*Mr. B. St. John Ackers.*) Do you keep up a knowledge of those who have left your institution?—As far as I can I do.

12,410. About what proportion of them have you any knowledge of?—From 1876 to 1886, out of 130 there are 27 that I cannot account for.

12,411. You know what the others are doing?—I know what has become of them.

12,412. You spoke of all those who are at Old Trafford being pupils, you do not call those who are upon the old asylum foundation pupils, do you?—They are all called pupils.

12,413. Even those women who are there for life?—Yes.

12,414. What was your own previous occupation before you came to Manchester?—Immediately before I came there I was master of a workhouse, and for 20 years I was a national schoolmaster.

12,415. Had you any previous special knowledge of the blind?—No.

12,416. Is there any association of blind workmen in Lancashire?—I think so.

12,417. Do you know where their headquarters are?—At Oldham. I do not know anything about it. I think our men are in it.

12,418. You think that those who are working for you at Salford are in that association?—Yes; it is a mutual benefit society formed amongst the men.

12,419. Do you know whether it in any way regulates the hours of work, and so on?—So far as I understand it has nothing to do with their work; it is simply a benefit society, so far as I know.

12,420. Is it limited to blind persons?—I think so.

12,421. Why do not you apprentice your children when they leave school and enter the workshops, if you find they leave so soon?—The board have never brought themselves to think that it was necessary to do so, or that any benefit would be gained thereby.

12,422. Has it never been tried?—It has never been tried.

12,423. And yet at the same time you say that a very large number leave at present before they become skilled workmen?—Yes, the majority.

12,424. You said that in your opinion it would be desirable that the State should grant a subsidy for the purpose of providing books for the blind, as they do for seeing children; can you tell us in what way that grant for books for seeing children is given?—I do not know positively whether there is such a grant or not now, but I thought there was such a grant. We used to be able to get Government books through the Education Department, but I do not know whether that is going on still or not. I am speaking of national schools. When I was master of a national school we used to be able to get books at reduced cost.

12,425. You stated that in your opinion it is probable that Braille will eventually be universal, and that all blind workmen will have been taught it in school at an early age?—Yes.

12,426. That does not apply to those blind men of which there are a large number who have lost their sight in after life?—If they are young men under 30 they will learn Braille as quickly as Moon. We have an evening school for our men who have become blind in after life, and those men learn Braille in preference to Moon. They pick it up very quickly.

12,427. If any subsidy were granted by the Government for books, would you suggest that it should be for books in any one system or that it should be divided between two or more systems?—I should not like to shut Moon out.

Mr. J. McCormick.

4 Nov. 1886.

12,428. (*Mr. Arrol.*) In answer to a question put to you by the Chairman, you said that you had a medical examination of all the pupils before they entered the school; does the medical man who makes that examination give any advice in each case as to the adoption of means to ameliorate the blindness?—In the first instance, for the election we have a set of questions that are to be answered by a medical man who knows the child, then he is examined by our own oculist to see whether he is a fit subject for the institution.

12,429. Does he examine the child with a view to see if it is possible to do something for the amelioration of its blindness?—Yes, he takes a great interest in it.

12,430. By the regulations by which your school is governed, is it necessary that the parents of a candidate or the guardians should come under some obligation to continue to pay a certain amount as long as the child is in the institution?—Yes.

12,431. What rate may the parents have to pay?—We take them at as low a rate as 3*s.* a week.

12,432. What do the guardians pay?—6*s.* We only charge the unions in Manchester and in the neighbourhood 4*s.* a week; that is to say, the Manchester union, the Salford union, the Chorlton union, and the Oldham union. We take children from Oldham because we consider the charity belongs to Oldham.

12,433. You say experience causes you to believe that it is a mistake to train all the pupils in music, and prior to their coming under a special course of training you have them thoroughly examined. Those 33 that you mentioned are in the meantime studying?—Yes.

12,434. Do you expect that they will become proficient?—Yes, they are all doing well at present; of course they may fall off; some of them are very young, and they may fall away and not be able to follow it up, but we expect they will turn out successes.

12,435. Have you any assurance that the guardians or the parents will continue them at the institution so long as they require musical training?—No; we do not find the same difficulty with regard to musical training as we do with the workshops; parents are more ready to contribute towards education in music than for industrial training.

12,436. They are more ready to continue the payment for the child who is being taught music?—Yes.

12,437. Do you certificate the pupils when they leave your institution?—No.

12,438. You have a workshop in connexion with your institution?—Yes.

12,439. What wages do you pay those who work in the workshop?—There are two departments of our institution, one is out-door and the other is in-door; mine is the school where we teach trades; we do not pay those who work in that school any wages, we put against the work of each worker what he would get for the work as a journeyman, and then at the end of each half year we give them 2*d.* per shilling on what their earnings would have been.

12,440. You give them that as a bounty?—Yes.

12,441. You said that rather than subsidise the wages of the blind you would increase their hours of labour?—Yes.

12,442. In the case of the inmates of your institution, which is a charitable one, do you not consider that rather a hardship?—No, our men work the extra hours voluntarily.

12,443. (*Rev. C. Mansfield Owen.*) You said just now that you thought Braille would become practically the universal system; do not you think it advisable that blind persons should be furnished with the means of communicating easily with sighted people?—I do not think that is necessary, because Braille is so easily learnt that a great number of the children's acquaintances learn it and correspond with them in it.

12,444. That may be the case with the friends of the child, but take the case of a blind person wanting to communicate with an ordinary tradesman, for instance?—In those cases they would get their writing done for them. One of my teachers, named Godwin, who became blind after he was 21, and who had been well educated up to that time, writes scarcely anything but in Braille.

12,445. He has practically given up the old system for Braille?—Yes, and all his friends learn Braille.

Mr. J. McCormick.

4 Nov. 1886.

12,446. (*Chairman.*) Would you know that that was written by a blind person (*handing a letter to the witness*)?—Yes, I should judge so, with a wire frame, I should think.

12,447. It is well written, is it not?—Very well, but that person would have learnt to write, I should say, before he is blind. As a rule, our blind do not know the alphabet. The only alphabet we bring before the blind in the seeing type is the Worcester one, and they would not be able to write in that to any advantage.

12,448. That is written by a person who was born blind (*handing another letter to the witness*)?—That is written very nicely.

12,449. (*Rev. C. Mansfield Owen.*) Is not it an advantage to a blind person to be able to write like that?—A great advantage; to enable a blind person to do this you would have to teach him the seeing type.

12,450. (*Mr. Johnson.*) As we are on the question of type, I will ask you this question, do not you think it is a desirable thing that the blind should be so educated as to approach as near as possible to the sighted?—Yes.

12,451. And do you not think, admitting all the advantages of Braille for educational purposes, that it would be a very desirable thing to teach the blind to write in the same characters as the seeing, as an adjunct to their education?—Yes, it would, if you had time to do it; it would take a great deal of time.

12,452. We have evidence before us that it does not take a very long time to instruct blind people, even those who are proficient in Braille, in writing the ordinary writing of the seeing. Would not it be an advantage if such a system could be taught, not in opposition to Braille, but as an adjunct to the education of the blind?—Yes, if there was time for it; my experience in my own institution leads me to say that there would not be time for it.

12,453. Suppose you could make time for it, would not it be a desirable thing?—Decidedly.

12,454. I see that since 1868 you have turned out 18 pupils from the institution who have been instructed in music?—Yes.

12,455. That is about one a year?—Yes.

12,456. Can you give the Commission any information with regard to what those 18 are now doing?—They are doing pretty well, as a rule. I should think not one of them is earning less than 1*l.* a week.

12,457. Do you know a person of the name of Woodhall, who was formerly in your school?—Yes.

12,458. What is he making a week now?—He told me himself that he was making about 12*s.* a week on the average.

12,459. That is one of your musical pupils?—Yes. I do not think we ought to claim him at all. I do not think he is getting his 12*s.* a week from anything that we taught him. He went to Norwood, and learnt tuning there. It is at tuning that he is getting 12*s.* a week.

12,460. Do you think that a fair remuneration for the education that he got either at your school or at Norwood?—No, I do not; but that is what he tells me he is earning.

12,461. Then there is another man of the name of Stewart, who was in your school?—I do not know him.

12,462. Do not you know that there was a pupil of that name educated in your school?—Not in my time.

12,463. We understood that he had been taught there, that he was living in Edinburgh, and that up to the present time he was not earning very much?—I do not remember the name in my time.

12,464. Do you know another pupil of yours of the name of Hollund?—He was at York.

12,465. You say you do not think music is a very good occupation for the blind on account of the want of energy in those who learn it, and because, when they have learnt it, there is a difficulty in their getting employment; can you give the Commission any instances of people trained in your institution who have not succeeded or who have succeeded in music?—No; because if they have not sufficient ability and energy to carry on their work as music pupils they fall back into the trades, or else leave us.

12,466. What I wanted to get from you is whether you have any account of those 18 who were instructed in music between 1868 and 1886?—Yes, we know what they are doing.

12,467. What is about the average that they earn?—I should not like to say that they earn more than 15*s.* a week on the average.

12,468. Do you know of any of them that earn more?—Yes, I know one, for instance, who is earning his 150*l.* or 200*l.* a year. Since he left us he has taken his musical degree.

12,469. Since he left you has he been to any other institution at which he has received any musical instruction?—No.

12,470. He was not at Norwood?—No.

12,471. Does he teach, or is he an organist?—He teaches and plays; he is at Wigan.

12,472. What is his name?—I forget his name.

12,473. (*Chairman.*) Is he employed as an organist?—Yes, either at a church or at a chapel.

12,474. (*Mr. Johnson.*) Do you remember a man of the name of Turner?—Yes.

12,475. Was he trained in your school?—Partly.

12,476. What is he doing now?—He left us to go to Norwood.

12,477. Is he a successful musician?—I think so.

12,478. Have you any evidence to show us that the blind do not like to work with the seeing?—Only the expressions of dislike on the part of my own people.

12,479. The blind dislike to work with the seeing?—Yes; and then in Manchester, when trade was good and they were working under the Trades Union laws, they were not allowed to work in seeing shops.

12,480. The blind would rather work among themselves than work with the seeing?—Much rather.

12,481. I see in your balance sheet for 1885, which is the last one we have had given us, the balance of loss for the half year on the outdoor workshop department was 105*l.*, so that we may take that at 210*l.* for the year?—Yes, that includes management and rent and taxes.

12,482. Does it include any loss upon the accumulated work?—Yes, if there is any.

12,483. Supplying these blind people with all these appliances, providing places where they can work, and supervision and material, do you believe that the workmen in that outdoor department can live upon the wages which you pay them?—Yes.

12,484. What is the average of those wages?—For the week ending October the 29th the average wages were 14*s.*

12,485. That is the basket-making shop?—That is the outdoor shop; the lowest wages earned that week were 12*s.*, and the highest 21*s.* 6*d.*

12,486. The average being 14*s.*?—Yes; one man who is deaf as well as blind earned 15*s.* 9*d.* that week. We do not pay exactly the same as they are paying outside. We are paying now 10 per cent. above the trade prices. On account of the depression, masters in seeing shops and paying on a reduced scale.

12,487. Do the workmen in the outdoor workshops get any subsidy?—No.

12,488. Do you employ only skilled workmen?—That is our rule, to employ only skilled workmen. If other than skilled workmen were employed in the workshops my school would be destroyed, because, if those in my school knew that they could get into the workshop and earn 2*s.* or 3*s.* a week, they would not stop long enough with me to become efficient workmen.

12,489. I find you manufacture potato hampers very largely?—Yes.

12,490. Is there much profit upon that work?—Not a great deal; a man can get a good living out of it, but since trade has been so very bad it has not been so profitable. The workmen at Warrington have reduced their prices so low that there is scarcely any profit to be got upon it.

12,491. Do you employ any of your pupils in making those potato hampers?—Yes.

12,492. You do not pay them wages?—No.

12,493. You produce them cheaply in one institution, and you debit them to the other?—No, the two institutions are kept quite distinct. A good many bad ones are made by the pupils, and I sell them at the best price I can get.

12,494. If you could make any good ones you would sell them to the trade department?—No, we should sell them ourselves; the accounts are kept quite distinct.

12,495. We were very much struck with the gymnasium at your institution. I should like to know if you could tell the Commission what was the expense of erecting and furnishing that gymnasium, and also what you pay your gymnastic instructor?—That building, with the workshop below it altogether cost us 2,000*l.*, the contract for fitting up the gymnasium was 170*l.*, it cost us more than that, say, 200*l.*; we pay the teacher 30*s.* a week; he is with us from 2 o'clock to 8 every day, except Saturday.

12,496. Does this man who is paid 30*s.* a week instruct the girls in gymnastics, as well as the boys?—Yes.

12,497. You have no boarding houses in connexion with your workshops?—No, our workshops are only just established.

12,498. Do you think that your Board would be disposed to entertain the question of the desirability of having boarding houses connected with them?—Yes, I think so.

12,499. What do you think is the average cost per pupil in your institution?—I think last year it was about 11*s.* a week, the whole cost of everything.

12,500. And you have 153 pupils now?—Yes.

12,501. I find last year your subscriptions were only 111*l.*, while the interest on your funded property was 2,225*l.*, and your expenditure was 5,976*l.*; do you find that your subscriptions have fallen off?—No, I do not think they have; if our subscriptions were larger the two years preceding it was on account of subscriptions being paid specially for the establishment of workshops; gentlemen undertook to give 50*l.* a year for three years.

Mr. J. McCormick.

4 Nov. 1886.

12,502. You are almost an endowed institution. You have only 111*l.* that you get by subscriptions?—I think there is rather an increase on our subscriptions. We have great difficulty in getting anybody to give us anything, because when we ask them to give us a subscription they say we are rich. We are poor at the end of it. We want 500*l.* a year more than we have got.

12,503. (*Mr. St. John Ackers.*) When you say the cost of a pupil is 11*s.* a week, do you spread the cost over 52 weeks, or 52 weeks less the time that they are away on their holidays?—The cost is reckoned on 52 weeks. We do not ask them to go away. We give six weeks at Midsummer and three weeks at Christmas, and those who like can go away for that time.

12,504. The average cost per pupil is 11*s.* per week for 52 weeks, though they may only remain in the institution 43 weeks?—Yes, we never get fewer than 30 stopping during the holidays, and some of those remaining in the holidays we send away to the sea side or country.

12,505. (*Mr. Johnson.*) There is no balance sheet with regard to the chapel?—The chapel belongs to two institutions—our institution and a deaf and dumb institution.

12,506. Does each institution pay *pro rata* the expenses of the chapel?—No, the chaplain is supported by the pew rents from the congregation, and we have the galleries.

12,507. You have one gallery and the other institution has the other gallery?—Yes.

12,508. (*Chairman.*) Does the chaplain give spiritual instruction to the inmates of the blind asylum?—Yes, and the deaf and dumb. He comes at least once a week to each institution.

12,509. What other religious instruction is given in the education of the blind?—Two and a half hours in school per week and two hours one evening in the week to adults, and there are Sunday classes.

The witness withdrew.

Mr. William Davis Hall examined.

Mr. W. D. Hall.

12,510. (*Chairman.*) You are teacher of music and organist at the Hardman Street School for the Indigent Blind, in Liverpool?—Yes.

12,511. How many years have you been there?—16 years last May.

12,512. Have you always given your whole time to it?—No, I am only occupied at the school two hours every day.

12,513. Do you teach all the children music?—Not personally; I have two assistants, one who is always one of my blind pupils, and another an outsider, a young lady, who comes two afternoons a week.

12,514. Does that represent the number of hours in which instruction is given in music?—It does not represent the number of hours during which instruction in music is given.

12,515. Will you tell us the number of hours per week that you and your assistants are engaged in teaching music in the institution?—I am engaged in teaching music two hours every day, and the lady who comes is employed there for three hours on two afternoons a week. Then my other assistant is occupied also two whole afternoons a week in teaching the junior pupils; that is the blind assistant.

12,516. If you find that your pupils have no taste for music, do you still go on teaching them?—No, not if we find they have no talent for it. We discontinue teaching them.

12,517. Out of the whole number of pupils how many are taught music?—I should think on an average about 40.

12,518. Out of what number?—Out of a little over 100 in the school now. There is room, I believe, for 120 in the institution. Of course the number of pupils that we have studying music will vary very much according to the condition and character of the pupils in the school; at times we have a greater number of young pupils in the school, and at other times we have a greater number of adults.

12,519. What number of adult pupils have you?—I could not tell you. I think the report gives their ages.

12,520. I have in my notes that there are three men and eight women who know and write music in Braille, would that be so?—There would be more than that. Many who would be able to write and read Braille have not done so for very long, because we have not had any very stringent rule as to the use of Braille. I have for several years requested in my annual report authority from my committee to make the study of Braille notation compulsory upon the music-pupils, but I have never received that authority yet. I have simply to act on my own individual wishes in the matter.

12,521. I gathered that they did not all write music in Braille?—Certainly, not all.

12,522. But you think it desirable that all should be taught to write Braille?—I think that every blind person ought to be taught Braille; I think it is the most useful thing that they could be taught, affording, as it does, facilities for assistance in education which nothing else can do—greater facilities certainly.

12,523. Your pupils do not go to hear music outside the institution, do they?—Yes, they do occasionally.

12,524. How often?—They are going now to hear all the Hallé concerts; they have been taken occasionally to the Philharmonic concerts. For their going to the Hallé concerts they are probably indebted to your visit.

12,525. It has not been always the case that they have been taken to concerts outside the institution?—No; they have gone occasionally, but it has been through the generosity of some individual.

12,526. I suppose you think it is desirable to teach music as an adjunct to the education of the blind generally, whether they make it a profession or not?—I do think so. I think so because I have seen so many instances in which it has had a beneficial result upon the pupil in refining him. We have in our school, of course, very various elements to deal with, some are of an extremely rough character when they first come among us. Many of our pupils come from the mining districts, and their early instincts and usages are not of the very pleasantest character, and I find if we can only get them under the influence of music, their general disposition and tone is improved.

Mr. W. D. Hall.

4 Nov. 1886.

12,527. Do any of your pupils in music, when they go out of the institution, earn their livelihood by music?—Since your visit I have gone through a considerable number of names, and I find it difficult to trace some of them; but I have traced at least 20 who are earning a very fair living by music and tuning, or by music alone. Some are doing very well, others, I am sorry to say, after having been very good pupils and very promising have, for lack of assistance or lack of means on leaving the institution, earned their living as itinerant musicians, and some of them make very good livings too; I am sorry to say, very good livings indeed, but they would not have taken to that if they could have done anything else. I know 20 males and about four or five females who are doing very well, getting very fair livings.

12,528. You have also a blind tuning master?—Yes, one of our former pupils.

12,529. Has he been kept in the institution since the time he was brought up there?—No; he is not in the institution. He holds an organist's appointment in the City, and he attends two afternoons a week at our institution to teach tuning; he has three pupils on his list at a time; he gives lessons in tuning to three pupils till they are efficient, and then he takes three other pupils.

12,530. How many have you turned out who are earning their livelihood by tuning simply?—I do not think there are any earning their livelihood by tuning simply.

12,531. All those who have been taught tuning are earning a living by music as well?—Yes; tuning was introduced at my wish; three years ago I asked for it, because I considered it would be an additional aid to them. I found there was great difficulty in getting them organists' appointments, and I suggested to the Committee that if they could be taught tuning it would probably render them independent of these precarious appointments.

12,532. Have you any definite ideas about the education of the blind, as to the age at which it should begin, and whether it should be compulsory?—My opinion is that the education should be compulsory, and that it should begin at as early an age as possible.

12,533. Would you say at six years of age?—Yes, and that the education should be compulsory—either that the children should be at some blind school or that they should go to some school where they might be learning something, at any rate. My opinion is very strong upon that point, because sometimes, when they come to us, they do not know anything at all; they will be poor, neglected children who have been sitting in the chimney corner all their lives before they come to us, and it takes a long time to develop any intelligence in them at all before their education can begin. You may probably not be aware that in connexion with our school we have a chapel—St. Mary's Chapel—at which we have a choral service twice every Sunday, and on Good Friday and Christmas Day, and Saints days. This is not a chapel simply for the blind; they sit in the gallery; but it is a chapel attended by a somewhat fashionable congregation, and we have to provide for this chapel a choral service, as I say, twice every Sunday, and at which we do two Anthems.

12,534. Is the clergyman who officiates at St. Mary's Chapel called the warden, or what is his title?—Chaplain.

12,535. Does he look after the religious instruction of the pupils at all besides officiating in the service at the chapel?—I believe his duties are to read one afternoon a week. I do not know what other duties he has in connexion with the school. Our music is of a somewhat diversified character. We do not confine ourselves to teaching the pianoforte and organ, but we have to supply the service at the chapel, also music for fortnightly concerts.

12,536. What sort of choral service is it?—It is a full choral service, in which Psalms are chanted, Litany sung, service setting of Canticles twice a month, and an Anthem at each service. We had 103 different anthems in the course of last year, without repetitions. I think we only repeated one anthem in the whole course of the year; and besides that we have been engaged some little time lately in learning a considerable number of hymns, ancient and modern, which have been introduced in the last three years in the chapel. That has been all new work to the pupils. They write those down themselves in Braille. Of course we have the tunes as they are published by the society.

12,537. Do you think that after the blind have left the school, satisfactory provision is made for their training in after life?—Not by us. I do not suppose there is any provision whatever.

12,538. Are you aware what happens to those who have been under your teaching, after they leave?—Yes, some of them get into various workshops; if they have friends they are enabled to take up a musical career. They cannot do that without somebody to help them, and sometimes, unhappily, when they have no friends, they drift to the workhouse.

12,539. Do you think it is one of the wants of the blind that there should be some place where, after they have been educated, they could find a home where they could have industrial training, or live together?—I do not think that is a want. I think the want is rather an organization which should assist them to be self dependent after leaving the educational institution.

12,540. How are they to be made self dependent?—By earning their own livings, which they can do by having opportunities afforded to them.

12,541. What organization would you have to enable them to earn their own livings?—I am supposing that some kindly interest might be taken in those who were musical, in assisting them to get organists' appointments, and in others who were not so educated, in assisting them to get work in workshops for the blind; but I do not think that the workshops, so far as I have been able to learn, afford sufficient subsistence to pupils who would be able to earn their livings if they had the work to do. The workshops generally have such a large number of hands working, that there are always some who cannot get work.

12,542. Do you think the educational books for the blind are sufficient?—No.

12,543. With regard to pianoforte instruction, is there a sufficient number of embossed books?—I think there is a lack of good elementary works for instruction in pianoforte music.

12,544. Exercises?—Yes, exercises, scales, and elementary instruction books; elementary books on the theory of music, for instance, are very much wanted. If the blind are enabled to help themselves, I find they do try to help themselves very much. The education of blind pupils is not a matter of very great difficulty; they are usually, according to my experience, very easy to educate; if you rouse their interest they try to educate themselves, and since Braille has been brought within their reach, they have improved very much indeed; and I think they only require more facilities. Then, when they are educated, the difficulty is to make their way in the world outside. Unfortunately in a school such as ours, we simply wish them a happy future and there is an end of it. Our work seems to me to finish where it ought to begin.

12,545. Pupils are not kept in your school more than six years?—Five years now; it used to be six years, but I am told it is now five. In the case of pupils who have shown exceptional musical talent, who are useful in the chapel, or in the concert room, they are simply re-entered at the expiration of the term, that is to say, the committee extend their term. I have known many cases in which we have had very nice pupils indeed—pupils who have been brought from exceedingly poor surroundings—who, after receiving the advantages of the institution, and acquiring a certain degree of refinement, have had no possible chance when they have been passed out of the school, but to go back to the workhouse.

12,546. Are you able to give us any information with regard to the marriage of blind persons?—I have been spoken to more than once by blind people with reference to the undesirability of it. I have been asked whether it would be within the province of surgical skill to say whether the offspring of such a marriage would be likely to be blind also. I know some cases in which two blind persons have got married, where the children have been sighted. I have known cases where one has been blind and the other sighted, where the children have been born blind.

12,547. I suppose you have not turned your attention to the question whether consanguinity has anything to do with producing blind children?—No, I have not. On this matter I have been questioned several times by pupils, and it would sometimes be, according to my own opinion, a very desirable thing that they should not marry.

12,548. Do you know whether their domestic happiness is always as great as that of sighted people?—I think, in many cases, quite so. I have known cases where blind couples have been exceedingly happy.

12,549. Have you known of attachments formed at the school which have resulted afterwards in marriages?—Yes, several. I have known such cases in our own school.

12,550. Do you think it advantageous that blind children should be all brought together in one institution, rather than that they should be taught with seeing children?—I think there would be a considerable difficulty in teaching them with sighted children.

12,551. Supposing that that difficulty was got over, do you think there would be any advantages in teaching them with sighted children?—I am not able to see any at present. I have not thought much about that phase of the question.

I may mention that we also have concerts at our institution once a fortnight, and I have brought with me a number of programmes of the music that we do in the concert room (*handing them in*).

12,552. (*Mr. Johnson.*) Have you had any experience in the education of the blind apart from music?—Only so far as my interest in the school is concerned. I go about among the pupils a good deal.

12,553. But you have never taken any part in their education otherwise than in music?—No, except in reading to them myself sometimes.

12,554. You stated just now that there was a difficulty in teaching blind people with the sighted; what has been your experience which leads you to that opinion?—I say I should think there would be a difficulty. I do not know that there would be a difficulty.

12,555. You are not aware that in some of the board schools blind children are trained together with sighted ones?—I have heard of such cases. I have heard of blind children being sent to a school with their sighted brothers and sisters, and, no doubt, the child in such cases gains some information, almost unwittingly. It imbibes instruction along with the others without having it actually imparted to it.

12,556. I understand that all your pupils are taught music indiscriminately?—Not all of them. We have a rule which limits the age at which they may begin music to 16 or 17.

12,557. I will put my question in another way. You attempt to teach music to those who have arrived at the age of 16?—No, those under that age, and then above that age I take it at my discretion whether they are taught or not; but I generally find that the more intelligent of them, whatever they are learning in the school, do try to learn music, and I generally find that it has a very beneficial effect upon them.

12,558. Do you think the arrangements made in the various institutions similar to your own are sufficient to give instruction to the blind in music so as to enable them to get their living when they leave the institution?—Certainly.

12,559. Do you think it is necessary that there should be a special institution for the higher cultivation of music?—I do not think so; not in the slightest degree.

12,560. Your institution, you think, is capable of instructing music pupils to the highest proficiency of their art?—Quite so.

12,561. As I understood, when I was at Liverpool, the exceptionally clever ones can get a living?—Yes.

12,562. The majority of them cannot get a living?—The majority cannot get a living.

12,563. Could you tell me about the percentage of your good pupils that can earn a respectable living at music?—I made a memorandum of that. I have all the names and all the particulars I could collect. This was taken out for me with the intention of putting it in a tabulated form to send up to the Commission; but I may say that the 20 male pupils and the five females of whom I spoke just now are taken from this list. The list contains the names of those pupils who have been studying music at our institution, some of whom were members of the choir, and some of whom were not members of the choir.

12,564. Were they instructed entirely in your institution?—Yes; I find that some of them, when they do not get a living at music (not any of those 20 males and five females, but some of the others), are getting a partial living by music, that is to say, they have got married and have a shop, to which the wife attends, and they teach as well, or they tune as well. In the case of females, I find that they also earn a living by music and by knitting combined; but the 20 males and five females of whom I spoke are, to the best of my knowledge and according to my inquiries, getting their living entirely by music. Those are out of a list of about 60 or 70.

Mr. W. D. Hall.

4 Nov. 1886.

12,565. Out of 60 or 70 pupils instructed 25 are getting their own living?—Yes.

12,566. You say that those 25 are getting their living entirely by music?—Entirely by music.

12,567. With regard to the other 40, what do you suppose they do?—Most of them are in workshops.

12,568. They go back to work?—Yes.

12,569. Have you any experience of their going as itinerant musicians?—Yes; outside of these four or five and twenty I have been able to identify three—one other I am doubtful about—but three I know who are getting very good livings in the street.

12,570. As itinerant musicians?—Yes, having been unable to obtain organists' appointments.

12,571. With regard to those 25 who are getting their living by music, do they owe in any respect the position they occupy and the living they get to the interest of the institution, or have they depended entirely upon their own resources?—Entirely upon their own resources.

12,572. The institution does not trouble itself about what becomes of the pupils after they leave?—Not to my knowledge.

12,573. I understand you train three of your pupils as tuners?—Yes.

12,574. Are any of those who have been so trained getting a decent living?—Some of those pupils whom I have referred to as getting a living by music are also tuners.

12,575. They would come under the phrase "partially getting their living by music"?—I call that getting a living by music. When I speak of getting a living partially by music, I mean a pupil getting his living partly by music and partly by trading.

12,576. Amongst those who are getting their living by music you include those three who are getting their living by tuning?—Yes; there are more than three getting their living by tuning—there are three always being taught tuning in the school, and when one of those three is taught another takes his place—there are always three under instruction in tuning.

12,577. I understood you to say that you teach the clever ones music, but what is to be done with those who are not clever?—There are some pupils whom you can never teach music; it is a mistaken idea that people have that blind people are all musical, because there is not a larger per cent. of blind people who are musical than of sighted people, only their memories become very much stronger, and they have a greater amount of application; when they want to learn a thing they try very hard to learn it, but there is not a larger percentage of musical people amongst the blind than there is amongst sighted people.

12,578. To those that are not apt you teach music as an elevating amusement and employment?—Yes; when their work is done every day (they cease work at 6 o'clock) it furnishes them with a pleasant mode of passing their evening hours, and I think it does them a great deal of good.

12,579. I understand that you have seven men and 12 girls in the choir?—13 girls.

12,580. And this choir, as I understand, takes part in the service at St. Mary's Chapel?—Yes.

12,581. Is the religious service carried on at St. Mary's Chapel the only service that the pupils attend—in other words, do they all go to church at St. Mary's every Sunday, or is there any service in the school for them?—There is no service in the school, only prayers, morning and evening.

12,582. The whole school goes to St. Mary's Chapel and finds the choir for it?—Yes.

12,583. Do they get any remuneration for singing in the choir?—Yes, some of the more proficient members of the choir get 10*l.* a year, others much less.

12,584. While they are pupils of the school?—Yes.

12,585. Does that go to the pupils themselves or to the funds of the institution?—To the pupils themselves,

Mr. W. D. Hall.

4 Nov. 1886.

but in one or two cases where the time had arrived at which they would be removed from the school, they have elected to pay for their own keep rather than be removed.

12,586. I see there is an offertory of 112*l.*, "Proceeds "of collection on Founder's day"?—That is once a year.

12,587. That goes to the school and does not go the pupils?—To the school. There was a rigid rule in force some years ago, that directly a pupil left the institution his connexion with the institution ceased, no matter how valuable his or her services had been in the chapel choir. I was enabled to overcome that little difficulty some few years ago, and we have now three pupils in the choir who are outside the institution.

12,588. And those three pupils are your best pupils, I suppose?—Not necessarily.

12,589. They act as a nucleus, as it were, for your choir?—Yes, they help to render sighted assistance unnecessary.

12,590. Do you think it a necessary thing in all choirs that there should be a nucleus?—In a case such as ours where the pupils remain such a short time, we could not carry on the services without such a nucleus.

12,591. (*Chairman.*) Do you make use of those outsiders as teachers of the choir?—No, they do not take any part in teaching the choir. Two of them are engaged in musical occupations outside, and they come to us to sing on Sundays.

12,592. (*Mr. Johnson.*) You are a great advocate of the Braille system, which is an admirable one, no doubt, for the purposes of music, but are you of opinion that that should be the only system, I do not mean for music only, but generally, for the blind to communicate by?—It seems to me the best. But in cases of blindness late in life, I find they often cannot learn Braille, when Dr. Moon's, or some other type is necessary.

12,593. Do not you think that it would be a desirable thing that the blind should be taught some system of writing by which they would be able to communicate with the sighted?—Yes, I do think so very strongly, and I have tried hard to get many of our pupils to write the ordinary writing.

12,594. You think it a desirable thing?—Yes.

12,595. We have a bundle of letters here, written by blind people, in ordinary writing?—I think it very desirable that they should be taught ordinary writing. I feel very strongly upon that point.

12,596. With regard to other systems than Braille, I take it you are not so conversant with general school work as you are with the work of teaching music, but for your own purposes you consider Braille the best?—I am speaking from my own point of view entirely.

12,597. (*Rev. C. Mansfield Owen.*) With regard to those pupils who leave your institution, and who attempt to make a livelihood by music, are there any who fail entirely, and have to fall back upon some other employment?—Yes, some are in industrial occupations.

12,598. Have you turned out any really good organists?—Yes; I have one blind pupil who always takes my services when I am away.

12,599. Do you know any blind man who not only plays the organ, but trains his choir?—Yes, I know one in the Isle of Man, one of our own pupils.

12,600. He is choir master as well as organist?—Yes, I know three or four such cases. There is another of my old pupils in Staffordshire, who plays the organ and trains the choir also.

12,601. Have you taken any steps to ascertain what proportion of blind persons are born blind, and what proportion of them become blind through illness, and so forth?—No.

12,602. (*Mr. Arrol.*) Who is the organist at St. Mary's?—I am the organist at St. Mary's. I am also choir master.

12,603. You said that three of your pupils failed to obtain organists' situations, and went to the street to earn their living as itinerent musicians; do you infer that of the 24 or 25 of whom you spoke, a considerable number are organists?—No, the three felt themselves specially qualified as organists, but failing to obtain situations as organists, they bought harmoniums and wheeled them about the streets.

12,604. Can you give me any reason why those three did not succeed in obtaining organists' situations?—I think it was probably because they had no supporters at all; they wanted to earn a living, and they took the first means that presented itself to them.

12,605. They had opportunities, but they were not considered qualified?—No, they had not opportunities; that is where they failed. That difficulty always exists, and always has existed, of obtaining employment for blind organists. There seems to be a prejudice against them generally.

12,606. Does your institution endeavour to obtain situations for your pupils who are qualified to be organists?—As far as I know, I am not aware that the institution does anything for them at all. I have written many letters myself for different pupils to clergymen when I have noticed advertisements for organists, but, so far as the institution is concerned, I do not think that they receive any assistance in that way from it.

12,607. Do you certificate your pupils when they leave, so as to give them a recommendation when they are applying for any situation?—No, I do not think there is any certificate. I have within the last six months entered a number of pupils in the examinations of the Society of Professional Musicians which is now examining in different parts of the country. I did that with a view to their obtaining certificates which might be of assistance to them as being certificates awarded by a body of professional men, and all the pupils whom I entered passed but one. I entered 16 this year; six for practical examination and 10 for theory, and they all passed, except one, in the theoretical examination. All the six practical pupils passed with second class honours, and of the theory pupils, five passed with first class honours, and the others with second class honours. One of the examiners at the theoretical examination was Mr. Ebenezer Prout, and I should think that it would be a very good thing for those pupils to have a certificate signed by such a man as that. That is the first time that that has been done, but I think it will not be the last.

12,608. You have 40 pupils under tuition just now?—As a rule; they vary according to the ages of the pupils in the institution; sometimes we have a larger number of junior pupils, and at other times we have a larger number of senior pupils. In cases where the adult pupils have been rendered blind by accidents in mines, we cannot teach them music; and so, necessarily, the number of pupils under musical tuition will vary a little; but, generally speaking, it is somewhere about 40.

12,609. Have they all been educated in the institution exclusively, or have you any cases of children who have been partially educated at a sighted school?—I do not think we have one instance of that kind in the school. It seems to me a very desirable thing that they should go to some school as early as possible. I find there is a great deal of time wasted very often when they have not been to school at an early age, in arousing their intelligence and rendering them receptive of instruction to start with.

12,610. (*Mr. St. John Ackers.*) Are the industrial pupils in your institution apprenticed?—No.

12,611. Can they leave when they like?—Yes, on giving notice a month beforehand.

12,612. If they have been there only six months or a year?—Yes.

13,613. What is their average stay in the industrial department, so far as you know?—I fancy most of them remain their full time.

12,614. Five years?—Yes; some of them may leave before that time.

12,615. Do the pupils have five years first in the school, and then five years in the industrial department?—No, the term of residence in the school is inclusive.

12,616. You spoke of marriages of two blind persons being happy, in your experience; can you tell us whether the marriages of one blind and one seeing person are generally happy?—So far as I have seen, they are. I have seen one or two such cases. I have never seen or heard of such marriages being unhappy, and I think I should have heard if they were.

12,617. Are the characters of those who have left your school and have been unable to obtain positions as organists, and have become itinerant musicians, good?—Very good indeed.

12,618. If their characters are good, and they have music only to lean on for a livelihood, what is your objection to their gaining a living as street musicians?—I think it is an occupation which is not quite good enough for them. I think it is a pity for them to have to fall back upon that, because, as a rule, I think that kind of life rather conduces to pauperise them.

12,619. You would not consider it asking charity if they were to perform in the street any more than you would in the case of a German band, or any other band?—I think it is a mode of life that is rather degrading to them. I think it would have a degrading tendency in time.

12,620. Your experience is that in time it has a degrading tendency?—Yes; those pupils that I speak of have only been engaged in this for six or eight months or so.

12,621. Are you aware of the existence of any associations of adult blind in your neighbourhood or in Lancashire?—No.

12,622. (*Dr. Tindal Robertson.*) How long have you been at this institution?—16 years last May.

12,623. How long have you taught music by the Braille system?—I think about five years.

12,624. On what system did you educate your musical pupils before?—Orally by reading to them.

12,625. Is the present system very superior indeed to the system of oral teaching?—It is a great help to it; you can do a great deal more work and do a great deal more good; the pupils are rendered more self-dependent and they save you a good deal of time in reading their lessons for themselves. When they have arrived at the condition of being able to read, they can do a great deal more work in the day.

12,626. Do they get a better knowledge of notation?—They have to get a knowledge of sighted notation quite irrespective of the other system. One of the wants of the Braille system is that it is insufficient in its provision for elementary tuition.

12,627. Insufficient so far as books are concerned?—Yes.

12,628. I presume the system itself is not insufficient?—It might be quite sufficient if there were sufficient materials.

12,629. The method of instruction is right, but the books which convey the instruction are not sufficient in number?—Yes; no system would enable them to acquire that which they must necessarily acquire orally, as far as I have been able to gather, a definite idea of the sighted characters of music, which of course they must understand before they can teach. That requires a considerable amount of oral instruction always. Some acquire this knowledge much more readily than others.

12,630. You said that you thought the system of education with regard to blind children ought to be compulsory as well as in the case of sighted children?—Yes.

12,631. Is your institution supported by voluntary contributions alone, or by voluntary contributions and by any capitalised fund?—It has invested moneys, but it has also voluntary contributions, subscriptions and donations, and so on.

12,632. If the education of blind children is to be compulsory, do you think there ought to be any system of grants, either by the Government or by the local authorities, for the education of those blind children?—I do not think that is a point upon which I am qualified to give an opinion. I have not thought much about that.

12,633. (*Dr. Armitage.*) You say that it would be very desirable for blind children to receive some kind of instruction before they enter your school; have you had any of the pupils who have been trained in the day school which Miss Wainwright has established?—We have had, I think, two.

12,634. Can you account for your having had so few?—No.

12,635. There are about 20 children in her class?—I do not know why we have had so few; I do not know anything about her class.

Mr. W. D. Hall.

4 Nov. 1886.

12,636. May we take it as the fact that you have only had two from Miss Wainwright's school?—That is simply my impression.

12,637. Were those two satisfactorily trained?—I could not say. I have no experience of Miss Wainwright's work at all.

12,638. When pupils are admitted into your school, is there an entry made of what their previous education has been?—I should think so; I cannot tell you with certainty. I have simply to do with the pupils that come to me; all the pupils who enter the school do not come to me, so that anything that I know about the others I simply know by passing amongst them.

12,639. How many hours a day pianoforte practice do the pianoforte pupils have?—They have an hour a day when they begin; as they become more advanced, and it is necessary for them to have more, they have facilities for more.

12,640. Is that about the length of time that a professional musician would devote to practice, an hour a day?—No, nor is it so short as that when they become more proficient, but I should say, in consideration of the other work in the school, it is probably as much as they can get.

12,641. How many hours a day do you think, on the average, you require your seeing pupils to practice?—Three hours, if I can get them to do it.

12,642. That is three times as long you give the blind?—Yes.

12,643. You say you consider the musical instruction satisfactory; do you think the blind are so talented that they can do with two hours a day less practice than the seeing?—No, I do not think so; but when they become more advanced, facilities are given them to have more practice. When the pupils first come among us, and they are put upon music, a single hour a day is allowed for practising, but when they become more advanced, and show some real talent for music, and that there is any likelihood of their working at music satisfactorily, so as to make a professional livelihood out of it, they are allowed to have more practice, and then probably, they get sometimes two hours a day.

12,644. Still they do not practice as long as seeing musicians?—No.

12,645. Do you think that is a desirable arrangement?—No; if they could have more practice it would be very much better for them.

12,646. Do not you think it possible that part of the failure that you told us of, of your musical pupils, arises from their not having the same advantages as the seeing?—No, I am quite certain of it, because I think that many of them have been fully qualified to take very good positions, to earn very good livings, and to acquit themselves as good musicians, but they have not had the opportunities when they left the institution. Their failure was not due to the fact that they were not qualified or in a condition to take good positions.

12,647. But you have told us that you do not consider that the blind have an exceptional talent for music?—I do not think that there is a larger percentage amongst blind people who are musical than there is amongst sighted people; that is what I wished to convey. As I said before, there is an impression in many people's minds that all blind people are musical. In speaking as I did of it being desirable to afford facilities for the pupils to learn music, even if they are not going to qualify for the profession of music, I said I did not think there was a larger percentage of blind people who were qualified to become professional musicians than there is among the sighted.

12,648. How many hours a day do those who practice on the organ get?—They only get about an hour a day.

12,649. Is that about what seeing organists take?—A great deal more. A great many professional organists never practice more than twice a week.

12,650. Then they get more advantages than seeing organists do?—Yes, they get more because they get a musical atmosphere. It is not merely the mechanical practice they get which makes the musician, but it is the general musical instruction they are receiving, so many hours a day in the music room, theoretical instruction and oral instruction in music generally, vocal music as well as instrumental, so that the hour a day that they get for practice does not at all represent

Mr. W. D. Hall.

4 Nov. 1886.

the amount of musical practice which they get in the school.

12,651. You say there is a great dearth of elementary books in music in Braille?—Yes, they complain of that themselves.

12,652. What elementary music books have you in use?—We have Burgmüller's Studies, and we have Czerny's 101 exercises, and that sort of thing, but they do not supply what is wanted; what we want is more scales. I am not aware that there is a copy of scales in Braille, fingered.

12,653. Those books that you have mentioned are not books for elementary instruction?—No.

12,654. You are aware that a great many elementary books have been published in Braille, are you not?—I am not aware. I have never seen anything in the list of an elementary character.

12,655. Does not Hunten's Instruction Book contain what you want?—I think that is rather an obsolete book.

12,656. Have you any objection to make to what has been published?—Some of it is very old fashioned.

12,657. Is Hunten old fashioned?—Hunten is extremely old fashioned. I think Hunten very unsuitable for the requirements of modern tuition.

12,658. You told us that there were 25 pupils who were self-supporting; can you tell us what the amount is that they earn, because different people mean different things by "self-supporting;" how much a year do they earn?—I do not know that, but I know that some of them present a very well-to-do appearance when one sees them. I do not think I should like to ask them what they earn a year.

12,659. (*Rev. W. Blomefield Sleight.*) Have any of your pupils received the Gardner Scholarships?—No, they have not. One of them has received a grant recently from the Gardner Trust towards supplying herself with a piano in the exercise of her profession. I think that is the only instance. Colonel and Mrs. Richardson-Gardner visited our school in 1879, and they were so very much interested in it that they came two or three successive days and heard our choir practice; and on the last day Colonel Richardson-Gardner expressed his intention of having the choir up to town, but for some reason or another it fell through; I have always wondered why, but he appeared to be quite delighted with us at the time. I do not know whether there were any difficulties with our committee or not.

12,660. How many of your pupils have been passed on to Norwood?—I do not think any have been passed on to Norwood.

12,661. Have any gone to Norwood?—Two, I think. One is now at Birkenhead, and one is dead.

12,662. How has the money been found to pay for their instruction at Norwood. I suppose by their friends; not by our institution.

12,663. None of them have received any grant from the Gardner Trust?—I am not aware that they have. I do not think so.

12,664. Did they have to pass through an examination before they were admitted to Norwood?—That I do not know.

12,665. Can you tell me whether any of your pupils have taken part in other choirs beside the choir of the church where you are the organist?—Not as a body; but many of them have sung with sighted choirs—some do so now—with success. I should here like to mention that at the close of the Liverpool Festival week in 1874, various competitions were held in St. George's Hall, when our blind choir took the first prize (which was doubled in the room) in competitions for church choirs, their opponents being sighted. The judges were Sir Geo. Macfarren, J. L. Hatton, Brinley Richards, &c.

12,666. (*Chairman.*) Have you visited Norwood and studied the course of instruction there?—I have not.

12,667. You cannot offer any opinion as to the method of musical instruction there, as compared with your method?—No.

The witness withdrew.

Adjourned to to-morrow at 12 o'clock.

32, Abingdon Street, Westminster.

Friday, 5th November 1886.

PRESENT:

THE RIGHT HON. THE LORD EGERTON OF TATTON IN THE CHAIR.

ADMIRAL SIR E. SOTHEBY, K.C.B.
W. TINDAL ROBERTSON, ESQ., M.D.
B. ST. JOHN ACKERS, ESQ.
T. R. ARMITAGE, ESQ., M.D.
W. AUCHINCLOSS ARROL, ESQ.

E. C. JOHNSON, ESQ.
THE REV. W. BLOMEFIELD SLEIGHT, M.A.
THE REV. CHARLES MANSFIELD OWEN.
CHARLES E. D. BLACK, ESQ., *Secretary.*

Miss BYERS examined.

Miss Byers.

5 Nov. 1886.

12,668. (*Chairman.*) You are honorary secretary of the Sunderland and Durham County Institute for the Blind?—Yes.

12,669. Have you taken an active part in the education of the blind for some time?—In their education since it was started in Sunderland. I have been for some time interested in the question of their education, but I had not taken part in this branch of the work before we took up the education of blind children.

12,670. Which, as I understand, was nine years ago?—No, the educational part of our work we only started, I think, four years ago. Exact date December 18, 1882. For two years the education was only given in the morning.

12,671. That education is conducted by the school board, is it not?—Yes.

12,672. The school board rent a room in your institute for the purpose?—Yes.

12,673. And a blind teacher is employed to teach the blind children?—Yes.

12,674. And has been from the commencement?—Yes, the same teacher.

12,675. Do you think that that part of the work is thoroughly satisfactory?—I think thoroughly so, and I think quite to the satisfaction of the school board.

12,676. Do you think that a blind teacher is fully as competent as a seeing one to teach blind children?—I think more so. I think he understands their needs better, and knows the whole system of instruction better, being himself blind, I think that he has more patience than a sighted teacher would have, and I think the result of the whole education would be quite as efficient. I know that thoroughly competent teachers have visited the school and they have been exceedingly satisfied with the progress of the children as compared with sighted children.

12,677. Do you think it would be possible, in a town like Sunderland, to educate blind children together with sighted children in school board schools?—I think not so efficiently.

12,678. Have you ever heard it said, as we heard in Scotland, that the education of blind children separately is a great evil for those blind children, and that it would be far better for them if they could be brought in contact as early as possible with seeing children?—There would be that objection in the case of a school where the pupils were boarded and lodged, but in the case of a board school I do not think that objection holds good. I certainly think it holds good in the case of schools conducted on the asylum system.

12,679. Can you tell us what the expense of this school is?—I can give you one or two items approximately; the teacher has 17*s.* 6*d.* a week, and for the room they pay 10*l.* a year, and they provide the necessary books and apparatus as well. The entire cost is, I believe, under 60*l.* per annum.

12,680. The school board compel the children to attend the school?—Yes; there was a woman fined a short time ago for not sending her child to school.

12,681. Do you think that the law of compulsion should be carried out more strictly than it has hitherto been?—Yes.

12,682. And that no exception should be made in the case of blind children?—There should be no exception in their case, rather the reverse.

12,683. Do you think it desirable that blind children should begin their education at as early an age as other children, say six years of age?—I do, certainly.

12,684. There is an existing limitation with regard to compulsion called the two mile radius; do you think that in a town children should be compelled to come in even from a greater distance than at present?—Yes, as a matter of fact, two of our children do come three miles, but we could not compel them to come from that distance as the law now stands. The question is what is a reasonable distance to compel them to come, the school board have not defined what they think is the distance. I think they say a reasonable distance. I should say the radius should be extended; I would say at least two and a half miles.

12,685. How are the blind children brought to and from the school?—Some of ours are brought by seeing children who are going to another school in the neighbourhood; some of them are brought by guides who are paid for by friends.

12,686. What provision do you think should be made for the blind after they leave school in order to enable them to gain their livelihood?—I think they should be taken straight from school into an industrial institution such as ours, if they were considered suitable for it, and if the institution had work for them. We are taking one or two now, children who are at school during the daytime; after being at school they go into the institute and learn to cane chairs and to sew.

12,687. The difficulty seems to be that for the first two or three years generally their labour is unprofitable, and they therefore could not possibly be received into an establishment conducted on purely commercial principles?—For the first year, if they had parents who could afford to keep them, their parents should keep them during that time, just as the parents of a sighted child would keep him while he was apprenticed.

12,688. Suppose they had no friends?—Then the guardians would have to provide for them.

12,689. With regard to their board and lodging while they were in these workshops, would you lodge them in a lodging house in connexion with the workshops?—No; it was the greatest bore in my life when that scheme was tried for a year and a half. They will grumble, as any ordinary Englishman will, at what they get in the way of board and lodging.

12,690. How would you provide them with lodgings?—I would let them find their lodgings.

12,691. Would the amount that they would get from the guardians enable them to do that?—In one or two cases they have had no friends, and they have had 7*s.* a week from the guardians, and there are generally one or two charitably disposed persons in a town who will assist a case like that. We have in our town several charitable people who will give an extra 2*s.* or 3*s.* to help such cases; the main part of the cost must be provided by the guardians, and I think they will generally do it if it is a good case.

12,692. I am assuming that they are leaving school and have got to learn a trade; in the first year or two their labour is not profitable?—I should say even for three years their labour is not profitable; but I should say a sensible fellow in three years should be able to keep himself; if he was 15 when he left school, I should say he would be able, when he reached the age of 18, to earn his own livelihood.

12,693. They are not always kept at school till they are 14 or 15?—The children we have had to deal with have not yet arrived at an age at which they would earn their own living; therefore I am not competent to speak with experience upon the matter.

Miss Byers.

5 Nov. 1886.

12,694. Do you think that the trades that they are taught should be, as far as possible, those that other persons learn, or do you think they should be taught special trades only?—I would teach them anything I thought they could do; but I think there are only certain things that they can do, as far as my experience goes.

12,695. We find from time to time that there are many trades which the blind are proved to be able to work at, which before they were thought not to be able to work at?—I should certainly let them work in those trades, but I think a boy who has been thoroughly educated up to 14, stands a much better chance of making a good workman than the same boy would if he had not had the education.

12,696. Do you think that the Government should give an education grant for the blind, the same as they do in the case of other children, only larger in proportion to the additional cost of teaching the blind?—I think so.

12,697. And, of course, Government inspection would follow?—Yes; then the ordinary inspectors would require a little special training; they would have to learn Braille, or there might be one special inspector for the whole kingdom for the inspection of the blind. Perhaps this Commission might see fit to make that recommendation.

12,698. Have you any idea about how you would deal with those who become blind in middle age, or are not strong enough to earn their livelihood?—Those who have got to be 50 or 60 are practically of little use in an institution like ours. I think such people become suitable objects for some sort of charitable help. One of our men, almost blind, 60 years of age, earns from 11*s.* to 13*s.* per week at teazing hair, &c. We also give work to two or three others who are over middle age, but we could only employ a limited number of such.

12,699. Has it ever occurred to you that there might be a special ward in the workhouses or in almshouses, where the blind could be put together without being placed in the ordinary category of paupers in the common wards, to which the blind have a strong repugnance; do you think that there should be some more liberal provision made for the blind by the Poor Law authorities?—I think it would be better if the guardians would give a little more out relief to the blind; the blind can hardly get any out relief. I think it would be well if this subject of out-relief were brought more prominently before boards of guardians.

12,700. You think exception should be made in the case of the blind?—I think so.

12,701. Do you know any blind who are receiving annuities from any charities in London?—Eight receive pensions from London, three from "Hetherington's" four from "Painter's," one from "Day's." We have one girl to whom we give 3*s.* pension at our discretion; that is given by the Home Teaching and Relief Society; we can withdraw it at our discretion.

12,702. (*Mr. Johnson.*) That is not a pension society?—No.

12,703. (*Chairman.*) Are there any points that I have not touched upon that you would like to mention?—I think it would be a good thing if the Commission recommended that blind teachers should pass a certain Government standard, say in certain things. They cannot pass the ordinary standard at present, because there are certain subjects that they cannot take, such as drawing, but they might be required to pass a suitable standard before they could become teachers of the blind in board schools. I am speaking more of board schools than institutions.

12,704. Do you think the board schools would generally appoint blind teachers for the blind?—I cannot tell that.

12,705. Do you think there is any prejudice against it?—There was not in our case; but then Mr. Walker is exceedingly clever.

12,706. It is stated that he passed in honours; what was the examining body?—It was an examination in connexion with the Presbyterian Church of England.

Miss Byers.

5 Nov. 1886.

12,707. He has not submitted himself to any recognised board of examiners connected with education?—*

12,708. With regard to the workshops, have you had any difficulty at all in dealing with the workpeople themselves; have they been regular in their attendance, and have they earned their own livelihood satisfactorily?—Yes, they have been, I think, satisfactorily regular in their attendance, because, of course, their object is to come; they want the work. When the times in Sunderland were good, we had plenty of work for them, and they were making very good wages.

12,709. What number of hours do they work?—Now they are only working three-fourths time, from 8 o'clock to 5 or 6; but we cannot judge of the general state of things in Sunderland by the last two years, for during that time the trade has been dreadfully depressed There are thousands of workpeople out of work, therefore our blind people ought to be very thankful for the wages they have been able to earn during the last two years.

12,710. (*Mr. St. John Ackers.*) You have told the Chairman that the school board rent a room in your building, and employ a teacher to teach blind children; do you know whether the school board have a class for deaf and dumb children as well as for the blind?—No, they have not. Those interested in the deaf and dumb would be very glad if the school boards would take up the education of the deaf and dumb.

12,711. What induced the school board to take up the class for the blind?—One member of the school board, I found, was interested in the blind children and in their education, and he was willing to move in the matter. I knew I had a teacher suitable, and I backed him in the idea, and he pressed it on the committee. Two or three of them were willing to take it up, and the thing was eventually brought about.

12,712. Do you know whether a similar effort was made to induce the school board to start a school for the deaf and dumb?—They have been asked to do so, I believe.

12,713. Have they refused to start such a class?—At least it has not been started.

12,714. You have stated that the expenses of a class for the blind are very considerable. Are they very considerable even with the help which is given by having a room in your building at a cheap rate?—I do not consider them large, I consider them small.

12,715. Are they smaller than they would be for a class of seeing children?—They are larger in proportion than they would be for the same number of sighted children, I think.

12,716. The expense of books alone, if you had to purchase books at the full price, would be very considerable, would it not?—I suppose it would.

12,717. The expense is considerably more than it would be in the case of sighted children?—It would cost more to educate blind children than it would to educate sighted children, I may safely say.

12,718. (*Mr. Johnson.*) Would you say considerably more?—No, not considerably more.

12,719. (*Mr. St. John Ackers.*) Do you think there should be sighted foremen in the workshop?—Decidedly, except in some branches where a partially blind man might be able to do the work of the foreman perfectly well. We have a partially sighted man for the matting and mat department, and we have a man with partial sight who superintends the cork fenders and also the feather department, but we would have a sighted man for basket work.

12,720. There should be sighted foremen for the industrial department?—Or partially sighted.

12,721. But you think a blind teacher is better for the educational department?—I think so. We have no sighted foreman in our mattress room—blind people have taught the blind—except that our manager was an upholsterer, and I suppose was a practical foreman in the business, and he has superintended the work. The covers must be cut by a sighted person, so that you must have a certain amount of sighted superintendence there.

12,722. I wish you to explain two of your answers which seemed to me to be a little inconsistent with one another. You said in one answer that the guardians pay 7*s.* a week to some of the adult blind, and in another answer you said it was very difficult to get the guardians to pay anything at all for out-door relief?—They are very reluctant to give out-door relief, except in connexion with an institution. They will pay willingly where the money is being given in connection with an institution, because they know that it will be to their advantage to pay it. We had one man (not totally blind, but quite too blind to obtain employment in an ordinary way) who was 19 years in the workhouse. They paid for him for one year 7*s.* per week, and he earned 22*s.* 3*d.* per week on the average in 1885. He was a burden on the rates for 19 years. We are going to take another who would simply be in the workhouse if we did not have him.

12,723. You consider it a very good arrangement for them to pay a certain amount for a year or two with the object of getting a person trained to some industrial purpose?—I think so. I think it a good thing that the guardians should pay for two or three years a certain sum to enable a man to be trained to basket-making, for instance.

12,724. Would you advise that that payment should be compulsory upon the guardians if it were proved that the relations of the blind person were wholly unable to pay anything?—I think it would be a very good thing if it were compulsory; they do not very willingly pay anything for longer than a year.

12,725. You spoke of a blind lad being able to earn his own living after three years from the time he left school?—I am not able to speak authoritatively upon that. The educational part of our work has not been sufficiently long in operation for the children to have grown old enough to go out into the world to earn their living.

12,726. What is the length of term of apprenticeship for the sighted in Sunderland?—Different terms for different trades. The ordinary term of apprenticeship in the basket making, I have been told, is seven years in the case of the sighted.

12,727. Is it reasonable to suppose that a blind person would become proficient in a shorter time than a sighted person?—I do not think so; but we would not attempt to teach them so many branches of basket making as a sighted apprentice would be taught. I think it quite reasonable that the blind should have three years apprenticeship at basket making, but I am not competent to give an opinion upon that point authoritatively.

12,728. Is there any association of adult blind workmen in your neighbourhood?—Yes, they have an association which they formed entirely among themselves.

12,729. Do you know anything of its rules?—I can send you its rules. They formed an association two or three years ago among themselves, and got the blind in other towns to join them; that association is entirely worked by themselves.

12,730. (*Chairman.*) Is the blind teacher, Mr. Walker, secretary of it?—I think he is, or was.

12,731. (*Admiral Sotheby.*) Have your workmen any sick club?—The men have a sick club.

12,732. Does it answer?—I think so. They manage it themselves. It has been a great blessing to some of the men. There are 17 members. They pay 3*d.* a week, and receive 6*s.* per week the first 13 weeks of their illness, 3*s.* the next 13, and 1*s.* 6*d.* the remainder of illness.

*The following is a list of examinations passed by Mr. A. Walker, with the names of examiners:—

1881. University Extension Scheme, Cambridge and Durham. Subject: "English History, 1688—1832." Passed. First Class. Examiner appointed by Syndicate at Cambridge.

Examinations under the Sunday School Union International System for Sunday School Teachers:—

1. Subject: "Principles and Art of Teaching." Certificate gained in 1884. Examiner: J. C. Curtis, Esq., B.A. London.
2. Subject: "Evidences of Christianity." Certificate with honours gained in 1885. Examiner: Professor Bedford, M.A. LL.B. London.
3. Subject: "Scripture History and Doctrine." Certificate with honours gained in 1886. Examiner: Professor Goadby, President of Chilwell College.

Examinations under the auspices of the Presbyterian Church of England:—

1. Subject: "First Three Centuries of Christianity." Certificate, with distinction, gained in 1885. Examiner: Professor Macalister, M.D., F.R.S., Professor of Anatomy, Cambridge University.
2. Subject: "Life of Augustine," Church History. Certificate, with first medal, gained in . Full marks 300.285 gained. Examiner: Professor Macalister, M.D., F.R.S.

In all the above examinations, excepting the first, the examiners did not know that the candidate was blind.

Miss Byers.

5 Nov. 1886.

12,733. Do you assist it at all?—We have occasionally given small sums towards it—a few pounds derived from different sources.

12,734. You mentioned that sometimes the workmen are on half wages; does that make them very discontented?—Of course they do not like it, but they have had to accept it. We have not reduced the rate of wages, but we have put them on shorter time, which they like better.

12,735. Do you consider that a sighted teacher could teach the blind to read as well as a blind teacher?—I should say he could, but I think it advisable, if you can get a blind man to do the thing efficiently, to employ a blind man.

12,736. Does the mattress-making pay well?—It pays the men very well, and, taken as a whole, it pays the institution very well.

12,737. You referred to the case of a man (not totally blind), who had been 19 years in the workhouse and then was removed to your institution; how long was he in your institution?—He is there now. In 1883 he earned 14*s.* 10*d.* a week. I think that, perhaps, would be the first year after he left the guardians; the next year his earnings went up to 20*s.* 5*d.* a week, and then in 1885, when he had become more proficient, he earned 22*s.* 3*d.* a week.

12,738. On piece-work?—Yes.

12,739. In making baskets?—Yes, rough basket-making.

12,740. How many years do you consider it takes a blind man to make baskets well? I mean the rough baskets that the blind generally do make?—It greatly depends on the man himself.

12,741. It depends on the age of the man?—The age and capacity. I should say he would be able to make them in two to three years.

12,742. Do you mean that he could make baskets well enough after two or three years to earn a livelihood?—Yes. This man was able to do so in a year after he had come from the guardians.

12,743. Do you make brushes?—No.

12,744. Brush-making would not pay?—It would not pay, and we cannot afford to lose any more money on different branches of manufacture.

12,745. If you introduced brush-making you think you would lose by it?—We think so, and we have not the capital.

12,746. (*Rev. W. Blomefield Sleight.*) You employ one young woman who is sighted, and who is deaf and dumb; would you employ more deaf and dumb persons if they applied for work?—We would rather not. That girl is useful to us, because we want a certain amount of work done which only a sighted person can do; but we would not employ her unless we wanted that work done.

12,747. Is not there plenty of work in the institute that the deaf and dumb could do?—There is a certain amount, and therefore we employ this girl.

12,748. (*Dr. Armitage.*) Is the school under Government inspection at present?—Not at present.

12,749. You do not have a grant?—No, we could not have a grant.

12,750. Why cannot you have a grant?—We could get the attendance grant if the children were to go half a day to a sighted school, but that would greatly interfere with our educational arrangements; then our teacher is not a certificated teacher; he could not pass the present examination, because he could not draw, for one thing.

12,751. If Mr. Walker was certificated, you would be able to get a grant?—Quite so, and that is what we want, that he should be able to pass a Government examination on a modified standard adapted for the blind.

12,752. Have you formed any opinion as to what modification there ought to be in the examination for a certificated teacher of a blind school?—Perhaps that is more for such a body as yourselves to recommend; there are one or two things, of course, that the blind cannot do.

12,753. Have you formed any opinion as to what subjects blind candidates for the post of teacher should be required to pass in?—I do not think I can give any opinion upon that. I think I would rather leave the answering of that question to those who have thought the subject well over.

12,754. Have you had any experience as to kindergarten work in a school like yours?—No, I have no experience of it; but I think it would be very advantageous if it could be introduced.

12,755. A blind teacher would have a difficulty in teaching kindergarten, would not he?—I cannot say. I suppose he would. I think it would be a great help in our school if we could get a lady to teach it gratuitously, if the board would allow it. I think it would be a very beneficial thing to introduce. I do not think that the blind teacher could do it himself.

12,756. From your experience, how do you think his would work: to carry on the school very much as it is now, and have a kindergarten teacher for a certain number of hours in the week specially to teach kindergarten?—That would be very nice if it could be done. I do not know that they teach kindergarten at all in our board schools. I know they teach it in other schools.

12,757. I understand you to say that, from your experience in your own school, you think it would be desirable to have kindergarten introduced?—I think it would be very desirable. I have been wanting to have it introduced myself.

12,758. Are you connected with the home teaching part of your work?—I am on the committee.

12,759. What system do they teach in the home teaching?—Principally Moon, but also the Braille type; they are teaching that now to the younger men who are wishing to learn it, and I think with great benefit. I would like to see it much more widely introduced along with the Moon type in the home teaching.

12,760. Do you know any adults who have learnt or are learning Braille?—Yes, I think we have five who are learning Braille.

12,761. Do they themselves say that it is any advantage to them?—Yes, I think they are very pleased with it.

12,762. Do you think, from your experience, that intelligent adults who are anxious to improve themselves, could in general learn Braille?—I think so by what I have been told by experienced blind people about it. I do not myself teach it or thoroughly know it, but I know that the adult blind can, if they are intelligent, learn it.

12,763. Was there any difficulty in getting it introduced in your society?—No, I cannot say that there was. Mr. Backhouse, who takes a great interest in the school board, offered the Home Teaching Society a present of books in Braille if they would take them, and we were very glad to have them. That is the way it was introduced, and we are very glad it has been introduced. For old people the Moon type is the best, because they do not like to trouble themselves to learn the Braille, but young men, and adults with intelligence and capacity, should learn Braille, certainly.

12,764. Do your adult workmen practically read much?—No, I do not think they do. I think they like being read to.

12,765. The men who are basket makers whose hands are hardened by work generally, do not read, do they?—I do not think they do. I think they generally prefer to get some one to read a newspaper to them, that is to say, most of them; there are intelligent ones who will read themselves.

12,766. They are tired when they have left off work, and they prefer sitting in a chair to reading?—Yes, those who were not the most intelligent would not read, but the intelligent ones would read in their leisure hours.

12,767. (*Mr. Arrol.*) You have said that Mr. Walker is a very superior master?—Yes, I think so.

12,768. His salary, I think, is 17*s.* 6*d.* a week?—Yes.

12,769. Is that for the number of weeks he is employed in teaching, or for the 52 weeks of the year?—I think for the 52 weeks of the year. I think he gets paid while he is away on his holiday.

12,770. As he is a very superior teacher, do you not consider 45*l.* 10*s.* is a very small salary for him?—Yes, I do.

Miss Byers.

5 Nov. 1886.

12,771. Is is from want of funds that he is not paid more?—I have asked one or two members of the school board to see if they cannot raise his salary a little, but they have not yet done so. It was rather a struggle to get them to undertake the education of the blind in the first place, and I am rather careful in asking them to spend more for fear they should give it up altogether, looking at the comparatively small number of blind children receiving instruction.

12,772. Do not you think that it would be advisable to have some sighted assistant with him, so as to enable any defect in deportment in the children to be corrected?—I think Mr. Walker makes them deport themselves very well.

12,773. You disapprove of children being educated and boarded in blind institutions?—I do not think it a good thing to congregate blind people together the whole of their time, as is done in blind asylums. Instead of building an asylum for the blind, I would say let them be educated by the school board in a class together, and then let them go home to their own homes and mix with their sighted friends and relatives.

12,774. Would you recommend that their education in a class together should be in a sighted school?—I do not think it would be so good as separating them.

12,775. Might not you give them the same blind tuition as you would give them if you were educating them in a school by themselves, and allow the children to associate with their sighted companions in the ordinary play-ground?—To give the same tuition as they are getting now efficiently by a blind person, our school board would have to supply an efficient teacher to each of its schools, or they might get an ordinary teacher with a slight knowledge of the Braille system, who one could hardly expect would give that extra attention to the blind children, necessary to make their education equal to that of the sighted. I think the blind children would not get proper attention if they were educated with the sighted.

12,776. You would recommend that the whole of the blind children should be congregated in one school or two schools, if there were a sufficient number of children?—Yes, if they could have a room in a board school I should say it would be a very good arrangement. I quite think that our method might be adopted with advantage in other places.

12,777. On the question of wages, I find in your report for 1885, that your wages to your blind workmen are 730*l.* odd, and the amount that you give for sighted supervision is somewhere about 650*l.* Is not that very large in proportion to the money given to the blind?—Yes, and we are reducing it considerably; we are doing without a manager, and we are putting more work on to the others; we are trying to reduce the expenditure for supervision in every way possible compatible with efficiency. At the same time I should add that upwards of 100*l.* of this amount is not for supervision but is paid to sighted workmen, whose work is profitable to the institute, and is such as blind people cannot possibly do.

12,778. You said that you were a member of the Committee of the Home Teaching Society; is it one of the objects of the Home Teaching Society to find employment for the blind?—No, the object of the Home Teaching Society is a teaching object—a missionary object—and to afford relief.

12,779. I suppose one of the best forms of giving relief to the blind is to obtain work for them?—I call that giving them employment.

12,780. Do you endeavour to obtain employment for them?—We endeavour to do that at the institution so far as we can.

12,781. Can your institution give employment to all?—To almost all in this town who are respectable, and who we think will be capable of earning a livelihood. The missionary would try and help them in all ways that he could, in temporary ways as well as permanently. He tells me of cases suitable for the institution, and if he thought he could find any work suitable for them especially, he would try and get it.

12,782. Have you any employed in public works?—One blind man is employed as a tuner in a music shop.

12,783. Are any employed in ship building yards?—One is employed as a polisher in a shipbuilding yard.

12,784. (*Chairman.*) Have you ever tried to introduce what we heard of in Glasgow, cleaning bolts?—I did apply for employment for them at cleaning bolts, but unsuccessfully at the time. I think if I had time to work it up I could succeed in it.

12,785. (*Rev. C. Mansfield Owen.*) What religious instruction is given to your blind children?—The Home Teaching agent visits them at the institution.

12,786. Have you certain hours for religious instruction?—Yes, from 9 to 10 a.m. The school board prescribe that there is to be prayer, and a certain portion of Scripture taught daily.*

12,787. Are any blind children withdrawn from the religious instruction?—No, none have been withdrawn.

12,788. (*Dr. Tindal Robertson.*) You are not yourself a member of the school board?—No.

12,789. This scheme for educating the blind in Sunderland was initiated by the school board at your suggestion, I understand?—It was initiated by a member of the school board; Mr. Backhouse, who is a member of the school board, was very anxious about the education of the blind.

12,790. Do you know whether a similar system has been adopted in any other part of the country?—I think Leeds has followed us; they are in communication with our school board.

12,791. I mean the system of hiring a room in which to teach the blind by themselves?—I am not sure how they do it in Leeds. As we had the room, it was considered to be a convenient arrangement that the blind children should be gathered together in it.

12,792. Is that room in a central part of the town?—Yes.

12,793. How far would it be from the extreme limit of the town to your institution?—The longest distance that they come is three miles.

12,794. Is there any part of the town which is beyond that distance?—I cannot answer that question.

12,795. Are you aware that in London the blind children are educated at different centres in different parts?—Yes.

12,796. What I am leading you to is this, whether you would think it advisable to have one centre in a large town such as yours, or several different centres?—I think it would be a matter for each town to decide according to the distance that the children would have to come.

12,797. With regard to pensions, do you know the persons who are in receipt of pensions in your town?—No, not all of them.

12,798. You know some who are in receipt of pensions?—Yes, I know one or two of them.

12,799. You said you thought that the masters or mistresses of these schools should be certificated; do you think that it would be an advantage if there were a special training institution for the education of schoolmasters and schoolmistresses for the blind, in London, for instance, where persons who wished to become teachers of the blind in London or in the country might be properly certificated?—I think that so long as you can get people who have been properly educated, that is not a necessity. Our teacher, Mr. Walker, was only two months at Norwood to learn the type; that is all the education he has had at a blind school.

12,800. He is not certificated?—No, he is not certificated; but I am sure that he would pass in anything that he would be required to pass, if a standard were adopted which was adapted for the blind.

* The following is a copy of the time table for the class of blind children, held in the school room of the Sunderland Institute for the blind, under the school board hours:—

9 to 10 a.m.	-	Prayer and Bible lessons.
10 to 10.5 a.m.	-	Registers marked.
10.0 to 13.30 a.m.	-	Reading.
10.30 to 11 a.m.	-	Grammar, Monday, Wednesday, Friday. Geography, Tuesday, Thursday.
11 to 11.15 a.m.	-	Recess.
11.15 to 12 a.m.	-	Arithmetic.
12 to 2 p.m.	-	Dinner Hours.
2 to 2.30 p.m.	-	Writing.
2.30 to 3 p.m.	-	Reading.
3 to 4 p.m.	-	Arithmetic.

A lady kindly attends the school once a week to give the elder children a dictation lesson for half an hour.

During the year a portion of the Old and New Testments is to be taught (the selection of the part is left to the teacher), two psalms and two hymns are to be learnt by heart. The blind teacher has chosen for this year: The Life of Samuel, four miracles, and four parables.

The same rule holds good in the schools under the Sunderland school board, which is unsectarian.

Miss Byers.

5 Nov. 1886.

12,801. You seem to think that it would be an advantage that you should have a blind teacher, who was certificated; then would it not be of advantage to have a special training institution for the education of such teachers?—I think at Norwood they have that. I think it is a splendid education that they give at Norwood.

12,802. (*Mr. Johnson.*) Now that we are on the question of teachers, I should like to ask you whether you do not think that it would take an ordinary sighted teacher in an ordinary board school a very little time to acquire the mode of teaching blind children?—I have heard that it has been acquired in a very little time.

12,803. You think it is possible to acquire it in a little time?—From what I have heard, I think it is. I do not consider myself very competent to speak upon that point.

12,804. I take it that you think that a sighted person who was well versed in the methods of teaching the blind, would make a better teacher than a totally blind person?—I should not like to say that.

12,805. Do you think that a blind person is able to see to the deportment of blind children equally well with a sighted person?—I think a blind person could see to the education of the children equally well with a sighted person; and, as regards deportment, I think that could bevery well left to the parents. I think a blind teacher soon knows whether his pupils are getting into bad habits.

12,806. Is it your experience that the parents do teach their children deportment?—Poor parents do not, perhaps.

12,807. Your experience is derived from this school, the average attendance at which is 10?—Yes.

12,808. Before this school was established, who took the educational part of your establishment?—Nobody.

12,809. Did not the Home Teaching Society for the Blind do it?—They taught the children to read a little; it was not regular education.

12,810. They were the persons who initiated the education of the blind in Sunderland, were they not?—The question of the taking up of the education of the blind was initiated by the Home Teaching Society for the Blind. Their secretary visited Sunderland 14 years ago, when a branch of the society was established there.

12,811. They established a branch of their society at Sunderland, and supplied a certain number of books to read in Moon's system, did they not?—Yes. All that the society did was just teaching people to read; it was not an educational society.

12,812. But that was the only education given to the blind in any way before this school was started?—Before this school was started, the only education that the blind children could get in the town was the little instruction in reading that they got from the Home Teaching Society for the Blind.

12,813. Before your advent no blind persons in Sunderland, according to your knowledge, read by any other system than Moon?—I think not; any blind children whose parents wanted them to be educated were sent to Newcastle.

12,814. What initiative did the school board take with regard to educational appliances for teaching the blind. Did they at once decide to adopt the Braille system in preference to Moon?—They took the Braille system to begin with on our recommendation.

12,815. You have had no experience in other schools of the modes of teaching the blind to read or write?—No.

12,816. Then what led you to consider that the Braille system was the best system to be adopted?—Practically we found it to be the best.

12,817. You initiated it, as I understand you. What was your experience in regard to it?—I had the experience of those who had had to do with it, and were learning it. I found for writing it was invaluable.

12,818. Had you had any experience with regard to the Braille system amongst the blind themselves, or was the opinion you formed of it derived from information that you got from the societies?—I think I got to know all about it through the societies at first, and then through blind people.

12,819. Before you initiated it at Sunderland, was what you knew about it derived from any practical experience, or only what you had learned from societies. Had you seen, say, a dozen blind persons reading and writing in Braille, and were you so struck with it that you introduced it?—We had experience of the superiority of the system before we introduced it; the experience, for instance, of Mr. Walker himself; we sent him up to Norwood to learn it.

12,820. But you initiated it before you sent Mr. Walker up to Norwood to learn it?—Yes.

12,821. You had had no experience in any schools of it before you initinted it at Sunderland?—No.

12,822. You were told it was a good system, and you made a trial of it?—I got what information I could as to the best modes of teaching.

12,823. Would you adopt Braille as the one system to the exclusion of all others?—In school work I would.

12,824. What is your opinion of the Moon type?—I think it is very good for old people and those who are not very intelligent.

12,825. What is your opinion with regard to the system by which the blind should communicate with the sighted?—I should say that they should write their letters in Braille, and that sighted people, if they wanted to read them, should learn Braille.

12,826. Those who want to decipher Braille must learn the key?—Yes.

12,827. But if blind persons wrote in the ordinary writing of a sighted person, then, of course, they would be able to communicate with the sighted world?—I think it would be an advantage for them to be able to communicate with their friends. I think it would be a very good thing if they could be taught both Braille and ordinary writing.

12,828. Do the school board ever remit the fees of your blind children?—Yes, as in the case of sighted children; if the board considered that the parents were too poor to be able to pay the fees, they would remit the fees.

12,829. When we were at Sunderland you told me that you considered that all the blind children in Sunderland that you knew of were brought into the board school?—Yes, except one child, who is sent to Norwood.

12,830. That means 12 or 14?—Yes.

12,831. Is there any difficulty in getting those 12 or 14 brought to the school?—Yes, there is rather a difficulty; there is a little difficulty in sending them, but that is generally got over. The difficulty of getting them to attend is generally due to lack of interest in the parents.

12,832. Does your institution or the school board pay anything for guides to bring the children to the school?—No; that must be done by philanthropy.

12,833. Perhaps if each blind child were allowed a certain amount of guide money it would be an inducement to the parents to send the children to school?—It might be an inducement. I am not very much in favour of giving guide money, though in case of necessity I have no doubt it would be a good thing.

12,834. In London guide money is given to a great extent?—Yes, but London is very different to a provincial town; it would hardly be safe for a blind child to go about London by itself; in a provincial town a guide is not so necessary as in London. I think in some cases it might be very desirable if the board would allow guide money.

12,835. In special cases?—Yes, only in special cases.

12,836. One of the reasons why they do not come to school is because no allowance is made for a guide?—I do not think that that is the reason why they do not come to school; I think in our case people would pay for guide money if the mothers would send the children, and if that system of giving guide money were adopted, the parents would send the brother of the blind child as its guide, and get 3*d.* a week.

12,837. You have told us that you thought it would take three years to perfect a boy as a workman after he left school at, say, 13 or 14 years of age; what would you suggest with regard to providing for those boys for those three years after leaving school?—I do not think I am capable of giving any opinion about how boys of that age should be dealt with.

12,838. You gave short wages during a portion of these two consecutive years; how did you reduce those

Miss Byers.

5 Nov. 1886.

wages; was it by time?—By time, and the piece-work naturally reduces itself.

12,839. Do you pay most of your workmen by time or by piece-work?—Most of them are on piece-work, but some are on time at fixed wages, the foreman, who is partially blind, is paid so much a week, and he superintends the bedding department, the feather part of it, and the teasing, the making of cork fenders, and the matting department.

12,840. His wages are not assessed upon what he earns; he is, as it were, a supervisor; he is what is called a foreman?—Yes.

12,841. Do you pay any fixed wages to any blind workmen?—Yes, two blind workmen in that very department are paid by time, because we find it most difficult to pay them by piece-work.

12,842. Do you in any way subsidise any of the labour of your blind people?—We do pay higher rates than the ordinary market rate in one or two cases, and we must reduce them, though, no doubt, the men will kick very much if we do. We began by paying a shilling a pair for mattress making, which was the market rate; after we had gone on for two or three years we made a profit, our expenditure was small, the manager was working late and early, he was working till 10 o'clock at night, and we paid him no more for it, besides which we had a great deal of unpaid labour, and we thought if we could do this, we would pay the workmen a little more, so we raised the rate for these mattresses 3*d.* a pair, bringing the payment to 1*s.* 3*d.*, but we did that because we were making money, and since we have been losing by making the mattresses, we have not reduced the rate.

12,843. You subsidise that particular portion of the trade 25 per cent.?—Yes; I believe as a matter of fact the former market rate of 1*s.* now stands at 10*d.*, but we are still paying 1*s.* 3*d.*

12,844. Practically, you subsidise that particular branch to the extent of 25 per cent. over what they would earn outside?—Yes. We do not subsidise the basket department.

12,845. Those who work in that department are paid wages according to the price that the workmen outside are paid?—Yes.

12,846. (*Chairman.*) There has been a reduction of 10 per cent. below the trade prices in consequence of the depression of trade?—Yes, I think there has been; I think we are paying the ordinary trade price. I do not think we are paying the reduced trade price.

12,847. (*Mr. Johnson.*) What I want to get from you is whether, on your general work, you pay your workmen something more than sighted workmen would be paid for the same work?—In some cases we do, and in some we do not.

12,848. To the extent of 25 per cent.?—Certainly, for the reasons given. We do not like to reduce the rates of pay for work unless we are obliged, but if there was a chance of our being driven out of the market if we did not reduce them, we should reduce them as a matter of business.

12,849. Is there any difficulty in getting rid of your manufactured goods?—There is a difficulty. If we were to let them work full time, there would be very great difficulty in getting rid of the goods. We have a great surplus stock of mats.

12,850. Would you work less time when you had got a very large amount of stock in hand?—Yes; we have not any charitable fund to fall back on.

12,851. Do you consider that your trade has been a loss or a gain in the last two years?—There has been a considerable loss in the last three years. We have adopted stringent measures to reduce our expenses in every way we can compatibly with efficiency.

12,852. If workshops were established through the length and breadth of the land, in which the blind could produce articles from materials supplied to them at trade price, and at which those articles could be sold, do you suppose that there would be sufficient trade to enable a large number of the blind to be self-supporting?—I cannot say, but think a considerable number might be. If it were only the work of the blind that was sold, institutions could not possibly be self-supporting; but we sell a great deal that is not made by the blind. I think that this is an absolute necessity, if such establishments are to be carried on as a business. If we do not sell articles not made by the blind, we must resort to charity, which goes entirely against the grain with me. I want the blind to be assisted as far as possible without charity.

12,853. (*Chairman.*) You like them to keep their independence?—I would rather that such institutions were self-supporting.

12,854. (*Mr. Johnson.*) 3,243*l.* was received last year for goods sold; would a large proportion of that be received for articles made by sighted people outside?—Yes.

12,855. The profit on which went to the benefit of the institution?—Yes.

12,856. Including bedsteads, and things of that kind?—Yes; and the finer kinds of baskets.

12,857. You largely deal in articles made by sighted people?—Yes, and we consider it a necessity if we are to be a business.

12,858. If the sale of articles made by sighted people was cut off from any blind workshop or any blind depôt, there would not be a sufficient demand for work produced by the blind for them to earn their living?—There would not be sufficient profit to enable the thing to be carried on as a commercial business.

12,859. One of the difficulties, as I understand, is the accumulation of stock?—It is a difficulty; that is to say, it would be if we were to keep on full time.

12,860. You are obliged to work less time because you are afraid to increase your stock?—At present.

12,861. What would you recommend the great institutions to do with their surplus stock?—That urgent efforts should be made to get people to buy it.

12,862. You would sell it at a very much reduced price?—I would sell it even at cost price rather than keep it.

12,863. Or at a loss?—I do not know whether I would sell it at a loss.

12,864. Can you explain to the Commission how it is that you pay so large a sum as 650*l.* to sighted people?—We were obliged to have a certain staff to work the place, as we thought, efficiently; but we now think that we will be able to cut down the expenses by reducing the staff, and we are doing without a nominal manager. We are giving the man who was the foreman greater responsibility in the manufacture, and we are giving the clerk more responsibility in taking care of the cash and attending to the correspondence, which the manager used to attend to. We are paying more to those two men, and we are letting the girl who superintended the girls also manage a branch shop where we expect to get more orders. With the same sighted staff, I think we could do almost double the work, and the comparative amount paid in wages to the blind would be much greater than at present.

12,865. (*Chairman.*) Do you think that there should be greater communication between the blind institutions as to the sale of their goods and the manufacture of their goods, so that they should not compete with each other in the market?—I think that that would be a good thing. I do not know that it is a good thing to stop competition.

12,866. You have plenty of competition with sighted people already?—Yes. I do not think we at Sunderland should try and get orders in a town where there is already an institution.

12,867. You would not manufacture the same things as the blind do at Newcastle?—Yes, we would manufacture the same things, but we should not go into Newcastle to sell them.

12,868. Could not blind institutions agree to manufacture certain things, and then agree each to sell the goods of the other as there might be a demand for them?—No, I think we should each manufacture according to the demands of our own neighbourhood, and supply articles to each other if we can sell them as cheaply as they could be got elsewhere.

12,869. Do the blind children who are taught in this school at Sunderland have any gymnastic training?—Yes, gymnastic training has lately been introduced.

12,870. They have to walk two or three miles?—Yes.

12,871. They get that exercise?—Yes; they play about in our institution yard, and they are very happy.

12,872. So far as you know, are there any blind children left outside the school?—So far as we know, there are not. We would inform the school board immediately we heard of one, and the school board would look the child up.

12,873. Is there any regular machinery by which the school board find out whether there are any blind children that do not go to school?—Suppose we came across a blind child, we would let them know. The same machinery exists for the blind as for the sighted.

12,874. Do you know anything about the United Kingdom Association of the Blind?—All I know about it is that some of the men got it up among themselves. They thought it would be a valuable thing if amongst the blind themselves they could have intercommunication, and thus get to know what was going on in different towns with regard to the blind, and if they could have the means of consulting each other as to the best means of furthering their own welfare. I think the blind people themselves, perhaps, know their wants best. My information with regard to the blind was got a good deal from the blind themselves.

Miss Byers.

5 Nov. 1886.

12,875. Do you know whether the association has received any great amount of support over the whole kingdom?—I think a very considerable amount. If carried on on a right basis it might do a very great deal of good, whereas, if wrongly conducted, it might not be beneficial.

12,876. I suppose you find that your selling goods made by sighted people leads people to buy goods made by the blind themselves?—I quite think so. If a person buys one thing at the shop, he is very likely to buy another.

The witness withdrew.

Mrs. Jane Chambers examined.

12,877. (*Chairman.*) You are one of the committee of the Home Teaching Society and Workshops for the Blind, in Cornwallis Street, Liverpool?—Yes, and have been since its commencement. My husband was the first secretary, and the first promoter of the institution with Miss Wainwright, the aunt of the lady who is our present honorary secretary.

12,878. What is the special object of the work outside the institution?—To visit the blind.

12,879. We understand that you have also a class for blind children?—We have a school for blind children. We assemble all the blind children that we can get together twice a week in our board room at the workshops. It is difficult to get them together more than twice a week, because there is a difficulty about the guides. We have a very competent and clever teacher, with an assistant, who teach the children in that room twice a week. Then on other days in the week our teachers, of whom there are four, call upon the children and carry on the lessons so far as they can, and the grown up blind people, who cannot read, they teach to read. The town is divided into sections, and three of our teachers are always out reading to the old blind persons, teaching those who do not know how to read, and supplying them with books.

12,880. What are the ages of the children?—From three years upwards, some of them being 18 or 19.

12,881. Do not you think that blind children should be sent to school in the same way as other children?—Yes, if they could be protected, and if they could have a special teacher; but they require more care in teaching. If you ask a child after a lesson to explain what it has been taught, you find, unless it has had some object lesson with it, that nothing has been conveyed to the child's mind. There ought to be a great deal more object-lesson teaching for blind children.

12,882. Do you think that infants, say from three years upwards, should be formed into a class, and taught as soon as possible?—Yes, in cottage homes for young children; nothing else will do in the case of poor people, because they neglect the children so much.

12,883. Do you think that such cottage homes should be, like infant schools, under the general education of the country?—Yes, if the system could be carefully carried out. Very young blind children, I think, should be maintained and educated in cottage homes, because they require protecting so much. We find from our experience that all our teaching is thrown away where the child returns to its home and the parents are careless or incapable of teaching them anything.

12,884. You are speaking of the poor parts of Liverpool especially, are you not?—Yes.

12,885. Not of the country districts?—No.

12,886. Their maintenance would be a matter for private charity?—We find very little difficulty with regard to that. Miss Wainwright has some cottage homes in which the children get on remarkably well, and we find that those children, when they are brought into the workshop to be taught a trade, learn their trade in half the time that others would, because they have been taught to use their fingers.

12,887. You think that they ought to be taught from an early age to use their fingers?—Yes; the immense trouble that we have in teaching blind children is because they have been neglected; there is scarcely one in a undred who will teach a blind child anything; they are kept entirely untaught. I could tell you of many such cases.

Mrs. J. Chambers.

12,888. Of course, in the case of poor children, the earlier they can be taught to earn their own livelihood the better for themselves and for the rates?—Yes. We have some boys and girls who were educated in Miss Wainwright's homes who are now earning their living. The girls are earning up to 10*s.* a week at brush making in our workshops. The moment they are competent to learn a trade we draft them into the workshops. We pay them a small sum while they are learning their trade, and then they work by piece-work after that.

12,889. What number do your cottage homes hold?—14, or 16, or 18; there are two little cottages. Twelve would be quite as many as it would be well to have in a cottage home.

12,890. Are they full?—No, I do not think they are quite full at present.

12,891. Do you think that in Liverpool every blind child is known by the school authorities?—As far as they are able to get to know.

12,892. Do you apply for assistance from the school board or from the guardians?—Guides are paid for in some special cases by the Home Teaching Society. The guardians have in one or two instances paid for maintenance of very poor children in the cottage home at the rate of 5*s.* per week each. Parents pay part when they can and will, and kind friends also help.

12,893. Has it ever been urged upon the Liverpool School Board to provide classes for the blind children?—We have not asked them to do so.

12,894. Why have you not asked them to do so?—I do not know why we have not asked them. We have had many blind children taught with the other children in the national schools, and only one or two have succeeded; they do not succeed there because they get so knocked about, and they become so nervous that we have had to take them away. One boy, who was at the national school, is at Norwood, he was a clever, intelligent, bright boy, not a nervous boy, therefore he got on well, and he has earned himself a scholarship; but we have had to remove many others from the national schools.

12,895. Would not dissociating them from their seeing schoolfellows tend to make them still more nervous?—Yes, I think so, except in the case of the very young. I think Miss Wainwright and I agree that the national school system would be good, provided they could have suitable teachers; a young pupil teacher would be very unfit to teach blind children.

12,896. If you could imagine that a pupil teacher would take the trouble to learn Braille, in order to teach blind children a class, that would show an amount of interest in the blind from which it might be inferred that she would be able to deal with, and teach blind children, as has been found to be the case in Glasgow?—We find from experience that the older teachers are more patient and considerate with the blind, and that they bring them on better. A certain training is necessary to understand the minute teaching needful for blind children.

12,897. Of course if the Government were to give a grant for the blind children, it would have to be a larger grant than for the sighted, in order to pay for the

Mrs. J. Chambers, 5 Nov. 1886.

extra expense; I presume you would recommend that?—Yes. Then also the blind need a playground very much; blind children do not get any exercise; all our young blind children are stunted.

12,898. They take no exercise?—No; if a separate playground could be arranged for them, it would be a great help to them.

12,899. That would rather lead, would it not, to a separate institution for the blind?—I do not think it need necessarily.

12,900. You could not have all the apparatus for gymnastics for a few children?—There might be a room arranged in a national school.

12,901. That would have to be for a certain number of children?—Yes.

12,902. You would have to collect blind children under the school board in a common centre, or in one or two centres, in a place like Liverpool?—Yes, in one or two centres, and then if they are examined they should not be expected to pass in the standards applicable to sighted children; they are so very different to sighted children.

12,903. I suppose blind children vary in capacity as sighted children do?—Yes.

12,904. But allowance would have to be made for their infirmity?—Yes, and for the way in which they have been brought up, many of them only beginning to learn at an advanced age.

12,905. Have you any acquaintance with the deaf and dumb as well?—Yes, I have had a little.

12,906. Do you ever take any deaf and dumb and blind children?—Yes, we had one who was found by our blind teacher; she was about 14 years old when she was found, and she had not had an idea conveyed to her for seven years; she was left in bed by her mother, and treated, in fact, as if she was an imbecile. Our teacher found her and taught her the deaf and dumb alphabet, and communicated with her. She became quite an intelligent young woman, and came to our workshop and earned her own living for some years. Many of our blind children are rather deaf.

12,907. What do you think should be done with blind children after they have left school?—They should be taught trades. While they were in school they should be taught to use their hands. We have a large class of boys and girls whom we teach in our workshops; we put them as soon as we can with our men or women in the workshops.

12,908. Are they kept in the institution, or do they go to their own homes?—They go to their own homes; it is very much better for them to do so.

12,909. How do you deal with boys with no friends, or with vicious homes?—We get lodgings for them with decent people, and if we can we get the guardians to pay so much; if not, we get some lady to help them. The institution will often pay 1*s.* or 1*s.* 6*d.* a week to help them, and in that way they live. Many boys we are obliged to take away from their homes, girls also, and place them, not two together, but singly, in nice cottage homes where we know something about the people.

12,910. How do they manage to come to the workshops—who leads them?—They generally get to know some one who will guide them.

12,911. Do they get some one to guide them as an act of kindness?—They always have to pay; that is the difficulty with the blind. Children who would be guides are at school, therefore it is difficult to get guides; there are very few of them who are independent enough to walk alone. We think, if they were properly trained when young, they would be more able to go about by themselves.

12,912. With regard to people who became blind late in life, what do you think should be done with them?—We have talked that over. We find if they do work it is very inferior work—we cannot sell it; it is all loss. Small annuities are best for them, and then they would eke out their living in other ways; they would go about selling things; many of them sell papers in the street.

12,913. Do you think they should be treated in a more liberal way by the guardians than other poor people?—I am sure they ought.

12,914. Would you suggest that they should have a more liberal grant of outdoor relief, or that they should be put in a special ward by themselves?—They are very much happier at home, where they can live with a son or a married daughter. I know several cases now of old people, husband and wife, who have lived happily together all their lives; they do not want to go into the workhouse, and it would be very hard for them if they were obliged to do so; but if the guardians would give them a little more, perhaps, than 4*s.* or 5*s.* a week, they would manage to live what they would call comfortably; but the guardians require them to come into the workhouse.

12,915. They impose the test, in fact?—Yes.

12,916. The blind would rather starve than go into the workhouse in many cases?—Yes, in many cases. Our teachers know them well, because they visit all the blind people in Liverpool, of whatever denomination.

12,917. Do they give them assistance?—We do, as much as we can. Our funds do not admit of our giving them very much assistance; still, we never allow them to starve if we know it. The adult blind who are in the workshops are really well off in comparison with other workpeople, remarkably well off now, because they are never dismissed. We always keep them, whether trade is good or bad; and just now, if we could enlarge our institution, we could take in a very great number. There are always a number on our books that we cannot admit, and we find, from applications, that we have had, both from the School for the Blind in Hardman Street, and the Roman Catholic one, that a number of them would be glad to come, because they can live at home with their friends—they look upon that as a great boon.

12,918. Is there nothing that the blind can do in the shipping trade in Liverpool?—Yes; we get a great many orders from the large steamship companies. We also have orders from the Corporation for the brushes that they use, and from the railway also. They make cork fenders remarkably well, I believe, in our workshops, and we used to do rather a large trade in mattress making.

12,919. We heard of the blind being employed in drawing bolts from the old plates of steamers, are any blind engaged in that work in Liverpool?—No, not that I know of. My late husband got the shipbuilders to take an interest in the blind, and in his lifetime they employed the blind to a much greater extent than at present. I suppose all people think workshops are the best for the adult blind.

12,920. (*Mr. Johnson.*) Is your society associated with the Home Teaching Society for the Blind in London?—It is not connected with it at all. It may be on the same principle.

12,921. Is it not connected with the society in New Bridge Street, Blackfriars?—No. We use Dr. Moon's books for the adult blind.

12,922. I see your society is in the list of London and Provincial Home Teaching Societies for the Blind in the Report of the Home Teaching Society for the Blind. Do you get any books from that society?—We get books from Dr. Moon direct.

12,923. Do you have to pay for them?—We pay for them generally. Sometimes we have a small grant.

12,924. Have you had any grant from any other institution for books?—Not that I am aware of.

12,925. You advocate the use of Moon's type principally?—We do for our workpeople. Our young people learn Braille; but when men or women begin to work, their hands get hard, and they cannot feel the Braille characters, so that it would be no use putting Braille before our workpeople; but for the young, and those with delicate hands, of course, Braille is very nice.

12,926. Do you advocate any other system of embossed printing?—No.

12,927. Do you advocate any system of writing by which the blind would be able to communicate with the sighted?—Only Braille.

12,928. You do not teach them writing by the ordinary system?—We do not.

12,929. When I was at Liverpool, I think Miss Wainwright said that one child attended a sighted school; can you give us any evidence about that child?—That is the boy I was speaking about just now, who is now at the Norwood School. Another boy mentioned, eight years of age, attends a national school now, but does not seem to learn anything but poetry.

12,930. If he is at Norwood, he is at a blind school?—Yes, he was at a sighted school, Higher Grade School, Park Hill Road, and he showed himself to be so clever, that a special arrangement was made that the boy next

Mrs. J. Chambers 5 Nov. 1886

to him should help him, and a special arrangement was made with the teachers also that they should push him forward from class to class, and in that way he became very well educated, and he obtained a scholarship.

12,931. While he was at that school, was he taught Braille, or to cypher by the ordinary appliances by which they teach the blind arithmetic?—No; he had learnt Braille in the home, and was allowed to write his lessons in Braille at the school, dictation, essays, &c., correcting them with the other boys. The school work was always supplemented by teaching at the home, and Cornwallis Street classes, for which he was allowed to absent himself from the seeing school two days in the week. This boy was a very quick and intelligent boy; he was not nervous, and he got on well with sighted children.

12,932. With regard to boys who have left school, you say in some cases you take them away from their vicious homes and lodge them out. How do you manage that?—We should look out for some respectable person as near as possible to our workshop, and pay so much a week for the boy, 5*s.* a week. The poor are very kind, and they will take a blind boy for that, and give him his bed and his food. We should know something about the people with whom we placed the boy through some lady district visitor, or some of our friends. Possibly we might get the parish to pay so much, and some lady would pay the remainder.

12,933. Is there any objection on the part of boards of guardians to find the money for lodging them out at that age?—Yes, there is a great difficulty in getting them to do it.

12,934. What is the maximum that they pay when you do get them to pay anything?—I should think 2*s.*

12,935. Not more?—No, 1*s.* 6*d.* or 2*s.*

12,936. The principal expense of lodging them out is borne by private benevolence?—Yes.

12,937. Do you think that it would be an advantage to have a large boarding house for the elder workmen—for those who are working in the workshops?—No, we think that they are better in their own homes, because their people take an interest in them, and they can easily get some one in the family to act as guide, and they get taken to places of amusement and to church, and they get help in a variety of ways. We did think of starting a home for our women, but we thought it better that they should lodge in their own homes. We had thought of taking a house that would accommodate eight or ten; but the blind get tired of living together, and they are glad to get with sighted people.

12,938. You have found these cottage homes answer, and you think they would answer if they were more fully developed?—Yes, we should like more cottage homes; they answer remarkably well.

12,939. Do you give all the children a dinner on Tuesdays and Thursdays?—Yes; lobscouse is given merely through the private benevolence of a lady through the winter months, as some of the children are so very poor.

12,940. I suppose that is to a great extent an inducement to persons to send their children?—It would make no difference in their attendance, as most of the children enjoy coming to school so much, that they give their parents no rest till they bring them or send them.

12,941. You give them no guide money?—No, we never give guide money. When I say never, in some case we do, where the blind child or the blind person could not get to the institution without arranging with someone.

12,942. (*Dr. Tindal Robertson.*) With reference to the condition of the children in the cottage home that you have spoken of, is their mental condition equal to that of sighted children?—Yes, after they have been trained.

12,943. Taking them as a rule?—Yes, quite.

12,944. Do you think that their physical condition is inferior?—Yes, I think it is.

12,945. I mean after they have been at the home for some time?—They are very healthy, as a rule, at the home, but they do not develop as they ought.

12,946. Before they come to the home, do you think that their physical condition is equal to that of sighted children?—Not as a rule; they are always pale and small.

12,947. Is there any system of physical training of any kind at the cottage home?—Every day; also a walk with a young teacher, partially blind, who, under the guidance of the head teacher, superintends their home lessons; and in summer time they go to play in the park.

12,948. Are you of opinion that a very important part of the education of blind children is the development of their physical condition?—It would help them very considerably.

12,949. Therefore you would think it advisable, in such homes as you have been speaking of, that some proper system of gymnastics should be adopted?—Yes, that is what they want very much.

12,950. What is the difficulty in introducing gymnastics at the cottage home?—The want of room. The cottage home consists of two little cottages, with a door of communication between.

12,951. Is there any kind of playground?—There is a sort of backyard. The cottages are in a very nice, healthy locality, and are such as our children would or ought to live in if they were with their parents. We think it would be very unwise to take them into anything better. We find, when they go from this home, with everything refining about them, to their own, they feel the difference very much.

12,952. (*Rev. C. Mansfield Owen.*) Have you ever interested yourself in the question as to the comparative causes of blindness?—Yes, it is generally from sickness, neglect in infancy, or accident; very few are born blind. We have only had one in our institution who was born blind.

12,953. Do you know of any preventive treatment being resorted to?—No.

12,954. Do you find that the blind belong to the poorer classes as a rule?—Yes, they go blind, many of them, from neglect after fevers and things of that sort.

12,955. (*Mr. Arrol.*) You give the children dinners free; I suppose you give them education also free?—Yes.

12,956. How many children may you have under tuition?—Between 30 and 40, that is, who come to school, there would be more at home that we cannot get to come to school because they have no guides.

12,957. You have expressed an opinion that it is very difficult to impart to the mind of the blind a proper estimate of the subject that is being taught; what appliances have you for giving the blind a definite idea of the subjects you are giving them lessons in?—Suppose a thing that was round was described, the word "round" would convey nothing to their mind, you must put something round into their hands.

12,958. Once they have ascertained what roundness signifies by putting a round object into their hands, they do not require to have that object brought before them again?—No, they are very quick in remembering.

12,959. The mind of the blind is, in a sense, a blank?—As to shape.

12,960. The want of knowledge on the part of these blind children is due to the failure of their parents to impart any instruction to them at home?—Yes, they do not teach them; there is not one in a hundred that will take any trouble with their blind children; they have not time for one thing, and if they had, they have not either the knowledge nor the energy to teach them themselves.

12,961. In Liverpool, apparently, among the poorer classes, the parents of blind children are very careless and indifferent with regard to their children?—Yes, sometimes through a mistaken idea of kindness.

12,962. Might not that difficulty be got over by making it compulsory to send all children, whether blind or sighted, to school, to a national school or to a board school?—It might be, but we have not been able to get over the difficulty; we have been trying in every way we could to induce parents to send their children to school.

12,963. Has your society ever approached the school board with a view to endeavour to get them to take blind children into the sighted schools?—I do not think so. We have placed them in the school in Prince's Park because we knew that we could get special attention for them there that they would not get in any other places.

Mrs. J. Chambers.

5 Nov. 1886.

12,964. It being the fact that in London the school board educate a large number of blind children, would you be disposed to recommend your society to try to get the school board to take the same action with regard to the education of blind children in Liverpool?—There are so many things to be considered in connexion with the blind, that I would rather not say off hand that I would be prepared to make such a recommendation.

12,965. Admitting that it is a great evil that parents should neglect their blind children, do not you think, that in providing these cottage homes, and relieving the parents of their parental duties by taking charge of the children, you are perpetuating that evil?—Yes, we think that it has done harm in that way, but if we are to help the blind, we are obliged to do it. We do not think it a good thing to take children away from their parents, but we find that they neglect their children.

12,966. If any means could be adopted by which parents could be got to recognise their responsibility, and train their children properly at home, you would dispense with the cottage homes?—Yes; if you saw some of the homes of these blind children you would see that it was impossible to deal with them, except by taking them away from those homes.

12,967. You are connected with the Home Teaching Society for the Blind?—Yes.

12,968. In respect to the adult blind, who are not engaged in the workshop, does the Home Teaching Society for the Blind endeavour to find those adults occupation?—No, our Home Teaching Society for the Blind is a sort of handmaid to the workshops. Wherever we find a blind person capable of learning a trade, we take him into the workshops, and we endeavour to teach him a trade.

12,969. If there is no room, or if they are too old to be taught a trade, do you endeavour to find them occupation?—We endeavour to help them in every way we can, but they always work at a great disadvantage.

12,970. (*Dr. Armitage.*) Are the children in your school drilled at all?—Yes, there is a room in our workshop where we assemble them twice a week to go through a little drill.

12,971. Do they use the gymnastic exercises?—Just the ordinary gymnastic exercises.

12,972. What kind of drilling do they go through?—They do not use poles.

12,973. You put them through different movements of the body?—Yes.

12,974. Does your teacher conduct those exercises?—She does at present.

12,975. Is she certificated?—Yes; she is a very able teacher.

12,976. Have you any Government grant for your school?—No.

12,977. Have you thought at all of applying for a grant, and putting your school under inspection?—No, we have not.

12,978. Is there any objection to that that you can see?—I do not know; that is a point that I have not thought about at all.

12,979. Have you any kindergarten teaching?—Only in a very small way; the children are taught to plait and do things of that kind.

12,980. Have you a collection of objects?—Yes, some.

12,981. Stuffed animals?—Yes, but only small ones, just a few. We have not room for them in the little cottage home; we are always rather cramped for money. We want all our money for books and our teachers really.

12,982. You have not a collection of objects in the school?—No, only just a few ordinary things.

12,983. Do your children learn modelling in clay?—No.

12,984. Do you think it would be desirable to teach them to model in clay?—I should think it would.

12,985. You say that Braille and Moon are taught in the school?—Yes.

12,986. In what way?—The young children are taught both; they can feel the Braille letters very well when they are young, but we find when they come into our workshops they are not so well able to feel the letters, and as they are all going to learn a trade after they leave school, we teach them both Braille and Moon, because we find when they begin to work, that they cannot keep up the Braille system.

12,987. Do they both read and write in Braille?—Yes; they write it very quickly.

12,988. Have you any school books in Braille?—I think not; I think our books are all Moon's.

12,989. How can they read it if they have no books?—They have things written for them.

12,990. They have no books for reading?—In the cottage home they have various Braille books, and in the classes, Braille as a writing lesson, and read afterwards,

12,991. Is there any reason why Braille books are excluded from the school?—I am not quite so well able to speak to this as our teacher would be, but as far as my knowledge goes it would be because our children are poor. We know they will have to earn their own livelihood, and we know from experience that they are obliged to use Moon after they begin to work; their hands get hard, and they cannot feel the Braille. Many of the adults write and read it, but they are people who are not employed in basket making and brush making.

12,992. I did not quite understand whether it is part of the work of your home teachers to find employment for the blind outside of the workshops?—They bring their reports to us, and they tell us about the people who are not doing any work; then if we can in any way help them by procuring them work, we do so, or if they are sick, we endeavour to give them help.

12,993. Do you find that in fact the blind people cannot get any work outside your workshops?—Yes, that is the case, unless we put them into some business.

12,994. They do not do manual work outside the workshops?—No, they cannot do it, except in a few cases of brush mat-making and plaiting for chain mats.

12,995. Are your home teachers blind or seeing?—Seeing. When the Home Teaching Society began, we had blind teachers, and blind overlookers in the workshop, but it was found to fail entirely. We find we get on very much better with sighted teachers.

12,996. You used to have a blind teacher, Miss Stout?—Yes. The difference in our classes now that we have a sighted teacher is remarkable. A blind teacher could not possibly see the habits that the blind children acquire. They get on much better with a sighted teacher.

12,997. (*Mr. St. John Ackers.*) You were asked just now whether you had ever applied for a Government grant for your school; your children only come twice a week to the school?—Yes.

12,998. It would be, of course, impossible to get a grant with such irregular attendance?—Yes; we cannot get them oftener because of the difficulty in getting parents to send their children. They find a difficulty in supplying guides, I suppose.

12,999. You spoke of a deaf and dumb blind girl; was she so from birth?—From nine years of age.

13,000. You spoke of her having been seven years without having had any knowledge conveyed to her?—Without a new idea being conveyed to her.

13,001. From that I gather that up to the age of seven she had had all her faculties and had received some amount of education?—Without referring to an old report, I should not like to say positively whether that was so.

13,002. You do not know how far she was indebted to previous training for her success in after life?—No, it was the blind teacher that Dr. Armitage mentioned, Miss Stout, who found her and taught her.

The witness withdrew.

Mr. George Goodwin examined.

Mr. G. Goodwin.

5 Nov. 1886.

13,003. (*Chairman.*) You are schoolmaster at Henshaw's Blind Asylum, Old Trafford, near Manchester?—I am.

13,004. How long have you been there?—Seven years last May.

13,005. What had been your previous training?—I was not trained to be a teacher, I was trained to be an engineer. Previous to teaching at Henshaw's I was assisting my sister at a young ladies' school in certain subjects.

13,006. You became blind after you had been for some time in practice as an engineer?—Yes, I was practising as a mining engineer.

13,007. Have you taken much interest in the industrial training of the blind?—Not so much as in their education. Of course I take an interest in anything connected with the blind, being blind myself.

13,008. Have you any strong views about the education of the blind, with regard to its being compulsory?—Yes, I certainly think that the same compulsion ought to be exercised in the case of blind children as in the case of sighted children; in fact it is more necessary. If it is necessary in the case of sighted children, it is more necessary for the blind, because they are really useless if they are not educated.

13,009. You think the State should give a grant in the case of blind children as it does for other children?—Yes.

13,010. And that the grant should be proportionate to the extra cost of their education, I presume?—Yes. We find when they come to us that they are very helpless, they are not admitted into our institution till they are nine years of age.

13,011. Do you think that too late?—Very much too late. When they come to us they are very helpless, and it is some time before we can do anything with them.

13,012. You would say that they ought to go to school at six years of age at least?—Yes.

13,013. Do you think that they should go to an infant school first?—Yes, an infant school in an institution, where the children could get the benefit of some light kind of teaching, such as kindergarten, so as to make them more helpful.

13,014. Do you think that teachers of the blind should have a special education, or do you think that they should be taken from the ordinary class of schoolmasters?—I do not think it necessary that they need be specially educated. A sighted teacher can soon pick up the use of the different appliances.

13,015. Do you think it advantageous for the blind that they should be taught by a sighted teacher?—I should prefer a blind teacher.

13,016. On what grounds?—To begin with, being blind himself, he has sympathy with his pupils, they place more confidence in him. Besides that, he has gone through the difficulties himself, and he knows what they are. If he has been blind from childhood he has had to be educated himself on the blind system, and he knows what the difficulties are, and he can better help the blind children that he is teaching to overcome them.

13,017. Do you think that he is able to detect and correct the faults of manner and tricks of the children in the same way as a sighted person would be?—Of course he could not see, for instance, any grimace that a boy was making; he would not be able to detect it as a sighted person would.

13,018. Do you think that the discipline of the school can be kept up as well by a blind teacher as by a sighted teacher?—From personal experience I can say that it certainly can. I do not think that you would find any better discipline than in my own first and second classes at Henshaw's; the discipline in them is perfect.

13,019. After the boys have left school, how would you propose that they should be dealt with?—It depends on the capacity of the boy. I do not approve of teaching every boy that comes into the school music, whether he has a talent for it or not. I think in the case of some boys who are taught music it does them harm rather than good; after they have been learning music a year or two, perhaps it is found that they have not sufficient talent to enable them to become proficient in that particular branch, and they are taken off music, then their parents take them away from the institution, and they are running wild in the streets, or perhaps they have picked up enough music to enable them to go and play at public-houses and such places. I think it does very great harm to teach boys music when they have not any talent for it; and I think it should only be taught to those who have a decided talent for it, and who are likely to make a living by it.

13,020. Do you think that the blind should be helped in the direction of enlarging the number of trades which they can work in?—Yes, I do. I think there are a number of talented blind boys who are not musical who ought to have a wider field open to them; there are boys who are capable of going to colleges, or to a university, and taking degrees, and becoming lecturers or ministers of different denominations, or solicitors. We have blind men in each of those professions. Such boys have a decided taste for literature, and they have become clever as assistant teachers, and I think that institutions ought to open their doors to them and accept them as teachers instead of sighted teachers. I do not agree with keeping a boy on as an assistant teacher in the same institution that he has been brought up in. He has not the same authority over the boys as he would have in another school. I have found that myself from personal experience with our own pupil teachers.

13,021. With regard to the industrial training of a good number of the blind who have no talent either for music or for literature, what system do you think is the best for them? do you approve of a system of workshops in all the large towns?—Yes, I do. I think that a blind workman has a much better chance in a workshop than he has either by beginning himself and trying to get sufficient work, or going into shops with sighted workpeople. In many cases they will not admit blind workmen there at all.

13,022. Do you think that the blind workmen employed in those workshops should receive any more than they earn?—That depends upon circumstances. At first it would be rather hard work for them to earn enough to maintain themselves.

13,023. At first it would be necessary to give them more than they earned?—They might not be able to earn enough at first to live on, but afterwards it would stimulate a man more if you let him feel that he must earn enough to live on. He would become a better workman necessarily, and none but efficient workmen should be admitted in out-door shops. In the first place, if they know that they will not be paid more than what they earn, they will remain in the school long enough to become efficient. In many cases they have left institutions before their trade teacher has believed them to be sufficiently well educated to begin for themselves; and in the second place, they are more likely to gain a reputation for the work turned out, and to keep up that reputation.

13,024. With regard to pensions or annuities for the blind, do you think they are utilised in the best manner possible?—I do not know very much about them. I think it is necessary if a person becomes unable to work through illness, that he should have an annuity. It is not pleasant for a man after he has been striving to gain a livelihood to feel that he must go to the workhouse. I think that help is necessary in such a case, and also in the case of aged people.

13,025. You think that the system of annuities is a good one, by which the blind are relieved in their own homes, rather than in an institution or almshouse?—Yes, I do.

13,026. You are no doubt aware that where annuities are paid quarterly, for instance, there is a danger of the money being misspent?—Yes. At the same time, I think perhaps the blind would feel happier amongst their own friends at home, than they would in an institution. They have the same feeling as the sighted, that there is no place like home.

13,027. With regard to lads after they leave an institution, do you think that if they have no friends, some provision should be made for their being lodged with respectable people, near the workshop?—Yes, if lodgings could be provided at a moderate rate, and with some person to keep their rooms in order for them. I

Mr. G. Goodwin.

5 Nov. 1886.

think it would be an advantage for them to be close to their work.

13,028. Have you any suggestions to make as to the type for the blind; as to whether it should be uniform?—Yes, I believe Braille is the one type for the blind of all others. I have found it so in my teaching. There is no type equal to it in my opinion. A boy after he has learnt Braille, if he has become thoroughly master of it, will drop the others; that is to say, if he is able to write it as well as to read it. And I believe in the Braille with many contractions, for several reasons. I think the contractions save time, save labour, save paper, and save room. It is a consideration to us where to put our books when we get them, and the expense of printing is a very great consideration. I believe in one type, and I think it would be better for our literature to be confined to one type. There are objections made, with very little ground, with regard to the workmen not being able to read Braille. I have not found that to be the case. Boys who pass from my school into the workshop let the other systems go altogether. Where I give out one of Moon's books, I give out 20 of Braille's every week to readers. I find that they read nearly as well after they have been in the workshops for several years, as they did when they left school. The only reason why they do not read quite so well is that they have not the same practice as the boys in the schools have; and I believe that when they get old they will still be able to read Braille as well as they would any other system.

13,029. Those who become blind late in life, find it difficult to read Braille, do they not?—No, I do not know that they do. They might have a difficulty in reading it with contractions, but the simple Braille I do not think they find any difficulty in reading, if it is sufficiently largely embossed. I certainly prefer it to any other. I can say that all the boys that I have ever educated prefer it. I do not know of a single exception. I believe they would read it as well after they have been in the workshop for some time, after their hands have got hard, as they could in school, only they do not get so much practice.

13,030. There is a great need of Government assistance in the way of giving books?—In printing books for us. We want the price reduced, and we want more good school literature than we have now. We have no good standard works, except for the lower branches; we have none for the advanced classes. Some of my boys learn Latin, Euclid, geometry, algebra, and arithmetic; the exercises in all those branches of education I have to write out in my own home. We have not a book of Latin exercises, and I have to dictate the exercise to the boys before they can translate it. And the same with geometry, I have to dictate the propositions, and they have to take them down. It takes up very much of our time; we have to dictate the exercise before they can use it; and so with arithmetic.

13,031. Have any of your boys shown themselves to be of a literary turn?—Yes.

13,032. Have any of those boys turned out successes?—Yes, two are teaching amongst us now.

13,033. Have you had any who have gone into any of the liberal professions?—No, there is no opening for them.

13,034. We have heard of one blind solicitor and several clergymen?—They were the sons of gentlemen who could afford to send them to Worcester College.

13,035. Without that you mean there is no opening?—No.

13,036. I do not know whether your teaching is of a sufficiently high class to enable them to take a degree?—Not to enable them to take a degree. I think there ought to be some place to send them to where they could be prepared to matriculate at the universities. There are some boys who are decidedly clever, and work their way up, who are not musical, and there is no opening for them. We know that we have nowhere to send them to. The only opening for them is the workshop if they are not musical.

13,037. (*Mr. St. John Ackers.*) Are you a graduate of the University of Cambridge?—No.

13,038. Were you at any university yourself?—No, I was at a collegiate school, not a university.

13,039. We have been told that the boys in your institution are not apprenticed, and that they leave very early, and many of them fail as workmen afterwards. Can you tell me whether there is any reason why the blind should not be apprenticed?—No, I do not know of any reason.

13,040. Would not it be a very great advantage if the stay of the blind children in the institution in which they were being taught a trade was such as to enable them to learn the trade properly?—Yes; I believe they are taken away sometimes because their parents are offended at little things, and they run about the streets, or are sent to other institutions where they have to begin over again. I think as well as being compelled to send their children to such institutions the parents ought to be enabled and compelled to keep them there, and not be allowed to remove them for any trifling cause.

13,041. After they have gone through your school, and the time has arrived when they are to be trained as workmen, at present you have no hold upon them?—No, they can leave when they like, and they leave before the trade teacher considers they are efficient.

13,042. (*Dr. Armitage.*) Have you any special knowledge with regard to blind teaching. You say you were trained in a collegiate school; were you also trained at a blind school?—No, not before I came to Henshaw's school. I did a little teaching amongst the blind in my own neighbourhood, just teaching them to read a little.

13,043. The knowledge you have of the blind system of teaching you have acquired yourself?—Yes.

13,044. How long have you been at Henshaw's?—Between seven and eight years. Then I had a very good education before I commenced teaching. I was at a collegiate school near Cheltenham, a school connected with Oxford University, and then I went on with my education after I left there under the Cambridge lecturers.

13,045. Have you at Henshaw's any kindergarten?—No.

13,046. Do not you think that is a desirable thing to introduce?—For young children.

13,047. Is there any idea of establishing it?—It has been talked about a good deal lately, having a museum with models of different things to enable the blind to feel things that they cannot understand the shape of. I find they have the most absurd ideas about the relative proportions of things.

13,048. You say that your pupils after they enter the workshop continue to read Braille. Do the basket makers continue to read Braille?—Yes, it is chiefly the basket makers that I refer to.

13,049. Do they adopt a special plan to keep their fingers soft?—No, I do not think so.

13,050. We have heard it stated several times that one reason for teaching Moon to children who are poor is that they have to earn their living by hand work, and, therefore, that Braille would not be so well adapted for them in after life. Do you think that there is anything in that argument?—No, I do not. As far as I have experience I am certain that it has not any foundation. I believe they prefer the Braille; they drop the Moon when they go into the shops, and continue the Braille.

13,051. You complained of the small number of higher class books that are published, especially the Latin books; do you use the books that are printed at Worcester?—We use the grammar, and I have the First Book of Cæsar, from Worcester. Of course Cæsar is for more advanced pupils. What we want is exercise books and a comprehensive vocabulary.

13,052. Is there any objection to the Worcester books on account of the price?—No, I do not know that the price is much higher than the association books.

13,053. Do you use Nepos?—No; one reason is that it is in the ordinary Worcester type, and not in Braille.

13,054. Nepos is in Braille; we publish it; is there any reason why you do not use it?—No; that is more advanced than the books I am speaking of.

13,055. Would there be any considerable demand for such books as you speak of?—I think so, particularly in the education of music pupils, who ought to have a rather more advanced education than the boys who are going into the workshops, to place them on the same footing as sighted music teachers.

13,056. Can you give us any idea how many such books would be wanted by your pupils?—No; we hardly ever take less than a dozen of such books as we can obtain from you.

Mr. G. Goodwin

5 Nov. 1886.

13,057. You think that about a dozen would be wanted?—Yes; we require a geography. We have no advanced geography. Of course you have done a great deal for us, but if we had State help more could be done. We are very pleased with what you have done for us. We should be in a bad position if it were not for the work you have done for us. All blind people acknowledge that.

13,058. Do you know at all what number of blind people, whether educated at Henshaw's, or Worcester, or anywhere else, are earning their living by pure literary work as clergymen, or solicitors, or teachers, or in any other profession?—I could not tell you the number. I know of several, but I could not tell you what the number is. I think if a field were opened out for them many more would enter those professions. There are many intelligent blind boys who might become clergymen, or members of the professions, or might be trained to be good teachers.

13,059. Have you turned your attention at all to the question whether there is any opening for blind men and women as teachers of languages to the seeing?—No; I have heard a little about it, not much.

13,060. Is that an employment which you think you would recommend?—No.

13,061. (*Mr. Arrol.*) Would you be disposed to recommend that the blind should be educated along with the sighted, say from 7 to 14 years of age, supposing all the modern appliances for teaching the blind to be used in the school?—No, I prefer their being educated in a blind school, where there is every appliance for teaching the blind.

13,062. I am assuming that all the appliances were provided; would you not then be disposed to recommend that?—No; in a blind institution the teachers concentrate all their efforts on teaching the blind; they are not thinking about the sighted, and I think they are more likely to be successful in teaching the blind than teachers in a sighted school would be.

13,063. Do not you think it an advantage to the young blind to be associated with the sighted?—No.

13,064. So as to enable them to acquire habits of self-reliance?—No; in their own homes we find they are spoilt or neglected. In some cases, where everything has been done for them, they are not made self-reliant; they are made more self-reliant with us.

13,065. You have no experience of children who have come to you from a sighted school?—Yes; we have had many who have been to sighted schools, and they have always been neglected.

13,066. You think there is more sympathy felt by a blind man for those who are blind than by the sighted?—Certainly.

13,067. (*Rev. C. Mansfield Owen.*) Have you a regular system of religious instruction?—We have.

13,068. Each day?—Not each day. We take a regular course for the examinations. Every day in our institution the Scriptures are read by Mr. McCormick or my colleague in the school night and morning.

13,069. I am referring to religious instruction. How many days a week have you religious instruction?—We prefer long lessons to short ones. There are two Scripture lessons a week in the school and one on Sunday.

13,070. You say long lessons; what time do they occupy?—An hour and a quarter—a little over an hour. We find it more convenient to give long lessons than short ones; there is not so much time occupied in taking books out and putting them in.

13,071. (*Mr. Johnson.*) Yours is a Church of England school?—Yes.

13,072. And you have a chaplain attached to it?—Yes.

13,073. Does he take any portion of the religious instruction?—He holds a service once a week and gives an address.

13,074. So that a thoroughly religious education is given in the school?—Yes. I should be very sorry to teach in any school where such religious instruction was not given. I believe that the Bible is the groundwork of all education. I should always stand to that principle.

13,075. You were saying something just now about the higher education of blind people, and you mentioned the Worcester books; have you found any difficulty amongst your pupils of the higher class in reading those Worcester books?—Yes, in reading the Worcester type; the boys do not take to it at all.

13,076. Do you teach Latin by the Worcester books?—By the Worcester Braille.

13,077. Not by the Worcester type?—No.

13,078. Have you had any experience of any boys who have been to Worcester?—No.

13,079. You do not know the course of instruction which is carried on there?—No.

13,080. Are you aware that Worcester College has produced a good many clergymen and lawyers?—Yes; if that college were thrown open to the blind, if they would allow more scholarships, I believe it would be a very good thing.

13,081. From what you know of it, do you think it is well conducted?—I believe it is an excellent school. I believe Mr. Foster is doing splendid work. At the same time I do not believe in their special type.

13,082. You think the college might be more fully developed by its doors being thrown open for the admission of blind boys from other institutions who had shown themselves to possess intelligence and capacity?—If the college were thrown open so that boys at institutions might compete for scholarships there, and go on with their education there, it would be a very good thing. Mr. Foster prepares his pupils for matriculation for the universities.

13,083. You are aware that the blind generally know that there are open scholarships there?—Yes, just a few, and it has only been just lately.

13,084. You think that there would be an advantage in increasing number of scholarships?—Yes, and if the standard was not too high.

13,085. With regard to music, I understood you to say that you thought that music ought to be taught only to boys with a decided talent for music?—Yes.

13,086. Have you had any experience of the success of boys in after life who have been trained in music in your institution, do you know whether they get a good living by it?—Not a very great many have gone from our institution up to the present time; we have some very well advanced in music now who will be going out shortly, one named Turner, who went from us to Norwood College, has been doing well.

13,087. Several have gone to Norwood College from Henshaw's, have they not?—Yes.

13,088. What has been the result in the case of those who have been sent to Norwood College?—This boy, Turner, has done very well; another, named Crank, went in for tuning, and I believe he is likely to do well.

13,089. Do you know what Crank does now?—He is trying to establish a business as a tuner in Manchester.

13,090. Have you any idea what Woodhall, another of your pupils, is doing?—No.

13,091. I understood he earned about 10*s.* a week all the year round?—I have not heard that.

13,092. Do you know what Stewart is doing?—I do not know him.

13,093. Then you know very little about the result of the musical training in your school?—I do not know very much about it. I believe the teaching is very excellent, the music is of a very high class, and the training is very thorough.

13,094. You think that the master who now teaches music is capable of turning out very well qualified musicians?—Yes.

13,095. You do not think that it is an absolute necessity for the institutions to send their good pupils anywhere else?—Certainly not, because the second institution gets the credit for the hard work done by the first.

13,096. Therefore you are not in favour of sending them to Norwood, or to any other similar college?—No. With regard to the other pupils that we sent to Norwood they were decidedly failures; we sent them to Norwood to go on with their literary education, and we found that the literary education there was not better than our own; and those boys who are now acting as assistant teachers, when they came back were behind boys that were behind them when they went away from us.

Mr. G. Goodwin.
5 Nov. 1886.

13,097. You think that the literary education of your school is as good as any that can be got in the country?—I believe it is, except that given at Worcester College. I am speaking now of a general literary education.

13,098. Do you include music in that?—Yes, I believe the musical education also is quite as good at our institution as it is at any institution.

13,099. (*Chairman.*) Are you a musical man yourself?—No, so that I am not prejudiced at all.

13,100. (*Mr. Johnson.*) How long have you been blind?—I have been blind a little over 20 years.

13,100*a*. You received your education while you had your sight?—Yes; I was assistant mining engineer at the Staveley Collieries, in Derbyshire.

The witness withdrew.

Adjourned to Tuesday next at 11 o'clock.

32, Abingdon Street, Westminster.

Tuesday, 9th November 1886.

PRESENT:

THE RIGHT HON. THE LORD EGERTON OF TATTON IN THE CHAIR.

ADMIRAL SIR E. SOTHEBY, K.C.B.
W. TINDAL ROBERTSON, ESQ., M.D.
B. ST. JOHN ACKERS, ESQ.
T. R. ARMITAGE, ESQ., M.D.
W. AUCHINCLOSS ARROL, ESQ.
F. J. CAMPBELL, ESQ., LL.D.
E. C. JOHNSON, ESQ.
CHARLES FEW, ESQ.
WILLIAM WOODALL, ESQ., M.P.
THE REV. W. BLOMEFIELD SLEIGHT, M.A.
THE REV. CHARLES MANSFIELD OWEN, M.A.
CHARLES E. D. BLACK, ESQ., *Secretary.*

Dr. E. M. GALLAUDET examined.

Dr. E. M. Gallaudet.
9 Nov. 1886.

13,101. (*Chairman.*) You are president of the National Deaf Mute College at Washington?—That is my office. I am president of the corporation of that institution, as well as of the Faculty of Instruction, the corporation being the governing body.

13,102. You were recently at a convention in California of instructors of deaf mutes in America?—Yes; I have here a minute from the proceedings of that convention, which I beg leave to present as a credential from that convention, giving its views with reference to my coming to give evidence before this Commission, which will show the Commission what constituency I represent relating to institutions for the education of the deaf in America; and before I read this minute, I should like to say that at this convention there were actual instructors and principals from 43 of the 67 schools in our country. This convention met in California in July, and it may be taken as having been the largest and most representative convention that has ever been held in America, consisting, as it did, of members from schools of all the different methods in our country. The minute is as follows:—"Minute unanimously adopted by the Eleventh Convention of "American Instructors of the Deaf, at Berkeley, Cal., "July 21st, 1886.—The American Instructors of the "Deaf, assembled in Convention at Berkeley, Cal., "desire to congratulate their professional brethren in "Great Britain and Ireland upon the appointment of "the Royal Commission to inquire into the Education "of the Blind and of the Deaf, and beg leave to express "the hope that the labours of the Commission will "result in the recognition by the British Government of "the just claim of blind and deaf children to education "by the State. We learn with pleasure that the Royal "Commission has invited Dr. E. M. Gallaudet, Presi-"dent of the National Deaf-Mute College, and Chairman "of the executive committee of this Convention, to "appear before them; and we take this occasion to "commend President Gallaudet to the Commission "as one who possesses in the highest degree our con-"fidence and esteem." I hold the office of chairman of the standing executive committee of that convention, which is held quadriennially, and my office as chairman of the standing executive committee places me at the head of the organisation in the interim between its meetings.

13,103. You have had previous meetings?—Quite a number.

13,104. How long have these quadriennial meetings been held?—Since 1851.

13,105. Can you furnish us with any statistics of the number of deaf mutes in the United States; has there been any accurate census made of them?—I am prepared to furnish such statistics. I have a brief statement before me giving some comparative results of figures with references to extended statements, which I am prepared to leave with the Commission, in the form of documents. I may say that during the last 50 years the statistics of the deaf and dumb have been increasingly full in our country, and an interesting question with us has been the proportion of deaf to the general population, and whether or not that proportion was increasing or diminishing. In 1830, out of a white population of 10,532,060, there were 5,363 deaf mutes, giving a ratio of one in 1,964. Ten years later, in a population of 14,189,218 white people, there were 6,682 deaf mutes, giving a ratio of one in 2,123. In 1850, with a population of 19,630,738 white people, there were 9,469 deaf mutes, giving a ratio of one in 2,079. I have given the white population for the reason that it appeared, on an examination of these results, that the enumeration of blacks was very erroneous, so much so that to take the few millions of blacks in our country in those three decades and mass them with the whites, would give an entirely erroneous impression as to the proper proportion, so I leave them out up to 1850. In 1850 much more care was taken, and the total population being in that year 23,191,876, there were 9,803 deaf mutes, making the proportion one in 2,365, rather diminishing the ratio. In 1860 the proportion remained almost exactly the same, one in 2,452, the total population being 31,443,321, and the number of deaf mutes being 12,821. In 1870 the proportion remained still almost exactly the same, one in 2,379, the total population being 38,558,371, and the number of deaf mutes being 16,205. I would refer the Commissioners to our Annals, Vol. V., p. 9; Vol. XIX., p. 107; and Vol. XXVIII., p. 206., where very suggestive and valuable articles are to be found with regard to these statistics, and where conclusions are drawn which may be taken as quite authoritative. In 1880, our last census, the proportion increases to one in 1,480 (the population being 50,155,783, and the number of deaf mutes 33,878) which is quite a remarkable change, and the cause of this apparent great increase in the number of deaf mutes has been a subject of very considerable discussion among specialists in our country. There are those who have said that it has grown out of the intermarriage of deaf mutes; it is seriously doubted by others whether that has had an important influence on the result, for an examination of the actual reports made in the taking of this 1880 census shows that the officers in charge of this special branch of the census, in their great zeal to have a very full and perfect census of deaf mutes, erred on the other side, and in many cases enumerated the same person twice, and even three times. It is extremely difficult to arrive at an absolutely certain result with regard to the proportion of the deaf at the last census, but a sufficient number of errors of the character I have mentioned have been found in examining the reports to make it practically certain that the ratio of the deaf to the whole

Dr. E. M. Gallaudet.
9 Nov. 1886.

population has not materially increased over the figures of the previous censuses. It may be taken that the ratio before 1880 was too small, and it may be presumed that one in 1,800 would represent accurately the proportion; and this figure of one in 1,480, if it were corrected for error, would come to very nearly the same proportion of one in 1,800, and that may be taken as undoubtedly very nearly the proportion of our deaf mutes in our population in America to-day.

13,106. After all, the figures are not absolutely accurate?—In the volumes of the annals to which I make reference, articles will be found written by specialists, who have very carefully considered these figures, drawing certain conclusions from them.

13,107. But after all they are only specialists?—Yes, the figures cannot be taken as absolutely accurate. We have not been able to arrive at a result which we could say was absolutely accurate.

13,108. You say that according to the last census, the number of deaf and dumb in the United States was 33,878. In one paper that I was looking at, giving a report of the proceedings at one of the conventions, the number is stated to be not less than 35,000?—This figure is less than 34,000. The 35,000 may have been given as round numbers. This was six years ago. We have had no census since 1880.

13,109. Probably 35,000 would be the number at the present time?—It is quite possible. In connexion with the statistics of the deaf and dumb, I may mention that there are to be found in the Report of the Special Committee of the Fifth Conference of Principals (which is set out in the Annals, Vol. XXX., p. 52,), suggestions of forms for collecting and preserving statistics of the deaf admitted to schools. Those suggested forms were prepared by a special committee appointed by a conference of principals held in Minnesota two years ago. I draw attention to them for the reason that an earnest effort has been made in America to induce all the schools to adopt these forms, which are very full and clear, for collecting and preserving statistics relative to deaf mutes, and which forms might probably be found useful as suggesting something which might be adopted in England.

13,110. I observe in one of the reports, allusion is made to boards of charity, and boards of education; will you explain the respective functions of those two boards?—Boards of charity are organised and authorised by the legislatures of our States. There is a board of charity in the State of Massachusetts, for instance, and another in the State of Illinois, and they are in the nature of commissions; a certain number of men are appointed by the legislatures, or authority is given by the legislatures to the Governor to appoint a certain number of men to supervise all the charitable institutions, and sometimes institutions for correction are included in those commissions, and they make reports to the legislatures. They have in varying degrees authority conferred upon them to interfere even with the management of those institutions.

13,111. Are the organization and government of schools for the deaf under the general boards of education, or under the boards of charity?—The practice varies. When I come to my next head I will give some particulars with regard to the relation of the State to the schools. In connexion with my first head (Statistics of the Deaf in America), I may refer the Commissioners to an historical sketch of the schools for the deaf, in America, in an article in the Annals, Vol. XXXI, p. 130. reprinted from the American Supplement to the Encyclopedia Britannica, and also to an exceedingly valuable article by Professor Fay, of the College at Washington, in Buck's Reference Handbook of the Medical Sciences, published recently at New York, which article contains very valuable information with reference to statistics, and various other points. A copy of Professor Fay's article is submitted.

13,112. Will you now go to your second head, the exterior organisation of schools for the deaf in America?—In speaking of the exterior organisation of schools for the deaf, it may be said that we have three different forms in America. First, we have the corporate form, where a certain number of persons are erected by law into a body corporate and politic, who exercise control over the institutions which they are authorised to create and sustain. That form of government exists in New England, in New York State, in Pennsylvania, and at Washington, the institution at which place is sustained by the Federal Government. There is then another form, called the State Institution, where the legislature of the State creates a committee or board of directors, or trustees as they may be termed, into whose hands it places the care and government of the institution, and the property belonging to such institutions under this State organisation belongs absolutely to the State; the lands and buildings are vested in the State (in the other case the property it vested in the corporation, who hold it as corporations usually hold property). The State organisation exists in the south and west generally. We have then a third organisation in some of our cities of day schools for deaf mutes, which are organised and governed by school boards, and sustained out of the taxes paid in the cities for the support of public schools; so that we have this variety of organisation in our country, and variety also of method of support; the Washington institution being supported out of the general Treasury of the United States, and so is a burden on the whole country, the State institutions being sustained by taxes raised in the States, while in the cities the school organisation is sustained out of the city taxes.

13,113. Is there any education rate?—We have in most of our States a general education rate.

13,114. In other cases the schools are supported by the general taxes of the cities?—Yes.

13,115. In how many cities are there these day schools?—There are day schools in about six or seven. I should be glad to be allowed to say, in connexion with these various organisations, that the corporate organisation in our country seems to have been the one under which the very best results have been reached, for reasons which I conceive to be very well worthy of the consideration of the Commission.

13,116. Have they any endowments?—Some of them have endowments, two or three.

13,117. Do you think that important?—I think it is quite desirable, where they have endowments, that they should be allowed to use the income of them; not to have them interfered with by the State. But I was going to say, that in the cases of the State organisations, those which are under the legislatures of the States, where we have changes of political parties from time to time, very disastrous results have occurred from the interference of the State authorities in the management of these institutions, purely for the sake of party patronage, valued and experienced instructors, and even principals, being replaced by persons very little competent to manage such institutions, solely for the purpose of giving places to persons of the dominant political party for the time being.

13,118. Is that difficulty avoided in the case of the corporate institutions?—I think I am justified in saying, that in the case of the corporate institutions, that difficulty is absolutely avoided.

13,119. I see that the President of the United States is the head of the college of which you are the president?—Yes.

13,120. Is he head of the college *ex officio*?—Yes; the President in his office as patron has the duty of attaching his signature to the diplomas which attest the degrees which are conferred by our college at Washington, and it is usual for the President to be present and preside at the anniversaries of the college. Our present President takes an active interest in the college, and his predecessors in office have befriended the college since its organization.

13,121. The President is not the head of all these corporate bodies?—No; he is by law of Congress, the head of this institution.

13,122. Because it is situated in Washington?—Because it is situated in Washington, and because it is very largely sustained by appropriations by the general government. I ought to say, with reference to these corporations, that in several instances they have on them officers of the States which contribute to the support of those corporate institutions, that is to say, to the education and support of the pupils in them. In New England the institutions have several of the State officers of the different States of New England on their boards, and in the corporation of the institution at Washington, there are at present two senators and two members of the House of Representatives, who take part in the government of the institution. The institution may, in fact, be termed a mixed corporation.

13,123. Are those senators and members of the House of Representatives elected from time to time, or are they members of the corporation for life?—The mem-

Dr. E. M. Gallaudet.

9 Nov. 1886.

bers of the Senate and House are appointed at the beginning of each Congress. I should correct myself and say that one senator is appointed by the President of the Senate, the other senator happens to be a member of our board. Then as regards the two members of the House of Representatives appointed by the speaker, their term of office is for two years; they may be reappointed at the end of that term. All the other members of the corporation of our institution in Washington and these other corporate institutions are permanent. I ought to speak of the organisation of one institution in America, in the State of Maryland, which is quite peculiar, and in which some of the difficulties which attend the organisation of the other State schools seem to be done away with. The appointment of the board of visitors is vested in the Governor of the State, and he is authorised to make appointments which are permanent, that is to say, for life, or till resignation; so that the board is appointed under the authority of the State. It is a board that cannot be changed by the action of a political party. That has always seemed to me a very wise arrangement, assuming that the Governor selects men well fitted to govern the affairs of the institution. I ought also to add, to show the relations of these corporate institutions to the State, that the support of the pupils is in most cases provided for by an allowance from the State for each pupil. That allowance is paid on a statement given of the number of pupils in the institution. Pennsylvania pays the institution at Philadelphia 275 dollars per annum for each child received and cared for in the institution.

13,124. Are those institutions so receiving grants from the State subject to inspection, and are the grants subject to approval by Government inspectors?—The institutions so receiving grants are subject to inspection. The inspection is usually managed by a committee appointed by the legislature to visit, inspect, and report, and of course any irregularity would immediately affect the action of the State in reference to this *per capita* allowance.

13,125. How many institutions for the deaf and dumb are there in the United States?—That brings me to the third head in the programme of topics that I have taken the liberty of submitting to the Commission, viz., the interior organisation of the schools in the United States, their number, the cost of buildings and so forth. There are at present 67 schools for the deaf in the United States. Of those, 14 are corporate, but practically supported by the State in the manner I have mentioned, with the exception that two or three of them have rather large endowments, and therefore the contribution of the State is not for their entire support, but only for their partial support; it supplements the income from those endowments. While for the Philadelphia Institution the State of Pennsylvania pays 275 dollars per annum for each child, the States of New England pay about 175 dollars per annum, the other 100 dollars being provided out of the endowments of the institution. The endowment of the Hartford Institution grew out of a very large appropriation of public lands by Congress in the very early history of the institution. The lands were sold, and the funds invested in interest paying securities. 34 of the 67 are State institutions. There are eight day-schools, and 11 schools of a private and denominational character, which cannot be said to be public schools at all, making 67 as the entire number. Of those 67 schools, 38 are now carried on on the combined system of instruction, 14 on the manual method, 12 on the oral method, one is reported as experimental, and in two the methods pursued are not known. The number of pupils in those institutions last year was 7,801, the number of teachers was 540, 228 of them being male and 312 female; the proportion of teachers to children being as 1 to 14. The number of pupils taught speech and lip-reading amounted to 3,032. To give an idea of the amount expended upon these institutions in what we call the plant, I may say that the buildings and grounds have cost in sterling money 1,700,000*l.*, and for their annual support there is expended 280,000*l.* The plant per pupil, including the expense of building, grounds, and everything that is permanent, is estimated at 212*l.* 10*s.* *per capita*, and the average annual *per capita* cost of educating those pupils is 38*l.*; that is excluding the interest on plant. If that was taken into account, that amount would be a little increased; but that is more fully given in detail in the Annals, Volume 31, page 82.

13,126. To whom is the executive management of these institutions committed?—With reference to the interior organisation of these schools, I should mention that the institutions are usually governed by a principal or superintendent, who is the chief executive officer, and a committee, or board of directors as they are usually termed, or trustees, to act as the legislative body. In most instances they take no part in the interior government of the institution. They digest the regulations for its government, and draw out its general line of policy, the executive management being committed to the superintendent or principal who is subject to and responsible to the board. There are a few institutions where a condition of things exist which we call the double-headed system, where there are two executive officers, neither of whom is responsible to the other, but both of whom are responsible to the board of direction and by those who may perhaps be said to be best competent to judge as to the efficiency of such an arrangement, it is an arrangement very greatly to be deprecated.

13,127. Is one of those officers the head of the education department, while the other is at the head of the housekeeping?—Yes; where it is attempted to govern an institution in that way, a certain amount of friction is found to exist, and the results reached have not been found satisfactory at all; so that it is laid down as a principle that the best thing to be got in the interior organisation of such institutions is a man who is an experienced teacher, and who is capable of assuming the executive control of the entire institution. The reason for this may be briefly stated thus: that though the domestic department may be thought, on casual reflection, to be separate from the education department, yet the same individuals, the pupils, are under these two kinds of management, and very often there is friction if two heads are governing; and there are only a few institutions in our country where this arrangement exists. I should like to add, on this matter of the interior organisation of our schools, that, as a rule, the principal or superintendent who has charge of the institution is not required to teach; he is understood, with very few exceptions, to have been an experienced instructor, but is not required to devote hours each day to the teaching of a class; that is felt in the organisation of our institutions to be of very great importance, for the reason that it gives the head of the institution time to be present more or less in all the classes, and to superintend the work of those doing the actual work of teaching. In the case of two or three State institutions, there have been men appointed to take charge of them who have been absolutely ignorant of the method of teaching the deaf, and they have gone on with a principal teacher under them, that principal teacher conducting the operations of the school. Such an arrangement is thought to be a very unfortunate one. It places a man at the head of the institution who cannot in any way direct the work for the carrying out of which the institution has been established; but that has been the result of political interference. We have also in the interior organisation of our institutions one arrangement that I conceive to be of very great importance, viz., that the classes are taught in separate rooms. I have found in my visits to schools in England that a number of them have several classes in a large school-room, the classes being in various parts of the room. We think that an unfortunate arrangement, and great pains are taken in our institutions to avoid it. I do not know one where that arrangement exists. It is thought that separate class rooms should be made use of for separate classes, so that the teacher of one class should not be interfered with by the operations of other classes. Under this head of interior organisation I may say a word with regard to religious instruction. There are a few institutions (I think limited to the State of New York) which are of a denominational character, which receive aid from the State. That is not the usual rule in the United States. The general rule is that religious instruction of a very simple and undenominational character shall be given, the pupils being taught the general principles of religion, and religious services—prayers and other services—being conducted by instructors who may be members of different denominations. So that it is the policy of American institutions to give religious instruction, but to give it in a careful, guarded, undenominational manner, allowing, of course, free access to the institution to religious teachers who may be desired by the parents of the pupils to be present and give instruction from time to time to the pupils.

13,128. Is religious instruction given in all the ordinary schools?—It is the rule to give religious instruction to a very slight extent, hardly more than the reading of the Bible and a prayer, and in some schools

not even that is given. It depends on the action of the local school boards.

13,129. Do the day schools come under the same category?—I think most of them have a brief religious service; they would come under the same rule as an ordinary day-school.

13,130. Can you tell us what the private schools are, whether they are on the combined system, the oral system, or the manual system?—Of the private schools, 11 in number, five are oral schools, three are combined, one is experimental, and in two the method is not given. The number of pupils in those schools is, altogether, only 165.

13,131. For all practical purposes, the private schools are not worth considering?—Hardly.

13,132. Now, will you tell us something with regard to the methods of instruction, the duration of pupilage, and the courses of study?—A very brief reference is probably necessary to the early work of the schools for deaf mutes in America. The method introduced 70 years ago in our first schools was the manual method. The decision to adopt the manual method grew out of two considerations; one was that the founder of deaf-mute education in America received his instruction as to teaching from the Abbé Sicard, in Paris, who at that time, the year 1816, was practising mainly the manual method; he taught articulation, but not to any large number of pupils or to any great extent. Then it was thought by those who established the first institutions in America that, in view of the fact that the public purse, aided by private benevolence, would provide, perhaps, only for a term of instruction of four years, or at the utmost five years, the manual method would probably produce results of greater value to the pupils than if the other method, the oral method, were pursued, and for those two reasons the manual method was made use of in the institutions of America at the beginning, and for many years. In 1860, however, the question of teaching deaf mutes to speak was brought forward quite prominently in America in several directions, and not very long after, about 1867, oral schools were established on a small scale in New York and Northampton.

13,133. Was the oral method introduced from Germany?—The suggestion that it should be introduced originated, I think, mainly in a report made by Horace Mann, who visited the German schools some years before that, and reported very favourably with reference to the oral method. The accepted term of pupilage by that time had increased, and it was possible to secure the assistance of the State, and to make use of funds from private sources, so as to continue the term of pupilage to seven and eight, and sometimes even nine or 10 years, and it was felt that it was desirable to teach speech to deaf mutes; in fact, there were those who urged that that method should take precedence of the other. The older institutions, at least one of them, the one in Washington, in 1867, sent a representative to Europe to make an examination of the schools for deaf mutes in the various countries of Europe, and to ascertain the results of the different methods. The result of this examination was a report which recommended very strongly the introduction of the teaching of articulation in all schools for the deaf. These distinctively oral schools, which were established in the first instance at New York, and Northampton in Massachusetts, about the same time, 1867, went forward in their work in a manner that won the approval of the teachers of the older schools, and in 1868 a conference of principals was held at Washington, representing quite a large number of old schools for the deaf in America, at which conference a decided approval was expressed of the recommendations of the report made at the instance of the institution at Washington in 1867, that the teaching of articulation should be introduced into all the schools for deaf mutes in America. The introduction of that method was gradual; it was not possible to secure immediately the action of boards of direction favourable to that change, but from year to year more of the old schools have adopted the method of teaching to speak, and so now the method of teaching speech may be said to prevail in all the prominent institutions of America.

13,134. Are you speaking of the combined system or of the purely oral system?—I am speaking of teaching speech. I do not mean to say that these schools have become what may be termed pure oral schools, for we conceive that the term "pure oral" really does not convey a correct impression. To say that a school is a pure oral school is to say what is almost an impossibility.

Dr. E. M. Gallaudet.

9 Nov. 1886.

13,135. You mean signs will be used?—Signs will be used. It is not practicable to banish them any further than from actual use in the school room, which may be done with difficulty, but signs will be made use of at certain stages of the instruction, more or less, to assist in reaching the end desired. The number of schools where speech is taught is now 50 out of the 67. Only 14 remain on the purely manual method; of those some are known to be making arrangements to introduce the teaching of speech, and will probably do so within a short time.

13,136. You have told us that there are 34 State schools?—Yes; and then there are the 14 corporate schools.

13,137. Making together 48?—The 48 would be called public schools, not counting the day schools.

13,138. Will all those have either the combined system or the purely oral system?—Out of those 48 schools the oral method is more or less practised in 36.

13,139. The majority of the leading schools adopt the pure oral system, or the combined system?—A very large majority are carrying on the combined system. That means that in a large majority of the public schools speech is taught to as great a number of pupils as it is found possible to teach with success; that is the policy in these combined system schools. That would lead me to ask permission to read the resolutions passed at the Convention in California this last summer, which I conceive to be of very great importance, and they will be seen to cover very broad ground with reference to this conflict of methods, as it is frequently termed, which has existed for many years, but which now may be said to have come practically to an end. The report of this Convention is published in the "International "Record of Charities and Correction," a periodical not devoted specially to the interests of the deaf and dumb, but covering many subjects of an allied character. Before I read the resolution I will read what a writer in that periodical says in speaking of the Convention:—"The proceedings were marked by an unusual degree "of harmony. The conflict of theories and methods "which has occupied so much of the time and attention "of previous conventions was almost wholly absent. "It was unanimously agreed that, like other people, "the deaf differ widely in their mental and physical "conditions, and, therefore, methods of instructions "differing as widely, are necessary for the highest "development of the class. * * The war between "the two prominent systems of instruction—the "'manual' and the 'oral'—which has been carried on "so vigorously for many years, may be said to be "practically ended, not through the victory of one "side or the other, but through the better understanding of each others methods and results. Discussions between men actuated only by philanthropic "purposes, and upon matters in which selfish interest "does not enter, lead to cordial recognition of whatever "strength there may exist in each others position, and "the yielding of untenable points, until they find "themselves occupying common ground. Such has "been the outcome of the long controversy upon the "oral versus the manual method. The method of the "future is the 'combined' or 'American' method, in "which the best features of both systems are incorporated. This method is outlined in papers read at "the Berkeley Convention by Dr. G. O. Fay, of Hartford, and Professor A. L. E. Crouter, of Philadelphia, "and covered by resolutions introduced by Dr. E. M. "Gallaudet, of Washington, and adopted without a "dissenting voice."

13,140. You endorse all that is said there?—Yes. I commend the resolutions which I am about to read, to this Commission, as a representation of the ablest and most recent thought on the subject; the resolutions being the outcome of papers read by gentlemen who are both highly educated men; one of them, Dr. Fay, who was at the head of the Ohio Institution for many years, and who is now at Hartford, and the other, Professor Crouter, who is at the head of the Philadelphia Institution. In Philadelphia the oral school exists quite separate from the manual portion of the institution. The action of the Convention is stated as follows, and I will remind the Commission that representatives from the so-called oral schools, or, as they are termed in England, pure oral schools, of Northampton, New York, Pennsylvania, Portland, and Maine, were present at this Convention, and gave their votes for this action.

Dr. E. M. Gallaudet.

9 Nov. 1886.

I speak of that as a matter of very great importance, because it was really a burying of the hatchet.

13,141. The resolutions were passed by a unanimous vote?—By a unanimous vote; I introduced the resolutions, and they were seconded by the most prominent professor in the Institution for the improved Instruction of the Deaf at New York, which is our pure oral school *par excellence*. The resolutions which were unanimously adopted were as follows: "Whereas the "experience of many years in the instruction of the "deaf has plainly shown that among the members "of this class of persons great differences exist in "mental and physical condition, and in capacity for "improvement, making results easily possible in cer-"tain cases which are practically and sometimes "actually unattainable in others, these differences "suggesting very widely different treatment with "different individuals; it is, therefore, resolved, that "the system of instruction existing at present in "America commends itself to the world, for the reason "that its tendency is to include all known methods "and expedients which have been found to be of value "in the education of the deaf, while it allows diversity "and independence of action, working at the same "time harmoniously, and aiming at the attainment of "an object common to all. Resolved,—That earnest "and persistent endeavours should be made in every "school for the deaf to teach every pupil to speak and "read from the lips, and that such efforts should only "be abandoned when it is plainly evident that the "measure of success attainable is so small as not to "justify the necessary amount of labour." I think it will be evident to the Commission that these resolutions approve an effort in the direction of oral teaching which may be said to be absolutely going to the extreme; that is to say, that if practice proves that all can be taught to speak, then manualists would be very glad to have that result reached. I call attention to the fact that those who had schools in which the manual method alone was used voted for this resolution, that in all schools all the children ought to be taught to speak who can be taught to speak; and it is with a very great degree of satisfaction that I present this result to the Commission, for we conceive that we have arrived in America at a conclusion with regard to this long vexed question of methods, a conclusion which approves of every effort being made in the direction of the oral method, the importance of which we admit. When I say "we" I speak as representing perhaps those who favour the combined system, and I would draw a distinction between the words "method" and "system." In America we apply the term "method" to the oral mode of instruction of the deaf, to the manual mode, and to another method of which I have not yet spoken, but to which I shall allude presently. We call those methods of instructing the deaf, and the system of which we speak in America as the "combined system" is one which allows of the bringing together of all methods under varying conditions. For example, the Philadelphia Institution has a separate oral branch in which pupils who are found to succeed well in speech are taught on what would be termed here in England the pure oral method. This which was started as a manual school is now conducted under what is called the combined system. The same institution has in its larger establishment classes which are taught entirely without the use of signs or the manual alphabet; and, again, there are classes which are taught by means of the use of the manual alphabet and signs, finding that there are a certain number of pupils who will not succeed with speech. And on that point I may, perhaps, be allowed to say a word with a good deal of earnestness. Those of us who started in our work in America as manual teachers do claim, and we ask that the claim be recognised, that it is possible for us to take a disinterested view of the oral method and judge of its results with unprejudiced minds. We have watched the progress of the oral mode of teaching the deaf, both in our own country and in foreign countries, and we do not hesitate to say that where the attempt is made on the part of a certain locality, a province or state, to carry on a school for the instruction of the deaf, there will be a very large number of pupils who under the most favourable circumstances will not attain to a degree of success in speech and lip reading which would warrant the time and labour and money that is necessary to carry on a school on what is termed the pure oral method. I was in Paris a few days ago, and I was told that the expense *per capita* of the pupils in the institution there is, without counting the cost of plant, 1,500 francs, equal to 300 dollars, or 60*l*., which is very much larger than the average cost of educating the deaf and dumb in our country. The number of teachers they employ is very much greater, and the expense is very much larger; and we who have had long experience in this matter of the education of the deaf have come to the conclusion that there is too large a proportion of the whole number of pupils that do not succeed in speech to make it right to continue that method for all.

13,142. As you have mentioned Paris, do you know at what age the oral system is begun to be taught in the schools in France?—I think at about eight years of age.

13,143. I think not till 10?—I was not aware of that.

13,144. Is it your experience in America, that in order to teach language well you ought to begin to teach it at the age of six or seven?—Our experience is, that if we are to teach language well we should begin at about the age of seven. My own opinion is, that we should not begin to teach deaf and dumb children language at a younger age than seven. Some advocate beginning at four or five.

13,145. You would treat deaf and dumb children the same as you would other children, as far as possible?—Yes.

13,146. Has it ever struck you that if you delay the teaching of the oral system beyond a certain age the vocal chords will get still, and that there will be a want of flexibility about them which will prevent a proper development of the voice?—I should say that to defer it beyond the age of 12, 13, or 14, in boys especially, would be very unfortunate.

13,147. Many of their pupils in Paris are older?—Yes. A third method which we are now practising in America with some exceedingly interesting results may be spoken of as the aural or auricular method. A very considerable percentage of those who are classed in the community as deaf mutes have a degree of hearing which makes it entirely possible that they may be educated through the ear. The percentage is put variously at from 12 to 25 per cent., which even at the lowest figure is a large percentage of the whole number. The first movement in reference to the aural teaching of the deaf was made in Nebraska four years ago, and it was found in that institution that the percentage was quite large of those who were capable of being taught by the ear. I saw in that institution a little more than two years ago a class which was being taught entirely upon this method, and the process of teaching was an exceedingly interesting one. The class consisted, perhaps, of 11 or 12 pupils. There had been a careful examination of the amount of hearing possessed by each of those pupils, and that pupil who heard the least was placed at the teacher's right hand, the one who had a little more hearing was placed next, and the one who had a little more further on, while the one who had the greatest amount of hearing was furthest removed from the teacher. The teacher then in a voice elevated above the ordinary tone was able to dictate to those pupils, and they had all of them been actually taught to use that hearing which they possessed, which prior to the instruction was not supposed to have been sufficient to be made available at all as a means of instruction. In other words, those pupils were gradually ceasing to be deaf mutes; they were speaking very well, and they were hearing as well as persons whom we call hard of hearing persons. The result would be that, having come to the school under the legal appellation of "deaf mutes," they would go out of the school not deaf mutes at all.

13,148. How is that result attained?—The process I can describe a little more fully by reference to the result of a very interesting experiment which we tried in the primary school connected with our college at Washington. In that primary school we try a good many experiments, and we do what we can to develop various methods. The children come in at the age of seven, and they continue in the school for eight or nine years. We had a boy who entered before we began to teach articulation. He was credited to us a deaf mute from one year of age. He lost his hearing in infancy before he learnt to speak; he was absolutely dumb, and the degree of hearing that he possessed was not supposed to be of any account at all. He was registered as hearing slightly very loud noises. Not long after he entered we began teaching him speech, and he was taught to articulate. His progress was only moderate; his success was so imperfect that after a year's effort it was almost decided to give up attempting to teach him any further, but his teacher discovered, purely accidentally, that in uttering a word when the boy's face was turned away from him the boy reproduced the sound. With the use of the hearing tube it was presently discovered that the boy could repeat the vowel sounds and many of the consonant sounds without difficulty; he could repeat words the meaning of which he did not in the least degree understand. The teacher then at once began to educate his hearing. This degree of hearing which the boy possessed had never been enough for him to hold any conversation with members of his family or with any person at an ordinary distance from him.

Dr. E. M. Gallaudet.

9 Nov. 1886.

13,149. Was the speaking tube that was used an ordinary speaking tube?—Yes, a flexible speaking tube. Within two years after that time I exhibited this boy before the American Academy of Sciences at Washington, and talked with him through the tube without difficulty, and to-day he has advanced far enough to be a student in our college; he is a young man full of promise, and he hears well enough to be able to sit by the side of either of you gentlemen and carry on a conversation with you through the tube.

13,150. The fact is that his power of hearing had been overlooked?—Just so.

13,151. There was no extra mechanism in the tube?—No. The result in that case shows that a very small amount of hearing, untrained to be useful, has existed in hundreds of deaf persons who have gone on through life dumb and hard of hearing, and classed as deaf, whereas they might, under this aural or auricular method of instruction, have been taken entirely out of the category of deaf mutes.

13,152. Is there any medical inspection of these children before they enter school, and is any attempt made by the doctors to improve the hearing if the passages have become clogged by cold or disease?—Yes, in all our better schools there is a careful medical inspection of the children as they enter; it is usually the case that all means have been exhausted to benefit the hearing by the parents and friends of the children before they are brought to the institution. An examination by the medical man exhibits that fact. There are a few instances where the hearing by medical treatment has been improved, but they are very few. I commend this auricular method to all who are interested in the education of the deaf as one deserving of very great attention, because, if we take the number of the deaf who are capable of being taught aurally as amounting to 10 per cent. only, it is conferring upon them a great boon to teach them aurally; it is a greater boon even than giving them the power of imperfect speech.

13,153. With regard to the facility of giving and receiving instruction in such a case as that to which you have just referred, can the boy take his place with the others in the class, or does he require the teacher's individual attention?—In the class at Nebraska, of which I have just been speaking, I think the boys hear when the teacher's voice is raised to a certain *timbre*. When the teacher elevates his voice to a certain pitch they have no difficulty in hearing him.

13,154. Would the teacher use the tube?—Yes, at times, but she was able to make the pupils in her class hear without the use of the speaking tube; they were so arranged that the one that heard the least was placed nearest to her, and the one who had a little more hearing was placed next, and so on.

13,155. No mechanical contrivance is made use of for increasing the volume of sound?—Mr. Edison, who is himself very deaf, told me a few years ago that he was working very hard to bring out some appliance by which the volume of sound might be so increased that a deaf person might hear with great ease.

13,156. Has Professor Bell taken that question up?—To a certain extent, I think.

13,157. Is Professor Bell an advocate of the aural method?—Yes, as well as the oral method. Every one who has heard of the results of the aural method is in favour of it wherever subjects are found that are adapted for it.

13,158. I see it stated that in some of these schools where the sign system prevailed, or used to prevail principally, there was a great lack of knowledge of the English language; was that so, or is it so still?—It is a fact that in many schools for the deaf the pupils, even after a number of years teaching, are lacking in the ability to use language idiomatically; the number of such pupils is not found to be greater in manual schools than in oral schools. It goes without saying that there are manual schools and manual schools, and that there are oral schools and oral schools; there will come into the management of schools of any class carelessness in the appointment of teachers, or there may be incompetent teachers appointed through the absence of sufficient funds to secure competent teachers; and so, undoubtedly, in manual schools there may be found pupils who will not succeed well in the idiomatic use of language who might have succeeded better if they had had better teaching. But it is also true that, under the best teaching, in the oral method as well as in the manual method, there will be found a certain number of deaf mutes who seem to lack the ability to attain to an absolutely idiomatic use of language. That, I think, is a fact that cannot be disputed, that under the best auspices and the best teaching, with the full period of instruction, there will be found pupils whose mental capacity seems to be lacking in some respects, and who will never be able to attain to an idiomatic use of their vernacular.

13,159. Would not the use of the manual system, that is to say, finger language, as against the sign system, tend to a more accurate knowledge of language?—I do not know what you call the sign system.

13,160. In some of the schools in our country we have seen children taught entirely by signs, without any finger language?—I know of no school in America where any sign system is exclusively used.

13,161. But are signs used as an assistance to teaching?—Yes, as an assistance to manual spelling and writing. The use of signs is resorted to for the purpose of explanation, but in none of our schools are the children exclusively taught by any such system.

13,162. The use of the sign and manual system does not lead to an accurate knowledge of language, does it?—I can answer that question very readily by making this statement: that it is admitted, without question, that an injudicious and incompetent teacher may make such an improper and inordinate use of gestures in the work of teaching in the class-room as to militate very strongly against the best success on the part of the pupils in the attainment of idiomatic language. That, I might say, goes without saying, and that in some of the manual schools such teachers have been found is too true. It may be said, on the other hand, that in manual schools where thoroughly competent and judicious teachers are employed the use of signs is not only found to be no impediment in the acquisition of the power of using language idiomatically, but is found to be a great help in reaching that end; so that the whole question would turn on whether the use of gestures was one that was subject to criticism on general grounds, as being injudicious and undesirable, or whether a proper use was made of gestures by the teacher.

13,163. Do you think that under the oral system there is the same difficulty as to a limited vocabulary as in the manual system?—I do. I think there is the same difficulty.

13,164. Deaf mutes under both systems are able to make use of only a limited vocabulary?—Naturally. Very little reflection will show us that a hearing person is compelled, whether he will or no, to hear an amount of verbal language on all occasions, that is simply out of all proportion to anything that can possibly be conveyed to one who is deaf, even under the most favourable circumstances; so that the vocabulary of a hearing person is necessarily much larger than that of a deaf person. The vocabulary of a deaf person could not possibly be equal to that of a hearing person until after a very long period of education.

13,165. I have before me a report of the proceedings of a meeting held in July 1884, in the Senate Chamber, Madison, Wisconsin, in which you say:—"I urge most "earnestly that those persons that reject the manual "alphabet, and who reject signs for the deaf, while "they are giving them speech and lip-reading, are "doing them a cruel wrong, in this: that they are "dooming them to a greater social isolation than they "are compelled to submit to who have no speech, but "who still use the manual alphabet and signs"?—In my memorandum of the topics upon which, perhaps, you might desire me to give evidence, I have made a note of that very point, the comparative social isolation of persons who are taught on the oral method, and who are taught to reject the use of signs and the manual

Dr. E. M. Gallaudet.

9 Nov. 1886.

alphabet, comparing persons so taught with others who have the use of signs and the manual alphabet; and from a considerably extended experience of persons who have been taught in both ways, I do not hesitate to express the opinion, that one who has been taught orally, and who does not use the manual alphabet in his family or among his circle of friends, is far more isolated in society than one who has not the power of speech, but who uses freely the manual alphabet and the language of signs. I speak from an experience that extends over the period of my whole conscious life, beginning in my infancy with my mother (who was a mute, who never heard and who never spoke, with whom I communicated freely by signs from the earliest days of my infancy, and with whom I learnt to communicate before I learnt the use of my voice), and extending over all the years of my life, mingling as I have in my earlier years with deaf people who had not the power of speech, and in later years with people who had the power of speech which they had gained from having been instructed in oral schools, or under private tutelage, where a single person has had the advantage of the instruction of many teachers; and I could mention the names of persons (which I forbear to do) whose intelligence and education were of the highest order, but who have persistently rejected the use of the manual alphabet and signs and only used speech, who could make themselves understood to their friends pretty freely, and to strangers with greater or less freedom and facility, but whose social isolation I am certain has been greater than that of others, whom I could also name, who have not had the power of speech, but who have had the use of the finger alphabet, and who could use signs in holding communication with those who understand signs; and the emphasis of the opinion which I want to express lies just in this: speech made use of by a person who is totally deaf, and who depends on lip-reading for his answers from others, is, at the best, a means of communication which is often unsatisfactory, involving many repetitions, involving much guessing, involving frequent misunderstanding, involving a feeling of dislike on the part of the person conversing with the deaf mute to repeat so many times what he wants to convey to the deaf mute, and a doubt in his mind whether he has been understood, this leading to an embarrassment in communication which frequently results, in a greater or less degree, in the social isolation of the person so depending on speech and lip-reading for communication with the outer world. I could give the names of persons whom I know in the highest society in America, who are more or less socially isolated on account of the acknowledged and admitted difficulty on many occasions, and under many circumstances, of making that means of communication of speech and lip-reading available exactly and quickly, and without very much repetition. I know many persons in America who are acquainted with these educated deaf persons, and who say to me, I dread to meet so-and-so, for I am expected to speak, and that person is expected to understand my lip movements. It is not always that my lip movements are understood, and it is not always that I can understand his speech. That is the feeling which many people have who meet such a person in society, and, therefore, the deaf person is let alone and but little conversation is attempted because it is carried on with such difficulty. I myself have sometimes at dinner parties sat by the side of a highly educated deaf and dumb person who has been educated on the oral system and who rejects the use of the finger alphabet and signs, and I have spoken with him more or less on a limited range of topics and carried on a conversation that was agreeable so far as it went, but I have found it impossible to branch off on a totally different subject as with an ordinary person. I have felt that I would give anything if I could speak with my fingers with that person for five minutes. On the other hand, a person who depends on the finger alphabet entirely, and who has not the power of oral speech or the power to read lip movements, if he has the power of forming friendships, will have a circle of friends who will acquire, for his sake, the finger alphabet, and with the use of the finger alphabet conversation can be sustained as fluently, as readily, and as perfectly as if he had speech. In other words, a deaf person, who has the finger alphabet as a means of communication, will have in his own family those who will learn to use it freely and fluently for his sake, and he has a circle of friends who will also acquire the finger alphabet so as to be able to carry on a conversation with him easily, and his social isolation will be less absolute than the social isolation of a person who depends entirely upon speech and lip-reading and rejects the use of the manual alphabet. I speak from experience of a very great number of both classes of persons.

13,166. At the meeting at Madison, I see Dr. Bell quotes you as having said this: "I see, running through "it all" (that is to say, the paper which had been read), "the fact, which I am very glad to have acknowledged "here so plainly in this Convention, and which we have "all to look in the face, that the deaf and dumb in our "institution, as a class, do not master the English "language." Then Dr. Bell again quotes you as saying: "If we want the children of our institutions "for the deaf and dumb to master the English language, "what have we to do with the sign language? I answer, "As little as possible." As I understand, you say an over-use of the sign system is a dangerous thing?—Yes.

13,167. Is it the tendency in schools on the combined system in America, and in schools where the manual alphabet is taught, to depend more on the manual alphabet than on signs in order to get a more accurate knowledge of the English language?—Yes, the tendency in the American schools is to a diminishing use of the language of signs. At Indianapolis, where I made that statement which was quoted by Dr. Bell at Madison, the subject of the use of signs in class-rooms was under discussion. At that time, 16 years ago, there were in many of our schools in America teachers who were very careless, reckless, and unjustifiable in their use of gestures, and the result was a very unsatisfactory development of the power of idiomatic expression; so at the discussion at Indianapolis I said that I felt that there was such a thing as a very pernicious and dangerous use of the sign language in the instruction of the deaf.

13,168. When you speak of the sign language, you mean gestures—conventional signs?—Yes.

13,169. Those signs vary in different countries and in different schools?—Yes, in different countries, and, to a certain extent, in different schools. I raised my voice at Indianapolis to warn teachers against making too great a use of sign language, and insisted that in the instruction of the deaf the language of signs should be used as little as possible.

13,170. You say that that meeting at Indianapolis was 16 years ago?—Yes.

13,171. Therefore, what you said then does not accurately represent the danger to which schools are liable now?—No; we were fighting against certain evils then existing in schools. With regard to the comparative social isolation which results from oral teaching, I may refer to an incident which occurred this last summer. One of the professors of our college at Washington was spending some time in New England, and he himself being a great bicyclist attended a meeting of bicyclists at a town called Brattleboro'. He noticed at that meeting a young man of very prepossessing appearance with a bicycle, who had come to attend the meeting, and he observed that he spoke on his fingers to some one near him. This professor speaks very well, and has always spoken, but he lost his hearing after he had grown up. He noticed this young man speaking on his fingers, and he naturally sought to make his acquaintance, he himself being a deaf man. He found that the young man was well educated, that he used his fingers very freely, and that he used even the language of signs; and he found to his surprise that he had been wholly educated at a pure oral school. He was the son of wealthy parents, and had been a long time at school, and completed his education there, and he spoke very well and read from the lips very well; but he told this professor of our college at Washington that, while among his intimate friends, he always spoke and read from the lips, and did so very well in a certain limited range of subjects, yet he found that in general society he got on more satisfactorily and pleasantly by using the manual alphabet; and therefore he adopted the use of it, and his friends learnt it for his sake. He being a person who had never been in a manual school or a sign school, still found it was necessary for him to learn to converse with his fingers, in order to avoid a certain degree of social isolation to which he would have been subjected if he had confined himself to the oral method. Then I will refer to the case of a Wisconsin lady who became deaf at the age of 18, and who became an exceedingly good lip reader. She called at my house with a lady friend of my wife's, and we were made acquainted and entered into conversation. She read my lips very readily, and we talked together for a little time, and I marvelled at her success in carrying on the conversation. Presently she said, "I did not under-"stand that last sentence; will you spell it on your "fingers?"; so I spelt it on my fingers. I said, "How "is it that you resort to speaking by your fingers?" She replied, "Do you think I would be so foolish as to "reject a means of communication which is absolutely "certain and reliable for one which I often find myself "blundering in? Whenever my speech and lip-reading "fails I like to resort to my fingers; that is sure and "certain while the other is doubtful." Then, again, I have the acquaintance of a gentleman in Philadelphia who became deaf after he had grown up, who is a very good lithographer, and he told me not a great while ago that, while he could speak and read lip movements, and often passed as a person who heard, yet he invariably, when he entered into any business contract, resorted to writing; he did not dare to depend on the power of lip-reading, because in carrying on conversation by that means there was a liability to mistakes. I refer to these cases simply to show that while people advocate this teaching of speech and lip-reading, we know (to use a commercial phrase) there is a discount to be allowed upon it.

Dr. E. M. Gallaudet.

9 Nov. 1886.

13,172. You said that the age at which children should be sent to school was seven years; should they be taught writing before they go to school?—Most of our institutions in their circulars recommend to the parents and friends of deaf children where they are able to do so to teach them writing at home; to teach them the use of simple words. I do not think the majority come to the institutions having been so taught; that is urged, but I think the majority of them do not come to the institutions with any knowledge at all. I should like here to refer the Commission to a very careful comparison of results of teaching by the oral method and the combined system, which was made in the oldest school in America, Hartford, by its principal in the case of more than 30 pupils who came to that institution from the oral schools in New England after having been in those schools a longer or shorter time. The paper to which I refer in which that comparison was made was presented at the conference of principals held in Minnesota two years ago, and it is found in the record of the proceedings of that conference, pages 182, 186, 187, which I will leave with the Commission. The paper gives the results arrived at from a careful examination of those pupils, running over a period of eight or nine years. The results are tabulated, and a comparison of the results due to oral teaching and manual teaching, or teaching by the combined system, is given which is not found, I think, elsewhere.

13,173. Will you now favour the Commission with any observations that you have to make with reference to the duration of pupilage and the courses of study?—With reference to the duration of pupilage and courses of study, in our institutions in America we endeavour to have a course of study practically the same as that which is pursued in the schools for the hearing. We take up the elementary study of geography, arithmetic, and history, and some little study of physics, perhaps, and occasionally some study of physiology, which we deem of importance even in the case of those who go through a limited course of teaching; and in nearly all, I may say all, the larger institutions in America, quite an important feature is made of instruction in art. We develop as far as possible the power of drawing, and instruction is given in the branches of art of painting and sculpture. Wood carving has come into great prominence in the last few years, and many institutions are establishing departments for instruction in the art, carrying it forward to a very high degree of development. I may speak particularly of the institution at Illinois, which is the largest in America, where they have a department of art with a teacher at the head, and four or five assistants, who devote themselves entirely to the instruction of the pupils of the institution in art.

13,174. Do they turn out many artists?—A large number, and an increasingly large number. They turn out artists of various degrees of talent, but an artist who is able to work in decorative art, designing, and things of that kind may be very successful, though he may not be able to paint landscapes or portraits.

13,175. Do you know Mr. Moore?—Yes, I know him very well. He is one who was never taught to speak. He has not been orally taught. He was taught under the manual method.

13,176. Are you aware that he is able to get several hundred pounds for his pictures?—Yes; he set a very good example by patient and long study for a number of years before he began to sell any pictures.

13,177. (*Mr. Woodall.*) Is what is aimed at to make picture makers?—No, it is general instruction in art that is given. We do not encourage the pupils to be portrait painters or landscape painters. In many cases in our large cities in which these deaf persons who have been instructed in art come into competition with others they have done extremely well.

13,178. (*Chairman.*) The instructions they receive in art enables some of them to become draughtsmen for engineers and architects, and so on?—Yes. In making drawings for woodcuts for illustrated papers many of the pupils have succeeded extremely well.

13,179. (*Mr. Woodall.*) Is anything done in the way of kindergarten teaching with a view to leading up to their industrial art teaching. In your primary school which you spoke of at Washington have you any kindergarten teaching?—We have not in the primary school at Washington, but in several of the schools there are departments for kindergarten work, and at our conference in California considerable prominence was given to the matter of kindergarten instruction for the deaf, and I know one or two, perhaps three, institutions in America in which there are separate departments for kindergarten instruction, where the children who are put under the instruction which is given in that department are very young, and are kept quite separate from the older ones.

13,180. Do you recognise any useful relationship between the kindergarten teaching and the subsequent teaching in art?—I should say the one would naturally be a good preparation for the other.

13,181. (*Chairman.*) With regard to industrial training, have the boys any industrial training given them while at school, or does it begin after the education pure and simple is finished?—There are some schools in America into whose curriculum industrial training does not enter; they depend entirely upon the apprenticeship of their pupils after they leave the school to mechanics with whom they may learn trades, and so be prepared to become mechanics; but that is the practice of a small number of schools comparatively; by far the greater number have a larger or smaller number of shops in which trades are taught. In the whole number of our schools in the United States only 14 have no industrial department, and eight of these 14 are day schools, so that there are only six of those institutions which would be called public institutions in America which have no industrial departments; those that have an industrial department and those that have not are named in the table in the annals to which I have referred. The feeling is decided among the managers of our institutions in favour of teaching trades while the pupils are in school. As to the amount of time that is given to industrial training, in some of the institutions, there is a division of the day between the forenoon and the afternoon, the boys being in the shops during one half of the day and in school the other half; and in other institutions the school hours are prolonged during a part of the afternoon for two or three hours, as the case may be, and industrial work given at a later time in the day; but as to the result of this training I can certainly say that a vast number of very competent mechanics have been turned out of these industrial departments of our institutions.

13,182. At what age are they turned out?—Varying from 16 to 20.

13,183. Do they keep them as long as that?—If they enter at 10 years of age they may remain 10 years in some of our schools.

13,184. You spoke of seven years as being the age at which they commence school?—When they commenced school at the age of 10 they would be retained to the age of 16 or 17; the time of their being discharged would vary from the age of 14 or 15 to 20, but if the children were discharged at the age of 13 or 14 they would hardly be old enough to learn a trade while in school.

13,185. What is the age at which you begin to give them industrial training; how long after they have been at school?—It would depend on the age at which they entered.

13,186. Would you begin their industrial training at 12, 13, or 14, according to the age at which they entered?—It would again depend on the physical condition of the boys; some at 12 years of age would be

Dr E. M. Gallaudet.

9 Nov. 1886.

quite as capable of beginning to learn a trade as others at 14.

13,187. What is the industrial work that is taught?—I have here a list of the trades taught: baking, basket making, bookbinding, broom making, cabinet making, carpentery, chair making, cooking, clay modelling, coopery, dressmaking, farming, gardening, glazing, knitting, mattress making, painting, printing, sewing, shoemaking, tailoring, wood carving, wood engraving, and wood turning.

13,188. Those are taught at different schools?—Yes, not all at the same school; here is one school, the New York Institution, where, besides art, baking, cabinet-making, carpentering, clay modelling, and dressmaking are taught; then in another, the Pennsylvania School, cooking, dressmaking, knitting, printing, shoemaking, and tailoring are taught. In Kentucky five trades are taught, in Ohio four, in Virginia six, in Indiana three, in Tennessee two, in North Carolina 10, in Illinois 10, in Georgia only one, and in South Carolina three; the number of trades taught varies.

13,189. Do the pupils assist in the ordinary house work of the institution?—To a very considerable extent. I may say that one of the reasons that induce us in America to be very earnest in teaching these boys trades, while they are in the school, is that the difficulty of apprenticing them after they leave school is very great, owing to the existence of very close trades unions in our country, under whose regulations the number of apprentices is limited.

13,190. Do they keep out the deaf and dumb from any prejudice against them?—They keep them out as they would anyone they did not wish to admit. They are not excluded simply because they are deaf, but still there would be those who would rather turn the cold shoulder to them because they were. We conceive it to be of great importance to give them this manual training even though they may not follow, after leaving the institution, the trade that they have been taught. We conceive it to be an important point, because dexterity in one trade, the training of the hand and the eye in the use of tools, prepares the boy for success in, perhaps, several different directions, and in point of fact, we find that there is that success. The institution for the improved instruction of the deaf and dumb in New York city favours very much the limitation of industries taught to the deaf and dumb to those of a higher character; that is, those in which the element of art may come to a greater or less extent. The authorities of that institution believe that it is well to endeavour to get the deaf to take up wood carving and lithography, and industries of that sort, rather than to relegate the deaf to carpentery, and shoemaking, and such trades; but that feeling does not prevail throughout the country. It is felt in a large number of institutions throughout the country that ordinary industries are as valuable to the deaf and dumb as those that may be said to be more refined. They succeed extremely well as gardeners. I could mention one coloured boy who seemed to possess very little intellectual power; we thought him at one time almost an imbecile, but he developed afterwards considerably, and lately he has become a competent gardener.

13,191. Are coloured boys taught in the same classes with the others?—In our primary school in which we have 60 pupils, eight or nine are blacks.

13,192. Are they taught in a class by themselves?—No, they are mixed with the others in the classes; in the sleeping apartments and at the table they are separated in deference to the caste prejudice, which still continues in our country to a certain extent, but in the classes they come together; the day schools have no shops. I ought to say that in America we do not consider day schools as capable of finishing the entire education necessary for the deaf, and we consider them rather as an expedient, better than nothing, as being schools into which the younger children can come, and where they can remain, perhaps, one, or two, or three years, but from which they ought to go to the boarding schools to reach the best results. The sentiment in America is against the extension of day schools, and in favour very much of bringing the deaf together in boarding schools.

13,193. You said that some of these day schools are conducted on the oral method?—Yes.

13,194. Would there not be more difficulty in teaching by the oral method in a day school than in an institution, looking to the probability that if a child goes back to its parents and friends it would necessarily make use of signs before it could make itself understood?—My own opinion is that the child in going home to its parents would, perhaps, get a practice in speech which would be a benefit to it.

13,195. Do you think that generally in America parents endeavour to assist the instruction of their children in the oral system?—Where they are in day schools, and they go home to their parents, I think they do, and when they go home from boarding schools, I think the parents and friends in the vast majority of cases take pains to keep up the speech of their children. We find often when they return from their holidays that their speech is improved.

13,196. It depends on the parents taking an intelligent interest in their children?—Very much.

13,197. Are any objections felt in America to collecting together the deaf and dumb in institutions in view of the probability that friendships will be formed resulting in intermarriage in after life?—There may possibly be such objections, but we believe that they are so far counterbalanced by the advantages to be gained in having the deaf in schools where they may be taught as such and receive the benefit of special training, that we think that the best way of treating those possible objections is to make the pupils, as they advance in intelligence, feel the importance of avoiding such marriages. Later on, I will go into that rather more fully.

13,198. Is there any separation of the sexes at school after the age of 13 or 14, or are they kept together?—They are separated altogether, excepting in the class-room; they come together in the class-room; in many institutions, where there are a sufficient number to classify the boys and girls separately, they have separate classes, but there are institutions where, as a matter of preference, in the dining room, the boys and the girls are seated together at tables; and it is claimed by those who keep up that practice, that the effect is good—that the boys are improved in manner by association with the girls, and that the girls are in no way injured by being thus associated with the boys in a sort of little family; but universally, in all matters of domestic arrangement, the dormitories, the sitting rooms, and the playgrounds, the girls and the boys are carefully separated.

13,199. Do the deaf and dumb find any difficulty in getting employment as soon as they leave school?—They do not find any great difficulty in securing employment; they secure employment with considerable facility, and the number of unemployed deaf in America would be found to be very small.

13,200. There is no prejudice against the employment of the deaf and dumb?—No general prejudice. There may be found individual masters who would not like to employ deaf persons, but, generally speaking, there is no prejudice against them.

13,201. Will you give us the substance of what you wish to say about the sign system, as distinguished from the manual, as bearing upon the answer which you gave to me on the quotation which I made from a former speech of yours, made 16 years ago, at Indianopolis?—In answer to the question, I beg leave to present two quotations. The first is from a paper of Dr. Fay, presented at the Convention in California this last summer, on the general subject of the education and care of the deaf. He speaks here with reference to the two methods often spoken of as the French and the German, or the manual and the oral, and makes some important comparisons, which I will read, as they bear very much on one or two of the answers given under that head. Dr. Fay says: "Errors of proportion have divided the "educators of the deaf into schools of opinion, not "exactly hostile, but certainly separated and narrow. "The schools of France, for a century, and subse-"quently the schools of the United States, while theo-"retically favourable to the teaching of articulation, "have demonstrated, only and mainly, through long "practice, the importance and possibilities of panto-"mime and the uses of the manual alphabet, supple-"mented by written speech. They have applied these "instruments with great skill and energy, and have "produced a remarkable body of silent scholars easily, "superior in scholarship to anything that oralists "have been able to produce. French and American "schools, true to their traditions, have been back-"ward, however, in taking up and applying, with "equal skill and energy, the teaching of oral speech.

"Might not a fraction of their silent, written scholar-"ship have been well exchanged for a degree of oral "skill? Such seems to be their own present conviction. "We are now witnessing the introduction of the "systematic teaching of articulation into all the pro-"minent institutions of Europe and America. And the "pursuance of this policy has exhibited the fact that "the development of the faculties and the acquisition "of verbal speech by pantomime, by finger spelling, "and by books, are an excellent preliminary training, "the full peer of all rival expedients, for teaching "associated with subsequent oral speech itself. The "pupil has something to say, and can be more easily "taught to say it. The present need of our historic "schools is to expand their scope still more widely, so "as to include and attach to themselves all that is "valuable in oral schools. If a longer school period "shall be found necessary for the best results, it should "not, will not, be withheld. Another school of opinion, "represented by the schools of Germany for a century, "and by a few recently opened in the United States, "ignores the pantomime of the deaf and uses none. It "omits the finger-alphabet and proposes to teach the "deaf at the start, and with no intermediate step, oral "speech itself, and by it all branches of desirable "knowledge. Though opposed to the use of extempore "sign-pictures, it uses all printed pictures freely. It "omits evidently and rejects such illustrations as the "pupil is likely to imitate and to incorporate into signs "of his own. It is communicating instruction with "great and increasing skill, and to a proportion of "pupils steadily enlarging. The partially deaf, and "those who have heard in early years, succeed from the "start. An additional number, some of them totally "deaf from birth, succeed to a certain extent, prac-"tically useful. A large number do not acquire it "sufficiently to be able to rely upon it, singularly "evanescent in after life. At school they habitually "invent and illicitly use a gesture-language for social "relief, and feel more confidence in their pencil than "in their voice. The time spent in oral teaching has "crowded out some topics taught in the sign schools. "The range of written scholarship, including English "composition and the ability to read newspapers, is "considerably lower. This deficiency is justified by "those who are responsible for it by the compensating "value of the oral speech, acquired or attempted. "These schools have yet to learn that, in omitting the "use of pantomime and finger-spelling, they ignore "the uneducated mute's best friend. They take away "a ladder, the only ladder known, by which all the "deaf can easily rise. They require the mute, scorning "all climbing steps and gradual approaches, to clear "at one bound the chasm that separates the deaf from "the hearing. They force the recruit at once upon "frowning breastworks. They apply a method derived "from the functions of the hearing mind, and not at "all from the essential, the universal functions of the "mind of the deaf. Attempting the best thing for all "the deaf by a method heroic, they succeed with a "small number, less than half, and, holding no middle "ground substantially, culpably fail with a considerable "number. The brilliancy of the operation is clouded "by its frequently fatal issue. These schools, excellent, "ambitious, and ably officered, need, in behalf of many "of their pupils, to incorporate into the early years of "their course all that is valuable in the sign schools. "The removal of intervening barriers will make the "two jarring methods friends,—astonished to remember "that they ever differed. Pantomime and finger spel-"ling, as jealously excluded now from oral schools as "the 'long keels of the northmen,' will prove a boon, "a help, and not a hindrance, to all their pupils They "will all easily rise, and rapidly, to the plane of written "speech; and those capable of taking the higher step, "the last, the crowning oral one, will not be the less "able for having a broader elementary base." I present that as the expression of what I conceive to be the best thought of the present day in America relative to what is spoken of as the combined system. It gives everything to the oral teaching that it can accomplish, and it still holds on to much that belongs to what may now be termed the old manual method, which exists no longer as the only method of teaching the deaf, but which still, the writer conceives (and there are a large majority who sustain his view), should not be given up.

13,202. Might I ask what was the view taken with regard to the aural system at that Californian convention; how far was it considered to be practicable in a sufficient number of cases?—It would vary in different localities, from 10 to 20 per cent. of the whole number of deaf mutes. Coming now to the other citation pertinent to the matter, to what extent signs are valuable in the instruction of the deaf, and in the life of the deaf, I would read this short paragraph from an article published in a handbook of medical science, on the general subject of gesture language, which I was asked to prepare with a view to giving information to medical men with regard to the treatment of the deaf: "At this point the "question will naturally arise in many minds: 'Does "'the sign-language give the deaf in these respects *all* "'that speech affords to the hearing?' The experience "and observation of the writer leads him to answer the "question with a decided affirmative. On many occa-"sions it has been his privilege to interpret, through "signs to the deaf, addresses given in speech; he has "addressed assemblages of deaf persons many times, "using signs for the original expression of thought; "he has seen hundreds of lectures and public debates "given originally in signs; he has seen conventions of "deaf mutes, in which no word was spoken, and yet all "the forms of parliamentary proceeding were observed, "and the most excited and earnest discussions carried "on; he has seen the ordinances of religion adminis-"tered, and the full services of the church carried on "in signs; and all this with the assurance growing out "of his own complete understanding of the language, a "knowledge of which dates back to his earliest child-"hood, that, for all the purposes above enumerated, "gestural expression is in no respect inferior, and is in "many respects superior, to articulate speech as a "means of communicating ideas. But the greatest "value of the sign-language to the deaf, when the "whole period of their lives is taken into account, is "to be found in the facility it affords for free and ur-"constrained social intercourse. And in this, as in the "matter of public addresses, nothing has been dis-"covered that can fully take its place. It may even be "asserted, that so long as the deaf remain without "hearing, nothing else can give them what speech "affords their more favoured brethren. They may "have much pleasant intercourse with others by the "employment of writing tablets; they may even enjoy "conversation under many limitations with single "individuals through articulation and lip-reading; with "the aid of the manual alphabet they may have a still "wider and more enjoyable range for the interchange "of thought; but it is only by employing signs that "they can gain the pleasure and profit that comes from "conversation in the social circle, that they can enjoy "such freedom of intercommunication as shall make it "possible for them to forget they are deaf."

Dr. E. M. Gallaudet.

9 Nov. 1886.

13,203. Does not the language of signs convey sometimes a slightly different idea to different people; for instance, take it in this way: Supposing a sermon was preached in signs, would every member of the congregation write the sermon down in exactly the same language?—No, not at all.

13,204. Then, clearly, there is room for a great latitude and variety of language?—That the ideas would be expressed clearly and distinctly is as probable, even as that the ideas would be so expressed in a case where a congregation heard a sermon preached orally.

13,205. I do not see how that is reconciled with what you said 16 years ago; that the effect of signs tends to make the language inaccurate or obscure?—I was speaking then distinctly of the use of signs in teaching, which I deprecate in the class room; but for purposes of lecturing, for purposes of public addresses, for purposes of social intercommunication, I insist that the language of signs is of such value, and the source of so much enjoyment and pleasure in the intercourse of the deaf, that it is cruel to take it away from them.

13,206. But I thought that from the passage you read out, you proved more than that; that you proved that everybody who has speech should use signs, because it is the more expressive of the two, as the Italian does?—I think there are circumstances where the language of signs is more expressive than that of speech. I often find myself better able to express certain ideas through the means of the gestural language than through the means of speech.

13,207. (*Mr. Johnson.*) You wrote that passage for the guidance of the medical profession, I understand?—Yes, this is one article in their handbook, intended to guide them in the treatment of these children.

13,208. (*Chairman.*) Going on to the higher education of the deaf, would you in the higher education of the deaf give all the lectures by signs rather than by the

Dr. E. M. Gallaudet.

9 Nov. 1886.

manual alphabet?—My preference would be to use the language of signs in most lectures; there might be some very much of a technical character, and in which scientific terms would be largely used, where the manual alphabet would be preferable.

13,209. You would not give lectures in Mathematics or Logic by signs, would you?—To a considerable extent; but in the use of the gesture language the interjection of words spelt upon the fingers is very common.

13,210. The mixture of the two would be necessary?—Quite necessary.

13,211. In order to give precision in certain cases?—Yes. You ask me, with regard to the higher education of the deaf, to speak somewhat to that point; and I will, therefore, with your permission, make a statement as to the establishment of the college at Washington in which the higher education of the deaf is provided for; and I have brought with me a few copies of a map which represents the grounds and buildings of the institution, which the Commission might be interested to look at, so as to get an idea of the extent and the arrangement of the grounds and buildings, that is, of the institution, including both the primary school and the college; they are quite distinct in their organisation. This map shows the grounds and the arrangement of the buildings. I am sure it would be of a little interest in connexion with the higher education of the deaf, to know how it came about that the Government of the United States became committed to the support of such a work; for it is probably well known, even in this country, that, constitutionally, the Government of the United States would hardly be at liberty to appropriate the money of the country at large for the support of an educational institution of this sort; in fact, that question in the progress of the relations of the college with the Congress at Washington has been often raised. The institution at Washington was begun in 1857 as a primary school. One of the clauses in the Act of Incorporation gave no limit, in providing for the period during which children should be received and educated, as to the time which they could be retained in the institution. They were simply to be received and retained there while they were of teachable age. That simple omission to place any limit on the course of instruction, suggested to those who had charge of the institution in its early years, that the course of instruction might be extended so as to cover the secondary or collegiate course. So in 1864 after the primary school had existed for seven years, it was suggested to the Board of Directors by the then superintendent of the institution, that the course of instruction should be extended to include collegiate training. The Board of Directors accepted the suggestion. Congress was asked to pass an additional Act authorizing the institution to confer collegiate degrees. This Act was passed before the Collegiate Department was organized, and in 1864 the simple pressing forward of a few of the more capable pupils of the school into collegiate study formed the nucleus of what became later the National College. Congress, made an appropriation for enlarging the grounds at that time, and later for additions to buildings, but no appropriation whatever for the maintenance of students in the college who were unable to pay their expenses. Private charity was appealed to successfully to secure annual contributions for the support of young men in the college who were unable to pay their own expenses. At a certain point, a little later, I think it was in 1866, I (if I may be allowed to speak in the first person, for I was then President of the college) received a letter from the Honourable Thaddeus Stevens, who was then the Leader of the House of Representatives, in that position on account of his being at the head of the Committee on Appropriations, saying that in his district there was a young man who wished to come to the college at Washington, who was deaf, had never been in a school for the deaf, but had become deaf, who was poor but very intelligent, and asking me if he could be admitted without charge. I replied that he could not, and I called upon Mr. Stevens to explain the reasons why he could not. He grew very much excited (he had previously been a friend of the institution and the means of securing appropriations for it) and asked why his constituent could not be received without charge. I replied, that there was no law for it; and in very emphatic language, which I need not repeat, he declared that there should be a law for it; and in a very few weeks he succeeded in passing through ongress a law for the admission of a certain number of young men from the States and Territories on a free basis; and that formed the beginning of our authority from Congress to receive young men into the college from the States and Territories, giving them board and tuition without charge when their circumstances were such as to make it impossible for them or their friends to meet the expense of paying.

13,212. And did the State vote the sum of money requisite for the purpose?—Not the State. The Federal Government gave those annual appropriations, increasing from year to year, and sufficient to cover the increased expenses owing to the reception of these young men, the majority of whom are in circumstances which make it impossible for them to pay.

13,213. But do not the State Governments also pay?—They contribute nothing.

13,214. But with regard to those in the primary school, do not the State Governments pay so much?—In the primary school at Washington the majority of the pupils are from the district of Columbia, and so they are paid for by the United States Government, as we have no local government in Washington.

13,215. Are you quoting this college as a model for the rest of the United States, or is that the only one?—It is the only one, and the only one that is at present needed; that is to say, it is able to furnish the secondary or collegiate education for all the deaf that are fit to take that course of study; so that we can say no other is needed at present in our country. We quote that as something very desirable to have, if possible, in other countries.

13,216. As I understand it all the education of the deaf and dumb is practically free in cases where the poverty of the parent requires it?—It is so.

13,217. Free; being borne either by the State or by the Federal Government?—Yes; so that even through the college the education of the deaf is practically free.

13,218. All education is free in America?—All primary education, but not all collegiate education. The deaf have an advantage there over the hearing.

13,219. (*Mr. Woodall.*) These pupils in Washington are received from all parts of the country?—Yes.

13,220. (*Chairman.*) Are they maintained there free?—It would not include, for instance, their clothing.

13,221. And in the holidays they go home at their own expense?—Yes.

13,222. They have their college training free?—Yes.

13,223. And their board and lodging free?—Yes.

13,224. (*Mr. Woodall.*) There is no system like what prevails in France?—No. We had what are called scholarships given by private individuals. These private individuals paid for certain students at the college an annual sum which was equivalent to the charge which we made to ordinary students for board and tuition; but those terminated and have not been renewed, and now the entire help of students needing help comes from the general fund appropriated by the Congress of the United States.

13,225. (*Mr. Johnson.*) There are certain people who do pay?—Yes.

13,226. It is only those who are unable to pay who claim a free education from the State?—Yes, those who are able to pay are expected to do so.

13,227. (*Chairman.*) Practically, what proportions pay?—Only about five per cent. pay their expenses; and it ought to be said in connexion with that, that the distances in our country from Washington are so great to all the outlying States, that even though the circumstances of a deaf young man may be tolerably comfortable he has to pay in coming and going such a large cost for transportation, besides going home during the holidays and expenses in connexion with that, that we assist young men who are not in a condition that we should call one of absolute poverty, but whose means are straightened and are not sufficient to enable them to pay these expenses; but they all provide their travelling expenses, their clothing and books, and what may be called their incidental expenses.

13,228. (*Mr. Woodall.*) What assistance do you give them?—We make them no charge for board or tuition. In no case do we assume the actual support in an eleemosynary sense of any of these young men who are following their higher education. I may say that we have been asked to do so by the managers of institutions in different parts of the country, and I have steadily refused, and have been sustained by the directors in refusing to adopt any course which seemed to make the collegiate education of the deaf an absolutely eleemosynary act. I claim that the deaf young man who is not able by his own energies or by the assistance of friends to clothe himself and pay his way to Washington and back had better not have the higher education.

Dr. E. M Gallaudet

9 Nov. 1886.

13,229. (*Chairman.*) Is this institution full, and what number does it contain?—In the primary school it contains 65 at present, and in the college 50. We have room for probably 25 or 30 more in our buildings.

13,230. What proportion of those in the primary school go up to the higher education?—A very small proportion, hardly one a year from our primary school. Before leaving the subject of the Governmental support of the institution, I would say that at present the annual appropriation for the support of the institution in all its branches by Congress is a little over 10,000*l.*, which makes, it will be seen at once, a very large *per capita* for the number of pupils and students, say 120, that would be taught during any given year. This large expense grows out of the necessity of paying large salaries to the professors in our college. One of the professors in our college, the one who is most highly paid, receives a salary of 3,000 dollars, or 600*l.*, and a house; and two others receive a salary of 2,400 dollars, or 540*l.*, and a house. The others receive rather smaller salaries, but these large salaries which it is necessary to pay men of ability to induce them to teach in the college carry *per capita* the cost up to the high point that it is.

13,231. What is that point?—It is quite 100*l.* a year.

13,232. That does not take into calculation the interest on the capital sum that has been spent on buildings and on land?—No.

13,233. (*Dr. Campbell.*) What is about the proportion in the primary department, and what in the collegiate?—The primary department is quite a different thing.

13,234. (*Chairman.*) Do you separate the expenses?—I have not done so in my calculation. This sum of 10,000*l.* covers the entire institution in both departments.

13,235. But of course there must be very much greater expense in educating the higher department than in educating the primary department?—Yes.

13,236. It means therefore practically that the expense of the higher classes is not only 100*l.* per head, but a great deal more; because in that calculation of 100*l.* you are giving them credit for the lower sum per head that the primary school costs?—Yes. But to compare the expense of the college with, for instance, the Government Schools at Anapolis and West Point for naval and military training, the expenses there run up to 1,000 and 1,500 dollars *per capita* per annum, and the expenses of young men securing a collegiate education in our colleges in America run up to a much higher sum than it costs in our college. I should pass on to give an idea of the course of study pursued in the college at Washington, and then to speak of some of the practical results of the higher education of the deaf, what they can do in after life, how they succeed, and what they accomplish. I may state that the form of admission is given in the appendix to the report of the institution. The course of study taken up at the college supplements that carried forward in the best and most advanced of our State schools, our primary schools. The applicant for admission to the college is supposed to have completed arithmetic, and to have completed primary studies of course, and comes in then to what is termed on page 27 of our report an introductory course of one year in a course of five years; and in this first year of the five of the course, which is termed our collegiate course, algebra, the study of English grammar and history, and original compositions, and Latin are pursued. Latin is begun at the beginning of this year, the lowest year of the five in the collegiate course. Then in the freshman year we continue in mathematics, algebra, and take up geometry; in English, original compositions; in Latin the study of Sallust and Cicero is carried on; Greek is an optional study; and the course of history is continued. Then in the next year, the Sophomore year, mathematics go on to trigonometry, mensuration, and surveying; zoology is taken up, and botany and chemistry; Latin is continued with Virgil's Æneid; Greek is an optional study, and there is quite a course in English. The next year, the junior year, mathematics are continued to the calculus and mechanics; physics are taken up; in chemistry, laboratory practice and qualitative analysis; and physiology. French is then taken up and continued during the year; and history and English and logic are studied. In the next year, the senior year, in English literature quite an extended course is pursued; German is taken up and continued for the year; natural science is taken up, and the elements of mental science; moral science is taken up, æsthetics, political philosophy, and international law. That affords an idea of the course of study pursued in the college which is necessary to secure a degree, and examinations in those studies are made at the end of each three months, each semestre, and then a record is kept of the marks obtained in the recitations and the examinations, and it is required that a certain standard should be reached (a standard of 6½ on a scale of 10) in order to enable the student to pass. And I may say that we have had whole classes that have reached the end of the college course, the average of which has been above 9 on a scale of 10 in recitations and marks for the entire course.

13,237. (*Dr. Campbell.*) In connexion with the study of languages, it is always written, I suppose, never oral in any case; take for instance French or German?—We do use speech in a good many cases, and speech is used as a means of communication in a great many cases where it is practicable. Of course we do receive students who have not power of speech, and with them the method of communication is mainly the manual alphabet. I may say that in the recitations and in the class room the sign language is very little employed, the students being taught by writing and the manual alphabet.

13,238. But do the deaf people learn to speak French or German?—Not to any very great extent. Now, with regard to the admission of young men who may come to us for the purpose of pursuing special courses, although our full course is five years we may have young men who come to us and study for two or three years, and leave us with a certificate of honourable dismission, showing what studies they have pursued. These of course take no regular diploma, and go out with no degree, but a good many young men take in our college what is tantamount to a high school course of study, such a course as will be beneficial to them in after life, the particular course depending upon what pursuit they intend to take up.

13,239. (*Chairman.*) I see that free admission is given also to those whose fathers are in the military or naval service?—Yes, that is the law of Congress. We rarely have a case of the sort; we have not had one for several years, but it is open to such, if such a case should occur. With regard to the admission of young men into this higher school at Washington, I am able to say that the whole country has been represented with the simple exception of the Pacific States. The distance by which we are separated from the Pacific involving a very large cost of transportation, has prevented the representation of any of the Pacific States in our college; but the South and the Middle States, and the West and the East, have been represented in a proportion almost exactly comparing with the proportion of the population of those different sections; and in this publication, which was printed three years ago, the number of students received, and even their names, and the States from which they came are given. So that running it over, it will be found that nearly every State, with the exception of the Pacific States, has been represented in proportion to its population. And that has been an interesting fact to us, and one that has commended the college to the liberality of Congress, for it sees at once that since our system of general education is so extended it is possible for deaf boys to be found in all parts of the country sufficiently advanced in their primary instruction to enable them to come into the higher school. I may mention that we have had two very estimable young men from the United Kingdom; in fact three. One young man came to us after a short residence in America in one of the primary schools, who was from Scotland. His father was a professor in one of the higher schools there, and this young man came to us and graduated, and is now a teacher in one of the western schools. Two other young men have come from Ireland. One after staying with us for three years developed Bright's disease, and died after returning home. He was a bright, intelligent young man. The other is with us now, and I will mention his name, Francis Maginn. His father is a clergyman of the Church of England, in Ireland, near Cork; his uncle was the distinguished "Doctor" of Fraser's Magazine, William Maginn, and his family is one that is well known in Ireland. He has been with us for two years, and is a very promising

Dr. E. M. Gallaudet.

9 Nov. 1886.

young man, sure I think to make his mark somewhere when he gets through his course of study. He is enthusiastic in his appreciation of his opportunities with us, and was extremely anxious that I should make it appear before the Commission that the higher education of the deaf was a practicable thing, and an important thing. He said he was feeling it in his own case, and that he expected to come back to Great Britain after two years more, and do something that would show that it was worth while for him to have had this higher education.

13,240. Do any of these students go out into the liberal professions, law, medicine, or the Church?—I will answer that by reading a brief paragraph. This was written three years ago: "Forty who have gone "out from the college have been engaged in teaching; "three have become editors and publishers of news- "papers; three others have taken positions connected "with journalism; 10 have entered the civil service "of the Government. One of these, who had risen "rapidly to a high and responsible position, lately "resigned to enter upon the practice of law in patent "cases in Cincinnati; one, while filling a position as "instructor in a Western institution, has rendered "important service to the Coast Survey as a micro- "scopist; one has become an accomplished draughts- "man in the office of a New York architect; one has "for several years filled the position of recorder's "clerk in a large Western city; two have taken places "in the faculty of their *alma mater*, and are rendering "valuable returns as instructors where they were "students but a short time since; some have gone into "mercantile and other offices; some have undertaken "business on their own account; while not a few have "chosen agricultural and mechanical pursuits, in which "the advantages of thorough mental training will give "them a superiority over those not so well educated. "Of those alluded to as having engaged in teaching, "one has been the principal of a flourishing institution "in Pennsylvania; another of a day school in Cin- "cinnati, and later of the Colorado Institution; a third "has had charge of the Oregon Institution, and a "fourth is at the head of a day school in St. Louis." And I would be glad to add to this enumeration a very interesting case which has come up since this publication was issued of a young man, who came to us, who was entirely deaf from birth, and had never learnt to speak. He devoted himself to chemistry, especially while he was in college, though he pursued the scientific course, and received a scientific degree. He became after his graduation an assayer in a prominent smelting establishment in Chicago, and soon rose to take the chief position there. He has had submitted to him on many occasions disputes between other practical chemists in Chicago, his judgment being relied on as very good; he has contributed to scientific publications several articles, some of which have been translated into German scientific publications; and now quite recently he has been called to St. Louis, where he has been appointed chief practical chemist to an immense sugar refinery. And when I say that this young man graduated from our college only four years ago, and is now only 28 years of age, I think you will agree with me that the deaf, with the higher training, may find their way into positions of practical use, and be able to stand side by side with those who have all their faculties. I should add that this young man has not the advantage of speech; he communicates entirely by writing or by the fingers. I merely speak of that to show that this practice of the oral method with the deaf is not essential to the highest success in the various pursuits which they take up. I may say that one or two of our young men have studied for the ministry, but none of our own graduates have been ordained. There have been three deaf men ordained to the ministry in America, and they are serving their own people very well in different parts of the country.

13,241. Do any of your students become doctors?—Doctors they do not try to be, because from their deafness they cannot make the necessary examinations of patients. I ought to speak in this connexion of a young man whose case interested me very much in the past summer. He is a farmer in Vermont. He spent two years with us. He was a young fellow of great intelligence, but not of the highest scholarship, but while he was with us he knew that he was to be a farmer, his father having a farm which he was to inherit, and so he pursued his studies with a view to making himself an intelligent and scientific farmer. I was at his house in Vermont, last summer, and I heard from his neighbours that he was absolutely the best farmer in the whole district; that he made more money out of his farm than any other farmer; that it was in better condition than any other; that he knew more than any farmer in the whole neighbourhood; that he was able to read intelligently the best scientific papers that have a bearing upon farming; and that his farm was a model of excellence. That would show that the higher instruction has its uses even with deaf young men who go into farming. This young man also is one who has no power of speech. Of course instances could be added, but it goes without saying that our graduates have little difficulty in finding their way into positions which they would be utterly unable to take had they not had the higher training that is given in the college. I think that I ought to ask to be permitted to give a little specimen of the excellence of the literary work of the graduates of the college. Some of our graduates have even aspired to be poets, which might be a surprise. There are a dozen lines which, if your Lordship would allow me, I should like to read, because they give a very interesting insight into the mental condition of one who has become deaf in childhood. These lines take the form of a sonnet, which describes the condition of those who have become absolutely deaf after having heard, perhaps, for a few years during childhood:—

"They are like one who shuts his eyes to dream
Of some bright vista in his fading past;
And suddenly the faces that were lost
In long forgetfulness before him seem.
Th' uplifted brow, the love-lit eye whose beam
Could ever o'er his soul a radiance cast,
Numberless charms that long ago have ask't
The homage of his fresh young life's esteem;
For sometimes, from the silence that they bear,
Well up the tones that erst formed half their joys
A strain of music floats to the dull ear,
Or low, melodious murmur of a voice,
Till all the chords of harmony vibrant are
With consciousness of deeply slumb'ring pow'rs."

I quote from an article on the poetry of the deaf which I contributed to the "Annals" three years ago, Vol. XXIX., p. 204.

13,242. (*Rev. W. B. Sleight.*) How was he educated?—Upon the manual system. He received his college education with us. He was at the Hartford School previously. He was not a mute from birth, but became technically a deaf mute, though retaining the power of speech, not having heard after his childhood, and all his education was carried on in the school for the deaf.

13,243. (*Mr. Johnson.*) At what age did he become deaf?—At the age of 10.

13,244. (*Chairman.*) Do the degrees which you give at your college bear comparison with those given in the universities of the country?—They bear comparison with the other colleges of the country. An university degree is in advance of what we give, but the degree of Bachelor of Arts compares with the degrees given in the ordinary colleges in our country. With us the term college means an institution which is not quite up to the standard of what you would term your full university course. We have universities in America which give this full course quite equal to the universities here.

13,245. I was rather asking the question with regard to the universities?—There is just that distinction which I have mentioned.

13,246. I will ask you now about the condition of the deaf after they have left the ordinary schools of the country. You have told us, to a certain extent, with regard to their industrial training and the occupations which are pursued?—Yes, but I have not spoken as to how successful they are in after life in any detail, or how they bear themselves in society in general. The 70th Report of the oldest institution in the United States, that of Hartford, issued this same year 1886, gives a very valuable account, which I will not attempt to read at all in detail, of a very large number of their graduates about whom they have taken pains to collect information; and a glance at a list like this would show you the number of occupations pursued by the graduates of this school. There are 50 or 60 different occupations, and there are observations with reference to the wages which they earn.

13,247. It is not a question with the deaf in the same way as it is with the blind?—It is not so serious with the deaf.

13,248. You do not find any difficulty, probably, any more than we do, in their getting employment?—No, no serious difficulty. This report might come in as an appendix to show the comparison of the wages they earn, and what they do; and the general statement can be made that the deaf, as a class, with education, are self-supporting. And I think it well, in connexion with that statement, to call attention to this point which I have had occasion in one or two instances before Congressional Committees to lay some emphasis upon, and which is not generally appreciated; that is to say, when the condition of the uneducated deaf, their dependent condition, the small amounts that they earn, the limited intelligence that they show in employments, and the cost of carrying them through the ordinary course of an average life, are taken on the one hand, and on the other the expense of educating the deaf in boarding schools at the public expense, paying for their sustenance as well as their education, then taking the period necessary to carry out this education, whether it be seven or eight years, when this calculation is entered into, it is found that the saving to the State in actual pounds shillings and pence, by educating them, is simply enormous. I will not stop to give figures. I have made the calculation, and I have presented it to the Congressional Committees; and, as a general observation, I may say that while it is perfectly conceded that it is an additional expense to educate the deaf in boarding schools, it is not generally understood that, even taking this addition into account, the saving to the State is enormous over what they would lose through the helpless and dependant condition in which the uneducated deaf are found during nearly the whole period of their lives The question is often raised by those who have the levying of rates and assessing of taxes. They say that it costs so much more to board these children, and that it should be considered a matter of pure charity. But we do not so look at it in America.

13,249. It is a matter of interest, you would say?—It is a matter of pure selfish interest that we take these deaf people out of the condition of ignorant dependence, and, by the expenditure of an amount of money easily calculated, we turn them over into the other side, the producers and self-supporters, and gainers of wealth to the community; and the gain to the State is simply enormous by the change effected by education. And there is one other consideration in connexion with that, which has had some prominence given to it in our own country. It has been urged, on the one hand, that the deaf could be educated in day schools, and the expense of their education much diminished. On the other hand, it has been also urged that the parents of the deaf in the community have the right to their having the best education, and, if the best education can only be obtained in boarding schools, then it is right that they should have that education in boarding schools, and that no parents, or few parents, would consider that the absence of a child from home in a boarding school was to be weighed as over and against the expense of supporting that child at home. Any parent would rather have the child at home than send him away for the sake of merely gaining the cost of his sustenance. So, all over our States, the doors of these schools have been opened to the children of the well-to-do, and even rich, as well as to those who are poor, and in some States it is considered absolutely a portion of the system of public education, and no statement of poverty or inability to pay is required, and that has become the tendency and practice in all parts of the country.

13,250. That is associated with the general free education that prevails in America?—Yes.

13,251. One cannot understand that there should be any reason why the deaf and dumb should be excluded from that?—Yes. The disposition to associate together in a clannish manner of the deaf after leaving school has been made the subject of considerable discussion in our country, and it has been urged that schools should be so organised, if possible, as to prevent this clannish association of the deaf in after life, with a view to prevent too much inter-marriage of the deaf, from the fear that inter-marriage of the deaf might increase the amount of deafness in the community, that their children might be more apt to be deaf than other children.

13,252. Have you any statistics to give us showing the effect of the inter-marriage of the deaf?—The statistics are far from being complete. Mr. Alexander Graham Bell, who, I believe, has been invited to give evidence before this Commission, has made, during the last two or three years, quite a study of the matter of the inter-marriage of the deaf, and has presented to some of our scientific associations papers in relation to the possibility of the formation by inter-marriage of a deaf variety of the human race. If Mr. Bell should appear before you, undoubtedly he would give you a great deal of information on that point. His studies, he admits, up to this time, are incomplete; the data he has had at his command have not been sufficiently numerous to enable him to make a complete statement; but it is a subject which engages the attention of all teachers of the deaf, and they feel it to be important that deaf pupils going out of the institutions should be perfectly aware as to wherein lie the dangers of inter-marriage. And, in connexion with this, it may be interesting to say that while we have not facts and figures to make a complete statement, we have enough data to show very clearly that the mere fact of one who is totally deaf marrying another who is totally deaf, does not at all suggest that their children are likely to be deaf; for the reason that if the parties have both of them acquired deafness by accident, there is no greater likelihood that their children will be deaf than the children of other persons.

Dr. E. M. Gallaudet.

9 Nov. 1886.

13,253. You are not competent, perhaps, to speak on the question of deafnesss running in families?—I can say that in America there is quite a body of statistics at hand with reference to certain families in which deafness seems to have run, and to have visited, in a considerable number, the members of these families, and it is certain that, wherever there is found, by the presence of more than one deaf person in a family, any evidence of a tendency to deafness, if a person belonging to that family, whether deaf or not, marries a person whether deaf or not belonging to another family in which deafness has run, you find that the children are, in a large proportion of cases, liable to be deaf. It is not the fact of the deafness of the contracting parties; but, if you find a family where there is evidence of a disposition to deafness, and members of that family marry into another family with a similar disposition to deafness, they are very apt to have deaf children; so, these institutions for the deaf, which stand in *loco parentis* to the pupils, many of them, take great pains to advise the pupils to be very careful, and to exercise a caution which people often do not exercise in regard to marriage, and where they know there is a disposition to deafness in a family to avoid marrying anyone belonging to that family.

13,254. Are you aware whether the marriage of first cousins produces deafness?—It is a subject that has received a great deal of attention.

13,255. Perhaps you would refer us to any statistics that are reliable on the subject, if there are any?—I can refer rather to papers and discussions based upon the rather limited area of facts which bear upon the subject.

13,256. We do not desire to go into the details now, but if there are statistics, perhaps you would kindly hand them in in your evidence?—Yes. *See* Topical Index of the American Annals of the Deaf.

13,257. The next point is what education does the State require in the teachers of the deaf and dumb, and what are the qualifications for the teachers required by the State?—I am sorry to say that we have not in America any normal school, or any examining board with reference to the qualifications of teachers before whom applicants for the position should go and prove their capacity. In each institution it is a matter for the governing body of the institution itself to determine the qualifications of the teachers. The course pursued is usually this: To take into the institution a young person, male or female, who has a sufficient amount of education and ability to make it probable, that he or she will succeed as a teacher of the deaf; and then for the principal of the institution, with the assistance of the teachers who are already experienced, to train this young teacher in the art of teaching the deaf. And in this way a body of very capable and experienced, teachers has been raised up in America in the different schools. In some institutions there has been pressure to bring them down to small salaries, and that keeps out teachers of the greatest efficiency from these institutions.

13,258. Does that system insure an uniformity or teaching in the schools, or would it not rather tend to produce uniformity of teaching in each particular schoo! rather than throughout the whole of the schools?—I think that would be the tendency, although I think that in a country so large as ours, considering our political organisation, and that local matters are quite independent of the Federal Government, it would be impossible to establish through the Federal Govern-

Dr. E. M. Gallaudet.

9 Nov. 1886.

ment any general system of examination. There has been a serious thought of establishing in connexion with our college at Washington a training school for teachers, and the establishment of such a school would no doubt be attended with good results; but that is still in the future.

13,259. You have only the judgment and discretion of the governing body to ensure that the teachers are good ones?—Yes, and yet it can be said that the practice has been in America, to require that the applicants for positions as teachers should be men and women of a very high order of education. A very large proportion of our men teachers of the deaf are, what would be called in England, university men; that is to say, graduates of colleges, men with high attainments; and running back for a series of years, we can point to many men who have gone out from institutions in which they have been teachers of the deaf, and taken positions of of the highest eminence in literary and scientific pursuits. I could cite the names of several presidents of colleges who where teachers in institutions for the deaf; and it is an interesting fact that both the candidates in the recent canvas for the highest position in our country, that of the President, Mr. Cleveland, and Mr. Blaine, began life as teachers of the blind. I mention this to show that men of a sort who might be expected to rise to high positions, are often found among the ranks of our teachers.

13,260. Is not that the case in America generally; there is no separate profession, a man begins his life as one thing, and ends it as another?—Yes. It ought to be said in connection with the employment of our teachers, a great object in the organization of our institutions is to secure permanency, and we pay salaries, for example, on which they can marry, and settle, and feel that the work of teaching the deaf is to be their life-work. That has an effect not only in the actual efficiency of the single and given institution, but also it has the tendency to establish, as it were, a profession in which it is possible to have an *esprit de corps*, and the opportunity for promotion. Teachers, for instance, look forward to the time when they may be principals, and they feel even if they are not, that they are to be well paid and enabled to live comfortably, and have their families about them; and so they consider that they are entering on a work which is to be their life-work; and experience of course is very valuable from year to year.

13,261. I think you stated that the principals in the ordinary State institutions were appointed by the President?—By the directing body that has been named by the Legislature.

13,262. Not by the President?—No. You understand that we have in our State constitutions a Governor and the members of the Legislature, and those officers are supreme in their own State. The President has nothing to do with what may be termed State patronage, only with what may be termed Federal patronage. So that in these State institutions the principals and teachers would be appointed by a Board of Directors or Trustees who are constituted by the Act of the Legislature; and when the complexion of the Legislature changes, for instance, from republican to democratic, or from democratic to republican, it often happens that the Board of Directors or Trustees changes also.

13,263. The principals of these institutions are liable to being changed by these bodies for political reasons?—Yes; and it has happened that when the existing law of the State was such that the removal could not be made of the principal of the institution, the entire existing law has been repealed, and a new law enacted, to enable him to be removed. To such a pass are we come, I am sorry to say. I do not speak of it with anything but mortification. It is a most pernicious system, and the results have been painful. I have seen men put into the office of teacher who had absolutely no knowledge whatever of teaching. The only qualification of one man put at the head of a large institution was that he was a very good dentist.

13,264. What you have said about the teachers is subject therefore to these contingencies which may or may not be prejudicial to the education of the deaf and dumb?—Yes. So that it is true that in many of these institutions governed by the State, the teachers are persons whose claim to be teachers is not a good claim; but in the corporate schools, those whose management is in the hands of a permanent board, the teachers are taken with great care.

13,265. Are the teachers who are chosen with great care often sent out to other schools for the deaf, or do they often follow a career in the body in which they have been first brought up?—They frequently change their place. If they are paid a certain salary in one school, and have the offer of a much better one in another, and if it is for their advantage to make the change they make it. I have a single note under this head of teacher and their relations to the institutions, to say that we have no arrangements in America in our schools for the deaf for paying our teachers by results. In the education of the deaf it would, in my judgment, be almost impossible to judge of the teachers' efficiency by any scale which could be marked by results, for often a class of deaf children of secondary mental power may have been laboured with by a teacher of the utmost devotion and earnestness, and yet the result in marks on any scale that might be applied to all deaf pupils would show comparatively but little progress. That very teacher might be the one who had worked harder than any other in the whole school. So that we have never made any attempt in America to pay our teachers by results, but simply to have that supervision over them by the principal in charge, which would make him satisfied that they are doing the best that can be done.

13,266. I think you have told us, with reference to the conferences, that they have now been in practice for some years, and take place every four years?—We have two bodies of instructors of the deaf meeting in America, one termed the conference of principals, which meets every four years, and the other the convention of instructors, including principals, which also meets every four years. Those meetings alternate with each other, so that we have a meeting every two years, one year the conference of principals and the other the convention of instructors; and those meetings have been continued since 1851, with an interregnum during the time of our civil war, when, for a few years, they were suspended. I have brought with me, and I shall leave at the disposition of the Commission, a number of copies of the proceedings of different conventions and conferences that have been held, in which there is a great amount of material of great value bearing upon the work of instructing the deaf in America. And I cannot speak too favourably of these conferences and of the importance with which they are regarded in our work in America. They bring teachers together. For instance, at this last convention in California, half of the time of the convention was taken up in normal sections; teachers of known capacity and experience were selected to take charge of certain subjects of instruction and to hold meetings of such teachers as were interested in those particular branches of instruction. They interchanged methods and means of instructing from one teacher to another, and so a normal school was carried on for a certain period that was productive of great benefit. And to these conventions the principals of the institutions are generally sent by the governing boards of the institutions and their travelling expenses paid; and in some instances teachers are sent, and their travelling expenses paid. The conventions themselves and the conferences are usually held in some institution during the vacation, and the institution which invites them entertains the members of the convention during its period. For example, the California Institution, by a vote of the Legislature, expended about 3,000 dollars in entertaining this convention that was held last July, during a little over a week.

13,267. It comes out of the funds of the State then?—Yes, or of the institution; but the travelling expenses of the members may be paid for each one by the institution which sends them; but the institution which entertains the convention, meets the expense of boarding it, and of publishing the proceedings. It is considered by the managers of our institutions that the presence of such a meeting, such a body of teachers of the deaf, is of value to the State where it is held in influencing public opinion, in increasing interest in the work of teaching the deaf, and in disseminating knowledge as to what it is; and so institutions are found every two years that are quite willing to bear the expense of entertaining these conferences and conventions.

13,268. Then it is rather through conferences such as these that you would get uniformity of teaching in America than in any other way?—The tendency is very strongly not towards absolute uniformity but harmony of action, which we feel is better than absolute uniformity. Different teachers have very different opinions as to the methods that come out in these conventions, and they find that those with whom they differ have a good many things that they are glad to learn; and so there comes about a harmony of action and a good feeling among the different teachers in the deaf schools all over the country that we think is very much better than absolute, uniformity.

13,269. Do these conferences generally end in the passing of certain resolutions?—Very rarely. It is not sought to pass resolutions which should bind the sentiments or practice of the members of the convention.

13,270. Papers are read?—Papers are read and discussions had, and methods brought forward and their importance heard; but the resolutions which I presented here were almost the only resolutions of that character. Of course there are complimentary resolutions passed, but the practice of our conventions is not to attempt to bind the members to any particular course or particular method. The convention, as I mentioned a little while ago, has a standing executive committee, and under that committee is published a publication known as the "American Annals," a quarterly publication which has been published for many years. I have a set of the "Annals" here. I have brought it over for purposes of reference, and I have a good many citations noted in my notes from the "Annals" which would be of value perhaps to the Commission. That concludes the ninth point upon which you were asking questions. If you were prepared to pass on to the tenth point I should have something further to say with regard to these publications.

13,271. Are the periodicals which are published in the interest of the deaf and dumb under the control and under the guidance of these conventions, or are there any other independent ones?—There are other independent periodicals published in the interest of the deaf themselves and for their instruction and general entertainment; that is to say, there are newspapers published for them; but the only publication which is in the interest of the education of the deaf, is this of the "Annals" which has run now through a period of 31 years. I have here an index to those "Annals," the whole set of volumes, which has been prepared at considerable expense and with great care, so that any one looking over this index can refer to this series of publications in a very easy manner. Any topic upon which it is desired to get information and on which information exists in the "Annals," can be found by reference to this index. And I should like to say, that this publication is sustained in a manner somewhat peculiar. It is not a publication which merely depends upon the subscription of those who may desire to have it and read it, but from a very early point in the history of its publication this method has been persued and found to be successful. The institutions were asked by the standing executive committee to contribute in proportion to the number of pupils in their respective schools to the support of this periodical, and an assessment has been made by the committee of certain sums upon the different institutions, which in general has been accepted. Of course these assessments were not at all compulsory, merely voluntary, but they have been so generally accepted that it has been possible to publish the "Annals" on a liberal scale, to pay an editor to take charge of it, and to pay contributors for articles contributed, which has stimulated teachers and others to write for the "Annals" in a way which has made it a periodical of increasing value. The assessments have been paid out of the general funds of the various schools of the country by vote of their respective boards of direction, and the money has been disbursed under the direction of the standing committee, and accounted for to the conventions as they have met from time to time. I am very pleased to be able, through the assistance and courtesy of the New York Institution for the Deaf, and by the co-operation of Dr. Isaac Lewis Peet, who is at the head of it, and who succeeded his father who was for many years at the head of the institution, to present in the name of the New York Institution, and of the Institution of Washington to the Commission this complete set of the "Annals" which I have brought with me as a matter of reference. It consists of 31 volumes, and with this index it is now a little difficult to get in a complete form; and if the Commission will accept it from these two institutions in America, it will give the managers of the institutions great pleasure I am sure. It may serve as a library for the Commission to delve in for themselves and to get information from, which may perhaps be helpful as the work of the Commission goes on; for these "Annals" speak of the education of the deaf not only in America but all over the world, and this may be said to be a mine of information which can serve many purposes.

Dr. E. M Gallaudet.

9 Nov. 1886.

13,272. I am sure the Royal Commission are most sensible of the kindness which has prompted the giving of so handsome a present to the Commission, and it will be most valuable for our labours. The Secretary will write officially and thank the institutions which have so kindly furnished the volumes; and we thank you for the way in which you have presented them to the Royal Commission?—I also present a couple of volumes relating to the work of the Columbia Institution at Washington. That is the corporate name of the institution which includes both the college and the primary school. They are the official reports to Congress of the institution during a period of 25 years. Under the matter of periodicals published in the interest of the education of the deaf, I ought, perhaps, to say a word with reference to papers published by different institutions. Where printing offices are in existence, it is quite the custom for the institutions to publish each of them a little paper, larger or smaller according to circumstances, in which there is much of interest in reference to the teaching of their pupils, and which serves to interest parents and the people generally of the State where the institution exists.

13,273. You mean a sort of school magazine?—Yes, a sort of school magazine; and then there are one or two other papers that are published in the interest of the deaf quite independently of any institution. I have brought with me two or three copies that might be looked over at the convenience of members of the Commission. Perhaps the particular interest in these copies would be that they contain accounts of two or three conventions of the deaf themselves that were held this last summer,—associations which were organised by the *alumni* of the respective State schools. They meet from time to time. They have benevolent contributions sometimes, and they raise money for certain purposes of a charitable nature; and in the proceedings of these meetings will be found papers presented by the deaf themselves, addresses made which have been reported, which would be interesting as showing the point of intelligence which they reach after they leave the various schools of the country and the college I have also copies of the American Manual Alphabet, which is not of much use in England, but which has been prepared to assist parents of the deaf by Professor Gordon, of the college at Washington.

13,274. Is the one-handed alphabet considered advantageous?—We prefer it in America very much, but that is a question, of course, whether it is better than the two-handed one or not; we think it is. And, in connexion with the alphabet, I have cited in my notes a paper presented to the convention at California by an instructor of the deaf, urging the teaching of the manual alphabet in all schools, so that all the children in the country may know the manual alphabet, and be able to converse that way with deaf mutes when other means fail, and when the lips are not perfect enough for oral communication to fall back upon that; and this paper was well received. (Annals, Vol. XXXI., p. 233.) It happens that when I was in Geneva lately, the American consul told me that three or four years ago he was extremely ill with an attack of hœmorrage of the lungs; his physician absolutely forbade him to speak or even to exert himself to write; but having learnt the manual alphabet, and it being known by members of his family, he communicated with them with ease, without making any exertion which might bring on any possible return of the hœmorrage; and he was quite ready to advocate the teaching of the manual alphabet.

13,275. I see in one of the books mention of a Milwaukee Wisconsin Phonological Institute; is that different from any other institution?—It is an oral school; it is only another name for it, that is all. I did not call attention just now, when speaking of the college at Washington, to the fact that we have 100 acres, which land lies within two miles of the National Capitol Building itself. Though we hold it now, we may not think it necessary to hold it for all time, the whole of it; but if the time should come when the city should extend out around it, a part of it might be sold and a very ample portion still remain, and, from the proceeds of the portion sold, might be formed an endowment for the institution. We carry on a farm here (*pointing to a picture*), and an orchard, and have our own dairy, and raise quite enough to feed a large number of dairy cows.

13,276. Can you tell us anything with regard to any of the Canadian institutions of the deaf and dumb; have you any special knowledge of them?—The list of

Dr D. M. Gallaudet.

9 Nov. 1886.

Canadian institutions is included in the "Annals" of last January, but beyond that I am not able to give any very definite information, excepting that I may say this, that I know that they are mainly upon the combined system—institutions which accept instruction in speech and give it to as large a number of their pupils as possible.

13,277. You do not think that there is any substantial difference in the teaching in the Canadian institutions?—No; but in the management there is. For instance, the management of the Ontario Institution is in the hands of an inspector or a government official who controls quite a number of public institutions; there is no board of directors; it is under the control of an inspector who, with the approval of a body representing the Government, appoints the principal and subordinate officers. The Mackay Institution at Montreal, I believe, is a corporation.

13,278. (*Dr. Campbell.*) Is the inspector of that institution at Ontario a superintendent of general education?—I do not think he is.

13,279. (*Chairman.*) Do you think that if a paper of questions was sent round by this Commission to the different institutions for the deaf and dumb in the United States, the managers of those institutions would be willing to furnish any replies to those questions for the use of the Commission. I only ask the question in case we should wish to supplement the information which you have already given us?—I have no doubt the majority of them would be quite willing to go through a great deal of trouble and pains to answer such questions. We are in the habit of answering such questions in our own country; for instance, to our department of education which exists at Washington. That sends round circulars which ask a good many questions which we grumble over a little, but always answer.

13,280. Is the inspection in each State carried out by an inspector-general of the educational institutions, or is there a special inspector for the deaf and dumb?—The practice differs very widely in that respect. There are some of the States in which there have been appointed these commissioners of public charities in general, and they inspect and visit and report upon the schools for the deaf as well as a number of other benevolent establishments; but the practice is not uniform throughout the country at all. I think, in general, the management of the institution is left very much to the local organisation which governs it, and then it is subject to the determination which may be made from time to time by a legislative committee, or in some of the States the governor takes pains to visit (in some he is required to visit) and report upon the condition of schools for the deaf

13,281. Have you any deaf and dumb and blind in any of your institutions?—We have quite a number in America scattered through the country.

13,282. Do the deaf and dumb and blind generally go to the blind institutions or to the deaf and dumb institutions?—I think generally to the deaf and dumb institutions.

13,283. I ask that question because Mr. Hall says "We have three deaf and dumb and blind in my institution"?—That would indicate that certainly some are found in blind schools. I think for purposes of education, on reflection, I remember a blind deaf mute who is in the blind institution in Maryland. There must be some of that class of persons in the blind schools. Of course, I am not able to answer with regard to that. I know that there are a number in the deaf mute schools. There are one or two in New York and in some of the other schools.

13,284. Do you think it is advantageous at all that the deaf and dumb and blind should be associated together in any industrial works; for instance we have had occasion sometimes to see a deaf and dumb person employed in the institutions for the blind; that is to say, to give sighted superintendence where sighted superintendence is necessary; have you any experience of that?—I have no experience of that sort of employment or mingling of the two classes. I can see no reason why in certain circumstances it might not be of some help, but not I think for the benefit of the deaf, but perhaps for the assistance of the blind.

13,285. In your opinion the deaf and dumb are able to earn their livelihood without being included in any blind institutions?—Yes; I do not think it is necessary to establish special places where the deaf and dumb may be helped to earn their living. I think they can earn their living side by side with the hearing.

13,286. Do any of the deaf and dumb institutions give any grants for the apprenticing out of young men, or is that generally done by the parents and friends?—It is generally done by the parents and friends. I cannot say with certainty that there are any that make a practice of doing that. I think there have been some that have had funds at their disposal perhaps for a short time, which have enabled them to help a certain number in that way, but the practice being so general in the schools in America of teaching industrial work while the pupil is in school, it would not be natural that they should make arrangements for having these grants to apprentice their pupils to masters when they go out.

13,287. In fact they are generally turned out of school with sufficient knowledge of some trade which they can practice in after life?—That is the rule.

The witness withdrew.

Adjourned to to-morrow at 11 o'clock.

32, Abingdon Street, Westminster.

Wednesday, 10th November 1886.

PRESENT:

THE RIGHT HON. THE LORD EGERTON OF TATTON IN THE CHAIR.

ADMIRAL SIR E. SOTHEBY, K.C.B.
W. TINDAL ROBERTSON, ESQ., M.D.
B. ST. JOHN ACKERS, ESQ.
T. R. ARMITAGE, ESQ., M.D.
W. AUCHINCLOSS ARROL, ESQ.
F. J. CAMPBELL, ESQ., LL.D.
E. C. JOHNSON, ESQ.
CHARLES FEW, ESQ.
WILLIAM WOODALL, ESQ., M.P.
THE REV. W. BLOMEFIELD SLEIGHT, M.A.
THE REV. CHARLES MANSFIELD OWEN, M.A.
CHARLES E. D. BLACK, ESQ., *Secretary.*

Dr. E. M. GALLAUDET further examined.

Dr. E. M. Gallaudet.

10 Nov. 1886.

13,288. (*Mr. Johnson.*) I suppose you consider that the statistics with which you have been kind enough to furnish the Commission, are on the whole fairly correct?—I think they are quite as reliable as any statistics that could be found. Taking them in connexion with the articles in the "Annals" to which I make reference, which explain them and give elucidations of the results which are given in the figures, I think one might arrive at a very approximately accurate idea with reference to what those statistics profess to show.

13,289. Did I rightly understand you to say that there were in America only twelve schools where the pure oral system was taught?—Yes.

13,290. In those oral schools is there no other system whatever taught but the oral?—I think if you will allow me in answering the question to make use of the word "method" instead of the word "system," I would prefer to use that word. I said yesterday that we apply the word "system" to that which may include two or

three methods. I am quite certain that in those schools the oral method alone is used.

13,291. Is any pure and simple oral teaching carried on in the other 38 combined system schools, or the 14 manual method schools?—In the 14 manual method schools there would be no oral teaching whatever; in the 38 combined system schools I am certain that there are many distinctively oral classes in which all the instruction is given orally, and not only that, but in more than one of those institutions that are classified as maintaining the combined system there are branches—separate schools—under one board of direction, in which the oral method is exclusively practised, so that the figure of 12 as applied to oral schools would simply mean those which were exclusively oral schools, while in the others which are put down as practising the combined system, there are distinctively oral classes; and then there are separate oral schools, branches of the larger institutions.

13,292. Wherever the pure oral method is taught in those combined system schools, are the children who are instructed in the oral mode separated from those instructed in the sign and manual mode?—Naturally where there are these separate schools—these branches—they are quite isolated from those children who are taught more or less by the use of signs and the manual alphabet. In the larger institutions, where there are these separate oral classes, I do not think that any effort is made to isolate the children taught upon the oral method out of school; to isolate them out of school from the others who may be taught more or less by the use of signs.

13,293. Is it the custom in America where some of the children are being taught on the oral mode, to put those children into a separate room or buildings, and are those children who are learning on the oral mode allowed to associate out of school with those who are being taught by the sign and manual mode?—The custom is, in general, with very rare exceptions, I should say, not more than one or two, to allow the free association of the pupils after school hours who are taught on the different methods. I can hardly think of any other case than that of Pennsylvania, which has its oral branch; I think there is one other institution, but I am not able at this moment to name it, that has a similar arrangement of an oral branch, and in those two there would be a complete separation.

13,294. (*Chairman.*) In those cases where you speak of an oral branch, you refer to an absolutely separate building?—Yes.

13,295. It is not like the case at Manchester, one building divided in the middle?—No.

13,296. (*Mr. Johnson.*) Is it desirable, in your opinion, to separate those who are taught orally from those who are taught by the sign and manual method?—My opinion is that nothing is gained by it. In fact, I may go further, and express my opinion that a great deal is lost by it; for in my judgment the association of children who are taught orally with those who are taught by signs, and the permission to use the sign language with a considerable amount of freedom out of school, greatly assists in the mental development of those children who are taught on the oral method.

13,297. When you speak of the oral method, do you mean the oral method, as we understand it here, pure and simple?—I do. Perhaps I ought to add, that it may be that I have not an exactly clear apprehension of what is meant in England by the term "pure oral "method."

13,298. The pure oral method, I should say, would be the method advocated by the Congress at Milan?—Even at Milan there was quite a difference of opinion as to what should be meant by the term "*La methode orale "pure.*" There were those who maintained that that should mean the absolute exclusion of signs from all instruction. There were others who claimed that it should mean that at the earlier stages natural signs, not conventional signs, might be made use of by the teacher in assisting to the end desired; so that, if I may be allowed to say so, there is quite a difference of opinion as to what the term should be understood to mean. If I may state in as few words as possible my understanding of this term the "pure oral method," I may say that I understand it to mean that method by which speech is made not only the great end to be attained in instructing the deaf, but to the largest possible extent the means of communication between teacher and pupil, from the earliest stage of education. If that is the understanding in England of the term "pure oral method" (though in America we do not use the word "pure"—we simply say "the oral method"), then the term "oral method," where I have used it in speaking of our schools, means in practice the same as the term "pure oral method" in England.

Dr. E. M. Gallaudet.

10 Nov. 1886.

13,299. It would be a difficulty to define it from your point of view, because, as I understand, in your combined system schools they teach lip-reading and a certain amount of speech. As I understand, in America speech is required to be a part of your education in the combined system, but your pure oral system does not find so many advocates as it does, perhaps, in other countries?—In America, in the schools which are maintained on the combined system, the practice differs in different schools. There are schools in which these oral classes, to which I referred a moment ago, exist, and in those the teaching cannot be differentiated in any essential particular from that teaching which would be given in the pure oral schools of England. We have schools carried on on the combined system, as it were—the oral method within the other. I will explain another method: classes are organised in which the general instruction is given by means of writing, the manual alphabet, and some use of signs in explanation, and the pupils go for half an hour or an hour every day to a teacher who teaches them speech and lip-reading; that is quite another method, and results are reached by that method which some teachers find to be equally satisfactory with the results reached where speech is the main means of communication in giving instruction; but those two different manners—if I may use the term—of carrying on instruction in speech may be found in schools which are conducted on the combined system. So it must not be understood that in those schools there is no pure oral teaching; on the contrary, the whole policy in those schools to-day (and I am sure that I do not misrepresent the management of those schools on the combined system) is to give oral instruction, as far as possible, to as many as possible, and by those means which in practice may be found best to conduce to that end.

13,300. There is another system which you mentioned, the aural system; I understood you to say that from 12 to 25 per cent. of those who are classed as deaf could be improved through the ear. That, of course, applies to persons who have not been born deaf?—On the contrary, a number of very interesting cases have come under the notice of careful observers in the different schools in America of children who were congenitally hard of hearing, if I may use that expression. They were so hard of hearing from birth that their hearing was never educated by the ordinary means, so that they have reached in several instances school age without having made any use of their hearing whatever, so far as the acquisition of the power of speech is concerned, or so far as learning to understand what is spoken by others is concerned; so that though they are not congenitally deaf they are congenitally so hard of hearing that they stand on arriving at school age in the category of deaf mutes, and not a small number of such persons have been found among the general class of deaf mutes.

13,301. Is the amelioration of their condition dependent on the training of the school, or is it dependent on medical treatment?—It is dependent on the training of the school. The condition of the ear will be found to be such that medical treatment will not improve it.

13,302. I suppose there is a medical examination in the case of every child that comes to a school for instruction?—In all our best establishments.

13,303. That is only on admission, I understood you to say?—In many of our well managed schools those examinations are made from time to time.

13,304. Is any effort made to improve the defective organ by medical treatment as a general rule?—No effort is made as a general rule, simply because the examination has shown that such efforts have been made previously and failed.

13,305. We have heard a great deal in this country of the Milan International Congress; were you present at that Congress?—Yes.

13,306. I see that a number of resolutions were arrived at by that Congress, and I think the Commission would be very glad to know if you could give us some idea of the opinion of those in America best calculated to express an opinion upon the results arrived at at that Congress?—The feeling in America was that the

Dr. E. M. Gallaudet.

10 Nov. 1886.

resolutions adopted by that Convention, giving a formal approval to the pure oral method, were not entitled to very great weight. The Convention was far from being a representative body. I mean to say that there was no basis of representation, so that a particular institution or a particular country should be considered as being represented by a certain number of delegates. My own opinion at the time was, and nothing has since occurred to change it, that the decision of the Convention at Milan as regards the pure oral system, as expressed in these resolutions, was not to be taken as of very great weight in determining questions of method, and that opinion was entertained by a very large majority of the teachers of the deaf in America, including many who taught then and teach now on the oral method. In justice to the few who hold to a different opinion I should say there were some teachers in America who accepted the decision of the Milan Convention as expressing their views. I am not aware that the opinion or the practice of any teacher in America, or of any school in America, has been changed by this action of the Milan Convention.

13,307. May I take it that from your own experience the combined system, with as much vocalization as can be added, is the method that you would recommend?—I should say oral teaching should be included.

13,308. Is that the method which is recommended in America?—That is the method which is recommended by the resolutions which I had the honour to read to the Commission yesterday, as coming from the largest Convention that has ever been held in America, and at which all methods were represented. My views are in accordance with the recommendations in those resolutions, and I have held those views during now a period of 19 years. I may say frankly, that my experience prior to that time was such as to lead me to depreciate and undervalue the oral teaching of the deaf, and I wrote and spoke and worked as a manual teacher purely up to 1867; but when I then visited Europe and examined the oral schools, especially in Germany, I became satisfied that I had failed to grasp the situation theretofore, and I accepted at once the addition of the oral method as a necessity in any system that aimed to reach the highest good of the deaf. In a Convention at Indianapolis, some quotations from speeches at which were alluded to yesterday, I was assailed by one of the old and very respected manualists as the degenerate son of a worthy sire, because I had fallen from the grace of the manual method. I survived the accusation. I do not know that I am less respected now than I was then.

13,309. (*Rev. C. Mansfield Owen.*) Do you consider it essential if State aid is to be given, that the State should enforce the adoption of any one method of instruction?—I should conceive it to be extremely deplorable if such State aid were coupled with such a restriction.

13,310. From your experience do you think that articulation can be successfully taught to those who have been born deaf, or who have lost their hearing in early infancy?—My experience leads me to say that in a very considerable number of cases success, and entire success, may be attained with deaf children who were born deaf or lost their hearing very early in life.

13,311. Have you ever known instances of deaf children who have been transferred from the oral method to the manual method because they failed under the oral method?—I have known many such instances.

13,312. Have the children in those cases succeeded under the manual method?—Yes.

13,313. Though they had previously failed under the oral method?—Yes.

13,314. When you said yesterday that the language of signs is diminishing, do I rightly understand you to wish the manual alphabet to be used more and signs less?—I recommend a restricted use of signs in the class rooms; I would have the use of signs restricted as far as possible in the class rooms, and the manual alphabet used rather more freely than I know it has been used in many of the manual and even the combined schools.

13,315. Do I rightly understand that you decidedly deprecate the adoption of the oral method to the absolute exclusion of the other methods?—I go even so far as to say that that oral method will conduce to the best results which does not disdain to make some use of signs and a considerable use of the manual alphabet; in other words, that the pure oral method, which attempts to exclude signs and which excludes the manual alphabet, I do not conceive can reach the best results under any circumstances.

13,316. Speaking from your experience, what proportion of pupils educated on the oral method are, in your opinion, enabled to rely solely upon articulation and lip-reading as a means of communication with hearing persons in after life?—The question is a difficult one to answer. It is a question which I asked myself many times when I was visiting schools for the deaf in Europe in 1867. I received answers to that question from a number of very prominent oral teachers of the deaf who were then actively engaged in some of the foremost schools of Europe; if it be desired I can give a reference to their answers, which are contained in my report on my visit to those schools in 1867. Speaking for myself, I should find it extremely difficult to give an intelligent answer to that question, for my experience with deaf children taught orally is not wide enough. I mean to say that it is mainly confined to a single institution, but I have the opinions on that question of Mr. Hill of Weissenfels, Mr. Hirsch of Rotterdam, and M. Vaisse of Paris, and one or two others, which were expressed at that time and which might be laid before the Commission.

13,317. Do you find that orally-taught pupils when they are not under supervision converse with each other manually or *viva voce*?—They converse with each other manually, almost wholly, even in the pure oral schools.

13,318. (*Chairman.*) You are speaking of America?—I should say it is the same in every country.

13,319. (*Rev. C. Mansfield Owen.*) Do orally-taught pupils after leaving school keep up their speech and lip-reading, or does your experience lead you to believe that they prefer to talk with their fingers, and that their speech and lip-reading falls into disuse?—I think it depends very much upon the energy and mental capacity of the deaf person. I am sure that very many of the deaf who have been orally taught not only keep up their use of speech and lip reading but improve it after leaving school, it is quite possible that they may do so, but because some do so, others who do not should not be perhaps seriously blamed, because their failure to do so proceeds from their very different mental constitution, a less persistence in the will, and a variety of causes. It is equally true that a large number of deaf persons orally taught, on leaving school, do allow their use of speech and lip reading to fall into considerable desuetude, they resort to the use of signs and the manual alphabet, and they associate with deaf persons with whom they may speak freely by those means.

13,320. In America, I understand, you do not make any special effort to follow up the pupils in after life, to know what system they keep to?—On the contrary the managers of the various schools do take pains to inquire what their graduates are doing, and to urge and encourage those who have been orally taught to keep up the practice of that very valuable acquisition of speech and lip reading. There are reports existing of some of the schools in America where very careful inquiries have been made to see whether the use of speech has been continued, whether it has improved, or whether it has grown less perfect, those reports are easily attainable.

13,321. In America, have you missionaries who assist you in that way, keeping the pupils in touch with the institutions?—Yes.

13,322. And they are able to report upon the method of communication which the pupils have adopted after leaving the institution?—Yes.

13,323. I presume you would consider the evidence of those missionaries very important?—I should, decidedly.

13,324. It has been stated in evidence that the pupil's "power of gathering from the lips of others is within "very narrow limits during the school period"; if that be so, do you consider it a proof of the inefficiency of that method of instruction?—I should say that that is undoubtedly true, but I do not consider that it is an evidence of the inefficiency of that method of instruction; it is simply evidence that the instruction has not yet been carried on to a successful point.

13,325. Do you consider that orally-taught pupils can go out in the world and converse freely with all with whom they come in contact?—Quite the contrary. I have known very few of whom that statement could be made with truth. I have known a few, but the number is so small that it would be represented by not more than one or two or three per cent. of the whole number of orally taught.

Dr. E. M. Gallaudet.

10 Nov. 1886.

13,326. Have you ever known instances of orally-taught pupils dispensing in after life entirely with the sign and finger alphabet and the use of pen and pencil in their communication with the world?—I have known those of whom I have been told that they did dispense with even the pen and pencil and paper; certainly they did with the use of signs and the finger alphabet.

13,327. Have you known of such cases yourself?—Yes, I have known of such cases.

13,328. Have you known of many?—Not many.

13,329. You think such cases would be the exception, and not the rule?—Decidedly the exception and not the rule.

13,330. Have you known of any taught on the pure oral method who could understand sermons or lectures if they could see clearly the utterances of those who were speaking or preaching, as the case might be?—The most important word in that question is the shortest—the word "if"; so much depends upon that "if"—*if* they can see clearly. I should answer the question as you have given it, Yes, but I should immediately say that the usual environment of a deaf person who is present on any occasion where public speaking is going on, is sure to be that which would render it impossible for him to see clearly the lips and vocal organs of the one who is speaking.

13,331. To take another example: Supposing there are one or two persons sitting round a table talking, have you ever seen an orally-taught person appear to understand or take part in the general conversation?—You limit it to one or two.

13,332. I mean in a room, in ordinary society?—I have never seen one who could take part with any freedom in the general conversation of a number of persons sitting round a table, for instance. Instead of "take part" I ought to say "take very much part." Taking part in the conversation round a table might mean that this deaf person orally taught would speak to one person across the table and do pretty well; he might be said to be taking part in the conversation at the table, but, properly speaking, taking part in a conversation would be when a number of people were talking, for this orally-taught person to glance from one to another and catch up the threads of conversation and join in them, and have his word to say upon them, that is what I understand to be meant by "taking part in the "general conversation," and my answer remains as before, with that explanation.

13,333. How long had the oral system been in vogue in America before you produced some good pupils who in after life could converse?—In the institution at Washington several years. Much to my regret the institution at Washington, the primary school, did not adopt the oral method immediately after the recommendation which I had the honour to make to our Board of Direction in 1867; the reason for this was owing to the fact that the whole of the energy of the management of the institution at Washington was then being directed to securing Governmental aid for the college, and to promoting the development of the college. As our primary school was small, the directors thought it was not essential that oral teaching should be immediately introduced, and it was therefore deferred for a few years.

13,334. Speaking from your knowledge, do you think that in fifteen or twenty years after the system was adopted, good results ought to be produced?—I should think so.

13,335. You think that would be plenty of time?—Ample time.

13,336. I believe that in America no pains or expense have been spared to attain full information on this oral system?—That is so.

13,337. Were deputations sent from America to Germany to examine into the subject?—There were as early as before 1850. I think in 1848, but I am not quite able to speak to the exact date.

13,338. What were the reports on the system adopted in Germany?—The reports given at that time were unfavourable to the oral method; upon the whole they gave approval to a certain amount of instruction in articulation to such deaf and dumb as had some power of speech or had some little power of hearing, but they did not recommend its general adoption.

13,339. Then as I understand, the fact that the oral system is not adopted universally in America cannot be attributed to want of knowledge of the subject?—Certainly not. We have had abundant knowledge of what has been done in any country in the world.

13,340. If the oral system is adopted to the exclusion of any other system, you consider it detrimental to the best interest of the children?—I should consider it extremely so.

13,341. It has been stated in evidence by an oral teacher that a boy educated on the oral system could, after three years' instruction, write an ordinary letter; have you known such cases in America?—Yes, I have, and I have also known cases where they have been taught upon the manual method where they could write quite as well and quite as accurately.

13,342. Taking an equal length of time, do you consider that a manual pupil or an oral pupil is the better instructed?—I should without question give the preference to the pupil manually instructed so far as the development of his mind is concerned and the aggregate amount of knowledge gained.

13,343. By which system do you consider that pupils attain a greater grasp of language?—When either method is carried on as it should be, and good teachers are employed, as between the oral method and the manual method, I have not been able to ascertain that any superiority is to be accorded to one over the other as to accuracy in the use of idiomatic language.

13,344. With regard to the cost per head, what is the cost per head in America as compared with that in Paris; I think you said it was 60*l.*, roughly speaking, in Paris?—38*l.* is the average cost per head in America as compared with 60*l.* in Paris.

13,345. Do you take into consideration the interest on plant?—Not in either case.

13,346. What compulsion can the State put upon parents or the representatives of the parents, to send deaf and dumb children to school?—I think in two or three only of the States of our Union in America are there laws which authorise any public officer to compel the attendance of deaf and dumb children in the schools.

13,347. Then when the State gives aid to an institution, is it the rule to insist upon inspection?—Yes; it depends on the will of the State Government to what extent that inspection should be carried. In New England it is an inspection made by the Governor and his Council, or by the Governor and a committee of the legislature. In some other States it is made by a Board of Charities constituted for such purpose, and again in other States it is made, as I said yesterday, by the actual governing body which controls the institution absolutely and reports to the State Government.

13,348. There are no school inspectors, as such, like we have in England?—No.

13,349. Will you tell us a little more of the oral branch of the Pennsylvania Institution?—The oral branch of the institution at Pennsylvania is one that I briefly alluded to yesterday, and it exists with a method of organisation which in the report which I made in 1867 on the European schools for the deaf, I commended as perhaps the ideal method of organisation. I found it then existing in Copenhagen, where there were two schools under Government inspection under the same general management, and there was a carefully arranged process of selection and discrimination among the pupils received and provided for by the management of those two schools, which formed practically a single institution, so that a very wise selection was made of pupils who should be taught upon the oral method or upon the manual method. That is the arrangement at Philadelphia, this oral branch occupying buildings which are under the charge of a matron, and quite separated by two or three miles, I think, from the buildings of the main institution. Those children who are found to be specially ready in speech and in lip reading, and who do not need perhaps, I say perhaps, in order to be consistent with what I said a little while ago as to the value of signs and the manual alphabet in all teaching of the deaf, who do not need, perhaps, the assistance of those means of instruction, are separated from those who use signs and the manual alphabet, and are taught on as pure an oral method as can be found anywhere in the world. Mr. Crouter, the very able and esteemed principal of this Pennsylvania institution, presented to the California Convention a paper on the true combined system of instruction, and I venture to give it

Dr. E. M. Gallaudet.

10 Nov. 1886.

some words of commendation, even more decided than I gave it in referring to it yesterday; and he gives opinions and results of the practice. This method is carried on in this, one of the oldest of the manual schools in America, which now takes its place, in my opinion, in the van of oral teaching.

13,350. With regard to religious instruction; what do you think is the best method of conducting religious instruction for the deaf and dumb?—There are in existence organisations in many parts of our country for the religious instruction of the deaf after they leave school. There are missions for their assistance, the head-quarters of one of which is in New York, my brother, Dr. Thomas Gallaudet, D.D., being at the head of that organisation; he has several assistants, two of whom are deaf and who are in holy orders, and he has services with the aid of those assistants in very many of the cities of the Union, in the west, and in the south, and in the east. Those services have been found to be a great help to the deaf in their moral and religious life, and more than that, that organisation has been the means of giving them assistance and comfort in a great variety of ways, helping them in their efforts to gain a livelihood, and to live decently and respectably. The work is regarded in America as a matter of very great importance, and those missions to the deaf are sustained very liberally. It is known to be absolutely impossible to carry them on excepting by the employment of a means of communication which shall be manual; it is impossible to conduct a service for the deaf orally which would be intelligible to any considerable number of those attending it.

13,351. Do pure orally-taught persons, after they leave the institutions, attend those services?—Yes.

13,352. Do they acquire the sign and manual language after they leave the institution?—Very readily.

13,353. In order to participate in those services?—Yes, and to enjoy social intercourse with those similarly afflicted.

13,354. All the services are conducted in the sign and manual language?—Yes.

13,355. You said that the Federal Government takes great interest in the amelioration of the condition of the deaf and dumb, and you said that the President of the United States is *ex-officio* patron of your college; does he take a personal interest in the present movement for the advancement of deaf and dumb education?—He does take a very warm interest in it. He began his life as a teacher of the blind, and he has never ceased to take an interest in institutions for the benefit of the blind and deaf, and he is patron of our institution at Washington for the deaf. The President has on several occasions manifested his interest by attending the anniversaries, and in other ways. On the morning that I left Washington to answer the invitation to give evidence before this Commission, I called upon the President to take my leave, and to inform him of the purpose for which I was to be absent from the country by the permission of the Government, and he expressed very great interest, not only in our work in America, but in the work proposed to be done by this Commission, which I explained to him at some length as far as I was aware of it; and before the day was over he sent me this note, which it may be of interest to the Commission to know is entirely written and directed by his own hand, expressive of his great interest in the object of my visit to England, and in the work of the Commission :—

"Executive Mansion, Washington,
"October 6th, 1886.

"Professor E. M. Gallaudet,

"My dear Sir,

"I am very glad to learn that you have been invited to give information before a Commission organised under the auspices of the British Government to inquire concerning the subjects of the education of the blind, the deaf, and the dumb. A country that contributes so largely from its public funds for these purposes, and with such gratifying results, ought to be able to furnish much that is interesting and profitable in such an investigation; and no person, I believe, can better represent our achievements in this field of inquiry than yourself. I hope that the trip you are to make in answer to this invitation will be pleasant, and in furtherance of the objects which you have so earnestly at heart.

"Yours sincerely,
"Grover Cleveland."

13,356. (*Mr. Arrol.*) You stated yesterday that one in 1,800 of the population in America is deaf; can you give the Commission any information as to how that proportion compares with the proportion in the continent of Europe?—The proportion on the continent of Europe, as well as I remember, varies more or less. In the mountainous countries, where physical disabilities, such as goitre and cretinism, and other evidences of physical deterioration exist, the number is much larger; but I think (I speak quite from memory, and not from any recent examination of the figures), that the proportion in the countries of Europe in which ordinary physical vigour and development exist, does not differ very much from that in America.

13,357. Can you inform the Commission what the proportion may be of persons who are born deaf?—Rather less than one half. A reference to the tables which I have submitted as an appendix to my evidence, would give that; there are two or three tables where that would be stated quite definitely, and the causes of deafness are there rehearsed.

13,358. Yesterday you mentioned, that of the 7,800 under tuition, you excluded 186 taught at pure oral schools?—Those were private schools.

13,359. You have mentioned that there are rather over 3,000 being trught articulation; what may be the reason why such a large proportion as the remainder are not being taught articulation?—Partly because there are still 14 manual schools in America, where no speech is taught, and then further, because in some of the larger institutions which are carried on on the combined system, the oral method has been recently introduced, and means are not available for the employment of teachers enough to teach as many of the pupils as might be taught orally, and further, because a large number of the pupils in our schools have been found to be not likely to succeed well in oral attainments, and so their instruction in that branch has been given up.

13,360. What may that large number represent in proportion?—I give only my own opinion, but it is that the proportion of the deaf who will not be likely to succeed in speech, to an extent to justify the expense and labour of teaching them orally, would certainly rise to 40 per cent.

13,361. In connexion with most of your schools, apparently, you have industrial departments?—Yes.

13,362. Fourteen only have no industrial branch connected with them; are those the private and the public board schools that have no manufacturing departments connected with them?—Eight of those 14 are day schools, and of the other six my impression is that at least three would be those private schools of which we spoke, so that only three of the public institutions of America can be said to be absolutely without an industrial department.

13,363. It is considered necessary to have an industrial department?—It is considered quite essential to the proper preparation of a young deaf and dumb person to go out and make his way in the world.

13,364. Did I rightly understand you to express the opinion that it is to the benefit of the deaf and dumb adults that they should be connected with the parent school or institution through missionaries?—I did not say that it was desirable, in my opinion, that they should be connected with the parent institution through the intervention of missionaries connected with the institution; those missionaries are not sustained by the institutions, but by organisations in which funds are contributed by persons disposed to carry on this missionary work among the deaf; they are not directly connected with the institutions.

13,365. How many missionaries have you trained and sent out from your college at Washington?—I think that three or four of the graduates of the college have gone out to become missionaries among that class. I am not able to speak with definiteness of the number, but I know several have. It may be five. I may repeat what I said a little while ago. I think it very important that these missions should be carried on for the benefit of the adult deaf.

13,366. Is it found that State aid in America conflicts with charitable benevolence?—It is found that so far as what might be termed annual subscriptions to aid in the ordinary support of schools for the deaf go, the general giving of State aid in America does away almost absolutely with such annual subscriptions, but it by no means stands in the way of bequests and legacies which

Dr. E. M. Gallaudet.

10 Nov. 1886.

in some instances have been quite large in amount; for example, in 1865 or 1866, a Mr. Clark, in Massachusetts, left a very handsome fortune for the establishment of an oral school for the deaf, which was established at Northampton. I think the endowment of that institution—I am speaking without any recent reference to the figures—is 50,000*l.* or 60,000*l.*, and that endowment was made, of course, long after State aid had been freely given in all that region of country. The Pennsylvania institution has large endowments which yield an income, which is devoted to certain purposes, and I am under the impression that in the case of that institution there are certain sums paid to those who leave to assist them in making their way with master mechanics as a sort of apprenticeship money. So that in the matter of legacies and charitable gifts to institutions the giving of State aid has not stood in the way of their continuance.

13,367. In America you consider it absolutely necessary for the Government to subsidise all these charitable institutions for the deaf and dumb?—It would be difficult to accomplish the end in any other way. It is looked on as a thing which it is right the State should provide for.

13,368. Do you or not consider that it is necessary, after a deaf and dumb person has been thoroughly educated that he should in any way receive a subsidy or grant to assist him in industrial pursuits or in earning a living in some other way?—That would depend a great deal upon the amount of industrial training that he had received while he was in school, and upon the age at which he left school, which would, of course, come in to affect the matter of the amount of industrial training which he might have received. Of course, if he was an accomplished mechanic, he would be able to go out and make his way without assistance; if he were not an accomplished workman, either from the fact of the short time that he had been under instruction, or from having been in a school where a sufficient number of industries were not taught, or from the fact that his education began at so early an age and closed at so early an age as to make it quite out of the question to teach him a trade while in school, I think it would be a very advisable thing that there should be funds existing, from the income of which there might be a sum of money paid to assist him in making a start.

13,369. The inspection of your institutions, I apprehend, is conducted by a board connected with the State, or connected with the institution; would it not be more thorough and more satisfactory to have Federal State inspection?—That would be quite inconsistent with the whole spirit of our Government; it would not be tolerated in the States at all; in fact, it would be inconsistent with the constitution of the several States for Federal inspection to attempt to extend itself into schools sustained either as corporate schools or State schools by the State Governments.

13,370. Do not you think that that system of inspection would be more thorough?—My own opinion is that the inspection of a local board of men having a local interest, and therefore a personal interest in the success of the school, would be likely to lead to better results than an examination which was made by an inspector or a board of inspectors appointed to go over a very large amount of territory and examine institutions all over the country. I think I said yesterday that in America the ideal exterior organization of an institution was felt to be a corporate institution with the assistance of the State, and without much interference, either in the way of inspection or otherwise, by the State, but depending for its successful development on the earnestness and activity of the men constituting the local board of management, and on a desire to show results comparing favourably with those of other institutions.

13,371. Perhaps you may have formed an opinion upon the reasons why the pure oral system, after being tried so thoroughly in this country towards the end of the last century and the beginning of this, should have been in a measure abandoned till recently?—My opinion is that it was for the reasons which operate to make my own opinion unfavourable to the attempt to force all the deaf into education on the oral method. It is undoubtedly the fact that when that is insisted on the result is that a very large number of deaf who are perfectly capable of being educated on the manual method are likely to be set aside as almost imbecile because they cannot succeed on the oral method. That, in point of fact, has been the case. In many countries where the attempt to teach all on the oral method is persisted in the results in a large number of cases are sure to be so unsatisfatory that is is not at all strange that the tide of public opinion should set back and sweep the oral method off and revert to the manual method. In my opinion the only way, perhaps I should not say the only way but the best way, to preserve the oral method in its best uses is to acknowledge that it is not possible to apply it to all, but that it is applicable to a certain number, and that other methods should be adopted for those who did not succeed with the oral method.

13,372. You made a tour of inspection in 1867, and visited some 36 schools: would you favour the Commission with your views in respect to what you found on your recent visit as to the increased amount of teaching under the oral system?—I know, as a matter of fact, that in France and Italy and in England the oral method is now employed in a much greater proportion that it was at that time.

13,373. Can you say to what extent?—I am not able to say to what extent: I know that quite a large number of the prominent schools in France have adopted it.

13,374. (*Chairman.*) It is not a question of adoption, it is now the law of the country that the oral method shall be taught in all schools?—I was not aware of that.

13,375. And, as I am told, the reason why the age of admission is at present fixed so high is because it is a survival of the old manual system, and they are gradually lowering it in France?—I was not aware of that.

13,376. (*Dr. Tindal Robertson.*) Is the physical condition of the deaf and dumb who have come under your superintendence equal to that of ordinary children?—I find that it is probably, and I think almost certainly, a little lower, not very much lower, but a little lower, for the reason that the deafness supervenes, in very many cases, in consequence of severe attacks of disease; those attacks of disease leave the system not only with the auditory organ destroyed, but with other conditions of feebleness, so that those cases where that physical deterioration has occurred would come in to lower the average a little, but not very much. I should say that, generally speaking, the physical condition of the deaf and dumb might be stated to be good.

13,377. Except in those cases where deafness occurs as a *sequela* to other diseases?—Yes.

13,378. Are there medical men attached to your institutions?—Yes.

13,379. Are examinations always made in the case of children who come into the school?—Yes.

13,380. (*Chairman.*) And periodically too?—Yes.

13,381. (*Dr. Tindal Robertson.*) In the case of death are there any post-mortem examinations?—There have been in some cases, but usually where the death happens from some well understood cause no post-mortem examination is made.

13,382. In cases where post-mortem examinations are made, is there any record of any abnormal appearances kept?—No; among some of our instructors the wish has been expressed that such examinations should be made more frequently.

13,383. Do you think that such a thing might be advisable, and might lead to information on the subject which would be very useful?—I should be inclined to say so.

13,384. (*Dr. Armitage.*) You grant diplomas at your college; how are they granted?—The directors of our institution at Washington, which includes the college and the primary school as well, are named in our annual report; they consist of one senator appointed by the President of the Senate, two members of the House appointed by the speaker of the House, and six directors, who hold a permanent position. The vote of that Board, of which I am the President, and before which recommendations come from the faculty of the college, is necessary in the conferring of degrees, the degrees being conferred upon the recommendation of the faculty.

13,385. In point of fact, you are self-contained; the professors, as I understand you, and the president examine the pupils as to their fitness to obtain the diploma?—Yes.

13,386. Do the ordinary primary State schools throughout the country grant diplomas to the pupils when they leave school?—I understand you to mean by diplomas, degrees; in no instance do they give such

Dr. E. M. Gallaudet.

10 Nov. 1886.

diplomas, they may give a certificate, the pupils receive a certificate of honourable dismissal or graduation from these schools.

13,387. You spoke of graduates from these state schools, did you mean by that simply those who had passed through the course of the school?—I think, if I remember rightly, when I used the term "graduates," I referred to those who had gone regularly through these primary state schools as pupils; they would be classed generally as graduates of those schools.

13,388. By the word "graduates" you simply meant former pupils?—No, but those only who have completed the prescribed full course of study.

13,389. To continue Dr. Robertson's questions as to physical training, are gymnastics and free exercises and outdoor games carried on in considerable extent in your American schools?—To a considerable extent; I regret to say not to as great an extent as would be deemed desirable. Six years ago at Washington we completed and opened a very well equipped gymnasium, in which physical training is carried on under the direction of a well educated and competent drill master and instructor. Since that time quite a number of State institutions have followed the example set at Washington, and have erected and equipped gymnasiums more or less perfect in their appliances for physical training. It is admitted on all hands that that is extremely desirable, and I think those appliances for physical training will soon be introduced in our institutions generally; physical training by such means is of even greater importance to the deaf, if that were possible, than to those who are not deaf.

13,390. As to another question which was touched upon yesterday, are inter-marriages among the deaf frequent in America?—They may be said to be quite frequent.

13,391. Taking the whole of the marriages of the deaf, can you give us an idea what the per-centage of those who have inter-married is to the whole number of marriages?—I am sorry to say I am not able to answer that question in figures. I can say, in general, that the number of inter-marriages of deaf persons would considerably exceed the number of marriages where only one of the contracting parties was deaf.

13,392. Do you think that the intermarriage of the deaf and dumb leads to bad results?—I think the whole subject depends on a matter of which I spoke yesterday. As a matter of fact, there are a considerable number of families now existing in America, the parents in which are both deaf, and in which there are to be found a large, not to say a lamentable, proportion of deaf children. My opinion is, that those marriages, on examination, would be found to be between parties who belong to families in which there was an indubitable tendency to deafness, proved by the existence in those families of a considerable number of deaf persons. It is also true that there are a large number of families in America where both parents are deaf in which no deaf children are to be found. The general opinion is that a deaf person in a family with a tendency to deafness should not marry a person of another family with a similar tendency. Where that is avoided the danger of deaf offspring is diminished to a very small figure. Marriages of the deaf are encouraged in America rather than otherwise by the officers of institutions; it is found unquestionably that the happiness of the deaf is immensely increased by happy marriages; of course they may make unhappy marriages as well as hearing people?—I have myself taken occasion in several articles that I have published to caution the deaf in the matter of marriage, and to urge that where it is practicable they should make choice of a partner who hears, for unquestionably it is more to the advantage of the offspring to have only one parent deaf than to have two parents deaf.

13,393. Do you believe that when the deaf contract marriages that question is considered frequently?—I think it is more and more considered.

13,394. You think that they would endeavour to avoid marrying into a family where there was a hereditary tendency to deafness?—I think it is more and more considered; the officers of the institutions take more and more pains to guard against such marriages.

13,395. Is the evil that we are referring to fully appreciated by the missionaries?—I am not able to say that.

13,396. Your brother, Dr. Gallaudet, is at the head of one of the missionary organizations?—My brother is at the head of one of the largest missionary organizations in America; he appreciates the danger of which we are speaking fully, and would certainly exercise his influence to prevent unsuitable marriages.

13,397. You think it desirable that the missionaries should throw their whole influence into the scale to prevent marriages where there is a tendency to deafness in both families?—Most undoubtedly I do.

13,398. Can you suggest any other way in which such inter-marriages can be prevented or discountenanced?—I have given the subject from first to last a great deal of thought, and I can see no other way. I think legislation upon the subject would be inconsistent with public sentiment. I think there is no better way of dealing with the matter than for the teachers, and those who have any interest in the deaf after they leave school, to give them the best advice they can upon the subject, and endeavour to lead them to do that which is best in the matter of marriage.

13,399. Is the matter one which is much insisted on in literature which is published specially for the deaf?—I do not think it has been very much insisted on.

13,400. (*Admiral Sotheby.*) Taking into consideration the great difficulty and the time required in teaching the deaf and dumb, do you consider that industrial training during the period of school life militates against the best development of education?—Not if the period of school life can be prolonged to at least seven years; if it is cut short of that it might be a question whether, in giving too much time to industrial training, you might not be lessening the value of the other department of instruction.

13,401. Would not you say that a little industrial training while they were under education might be beneficial to their health and be a relaxation?—Yes, I should say that industrial training rightly carried on might be beneficial to health.

13,402. You have stated that you were present at the Convention at Milan?—Yes.

13,403. Are you aware that the French went there strongly prejudiced against the oral system?—I have heard it said that a number of teachers went from France who were previously manual teachers. I have no positive knowledge that they went there with any strong prejudice against the oral method.

13,404. Are you aware that the French Commissioner and the teachers who went from France to that Convention came away converts to the oral system?—That is a fact quite well known.

13,405. And then a law was passed in Paris that the oral system should be adopted as the State system?—So I understand.

13,406. I think you said that for church and platform purposes the sign and manual system is certainly the best?—Certainly the best, and the only method, so far as I am aware, by which one can succeed in imparting information to a considerable audience of deaf persons.

13,407. Who makes out the syllabus for the religious instruction in the schools in America?—Whatever body controls the course of instruction in the school.

13,408. The syllabus is not drawn up by the superintendent himself?—If the board of directors authorise the superintendent so to do it may be done by the superintendent himself; it may be done by a committee; it may be done in any manner that the board of direction direct.

13,409. There is a regular syllabus made out?—Yes, for a certain amount of religious instruction.

13,410. Do you consider that the deaf and dumb will fairly compare with hearing people as to morality?—I consider that they will.

13,411. You say that deaf mutes lose much social intercourse if their conversation is confined to the lip system; do you find in America many people who understand the sign and manual system or the manual system only so as to be able to converse with them?—I find in America that a very large number of people understand the manual alphabet, through the means of which they converse readily with deaf persons who have never been taught orally.

13,412. And they prefer doing that?—They prefer it in many instances; they find it a means of communication more direct and more agreeable, less coupled with the necessity for repetition, and less liable to misunderstanding than the oral method of communication.

13,413. Do you consider that the deaf and dumb are able to take their part with hearing people in all manly sports?—So far as hunting and shooting are concerned, for my own part I advise the deaf to let them alone, for so much depends on what may come to one through the ears if one goes hunting or shooting that it is dangerous for them to engage in those sports. But we find that the deaf are quite capable of taking part in such games as cricket, or base-ball, or football, and we encourage them to do so.

13,414. You would probably add swimming to the list of manly exercises in which they might safely take part?—Yes; we have a swimming school in connexion with our gymnasium at Washington.

13,415. I understood you to say that between certain times 40 had left the college at Washington, and are now occupying very lucrative positions; what would that period be?—My statement was that 40 who had gone out from the college had been engaged in teaching. I enumerated a large number of others who were engaged in various pursuits, but the 40 had become teachers of the deaf, and the period during which they left the college and entered upon those various pursuits would extend over about 20 years.

13,416. (*Rev. W. Blomefield Sleight.*) At what age do you consider that the education should begin under the oral method, and at what age under the manual method?—My own judgment is in favour of beginning the instruction of deaf mutes in school at the age of seven years as a rule. In certain cases where the physical development is very decided, and the home associations are such as to make it desirable that the child should be placed in school at a younger age, it might be placed there satisfactorily at the age of six, or even a little younger. That would apply to either method. I should say, further, that wherever it is practicable for the child to receive instruction at an earlier age at home, or even in a kinder-garten with other children, not depriving the child of that opportunity for play and free run which a child needs till it is seven years of age, the instruction should begin at an earlier age than the age I have mentioned as that at which it is proper for a child to be placed in school.

13,417. You will admit that the degrees of the affliction of deaf-mutism vary very considerably; under what heads would you classify deaf mutes?—The class should always be spoken of as the deaf; the term "deaf mute" should only be applied to such as are totally deaf and completely dumb. Besides this sub-class we should then have the speaking deaf, the semi-speaking deaf, the speaking semi-deaf, the mute semi-deaf, the hearing mute, and the hearing semi-mute; those last two classes being usually persons of feeble mental powers. I ventured to lay down that classification a few years ago in an article published in the "International Review" on the question, "How should the deaf be educated?" which had previously been submitted to a meeting of the American Social Science Association, and I think the classification has been accepted as one of some importance in discovering just how to deal with the differently constituted units of the great class usually spoken of as the deaf and dumb; and by assigning the various members of the great class of the deaf to those various sub-classes very important results are obtained in the way of classifying them for different modes of instruction. If you will allow me I will explain a little the meaning of those sub-classes:—The "speaking deaf" would include a child who has learnt to speak and lost his hearing after he was five or six or seven years old. Of course he is perfectly deaf, but he speaks fairly well; still in the eye of the law he is classed as a deaf mute, for he cannot go to an ordinary school. Then the "semi-speaking deaf" person is one who lost his hearing—we might say at perhaps two or three years of age, who retains the power of uttering disconnected words, but has not the power of expressing himself in connected language. He would have one advantrge over the absolute deaf mute in starting on his course of instruction, and it would probably be considered advisable that having this limited power of speech he should in his course of instruction come under the oral method. Then we come to the "speaking semi-deaf," comprising cases where from disease a child might lose his hearing partially and still have the power of speech, who was so deaf as not to be able to enter an ordinary school, but who could hear enough to be taught on the aural method. Then as an example of the cases that would come under the sub-class of "mute semi-deaf," I may refer to the case I spoke of yesterday; the boy who came into our institution deaf, as we supposed, from the first year of his infancy, but who had, as we discovered, an amount of hearing sufficient to be able to be taught on the aural method. Then the next sub-class, the "hearing mute," would comprise such children as hear perfectly well but who do not speak; such are almost invariably idiots. When we find a child who hears perfectly well but who does not speak, and numbers of such are brought to me as deaf mutes, I almost without exception have to send them to schools for feeble minded children. Hearing mutes and hearing semi-mutes, when found to be dumb *only*, because of feeble mindedness, should not, speaking with precision, be regarded as belonging to the "deaf and dumb." I have included them only because of misconceptions, which seem to be deeply rooted in the uninstructed public mind.

Dr. E. M. Gallaudet.

10 Nov. 1886.

13,418. As I understand you, there are exceptions?—There are exceptions where through some malformation of the vocal organs there is an inability to speak; one such case I can recall recently in the Washington Institution, where we were able to overcome the defect in the vocal organs and to teach the boy to speak very well after some little practice.

13,419. (*Dr. Armitage.*) Was that defect overcome by a surgical operation?—No; there had been a partial paralysis of the vocal organs, a feebleness of muscular power and a disinclination on the part of the boy to make an effort to speak. We encouraged him to speak, and after some time he attained a reasonable degree of success in speech.

13,420. (*Chairman.*) It was a case of restoration of the voice which had been lost through partial paralysis?—Yes; the restoration of the voice being effected not by surgical or medical treatment but simply by patient instruction on the part of the teacher.

13,421. (*Dr. Armitage.*) By encouraging the child to make use of the organ which had been long disused?—Yes.

13,422. (*Dr. Tindal Robertson.*) Was the child before he came into the institution badly fed, and did his physical condition improve *pari passu* with the recovery of his speech?—Yes; he was a child of an inebriate father, and he had grown up under very poor surroundings.

13,423. (*Rev. W. Blomefield Sleight.*) In schools where the manual system was taught, should not every endeavour be made to develope the power of speech of those who manifested any such power?—That is what I have now for 19 years urged very earnestly, and what has come to be the accepted practice in our American schools. Manual schools which adopted that method would be no longer manual schools, they would then be combined schools.

13,424. (*Chairman.*) In the manual schools all those who were not absolutely deaf would be forced to continue on the sign and manual system, whereas they ought to be treated on the oral system?—Yes, and if such pupils were allowed to remain in manual schools they would have a great wrong done them. I should deprecate very strongly their remaining any longer in manual schools.

13,425. (*Rev. W. Blomefield Sleight.*) What, in your opinion, is the greatest alleviation that can be given to the deaf and dumb?—If I rightly understand the purport of the question, the greatest alleviation which could be given to the deaf would be that their minds should be developed, and that they should be given the power of expressing themselves in verbal language by their fingers or by writing, and given the power of reading books. Then, when they have the vernacular of their country, they come in easy association and contact with those who can read and write, and are able to communicate by writing. The giving of speech to the deaf, while it is admitted by everyone to be a very valuable thing, occupies a secondary position by the side of the mental development which may be brought about by a course of training which will open up to a deaf person all the stores of literature. Of course oral training is not an essential thing in the education of the deaf—it is an important thing, but by no means a thing of such transcendant importance as some pure oralists would have the world believe.

13,426. By what method can a knowledge of written language be best imparted to the mass of the deaf?—To the mass of the deaf I should not hesitate to say that a knowledge of the use of written language can be

Dr. E. M. Gallaudet.

10 Nov. 1886.

best imparted by the use of the manual alphabet, by signs, and by writing.

13,427. On referring to the American annals of the deaf and dumb (January 1881), I see you stated at the Milan Conference: "In my opinion it is by the practice "of the combined system that the greatest advantage "to the greatest number may be secured." Is that still your opinion?—I have seen nothing to induce me to change or modify that opinion in the least.

13,428. Can you give us the number of children that are being taught under the oral method, the number who are being taught under the manual method, and who are being taught under the combined system in your American schools?—In oral schools, 583; in manual schools, 430; in combined schools, 6,788.

13,429. Did you before the oral system came into prominence teach speaking to semi-mutes in your institution at Washington?—I am sorry to say we did not; we ought to have done so.

13,430. Was any such teaching given in other schools?—In a few of the manual schools in America teaching speech to the semi-deaf and the semi-mute was practised before the matter of oral instruction attained much prominence as it began to do 20 years ago.

13,431. (*Chairman.*) You said that there were only two schools at first?—Yes, both started in 1867.

13,432. (*Rev. W. Blomefield Sleight.*) Could all deaf mutes be taught to talk and read from the lips with success?—In my opinion decidedly not.

13,433. In pure oral schools would you prohibit the use of signs altogether?—I should not, for the reason that I am very slow to attempt the impossible.

13,434. Can you give us the proportion of children in the oral schools who were born deaf?—I am not able to give the proportion of such children.

13,435. Is it your opinion that it is easier to instruct a child who was born deaf in the oral method than one who has become deaf?—I should say that there are to be found children who were born deaf who learn to speak much more easily than other children who might be placed by their sides who were not born deaf; but if you take the two sub-classes of those born deaf and those not born deaf then the sub-class of those not born deaf would learn to speak much more readily than the sub-class of those born deaf.

13,436. Taking them as a whole?—Taking them as a whole.

13,437. What length of time is needed to educate a child under the manual method, and what length of time is necessary to educate a child under the oral method. I am speaking of ordinary school education?—In my opinion, with a child of average intelligence, not less than seven years if the manual method were entirely used, and if the oral method were used I should add at least a year or two to reach the same results so far as the intellectual development of the pupil is concerned.

13,438. Are the oral schools ready to admit all children or do they practically make a selection?—I am credibly informed that they practically make selections. I know as a matter of fact that in a number of instances where application has been made for the admission of pupils into oral schools the application has been refused, that is to say, pupils have been refused admission into oral schools because, in the judgment of the teachers of such schools, they were not likely to succeed in speech. I have had under my charge in Washington pupils who would prove that fact.

13,439. How do children taught under the oral method communicate with those taught under the manual method?—Naturally by signs and the manual alphabet.

13,440. Principally by signs, or principally by the manual alphabet?—Rather more by signs, I should say.

13,441. By what system do deaf mutes make themselves best understood with the outside world?—It goes without saying that a deaf person who may be taken as a shining success under the oral method may communicate with the outside world more readily and with less loss of time than one who is reduced to the necessity of writing; but taking the whole number of deaf who have been orally educated as compared with the whole number of deaf who have been only manually educated, in my opinion the deaf educated under the manual method would have the precedence over those educated under the oral method, taking them *en masse*; that is to say, if those educated under the oral method undertook to make their communications through the means of speech, there would be so many of them that would speak imperfectly and read from the lips imperfectly that the average of those that would be able to communicate with any degree of success with the outside world would be less than the average of those educated under the manual method.

13,442. Do you find that children who have been educated on the oral method, when they leave school are inclined to congregate together, and that those educated under the manual method are inclined to cling together?—The tendency, in the great majority of cases, is for the two classes to mingle as one class after leaving school, those educated in oral schools mingling freely with those educated in manual schools.

13,443. Then how do those who are orally taught converse with those who have been taught by the manual method?—Almost entirely by signs, supplemented by the manual alphabet.

13,444. By which method do you consider the brightness and general happiness of a deaf child's life may be best promoted?—I have said on a former occasion in America, that if, by a process which of course is impossible, I could be projected back to a period of existence which ante-dated my mother's life, and could choose for her, it being a necessity that she should be born deaf, whether, on the one hand, she should be educated upon the oral method, and should be denied through her life the use of signs and the manual alphabet, even allowing that she might be educated under the oral method with very great success, or whether, on the other hand, she should be well educated, so far as mental development was concerned, but should have no speech, and should be allowed the free use of signs, and the manual alphabet, considering her happiness, I should choose the latter unquestionably; that is to say, that she should remain mute during her whole life, without the power of speech or lip-reading, but be allowed to have the use of signs and the manual alphabet. My mother, as is known, was a deaf-mute, and of course I observed her life, so far as I was able, after I arrived at a sufficient age to be observant, and I have no hesitation in saying that in my judgment the happiness of a deaf person is greater who may be educated without speech, but still who uses the manual alphabet and signs, than one (and I hope I shall not be misunderstood) who has the power of speech and lip-reading but refuses to use signs and the manual alphabet. I know of such persons, and I am certain that their lives are more isolated, and they have a less degree of happiness in society and among their friends than those who without speech still use freely signs and the manual alphabet. I would not be understood, in giving this answer, to under-value the usefulness of speech to the deaf, but understanding the question as put to me to have reference to the general happiness of the person, I should not hesitate to say that one taught under the manual method, would have a great superiority over one taught on the pure oral method, with all that that implies.

13,445. Do you think that the heart, the imagination, the soul, and the affections of a deaf mute, can ever be so deeply stirred by speech and lip-reading, as by the manual method?—I do not think they can ever be so deeply stirred or strongly moved as by the use of gestures.

13,446. Were you present at the conference of principals of American institutions in 1884?—I was.

13,447. Did Mr. Williams produce specimens of the composition of oral and manual pupils?—He did. I have made reference to that paper of Mr. Williams, which is published in the proceedings of that conference (which I have left with the Commission for them to refer to if they should wish to do so) in which that comparison is presented with very great clearness.

13,448. At what age do you admit students to the Washington College?—We have no absolute limit of age; we require an entrance examination; we have admitted students as young as between 15 and 16 into the college; we prefer that boys of so young an age should not generally be received; we prefer that they should not enter under 16, and for the reason that the discipline of a college is naturally not so rigid as that of a primary school; and we think that the age of 16 should be reached before boys should be allowed that latitude that is given to the students in a college.

13,449. What per-centage of your students take their degree?—I think about 25 per cent. of those who enter the college graduate in the full course: the others pursue the courses I spoke of yesterday; they select special courses, cutting short their period of connection with the college to two or three years.

13,450. You have at present 50 students?—About 50.

13,451. Can you tell the Commission how many of those have been educated under the oral method, and how many under the manual method?—I think five or six of those have been educated in oral schools; they came to us from oral schools; the remainder having mainly come from schools where the combined system is maintained.

13,452. By what method do you interpret the lectures to them?—By the use of gestures entirely.

13,453. Do you or your professors ever deliver lecturers to them *viva voce*?—We never do; we know it would be useless to attempt it even to those who read well from the lips.

13,454. (*Chairman.*) You consider it would be a waste of time?—We should not be understood at all; some few sentences might be understood, but no continuous lecture could be given to a dozen deaf mutes orally in my judgment, with any success.

13,455. (*Rev. W. B. Sleight.*) Do not you consider that teaching by the lips is, after all, a gesture method?—I have always called it a gesture method; it is a method in which signs are used; the signs are very small, and they are made by the vocal organs, but they are gestures for all that. The method of teaching by lip-reading is a sign method. Certain movements of the vocal organs are taught, in a perfectly arbitrary manner, to mean certain things; these signs are perfectly arbitrary, which the gestures and manual movements of those who have been taught by the sign and manual method are not; they are pantomimic and ideographic, which the signs made by vocal organs never can be.

13,456. Where did Mr. Maginn receive his primary education, and by what method?—My impression is that he was at a school at Belfast. He was a teacher in a London school before he came to Washington, but I think he was at Belfast.

13,457. Where the sign and manual system was taught?—Yes. He has no power of speech.

13,458. You mentioned that 40 who have gone out from your college are engaged as teachers, are any of those 40 engaged as teachers in oral schools?—It is quite impossible that they should be, unless in oral schools they resort to some instruction in the sign and manual alphabet. It is impracticable for deaf persons to be teachers in oral schools.

13,459. Does not the industrial training which you give your pupils somewhat interfere with their education?—In my opinion, not unless it is made to occupy too large a proportion of the time from day to day; it could be made, of course, to occupy an amount of time which would seriously militate against the proper advancement of the pupil in the intellectual department; but, ordinarily speaking, the amount of time that would be given to industrial work in our schools would not interfere with very good progress being made in the school.

13,460. Of what real value do you consider speech and speech reading to be to deaf-mutes in the prosecution of their callings in after life?—I think that, in the frequently arising circumstances in which they may be placed, the power to speak and read from the lips of others gives them a decided advantage over those not able to speak or read from the lips; it would be very difficult to state to what extent that would be an advantage. It goes without saying, that a deaf person who has the power of expressing himself so that strangers, or even those who are not strangers, can understand him pretty readily and reading from the lips, has a great advantage over one who cannot do that. At the same time it is only right to say that there are a vast number of deaf-mutes living now who have been educated without speech who have got on in the world with entire success, who have maintained themselves and their families, and have even amassed wealth; they have, in fact, practically succeeded in all the essential elements of success in life without speech. I think, however, that any such deaf-mutes who had had the power of speech added to their other attainments would have had an advantage in their contest with the world.

13,461. You mentioned three cases of young men doing very successfully in after life who had been trained by the sign method; could you give cases that have been taught on the oral system doing as successfully?—I know cases of young men who have been taught in the oral method who are now succeeding very well and doing admirable work, maintaining themselves in a very creditable manner.

Dr. E. M. Gallaudet.

10 Nov. 1886.

13,462. How do you consider the condition of the educated deaf compares with that of others of a similar station in the matters of, say, thrift, industry, perseverance, and honesty?—I think it compares very favourably with that of other persons of their station; possibly on the whole they get on better than the mass of persons do of their station in life, for the reason that their training in special schools has been of a character to develop in them those peculiarities of character and constitution that tend to success; in other words, one may say, that the training in the special schools for the deaf tends to raise the general standard of capability.

13,463. I believe I am right in stating that, with regard to most of the deaf and dumb institutions in our country, no industrial workshops are attached to them; from your experience in America, do you think that it is of use to the deaf and dumb to have these industrial workshops?—In America I think so. I am not perhaps sufficiently well acquainted with the conditions of labour in this country, and the difficulties which attend the entering into various trades by young people who would be apprenticed, to be able to express an opinion as to what would be the desirable thing in this country. In general, however, the opinion is very decided in America that it is well to give instruction in industrial pursuits while the pupils are at school.

13,464. Would it be possible for a debate or a discussion to be carried on among deaf-mutes by articulation?—I have never heard of such a discussion or debate, and I doubt whether it is practicable. I have heard of conventions of deaf-mutes meeting in Germany where the oral method alone is practised, and that they invariably carry on their discussions by gestures.

13,465. I was going to ask you some questions on the religious question, but I think Mr. Owen has touched pretty fully upon that subject; but I will just put this question: Do you think that the hearts of your audience, of your congregation, could ever be as deeply touched by the oral system as they can by the manual; in a sermon I am speaking of now?—I feel very certain that they could not; in fact I have never yet known the case where any body of persons sufficiently large to be called an audience could be spoken with at any great length orally at all. I do not think it can be done. I know that in some of the oral schools there are religious exercises conducted orally for a certain number of the pupils, and they usually consist of reading passages of scripture, the offering of prayers, which are more or less familiar, and perhaps a simple exposition which is understandable in part only, even by those who are the best lip-readers.

13,466. In your opinion could higher and larger results be obtained by the combined system than by any single method?—That is my opinion very decidedly. I have maintained that on all occasions for a number of years.

13,467. One question occurred to me to-day: are any aural cases found among those who have become deaf?—Yes, quite a number; for in the instances where deafness is caused by disease, it not infrequently happens that the organ of hearing is not entirely destroyed, but the hearing is only partially destroyed, so that in quite a number of cases where the aural or auricular education of the deaf is possible, it is true that deafness has supervened as the result of accident or disease.

13,468. The progress of disease may have stopped the ears?—Yes. As, for example, with scarlet fever; the tympanum may have been perforated, and the organs of the ear may have been disturbed, but not so far destroyed as to render hearing impossible.

13,469. Do you approve of deaf and dumb persons being employed as teachers in institutions?—I do give my approval to the employment, in a reasonable proportion, of deaf persons as teachers of the deaf, and I think that when this proportion is not too great, this policy is to be decidedly preferred over that of employing hearing persons for the entire corps of instruction, and for the reason that the deaf, having had themselves a personal experience of the difficulties that surround the education of the deaf, are, in many respects, better

Dr. E. M. Gallaudet.

10 Nov. 1886.

able to teach persons of their own class than others who may be equally intelligent and equally capable who are without that experimental knowledge. I favour decidedly the employment of a certain proportion of deaf teachers in schools for the deaf.

13,470. I will put one more question. I will quote from the same article as before in the American Annals for 1881. You say: "I do not fear to predict that the "system of the future, that on which all opposing "elements will unite, and in the upholding of which "all hostility and animosity will be transformed into "generous emulation, is the combined system;" is that your opinion still?—That is my opinion very decidedly, and I have had some recent reasons for strengthening that opinion, and for the entertaining of that hope as concerns other countries than my own. And I may add that I consider that the element of harmonious action which is found in the teaching of the deaf in America seems to have added a greater strength to the cause; that when teachers of the deaf in various methods are fighting among themselves, the public has less interest in sustaining the work than when they are acting in harmony.

13,471. (*Dr. Campbell.*) In the first instance, I would like to put a question which I have been requested to put, and I will do so before forgetting it, and that is, whether you have ever known a deaf and dumb person to speak so perfectly that you would be unable to distinguish him from an ordinary speaking person?—I have known a very few such persons. I was very much impressed when in Rotterdam, a number of years ago, with a pupil of Mr. Hirsch, who is a very eminent teacher of the oral method, of the name of Polano, who was born deaf, and who spoke in a manner that was simply marvellous. I had a long conversation with him. I walked with him arm-in-arm through the streets in rather a hurried manner to catch a train for which I was a little belated, and to get to which I was unable to find a carriage when I wanted it, and, to my great surprise, we were able to carry on the conversation with our faces very slightly turned towards one another, at least, with my face very slightly turned towards his. He caught the expression of my speech from a side view of my mouth, and I was able to understand him with perfect ease; and I can say of him that his speech seemed to me like the speech of a person who had always heard.

13,472. (*Chairman.*) Did he speak in English?—He spoke in German.

13,473. And do you know whether he was deaf from early life?—He was born deaf, and had a sister born deaf. That is a marked exception. I have also the acquaintance of a lady in America who has been taught to speak. I think she is a congenitally deaf person, and she was largely taught to speak by her own mother, who was very earnest and patient with her. She speaks in a voice that suggests her being a foreigner. Her voice is not quite natural; her pronunciation is a little peculiar; but she speaks with great fluency, and reads from the lips with great readiness, and altogether might converse with you for half an hour, and you would never dream she was deaf. She would stand in my own country as, I think, the most accomplished speaker and lip-reader among deaf persons I have ever known; and she had a private education, not in a school at all. But such instances are really very rare among the orally taught deaf.

13,474. With regard to the blind, I hold that the blind themselves in using methods and so forth, are really the best judges in regard to the best apparatus, and specially as to things that apply to the touch and so forth. I should like to inquire, taking the deaf themselves, where they have been well taught both by the oral system and by the manual method, what the opinion is among that class in regard to the best method of teaching their class; is it that the combined is the best, or do they generally take either one side or the other?—I have met many deaf young men who have come to our college from the oral schools, and I have yet to remember to have learnt from any one of them that he held the opinion that the oral method was the only method that should be used in the education of the deaf. I think, without an exception, I may say I am sure without an exception, among those young men who have come to our college from the oral schools (and naturally before they get to our college course they are adults, and their judgment is worthy of considerable weight), their opinion would be in favour of a combined system which would include oral schools, even some pure oral schools, for those who might unquestionably succeed well on the oral method, at the same time that it would require manual schools and manual teaching for a considerable praportion who would not be able to succeed on the oral method; and the same view would be held by those who have come to us from manual or from combined schools. In short, I think that I may speak for the educated deaf in America, and say that the weight of their opinion is in favour of the combined system of educating the deaf.

13,475. In regard to the subject of marriage between deaf-mutes, you remarked that where both parties had an hereditary tendency to deafness you would discourage it; would you not go further and say that if either of the parties had an hereditary tendency, I mean from their parents, and it was known that it was in the family you would discourage their marrying even with an ordinary person?—It would depend very much on circumstances. I should say that taking a person whose family had the tendency to deafness, perhaps not very strongly pronounced, suppose that person had the opportunity of marrying another of a family where there was not the slightest tendency to deafness and where there was health and strength and vigour, there would be a considerable presumption that such a marriage might tend to eliminate the tendency to deafness; in other words, the man being the one that belonged to the family where deafness existed, the woman being of a strong and vigorous constitution, the probability would be strong that their children would not be deaf. So that it would depend on the circumstances of the individual case. It might be perhaps said in general that such persons might be advised not to marry at all, but I can easily conceive of a case arising where that would seem a very cold-hearted piece of advice to give them.

13,476. I quite admit that, but the great point is that where there is this tendency unless the circumstances are very favourable and such as you state them, there the tendency would be to hand down the calamity. I should like in the next place to know whether among the educators of the deaf and dumb in America the same thing prevails as among the blind in this respect, that so far as possible we should increase the public feeling against terming the schools for the deaf mutes and the blind, and so forth, charity schools? The idea I want to convey is this, that it is detrimental to the class; for instance, it would be advantageous to the blind in their education was regarded in the ordinary sense, not as a charity, but as a part of the great system of the education of the country, as it is in some of the States I know, and that is growing. Is that so with the education of the deaf and dumb?—The instructors of the deaf seem very strongly disposed to ask that legislators and the public shall look upon the education of the deaf as a matter not at all of charity, but as a pure matter of right when it is admitted in any State or Nation that general public education is the right of the people; and they feel it so much that they have entered in several instances objections to the census officers for having the particulars relating to the deaf classified with those relating to the insane and even the criminal, which is often done. That answers your question as to the opinion and feeling of the teachers of the deaf in America on that subject. They look upon it as a matter purely of educational interest, and one that should be so regarded at all points.

13,477. And for that reason the whole idea of asylums, and the consideration of charity, is as far as possible being obliterated?—That is the fact, that the word asylum is very offensive to the vast majority of teachers and officers of institutions for the deaf in America, and to the deaf themselves, conveying an idea which is wholly inconsistent with what is actually done in the institutions for the teaching of the deaf. There are but two institutions now that retain the name of asylum, the old parent school at Hartford, which, I am sorry to say, holds on to the name, and one in Texas, which is a little bit in the wilderness. I hope the day is not far distant when the oldest and most dignified of the institutions, and I will not say the least dignified, but one of the younger, will remove that name from the corporate name of their institutions.

13,478. Would there not have to be Government action to effect that at Hartford, they having originally received a large grant from the Federal Government, they would have to get the consent of the Federal Government to the change of name; is not that the reason?—That may be so in part. A mere petition to Congress, I believe, would be all that would be needed to authorise the asylum at Hartford to change its name. And I think the State Legislature of Connecticut could

Dr. E. M. Gallaudet.

10 Nov. 1886.

do it. The institution is incorporated solely under the laws of Connecticut, and when the Government of the United States gave a large tract of land, this donation was given to a corporation existing under the laws of the State of Connecticut only.

13,479. Was that donation of land in the case of Hartford given on the condition that the deaf and dumb from other States should be taken at 100 dollars per annum to be educated in the school?—I do not think any such condition was attached. As a matter of fact for many years the institution at Hartford did receive pupils from Connecticut and from the other States, and, in fact, from any, on the payment of 100 dollars per head, because from the invested fund they had money enough to make up the difference; but I do not think any law was passed. They changed the requisition in later years; they require now more than 100 dollars.

13,480. I should like to know whether there is any tendency among deaf mutes more than ordinary persons to secret vices, whether your attention has ever been called to that?—I would answer that, so far as I am able to speak, I think not. That there is that tendency, of course, goes without saying, and in an establishment where many children and youths are brought together there must be much watchfulness to reduce the practice of such vices to the lowest possible point. Human nature is human nature, and I do not know that there is any more of it in the deaf than there is in other people.

13,481. (*Chairman.*) I should like to ask you some further questions. You told us that you have visited most of the institutions for the deaf and dumb, both in England and on the Continent, and you have visited specially the oral schools, where the German system is adopted?—Quite a number of them.

13,482. Do you think that the oral schools in Germany are more advanced in the success of their teaching than in England and in America, as far as your knowledge goes?—I am really not able to speak from a recent examination of those schools.

13,483. How long ago was it that you visited them?—It runs back now to my visit of 1867, so that I am not able to speak of recent advances in Germany.

13,484. I think that you have visited later than that date the schools at Milan?—Yes, at the time of the convention, six years ago.

13485. Did you find the oral system there carried out to a very full decree?—I found it in a very high state of perfection.

13,486. From your visits both to Germany and Italy, do you think that the German or the Italian language lends itself more readily to the oral system than English does?—Speaking in a rising way of the facility and adaptedness of language for the purposes of oral instruction, I think that the German language is probably best fitted for success in speech of the deaf; the Italian would follow, the French would follow that, and the English would be found the most difficult of the four. That is my experience, and I think that that view is generally held. German is the easiest, in fact, there every letter is pronounced. Then follows the Italian; that has a great advantage in its liquid sounds, and its open expression of the mouth, especially in lip reading. Then again the French is less difficult than English. I believe that view would be sustained generally, and may be taken as one reason why in schools of English speaking countries it should not be absolutely insisted upon that all the deaf should be educated under the oral system. It is an absolutely practical question.

13,487. Then I understand you generally from your evidence to say, that, although the combined system is the one that is gaining most ground in America, yet it is in consequence of the older schools having adopted the oral system more or less, that you have formed that opinion?—Quite so. It is true that the effort made 20 years ago by the promoters of the oral teaching, which was at first ridiculed and resisted by very many of the old teachers in schools where the manual method was used, has resulted most beneficially to the welfare of the whole mass of the deaf, and that the managers of the old manual schools have been compelled in many instances, a great deal against their will, to recognise the value of oral teaching to at least a large portion of the deaf, and so they have come at length to accept it very heartily.

13,488. Are the schools in the United States for the deaf and dumb all conducted and built on as large and as liberal a scale as those at Washington?—Very many of them are. I have visited within two or three years the schools of the south, even, (that is a portion of the country which you are aware, suffered very much from the war 20 years ago), and I was extremely gratified to notice that the Legislatures in those States had been ready to make handsome provision for the education of the deaf, in putting up commodious buildings, providing large grounds, introducing the oral teaching, and generally reaching results that would compare favourably with the results of any part of our country. In the richer States in the west, and the north, and the east, there are many other establishments that are provided for as to grounds and buildings on a scale quite as commodious and extensive as the institution at Washington.

13,489. In all those cases is the ground itself and the grant for the building provided at the expense of the State, or is it in any case, or generally, by private munificence?—The practice differs in different parts of the country. In the State of New York, the recent policy has been for the State to decline to appropriate money for the purchase of ground, or very much for the erection of buildings. They have been provided by the donations of residents of the locality in which it was proposed to establish these institutions; and after they are established and provided for as to the grounds and buildings, then the State, under a general law, gives a *per capita* allowance to all the schools in the State for the deaf.

13,490. We had evidence from Mr. Hall, that New York gives a subsidy of 20,000 dollars a year to the education of the blind; do you know at all whether the same system of large grants of that kind applies to the education of the deaf and dumb?—No, it does not, and for this reason: the institution of which Mr. Hall speaks in New York, is a State institution, pure and simple. There are no such institutions for the deaf in New York.

13,491. Is there not one at New York for the deaf on the oral system?—Yes, but it is a corporate institution. This one for the blind stands rather by itself as a State institution, under the control of the State Legislature. Purely State institutions are those which the State absolutely controls; corporate institutions are those which the State may assist to the extent I have described.

13,492. My question was whether there is any similar grant by New York to the deaf and dumb, to that which is made to the blind?—I am quite sure there is not.

13,493. (*Dr. Campbell.*) In these corporate institutions where the State pays for the education of the blind, in most of them, not in all, the State has the power of appointing a certain number of the governing body, has it not?—That is the fact. The entity of the corporation exists, the autonomy, but there comes into it as there does at the institution in Washington, this element of State supervision by the presence of directors on the part of the State.

13,494. (*Mr. Johnson.*) I suppose as a general principle the State goes hand and hand with benevolence?—Yes.

13,495. (*Chairman.*) But what I wanted to know is this: With regard to New York. I think you told us that there is only a pure oral school at New York?—Do you mean the city or the State?

13,496. I have got in my notes that the leading school in New York was a pure oral one; I have not a note as to whether that applied to the State or to the city?—That is not the case in the city. The leading school in the city is one that is sustained on the combined system. There is a very flourishing oral school in the city which has 200 pupils, but the other has as many as 400.

13,497. I wanted to elicit by my question, whether side by side in a large city like New York there were the means of education on the two systems?—Quite so.

13,498. Therefore, of course, nobody would be forced to go either to the one system or to the other, but he would have the option of both?—Yes; and in the whole of New England there is a legislative provision which makes it possible for the parent of any deaf child to elect whether that child shall go to Northampton, where there is a pure oral school, or to Hartford, where there is a combined-system school; they may choose; and it has very often been the case that parents having had their children in the oral school for a year or two, and

Dr. E. M. Gallaudet.

10 Nov. 1886.

not finding their progress satisfactory, have placed them in the other. They change from one to the other.

13,499. They have that power?—They have that power.

13,500. Do you think that it should be attempted to teach all the children the oral system, and that in the case of those who are failures, after a certain time it should be given up and they should be taught the manual system; so that all should have the opportunity of being tested as to their capabilities of learning the oral system; do you think that that is desirable?—My opinion is very earnest on that point. I do urge it strongly, and I am glad to be able to say that opinion is gaining ground very much in my own country; and I think the time is very near when persistent efforts will be made to give to every child the opportunity of learning to speak, and that those efforts will only be intermitted or given up altogether when it seems to be certain that the child will not be able to succeed in speech.

13,501. Assuming that it is desirable that the oral system should be taught if it can be taught, it would be quite possible to teach every child, say for one or two years, on the oral system, and yet not lose any material portion of the time available for instruction. If the child was found to be unfitted for the oral system it might then go on at the age of nine to the manual system, and not be in a worse position than children were before under the old system with the advantage that in that way every child would have its capacity for speech tested?—I can only give my assent in this qualified manner, that I should hardly lay down a limit of two or three years as the period for which it is necessary that the oral system should be taught; because sometimes in six months it might be very plainly shown that the child was making no progress at all; in other cases it could not be settled in six months, or there would be a certain measure of success that would suggest that the effort should be continued. And then the same thing may happen with the deaf as we find happens in our education of the blacks in America. We find in many instances that when the blacks begin their course of instruction their minds develop very rapidly, and after two or three years they reach a certain point and seem incapable of going on further. That is the case with the black race. So in the case of the deaf, it might be that for a year or two the deaf child might do very well in speech, and then it would seem to be impossible for him to go any further. With that qualification I would assent to the views suggested in your question.

13,502. Would you carry out that in the combined system by a system simply of separate classes, or of separate instruction in a separate building, and draft them off from the one building to the other as their education required?—My impression would be that the result could be reached in either way. The separate building and the separate school, for instance, such as I have spoken of in Philadelphia, would seem to be suggested only in cases which from the very start might be counted as quite hopeful cases. Let them be placed at once in a school of that sort; but in the matter of determining whether others are going to succeed or not, I think that experiment could be made and results ascertained either by instruction in a class or in some other way. In a variety of ways the test might be made. I do not think it is necessary to lay down one rigid method of making that test, if only the test is faithfully and fully made.

13,503. I gathered from what you said that you would not forbid the use of signs in connexion with the early teaching of the oral system?—So far from it, I should say that the test can be certainly in my judgment better made by placing the teacher in possession of any means of communication that is free and full between the child and the teacher. So that in my opinion the use of signs during these experimental years is far from being detrimental, it even assists the teacher; and I have seen oral teachers carry a pupil right over a difficulty in speech by the judicious use of gesture; so that I have no question, but that in oral teaching the use of signs is often of great assistance.

13,504. (*Mr. Johnson.*) Can the pure oral system according to your American view be carried on side by side with that of manual signs or the alphabet; you are aware that it is on the pure oral method that so much controversy has arisen in England?—I certainly say that classes in which the oral method (if I may use that form of expression instead of "the pure oral method") is rigidly adhered to, may exist side by side in institutions or schools with classes where signs are used and more or less interchange of the use of signs goes on, and at the same time extremely satisfactory results in speech be attained. There is evidence of that in many of our best schools.

13,505. (*Chairman.*) I should be glad if you could give us the daily routine of teaching and the play-hours and meals in your primary school and also in your college at Washington; could you hand that in, or is it stated in any report?—With regard to the college I can give it to you now. In the college, recitations begin in the morning at a quarter past eight, and they are continued in lengths of three-quarters of an hour each.

13,506. What time do the students rise in the morning?—They breakfast at seven. The first recitation is at a quarter past eight, the recitations continuing after that for three-quarters of an hour duration, with 15 minutes interval between one recitation and the next, until mid-day, when at half past 12 their principal meal is served. Occasionally a recitation is had in the afternoon from two to three, when it is necessary. That is not always done. When the arrangement of classes makes it possible to have all the actual recitations during the forenoon a study time is prescribed from half past one until half past three in the afternoon, when the students are expected to be in their rooms.

13,507. Have they no recreation until after dinner?—The recitations end at 12. They go into the dining-room at half past 12, and usually spend half an hour in the dining-room and have half an hour for recreation, until they go into their rooms to study at half past one. Then from half past three till six o'clock they are quite at liberty, with the exception of an hour taken on four days of the week for physical training at the gymnasium, which of course is exercise for them. At six o'clock their supper is served, and from half past seven to ten they are supposed to be at study. There is a little latitude allowed with reference to that; they may be engaged in writing letters part of the time, or sometimes they have permission to be absent in order to pay social visits; but those are the prescribed hours.

13,508. Will you explain to us exactly what "recitations" are?—"Recitations" means in the college the meeting of the instructor with the class for the purpose of examination in a portion which has been prescribed in some text book, and the time is spent in examining the class to see whether they have acquired an understanding of that portion of the text book. These examinations go on from day to day.

13,509. In fact, it is question and answer on the part of the teacher and students?—Yes. These differ from the exercises of the class-room, as they would be understood in an ordinary school, where the scholars are expected to be in the class-room with their teacher and do their study there, and have explanations from the teacher there, and so forth. The studying of the students in the college is all done in their private rooms, and they come to the class-room for this purpose of recitation and meeting their instructor, and showing that they have properly mastered the portions assigned for study in the text book.

13,510. What proportion of those instructions are given by the finger-language, and what by signs? Of course there are some things that cannot be expressed by signs?—Very little is done in the recitations of the college by signs. The greater part of the communication between the pupils and the teacher is by the manual alphabet. Some portions of it, where the pupil is a good lip-reader and speaker, are given orally, but it is found to be difficult under that method to have the attention of the entire class to everything that is said by pupil and instructor as well; so that the manual alphabet and writing on large slate tablets, or writing theses on paper, may be said to be the means used mainly for giving the question and answer in recitation.

13,511. Do you make use of looking-glasses in your class-rooms to assist the view of the teachers?—In oral teaching we do.

13,512. And in all cases they are in separate rooms for oral teaching?—Yes, we have no two classes in one room.

13,513. What proportion of the teachers are of the first class or second class; that is to say, what proportion of the teachers in your college are upper teachers, and what proportion lower teachers?—In our college we have an active faculty of six professors, including myself. My own professorship is that of moral and political science. Then there are three regular—we term them—professors and two assistant professors. That is the only division of rank in the college. These two assistant professors are graduates of the college, deaf men who speak very well, and they will probably in a year or two be promoted to be professors.

13,514. Are they deaf men who have had speech and then become deaf?—Yes.
