13,515. Can you tell us the remuneration of the professors generally in the college?—In our college the professor who ranks next myself, and now acts as president in my absence, receives 3,000 dollars and a house. Two other professors receive 2,400 dollars each and a house. Of the assistant professors, one receives 1,500 dollars and a house, who is a man with a family, and the other, who is a bachelor, receives 1,500 dollars and a suite of rooms, and is boarded in the family of the institution.

13,516. There are no totally congenitally deaf professors?—Not in the college.

13,517. But in the primary school are there?—In the primary school we have one.

13,518. Is your primary school, in connexion with this institution at Washington, a fair sample of the other deaf and dumb schools in America in its methods of teaching; I mean is it a pattern that is followed?—I may say this, that the general method and arrangement of classes and giving instruction is quite the same as prevails in the State institutions, the primary schools, throughout the country.

13,519. Could you give us in the same way the daily routine of a combined school?—In the tables which I have referred to on one or two occasions, contained in the January number of the "Annals" of this year, that is stated very fully with reference to each school.

13,520. When I was speaking of your visit to the Continent, there was one question which I omitted to ask you. You have before referred to the Convention at Milan. I should like to know whether, having been present there, you can inform us what the constitution of the Convention was. You have, perhaps, already given a description of it elsewhere which you might read to us?—I referred to it, and said in general that it was not looked upon as a representative body, but I am able to say, quoting from an article which I published after the meeting at Milan (which took place in 1880) that "out of the 164 active members of the Convention, "87, or a clear majority of 10, were from Italy; that "56 were from France, making, with the Italian "members, a majority of seven-eighths; that of the "eight English delegates, six were ardent articulationists, and only two at all favourable to any other "method; a proportion which entirely misrepresents "the present" (in 1880) "sentiment of English teachers "of the deaf; that the only truly representative delegation present was that from the United States, "consisting of five members duly accredited to the "Milan meeting by a conference of principals of "American Institutions for the Deaf and Dumb held "at Northampton last May, in which the supporters of "the several methods of instruction now made use of "in this country (including all that are known in the "world) were assembled in friendly council; that the "American delegates represented 51 schools, con-"taining over 6,000 pupils, a greater number than was "represented by all the other 159 delegates taken "together; that the Convention allowed the American "delegates to be out-voted in the proportion of nearly "10 to one by the representatives of the two schools of "Milan, they being accorded 46 seats in the Conven-"tion." I think that would be sufficient to make it evident that the Convention at Milan was in no sense a representative body; it was an assemblage in which it happened that those who were in favour of the oral method were largely in the ascendant at the beginning. There were two very large oral schools at Milan which had produced remarkably good results, and those two schools were accorded 46 seats in the Convention; and that had this result, that on a vote, if any vote was taken affecting the pure oral system, the remonstrance of any of us from America who felt that the pure oral method was not the best for all the deaf, was of no avail.

13,521. Are you aware at all of the steps that were taken by the permanent committee for endeavouring to obtain a convention of a representative character on that occasion?—I am well aware that the invitation of the committee which went out before this meeting at Milan was extended to all teachers of the deaf of institutions of every sort and every method in all countries.

13,522. (*Mr. St. John Ackers.*) So that everybody had an opportunity of coming?—Most certainly everybody had an opportunity of coming, but when we from America, five in number, had come (and we could not bring a hundred from America owing to the shortness even of an American purse) and we were in a position actually to represent the whole body of institutions in America, as I have said in my article there, representing some 6,000 pupils and over 50 schools, we were allowed five votes and no more in making up the conclusion which was reached by this Milan Convention. The invitation was broad enough to every one, but when it was found that from America there were five only who represented this large constituency, there was no motion made to limit the representation from Italy or from France, or even from the schools in Milan, where 46 persons were allowed each to cast his ballot, and determine the results, as against five votes which we had, when we had a backing of 6,000 pupils, as compared with 300 of theirs. I think it is evident that, while the invitation was broad enough to the Convention, when it came to be constituted and it was found who were there, and what they represented, no notice whatever was taken of the fact that the five American delegates, or the eight English delegates, represented a far larger and stronger constituency than these Italian and French delegates who outvoted all the rest.

Dr. E. M. Gallaudet.

10 Nov. 1886.

13,523. (*Chairman.*) I think you have furnished us in this report of your college with various facts with regard to gymnastic training; I understand that you have, not very long ago, fitted out a complete gymnasium?—You will find a drawing of it in that number.

13,524 And you have also a large swimming school and two bowling alleys?—Yes.

13,525. Do you find that the health of the inmates of the college has been improved since those have been added to the institution?—We find that there has been a remarkable improvement, both physically and morally. A moment's reflection may show you that when a lot of youths like that have the opportunity of working off their physical strength and vigour and steam in gymnastic exercises, they are much more amenable to discipline; and so we find the effect to be wonderfully helpful both from a physical and moral point of view; and I may, by relating a little incident, show how marked that result has been. At an anniversary which occurred two years ago when the first class of our college which had gone completely through the college course of gymnastic training, appeared before the public, Mr. Bayard, now our Secretary of State in America, and then a director of the institution, was on the platform, and after the exercises were over he said to me:—"I want to "ask you a question. I was very much struck with the "fact that every young man who came up on to this "platform to deliver his address at graduation and to "receive his degree, came up with a firm, manly, vigorous "step. Now, I have noticed in ordinary colleges that "a certain number will be men who look feeble and "delicate." I said:—"You remember this is the first "class that has been entirely through its course in "gymnastic training." The fact was that there were two young men among that number who entered the college apparently soon to die. One with a hollow flat chest and no muscles at all seemed to be a candidate for an early grave from consumption. He came out as well-rounded and vigorous as any of the others. And I cannot speak in too strong terms of the importance of gymnastic training for the deaf.

13,526. I think you have kept some statistics with regard to the muscular improvement and measurement round the chest, also of some of your pupils?—Yes, we have done so; and they will be found in the twenty-fifth of the annual reports bound up in the volumes I have left with you.

13,527. Will you kindly refer us to the passage?—There is a paragraph in our report made in June 1882, with reference to some of the results of physical training. The paragraph is as follows:—"The results grow-"ing out of the work done in our new gymnasium have "been most gratifying, whether they are regarded from "a moral or a physical point of view. The morale of "the institution was never as high as during the past "year. The instances where discipline became neces-"sary have been very few as compared with former "years, and the reactive effects of an improved physique "on the mental and moral faculties has been markedly "favourable in many instances. During the six months "from November 1 to May 1, all the students of the "college and the older boys from the primary school

Dr. E. M. Gallaudet.

10 Nov. 1886.

" were required to spend four hours a week in active " gymnastic exercises, viz., an hour on Monday, Tues- " day, Thursday, and Friday of each week. These " exercises consisted of dumb-bell practice, in concert, " intended to open the lungs, stir the blood, and set in " motion the whole body, and in the development of " special muscles by the use of a number of ingeniously " prepared machines, designed and furnished by " Dr. D. A. Sargent, the director of the gymnasium of " Harvard University. The dumb-bell exercise was " acquired with great readiness, and given with pre- " cision, the idea of rhythm and time in marching being " conveyed by the assistance of drum beats. The great " benefit arising from the use of the special apparatus " has been clearly shown in the uniform increase of " chest girths, arm girths, &c.; in the erect carriage " and springy step of the students, and above all in the " desire for *regular* exercise, as shown in their work on " days when the exercise was not compulsory. The " physique of each student was carefully recorded in a " series of 42 measurements taken at the beginning and " again at the end of the season. The average chest " girth of about 50 young men showed the following " gains:—

	November.	May.
" Inflated - -	·897	·918
" Repose - -	·853	·864

" The measurements given are decimals of a meter.
" The greatest gain in chest girth was:—

	November.	May.
" Inflated - -	·890	·972
" Repose - -	·855	·910

" Some interesting cases occurred of the development " of limbs into symmetrical proportions where marked " discrepancies existed when the first measurements " were taken. A single illustration will be sufficient:—

	November.	May.
" Right calf - -	·377	·388
" Left calf - -	·373	·388
" Upper right arm -	·297	·305
" Upper left arm -	·300	·305"

We were able to produce symmetry in that young man whose left side at one time had probably been slightly paralyzed.

13,528. (*Mr. Johnson.*) With regard to what you have said about the Milan Conference, I should like to put a question to you. Have you any idea what are the opinions of the teachers of the deaf and dumb in America as to the adoption by the London School Board of the oral system of teaching; has it been made a subject of any comment or consideration amongst the teachers of the deaf and dumb in America?—I can say that it has not been in any formal manner in convention, but it has been commented upon, and decided regret has been expressed that where so many children were to be taken care of as in these schools in London, that rigid rule has been laid down, and it has been felt that the best results would not be obtained.

13,529. Were those gentlemen whom you consulted, or with whom you talked, aware how it was that the London School Board came to that conclusion; might they have been guided, do you think, by the results of the Milan International Convention?—It has been a subject of complaint in America among teachers there, that the action of the Milan Convention seemed to have had an effect in England far greater than we could bring ourselves to recognise in America as proper; but that has always been spoken of as a matter of some little surprise.

13,530. (*Rev. C. M. Owen.*) Because it was not of a sufficiently representative character?—Precisely so.

13,531. (*Admiral Sir E. Sotheby.*) What are the hours that the professors are supposed to be present in the college; how many hours?—The professors of the college are on an average engaged in three recitations each day, of from three-quarters of an hour to an hour each. That however, does not represent by any means the entire amount of time that they give to the work of their professionships, for essays are submitted to them, preparations are made for lectures, and much work is done outside those three hours. They are required to give lectures, and to perform duties, and attend faculty meetings, and to do other things in connexion with the work of their professionships that would very much extend the hours that were given to their duties. So that in speaking of the hours given to duty by college professors, it would be extremely difficult and unjust to make any comparison between them, and the hours that might be expected to be required of teachers in a primary school, who would go into the school-room, and remain in it five hours.

13,532. How many hours do you think the professors give altogether, from the time they go into the college, until they come out of it?—They are supposed to give all their strength.

13,533. But then they are professors elsewhere, are they not?—No they are not.

13,534. They hold no other office?—No.

13,535. They cannot?—They would not be expected to.

The witness withdrew.

Adjourned to Friday, December 3rd, at 12 o'clock.

6, Old Palace Yard, Westminster.

Friday, 3rd December 1886.

PRESENT:

THE RIGHT HON. THE LORD EGERTON OF TATTON IN THE CHAIR.

THE RIGHT HON. SIR LYON PLAYFAIR, K.C.B., M.P.
THE RIGHT HON. A. J. MUNDELLA, M.P.
ADMIRAL SIR E. SOTHEBY, K.C.B.
W. TINDAL ROBERTSON, ESQ., M.D., M.P.
B. ST. JOHN ACKERS, ESQ.
T. R. ARMITAGE, ESQ., M.D.
W. AUCHINCLOSS ARROL, ESQ.
F. J. CAMPBELL, ESQ., LL.D.
E. C. JOHNSON, ESQ.
THE REV. W. BLOMEFIELD SLEIGHT, M.A.
THE REV. CHARLES MANSFIELD OWEN, M.A.
CHARLES E. D. BLACK, ESQ., *Secretary.*

MR. JAMES SIME examined.

Mr. J. Sime.

3 Dec. 1886.

13,536. (*Chairman.*) You are one of the directors of the Royal Blind Asylum and School at Edinburgh?—Yes.

13,537. For how many years have you held that position?—I have been a director for five or six years; since December 1880.

13,538. Previous to that time had you taken any part in the education of the blind?—Previous to that time I was not engaged in taking any part in the education of the blind, but I was largely engaged in education generally.

13,539. We found in Scotland different systems of education for the blind existing. At Glasgow we found that the blind children were educated in the board schools. Have you had any experience of that system as distinguished from large schools and institutions for the education of the blind?—I have seen blind children being educated in a board school, and I have been in communication with others who have had to do with blind children in board schools, but my views regarding the teaching of blind children in board schools are, I may say, more theoretical than practical.

13,540. You are aware that the blind workers in Scotland memorialised the Commission that blind children should be taught, as far as possible, in the board schools, and not in separate institutions?—Yes, I am aware of that. I have seen their arguments.

13,541. Do you think that, on the whole, it is better that they should be taught in separate institutions than that they should be taught in board schools?—My belief is that, on the whole, blind children would be better dealt with in separate schools. Experience may lead to a combination of the separate system and the school board system, but I see no way of combining the two at present.

13,542. I suppose it must be admitted that there always will be a certain number of cases which, from various causes, would require a greater amount of care in instruction than they would be likely to get in the ordinary schools?—That is unavoidable, I should say.

13,543. That being so, we may assume that institutions for the education of the blind must always exist; and, therefore, it would be a question rather of degree than as to their existence or non-existence?—That is my impression.

13,544. Do you think that blind children become more helpful to themselves if they are taught in a separate school than if they are taught with seeing children in a Board School?—My opinion is that they become more helpful to themselves if they are taught in a separate school.

13,545. Is that opinion founded upon any experience?—Upon what I have heard from others.

13,546. Do you find, as a fact, that children after they have left your institution are able to look after themselves, and that they have the same confidence as those who have been in the habit of mixing freely with the sighted?—Judging from what I see boys do and girls do in the gymnasium, and judging from the way they go about the grounds, and the way they move along the street, I would say that as a rule blind children taught in a separate school, such as we have in Edinburgh, have really as much confidence as sighted children.

13,547. That presumes the existence of a gymnasium in such schools and every facility being afforded to give them confidence; where those were absent may I take it that you would not find the same confidence?—I would not say that it presumes the existence of a gymnasium, that is not indispensable to give confidence, because the confidence existed before we established a gymnasium in our school. Before its establishment the children were running about the lobbies mixing with one another. They were very cheerful and very confident; after they had been a little while with us, that is to say.

13,548. You think a gymnasium is not so valuable for giving confidence as it is for improving the general physical health of the children, who otherwise would not take the same amount of exercise as sighted children would do?—It does both; it both gives confidence, and it developes the muscular system of the children.

13,549. What is your opinion with regard to the practicability of teaching blind children at their homes by means of outdoor missionaries, or through any other similar organisation, or visiting and teaching children in their homes?—After talking it over with one or two of the missionaries (who are engaged in a very good work), I came to the conclusion, from the information which they themselves have given me, let alone the theoretical considerations that would lead anyone acquainted with education to form a conclusion on the subject, that the work could not be well done in the child's own home.

13,550. Of course in the case of many blind children the parents are unable to look after them, as they would be looked after in a well-managed institution such as yours is?—That is unavoidably the case; the parents of some of these blind children are engaged, at least the father is, the whole day at work.

13,551. I think you are acquainted with the experiment that was tried at Greenock some time ago of teaching the blind in the public schools?—I have heard something about it from members of the School Board at Greenock,—members who have taken a great interest in the affairs of the School Board, and I have also heard something about it from a young man (he is a young man now) who had been a boy at one of these schools. It was about 18 years ago when the experiment was commenced.

Mr. J. Sime.

3 Dec. 1886.

13,552. Did he say that the education that he received was unsatisfactory, and did he receive any other education elsewhere to supplement it?—This boy received education from his father at home. He told me that he got a good deal of information of course from the lessons given to the sighted children in the class. I have a letter from him which perhaps I may as well hand in (*handing it in*).

13,553. You are aware that the people of Glasgow have not been dismayed by the so-called failure of the system of teaching the blind in the ordinary schools at Greenock, and that they are trying it now in Glasgow?—I asked our manager to inquire how many blind pupils they had in the Glasgow schools, and he got this answer back from the clerk to the School Board of Glasgow:—"Dear sir, annexed I send you note of " names and addresses of children attending public " schools under this board.—William Grubb, 48, Sham- " rock Street; Margaret Aitken, 674, Gallowgate " Street; Agnes McQueen, 61, Queen Mary Street." But we do not know whether these are wholly or partially blind, which is a very important difference. I was at a school this morning in London (the Bowling Green Lane School) where there were three or four blind children, but none of those I saw were really blind; they could distinguish colours; they could distinguish my fingers when I held them up; they could distinguish places on the map of England when I pointed to them.

13,554. Still they might be blind for all purposes of general education as compared with other children?—Yes, threatened with blindness.

13,555. Do you think in Edinburgh you have got all the blind children into schools of one kind or another?—I could not answer that question; but I am afraid that we have not. We have done our best in Edinburgh to get all the blind children to attend school; but the parents are usually so poor that it is not easy for them to send their children to school. There are no blind children in the Board Schools in Edinburgh.

13,556. Do any of the parents of the blind children in your school pay anything for their education, or do the Parochial Boards pay anything?—Sometimes the parents pay, sometimes the parochial authorities pay.

13,557. I think you told us when we were at Edinburgh that some of these parochial boards only pay for the children up to the age of 13?—Yes.

13,558. Though they can legally pay for them up to the age of 16?—I am not certain whether they can be compelled to pay for them up to the age of 16.

13,559. You keep your children after they have arrived at the age of 13?—We keep them up to the age of 16.

13,560. Is it the fact that the parochial boards do not pay for them between the ages of 13 and 16?—I would not like to say that. I think they sometimes do. The Education Act (1872) fixes 13 as the maximum compulsory school age (§ 69).

13,561. Do you think it would be desirable that the parochial boards should be compelled to pay for the education of blind children up to the age of 16?—I think they should up to the age of 16.

13,562. You are in favour of compulsory education for the blind up to the age of 16?—I am in favour of that; I think that 13 contemplated by the School Act for Scotland of 1872 (§ 69).

13,563. As you have told us, it is not carried out?—Theoretically it is in the Act to which I have referred.

13,564. You would prefer that means should be taken to see that all blind children are educated?—Decidedly.

13,565. Do you think that they should receive a distinct grant from the State?—I think they should—a different grant from the sighted.

13,566. But on the same principle?—On a similar principle, or the same principle.

13,567. Have you considered at all whether the locality in which the blind child resides should be called on to make a contribution in aid of the grant by the State?—It seems to me that when a blind child comes from any locality, the whole expense of the child's education should not fall upon the State. I think the locality itself has something to do with its own blind, and that the locality and the State should go hand-in-hand in what they contributed. If the locality contributed one-half,

Mr. J. Sime.

3 Dec. 1886.

the State should contribute the other to the grant that was given. At present we receive 20*s.* for each pupil from the State, calculated on the average attendance.

13,568. That is not simply for attendance?—No, we are on the same footing as an ordinary school. We have a certificated teacher. We receive nothing from the school board; we receive money from the parochial boards. We do not object to receiving the money, but we object to the money coming through the parochial boards in the form of an eleemosynary grant. We think that the blind scarcely stand in the position of paupers; we think they should be taken out of that category, if any means could be adopted for doing that. Then we think that the grant as at present given by the State is too small for blind children, though it may be a very good grant for the sighted. In the sum total taken all over the country it is a very large grant for the sighted, but for the blind it is a very small grant, and it seems to me that the State ought to give a far higher grant than 20*s.* or 21*s.*, and that the School Board of the locality, or the parochial board, ought to contribute in the same proportion as the State contributes. My idea is that if we had 5*l.* from each for each blind child we would then be able to teach blind children properly in separate schools.

13,569. Is 21*s.* per head the highest amount that can be earned in Scotland?—I think that is about the highest calculated on the average attendance.

13,570. Voluntary contributions, of course, have provided the buildings in your case, and would generally in most institutions in Scotland, I suppose. You do not contemplate that 10*l.* would cover the cost of fresh buildings. You assume that voluntary contributions provide the buildings?—I am assuming 10*l.* for maintenance, education, and upkeep.

13,571. Voluntary contributions would have to be relied on to a considerable extent, because they would provide the buildings?—They have done so.

13,572. And they would continue to do so if a grant of 10*l.* were given by the State and the locality for each child?—It comes to be a question whether voluntary contributions would keep up if the State were to give a grant similar to that which we are speaking about. I do not think we would much suffer in the way of voluntary contributions.

13,573. For the maintenance of the school?—For the maintenance of the school and for other purposes, even though we had a grant from the State.

13,574. What is the cost of the maintenance and education of each child in your institution at present?—Between 15*l.* and 20*l.*

13,575. Supposing 10*l.* per head were given by the parochial boards and the State, what would be the cost to them of the education of all the blind in Scotland?—It depends first of all upon the number of the blind in Scotland. Now I have got a very accurate return made out of the number of blind in Scotland based on the census of 1881, which gives us about 3,158, or say, 3,200. I do not think there are more blind in Scotland than that number. I believe that other estimates have been formed of the number of blind in Scotland, but I prefer to base any estimate on the census. I think it is the safer thing to do. The number of children of educational age is put down in this return at 406, but that includes 65 who are under five years of age; the custom in Scotland is not to send children to school till they are past five, past six indeed; it is different from the custom in England; so there would not be more than about 360 or 400 children to provide for altogether, even up to 16 years of age. I am not sure that there would be so many. In that case the total cost for the whole of Scotland if every child was at school would not exceed 4,000*l.* That is for children under 16 years of age.

13,576. With regard to the general education of the blind how far, in your opinion, should it differ from that in ordinary schools?—The subjects should be the same.

13,577. Would you not teach music to a greater extent than it is taught in the ordinary schools?—In some of the ordinary schools in Scotland the piano is taught, and there may be other things taught besides the piano.

13,578. Do you think music should be universally taught in the case of the blind?—Not universally; it should be taught to those who are able to pick it up and who give some promise of doing well in it. I am speaking of instrumental music and piano tuning.

13,579. I am asking you specially with regard to institutions where you keep children to the age of 16?—My answer has reference to such institutions.

13,580. Do you think that Kindergarten instruction should be made more of a subject than it is in the existing Education Code, where it is, I believe, confined to the infant classes?—My opinion is that Kindergarten teaching should be very extensively given in the case of blind children.

13,581. More so than it is?—More so than it is. We are carrying out the system as far as we can at Edinburgh.

13,582. You have alluded to gymnastics which is not always part of the ordinary training?—It is coming to be part of the ordinary training; it is not a part of the ordinary training to the extent it should be; we make it part of the ordinary training in the Edinburgh Blind School.

13,583. With regard to the types used do you think there would be any advantage in having one uniform type for the text books?—It would certainly be an advantage if there was one uniform type, although it is not indispensable to have only one system.

13,584. Assuming that for those who become blind when they are aged the Moon type may be desirable, do you think that for elementary education the Braille type should be the only one taught?—The advantage of the Braille type over the Moon type is very great in point of compactness. In order to get at that I got a comparison made of the amount of space occupied by the New Testament in Braille, and the amount occupied by the Moon type, and the proportion of the two is two thirds to one. That is an immense advantage in favour of Braille.

13,585. Is that the Braille with contractions or without?—It is the ordinary Braille with contractions except for beginners. A child can easily learn Moon as well as Braille, but the Braille type has so many advantages that people prefer it as a rule.

13,586. Where do you get your books from at present?—We print some ourselves: the pupils make others, but we get them chiefly from Dr. Armitage.

13,587. Do you think there should be any assistance from the State with regard to the printing of books for the blind?—That is a point that it seems to me the State could give help in as they do in America. In 1879 Congress voted a fund of 250,000 dollars to be left in the hands of the Treasury, the interest of which, 10,000 dollars, was to be specially appropriated to the American Printing House for the Blind, which is a private printing establishment, and they get this grant of 10,000 dollars annually for the purpose of producing books for the blind.

13,588. Do you think the State here should set up a printing press for the blind, or subsidise an establishment like that of which you have just spoken?—I do not think the State should set up a printing press, nor do I think that they should subsidise a private printing press.

13,589. But you think that they might be asked to make a grant for the purpose of buying books?—Yes, the same as the Education Department used to make in former days to sighted schools.

13,590. Do you think it would be an advantage that every blind child should be taught to write by the printing frame in the ordinary writing type of the seeing?—Yes; the intelligent blind somehow pick it up very readily; one young man of 21 picked it up in a week with us lately, but others would have more difficulty in picking it up considering the number of movements that have to be executed.

13,591. Can the blind use the type writers with facility?—Yes. I have a specimen of the Remington type here done by one of the girls in our Edinburgh institution (*handing it in*). The composition is her own.

13,592. These type writers would be especially valuable for the education of those who were likely to be engaged in any profession?—Of course they would be very useful in those cases.

13,593. Do you propose to give higher education in your school, if possible?—I should like exceedingly if we could give higher education.

13,594. To those who remained to the age of 16?—And were competent to receive the education, but without funds we cannot give that higher education.

Mr. J. Sime.

3 Dec. 1886.

13,595. Do you give any industrial training at your school preparatory to the children going into the workshops?—None to speak of to the boys; to the girls we do; they are taught knitting and sewing.

13,596. Are they taught to use sewing machines?—I do not think the girls use sewing machines.

13,597. Have you any suggestion to make with reference to giving blind children greater facilities for becoming pupil teachers than exist at present in Scotland?—If a blind boy or girl of 14 or 15 or 16 were competent to become a teacher I do not see why that boy or girl should not be apprenticed the same as a sighted child is; there has been nothing of the kind as far as I am aware, and I think it would be an advantage to blind children, who are able to become teachers, if it were in their power to become such teachers. A very slight modification of the existing code would enable that to be done.

13,598. At present a blind child would not be recognised as capable of being a pupil teacher?—There are no blind pupil teachers that I am aware of. If the question were asked, will you take on a blind pupil teacher? I do not know what the Government Department would say; very likely they might be in a difficulty.

13,599. You think that greater encouragement should be given to the training and employment of blind pupil teachers in blind schools than is given at present?—Yes.

13,600. Is it impossible, under the existing system, to get a grant for the blind pupil teachers who are being trained in your school?—We have not raised the question. We had an assistant teacher who was blind, and a very capable teacher she was, but she received no grant from the Government. I forget whether the question was laid before the Government or not, at any rate she never went in for her examination, though she was quite competent to have been an assistant teacher under the existing code.

13,601. You want an amendment of the law in that respect?—Rather a declaration of the law; we want a declaration of what the state of the law is in that respect as regards the blind.

13,602. Passing from school life to the industrial training of the blind after they have left school, will you tell us your experience of the working of your system of workshops, and your boarding-house in connexion with them?—Our system is this: Boys of 16, who wish to become workers in the workshops, are transferred to a boarding-house that we have, connected with the institution, or they reside with their parents or near relatives. Then for some years they are engaged as apprentices; if they are living in the boarding-house, the cost is 8*s.* 6*d.* per week for them, and then as they begin to make a little money by their work, that of course is accounted for. If they live with their parents, then they come in every day to learn their work. As regards the girls, they do not leave the school, they are simply transferred to another department of the school, where the women are, called the work-room. Then if either the boys or the girls have no relations who can pay for their keep, it comes to be a question how much the parochial boards will give, which is usually a question difficult of solution.

13,603. Have you had any refusals from the parochial boards to contribute to the maintenance and assistance of those lads or girls after they have left school?—The manager conducts all the correspondence with the parochial boards, and it would be better to ask him that question, because he can go into all the details. It is always a difficult question.

13,603. With regard to the adult blind, those who become blind at a mature age, what provision do you think should be made for them?—That is one of the great difficulties we have had to contend with in Edinburgh from the date of the foundation of the school; from 1793 onwards it has been a very serious difficulty. Our directors, or rather the founders of the Institution went on two principles. One of those principles was that the blind could not, as a rule, compete on equal terms with the sighted, and the other principle was that really good workers should have their wages supplemented in proportion to their diligence and their good conduct—"industry and diligence" was the phrase used about a century ago by the founders of the school—and we try to go on those same principles still. Where several of our blind workers make good wages, they require no augmentation in order to lift their wages up to a living point, so to speak; others of them, the majority I should say, do require something added to the wages allowed to them, and we make allowances to them from funds that we receive in the shape of charity. Those allowances take different forms. We give them clothing; then if they happen to be ill they have what we call sick allowances, there is a medical man to attend them, and for a considerable time their wages were continued to them as if they had not been sick. Then they have also an allowance of so much per week to bring their wages up to 14*s.* or 14*s.* 6*d.* a week, because we consider that to be the lowest point at which they can manage to keep a family. All this comes from charitable funds, and the charitable funds that we raise are not sufficient to meet all these requirements for the adult blind.

13,604. You have not any extensive system of pensions in Scotland as there is in London?—No; you have more pensions for the blind in London than we have in Scotland; however, a considerable sum of money has been left in Dundee and other places for pensions to the blind.

13,605. Is that form of charity spreading in Scotland?—It is spreading.

13,606. Do you look upon that as the best means of providing for the aged and deserving blind?—It is a good means of providing for them.

13,607. Do you think it is the best means?—It is certainly immensely better for them than receiving poor relief. I would say it is the best means if there was money enough to provide for them in that way.

13,608. Do you think the State should in any way assist those who have become blind and who are unable to work, from no fault of their own, and should put them in a better position than the ordinary pauper who receives relief from the parochial board; do you think a distinction should be drawn by the State between the two classes?—As regards aged and infirm blind, those who are unable to work, pensions from charitable funds are as good a means of providing for them as you could have; but as regards those who are able to work, who are under 40 or even 50 years of age, who may be willing to work, but who have not that aptitude or capacity for working that would enable them to earn a sufficient maintenance, they stand on a different footing. I should say it is not likely that we shall ever have in Scotland funds sufficient to provide them with the necessary augmentation. I should say that that was a case where, as in the case of juveniles in America and elsewhere (at all events in America), the State should come in with some help, whatever form it took.

13,609. How should that help be administered?—Under the inspection of an inspector.

13,610. How would the funds be distributed?—I do not see how they could be distributed except through the agency of institutions. I do not see how the money could be paid to the blind themselves individually.

13,611. That is what is asked for by the blind workers in different parts of Scotland?—Yes, I am aware of that.

13,612. You do not approve of that?—I do not see how the State could pay them in the same way as pensions are paid to individuals. The payment of pensions to blind workers, to men under 50 years of age actually engaged in trade, would have to depend upon a certificate given by a qualified inspector who would certify that they had been really diligent, and were really doing their work well, and were worthy of help. I think that certificate would be indispensable.

13,613. Do you think that there should be some place where all those who are blind should have the opportunity of getting work, rather than that they should be left to work at their own homes?—I can only speak of our own experience.

13,614. Does that cover all the adult blind in Edinburgh?—It covers all the adult blind in Edinburgh, I think.

13,615. Except those, perhaps, begging in the streets; —Yes. My experience derived from our own institution is, that the blind as a rule will get on better in institutions than if they attempted to set up business on their own account, because those who have attempted to do that, either in Edinburgh or the country towns, have come back to us even when they have got help from us.

13,616. They no doubt had a difficulty in getting materials, and in getting their work sold, which in the institutions of course there are facilities for?—Yes.

Mr. J. Sime.

3 Dec. 1886.

13,617. Is there any other point you would like to bring before the Commission which I have not touched upon?—You were asking me about music, and about piano tuning. I may say that my experience is not that music is specially fitted for the blind. I could not take that view. The blind can do a great deal in music. Perhaps there is a larger proportion of the blind able to become good musicians than there is of the sighted; but that a very large proportion of the blind could earn a livelihood by piano tuning or as organists I am not so sure about.

13,618. From your experience of the blind in Scotland, are you able to say whether there are many who are getting a good livelihood either as organists, or as performers on any other instrument, or as tuners at the present time in Scotland?—We have several in Scotland in connexion with our own institution. One, a young man of about 24, who is a capital violinist; he goes out as a piano tuner. He has 30*s.* a week from us as a piano tuner.

13,619. He gets outside employment?—Yes, we send him out.

13,620. You guarantee him that, in fact?—Yes.

13,621. Are there others in Edinburgh?—There are others in Edinburgh whom I sometimes speak to in the street, who go about as piano tuners, and there are others whom I know in the country.

13,622. Have those been educated in your institution?—Some of them in our institution, and some of them in London. I met an organist in Alloa the other day who is making a good thing of it. He came from London. He was educated at Norwood. We give every facility for instruction in music: the great drawback is that we have not the means we would like.

13,623. (*Mr. Arrol.*) Do you teach the organ?—Yes we have an organ in the chapel, and we teach the violin and the piano. One of our blind boys wrote an International march, which was played at the Edinburgh Exhibition. He played it himself on the organ. He was educated with us wholly, and he is now acting as a pupil teacher with us.

13,624. (*Dr. Armitage.*) I think you said that you preferred the blind being educated in separate institutions to their being educated in the ordinary day schools?—I did.

13,625. Do you think it better that blind children generally should be taught in special institutions rather than that they should receive their elementary education in board schools, and then be passed on to the workshops at 13 or 14 to learn their technical work?—Yes, I believe a separate school is a better arrangement for the blind children.

13,626. You think that a blind child receives a better elementary education in a separate school than in an ordinary day school?—I think he gets more justice done him in a separate school.

13,627. I want to ask you about the system of Government inspection that you have; are the children at Craigmillar inspected by a Government inspector?—The school has been inspected twice by the principal inspector for Scotland, Dr. Wilson; he brings along with him one of his assistants, and they go over all the standards, and the assistant to Dr. Wilson picks up, as far as he can in the short time, the methods adopted by the blind and is able to go very thoroughly into the work done by the blind in the school.

13,628. In order to obtain the grant it is necessary that the children should pass in the respective standards, the same as children in sighted schools?—Yes.

13,629. The grant is not simply a capitation grant; it is a grant for results on examination?—It is a grant on the same principle as in ordinary schools: it is not a capitation grant merely.

13,630. (*Dr. Lyon Playfair.*) I suppose we may assume that the inspector was inclined to be lenient in passing the children through the standards?—He was rather surprised at the results that were achieved; but I cannot tell whether he was lenient or not. Naturally I should say one would be inclined to be lenient in the case of the blind; but I have no reason for thinking that he was.

13,631. You think it would be a desirable thing that the Education Department should encourage blind pupil teachers when they show a capacity for teaching?—I think so.

13,632. And that those blind pupil teachers should either teach in board schools, or in separate institutions?—I think so; I think they should be on the same footing as the sighted.

13,633. You think that is not done now?—It is not done now so far as I am aware.

13,634. (*Rev. W. Sleight.*) Have you an infant school in connexion with your school?—Some of the children are what would be called infants. We have not a formal infant school, but there is what may properly be called an infant class.

13,635. Did that infant class earn a grant?—It underwent examination.

13,636. Do you know of any case of a certificated blind teacher in Scotland?—I do not know of any such case.

13,637. (*Dr. Campbell.*) You told us that the apprentices cost you 8*s.* 6*d.* a week; is that 8*s.* 6*d.* only for maintenance, or does it include also the cost of technical instruction?—That 8*s.* 6*d.* includes everything though nominally for maintenance only.

13,638. What proportion goes for instruction in trade?—There is no division made.

13,639. Do those who live with their friends and who do not live in the boarding-house receive their instruction in trade for nothing?—They do not pay the 8*s.* 6*d.* of course.

13,640. Do they pay anything for instruction?—No.

13,641. In round numbers 8*s.* 6*d.* a week would come to 22*l.* per annum. Why does it cost so much more in the trade department than it does in the school department? You say the cost in the school is 15*l.* to 20*l.* per annum, including instruction, maintenance, and everything?—I do not know what the exact cost in the school is, but it is something under 20*l.*, but not for everything. I am not sure of the exact cost.

13,642. There are many blind persons who become blind, after school age, at the age of 30, and so on, who are too old for school and too old to teach them anything but some simple trade. Do you think the Government ought to do anything towards providing instruction for them in some trade?—There are a good many who become blind by accident after they are 25 years of age, sometimes even they are 40 years of age. In some cases the works in which those people meet with their accidents keep them on; we have examples of that on the Clyde. In other cases they come to our manager and ask him to take them in, and they learn a trade under him.

13,643. Would you recommend that the Government should assist men of the class of which I am speaking by affording them the means of learning a trade?—I think they would come under the class of those who on account of their being blind have a claim to help from those who have the use of all their senses.

13,644. (*Dr. Tindal Robertson.*) I understood you to say that if the State would give 5*l.*, and the parochial authorities would give 5*l.*, towards the costs of the maintenance and education of blind children, you thought you could get the rest by voluntary contributions; the rest, I assume, would be about 10*l.* You said that between 15*l.* and 20*l.* was the cost; would it be nearer 15*l.* or 20*l.*?—I should say it would be nearer 20*l.*

13,645. Do not you think that if you got 10*l.* a head by State aid, and by parochial aid, you would kill, to a certain extent, voluntary aid?—You could not tell till you actually put it to the test, but I would fain hope it would not.

13,646. With regard to training do you carry on any handicraft training concurrently with the ordinary school education; are the children when they are receiving school education sent for a certain time to handicraft work?—The boys have no such industrial training to speak of; the girls are taught sewing and knitting.

13,647. With regard to pensions, it has been found in England, according to the evidence given here, that the pensions overlap each other; do you find that that is the case in Scotland?—We have very few pensions for the blind in Scotland.

13,648. Do you find that one person ever gets more than one pension?—As a general question I am afraid it is too much the case, but we have very few of those pensions for the blind in Scotland, especially in Edinburgh.

Mr. J. Sime.

3 Dec. 1886.

13,649. Do not you think that with a view of avoiding that evil the administrators of those pensions might very well put themselves in communication with one another?—I certainly think so.

13,650. (*Mr. Mundella.*) Do I rightly gather that you are of opinion that the education of the blind should be regarded as a duty by the municipality and by the State combined?—My idea is that the local parties and the State are both interested and both ought to combine in doing their duty by the blind.

13,651. Then you would confer upon the local authorities the power and the duty to educate the blind?—Both.

13,652. That is to say you would make it obligatory that they should educate them, and you would empower them to raise the means for so educating them by rating or otherwise?—You are aware that it is obligatory already in Scotland by the Act of 1872.

13,653. It is obligatory that you should educate all children, no doubt, but I am afraid it has not been regarded as strictly obligatory so far as the blind and the deaf and dumb are concerned up to now?—That is the case.

13,654. You are of opinion that the obligation ought to apply to all children including the blind and the deaf and dumb?—Yes.

13,655. And that the local authorities should have the power of enforcing that education and of paying for it?—I think so.

13,656. And that that ought to be supplemented by a State grant?—I think it should.

13,657. Suppose you have trained a child to a trade at the age of 16, and suppose he is able to earn nearly as much, but not quite as much, as will maintain him, do not you think that it is there that voluntary effort should come in to assist him in maintaining himself till he can earn his own living?—Unfortunately voluntary effort does not do it at present. If we got Government help to train these blind young men to earn a livelihood for themselves, voluntary effort, I hope, might still be counted on.

13,658. But do not you think that if the State and the locality combined provided the education and the training of blind children, voluntary effort would then afterwards come in to assist them in maintaining themselves in a condition of independence after they had been properly trained?—I believe voluntary effort would come in, but I am afraid voluntary effort would not be sufficient.

13,659. At present your voluntary effort is directed to education and training?—It is directed to education and training and augmentation of earnings.

13,660. If it was devoted to only one purpose, namely, assisting blind youths and girls after they have been educated and trained to industrial work, do not you think it would stimulate voluntary effort, and tend to show those who were willing to come forward with their voluntary contributions that what was being done was done to assist those who were helping themselves to the best of their ability?—I am not certain that voluntary effort would be sufficient of itself even for that restricted field.

13,661. You do not know that in Saxony it is found to be sufficient?—I have read about it; but I have no personal experience of it.

13,662. We will pass on now to those adults who become blind by accident; what do you think the local authority and the State ought to do for them?—I think it may be assumed that the majority of those who had to learn a trade after they become blind would not be able to support their families by the new trade which they learnt.

13,663. First, they have got to learn a trade; in your opinion, would not the local authorities be expending their money wisely by stepping in to make grants of so much per head for the training of those persons in a trade, rather than for maintaining them in the workhouse?—Most certainly, I would rather have them be trained to be taxpayers than to be eating the taxes up.

13,664. (*Mr. Johnson.*) I think you told us that you know of a board school at Glasgow where blind children were educated with the seeing; have you any such arrangement in Edinburgh?—I believe there is no arrangement of the kind in Edinburgh. I was not aware of any arrangement of the kind, but to make certain I wrote to the clerk of the school board, and I have had a letter from him in which he says there are no blind children educated in the board schools in Edinburgh.

13,665. You suggested that the local authority and the State should each contribute 5*l.* towards the education and maintenance of blind children; do you suppose that 5*l.* from the State, and 5*l.* from the local parties would be enough to educate and maintain a child up to 16 years of age?—I would not like to say that; that would be a rate in aid, and a good rate in aid.

13,666. In the case of an institution, with its building and appliances already provided, that would be a very considerable rate in aid I suppose?—It would be a considerable rate in aid to us; though we have got our school built, the school, I am sorry to say, is very heavily burdened with debt.

13,667. A contribution of 10*l.* from these two sources would not be enough to educate a child and maintain it up to the age of 16?—It would not be enough, we should require more.

13,668. Do I rightly understand that 15*l.* is about the ordinary cost now?—Between 15*l.* and 20*l.*

13,669. You were asked where you get your printed books from; I suppose you get some from the British and Foreign Blind Association?—A good many of our books are printed by the children themselves, and by the masters, and I remember that the manager told me that he got a good many from Dr. Armitage.

13,670. By purchase, or as a gift?—Purchased, but they were bought certainly on very liberal terms.

13,671. Are there any books used in the school in any other type than Moon and Braille?—I think we have some books in Alston type.

13,672. The Alston type was the ordinary type of the blind in Scotland a few years ago?—Yes. Mr. Gall's type was the one used first of all; I do not know whether there are any books in Gall's type in the library or not, but I know the manager has some of them; they are not used now in Scotland.

13,673. I understood you to say that a portion of your education was music?—A portion of our education is music.

13,674. To what extent do you teach music. I am speaking of the school at Craigmillar?—We carry the children as high as we can, and we are anxious to carry them further than our present staff allows us to do. Some of those whom we have are being educated in music after the age of 16.

13,675. I suppose by special grants?—By special effort on our part. We have pianos, an organ, and an American organ, and instruction is given in all those.

13,676. Have you had any very great success in placing out blind persons who have received a special musical education?—Considering the extent of the country and the demand for organists, and so forth, I suppose our success has been very fair. We have some in Edinburgh, we have some scattered over the country, but it would depend altogether on circumstances whether you could say it was a great success.

13,677. But you have had a certain amount of success with your pupils who have received a musical education at your institution solely?—Decidedly.

13,678. Have you any statistics to show the number that have been sent from your institution to any particular college or institution where they teach music specially?—I do not think there are any such statistics. I sometimes hear of one or another who has gone to Norwood, for example. I cannot give you statistics.

13,679. From your experience among the blind generally, which has been a very large experience, do you think it is a desirable thing to educate them to a very great extent in music, with a view of following it as an occupation?—To those of them who have a great taste for it, I would give every facility possible.

13,680. But you would not specially educate them till they had developed that great taste?—My experience, both of the sighted and the blind, is that the taste for music is a taste that will not develope if it is not there by nature.

13,681. I think you said that your institution had these two ideas in view, the idea that the blind could not compete with the seeing, and the idea that the majority required help in the shape of some sort of subsidy; is

Mr. J. Sime.

3 Dec. 1886.

that subsidy supposed to be for those persons who are very fair workmen?—Who are doing their best; but even when they do their best they do not come up to maintaining point or living point.

13,682. Have you any idea of the number of blind people who do come up to maintaining point?—The number is very small that come up to maintaining point We have 26 females in West Craigmillar, and they earned altogether 94*l.* last year. Some of them will earn 11*l.* and some only 4*l.* or 5*l.*

13,683. I was speaking about Craigmillar? — If we restrict ourselves to Craigmillar we have 26 females there, and they realise in the shape of wages 94*l.*

13,684. Amongst the 26?—Yes, of course they are of all ages.

13,685. Then your position as I understand it is this, that these people could not live upon the wages that they earn, and that is the reason why you supplement them?—They could not live on the wages that they earn at Craigmillar, and they are supplemented.

13,686. At Craigmillar the wages of the people that you employ are subsidised?—They are.

13,687. (*Admiral Sir E. Sotheby.*) Do you not think that the education of the blind children with the sighted would produce a spirit of emulation?—That is a question to be answered by experience.

13,688. But you said yourself, did you not, that you preferred the blind children being educated by themselves?—My feeling is that the spirit of emulation would not be developed to any extent sufficient to counterbalance other disadvantages. I am afraid that three or four or five or six blind children educated amongst 400 or 500 or even 40 or 50 sighted children would be so much taken care of at first that they would be spoilt rather than otherwise, and then ultimately they would come to be neglected.

13,689. Are you aware whether any of the blind people who have been taught music at your school are now begging or playing instruments in the streets?—There are not any that I am acquainted with, though there may be some such cases.

13,690. (*Mr. Mundella.*) Is there much blind begging in your opinion in Scotland?—In Edinburgh there are two or three blind whom I see very much engaged in what I can only call begging. They profess to be reading the Scriptures when people pass, and when I speak to our manager about them, he seems to be acquainted with them, and to look upon them as helpless cases. As to the general question as to whether there is much blind begging, really that depends upon the locality of the country in which one is, and I could not answer that question.

13,691. How would you treat isolated cases of blindness in the country. I do not mean in Edinburgh?—Do you mean juvenile blind.

13,692. Adult blind especially?—An isolated case of a blind boy or girl I see no way so well fitted for treating as by sending the child to an institution. I think that is the most effectual way of dealing with it. If the teacher of a village school, a board school, could do the work, it certainly would be an advantage; but I doubt very much whether he would have time with his other duties to do the work satisfactorily. Then in the case of a young lad above 16 years of age, and under 21 he should be sent to some institution to learn a trade or profession, as the case may be, according to his ability.

13,693. I am speaking now as to teaching them to read and write for educational purposes, and not as to their learning a trade?—If you are asking me whether I think young lads or adults should be taught to read; I say certainly they should.

13,694. But how would you propose that they should be taught in isolated cases in the country?—It is very difficult to start any plan. The outdoor missionaries for the blind who have a large sphere of good work for themselves profess to do this teaching, and they certainly ought to be encouraged in every way to do that teaching where it can be done; but every missionary has a wide extent of country to go over, and has to get up subscriptions besides for his society, and it is a very difficult thing for him to give time sufficient to teach one man in one part of the country, and another man or another woman in another part of the country. I would like something more effectual than that for the sake of the blind. I do not think that that is sufficient in the interests of the blind themselves.

13,695. (*Mr. St. John Ackers.*) By the Scotch Education Act it is compulsory is it not that the blind children should be educated?—That is compulsory. There are two clauses in the Act which deal with that.

13,696. But you have stated in evidence that they are not all educated; where in your opinion does the Act fail?—The Act fails in educating them, or in bringing a compulsory power to bear.

13,697. But will you point out in what way you would like the Act altered so as to strengthen the weak point to which you have alluded?—The weak point is the difficulty of educating and maintaining the child in its state of blindness away from home, supposing that the child's parents wanted to send the child to an institution. There are two authorities that come into collision, the Parochial Board Authority and the School Board authority. The parochial board authority may say that the child is not a pauper, and if the child is not a pauper then they may decline to give any help, and in that case there is no provision made by the Act for the child being properly educated.

13,698. Then, in your opinion, as the Act now stands it wants alteration?—I think it wants amendment.

13,699. In the direction of making practically universal the compulsory education of blind children?—Giving more power to that effect.

13,700. In your opinion does the Act require a further alteration so as to include the deaf as well as the blind, for you are aware that at the present time the deaf are not included in the Scotch Education Act?—I would certainly include all.

13,701. You have already stated that it is impossible to get a blind pupil teacher recognised so as to become eventually a certificated teacher. I suppose that difficulty arises from the fact that to enable a person to become a certificated teacher, there are certain branches of learning necessary which the blind cannot undertake, such for instance as drawing, is that so?—That is one branch.

13,702. In your opinion, should the present regulations be altered so as to enable blind persons to become certificated teachers?—My idea is that they should be so altered that facilities should be given for the few blind that would be required to become pupil teachers or assistant teachers.

13,703. In your opinion is it advisable that blind persons should ever become head teachers in schools?—It is a matter of fact that we have had a head teacher who was a blind man.

13,704. I am perfectly aware of that; but is it, in your opinion, advisable that it should be so?—I would prefer not to give a general answer to a general question. I would rather say, Let me see what the blind man is, and I will tell you. It will depend entirely upon the blind man's powers.

13,705. But there are certain blind men whom, in your opinion, it would be advisable to employ as head teachers?—Certainly.

13,706. Is it not a distinct hardship that blind persons cannot become certificated, and therefore the schools in which they teach cannot get the grant?—I quite agree with you.

13,707. You spoke of inspection by Her Majesty's senior inspector for Scotland; had he himself before he came there any knowledge of the different systems of teaching the blind, so far as you are aware?—Not that I am aware of.

13,708. The examination was conducted by a layman, with the assistance of one other person; was the assistant whom you mentioned who came with the chief inspector skilled in the methods of teaching the blind?—Not when he came.

13,709. So that in fact the whole examination was conducted by persons who up to that time had no technical knowledge of the education of the blind?—Practically it was.

13,710. We noticed in your institution one blind woman, if not more, who had become blind through small-pox, not having been vaccinated; is that common so far as you know in Scotland?—I do not think it is.

13,711. Have you any statistics (I do not see any in your report, but possibly you have some), as to the causes of blindness in your institution?—There are statistics. I do not know that I have them with me, but I think that I could give you them.

13,712. Is it the habit of your institution to keep accurate statistics as to the causes of blindness?—We usually ask the causes, but I have not the statistics with me. The per-centage of those who have been blind from birth is comparatively small, and the number who become blind from accident or disease goes on increasing.

13,713. Is it so far as you know universal in Scotland to keep statistics of this kind in these institutions?—Not that I am aware of.

13,714. Would it not be very useful that such statistics should be kept?—It would be useful, and I see no reason why they should not be kept. No one can be admitted to our institution without a medical certificate stating the cause of blindness, and that the child is really blind and an object for the charity.

13,715. And these are all tabulated?—They are all scheduled and tabulated.

13,716. We were told in Edinburgh, when visiting your institution that, last winter, which was a time of considerable distress amongst the working population of Edinburgh, there was not a single blind workman out of employ?—Judging from the papers that was our impression. We saw none and knew of none.

13,717. Is that usual throughout Scotland?—I could not say.

13,718. You spoke just now in answer to a question with regard to the number of street musicians; are you aware that the returns of the society for promoting reading amongst the blind in Edinburgh gives ten as the number of street musicians in that city?—I am not aware; there may be that number, or there may be even more.

13,719. But at any rate there is a very considerable number of blind persons who get their living in that way?—I have no doubt of that.

13,720. Is it your experience that they are people of good character who are unable to get their living by a higher class of music, simply because there is no opening for them?—I do not know; but I would not encourage them.

13,721. Do you think that it has a detrimental effect upon their character?—I think so.

13,722. I am afraid I must revert to a question which has been brought forward over and over again to-day, viz., the question of the cost of from 15*l.* to 20*l.* I want you kindly to explain to the Commission how you arrive at those figures; because taking on page 18 of your report the total cost and dividing that by the total number of inmates, we get, so far as I can see, an average of over 40*l.* per inmate. Will you be good enough to tell us how you work out the figures which were given us in Edinburgh, and which were given us again to-day in evidence?—I cannot pretend to have worked them out.

13,723. The amount is 1,998*l.* divided by 48?—I should require to look into these figures very carefully before answering the question. But there are two departments in the institution with 73 inmates. 47 is only the number of children, and the divisor should be at least 73, not 48.

13,724. What does the 15*l.* to 20*l.* include?—What we say is, that the 15*l.* to 20*l.* is the cost of the keep and education of the child.

13,725. Merely the food of the child?—No.

13,726. That does not include the clothing of the child?—I am not sure about the clothing.

13,727. Then so far as I understand from you it is the food that costs that amount, but the actual cost per child, taking all the extras, comes to something over 40*l.*?—Taking all the extras, the cost of the school department is about 29*l.* Of course it is not easy always to separate the two departments.

13,728. (*Mr. Arrol.*) On the admission of children to your institution do you cause them to pass under any examination by an oculist for the purpose of ascertaining whether it is possible to apply some skill to the amelioration of their complaint?—Not so far as I am aware with that view. We require a medical certificate, and the medical officer connected with the institution examines the children's eyes, and if he saw that the child was really a sighted child, then of course, unless the case was a very serious one, we should not think of admitting it; but I cannot say that we do it with that distinct end in view.

13,729. Do you not think it advisable for all institutions to adopt some system of that kind?—I have no doubt that it would be advisable, but I do not know that it would give us much help. *Mr. J. Sime.* 3 Dec. 1886.

13,730. Would it not confer much benefit upon the unfortunate blind. Are you disposed to consider that it is advisable for children to be removed from their parental roof in early years and brought into these institutions, which are specially set apart for them?—In not a few cases it is a great advantage to the children to be removed. In other cases it may not be an advantage, so far as parental control is concerned, and so far as home is concerned; but then it is always a balance of difficulties with children as well as with grown up people; and the advantages which a child gets in the way of education, even when his home is comfortable, and his parents all that can be desired, are such as to form a counterbalancing consideration, and I see no harm in removing such a child from home, but rather an advantage.

13,731. You were good enough to refer to the census returns when his Lordship asked you about children of educational ages; did you yourself compile the abstract which you have submitted?—The abstract is taken from the census returns; it is simply a copy of the page.

13,732. I think you read it so as to show over 400 children. If you have the census returns with you, you might refer to them if you please?—The number between the ages of 5 and 10 is 215, and the number between the ages of 5 and 15 is 341.

13,733. I take exception to that return?—I have seen another return.

13,734. I presume you apprehend that these returns are accurate?—I prefer to trust to the census returns; I believe them to be accurate.

13,735. You have shown that there are 3,158 blind in Scotland; did you take the trouble to test throughout any of the counties in Scotland whether those figures are correct?—No. I think that when Government authority is given to get these returns, as is done in the case of the census papers, we are bound to take those returns as correct.

13,736. I am sorry to say that they are very far from being so. Your institution I presume will admit all adults that may apply for trade purposes?—Of good character, when we can.

13,737. What may be the reasons why you cannot take in all of good character?—If a number of basket makers apply to be taken in, we may not have work, and the state of trade may be such that there may be no prospect of work for a larger number of basket makers than we have. A great deal will depend upon the state of trade.

13,738. Your institution cannot cope, I suppose, with all the blind that are in and around Edinburgh?—We have blind from Edinburgh and from all parts of the United Kingdom. If proper help were given us we would cope with all the blind in Edinburgh, and (as we are bound to do in the capital of the country) even with those beyond it.

13,739. What may be the nature of the help that you require?—Such as I was referring to in my examination to-day.

13,740. (*Chairman.*) I understand that you are giving evidence after consultation with your directors, and that you believe that the evidence which you have given is in harmony with the general views of the directors whom you represent?—I think it is.

13,741. (*Sir Lyon Playfair.*) In stating that the cost of maintenance is nearer 20*l.* than 15*l.*, did you not mean that the actual cost for food and clothes is about 18*l.* per person?—Yes, including education.

13,742. (*Chairman.*) Was not your estimate of nearer 20*l.* than 15*l.* for board and maintenance, not including clothing?—That has always been our impression from year to year.

13,743. Is it not the fact that it is nearer 20*l.* than 15*l.* for board and maintenance?—It is nearer 20*l.* than 15*l.* for food and clothes, but 20*l.* would cover clothing as well.

13,744. (*Dr. Tindal Robertson.*) Following up the question which Mr. Ackers put as to the causes of disease, is there any system in Scotland for the prevention of infantile blindness. I refer of course to the

Mr. J. Sime.

3 Dec. 1886.

purulent ophthalmia of infants, which is a preventible disease?—Not that I am aware of.

13,745. (*Mr. St. John Ackers.*) It has been suggested both in England and Scotland that there should be simple rules for the prevention of blindness; is there anything done in the parochial boards in Scotland with regard to preventing these things?—Not that I am aware of, except in the way of general regulations.

The witness withdrew.

Mr. WILLIAM MARTIN examined.

Mr. W. Martin.

13,746. (*Chairman.*) You are the manager of the Royal Blind Asylum and School at Edinburgh?—Yes.

13,747. We have heard generally about the working of the institution; will you state to the Commission your views, more especially with regard to the industrial training of the blind after they leave the school at Craigmillar, and with regard to the present working of your institution, and in what way you think that generally the education of the blind can be improved?—I should have liked to have begun at an earlier stage in so far as the school and early training was likely to have an effect upon the physical character of blind persons, because we find those blind persons who come into the institution who have never been at blind schools very deficient in touch, and very deficient in physique, and I meant to have adverted to the absolute necessity of more attention being paid to that.

13,748. But at Craigmillar that is already being done?—It is being done there.

13,749. Will you describe fully what is the process of the industrial training after your pupils have left Craigmillar?—We get the pupils from Craigmillar at 16 years of age, and we apprentice them to various departments of trade, seeking of course, to make them proficient workmen. We have a number of blind people coming into the institution from the country who lose their sight after they are 16 years of age, and those also we have to train industrially, naturally the more difficult trades are given to the younger blind; basket making for instance. We ask for their support, and we have a very great deal of difficulty in getting it. We ask the parochial board or the relatives to pay for them at the rate of 8*s.* 6*d.* per week for the first year, and for the first year we ask them to pay two guineas for their clothing, which makes 24*l.* 4*s.* altogether. After the first year we deduct the value of their labour from the amount charged for their board, and we give credit for their labour to the parishes or to the relatives who send them into the institution. We supply gratis, of course, the foreman, the materials, and the tools. Naturally a quantity of material is spoilt, and the time of the foreman is occupied in training those lads. The number of trades to which we can put them is limited, and the time required in learning varies according to the capabilities of the pupil. If a lad who is put to learn basket-making is likely not to be proficient at basket-making, we sometimes, if we happen to have a vacancy in one of the other departments, move him from basket-making, and put him to some other trade. Oftentimes we find that the parishes are unwilling to continue their support, and they only give that support in anticipation of the blind children being eventually self-supporting. It is, of course, a matter of calculation with them whether they should continue their grants. They are really grants in aid anticipatory of relief to the parish more than grants in aid of the relief of the blind persons.

13,750. Can you teach the children in the time for which the grant is allowed?—We have that in our own hands pretty much, because we deduct the value of the labour after the first year, year by year, as they progress; but many of the parishes become restive under the charge and refuse to continue the payments, and oftentimes we have found lads thrown upon our hands for whom the parish will not pay anything.

13,751. But does it not take four or five years to train a man to become a good basket-maker?—Five or six years is a sighted basket-maker's apprenticeship time.

13,752. If the parochial boards do not continue their grant after the first two or three years, do you lose by it?—We lose by it. In that case the pupil has to fall back upon the funds of the institution.

13,753. Do you wish that it should be compulsory upon the parochial boards to continue the grant in aid of the industrial training of the blind until they are able to earn a certain amount for themselves?—At present it is within the power of the parochial boards to give those grants in aid, but it is not compulsory for them to do so.

13,754. Do you wish it to be made compulsory, say up to the age of 21 in the case of boys entering at the age of 16?—I should like it to be compulsory if that does not put the brand of the pauper upon the blind person; that would be my fear in connexion with it. I should be very anxious that it should be distinctly understood that it should not be held as pauperising the blind person.

13,755. There is a precedent, is there not, in regard to reformatory and industrial schools; that is to say, that a certain sum is granted in aid up to the age of 21 in reformatory schools in England for the maintenance and industrial training of certain lads?—3*s.* a week, I think, is given for them until they are 12 years of age, and 5*s.* a week until they are 15 years of age; it is reduced to 3*s.* between the ages of 15 and 16, because they are supposed to be earning something; but those are lads who have been "committed" by a magistrate or justice of the peace.

13,756. May it not be argued that as the State makes an exception with regard to one class they should make an exception with regard to those who are exceptionally deficient?—It would certainly be better, I think, if it came directly as a grant to the Institution for the Blind.

13,757. (*Mr. Mundella.*) Why should it not come from the School Board?—The School Board, as I understand, is for education; this is for training.

13,758. (*Chairman.*) There are precedents or analogies for that course being pursued?—Yes. I should like the Commission to notice that the money we get from parochial boards is entirely spent upon the board of the apprentices; they cost us 8*s.* 6*d.* a week for food.

13,759. Therefore they really get their industrial training for nothing?—They really have their foremen, their materials, and their tools gratis.

13,760. And they get their training for nothing until the time when they earn something for themselves?—Yes, and their industrial training has on that account been, to a certain extent, deficient in quality. There has not been the amount of attention paid to the industrial training of blind children that I should like to see given to it, and for the same reason, that in many cases they are just simply, I believe, tailed on to the fag end of the foreman's time. He is engaged in looking out material for the journeymen, and those journeymen are naturally anxious to make as big wages as they can, and they press him for their material, and the boys get the go-by, and do not receive the thorough attention which they ought to receive, and which they would receive, if this foreman, who is set apart for the training, were under proper supervision.

13,761. Do those who are receiving industrial training, after they consider that they have received enough training to earn a living for themselves, leave you and go out for themselves?—On hardly any occasion do they leave us, and if they do they invariably come back to us. We have had cases where they have gone out, and they have always found their way back again to the institution, and they have been very glad to get back. We encouraged them in every possible way, giving them loans of money, asking for orders for them in the localities, and dealing with them in very friendly ways, but they find themselves unequal to the struggle outside.

13,762. You were present at the conference of managers which was held last year at Edinburgh, were you not?—Yes.

13,763. Did you come to any conclusions with regard to these points of industrial training?—Yes, they are embodied in that report which you have before you.

13,764. The report that I have before me embodies certain decisions as to the wages; will you state what are the resolutions that you come to?—"It appeared "that the duty of the parochial board had not been "much recognised by the institutions, and it was "agreed that in future an arrangement be come to

"between the institutions and them previous to the "admission of inmates. In sending a blind person to "the institution the board have the prospect of being "in a few years relieved of all future responsibility, "while in declining to comply with the claims of the "institution the blind person is likely to become a "permanent burden on the board." That means that if the parochial board does not send in the lad for industrial training he is likely to become permanently a burden upon the parochial board.

Mr. W. Martin.

3 Dec. 1886.

13,765. Therefore you urge as a matter of economy to the ratepayers, that the blind lads should get as good an education as possible in the first instance at the expense of the ratepayers?—Yes. Then the next point is: "Should asylums undertake to find constant employ-"ment for those admitted? It should be clearly "understood by all inmates that the institutions do not "guarantee to afford constant employment to those "admitted, and that should circumstances arise to "necessitate it, they may be dismissed at any time. "The managers are bound to use every effort to secure "employment for the blind, but they should neither be "expected to receive into the institution all applicants "(when there is no prospect of being able to employ "them), nor to retain in the institution those who are "at present there, should the state of trade and of the "charitable fund not warrant it." That covers a large amount of ground.

13,766. What led you to that conclusion; was it first because it was found to be unprofitable to employ an indifferent workman in your workshops?—No, I think it arose from some of the men laying claim to permanence in the institutions, and declaring that they were entitled to be there permanently, no matter whether the managers of the institution could give them employment or get supplemental aid for them.

13,767. Would they be liable to be dismissed for any misconduct, or say for constant idleness or inattention to their work?—Either for inattention or for misconduct they are always liable to dismissal; but should the state of trade not permit of it, or should there be no work for them to do, then the institution is not to be looked to permanently to care for them, because the charitable fund would not admit of it.

13,768. How do you deal with those in the institution who are adult blind, having lost their sight in mature years, and who do not know any of the trades that the blind can profitably work at?—We endeavour to put them to the simplest trades that we have, such as mattress making, palliass making, and mat making.

13,769. Did you come to any conclusions with regard to the interchange of communications between the different institutions?—We had that question before us.

13,770. Do you think that there is any room for improvement in that direction?—Yes, there is a great deal of room for improvement. Of course the great difficulty is the disposal of our manufactured goods.

13,771. What amount of interchange and co-operation would enable you to get rid of your manufactured goods?—There has been a great deal of interchange of ideas going on amongst the managers of different institutions for many years, but I do not think that is exactly what we require. Our production is more than our power of disposal. Dr. Armitage had an idea some time ago that we should establish in London a central depôt for the disposal of the various manufactures of the various institutions. That would certainly greatly aid us.

13,772. Why not have a depôt in Scotland?—I think our Scotch depôts are doing their work pretty well. You will notice the large amount of sales effected by the four Scotch institutions as compared with the sales effected by the English institutions. There are really five Scotch institutions, but I would not call the Inverness institution one of the commercial institutions yet though it may grow to be one. It is producing to a very small extent, and I question very much whether that centre will ever be such as to maintain an industrial institution for the blind. We have with us one of the men who was sent away from Inverness, whom we took out of the Edinburgh Poor House.

13,773. Is there much competition between the different blind institutions for the sale of the same sort of goods, and do you endeavour to avoid that as much as possible?—We endeavour to avoid it as much as possible, but we sometimes come into conflict with each other unknown to each other. I had a large Govern-ment order for baskets the other day, and I found that I had quoted slightly below another institution, and I knew nothing about it until the order was fairly secured. I certainly did not quote under them that I might get it, nor do I suppose that they quoted with any knowledge of the price that I quoted, but it so happened. Then I suppose the commercial travellers of the different institutions press their sales as much as possible. Several of the institutions in Scotland cross the same ground. That was one of the questions we brought up at our meeting of managers.

13,774. Was the scheme suggested workable?—It was not workable. They thought the more competition there was the better in that respect, because we might call at one time and get an order, and the representative of another institution might call when goods were next required and secure the order which would likely be given elsewhere and run away with it if the representative of this other institution had not come.

13,775. Have you any tables to lay before the Commission?—I have prepared to some extent a table of the industries of the men in the institution. We have 38 basket-makers, of whom 28 can read raised type; there are 34 mattress-makers, of whom 21 are readers; there are 6 feather-cleaners, of whom 4 are readers; there are 19 mat-makers, of whom 9 are readers; there are 10 packers, of whom 8 are readers; there are 29 brush-makers, all of whom are readers; there are 7 messengers, who are all readers; there are 2 packers, who are both readers; there are 2 collectors, 1 of whom is a reader; there are 3 tuners who are all readers; and there is one traveller who is a reader; giving a total of 151 males, 131 of whom are able to read. Then we have eight sack-sewers, these are the wives of the men of the institution who take the work home, and it makes a small addition to their weekly earnings. Then there are 22 blind females residing in their own homes and working in Nicolson Street.

13,776. (*Dr. Armitage.*) Are those sack-makers blind or seeing?—They are some of them blind and some of them seeing. That gives a total of 181.

13,777. (*Chairman.*) Then you have also sighted supervision, and you have also some deaf and dumb on the premises, have you not?—Yes.

13,778. Do you find that they answer the purposes of the supervision of the blind?—We have not them as foremen, but we have them for the purpose of supplementing the work of the blind. I think we have six or eight deaf and dumb persons in the institution preparing the bristles for the brush department, boring the stocks of the brushes, and finishing the brushes. The total amount of the payments to the 173 blind for the past year is 5,318*l.* 6*s.* 3*d.*, of which the *bonâ fide* earnings of the blind amount to 3,440*l.* 1*s.* 5*d.* We gave in the shape of gratuity 1,286*l.* 8*s.* 5*d.*, and it is instructive to notice the method and the cause of that gratuity. The 38 basket-makers getting 1,500*l.* earned 1,207*l.* 5*s.* 10*d.*, and the gratuity given to these amounted to 93*l.* 1*s.* 7*d.*; of that gratuity 49*l.* was to pay a blind teacher. The Commission will understand that if we charge it to industry it comes from our commercial accounts, and if we charge it to gratuity it comes from our charitable accounts.

13,779. You keep the two distinct?—Totally separate. We debit commerce or trade with the value of the work done by the blind, and we give them the full value at sighted rates of what they do, and in many cases over the value of sighted rates.

13,780. Do you think it is important that the public see exactly what is given in charity and what is made commercially by the institutions?—Yes, I think it is most important, it shows the public that the blind are willing to do what they can for their own support, and it shows the public the amount of duty which lies upon them of making up to the blind the loss that they have sustained through blindness.

13,781. How would you deal with the adult blind who through infirmities or sickness are unable to earn their livelihood by work at all; what provision do you think ought to be made for them?—Few blind persons have been dismissed from our institution on account of inability to work, and that to some extent accounts for a good many of the charges against us. We continue paying some though they are only looking in in the morning and staying at home for the rest of the day. The fact is that we have never turned away an old blind man from the institution because he has become unable to work.

Mr. W. Martin

3 Dec. 1886.

13,782. But supposing the case of those who meet with an accident, and who, after trying to learn some trade, fail to learn that trade, how do you provide for them?—We make no provision for them in our institution.

13,783. Do you dismiss them?—We never admit them.

13,784. But supposing that a man has met with an accident, and he comes to you wishing to learn something, and he fails to do so, what becomes of him?—If he has been admitted into our institution; I do not remember a case of dismissal; he is moved about from one kind of work to another, and invariably settles down in some simple employment, possibly not at a very large wage.

13,785. Do you think that private charity or the State should supplement or provide means to meet the case of those who are unable to work by reason of infirmity?—There are certain funds already in the country for that purpose.

13,786. But are they large enough?—I think not. Certainly they are not large enough in Scotland. In London you have somewhere about 32,000*l.* per annum available for that purpose.

13,787. I see that there has been an endeavour made to start an endowment scheme in connexion with your institution?—I made an effort in the year 1878 to raise 10,000*l.*, 5,000*l.* of it for the education of blind children, and 5,000*l.* for the maintenance of old blind females. I am sorry to say that I have only got 1,272*l.*, or something like that. That shilling scheme, however, has been supplemented by Dr. Donald Fraser of London, who took an interest in it, and who left us a considerable sum of money. Altogether, we have somewhere about 9,800*l.* of endowment, but there is only 500*l.* of it applicable to adults. The interest upon the rest goes to the West-Craigmillar Institution for the juvenile blind.

13,788. Then, practically, there is no pension system for the blind?—There is no pension system in Edinburgh.

13,789. Do you think the parochial boards or the State should place the pauper blind in a better position than the ordinary paupers by giving them a special relief outside any workhouse?—I think that the parochial boards should at any rate be prohibited from offering the house to respectable blind persons, and that they ought on all occasions to give them outdoor relief. I am not prepared to say whether the State or the parochial boards should be held responsible, but I should imagine that the parochial boards would be better able to supervise it, because they have the whole machinery in motion already, clearing it of the brand of pauperism by a special order to the parochial boards to give relief to blind people. Then this gratuity which I stated at 1,283*l.* would be very largely reduced if we had more trade or fewer hands. In the bedding department, for instance, there is no difficulty in a blind mattress-maker earning 24*s.* a week at sighted rates; he can do it in Aberdeen, and he can do it in Dundee, where they adhere strictly to piecework; but it cannot be done in Edinburgh, because we have too many men, and we pay them a set wage, and they do what work we have coming in. We have a very large amount of work, but not sufficient to keep them in employment.

13,790. What is your set wage?—14*s.* 6*d.* per week. Then also one great difficulty that we have is finding employment for the female blind.

13,791. Beyond, I suppose, knitting and sewing?—Beyond knitting and sewing. The same observations that I made about the men for training in the department for the males would apply in the case of the females, and they might produce good workers amongst the females in several departments, especially in brush making or chair caning, or fine fancy knitting; and possibly other trades might be got if it were not for the trade jealousy which surrounds every adventure of the sort. It is associated especially with our institutions, and you cannot help it; you cannot dissociate trade jealousy from the working of institutions for the blind. On that account I should consider that they would be to some extent safer with Government aid than with public aid. Many persons refuse to subscribe to a Blind Asylum because in disposing of the manufactures of the blind they compete in trade.

13,792. (*Mr. Mundella.*) It would be a very small part of the public that would refuse on that ground, I suppose?—No, I know a good many in Scotland.

13,793. (*Chairman.*) You spoke of having Government contracts; I suppose those were obtained by open competition?—By open competition. We had an order from the Government for a small number of brushes at a fixed price, a very low price; and those can only be brought out by employing females. Of course they could be brought out by calculating female labour and paying them at the rate of men's labour, which is double the rate that is paid to females.

13,794. But by calculating it as ordinary female labour you are able to put it at a lower figure?—Yes. The Belfast Institution has also an order, and Mr. Hewitt wrote to me saying that by female labour he could bring it out; but it shows that there is a field for female labour if we had a teacher and thorough supervision, accompanied of course by aid from the Government in the industrial department.

13,795. In your opinion of course the blind do much better in an institution like yours than they can do at their own homes?—Certainly.

13,796. In point of fact it would be impossible for them to get the orders that you are getting now if they were working isolated in their own homes?—Certainly they could not get these large orders. We are making somewhere about 800*l.* worth of baskets for the Post Office, and in that even we have sub-divided the labour. A sighted man does a bit of the basket and a blind man does the rest.

13,797. Is there any jealousy about the employment of a seeing man in a blind institution?—No, not with us, and for this reason: that our blind basket-makers are trade unionists, and they happen to be the majority of the trades union, and if any question of wages comes up the blind men have simply to go in a body, and swamp the rest and carry the matter.

13,798. In Edinburgh?—In Edinburgh. The blind men are in the majority of the trades union of the basket department. They are paid by the sighted book; we take the sighted basket-makers' book for their rates.

13,799. (*Mr. Mundella.*) And they do what they can to raise the rates I suppose?—They do undoubtedly. One difficult question was in the case of a small Christmas basket for which 6½*d.* was paid, and it was very keenly cut; I could see no profit, I could only see a loss out of it. I said "Sixpence ought to be the price "for making that"; they said "no." It went to the trade, and the trade held that 6½*d.* was the price of it. One of the sighted masters instantly sent the basket over to Germany and flooded the market last Christmas at 9½*d.* with the same basket; the basket that we were wishing to get 1*s.* for, and for which we were getting 1*s.*, and if we had got it to sell at 1*s.*, this opposition would not have been started.

13,800. (*Mr. Arrol.*) I thought you made a general statement in respect to the apprentices; does that apply to all institutions that you are conversant with?—Yes; from my own observation I should say that more careful training of apprentices is absolutely necessary everywhere.

13,801. I rather missed the figure of the money that you have given the blind during the last year?—5,318*l.* 6*s.* 3*d.*

13,802. You have stated, I think, that the direct wages were 3,440*l.* 1*s.* 5*d.*?—The value of the labour was 3,440*l.* 1*s.* 5*d.*

13,803. And you have given in the shape of gratuity 1,286*l.*?—1,286*l.*, and 213*l.* 11*s.* 3*d.* for sickness or old age, 58*l.* 13*s.* 5*d.* for holidays, and 424*l.* 3*s.* 4*d.* for clothing to men.

13,804. (*Dr. Campbell.*) Does that provision for sickness mean that it is wages paid while men are unable to work?—Not wages, gratuities. Then there is 346*l.* 19*s.* 4*d.* from parochial boards.

13,805. (*Mr. Arrol.*) What is the reason why parochial boards should give you such a large amount?—I think it is a very small amount. That is given in some cases for apprentices. There is a collier who lost his eyesight in a pit 22 years of age; he has been two years in the institution, and the parochial board paid 8*s.* 6*d.* per week for the first year and reduced it by 6*d.* the second year.

13,806. Is that all included in the gratuity?—No, those are added to the gratuities.

13,807. Should they not be embraced in the gratuity because they are given from a benevolent point of view?—The gratuity is given by the institution and is debited to the Charitable Fund; it is the same with the sickness and the holidays; and the parishes have a cross entry; it comes in and goes out.

13,808. Then the general wages average about 29*l.* a year?—

13,809. You said that there were 38 blind in the basket-shop; how many sighted have you employed there?—Usually we have one foreman and a man who gives half his time for training, and two sighted workmen. At present in the basket department we have 12 additional sighted workers because of the extra hurry in getting out that large order. In the brush department we have one foreman and one warehouseman; we have two bristle-dressers, one of them deaf and dumb; we have two borers, one deaf and dumb; one hand at the pitch-pan, and one fininisher deaf and dumb.

13,810. In the mattress department you employ 34 blind; how many sighted have you?—We have two sighted females who do the cutting; all the rest are blind.

13,811. Then for the 173 blind, how many sighted do you employ?—In all connected with the institution we have, including the 12 extra basket-makers and the six deaf and dumb, a total number of 68 sighted persons.

13,812. What is the number of sighted employed to direct and assist in every way the working of those 181, including the deaf and dumb?—In all 56 sighted workers; we usually have 44, but we have 12 additional at present on account of emergency.

13,813. (*Mr. Mundella.*) Those 12 whom you have called in are not necessary for the conducting of your ordinary business, I suppose?—No. We have at all times a number of workers who are paid for their work without being chargeable upon the work of the blind at all. The oversight is very small. In the brush department there is a little.

13,814. They supplement, I suppose, the work of the blind?—Yes.

13,815. (*Mr. Johnson.*) Are they sighted supervisors?—Not sighted supervisors, but sighted supplementers, working some of them apart from the blind altogether.

13,816. But they are, I suppose, working in the blind shops with the blind and upon the blind work?—In the shops, but not on blind work.

13,817. (*Dr. Campbell.*) I suppose they are employed to do certain things which the blind cannot do?—Quite so. We never allow a sighted person, except on a great emergency, to do a bit of work in the institution which can be done by the blind.

13,818. In your view, by employing these sighted men you are able to keep a great many more blind men employed than you would be able to keep employed if you did not employ sighted people?—Yes. Those 56 sighted workers include the lady clerks (our clerks are all ladies; the head clerk is a lady); and the salewomen, and the travellers, and the whole of the staff of the office.

13,819. (*Mr. Johnson.*) For which you pay 1,027*l.* 11*s.* a year?—Yes, and the manager's salary.

13,820. You say on page 17 of your report for 1885. "wages paid 617*4l.*," and then I see "salaries to manager, clerks, shopkeepers, and travellers, 1,027*l.*"?—Yes.

13,821. (*Mr. Arrol.*) Can you state the amount of wage which is paid to these 44 sighted labourers?—No, I cannot; it varies from 8*s.* a week up to two guineas.

13,822. In taking your stock at balance time, do you return it at cost value or at market price?—I do not suppose that any wise man would take it at market price. We take it at nett cost, and anything that has in the slightest degree depreciated in any way we throw on one side and do not enter it at all; if we get anything for it in the course of the coming year it goes to profit, but if we give it away in presents it will not injure our balance sheet.

13,823. Your sales last year amounted to 26,422*l.*; how much of that was for purchased goods?—A very small proportion.

13,824. (*Mr. Johnson.*) You have "Cash sales, 3,000*l.*"?—That is ready money.

13,825. (*Mr. St. John Ackers.*) We have had it evidence that your school at Craig Millar was inspected by a Government Inspector, and that a grant was given because you had a certificated teacher, and that it amounted to 19*s.* per head; can you tell us whether there were any deductions, and, if so, from what cause?—There were deductions for five girls in English literature, because they did not take domestic economy. I think it came to 22*s.* in 1886.

Mr. W. Martin.

3 Dec. 1886.

13,826. What amount did you get per scholar from that Government inspection, and how was it arrived at?—We got 39*l.* 14*s.* for 36 scholars, 22*s.* 0½*d.* each; arrived at by the ordinary examination of board schools.

13,827. You spoke of the possibility of employing a large extra quantity of female labour profitable if certain things were done which you mentioned; would that necessitate a boarding-house for those females as you have for the men workers, that is to say, could they live at their own homes and come to the factory or workshop; or would it necessitate either there being an institution for the work where the females were boarded or a separate boarding-house?—Of course that is a very difficult question indeed. I generally hold myself that if a blind female can live with relatives she ought to live with them, but if she cannot live with her relatives it is much better for her to be boarded in an institution, and I would say that they themselves prefer it.

13,828. But you said that you were yourself, as I understood, as manager of this institution, prepared to largely employ female labour; how would you do it?—By boarding them, except in the case of those who would reside with their relatives.

13,829. (*Admiral Sir E. Sotheby.*) You stated that you have had contracts with the Government; could you say whether you lose by them or make by them?—We do not make anything, and I do not think we lose anything.

13,830. Have you a large accumulation of stock in hand arising from the return of what you make?—We have; we have a considerable number of brushes in stock.

13,831. What is the per-centage that you think you get returned?—It varies very much.

13,832. What is the average?—I have not made any calculation of the average.

13,833. Is it a considerable quantity?—Yes, going over a number of years it has accumulated.

13,834. What do you do with that stock?—We dispose of it at lower prices.

13,835. Have you any difficulty in disposing of it?—In some one or two kinds of brushes we have a little difficulty.

13,836. I suppose that these brushes are of a Government pattern?—They are of a Government pattern, but they are being largely used in Scotland now, and they are indeed asking for them.

13,837. You stated that you had just received an order from the Government; was that for baskets?—For brushes.

13,838. What sort of brushes?—Brushes that are used for brass buttons.

13,839. For the soldiers?—Yes.

13,840. Will you lose much by that?—No, we make a profit upon that. I telegraphed for the cost price of them before I would accept it to-day.

13,841. Do you know at all what is the amount of rent that the blind people pay who live outside the institutions in Scotland?—I personally become guarantor for all the rents of the blind men in the institution, and as a body they become guarantee to me for any deficiency. In the event of a deficiency we make a levy upon the whole of them; so that it is a sort of mutual guarantee society. But during the time that I have been guarantor, somewhere about 20 years, there have been only three failures, and we have not had one levy.

13,842. But can you say how much they pay for a room in Edinburgh, for instance?—Rising from 6*l.* 10*s.* a year to 15*l.* a year.

13,843. (*Mr. Mundella.*) For a single room?—For two rooms, but they will be very small.

13,844. (*Admiral Sir E. Sotheby.*) You pay extra wages; how do you augment those wages; is it a percentage on the work actually done or is it given out as a dole?—It is given out more as a dole than as a percentage. We have endeavoured to arrive at an exact per-centage system, but we invariably fail.

13,845. If a man earns 12*s.* it is easy enough to calculate the per-centage upon it?—If a man earns 12*s.* and you give him 50 per cent. he will get 18*s.*, but if he

Mr. W. Martin.
3 Dec. 1886.

only earns 5s. and you give him 50 per cent. upon that he is not able to live upon the 7s. 6d., and you must increase it. But the man who gets the 18s. can do with 15s., so that you can reduce the augmentation to him and give it to the other.

13,846. But would it not rather have the effect of making a man work more if he knew that he got a per-centage on his work?—Yes, undoubtedly.

13,847. Does not your system tend to pauperise them more if a man knows that he will get so much whether he earns 5s., 6s., or 7s.?—But is he not pauperised in the same way by getting the money for which he has not wrought, whether it is in per-centage or in dole? He does not get it whether he works or not, he only gets it of his necessity.

13,848. Have you dismissed any people owing to your not having work for them at any time?—No.

13,849. What do you consider the most profitable trade for your blind men?—For the men themselves basket-making is the most profitable trade, without doubt.

13,850. And there is a very good living to be got out of basket-making?—Yes.

13,851. You say that you got a large order from the Post Office for making these baskets; do you gain anything by that order or do you lose?—We gain. Amongst our 38 basket-makers, two have 32s. 6d. per week. Those that earn 32s. 6d. have very little gratuity.

13,852. (*Dr. Campbell.*) Are they entirely blind or only partially blind?—One is totally blind and the other has a very little bit of sight, but not enough to see to read; he can get about, but that is all.

13,853. (*Admiral Sir E. Sotheby.*) Are you aware of any blind people outside your institution who are getting a livelihood by trade?—I know a few who are getting a livelihood by trade, but I do not know whether they are working for all they are getting. I know a number of people who are going about selling tea, and they are said to get a living.

13,854. But I mean by the trades that they have learnt, such as basket-making?—No. One basket-maker has left our institution who is making a living, but he became a financier.

13,855. (*Mr. Mundella.*) What do you mean by a financier? — That is his explanation of it; he was loaning money at 60 per cent. to his poorer friends.

13,856. (*Admiral Sir E. Sotheby.*) What do you do with your surplus stock?—We endeavour to get rid of it as quickly as possible. Our stock has not been increasing for a number of years back but rather decreasing.

13,857. I see that there is 15,000*l.* put down as being spent in material. Is that the raw material?—It is; that shows you how little is purchased manufactured.

13,858. But you do sell a large quantity that you purchase outside, do you not?—Not a very large quantity.

13,859. Do you consider that it is an advantage to the blind to sell goods made by the sighted?—So long as you adhere strictly to articles connected with their departments, but if you go beyond it you injure the institution.

13,860. (*Mr. Mundella.*) One helps the sale of the other, I suppose?—Yes; for instance, if a lady wants two baskets, one of which may be a laundry basket, she will not come to us for one and go to another shop for another if she can get both in the same shop.

13,861. (*Mr. Johnson.*) That is why you have to keep fancy baskets which you do not make yourselves?—Yes, German fancy baskets.

13,862. (*Admiral Sir E. Sotheby.*) Are those the only things that are made outside that you sell in your institution? — We sell bedsteads in order to sell the bedding.

13,863. Do you think that mattress-making is the most profitable work for the women?—For the women and for the institution. The women make the cases and the men fill them; but we find that female labour is beginning to compete with us in that, especially in Glasgow. They are making straw palliasses in Glasgow by female labour and selling them at a very low price.

13,864. Are you aware that sighted wages have been reduced in Edinburgh, and if so, will not that affect you very much?—I am not aware of any reduction having taken place lately, but we should follow in the price of work if there were any reduction.

13,865. (*Mr. Johnson.*) You follow the sighted price outside?—We calculate all the labour. In the basket department we are almost necessarily paying at the same rate as the sighted labour.

13,866. But in other trades you use your own judgment?—Yes, we pay a set wage and use our own judgment, invariably, however, keeping a note of the value of the men's weekly work.

13,867. Do you think that blind people can profitably work in their own homes?—I do not.

13,868. From what you say, I gather that all the workpeople employed require a subsidy?—All the people employed in our institution have a subsidy of one kind or the other; I do not say that they require it.

13,869. But they get it?—We give them a suit of clothes all over every year, and a pair of boots, and an odd shilling or two. It is an old custom and we continue it.

13,870. As I understand, you supplement the wages in an ordinary way up to 14s. or 14s. 6d. per week, that is to say, if a person can only earn 8s. per week by honest labour you make up the difference so that he can live upon it?—Not to the apprentices, but to the workers, yes.

13,871. The apprentices of course are *in statu pupillari*; you only pay them according to their progress, or rather deduct from the weekly payment made by the parochial board, or their parents, according to their progress, but all the people who are actually workmen in your establishments are more or less subsidised?—Yes.

13,872. Then it is your opinion that generally blind people cannot support themselves by their work without subsidies?—There are notable cases of men who have supported themselves without any subsidy.

13,873. Do you think that the generality of them could not support themselves without subsidy?—Certainly they could not.

13,874. Supposing that the State or any individuals were to start workshops for the blind, even in London, or in Edinburgh or Glasgow, or in any of the great towns, do you think that the blind there would be unable to support themselves by their labour and would still require a subsidy?—Do you mean the State supplying the buildings?

13,875. The State supplying what you supply, that is to say, the buildings and the supervisors; you find the building, you find the supervisors, you find and select the materials, you train workmen, and when the workmen have become good workmen they cannot be self-supporting except by your aid. I want your opinion upon this because there is a question before the country now, whether it would not be a desirable thing to establish workshops for the blind throughout the different centres of England and Scotland. If such workshops were established, do you believe that the blind people could earn their living there without subsidies?—I have already answered that question. May I ask if you mean that the Government should take over the direction of the institutions and take them all into their own hands?

13,876. Supposing that workshops were established throughout the length and breadth of the land, do you believe that blind workpeople could support themselves without a subsidy?—They must have a subsidy as a rule, but there are notable cases, and there will be notable cases of blind men who would scorn to take a subsidy.

13,877. You say that your pupils mostly return to the institution if they find themselves unable to support themselves outside the institution; is that very generally the case?—That has been invariably the case with me.

13,878. And they are people who have been trained in your institution and cannot succeed outside?—Yes.

13,879. With regard to the difficulty that you find in the markets, we hear that some of the material is sold in other parts of Scotland; you have told us of mattresses for instance, how is it that you have a difficulty with the markets, and have so large an accumulation of stock?—We have not a large accumulation of mattresses, for this reason, that we do not make them up until they are ordered. More than one half of the stock is material for manufacture.

13,880. Not made up?—Not made up.

13,881. Then it is material that you could get rid of in a moment?—If you liked to throw it into the market you could get market price for it.

13,882. Then you have not a large manufactured stock?—Somewhere about half.

13,883. About 5,000*l.* or 6,000*l.* worth?—Yes, about that.

13,884. In what particular branch of the trade have you most manufactured stock?—Chiefly in the brush department, it is the most expensive department in which institutions for the blind can engage.

13,885. When you have not orders do you still keep your people working?—In the brush department we do.

13,886. And you thus accumulate stock of which you have no reasonable chance of getting rid?—We should be very foolish to go on making up stock that we had no reasonable chance of getting rid. We should stop doing that..

13,887. When you have a large stock of brushes do you reduce the time, or do you discharge hands?—We discharge sighted hands, but no blind hands.

13,888. Then the blind hands are going on at the ordinary wages whether you have a sale for the material or not?—I would discharge the hair hands and put the blind men on to working the fibre, and in that way carry them on for a time working at a low-priced article, such as scrubbing brushes. We have just gone through that experience, and we have now started off with our hair hands again.

13,889. Do you ever reduce the time at all when you have slack trade?—We have not done so in my experience.

13,890. Do you think that is a desirable thing?—I say it advisedly for myself, no, when your stock grows you ought to put on more energy in selling.

13,891. Do you find that the employment of travellers is a good way of getting rid of your stock?—We have a blind traveller who has placed 1,300 orders in our books this year.

13,892. Do you think that blind men have a greater advantage than sighted men in becoming travellers for a blind school?—Some of them, but this lad of whom I am speaking will not leave your warehouse without an order. He is persistent and insistent. But there are other blind travellers who would not succeed.

13,893. I asked a question just now of the last witness about music and I was referred to you. I see that you have four pianoforte tuners employed at your institution; do you know what they earn?—One is in full employment earning thirty shillings a week.

Mr. W. Martin.
3 Dec. 1886

13,894. And he gets something from the institution, does he not?—Yes.

13,895. And you take the risk of whether he makes anything or not?—We take the risk.

13,896. What are the other three doing?—They are partially at home and partially idle.

13,897. Where were they educated?—They have all been educated with us. We sent out one tuner some time ago who is taking up a large portion of our ground. He came to us from New Zealand unable to do any tuning; and after being 15 months under training started in business on his own account, and I am glad to say that he is able to make 200*l.* a year if not more by tuning.

13,898. Does he combine anything musical with that; does he teach the piano or the organ?—No, he does no teaching; he simply does tuning and selling pianos on commission. We have sent out several who are doing fairly well; we sent one to Dundee not long ago, he is a very good tuner, remarkably steady good lad, and has begun well. We sent one north to Thurso, who is doing very well, and we sent one to Kilmarnock who is doing very well too.

13,899. Were any of them sent to any other institution or college, or did they entirely get their education at your institution?—Entirely with us.

13,900. What is your opinion with regard to music as a means of support for the blind generally: do you think that it is a good *métier* for them?—That is a wide question, and it is one that will require a very large amount of care and judicious treatment. I do not think it will do for us to make the public believe that all the blind are musical, or that all the blind will ever become musicians. I believe that it is with the blind as it is with the sighted, that the musician is born and not manufactured. Amongst the sighted it is only one in a thousand so to say that rises to proficiency, and it will be the same I believe among the blind. As I have said again and again I am often afraid that if you do not educate the blind in music sufficiently they will be under very great temptation. That is not to say that we are not to endeavour to do it, and if it can be done, to do the best we can for their good; but to imagine that you will get a very large proportion of the blind to be able musicians, or able to earn a livelihood by it, I think is a mistake. Those who do become able musicians will undoubtedly make a fair income.

The witness withdrew.

Adjourned to to-morrow at 11 o'clock.

6, Old Palace Yard, S.W.

Saturday, 4th December 1886.

PRESENT:

THE RIGHT HON. THE LORD EGERTON OF TATTON IN THE CHAIR.

THE RIGHT HON. SIR LYON PLAYFAIR, K.C.B., M.P.
ADMIRAL SIR E. SOTHEBY, K.C.B.
W. TINDAL ROBERTSON, ESQ., M.D., M.P.
B. ST. JOHN ACKERS, ESQ.
T. R. ARMITAGE, ESQ., M.D.
W. AUCHINCLOSS ARROL, ESQ.
E. C. JOHNSON, ESQ.
THE REV. W. BLOMEFIELD SLEIGHT, M.A.
THE REV. CHARLES MANSFIELD OWEN, M.A.

CHARLES E. D. BLACK, ESQ., *Secretary.*

Mr. WILLIAM MARTIN further examined.

13,901. (*Rev. W. Sleight.*) With regard to the school you employ a certificated master; does he require a larger salary than a non-certificated master would require?—Of course a certificated master will always command a higher salary in the open market. Our master has 100*l.* a year, and 10*l.* for gymnastic instruction, which he gives in his own spare time, and he has a portion of the Government grant over and above that.

13,902. What was the full amount earned by the Government grant?—It is stated in the report to be 21*l.* 6*s.* 6*d.* A member of the Commission yesterday thought that we had not stated that in our report, it is in the report at page 18. I wish to state that there were three failures of children who were to some extent either imbecile or weak-minded, and who had become so I believe principally in consequence of neglect in early youth. Mr. Sime desired me to state that the expense at Craigmillar must be spread over the whole of the inmates and not over the scholars only, because the females there are eating up the food as well as the blind children.

Mr. W. Martin.
4 Dec. 1886.

13,903. At the workshops you employ several that are deaf and dumb?—Yes, we employ a deaf and dumb painter; two girls at sewing one of whom is deaf, dumb,

Mr. W. Martin.

4 Dec. 1886.

and blind, she can mutter a little, that is all; then we employ two hands at boring, one at hairdressing, and one at brush finishing; and we shall gradually extend that as we find opportunity, dispensing with the services of full sensed men.

13,904. Do the deaf and dumb require any subsidy for their work?—No.

13,905. Can you state what they are able to earn?—From 21*s.* to 30*s.* a week, except the girls of course.

13,906. How do the deaf and dumb communicate with the blind?—By the fingers.

13,907. Have you seen the Government statistics of the blind?—Yes.

13,908. Do you agree with those furnished from Glasgow?—I have seen statistics which give a larger number of blind people than is given by the Government statistics. I think that is caused by re-duplication.* In one of the reports you will find that the workers in the Glasgow Blind Asylum are included in the list of the Glasgow Mission, and there are a number of our workers included in the list of the Edinburgh Mission, the same I believe also applies to Dundee. That I believe is the explanation of the larger number in the statistics to which I refer as compared with the number given in the Government statistics. I believe instead of increasing, blindness is decreasing. I think that the census is perfectly correct in that respect. I should not doubt the census because I understand it is taken by parties who are upon their oath.

13,909. (*Dr. Armitage.*) Mr. Sime proposed that the Government should give a 5*l.* capitation grant for the education of children of school age, and that 5*l.* should be paid by the parochial boards. In what way do you think it would be desirable for the Government to assist school for blind children, yours among the number?—In America the Government not only build schools for the blind, and supply them with all their special apparatus, and give them a grant of books but they also pay from 40*l.* to 60*l.* per annum for each blind child. That means the State taking the entire supervision of the blind, and relieving the charitable public of their obligation. It does not seem to stop voluntary effort, because they seem to get legacies notwithstanding in America. I should not consider 5*l.* an adequate grant from the State; we should require 10*l.*

13,910. Independently of the sum to be given, what do you think would be the best mode in which the Government should assist blind schools, in order not to perpetuate bad schools, and in order not to stop charitable contributions from flowing in. Taking those two things into consideration, what would you advise?—I should say first of all, there should be a special grant for technical apparatus and educational appliances, and a continued supply of books, and thereafter, I suppose, payment by results.

13,911. Would you make such a grant for technical apparatus and educational appliances a fixed grant *per caput*?—I think a fixed grant *per caput* would be much better than any other arrangement.

13,912. If a school contained 100 children it would get double the grant that a school containing 50 would get; is that the arrangement that you would recommend?—No, I am afraid that that would not do, because a school with 50 pupils might require the same apparatus as a school with 100. You would want the same gymnastic apparatus and the same swimming bath.

13,913. Do you include gymnastic apparatus and swimming baths in the technical apparatus?—Yes, and Kindergarten apparatus. I believe the introduction of gymnastic apparatus and Kindergarten work to be at the present moment at the very foundation of the salvation of our blind people in every respect, not only educationally, but technically.

13,914. What in your opinion would be the best way for the State to make a grant for educational apparatus?—Certainly by means of its own committee, advised by its inspectors.

13,915. You could not suggest any fixed rule to be followed?—I do not see how we could suggest a fixed rule as to the amount for the apparatus, because, as I have pointed out, a small number might require the same apparatus that would be suitable for a large number.

13,916. Would you suggest that each school should make a requisition of its wants, and that the Government should deal with each case separately?—Yes, I would suggest that each such school should make a requisition to the Committee, and that the State should supply each school separately according to its wants.

13,917. What do you refer to when you say a Committee?—I would expect that a permanent committee for the education of the blind would be established. The Government could not properly deal with the education of the blind unless they established a special department; they could pin it on to the Education Board, if they chose, but I believe it would be absolutely necessary to have a special department for the education of the blind.

13,918. (*Chairman.*) You mean that some sort of inspectors should be appointed?—That there should be a branch in the Education Department for the blind.

13,919. (*Dr. Armitage.*) In your opinion there ought to be a special education department which should overlook the education of the blind?—Yes, and then that the whole education of the blind in the kingdom should be laid hold of and kept hold of and be supervised by that committee or department. I do not believe you will ever attain to satisfactory results in the education of the blind without some such arrangement as that.

13,920. And you would propose that each requisition of the schools and of the workshops should be referred to this sub-committee of the education department?—Yes. With regard to the education of blind children in separate schools, I should like to make a brief statement which has been suggested by my friend Mr. Johnson, in explanation of what I presume has been considered a change of position on my own part. At a very early period I took up the idea that blind children could be satisfactorily educated at sighted schools, and I advocated that very strongly. I had a good deal of communication with a number of schoolmasters in Scotland, and I sought to prompt them to pick up blind children, and to educate them with the sighted. To some extent I was successful. I found here and there an enthusiastic schoolmaster who was willing to devote his time to the education of the blind in his school, but in 1873 I had occasion to be present at the Conference in Vienna, and there I saw the improved apparatus used for the blind, and I saw also the Braille system, which I consider of inestimable value to the blind, and when I came home and came to compare the blind schools which then existed with the blind schools of the continent, and came to consider what blind schools ought to be, I felt that we could no longer continue the education of blind children in sighted schools, and that we must certainly improve their education in the blind schools. I do not believe that blind children will ever be satisfactorily trained in sighted schools. I think that the experience of the London School Board points in that direction, because they have appointed special blind teachers scattering them over the City, to teach blind scholars collected in various classes. When I say what I do about the Braille system I do not depreciate any of the other systems of printing for the blind; some of them have done a very great deal of good in this country; as a Christian man I should do wrong if I were to depreciate the good which Moon has done. At the same time, looking at it from an educational point of view, I would say that the Braille system is unquestionably the system which must be introduced, taking it in all its ramifications, in its music, in its means of inter-communication with the blind, and now in the facilities that it gives of transference, by means of the Remington Type Writer, from the type of the blind to the type of the sighted. You can immediately make that transfer by means of a Remington machine by putting the Braille on the keys of the Remington Type Writer, and so allow a blind child to correspond with his friend. Then there is also the Goldberg system, which is very easy of acquirement. You will pardon me for saying that the development of the education of the blind depends more on the enthusiasm of the master and other officers of the school than it does upon the missionary. We have had in Scotland very good-hearted men engaged in the work of the education of the blind, but in Edinburgh we have only just now got an enthusiast to go to work, and it is progressing by leaps and bounds. I have not yet entered upon the question of the comparative expense of teaching in special schools and teaching in sighted schools; but I do not think you will ever satisfactorily teach and train blind children without bringing them together in special schools. The necessity of doing so

* This is denied by Mr. MacDonald.

Mr. W. Martin.

4 Dec. 1886.

is the greater considering the class from which blind children specially come, they do not all come from the upper classes, most of them I believe come from the lower classes, and to dissociate them from their relatives is oftentimes a very great blessing indeed, if that were possible. I am open to all the arguments about breaking up household ties. I am very much opposed to that, but I hold that where you cannot satisfactorily accomplish the work without doing so, of two evils you are bound always to choose the least, and, therefore, I would rather separate the children from their parents than allow them to go in a state of flabby ignorance, such as they do go in. Then, in pressing the Kindergarten system, I want to say this, that I believe that it is in very earliest youth that blind children are spoilt. I believe we cannot too soon lay hold of them. The other day I offered to take in a child of two years of age, and make it the baby of the institution, because a baby begins to learn from its mother's nod and smile, and the sooner we get hold of children, linking them on to the Kindergarten system, the better.

13,921. To resume the former question, we have now dealt with what you think ought to be done with regard to the educational apparatus, and the technical apparatus in schools. Would you advise the State to give any other assistance to blind schools?—You must have assistance in some way, you must either have it from the parents, or from the parochial boards, or from the State. I say always from the parents if they are able to pay, never from the State, nor from the parochial boards, till you have exhausted the parental duty; hereafter I should say assistance should come directly from the State.

13,922. By a capitation grant from the State or by the results of examination?—The grant would have to be given by the results of examination, and according to the necessity of the case, because you must ascertain first, whether the parents are able to pay for their children, and thereafter fall back upon the State *in loco parentis*.

13,923. Supposing that in a given case no assistance was forthcoming from other quarters, and the State was called on to assist the child, do you think it desirable that that assistance should be given simply because the child was in a blind school, or would you think it better that it should be given on the results of the training as tested by the Government Inspector?—The education grant should come I think as the result of the education test, which education grant might be divided among the teachers, but a special grant ought to be given for the teaching and maintenance of the blind child, of I should say not less than 10*l.* a year.

13,924. Do you think that it would be safe to do that irrespective of the progress the children were making in the school, would you subsidise good schools and bad schools alike?—Certainly, I would only subsidise schools that came up to certain requirements.

13,925. How would you test them?—By inspection.

13,926. (*Chairman.*) Do you mean general inspection?—Yes.

13,927. You would not have payment on educational results only, as in an ordinary school?—I thought that that should remain as it is, it comes to a very trifling sum, it comes to about 1*l.* a head. I thought that that should remain as an incentive to the teacher for bringing forward his pupils, but that the Government should give a special grant for education of the children.

13,928. On a general inspection of the school?—Yes.

13,929. (*Mr. Johnson.*) Have you any experience with regard to school work?—I have taken an interest in schools from my earliest connection with the Blind Asylum, not as teaching children to read, but as watching all the details of their instruction, and especially their technical instruction. I published a pamphlet some time ago on the Kindergarten system for the blind urging its adoption, and I had a great deal of correspondence with all the Governors of Institutions all over the world regarding the education of the blind. Education is not my special forte, but I do not suppose that it requires a man to make it his special forte in order to see that children are being properly trained.

13,930. (*Dr. Armitage*). Then if you think it best that Government aid to blind schools should be given accordingly to the state of the schools as tested by proper Government officers, do you think it desirable that the same code should be used in inspection and examination as is used for seeing schools, or do you think it desirable to make any modification?—The codes of sighted schools seem to be daily changing, I believe there has been a change recently in the School Education code, and I am not sure how far we would be able to conform to that, but I think it would be a pity to depart from the ordinary code in the case of blind children.

13,931. You know that the code does not include Kindergarten work but it does include drawing?—Yes, I know the code does not include Kindergarten work, and I know the difficulty that our teachers will labour under in working forward the Kindergarten system, but I think that the Kindergarten system is such that it can come in in the hours of play, you can be conveying instruction to children when they are amusing themselves, and in that respect there is a great benefit in special schools as contrasted with ordinary schools. In an ordinary school the child is out in the street or loafing at home, in the other school he is enjoying himself and during that enjoyment is getting education.

13,932. To pass from the school to the workshop, have you given any thought as to how the State can best assist the blind in their technical education, the education that they receive after they leave the elementary school and become apprentices and learn trades?—Hitherto, as I stated yesterday, the blind have not received that amount of special instruction and industrial training which they require. As I said yesterday they have only the fag end of a foreman's time, or a third portion of a man's time, simply because the institutions cannot afford to pay for more instruction. I believe the managers of all institutions will homologate what I say in that; I do not throw brick-bats at any one of them; if I did I should have to throw them at myself as well. I do not cast any slur upon any institution when I say that the technical instruction is not what it might be. From the necessity of the case we have not been able to appoint and pay special instructors as we should have done. If we had been able to do so, I believe we should have produced much more satisfactory industrial results, and that the claim upon our charitable funds would not have been so large. That state of things would be met by the Government giving special grants to institutions on results of industrial training.

13,933. In other words you would extend the school age from 13 to what?—In our case the children do not leave the school department till they are 16, and I never found a boy take heartily to industrial training until he was 16; he does not seem to realise that the world is in front of him till he is 16; if we take them earlier they seem to look upon it as play, but at the age of 16 he seems to realise that he must do something for himself, and he gradually gets into work and into harness properly; so that at 16 I should begin the industrial training and give payment by results to the institution.

13,934. That is to the technical schools?—Yes.

13,935. You would pay them by results in the same wages you would pay the elementary schools?—Yes.

13,936. By inspection on the part of a Government department?—Yes.

13,937. Then to follow the blind on in life; we will suppose that they have passed the school stage and the apprentice stage and have become workmen; do you think it desirable that the Government should extend any further aid after apprenticeship stage is passed?—It seems to me that you must leave something to the general charity of the public, and I think that is the stage at which the charity of the public ought to come in to help in institutions; if a Government grant were made to the adult blind, it would be a very difficult matter to distribute it; you *could* certainly give each blind man a pension direct through the Post Office, whether he was able to work or not, but you might be giving in many cases to men who least required it, and you might not be giving sufficient to the men who most required it. That has always been the difficulty in institutions; it is not possible to adjust that by results. If you give a man a pension of so much per cent. on his earnings then you are manifestly giving help to the man who least requires it, and withholding it from the man who most requires it.

13,938. You stated, I think, that in your opinion one of the principal difficulties in the way of workshops is to get an outlet for the work?—Undoubtedly.

13,939. You have had from time to time large contracts in Edinburgh from the Government?—Yes.

13,940. Do you think that the State could assist the adult blind by making it more easy for blind institu-

Mr. W. Martin.

4 Dec. 1886.

tions to obtain such contracts by giving a preference to blind institutions for those things that they can do?—In considering that of course I have to put myself in the place of Mr. Nepean, and in his place I should at once find myself in a great difficulty; I would not know what price to pay for the articles unless I asked for tenders. I must know what other manufacturers are willing to make the brushes for, but having done that I daresay in the exercise of my undoubted prerogative I would feel inclined to give the same price to institutions, and say to them, if you can give us 50,000 brushes at such and such a price, certainly I would be very glad to have them.

13,941. (*Rev. C. Mansfield Owen.*) At the price of lowest tender?—The Government is not always bound to accept the lowest tender. If the notion gets abroad that the Government in the matter of contracts are favouring any party it naturally creates discontent. It is quite human nature that a brush maker who employs sighted labour, and who, having tendered for Government brushes, finds out, as he will find out by ways and means which we do not understand, what prices are given by the Government to institutions for the blind, and discovers that they are paying more to institutions, will say, we are being taxed on all hands. We are being taxed to maintain the Government, and now the Government is spending our money in subsidising institutions for the blind. So I suspect, as a matter of business, you must look only to get your business prices; if you wish to get contracts you must become contractors, and compete with the sighted; hence the necessity for the institution being provided with charitable funds, to supplement the wages of the blind worker, and that I think has all along been my strong position in reference to institutions; you must clearly define between trade and charity; you must make that definition for the sake of the institution, and you must make it for the sake of the independence of the blind man himself. There is no good in my paying a blind man at a high rate, and allowing him to go and say that is his wages; you can only pay him his wages by calculating his wages at the ordinary rate, and thereafter, if necessity requires it, adding a bonus.

13,942. (*Mr. Johnson.*) In the form of charity?—We would rather call it supplement.

13,943. (*Dr. Armitage.*) Then is it your idea that the way in which large contracts will have to be obtained by blind institutions will be by competing by tender in the ordinary market, and if the institution at the rate at which the tender is taken cannot pay the workpeople wages sufficient to maintain them it should supplement them, *pro tanto*, out of its charitable funds?—Yes, I see no other way out of it. Of course, there is one thing to be borne in mind, it never will do for an institution to use its charitable funds in order to depreciate the price of its articles. I mean if an article would cost me 2*s.* 6*d.* as an ordinary merchant, it will never do for me to sell it for 2*s.*, and take 6*d.* out of the charitable funds; it will never do for me to fall back upon the charitable funds in order to make the sale of my goods easy. It would not be proper for institutions to use the charitable funds to reduce the price of articles in order to get rid of them.

13,944. You told us yesterday that you lately took a Government order for baskets, and that you found after you had obtained the contract that another institution had also been tendering for them?—That was whispered.

13,945. In consequence of obtaining that order in order to execute it in the time you had to put on 12 sighted basket-makers?—Yes.

13,946. Is there any reason why you should not have passed on part of that order to another blind institution?—The Glasgow Institution was working overtime, I understood, at the time.

13,947. Still, there were a great many other institutions that would have been glad of the order?—Those baskets that we were making required a great deal of extra appliances, such as leather straps and various kinds of mountings, and we having them ourselves at our institution it would not have been a convenient arrangement to subdivide the work as we might have been able to with other kinds of baskets; but the idea of giving over part of this contract to another institution was present to my mind, and I have repeatedly done so.

13,948. Do they return the compliment and give you part of their contracts?—Yes. In Scotland there is a very friendly spirit between the different institutions.

13,949. Is there any definite arrangement amongst the institutions that that should be done?—It simply depends upon the goodwill of the managers towards each other.

13,950. Do you interchange with English institutions as well as Scotch?—We have done so to a small extent with Newcastle and with York and with Leicester and with Leeds. I daresay most of them. The linking up of institutions together, which I believe will be brought about as one of the results of this Commission, is extremely necessary.

13,951. You were suggesting yesterday that it might be possible to have a sort of central depôt here in London for buying material for all the institutions and for obtaining Government contracts, and so on?—That I suspect would require to be done by an efficient committee in London composed of business men. A very large amount of capital would be wanted, and a large amount of business talent would be required to be possessed by those composing the committee.

13,952. I wish to put to you this difficulty which it appears to me would arise if such a central depôt were established; there would be an enormous amount of buying of material. I think it is pretty well understood that in business houses, no matter what salary is given, it is scarcely possible to keep all buyers straight; do you see any way of getting out of that difficulty?—The appointment of a committee might obviate the difficulty, but I suppose it would be suggested that even that committee might be bribed; it is within the bounds of possibility that a Judas might be amongst the twelve. You must not let that deter you from doing the good that the establishment of such a central depôt would accomplish.

13,953. If such a central depôt were established all the institutions would have their heads on one neck?—Not necessarily; I believe that it could be carried out and with great advantage to the blind, both in the buying and in the selling; it is a question of co-operation. You surely have honesty in your great Civil Service stores, at least you imagine so. There is one incident that I should like to mention, the blind workers in their memorial desire that blind children should be provided for in the ordinary board schools. We have one man in our institution who has three children, the eldest of whom is deaf, dumb, and blind, who was partially educated at the Deaf and Dumb Institution, but who has been transferred to our institution; the other two children are blind; the whole of the three are with us. That man was a strong advocate for the education of blind children in sighted schools, till he had children of his own, and now he says he never ceases to thank God that he has such a place as ours to which to send his children, and he pays 6*s.* a week from his earnings for those three children, the parochial board coming forward and supplementing that payment.

13,954. (*Chairman.*) As you have alluded to this memorial, I will ask you whether the wish expressed therein, that the blind children should be educated in the board schools is not to a certain extent prompted by the desire of the working men to get hold of funds that are now used for educational purposes in some of the institutions, in order that more may be spent on the industrial portion of those institutions than is spent at present?—I have no hesitation in saying frankly your Lordship is correct.

13,955. (*Mr. Arroll.*) May not the reason why that man is so thankful that his children are being educated in a separate institution be that he is relieved of their maintenance by paying such a small amount as 16*l.* a year for his three children, whereas, if they were sent to the public school he would have to provide for them?—I firmly believe that the progress which the children are making has convinced the father that his children could never be educated as they are in any sighted school; moreover, he has a blind wife, and when you take 6*s.* off 21*s.*, you only leave 15*s.* for him to live on, and pay rent; he could not have done more, he did to the utmost of his ability in paying before the parochial board came in. I think intermarriage of the blind ought to be prohibited by the State.

13,956. (*Chairman.*) Is it your experience that a blind husband and a blind wife will have blind children?—In some cases I have found it so; but if any man wants a woman with eyesight a blind man does, to keep his home clean and keep himself clean. I have never seen anything but either blind children or dirt and filth result from the intermarriage of the blind. I have seen an instance or two of a tidy house kept by a blind person; certainly such cases would be exceptions.

13,957. (*Dr. Armitage.*) Are any steps taken by the Edinburgh Institution to prevent such marriages?—We had a rule prohibiting those marriages, and it was generally carried into effect; the blind in our institution were told that they would incur the severe displeasure of the directors if they intermarried, and that they would be dismissed; but unfortunately, after a certain period of probation, the directors re-admitted those parties who had got married, and it was only a question of undergoing that probation ever after. I said they had better abrogate the law altogether, than wink at the infraction of it in that way.

13,958. (*Sir Lyon Playfair.*) Was there any hereditary blindness in the family of either the man or the woman in the case to which you have just referred?—There was hereditary blindness in the case of the female.

13,959. (*Dr. Tindal Robertson.*) In the case of the man, was his blindness accidental, or had he been blind from birth?—He lost his eyesight gradually when young. He had a brother whose eyesight gave way also when he was young.

13,960. (*Dr. Armitage.*) Could you state what was the nature of the hereditary taint in the case of the woman?—There is difference of opinion in this case; it is a very peculiar and interesting one.

Mr. W. Martin.

4 Dec. 1886.

13,961. (*Chairman.*) With regard to the Donald Fraser bequest, have you any statement to make with regard to that?—I have the scheme of the administration of the Donald Fraser bequest, which I can leave with the secretary.

13,962. Have you any experience of the working of it?—I have had occasion to correspond with the administrators of that fund with regard to the administration of it, and I find they are applying it entirely to the education and industrial training of young blind persons, and in the payment of inspectors to investigate and report on the claims and qualifications of those appointed to the benefits of the bequests, but it is intended for the whole of the blind of the county of Inverness, though primarily it is for the other purpose. I think the very word "primarily" shows that it ought to be applied for the benefit of the blind generally in the county of Inverness. Though it is primarily for the education and industrial training of the young, I think the whole of the blind of Inverness have a right to a share of it.

13,963. The aged as well as the young?—Yes.

13,964. (*Mr. Johnson.*) Those who participate in the benefit of the bequest must be born in the county?—They must belong to the county. I can also leave a schedule which I have prepared of the various funds for the blind in Scotland, including the funds vested in institutions.

The witness withdrew.

Mr. William Gilroy examined.

Mr. W. Gilroy.

13,965. (*Chairman.*) You are connected with the Newcastle-upon-Tyne and Gateshead Workshops for the Adult Blind?—Yes.

13,966. In what capacity?—I am a sort of traveller. I collect accounts and seek orders, and I fill up my time in soft work, in making hair mattresses and wool mattresses.

13,967. You have some sight?—Yes. I cannot see to recognise anyone, but I can see enough to keep out of danger.

13,968. The last report of the association dates from three years back?—Yes.

13,969. When we visited your institution you told us that the means of the association were not very great, that it was mostly kept up by the working men's own wages, and was very little dependent upon charity for its support?—That is so.

13,970. Is that still the condition of the institution?—Yes. Money was got by giving concerts till there was a capital established.

13,971. A capital of 500*l.*?—Yes, now the institution is practically self-supporting.

13,972. What number of sighted people do you employ in the workshops?—Three. There is a manager who keeps the books and buys the stuff. There is also a sighted girl in the shop who takes orders in the manager's absence, and who fills up her time by doing machine work, and there is a porter, a sighted youth, who goes out with a handbarrow (we have not the means to provide ourselves with a cart) to take out the manufactured stuff, those are the only sighted people engaged.

13,973. Do you pay the blind workmen a little more than the average wages for sighted people?—In the sighted shops a shilling is given for making mattresses. We give 13*d.*, a penny on the mattress to the man is the only supplement that we give.

13,974. Is that the only trade in which you give any supplement, or do you give the same supplement throughout?—We do not in the basket making, the basket-makers are paid according to the society's list; that is to say, the list of sighted people.

13,975. Is not it the case that in consequence of the depression of trade, the society's list prices are higher than the prices actually earned outside, and that therefore you are paying more than the outside prices?—That is true, but the difference would not be very great.

13,976. Do you teach industrial occupations as well as give work work to journeymen?—Yes, we have to do that in the case of those who require to be taught a trade.

13,977. What is your experience with regard to the blind when they leave school; do you find that when they leave school they have had any technical instruction, or that they are ready to turn their hands to handicraft work?—I regret to say that I do not find that to be the case. I find fault with the system under which ordinary education, music, and industrial work are carried on concurrently; the attention of the pupils is divided, and they seem not to give that attention they ought to do to the trade which they intend to make their living at in after life.

13,978. What would you suggest as an improvement on that state of things?—I would suggest that education and music should go together, but that they should be divorced from the work, so that blind children should be dealt with in the same way as sighted children; that is to say, that a blind child should receive his ordinary education, and some instruction in music up to the age of 14 or 15, and if he showed a decided ability for music he might be drafted to a college such as the Royal Normal College, and if he showed a mechanical bias, he might come to the workshops and be apprenticed in the same way the sighted are apprenticed. At mattress making for instance, he might be apprenticed for three years, in the second year of his time we might give him 4*d.* in the shilling, and in the third year 8*d.* in the shilling, that would help to maintain him. If that was done it would be a great boon to the blind, they would then go thoroughly into their trade, and they would become efficient, and get permanent employment afterwards.

13,979. Do you receive any assistance from other institutions, from the blind in Newcastle?—We get no assistance whatever from the Royal Victoria Asylum, no blind person after crossing the threshold of our institution to my knowledge gets any assistance whatever from them.

13,980. Have young men come direct from that institution to yours?—Yes, the two basket-makers came from there. They had to improve considerably after they got to our place, much of their work was not profitable. In the Royal Victoria Asylum they do a great deal of fine basket work, in which they cannot compete with the work sold at the sighted shops. I worked as a journeyman at Harrison's in Grey Street for eighteen months, and when I was there I found that what I had learned in the way of basket work at the Asylum was not of any use to me afterwards, the foreman said it was a great mistake to teach this fine work at the asylum, because French beat the English out of the market in those goods, and there is no chance for sighted people, let alone blind people. It is a great mistake to teach fine basket work.

13,981. When young men leave the asylum how do they support themselves if they have no friends to assist them; are they supported by charitable contributions?—Those who do not succeed in getting into our institution try to get a living in various ways. I am

Mr. W. Gilroy.

4 Dec. 1886.

sorry to say I do not know of one during the last 25 years who has left the blind asylum making a respectable living at music; they play in the streets or in public-houses. That is not from any fault of the committee or the teachers of the asylum, but they have not had friends to get them into a respectable position as professional musicians, such as organists.

13,982. We know there are some who do get those positions; your acquaintance has been with those who have failed?—Yes; for the last 25 years I do not know of one blind person making a good living at music.

13,983. You are speaking of Newcastle and the north of England?—Yes, I am speaking solely of ex-pupils of the Royal Victoria Blind Asylum at Newcastle.

13,984. Do you think it would be an advantage if workshops could be established in which the blind could find employment after they had left school, and after they had learned a trade?—Yes, that would be a great boon to the blind because it is of little use teaching a blind man a trade if you cannot find him employment afterwards. Blind people are at a very great disadvantage in carrying on a trade by themselves; they cannot buy suitable stuff advantageously, and they have a difficulty in obtaining credit.

13,985. Do you think that boarding houses should be provided for those young men who were serving their time as apprentices, in connexion with the workshops, or that they should live with their friends?—There might be a boarding house in connexion with the workshop for those who came from the country, but if the blind had friends in the town I should think it would be better for them to board and lodge with their friends.

13,986. Do you know whether there are any blind children in Newcastle who are not at school at present?—There are about six, I think, who are not at school.

13,987. Are your premises rented?—They are rented.

13,988. What is the number in the institution at the present time?—Seventeen.

13,989. Would you take in any that came from the neighbouring towns, for instance, Gateshead?—Yes, there is no objection; they are admitted if they have ability, and if there is a vacancy.

13,990. Suppose a man is such a bad workman that he is unable to earn his livelihood do you keep him on?—Yes; we might perhaps put him to firewood chopping.

13,991. You supplement the earnings of men who from various causes are unable to earn their full livelihood?—Yes, the manager is not close-fisted in that respect.

13,992. You find work for them to do?—Yes, there is an old man in the institution at present who teases hair and chops firewood, and so fills up his time.

13,993. (*Mr. Johnson.*) As I understand, your men are principally employed in mattress making?—Yes, straw mattress making.

13,994. I see it is stated in your report that you have only one basket-maker employed?—There are two now—they are both ex-pupils of the Royal Victoria Asylum at Newcastle—one we have had about seven years, and the other has come to us recently; he served three months for nothing, and he makes about 5*s.* a week. He is what you may term an improver; that is all we have room for at present.

13,995. What are the average wages of the mattress-makers?—14*s.*

13,996. What are the average wages of the basket-makers?—15*s.*

13,997. The 14*s.* is only supplemented by 1*d.* in the shilling?—That is so.

13,998. What cost are you put to in instructing your pupils or apprentices?—If a young man comes to us to be taught a trade, we apprentice him to one of the journeymen, and we give the journeyman 4*s.* a week for three months, that is to compensate him for the time he devotes to the teaching of the apprentice.

13,999. In teaching the apprentice he would lose something from his 14*s.* or 15*s.* that he would otherwise gain?—Yes.

14,000. And that is made up to him?—Yes, that is made up to him by giving him 4*s.* a week for three months.

14,001. How long is that apprenticeship?—In the mattress making it has always been three months.

14,002. As you have only two basket-makers, you have no very great experience with regard to that branch of trade?—It is simply a beginning; we have not had much experience in it.

14,003. As I understand, most of these men who are working with you have come from the Blind Asylum at Newcastle. I suppose they do not learn their trade there?—No, not straw mattress making, there is none done at the Royal Victoria Blind Asylum, or at least very little, they get a little insight into it, but they could not come into our establishment as journeymen, they must come as improvers.

14,004. Do I rightly understand you to say that they do not teach mattress making at the Asylum?—They teach it, but they never get any to do, that is to say, straw mattress making; what they do is the higher class work, such as hair mattress making, not straw mattress making. They might have a pair or two to make in the course of six months; they do not canvass for it.

14,005. You are strongly of opinion that the education of blind children and their instruction in trade should be entirely divided?—I am strongly of that opinion.

14,006. At what age do you think instruction in industrial work ought to begin?—At the age of about 15; they are strong enough then to be put to work.

14,007. You think it is undesirable to begin teaching them a trade at an earlier age than 15 or 16?—In my opinion it is a mistake to attempt to do so. Children are not strong enough to do hard work till they are 15 or 16, and it is no use teaching them fine work. When they arrive at the age of 15 they are setting their minds to be something, and they give their whole attention to their work afterwards, if it is not divided by their being taught music or anything else.

14,008. You have had a good deal of experience among the blind. What is the general impression amongst the blind with regard to the early education of children; do they think it desirable to educate them in Board Schools, or in classes, or in institutions?—This is the suggestion which I would make: that the School Board in large centres like Newcastle, where there is a blind asylum existing, might give a grant to that asylum for the education of blind children. I think it is the business of the School Board to educate the children, and the parents and the friends of the children would have to maintain them while they were being educated in the Blind Institution.

14,009. What I was putting to you was this, whether the blind generally thought it was right that blind children should be educated together with sighted children in Board Schools?—We think not. We think the better arrangement would be that a school should be established (unless there was one already existing in the locality) for the separate education of blind children, the expense of their education to be defrayed by the School Boards, and their maintenance to be defrayed by the parents or the friends of the pupils.

14,010. You think it undesirable that blind children should be educated in Board Schools together with the sighted?—I do not think it would be desirable.

14,011. Have you any experience with regard to those blind people who have been educated in music; do you know of any who are getting a living by playing in the street?—Yes. I could give the names of about five or six who are getting a living in that way.

14,012. If workshops for the blind were established in the towns throughout the country, do you think the blind could be self-supporting?—I believe they could; that is if they have been trained as journeymen. Generally speaking the blind have not hitherto been sufficiently taught in their trades; but if they were apprenticed, and then afterwards worked for some time as journeymen, I believe they could be self-supporting; that is to say, the most of our blind, but there is a great difference in the blind, some of the blind are very clever and very quick, while others seem to suffer from nervousness as well as want of eyesight, and I think the earnings of those ought to be supplemented. I would supplement the earnings of a young man who was slow at his work. The idea is to keep up the quality of the articles made at the institution; if a man makes a bad article it injures the character of the institution for good work. The idea of supplementing a young man's earnings is to enable him to take time over his work, and so turn out good work, and keep up the character of the institution.

14,013. But thoroughly good workmen would not require a supplement?—In some trades they might.

14,014. (*Rev. C. Mansfield Owen.*) Can you make and complete these palliases fit for sale without any sighted supervision?—There is no sighted supervision required in the making of the palliases, except in the cutting out of the canvas for the sewers, there is a sighted cutter kept, but the blind girls sew them, and the blind men stuff them without any sighted-people interfering.

Mr. W. Gilroy.

4 Dec. 1886.

14,015. You say that 14*s.* is about the average wages earned by your blind workers, could they earn more if there were work?—Yes.

14,016. About how much could they earn?—About 22*s.*; they could do four pairs a day.

14,017. When we were at Newcastle you told me they could earn as much as 26*s.*, has that been earned?—That has been earned in busy times; they could do the work which would represent that amount if there was a push for work.

14,018. Do you find that it is an advantage to have a traveller in connexion with a workshop?—Yes. Since the committee put me on to travel in the last three years, we have got a great many customers whom we would not have had otherwise. I believe it is very useful to have a traveller, and indeed I might almost say absolutely necessary, because an intelligent blind person if he importuned people to purchase goods would be likely to have more success than a seeing person would.

14,019. Can you suggest any trades which might be introduced at Newcastle, other than those which are now carried on?—I should think lath rending and straw-rope making might be introduced.

14,020. Do you think netting and sail making might be advantageously introduced?—I do not know much about those. I do not think it would answer to introduce them, the making of cork fenders would be a good thing to introduce, I think.

14,021. (*Chairman.*) Have you ever tried making straw envelopes for bottles?—No, we could not compete with the straw envelopes that come from abroad.

14,022. (*Sir Lyon Playfair.*) Do you know that there is a strong feeling arising that in ordinary schools boys should be taught the handling of tools long before they are 15 years of age, and that workshops are now being established, in connexion with sighted schools to teach the children the use of tools when they are very young?—I have not heard that. Our idea at Newcastle is this, not to begin teaching them to learn their trade till they have arrived at the age of 14 or 15.

14,023. Do not you think it might be useful for them long before they arrived at the age of 14 or 15, and before they learnt special trades, to learn to use tools and to use their hands?—Yes, I should think it would be very useful to teach them how to saw, or how to plane, or anything in that way by way of amusement.

14,024. When you said that they should not learn any trade till they arrive at the age of 15, you did not mean that they should not be taught the use of their hands and the use of tools?—No, I meant to say when trade instruction was going on concurrently with ordinary education, their attention was divided, and they did not give sufficient attention to the trade in such cases, they would be trying to learn too much at once.

14,025. (*Admiral Sotheby.*) Do you make brushes at your establishment?—No.

14,026. Do you consider that a blind man can finish a brush altogether himself?—I do not think he can, the wood work is done by sighted people.

14,027. A brush has to go through several stages?—Yes.

14,028. What do you consider the best employment for the blind?—The most lucrative employment has been straw mattress making at our place.

14,029. How much can the best basket-makers make?—15*s.*, I believe, would be the average wages of our basket-makers.

14,030. (*Mr. St. John Ackers.*) The report which we received at Newcastle of your Association is two or three years old?—Yes.

14,031. Can you tell the Commission what amount has been received in the last year from charitable sources?—I could not exactly tell you that, I might say that we do not receive more than 10*l.* a year in charity, and we pay poors rates, so that it goes back again.

14,032. You pay the poors rates, you pay the taxes, and you pay your rent like any other business undertaking?—Exactly so. If we had not the poors rates to pay it would come to something like the same thing; what we get we pay again.

14,033. It is so far a co-operative undertaking that the profits of the business go towards increasing the wages; is not that so?—I scarcely think that if there were but small profits the men would be entitled to get an increase of wages.

14,034. We were informed, when we visited the shop, that the blind workpeople got from 15 to 20 per cent. more than sighted persons engaged in the same occupation, that being given to them out of the profits?—That may be reckoned at 1*d.* in the shilling if you call that 15 per cent., but that is all they get.

14,035. That is out of profits?—That is out of profits; but the few blind that there are could not claim the profits of that institution to be divided the same as if they were a co-operative body.

14,036. Supposing that you were fortunate enough to get a considerable profit in the course of any one year, what would become of that profit?—We would introduce other trades and teach other blind people, and extend the usefulness of the work.

14,037. Do all the workmen live at their own homes;—Yes, some are married and some are at lodgings.

14,038. But none live in any buildings belonging to your association?—None whatever live on the premises. The premises are locked up at six o'clock every night.

14,039. (*Mr. Arrol.*) You have expressed an adverse opinion to the education of the blind along with the sighted; is that opinion based upon any practical experience?—No, that is not based upon any practical experience, it is simply that we have not known of any case where the blind have been educated among the sighted, but we have been cognizant of the fact of the blind being educated by blind teachers. We think that blind teachers are more suitable for the blind than sighted teachers would be, because they would not have time to attend to the blind in a sighted school.

14,040. Do you not think that it would be beneficial for the young blind to be educated alongside of the sighted, inasmuch as it would make the blind more self-reliant?—They would have to learn the types such as the Braille type and the other things that they learn from the blind teachers; they might learn those from the schoolmaster; but if you put a blind child into a sighted school amongst 60 sighted children with their slates and pencils, he would be much quicker with his pencil when he had learnt how to use it.

14,041. (*Chairman.*) Is there any other point which you would like to lay before the Commission?—The aged blind would like it to be represented that they think they ought to have a sort of pension, if it could be got from the Government, for those who are entirely helpless. They wished me to mention to this Commission that they hoped that they would not be forgotten. Those who are past doing anything would like to have something in the way of annuity, and to remain with their friends, those that have home attachments.

14,042. How do the boards of guardians treat the aged blind; do they force them to come into the house or do they give them outdoor relief?—I am sorry to say that some of them are forced into the house and that is a sore point with them; they decidedly object to that because they perhaps get amongst those whom they do not like.

14,043. But they would be quite willing to receive outdoor relief from the guardians if they would give it to them?—They would be only too happy to get it; but I think that there is a feeling amongst the blind that they would rather have an annuity from the Government in the way of a pension independent of the guardians. It may be a little ridiculous, but I am stating the feeling of the old blind. There is a strong aversion on the part of us blind in the North to come on the parish at all; we use strenuous efforts to avoid the parish in any form.

14,044. But in Newcastle you have the benefit, as they have not in Scotland, of a great number of pensions which are offered to the blind of England; do none of your friends apply for those pensions?—There are only two that, I believe, are getting pensions from London. Allan Watson and another, I believe, but I cannot be certain. A number of the blind that I know do not get pensions. The reason is that they have not had influential friends to speak for them, or it has not been gone into.

14,045. Have they applied?—They are very poor and they seem to be forgotten, they have not had friends to

Mr. W. Gilroy.

4 Dec. 1886.

take it up, and they have not gone about it. I do not think that there is any fault here, but simply that it has not been thoroughly looked after.

14,046. (*Sir Lyon Playfair.*) In stating that the blind wish to receive pensions direct from the Government, do you state that as your own opinion, or only as a view that you have heard expressed by other people?—I have heard it from the blind at their meetings.

14,047. Do you not see what an immense danger there would be in giving any pensions without the supervision of a locality?—Yes, that would be a danger; but still they themselves feel that blindness is exceptional in its nature, and that being deprived of the blessing of eyesight, there ought to be a compensation from a kind Government to them.

14,048. Do you not think that if there was any relief it must be a relief from the locality which has the power of understanding whether a man has a claim and the nature of his resources, and other similar points?—They have an idea that blindness in itself gives them a sufficient claim for protection against the necessity of having recourses to the parish.

14,049. But is it your opinion that the Government should intervene in a question of that kind?—I should like to see it.

14,050. Supposing that a blind man was a drunken and utterly worthless man, how is the Government to know that?—In that case the clergyman of the parish, or the Home Teaching Society, might report that.

14,051. That is to say, you would not make the locality responsible for the conduct of the man, and for the mode in which the pension was bestowed?—There is a feeling amongst the old blind that they wish not to be forgotten if there was anything being done in the shape of establishing workshops and other things; they would like to be kept from starvation. I could not go into detail as to how it is to be done.

14,052. (*Dr. Armitage.*) Could you tell us how many mattress-makers you have employed?—There are six straw-mattress-makers.

14,053. Are the hair-mattress-makers separate, or do they change from one sort of mattress to the other?—There is only one hair-mattress-maker and myself, I fill up my time, as I have already said, when we are extra busy, by making hair mattresses myself. There is a mat-maker, there are two basket-makers, and the rest are females, who sew the cases for the straw-mattress makers.

14,054. That makes 11; then there would be 5 females?—Yes, there are five females.

14,055. You have not mentioned that old man whom we saw who was teasing hair?—We do not reckon him among the workmen.

14,056. He is not reckoned amongst the 17?—There are 18 if you reckon him in.

14,057. With regard to the outdoor relief; you said that the objection that most of the people made to going into the house was on account of the kind of people with whom they had to associate when they were in the house; do you think that if some arrangement could be made in classifying in the house, that is to say, if those who are paupers by the visitation of God, no matter whether blind or not, should be put into separate wards, and if the criminal paupers, I mean those who have become blind from their own vice or neglect, should not be allowed to associate with them, that would remove most of the objections to going into the house?—Yes, it would remove a great deal of the objection; but still we blind people have a great prejudice against the workhouse; we would rather have the relief outside. I do not know how it is, but it is the fact that we do not like the workhouse in the North at all. That would remove a great deal of the objection.

14,058. Do you think that it would remove a real grievance?—Yes, there are many blind who have led good lives, and who feel keenly being put, as you describe, amongst the vicious and the worthless.

14,059. Have you a home teaching society at Newcastle?—Yes.

14,060. Is there any building of iron ships going on at Newcastle?—Yes.

14,061. Do you know whether there are any blind people employed in the shipyards?—Not in the shipyards, but there is a blind man, named James Foster, employed by Messrs. Coxon, and he gets the shipwork on to his premises.

14,062. What work does he get?—Ship cushions.

14,063. Have you ever made any inquiry as to whether it would be possible to get blind people into the shipyards for cleaning boats and spinning oakum, as they do in Glasgow?—I have not gone into that. I think that the difficulty would be in getting them on board, and backwards and forwards; that is the only difficulty that I can see about it; but when they were there I believe they could do the thing thoroughly well.

14,064. You say that there would be a difficulty in getting them on board, but the yards are on land?—Yes, but it would be awkward for a blind man to go about a shipyard, because there are so many things lying about.

14,065. Do know that it is done in the Clyde yards to a very large extent?—I did not know.

The witness withdrew.

Mr. WILLIAM MESTON examined.

14,066. (*Chairman.*) You are the superintendent of the Aberdeen Asylum for the Blind?—Yes.

14,067. And you have charge of all the industrial departments, and of the institution generally?—I have.

14,068. Have you many apprentices at the present time in your institution?—No; we have only some five or six apprentices apart from our inmates.

14,069. I think you told us that the apprentices were only taken for three years?—The apprentices are only asked to serve for three years.

14,070. Is not that rather a short time for them to learn a trade in?—It is too short a time, but our directors were anxious to make the time as short as possible so as not to discourage the blind in any way, particularly the adult blind who were admitted.

14,071. That applies to the adult blind, and not merely to those who are taken in the ordinary sense as apprentices, as lads?—With regard to the lads, I may say, that during the time that they are in the house, after they are 16 years of age they go to the workshop for part of the day, and some of them, if they are sufficiently advanced in education, probably up to about the fourth or fifth standard, will go to the workshop for the whole of the day. The time during which they do so, counts as so much of their apprenticeship, so that when they leave the institution altogether they may be journeymen, or have only one or two years to serve. But the three years apprenticeship applies equally to the adult blind who generally get blind through accidents, at least those who are admitted to our institution.

14,072. Is it the principle of your institution not to keep these whom you train constantly working there, but to let them go out and earn their own livelihood?—They always remain with us. They have no means of finding employment throughout the towns saving with us, because ordinary manufacturers, as a rule, I should think, do not care for giving employment to blind people; at least, with so much competition, they try to get the very best workmen that they can.

14,073. Then, besides the blind, you employ a large number of sighted persons, because I think you told us that the wages paid to the blind amounted to 1,296*l.*, and to the sighted 998*l.*; I suppose that includes provision of all kinds?—No, the 1,296*l.* paid to the blind is paid to blind adult workers.

14,074. To whom is the 998*l.* paid?—To sighted workmen employed in the industrial department, not living in the institution, nor connected with the institution, further than working there as foremen, and as men preparing material for the use of the blind. There is one of our departments, the twine department, which necessitates the employment of a considerable number of sighted persons.

14,075. But is it not rather a question whether it does; do not your own blind workmen themselves rather question it?—No, they do not question it, because the hemp has to be hackled; that is to say, the hemp has to be dressed over steel pins which would be very dangerous for blind people to work with. Then, in addition to that, we have to employ sighted boys to assist the blind workers, when they lose their threads or break their threads, by picking them up and handing them back to them again.

Mr. W. Meston.

4 Dec. 1886.

14,076. Have you any difficulty in getting subventions from the parochial boards for the instruction of the juvenile pupils in the school?—Yes, sometimes we have. The parochial boards, especially in country districts, object to paying for maintenance along with school fees, on the ground of not pauperising the parents. Where a child comes under the head of being a pauper, or the child of a pauper, there is no word said about him; they very readily pay the amount in his case; but in the case of its being the child of a parent who does not come under this description, the parochial board say that they are not legally entitled to pay more than the school fees.

14,077. And that is a comparatively small sum, is it not?—It would just amount to the ordinary school fees.

14,078. But the annual charge for your pupils is 10*l.* per head, is it not?—10*l.* and the clothing.

14,079. Do you think it is desirable that there should be an alteration of the Education Act, so as to enable parochial boards to give a larger amount for maintenance and education of blind children than they give at present in all cases where the parents themselves are unable to pay?—Yes, such an alteration is desirable; but we do not receive them into the Asylum unless the 10*l.* is paid either by the parents or by the parochial boards.

14,080. Then are there not some left out who might come in?—No, not at present, I think. We have got the parochial boards for the most part to concede that point now, but we have had great difficulties with them in the past, because they say that they are not legally entitled to do it.

14,081. With regard to the age of admission do you think that the girls should only be admitted at the age of 8, and the boys at 10; is not that rather late?—We have reduced the age for both boys and girls to six. That was done about two years ago. Speaking of parochial boards, there is one peculiarity about the children that we have; I do not know whether it obtains in other districts or not, but the number that we have at present are all paid for by parochial boards saving two, and in those two cases the parents only contribute, or are able to contribute, but a small sum towards the premium payable. Now I do not think that the same extent of pauperism, if you might call it so, exists among the parents of the blind in other districts.

14,082. You think that there is rather a larger number of poor blind in your district than in other districts?—Yes, it is evident that the juvenile blind in our district belong to a poorer class.

14,083. Are they not of the poorest kind?—Of the very poorest kind.

14,084. For instance, the sons of fishermen who have very precarious means of livelihood?—Yes. So much is this evident that in many cases we get the child has been found to be of little or no use to itself in its ordinary requirements, and it can hardly put on any article of clothing, or do any necessary thing.

14,085. Have you altered the maximum at all; if you take the children in at six years of age, do you keep them up to 16?—Yes, we are quite content to keep them as long as the parochial board will pay for them.

14,086. How long will that be?—We have kept them up to the time when they were 18 or 19 years of age, and were able to earn as much in the workshop as would maintain themselves. In the case of the children that I refer to, these semi-pauper children, if we put them out at the age of 16, the parochial board would have to subsidise their wages for two or three years in order that they might maintain themselves, so that it is of little moment to the parochial board whether they continue paying us the 10*l.* for a few years, and then when we let the children out, being relieved altogether, or whether they have to subsidise their wages when they come out earlier.

14,087. But would it not be good economy upon the part of the board for the board to pay for the children's instruction in technical work, in order that they might be able to earn their livelihood, and not be dependent upon the rates as they grow up?—It would certainly be very important, and in cases where the parochial board have demurred to paying the 10*l.* we have pointed out to them that if they keep on paying a short time longer the probability is that they will be entirely relieved from any liability in future, but some boards do not care for that, and say, well, that is a matter which concerns future boards, but does not concern us.

14,088. Have you ever tried to earn a Government grant in the school?—No, the reason being that the present lady who is teacher was employed as matron. About eight or nine years ago, we had only five or six inmates in the institution, and the managers thought that they were not warranted in going to the expense of having a teacher and matron; so the lady who gives instruction now never had the advantage of being trained as a teacher; but at the same time, we have had the school examined by educational gentlemen on more than one occasion, and they have expressed themselves very highly satisfied with the education given. We aim as far as possible at training the more intelligent up to the fifth or sixth standard, but there are several cases with us, and I daresay the same is found in other institutions, where there is a mental deficiency, and the children are not able to reach higher than perhaps the second or third standard.

13,089. The commission received a deputation to working men at Aberdeen, and one of the points that they urged was that at this asylum for the blind, they had not a certificated teacher; and they also urged that it would be better that the blind children should be sent to the ordinary board schools, and that the sums which are now spent upon their education in your institution should be spent in the technical and industrial portion of that education; have they ever made known to you that proposition?—Yes.

14,090. What answer did your institution give to that?—The workers in our institution have never approached our directors making such a request as that, but I know that such ideas as you have stated exist among them.

14,090*a*. Has there never been a deputation to the directors or managers making known these views by word of mouth?—It occurs to me that they drew up some memorandum a few years ago about the teaching of the blind. At that time we had a small number of inmates and there was a memorial got up among the workers, pressing upon the directors to discontinue the inmate department, so that the cost of carrying it on might go to the benefit of the workers.

14,091. The working men also complained that there was a large number of sighted workmen employed on the premises, at work which they said could be equally well done by the blind; that is a distinct assertion made on their part?—That is utterly false, and the men are quite well aware of that. We have only two foremen for the whole number of blind that we have.

14,092. I think they said that the heckling could be done by the blind, and that some baskets were now being made by sighted people, which the blind would very well make?—I should be very glad if they would do the work which we give to the sighted people, because it is the aim of our directors, and I am very strongly of the same opinion myself, that no sighted labour should be employed upon work that can be done by the blind. It is a new discovery to me if the blind can heckle; I do not think they could possibly manage to do such a thing. We have a number of sighted boys who have to assist the blind in their spinning; they often break a thread and the boys must be about to pick it up and give it to them. We should be very glad if we could do without those boys; we tried to reduce the number, and they made a very grevious complaint about it.

14,093. Your point is that you can make more money by the manufactures which you turn out by the help of some sighted labour than you could if you depended entirely upon the blind?—Yes, that is so, and also the departments, especially the twine department, could not be carried on without the sighted assistance which we at present have.

14,094. How far is your manufacturing department conducted on business principles; how far do you subsidize the wages of the working man?—As regards wages we have two classes of workers; we have those who are at piecework, and we have those who are getting set wages, because they are unable to learn any of the skilled trades that we have. Those who are getting piecework, began their three years apprenticeship that

Mr. W. Meston.

4 Dec. 1886.

we have already spoken about, and after that they get the same rate of wages as is given to first-class sighted workmen, although their work is inferior to that of the best sighted workmen, and although they require in some of our branches a much better class of material to produce even saleable work, and although they also require additional sighted assistance. So that, with the wages which we pay our blind workmen who are on piece work, we consider that of that amount they are receiving one third as charity, considering the quality of the work, the assistance that they require, the better class of material, and the constant employment, whether we have a demand for the goods or not. Taking those four things into consideration we think that one third of the amount that they are getting is charity. Then the other class that we have are those who cannot learn any skilled trade, being either physically or mentally incapable of doing so. We give them a wage according to their circumstances, in fact the wage paid to them is much left to my own discretion, and the greater part of it, if not the whole of it in many cases might be set down to charity.

14,095. For the sale of your stock do you put yourself in communication with any other institutions, so as not to compete with them unduly?—Our trade is mostly in the counties of Aberdeen, Banff, and Kincardine, and it is from those counties that we take our blind; we do not take them from other districts; they must either have been born, or have been resident for three years in either of those counties.

14,096. Have you travellers to sell your goods?—No one but myself. I travel in Aberdeen, and in the principal towns in the three counties that I have mentioned.

14,097. Have you a difficulty in selling your goods?—Sometimes we experience great difficulty.

14,098. Have you seen the memorial of the blind working men of Scotland?—No, I have not.

14,099. Have you any views to lay before the Commission with regard to the manner in which the aged and infirm blind should be treated. At present, I suppose, in many cases they go into the house?—Yes, but we have never sent away any aged blind that have been workers in our institution; we have always kept them.

14,100. Has your institution then been large enough to supply the wants of the aged blind in the counties that you have mentioned?—Yes, to all who have been admitted to the institution.

14,101. Are there any blind persons in those counties who do not enjoy the benefits of your institution?—Yes, there are a great many blind throughout those counties who are not in our institution.

14,102. And not requiring relief?—I should think there are a good number of cases.

14,103. How would you think they ought to be treated?—At present there is a doubt that if their friends cannot help them they go to the poor house.

14,104. Do you think it is a desirable thing for the blind that they should be so treated?—Unless a sufficient annuity was given to them, to keep them in comfortable circumstances and in respectable lodgings, where they could be properly looked after, I believe in the majority of cases they are better in the poor house.

14,105. Do you think that they ought to have liberal outdoor relief, for instance?—Not the class who descend to pauperism.

14,106. Then you think that they should be put in the ordinary wards of the poor house with the sighted?—So far as the poor houses with us are concerned, I know cases of blind people being there who do not get the same strict treatment as the sighted get.

14,107. From your experience of the poor blind do you consider that they are well treated in the poor houses, in the three counties that you have mentioned?—Yes, so far as it has come under my notice.

14,108. (*Dr. Tindal Robertson.*) With reference to the payments made by the parochial board, of which you have spoken to the Chairman, about how many benefit by those payments in your institution?—We have at present 13 inmates (we had 16 at the end of December), and of 13, 11 are paid for by parochial boards.

14,109. The parochial boards you say are not compelled to pay, but they pay of their own free will?—In several cases they are compelled to pay because the children are pauper children. In the other cases, so far as maintenance is concerned, it is of their own free will that they are doing it.

14,110. Supposing that they were not compelled to contribute, and that they were to decline to do so, would you still take the children in?—Not without the payment.

14,111. What do you think would become of the children in that case?—They could not be educated in the ordinary schools because we have had cases in which the ordinary schools have turned round and said that they can do nothing. There are two cases that have come under my notice within the last few years. The parents of the children were not paupers; they sent their children to an ordinary school; indeed they were compelled to do so; but the schoolmaster sent them home saying "I cannot educate you, I have no books; I do not understand your system." The children remained at home. However the school board officer went and said to the parents, "Now this child must be "educated." The parent said, "Well I have sent "the child to the school, and the schoolmaster can do "nothing with the child." "Well," said the school board officer, "he must be sent to the blind asylum; "you must apply to the parochial board and put your "case before them." After a considerable amount of trouble the parochial board said "Well we must pay the "fees, we will pay so much, and you will pay so much;" and they tried to make a compromise between them. In a case of that kind the position that we take up is, that we ask the parochial board to be entirely responsible, and if the parochial board can get anything from the parent, well and good. But in the two cases that I have mentioned the ordinary schools said that they could not give instruction to these children.

14,112. Then I come back to the question that the Chairman put to you; would it not be advisable that the payment should be compulsory upon these parochial boards?—Yes; and if that difficulty was removed I have no doubt that the parochial boards would acquiesce at once. But they say, "Here is a parent applying for "school fees, but along with the school fees there is the "cost of maintenance incurred, and unless the parent "is a pauper we cannot pay for maintenance." If this difficulty was removed then the parochial board could pay the whole amount without pauperising the parent.

14,113. You take in children to educate as well as to train in some trade, do you not?—Yes, we begin with their education and when they are about from 14 to 16 we allow them to go to the workshop for part of the day, so that they are picking up a trade during the time that they are inmates.

14,114. Had you any experience with regard to the education or trade training of the blind before you became superintendent of this establishment?—No.

14,115. Then you have only the experience of this institution to speak from, have you?—Only the Aberdeen institution.

14,116. With reference to that experience do you think it better to dissociate the education from the trade-training, or do you think that it is desirable to carry them on to some extent together?—I think it is desirable that if not workshops, at least technical schools should be used for the training of the juvenile blind in connexion with educational establishments.

14,117. Would you carry on the educational training and the trade training under the same roof and at the same time?—Yes, after the pupils had arrived at about the age of 14, so that when they cease to be inmates and become workers, they may the sooner be able to earn a livelihood, and become independent of parochial assistance or the charity of their friends. But I do not think it advisable for young blind children to mix with the adult blind in the workshops. It would be very much better to have a technical school-room or a technical workshop where the children could be trained.

14,118. May I take it as your opinion that it is advisable that the education and the trade training should be carried on separately?—I would have them in the same school, but the trade training given in a technical workshop.

14,119. Would you briefly give your reasons for that opinion?—One reason is that it could be done very much more economically than if they were separated, and in our case parochial boards demur to continue education payments after the school age, and expect that the children they are paying for are being taught a trade, with the view of becoming, as early as possible, self-supporting. But it is not good for the young blind children to be associated with the adult blind lest they might be taught things which it is unadvisable that children should know. With our present arrangements we cannot in training the children in their trades give them that attention which is absolutely necessary to turn out good workmen. If we had separate technical schools and a better class of instructors than we at present have, I have no doubt that we should turn out very much better workmen.

Mr. W. Meston.

4 Dec. 1886.

14,120. (*Chairman.*) You mean alongside your existing schools and under the same roof?—Yes. Then again there is the question of the disposal of the articles which the children make. That would be done much more economically and to greater advantage if it were done in connexion with the workshops so far as the articles of work are concerned.

14,121. (*Dr. Tindal Robertson.*) Do you think that the education of the children would be of a higher character and better and more complete?—At present they are entirely separated, so far as ordinary education is concerned.

14,122. Is the education kept absolutely apart from any technical training up to the age of 16?—Yes, up to the age of about 14.

14,123. But the two are conducted under the same roof?—In the same establishment.

14,124. Then is there any combination of the two in any way up to the age of 16, or is the training absolutely confined to education?—The education and the technical training are quite separate up to the age of about 14.

14,125. (*Rev. W. Blomfield Sleight.*) The deputation that waited upon the Commission at Aberdeen stated that they felt that the education given in the institution was of a very inferior kind, that the children were greatly neglected, and left the school in an uneducated state; does your knowledge of the state in which the children leave the school after their education is completed, bear that out at all?—That is simply not true; I can most flatly contradict such a statement. There are some cases (and the same thing happens with the other institutions) in which the children are mentally unable to take up education to any great extent. We have and have had cases in which the children are only able to receive education to a very limited extent; but those who are able to receive it receive an education up to about the fifth and sixth standards, in fact we go through a regular course of instruction up to that point. But there are cases in which children through physical infirmity or mental defect of some sort or other are not able to go to so high a standard as I have mentioned.

14,126. Do you employ an efficient teacher for educating the blind children?—I explained that our present teacher is not a certificated teacher, but the education she imparts has been examined by competent authorities on more occasions than one, and their report has been entirely satisfactory to our directors. Some time ago Dr. Christie, who is a professor in our university, was asked to examine the school and to report to the directors; and he gave certainly a most satisfactory report upon the education that the children were receiving. Since that time the education is better, because we had not the Braille system; since we have introduced the Braille system we have made very much greater progress than we did before, because previously we were confined entirely to Moon's system and had only a very limited supply of educational books.

14,127. Were those changes that you speak of the result of a deputation from the workmen waiting upon the Committee and asking that changes might be made with regard to the education in the school?—No those changes were the result of an inquiry by Sheriff Wilson. I think the Commission have a copy of his report; he took a very great interest in the education of the children some few years ago, and obtained reports from various countries as to what was being done for the education of the blind, and it was through him that the changes I refer to were made.

14,128. Then in your opinion the education given at your school is as good as can be obtained for the blind?—I would not say that, because the education, for example, at Norwood is a very much superior education to that which exists at Aberdeen.

14,129. I mean elementary education?—If you speak of elementary education then I say that the education that we give is as good as can be obtained for the blind.

14,130. Do you know the case of a lad called James Rae?—Yes.

14,131. Can you state why he was taken from the school to the workhouse instead of into the industrial home?—The lad you refer to was put into our institution by the parochial board for one year for the purpose of commencing to learn a trade. He was at the time in very delicate health through the poverty of his home, and the board agreed to pay for him for one year, with the view of his gaining strength with good food and proper treatment. At the end of the time the board removed him to the poor's house, as they did not consider his home a suitable place for him, intending to send him to our workshops as a worker as soon as they could find suitable lodgings for him in the vicinity of the asylum.

14,132. Did he receive any education while he was in the asylum?—Yes, he learned to read from Moon's, but he was of a type that could not receive education to any extent.

14,133. You mean mentally?—Yes. He was not admitted into our institution until he was over the school age, and the reason why he was put into the institution was not to receive education but to be taught a trade. The parochial board put him into the institution not for the purpose of education, but for the purpose of industrial training; they put him in for only one year, and they would not pay for him longer, hoping that at the end of that time he would be able to earn something towards his own maintenance.

14,134. Do you think that the education of blind children in an institution tends to produce a want of self reliance?—I think it has the very opposite effect if it is conducted in the proper way. I do not see why it would engender such a feeling any more than in the case of the sighted sons of gentlemen who are sent to ordinary private schools, and that is very largely done.

14,135. But do you consider that teaching blind children in an institution collectively instead of their being educated with other children in ordinary elementary schools, tends to produce want of self reliance?—I do not think that educating them in asylums engenders want of self reliance where the education is properly conducted.

14,136. With regard to workshops, in your opinion can the blind earn for themselves as good wages in their own homes as they can earn in workshops?—I do not think so, or they would not come to asylums.

14,137. Do you remember the case of one man, a basket maker, who is said to have left your workshops and to have endeavoured for three years to get a living in his own home, and after that time to have returned to you?—Yes, I know whom you mean. He could not make a living at his own home. Taking the three years during which he tried to do so, I do not believe he earned an average of 5*s.* per week.

14,138. What would he earn in your workshop?—He earns about 18*s.* per week. He had to get the willows which he generally purchased from us; the willows had to be sent a considerable distance into the country; then he had to make the baskets, and go and hawk the baskets through the country in order to get them disposed of. Many people gave him orders simply out of charity, but, of course, after two or three years that soon died out. Then he came back to us, and the directors, although they were unwilling to do so, took him back to the workships.

14,139. Is any work done by sighted workmen in your industrial shops that you think might be done by blind workmen?—No.

14,140. (*Mr. Arrol.*) You adverted to an instance where a master said that he had no power of teaching the blind in sighted schools?—No means.

14,141. If he had the present appliances, do you think that the difficulties might be got over by a double grant being given to the master?—I should think not in country districts in isolated cases. In towns it might be done where a number of blind pupils might be got together; but in isolated country districts I do not think that there would be anything like an adequate inducement to a schoolmaster to make himself familiar with the Braille system, for example, in order that he might teach a blind child properly.

14,142. Have you any experience of any blind children being taught in a sighted school other than the private school in Aberdeen?—No, I do not think that such a thing exists either in Aberdeen or in the North of Scotland.

Mr. W. Meston.
4 Dec. 1886.

14,143. What would be your opinion with respect to educating the blind in sighted schools?—With a certain number of the blind the thing is practicable; I mean with the blind of the middle and the better classes; but I do not think that it would be practicable with the blind of the poorer classes, unless you had thoroughly equipped teachers in the schools. When I make this distinction I mean that the parents of a blind child of the middle or better classes would do all in their power to assist and make up for whatever was deficient in the ordinary teachers, and help the child to prepare its lessons, but with the lower classes I think they would be entirely neglected. In our own case, as I have already mentioned, one very important work that we do is this: most of the children that we get are utterly neglected so far as training to be of use to themselves is concerned; they come from the poorer classes, and several of them are illegitimate children, and they come to us entirely without any training to be helpful to themselves, to put on their clothes, or to attend to any of their ordinary requirements.

14,144. Would you recommend then that the blind children should be boarded for the purpose of training them to look after their own personal requirements, and that they should be sent to sighted schools for education?—No, I do not think so, because the appliances which are necessary for the proper training of blind children, should, I consider, be in one central place. You cannot have them in a private house; for example, for gymnastics, which is a most important thing for blind children.

14,145. You might have them at a board school, might you not?—In the board schools of Aberdeen there are not such things to any extent.

14,146. You have expressed your opinion with regard to parochial relief for the blind; what is the opinion of the blind themselves as to whether the house test be applied, or whether they should receive relief, and be allowed to remain at their own homes?—I do not know the opinion of the blind on this point, but I believe they would prefer receiving out-door relief.

14,147. Am I to understand that it is the opinion of the blind in those three counties that you have named, that they would rather be in the workhouse than in their own homes?—No. I did not express such an opinion, because I do not know what their opinion is; but I have no doubt that they would prefer to be at home if you would give them an annuity.

14,148. (*Mr. St. John Ackers.*) Is it not a fact that your institution was founded for the purpose of giving education as well as industrial training?—It was founded without anything specific being laid down in regard to whether the children were to receive one or the other. The deed of bequest was for the purpose of endowing an hospital in Aberdeen for the benefit of the indigent blind of the three counties, and it was left very much to the trustees to adopt what means they thought best for disposing of the funds.

14,149. In whose power is it now to change the method of spending those funds if it is desired, is it in the power of the trustees?—No, I do not think so. It would require an Act of Parliament. We have a Royal Charter.

14,150. Does that charter specify that education is to be given?—No, it does not do so; it leaves it very much in the hands of the trustees.

14,151. Have you heard much dissatisfaction expressed on the part of the workmen as to the constitution of your present Governing Body?—Sometime ago our directors had under consideration the fact that the sphere from which trustees or directors are appointed was very limited. When we began to make application for public subscriptions, which is only within the last four or five years, they thought it desirable that if the public would subscribe, the subscribers should have the chance of putting in so many directors; so they applied to the Education Commission to have the appointment of trustees as stated in the Charter altered, so that subscribers would have the power of electing so many directors.

14,152. So far as you know does that scheme meet with the approval of the blind workmen, or have they since that scheme has been adopted expressed satisfaction?—Well, I do not know what schemes would satisfy them.

14,153. As I understand from your answer, you think that the desire of the workmen is such that no board of directors having the charge of the property of that institution would be inclined to give way to them altogether; is that so?—Yes. This scheme was drawn up without any consideration by the workers at all; it was done by the directors.

14,154. (*Admiral Sir E. Sotheby.*) Why do not the blind people in your institution make brushes?—Because it is the experience of the other institutions (at least they tell us so) that they lose a lot of money by it. That is the reason why we do not make brushes.

14,155. Then you think brushmaking a most unprofitable trade for blind people?—I am told so.

14,156. You keep your children at school until the age of 17; have they by that time acquired the same amount of education as children who are dismissed from Board Schools at the age of 14?—I think that not a few of our inmates would compare very favourably with the sighted children at the same age.

14,157. At 17, blind children ought to compare favourably with sighted children of 15 years of age?—Yes; but I explained that when the blind children arrive at about the age of 15 or 16 we allow them to go to the works, although they continue to live in the house.

14,158. (*Mr. Johnson.*) There was a report made, I believe, to the committee of directors by Mr. Wilson, in which there were a number of suggestions made; do you know whether the committee has carried out any or those suggestions?—They were entirely in connexion with the Educational Department, and for the enlarging of the sphere for the appointment of managers. In regard to the education, what was suggested has been entirely carried out; in regard to the managers, it is in process of being carried out.

14,159. Has the limitation of admission to cases connected with the counties of Aberdeen, Banff, and Kincardine been altered?—Yes, that has been altered.

14,160. Then, as I understand, workmen can come to you from anyportion of Scotland; is that so?—No, we only made that alteration to try and make our school a little larger. That was Sheriff Wilson's idea. The number was small at that time, and he was under the impression that unless the numbers began to increase it would be better to send off the children either to Edinburgh or to Glasgow to be educated. In order to increase the number he thought it advisable that where proper pupils presented themselves we should accept them even although they did not belong to Aberdeen, Banff, or Kincardine; but no alteration was made with regard to the workers. In the case of admitting those who did not belong to Aberdeen, Banff, or Kincardine, they were to be charged a higher rate, they were to be charged 15*l.*, whereas the others are only charged 10*l.*

14,161. Am I correct in saying that in your establishment there are six blind men married to six blind women?—That is about correct, I think, but I can tell you exactly.

14,162. Does your committee take any cognizance of blind persons who marry blind persons?—We have not done so hitherto, although I think they ought to do so.

14,163. Is it your opinion that it is desirable or undesirable that the blind should intermarry?—My opinion is that it is undesirable.

14,164. (*Dr. Armitage.*) Why do you consider it undesirable that blind people should intermarry?—Because it is surely enough that one should be defective in so important a thing as sight without both being in the same condition. Then another thing is the difficulty that arises in the case of either the wife, or more especially the husband, being laid up. In case of the husband being laid up of course the wife cannot attend to him, and it places a double charge either upon the rates, or upon the charity to maintain them, whereas if they had not been married probably the woman would have been earning her wages in the asylum.

14,165. Have you any practical experience of the way in which blind women manage their home and look after their children, and after the cleanliness and general arrangements of the place where they live; is it good or is it bad?—I have not been in any of the homes, but there are exceptions to their not being kept clean.

14,166. But you do not practically know it of your own knowledge?—No, I do not.

14,167. Can you tell me what are the average wages of your journeymen rope makers?—12*s.* 6*d.* or 13*s.* is the average wages; the wages run from 9*s.* to about 17*s.*

Mr. W. Meston.
4 Dec. 1886.

14,168. You told us that taken as a whole we may assume that about one-third of the wages paid is supplement or charity; do you think that the proportion paid to the rope makers as supplement is larger or smaller than one-third?—In the case of the rope makers I think it is rather more than one-third, and in the case of the basket makers perhaps it is a little less.

14,169. When you say that in the case of the rope makers the supplement is rather more than one-third, do you simply mean that it is fractionally more, or can you by reference to your books tell us exactly what the supplement to the rope makers is?—Paying them in the way that we do, I think it may safely be put down at one-half. That of course includes the apprenticeship. We put them on a three years apprenticeship, whereas outside the institution the apprenticeship is six years.

14,170. But my question had reference to the time after they had passed through their apprenticeship?—Nearly one-half I think, it is more than a third.

14,171. Can you tell us what your mattress makers earn?—They earn from 10*s.* to 20*s.*

14,172. What amount of supplement do they get; is it over one-third or under one-third?—It is over one-third, in the mattress department it is fully one-half. At the conference of Managers of Scotch Blind institutions at Edinburgh (at which conference I was present), we agreed to the recommendations set forth in the proceedings of the conference; but previously to that conference our Directors had revised our scale of wages, and they did not, even after this conference, care to alter the scale that they had made up to that time, which on comparison with this is very much in favour of the blind.

14,173. (*Chairman.*) Your scheme is more in favour of the blind, than the decisions which they came to in Edinburgh?—Yes.

14,174. (*Dr. Armitage.*) Can you tell us what amount of supplement the basket makers get?—Taking it as a whole I should say one-third; but our journeymen basket makers all get journeyman rate. Some make work of a quality which is only equivalent to that of a second or third year's apprentice, and they are inferior workmen. Another blind workman will make work which is nearly equal to that of a sighted journeyman.

14,175. I understood you to say that you do not separate supplement from wages?—No. In some institutions I think when a payment is made to a blind man the manager says: "What is the value of this work?" and whatever he considers to be the value of the work he charges to trade account, and whatever he thinks is paid beyond the value he charges to charity; but instead of our separating them in this way, we deduct one-third all over.

14,176. (*Chairman.*) Should you be able to furnish us with a short labour statement showing how much each trade has over or under one-third in the way of supplement?—I could only do it in a general way. We give our journeymen all the same rate, without discrimination as to the quality of the workmanship. In an ordinary basket shop the men do not all get the same rate. A manufacturer will give one man the full rate, and to another man who is an inferior workman he will perhaps only give three-fourths of the rate.

14,177. He will take fourpence in the shilling off, or something of that kind.

14,178. (*Dr. Armitage.*) The drift of my questions to you has been rather to ascertain which in your institution is the most profitable trade, and I judge from what you have said that rope making is the one by which the institution loses most; is that so?—You mean that we give more in charity in the rope making than we do in the other trades.

14,179. You have to give more charity to enable a man to live by rope making than you have to give to enable a man to live by the other trades?—I would say that the rope making and mattress making are just about equal; but we cannot increase the other departments that we have, because we cannot get an outlet for the goods that we make. The reason why we have rope making so largely is, because we can find a more ready outlet for what is made.

The witness withdrew.

Adjourned to Monday next at 12 o'clock.

At 6, Old Palace Yard, S.W.

Monday, 6th December 1886.

PRESENT:

THE RIGHT HON. THE LORD EGERTON OF TATTON IN THE CHAIR.

THE RIGHT HON. SIR LYON PLAYFAIR, K.C.B., M.P.
THE RIGHT HON. A. J. MUNDELLA, M.P.
ADMIRAL SIR E. SOTHEBY, K.C.B.
W. TINDAL ROBERTSON, ESQ., M.D., M.P.
B. ST. JOHN ACKERS, ESQ.
T. R. ARMITAGE, ESQ., M.D.
W. AUCHINCLOSS ARROL, ESQ.
F. J. CAMPBELL, ESQ., LL.D.
E. C. JOHNSON, ESQ.
THE REV. W. BLOMEFIELD SLEIGHT, M.A.
THE REV. CHARLES MANSFIELD OWEN, M.A.
CHARLES E. D. BLACK, ESQ., *Secretary.*

Mr. JOHN MACDONALD examined.

Mr. J. Macdonald.
6 Dec. 1886.

14,180. (*Chairman.*) You are superintendent of the Mission to the out-door blind for Glasgow and the West of Scotland?—I am, and I am also secretary of the Scottish Out-door Blind Teachers Union, which embraces the whole of the out-door missions to the blind in Scotland.

14,181. Do you yourself visit the whole of the districts in the West of Scotland?—Yes, the districts in the six south-western counties of Scotland.—Lanarkshire, Ayrshire, Renfrewshire, Dumbartonshire, Buteshire, and Argyleshire.

14,182. Will you tell the Commission, first of all, what are the operations of the society of which you are superintendent?—The Glasgow Mission to the out-door blind was instituted in 1859, for the purpose of visiting the blind at their own homes, teaching them to read, and supplying them with books in the raised type. At first and for several years it confined itself to this special object, but as the condition of the blind became better known it was found to be absolutely necessary to do something towards relieving their pecuniary needs. The first effort in that direction was the institution of our Ladies' Auxiliary Society in 1865 "for the purpose of promoting industrial employment among the blind females in poor circumstances, by teaching knitting and other such work; by supplying material when needed, and assisting to procure work or get it sold when made." The auxiliary now carries on its work in a large double shop with workroom at the back, in one of the public thoroughfares of the city, it employs one teacher and two assistants, and has 90 knitters on the roll, all of whom are kept in constant employment. Efforts were also made at a very early period in the history of the mission to procure employment for blind men in public works and elsewhere, and to assist them in starting various trading pursuits on their own account; and to aid in carrying out the latter object, an Endowment Fund was instituted in 1881 by Sir James Watson (President of the Mission) and some other philanthropic persons, for the purpose of granting pecuniary aid to the indigent adult blind with the special view of enabling

Mr. J. Macdonald,

6 *Dec.* 1886.

them to earn a livelihood; and also for the purpose of giving relief in times of special distress.

14,183. Can you give any statistics of the number of blind people that you have to deal with?—The number of blind on the roll of our own mission is 1,193 at present. The number of blind in Scotland may be stated at 3,650. I am aware that in the Government census for 1881 the number is returned at 3,158, but it is well known that many who are practically blind do not return themselves as such. Taking the three counties of Lanark, Renfrew, and Ayr, which contain about one-third of the population of Scotland, the census gives 1,037 blind persons; while, if we take the 1,060 actually known and on the roll of the out-door mission in these counties in 1881, and add the workers and inmates of the Glasgow Asylum, 150, the total is seen to be 1,210, or 173 in excess of the Government return. I am now showing how we bring out the 3,650. The excess of our returns over the census returns in those three counties is 173. Assuming that the excess is the same proportionally in the other parts of the country, 3,650 may be safely accepted as the actual number at present, seeing it does not include those blind persons of good social position, whom missions take no cognisance of, nor the natural increase of the population since the census was taken.

14,184. How do you account for that excess of 173 over the Government returns?—From the fact that many who are practically blind do not return themselves as such.

14,185. Will you proceed with your statement with regard to the operations of your society in the counties you mention?—Generally speaking, they are to visit the blind at their own homes, to teach them to read, to supply them with books in raised type, and to assist them in every way that we can, and, if possible, try and find employment for those able to work; generally speaking, those are the objects of our society.

14,186. What number of missionaries have you under you?—Seven, three in the city and four in the counties.

14,187. How many visits to each blind person do your missionaries make in the course of a week or a month?—They will go round the districts in the town about once in every three weeks and in the country about once in six weeks.

14,188. Besides teaching adults to read you teach also the young?—We do.

14,189. What are your operations with regard to the teaching of the young?—The number of blind children of school age in the whole of Scotland may be stated at 240; the Census returns give 210, but we know from actual fact that there are more than 210—we make the number 240, and of these about 30 may be safely struck off as incapable of being educated, owing to bodily or mental infirmity—we find 10 or 11 such under our own mission. Of the remaining 210 only 102 are pupils in the various asylum schools, leaving 108 for whom no such provision is made; and it is with this number that we have now to deal. Carelessness and indifference on the part of some parents, and the reluctance of others to allow their children to leave home at such an early age, prevent a few from entering those institutions. The expense, we believe, is the chief cause. In the course of our ordinary work among the adult blind we found many such children growing up in ignorance, and the question forced itself upon us how these children were to be educated. We applied to the directors of our Glasgow Institution to open their school to receive day scholars. This was readily granted, and a few who were living in the vicinity of the institution took advantage of it. This plan is still in operation, and seems to work well enough so far—there are three or four day scholars attending at present. This, however, did not meet the requirements of the case, even for Glasgow. It was in these circumstances that the common school suggested itself to our mind as the only practical solution of the difficulty, and we set ourselves to work it out. Passing over the preliminary arrangements with teachers and parents (there were no school boards in those days), and how sundry obstacles were overcome, we succeeded in placing two blind pupils in a sighted school in Greenock in October 1868. That was the beginning of what I would like to make some reference to now.

14,190. We have been told that the experiment has been tried in Greenock, and failed?—It has not failed. If you will allow me, I will state what we have found in our own experience. In October 1868 the first pupils were placed in the school. The experiment proved successful even beyond our own expectation. It was found to be not only practicable to educate the blind along with the seeing, but that in many respects it was preferable to the asylum system.

14,191. There are no blind children in the school at Greenock now?—There are no blind children of school age in Greenock now.

14,192. How long is it since there were any?—Two or three years.

14,193. As a matter of fact there are no blind children in Greenock; perhaps it may be said that the experiment has been given up?—The fact that there are no blind children of school age in Greenock now, instead of suggesting the idea of failure proves the very opposite; for, one advantage of the common school system is, that you not only bring education within reach of the blind in the localities where they reside, but obviate the necessity of establishing local special schools, which, when there were no pupils, would be left empty.

14,194. How long did that experiment continue in Greenock?—It was continuous with few, if any intervals, for 15 years, *i.e.* as long as there were children of school age capable of being educated.

14,195. How many passed through the schools during those years?—We have not hitherto kept a register of the pupils who have passed through the schools, but in Greenock alone I can recall the names of five boys and three girls; and over the whole territory occupied by our mission, I can recall the names of about 50 who have received a good elementary education in common schools.

14,196. Have you any further remarks to make with reference to the advantages resulting from the system of teaching blind children in board schools as compared with the system of teaching them in hospitals or institutions?—It is worthy of note that the evils resulting from the congregate system for children attracted the attention of the parochial authorities in Scotland more than 30 years ago, when they adopted the system of boarding-out pauper children in respectable families, instead of grouping them in hospitals or institutions; and the chief consideration which led to the adoption of this system was the moral and physical well-being of the children. In a special report on the subject, issued by the managers of the City Parish of Glasgow, they say, "The family circle is the most natural one for the "bringing up and training of children. It is of Divine "appointment; and in their humble endeavours to "follow out the plan the Committee feel confident they "are more likely to succeed than by congregating a "great number of children in an orphanage. They are "satisfied they are following the arrangement of the "Sovereign of the Universe by placing these children "in families where their moral, intellectual, and phy-"sical training is calculated to fit them for that sphere "of life which they are likely to occupy."

14,197. That has reference to sighted children?—Yes. I am referring to the action of the parochial authorities as bearing out what we have all along pointed out, namely, the evils of congregating young children together in asylums. I am trying to show that the parochial authorities in Scotland hold the same views, and for the same reasons they have adopted the system of boarding out pauper children in families instead of bringing them up in a hospital. If the parochial authorities, who are usually credited with being not over kindly in their treatment of the poor, have found by experience that the congregate system is so injurious to the moral and physical well-being of sighted children that they have adopted the family system, the principle must apply, we think, with increased force in the case of blind children.

14,198. What number of out-pauper children are now boarded out by the parochial authorities?—Seventy-five per cent. of the total number of the children chargeable to the parish.

14,199. Has that experiment of boarding out been tried in the case of the blind?—It has not been tried with the blind.

14,200. You have stated that the number of blind children who are now being taught in asylum schools in Scotland is 102?—There are 102 blind children now under instruction in asylum schools, and there are 108 not in any of the asylum schools.

14,201. How are they taught?—Thirty-five are in board schools, the remainder are being taught at home as far as possible.

14,202. How are they taught at home?—They are practically not receiving a regular education—they are simply receiving instruction at home.

14,203. Does your Society do anything towards educating those children who are neither at school nor in any institution?—We teach them at home.

14,204. Do you teach all the children who are not taught in any other way?—All that come under our notice. We teach all that we know of in Scotland.

14,205. You make visits from time to time, once in three weeks in the town, and once in six weeks in the country; how do you manage to teach children in that peripatetic way?—Those between five and seven years of age we regard as being too young to go to school and we teach them at home and prepare them for school, that is to say, the board school when they are able to go, that accounts for so many.

14,206. They are included in the 108?—They are.

14,207. Will you tell us how you teach those children between five and seven years of age at their own homes?—We teach them to read by Braille usually.

14,208. How many days a week do you give them?—Our visits in the town are, as I have said, about once in three weeks, but there are special times when our agents visit them much more frequently than that. I have stated that three weeks is the time usually taken to go round a district, but that does not mean that each blind person gets a stereotyped visit once every three weeks. There may be some who do not get a visit once a month and others may be visited once a week.

14,209. Do you teach the children individually or do you collect them together in classes at certain places?—We teach them in their own homes individually.

14,210. Can you tell us how many hours a week or a month you give to those children that you profess to teach before they go to school?—In some cases they receive lessons perhaps twice a week, in some cases three times a week, and in other cases not so often, but we usually give such an amount of instruction to the parents or to some member of the family as to enable them to give lessons to the child in the interval.

14,211. You trust to the teaching that you give being supplemented and kept up by some member of the family?—That is so.

14,212. In cases where there is no member of the family available to keep up that instruction what happens?—We usually get a friend.

14,213. You have no difficulty in getting some one to give some instruction to the child in the intervals between your visits?—Sometimes we have, but we usually succeed in getting some one.

14,214. Are there any children who are not sent to board schools or to any institution and who remain at home the whole time of their childhood?—There have been very few under our mission, but I believe there are a number in other parts of Scotland.

14,215. Are there not corresponding missions to yours travelling over the whole of Scotland?—Yes, but this question of education so far as the young are concerned has not been taken up so enthusiastically with some of the Societies, they are all doing something, but the agents of some of them are not so energetic as our agents are.

14,216. With regard to those children who go to a board school after having received some instruction from your agents, what amount of instruction are you able to give them before they go there?—They are usually able to read, not to write; we usually teach them to read by Braille, so that they are able to take their place in the class as ordinary pupils.

14,217. Do you teach them Braille entirely or any Moon?—Braille entirely now.

14,218. Since when has that been the case?—About four or five years.

14,219. Previously to that you taught them Moon?—Moon and the Roman type, the Roman capitals. We also used the Worcester type, that is the Roman characters with the capitals and small letters, but for the last four or five years we have used exclusively Braille for the children who are going to school.

14,220. And your society provides them with books in Braille?—We do.

14,221. Both the young and the adults?—Both the young and the adults. In the case of a child when the parents are able to pay we allow them to pay if they are willing to do so.

Mr. J. Macdonald.

6 Dec. 1886.

14,222. Have you any remarks to make with reference to the operation of the 69th section of the Scotch Education Act as it affects the blind?—That part of the 69th section of the Education Act referring to blind children was prepared under the direction of the president of our own society, Sir James Watson, with the special object of bringing the blind within the full scope of all the benefits of the Act, and placing them on an equality with the seeing in regard to elementary education. There is still considerable doubt, however, as to the true meaning or interpretation of that clause, and that has given us considerable difficulty. The Education Act has been a dead letter so far as it applies to our blind children.

14,223 What has been the cause of that?—Simply because the school boards have taken no action in the matter.

14,224. You think that it is the school board and not the parochial boards who ought to take action?—We believe so.

14,225. Do you think that they should have power to contribute also to the maintenance of blind children in any institution?—I daresay the clause may cover that, but the circumstances that called forth that clause in the Act make it evident that what was desired and aimed at was to delegate the whole matter of the education of blind children to the school boards; that is to say, that it should be enjoined upon school boards to provide education for blind children in the same way and to the same extent as sighted children. The clause says that it shall apply to the education of blind children.

14,226. But it does not allow the school board to carry it out?—The school board have simply taken no action. Till within two years ago the Glasgow school board took no action in the matter. I am glad to say that they show more readiness now to co-operate with us in the education of blind children, but they have not used their compulsory power to secure attendance.

14,227. With regard to pupil teachers in blind schools, have you anything to say?—I do not wish to go into the question of education in blind schools.

14,228. You are not in favour, as I understand, of children being congregated together in an institution?—We are not. Perhaps your Lordship will allow me to refer to one or two letters that I have received from school teachers, both in the city and in the country, who have had the practical working of this system of teaching blind children in common schools, showing that both in city and country districts this system is not only practicable but beneficial to the children, and entails little or no trouble on the teacher.

14,229. Are those letters from schoolmasters who have blind under their care?—Yes. Some of them have two blind children in their school, and some have had several years experience with several pupils. I should say that these letters are in reply to letters which I addressed to the teachers, asking them their experience with regard to the teaching of blind children in their schools.

14,230. Are all those to whom you addressed letters and from whom you received replies favourable to blind children being taught in board schools?—Without exception; there are 20, I think, here, and some have not yet replied.

14,231. Will you read one of those letters?—This is dated the 10th of November 1886, from the St. George's Road Public School, Glasgow: "Dear Sir. In reply to "yours permit me to state that I have only had two "blind boys under my care in sighted schools. My "experience extends over seven years, the first boy "being four years while the second has been three "years, and is still under my charge. So far as my "limited experience goes, personally, I have felt very "very little, if any, inconvenience in the teaching of "the blind, on the contrary, I have rather taken a "pleasure in teaching these two children. After their "first year at school, and when once they can be got to "monosyllables, they are then very easily taught, the "writing, and especially the arithmetic, is so simple "that the child is very easily instructed. The blind "child is little or no difficulty for he seems to be gifted "above the average child and easily acquires what is "required of him in a given period. Speaking more "particularly of the one presently under my charge, "and who is in Standard IV., I find it requires very

Mr. J. Macdonald.

6 Dec. 1886.

" little effort on his or his teacher's part for him to " keep apace with the rest of his class. His memory " work and intelligence are above the average. At " this stage the only thing is the geography, so far as " to learn him to know the relative positions upon a " map, but when the teacher cannot afford to spend the " time over him individually, then the best, or one of " the best, scholars in the same class is placed beside " him, and this scholar guides the blind boys fingers to " the proper place on the prepared map, at the same " time that the rest of the class are being shown places " on a large map. I may mention that the presence of " a blind boy has a most wholesome effect upon the " rest of the children in the same class. His presence, " I think, makes them have a greater consideration and " respect for their neighbours or neighbour who in this " instance is less gifted. In my opinion the blind boys " who are educated at sighted schools are more likely " to have the natural ways of boys, they can engage in " the general work better, and be trained so that when " they enter the battle of life, or bloom into manhood, " they may not feel the same diffidence in mixing with " those endowed with sight. A pupil teacher, of average " ability, can easily be trained in a short time to instruct " a blind child, and I have found it comparatively easy to " get the same pupil teacher for two consecutive years to " give the lessons. I may state that these blind children " have kept pace with the class each year, and have " been presented to Her Majesty's Inspector of Schools, " and received and passed the same standard of exami- " nation as sighted children. I am, yours faithfully, " R. J. Wilson." Then I have another letter from the master of the Garrallan Public School, Old Cumnock, dated the 23rd of November 1886, in which he states that his experience is similar to that of the writer of the letter I have just read, and in the postscript he says this: " Her Majesty's Inspector's examination of this " school takes place in January. You might kindly " forward a note requesting that Hugh " (that is the blind pupil at the school) " may be examined in the " 6th Standard, which I will show to the Inspector " who may be kind enough to do so. I think it should " be compulsory for inspectors to examine blind pupils, " and payment of the passes made along with the rest, " and I see no reason why this should not be the case." He is going on former experience when this same blind boy was not examined by the Inspector at the examination.

14,232. That is a point which you think ought to be borne in mind in any alteration of the law?—Yes, we think that our blind children ought to be put under the same examination as sighted children, and that the school teacher should receive payment by results. Perhaps you will allow me to point out another matter in connexion with the education of the blind, we have not yet received an authoritative interpretation of this 69th section of the Education Act.

14,233. It has never been brought before a court of law?—It has not. I have brought it under the notice of the Scotch Education Department myself, and have received a reply, leaving the question just where it is.

14,234. I suppose they decline to interpret the Act of Parliament?—Yes.

14,235. Why has the question never been brought before the courts of law?—So far as we are concerned, we were always anxious to keep on good terms with the school boards, and we never pressed the matter—we have usually got into the good graces of the individual teachers and wrought with them—we have sometimes had difficulties, but we have usually managed in the end to get the children admitted.

14,236. What are the operations of your society with regard to finding employment for the blind?—On the question of employment I should like to call the attention of the Commission to some statistics, as they bring out the number who require employment and show their general condition.

14,237. Are those statistics taken from the annual reports of your society?—Yes.

14,238. Have they been personally verified by you?—They have been personally verified by me.

14,239. These are very interesting statistics, and we may perhaps find a place for them in the appendix, but I would rather get from you your opinion as to the best way in which the adult blind can be occupied?—The industrial blind may be divided into two classes, namely, the young, say between the ages of 15 and 25, which may be reckoned the best period for technical education and training, and the adults, say from 25 to 60 years of age. From the Government census and from our own statistics taken together, as they require to be taken together to bring out the actual number of the blind, there are in Scotland about 330 blind persons between the ages of 15 and 25.

14,240. Can you distinguish between those who have been born blind and those who have become blind in after life?—I cannot distinguish between those who have been born blind and those who have lost their sight afterwards, but of those 330 between the ages of 15 and 25, there are in the various institutions about 150, leaving 180, say, between those ages who are not provided for.

14,241. It makes a great deal of difference whether they were born blind or whether they have lost their sight afterwards, that is to say, whether they have been educated in any particular trade or business before they lost their sight or have merely passed through the ordinary elementary schools of the country, therefore, if you class together those who have been born blind and those who have lost their sight afterwards, it would give a false impression?—The proportion of those born blind is very small, not perhaps 4 per cent. according to our reckoning, but according to a report or a letter which I have received from an eminent oculist in Glasgow, Dr. Pollock, who has just published a valuable work, entitled "The Normal and Pathological Histology of the Human Eye and Eyelids," he brings down the percentage of those actually born blind to a very low figure indeed, something like two per cent.; but of the 1,200 on our roll I find that there are 105, or about nine per cent., between 15 and 25 years of age, and of these 13, or about 12 per cent., were born blind, or lost sight a few days after birth.

14,242. Then may we assume that the larger number of those you mention between the ages of 15 and 25 have become blind after the age of 15?—A good many have become blind during the first three months of their life.

14,243. Can you tell us what percentage of those 180 between the ages of 15 and 25 would have passed through a sighted elementary school—that is to say, who had been brought up with seeing children?—I have no correct record of the number who have passed through sighted elementary schools.

14,244. When you are speaking of the occupation of adults, you are speaking of males?—Yes.

14,245. I may take it that about 12 per cent. of those have been born blind or also have become blind early in life?—Yes, of that class of blind between the ages of 15 and 25, of which there are about 330 altogether in Scotland, about 150 are provided for in the blind asylums at present, leaving about 180 who are not so provided for. I do not blame the managers of the institutions for this, they have no doubt a difficult task; but what is needed to meet the requirements of the 180 who are apparently not provided for by the various institutions is increased accommodation, suitable provision for the maintenance of pupils during apprenticeship, and increased facilities for their efficient instruction.

14,246. You think there should be workshops established in which those who are not in any institutions should learn some trade?—There ought to be such workshops established: the accommodation is too limited at present.

14,247. Would you recommend that such workshops should be established in one centre or two or three centres?—We think there ought to be workshops in every town where the number of blind would warrant the establishment of such an institution.

14,248. It would be more economical to have a large number of blind working together in one centre than to have one in every town in Scotland?—Yes; but there are other considerations to be taken into account. Take a town 20 or 30 miles from Glasgow, take Kilmarnock, where there may be say 15 or 20 blind adults: they have their families and all their associations in Kilmarnock, and some of the members of their families may be employed there, and to remove the family to Glasgow would be to break up all their associations.

14,249. Assuming they are between 15 and 25 years of age, it is not many of them who would have families at that age?—I refer to blind men who have families—blind adults. I am not referring to age just now; I am referring to the number of individuals in a particular town, say 15 or 20, whose ages may average say 25 to 60 years. They would require to break up their family associations in the town where they were known and, where they would have a better chance of supporting themselves, and come to a town where they might find employment or they might not. The father of a family might have no wages for the first year, perhaps not for two years; how is he to be supported?—We believe that it would be in the interest of the blind to have a workshop in Kilmarnock rather than to bring all the blind into one centre in Glasgow.

14,250. In Kilmarnock how many blind would there be to form a workshop?—I have simply named Kilmarnock as an instance.

14,251. I take that as an instance. You would not, I presume, have a workshop unless there were at least 8 or 10 blind adults to take advantage of it; would there be 8 or 10 in Kilmarnock?—There would, and perhaps more.

14,252. What is the population of Kilmarnock?—25,000 to 30,000, I think.

14,253. In a town of that size you would have a workshop?—Yes, for employing adults.

14,254. (*Dr. Campbell.*) A permanent workshop or a place in which to teach them a trade?—They would not board there; they would simply get employment there. The occupations would require to be simple. I am speaking more particularly now with regard to grown up people, that is, those between the ages of 25 and 60. The occupations for that class would require to be very simple, because they could not learn such work as basket making or brush making so as to earn a livelihood by it at that late period of life; but as regards the younger and more active blind, I believe it would be better for them to be drafted into larger institutions where they would be trained to skilled handicraft trades.

14,255. (*Chairman.*) That is to say, those between 15 and 25?—Yes.

14,256. You have already told us that in the case of the elder men basket making would not be suitable: what are the trades that you would start for those who become blind in mature years, say after the age of 25?—Fire-wood breaking and sack sewing.

14,257. Would you try mattress making?—Yes.

14,258. Suppose the workshop made mattresses; do you think that it should also sell iron bedsteads in order that it might sell its mattresses at the same time?—It might do so. What I thought was that a number of these small workshops might be joined together under some co-operation—that they might work together and send their work to and get their material from a central depôt.

14,259. Do you mean you would have a central depôt for Scotland for the sale of work produced by the blind?—It might be too large an undertaking if you had one central depôt for the whole of Scotland; but there might be a central depôt for the West of Scotland, say at Glasgow.

14,260. And one at Aberdeen for the north and one at Edinburgh for the south-east?—Probably; but for all skilled trades brush making, basket making, and where machinery was required, you would need to have a large institution where all the young and more active would be trained properly.

14,261. You could not have such a large institution in many parts of Scotland?—No; perhaps the existing institutions might be sufficient, if enlarged and better equipped, to meet the requirements of that class.

14,262. With regard to teaching those to read who become blind in mature years, what proportion of those whom you now visit can read either Braille or Moon type?—About 45 per cent.

14,263. Do you find any difficulty in teaching men in those circumstances to read?—In some cases we do.

14,264. Do you teach them Moon?—Principally; we have a number who read Braille. We have now, I should say, between 70 and 80 who read Braille. A number of those are children; but we have a number of adults who also read Braille.

14,265. With regard to the question of pensions, you have not many pensions in Scotland?—We have practically none.

14,266. You have none in your district, at all events?—Not in our district, and there is only one fund in Dundee, the total amount of which is about 12,000*l.*

14,267. There is one in Inverness?—Yes; I wrote to the agent there to get some particulars of it, but he has not given me any particulars. We have no pensions in Scotland except those.

14,268. What provision do you think should be made for the infirm or aged blind?—I would divide the blind into two classes. With regard to all the able bodied, I would say that provision should be made for employing them and they should be aided by the State. With regard to those who are aged and infirm, and incapable of working, I would not recommend that the State should be called upon to aid them.

14,269. You would throw the aged and infirm entirely upon private benevolence?—Upon private benevolence and the parochial authorities.

14,270. How are the parochial authorities to treat them; are they to take them into the house or to give them relief outside?—We think they ought not to apply the house test to the blind, and that the out-door relief ought to be much more liberal than it is at present. About 2*s.* 6*d.* a week is the average sum now given; we think it might be increased to at least as much as is required to support them inside the poor-house, which might come to from 3*s.* 6*d.* to 4*s.* a week at the least, I should think.

14,271. You know that some of the blind workers in Scotland have asked that State aid should be given them direct?—I am aware of that.

14,272. You do not think that it would be wise for the State to grant that?—In a modified form I do. In the case of the young who have been trained in institutions, I would suggest that such aid be given on the principle of "payment by results," and that three-fourths of the grant thus earned be payed to the blind direct, and one-fourth to the institution in which they were trained; and that a corresponding grant be paid to the adult blind who have had no such training, but who may be employed in various ways outside institutions.

14,273. Would the aged and infirm blind object at all to receiving aid through the parochial boards?—Parochial boards and private benevolence might supply the wants of that class, but as regards the industrial blind we strongly recommend that the State should be asked to aid that section of the blind, so as to encourage industry and self-help. I believe that that is the unanimous voice of Scotland. There may be some differences of opinion as to the mode of distributing the State aid or charity, as to the hand through which it should reach the blind, but I believe both the blind and those who are specially interested in them are unanimous in the feeling that the State ought to support to a certain extent the industrious blind.

14,274. (*Dr. Tindal Robertson.*) Is the mission to the out-door blind for Glasgow and the West of Scotland a branch of any London society?—No.

14,275. Was it established entirely independently?—Yes.

14,276. Was it established in the first instance to put forward any special type or system of teaching?—No; we taught the Moon system specially, indeed, exclusively, for many years, simply because it was at that time, and still is found to be best for the adult blind, and it was for the benefit of that class that the mission was specially instituted.

14,277. When did you begin to start the Braille?—Four or five years ago: we had been using it a little before that; but it was five or six years ago that we took it up specially and almost exclusively for the children.

14,278. What induced you to take it up?—We found the Roman type would not suit.

14,279. You did not teach any writing at that time?—Not till we introduced the Braille. We introduced the Braille because by it we were able to teach writing; the children could write their own exercises at school, and it saved them learning an extra type, and we found also that we had better literature. We could get Nelson's Royal Readers in Braille, and we had no class books in the Roman type.

14,280. What are your reasons briefly for advising that blind children should be educated at a board school instead of in separate institutions?—In the first place it takes the children away from home to send them to an institution; it deprives them of the benefits and

Mr. J. Macdonald.

6 Dec. 1886.

influences of home life. We believe it is injurious to congregate blind children in large numbers, shutting them out from the world and allowing them to mingle only with those afflicted like themselves; we think that they cannot possibly have the same idea of the outer world, and the ways of the world, and the thoughts and habits and usages of ordinary society by being shut out from the seeing community.

14,281. I understood you to say that you would wish that section 69 of the Scotch Education Act of 1872 should be amended in such a manner that school boards might have the power to enforce compulsory attendance on the part of blind children in the same way as in the case of sighted children?—Yes.

14,282. Suppose the school boards had that power, would you advise that they should send a number of children to separate institutions and pay those institutions for their instruction?—We would propose that the school boards themselves should educate the children; it should be left to the school boards to provide education for them in their own schools.

14,283. In that case you would require inspection?—The blind children would be treated in all respects as sighted children; they would be taught in a class as the sighted children, and they would be examined by Government inspectors in the usual way, just the same as sighted children.

14,284. And the teachers would be paid by results?—Yes.

14,285. Would you think it advisable to have special inspectors appointed for the examination of blind children?—No. The inspectors who put themselves to the trouble—I need not say trouble because they have not found it any trouble—have been examining our blind children for many years past along with sighted children.

14,286. Without any difficulty?—I have no report from any of the inspectors as to any difficulty that they have experienced.

14,287. You referred to some letters from different schoolmasters, have they alluded in those letters to that question of inspection at all?—One of them has, but he does not point to any difficulty. He merely mentions the fact that the inspector was specially pleased with the blind pupil.

14,288. Have you any suggestion to make with regard to the qualifications that would be necessary for the special inspection of these blind children?—I think the inspector would get through his work much better if he understood the special appliances used by the blind for reading, writing, and arithmetic.

14,289. Do you consider that it would be absolutely necessary, in order to enable the inspector to make a satisfactory inspection, that he should have that qualification?—I believe it would.

14,290. With regard to State aid, which has been alluded to by the Chairman, we have been told by one witness that he thought it advisable that aid should be given partly by the State and partly by the parochial board: do you agree with that?—No, not to the same individual, at the same time.

14,291. For what reason?—I think that parochial relief ought not, unless under very special circumstances, to be given to an able-bodied man, notwithstanding that he is blind, but I believe the State ought to aid such a man to enable him to support himself, that is to say, to help him to put forth his own exertions.

14,292. For educational purposes as well as for industrial purposes there are very large voluntary subscriptions, I presume, in Scotland as in England?—Yes.

14,293. Do you think that if State aid was largely given that would at all interfere with those voluntary contributions?—I think it would not. I think it would rather stimulate and encourage private benevolence.

14,294. (*Mr. Arrol.*) With a view to reward masters in the sighted schools for taking extra pains with blind children, would you be disposed to recommend that an increased grant should be given to the masters in whose schools blind children were received?—Yes, say double.

14,295. Have you found throughout Scotland that many masters have an objection to taking blind children owing to the increased trouble?—No, not now. At the beginning we found there was a little objection on their part until they quite understood the method. Now I might say we have little or no difficulty in getting a teacher to receive a blind child.

14,296. Have you any experience as to the success that has attended a blind child that has been taught in a sighted school after it has gone out into the world?—Yes. several have been sent to the Royal Normal College, who have taken a good place there on their entrance, and who have, after a short period of training, —two or three years—turned out very excellent workmen, and taken their place in the world with credit to themselves.

14,297. Do you think they were better prepared to receive the training which they got at the Normal College, owing to the education they received in the sighted school, than if they had passed through a blind asylum?—Very much better; their self-reliance was much greater, and they knew more about the ways of the world, and could move about with more confidence than if they had been trained in an institution in early life.

14,298. In answer to a question which his Lordship put to you as to the objects of your society, you said that, besides being a missionary society you are a benevolent society, and that you endeavour to find employment for the blind with whom you come in contact. You stated that there were 1,193 blind persons under the care of the mission; how many of those have you found employment for?—Just now we have 183 who are more or less employed, contributing more or less to their own support.

14,299. Can you give us any information as to the amount which those 183 earn weekly?—Yes; and also, generally speaking, I can tell you how they are employed. Of those, there are 15 tuners and teachers of music—those have received a special training at the Normal College; three are missionaries, one is a commercial traveller, with a salary of 100*l.* a year. Of shopkeepers (various) there are seven, averaging 15*s.* a week. There are 87 selling coals, firewood, drapery, hardware, and other commodities, whose average earnings weekly would be about 9*s.* 6*d.* Then in public works there are 34, some of them being in shipbuilding yards, engaged in spinning oakum and re-screwing bolts, putting nuts on bolts; and there are also a few labouring on farms, working as ordinary labourers.

14,300. (*Chairman.*) Those would be persons with defective eyesight, not totally blind; they are mostly totally blind.

14,301. (*Mr. Arrol.*) What wages do those 34 receive?—Eight 15*s.*, and upwards; 20 10*s.*, and upwards—that is, between 10*s.* and 15*s.*; and six between 5*s.* and 10*s.*

14,302. Have any of those 183 that you have mentioned been trained in a blind asylum?—About one half of the tuners and teachers have, but none of those who are trading on their own account or working in the shipbuilding yards; they have not been taught any industry as blind persons, they lost their sight when they were beyond the age at which they could be received into any institution.

14,303. Have any of those who lost their eyesight when employed in any shipbuilding yards been retained in those works after losing their eyesight?—One or two have, but in most cases they were not employed in the same shipbuilding yard before losing sight in which they now are; while a number had never been so employed as sighted men.

14,304. You have mentioned that there are 15 tuners in your district; can you say if success attends the whole of them?—I have their rates of earnings here: three are at and over 40*s.*; two at and over 30*s.*; four over 25*s.*; four over 20*s.*; one over 15*s.*; and one over 5*s.* I should say that the one over 5*s.* has just recently started on his own account in a small town. When this information was obtained he had newly started business, and had obtained a very small connexion.

14,305. Have none of those who have been trained in one of the higher institutions for music taken to playing in the streets in order to get a livelihood?—Not one; they are all thoroughly respectable men, earning their living by the profession that they were trained to.

14,306. (*Mr. St. John Ackers.*) You have stated that in your opinion the memorial of the blind workmen conveys an expression of the opinion of the whole of the blind workmen, or nearly so, of Scotland?—Yes, that is to say, of those who are in institutions.

14,307. Then if that is so, can you tell the Commission why so many of the workers in institutions either profess to know nothing of that memorial or disagree with the terms of it when they are asked about it?—I cannot answer that; I was not aware that there was such a diversity of opinion upon the points brought out in the memorial. I have been in communication with those whose names are appended to the memorial, and I understood that they were thoroughly representative blind men.

14,308. Have you yourself ever visited any industrial institutions and asked the blind people at work in those institutions whether they agreed with the terms of the memorial?—I have in our Glasgow institution. I have also been in communication with some of the blind men in Edinburgh, and their views are in accord with those brought out in the memorial.

14,309. Are you in favour of having blind teachers of the blind. I mean for educational purposes in schools?—I have not had much experience of blind teachers in schools.

14,310. Have you had any experience with regard to blind teachers of trades?—No.

14,311. Are you in favour of the employment of blind teachers in connexion with your society?—Yes, we have one just now.

14,312. (*Admiral Sir E. Sotheby.*) How far do the agents of your society visit outside towns?—We visit every town and village and rural district within the counties that I have named, wherever a blind person is found or can be heard of.

14,313. You are able then to deal with isolated cases in the country?—Yes.

14,314. How do you deal with isolated cases of children?—I have read an extract from a letter from the teacher of the Garrallan Public School, a little way out from Old Cumnock. We got that teacher to take the little boy that he refers to in his letter into his school, after a little preparatory teaching on our part, we got his parents to assist us in teaching him at home preparatory to his being sent to school, then we explained the whole system to the schoolmaster and provided the boy with suitable apparatus and books, and he took his place in the school as an ordinary pupil, and has now passed the Fifth Standard.

14,315. Would that be an exceptional case?—There was nothing exceptional about the family—they were just poor working people—there was nothing exceptional that I could see in his case.

14,316. You think that there is no difficulty in teaching an isolated case in the country?—There are difficulties, but they may be got over. I may mention another case in which we got over the difficulty some years ago. In another country district, in Ayrshire, we came across a boy who was one of a large family of young children, the mother could not devote much time to teaching the blind boy; and we got a lady living near to allow the blind child to visit her every afternoon, and she gave him lessons.

14,317. With regard to the adults, how do you deal with them?—We visit them as missionaries, teachers, and friends, and advise with them in regard to their temporal and spiritual interests, helping them when necessary as far as we are able.

14,318. Do you visit them once in every three weeks?—In the town once in three weeks, and in the country about once in six weeks. I should also repeat that while we go over a country district, say on an average once in six weeks, there are many cases that our missionaries or teachers see much more frequently than that when special circumstances require.

14,319. Do you consider that you are enabled sufficiently to educate an adult in that number of visits per quarter or half year?—Yes, and, as in the case of children so in the case of adults, we try to get some member of the family interested to assist.

14,320. Is the instruction which is given at your board schools given entirely by sighted teachers?—Yes.

14,321 There are no occasional blind teachers as in the case of the English board schools?—No, there are no blind teachers.

14,322. It is found that an ordinary sighted teacher is competent to teach blind children?—Yes.

14,323. And the result is found to be perfectly satisfactory?—Yes, under the present arrangements we think it is.

Mr. J. Macdonald.

6 Dec. 1886.

14,324. The blind children who are being instructed in the board schools compare favourably with the sighted children?—They take their place with the sighted children, and, as a rule, keep pace with those in the same class.

14,325. You see no objection to blind children being educated with the sighted ones?—I see no difficulty or objection in their being educated in sighted schools.

14,326. You say that out of the 1,193 blind that you visit 183 are employed. Out of those 183 how many gain a livelihood by music?—Fifteen.

14,327. Then the balance gain a livelihood by other occupations?—Yes, the occupations that I have mentioned.

14,328. (*Mr. Mundella.*) Will you state to the Commission the general purport of the letters which you have received from masters of board schools. Is it that blind children can be educated with sighted children by ordinary schoolmasters?—Yes, that is so.

14,329. As I understand, your opinion is that it is injurious to separate blind people from the sighted for educational purposes any more than is absolutely necessary?—Yes, I think the separation ought to be as short as possible in duration of time.

14,330. You believe that by educating the blind with the sighted they gain more confidence and self-reliance, and that they get more sympathy from their fellows and have more sympathy with their fellows than by separating them and putting them in institutions?—Yes, and they also learn a good deal through the eyes of their schoolmates about the world and things in the world.

14,331. I understood you to say that you thought it would be an advantage if the school boards had the power to compel the attendance of blind children at their schools?—Yes.

14,332. In Scotland you have a school board in every parish, have you not?—Yes, I believe so.

14,333. The whole education of Scotland is practically under the control of school boards?—That is so.

14,334. Did I rightly understand you to say that you were in general agreement with the statements made in the memorial of the blind workmen in Scotland?—Generally, I agree with them.

14,335. As a whole, you believe that the proper course of treatment of the blind is first to give them a good educational training in their youth and then to throw them as much as possible upon their own resources, supplementing their earnings where necessary either from voluntary contributions or from State funds?—That is our view. We believe that blind children ought to be treated, both at home and at school, as nearly as possible as we treat the seeing; and that the earnings of the adult blind be supplemented from State funds.

14,336. (*Mr. Johnson.*) You employ seven visitors in your society; how many of those visitors are blind?—One.

14,337. Have you been in the habit of employing blind visitors?—We had two, but one of the two died, and we have only one now. The one who died was an agent of the society for about 20 years; the present one has been with us for about four or five years.

14,338. Do those blind visitors teach by Braille or by Moon?—Both.

14,339. At the commencement of your operations you taught, as I understand, by the ordinary Alston system?—Yes.

14,340. Did you find that there was any difficulty in teaching those whom you visited by the Alston system?—There was not so much difficulty in teaching the children the Alston type, but it did not serve them for any purpose in after life. In the first place, when they went to learn a trade they could not continue to read it, and, in the second place, the literature in that type was so limited that there was practically nothing in it; so we found that if we wanted to teach them a type that would be of use to them in after life it was much better that we should teach them Braille than the Alston, and further, by learning Braille, they had the means of writing.

Mr. J. Macdonald.

Dec. 1886.

14,341. As I understand, you have not excluded other systems than Braille entirely; you teach Moon as well?—We teach Moon to adults.

14,342. You stated that you do not teach them to write; can you give any reason why you do not teach them to write?—We teach the children to write in Braille.

14,343. But you do not teach the adults to write?—We have taught a few, but we have not made that any special part of our work.

14,344. Do not you think it a desirable thing that you should teach blind adults to write in the same characters as the sighted, so that they might communicate with their sighted friends?—We have never found it to be any great want. The blind themselves have never expressed any desire to be taught to write, nor have they shown us that they were suffering any deprivation in not being able to write. I should say, however, that a number of our adults do write, but we do not make it a special part of our work.

14,345. In what system do they write?—The ordinary writing.

14,346. Do they use the embossed frame and the ordinary Roman letters or the Guldberg frame?—They use a tablet with raised lines to guide the hand, and write with a pencil.

14,347. I understood you to say that while you advocated the education of blind children in board schools you would suggest some alteration in the mode of their education there; what suggestion would you make with a view to improvement in that respect?—I would recommend that it should be authoritatively declared that school boards be held equally responsible for the education of blind children as they are for the education of seeing children, either by accepting what we believe to be the true interpretation of the 69th section of the Act of 1872 or by amending that section so as to give it the effect which we say it was intended it should have; that provision be made for supplying the requisite class books and other educational appliances at reduced rates, or free of charge; that scholarships be established to aid and encourage higher education; and, as I have said, that the Parliamentary grant be double.

14,348. I understand that School Board schools are established in almost all the parishes in Scotland; would there be any difficulty in getting blind children into those schools on account of distance?—No, there could be no difficulty; the schools are situated to accommodate the districts for sighted children, and there is nothing to hinder a blind child from going to anyone of those schools.

14,349. You tell us that of the 183 people employed there are 15 tuners and teachers of music, are they tuners and teachers of music only, or do they carry on the profession of musicians as well?—Some of them are both tuners and teachers of music; some of them are tuners pure and simple, some are teachers of music and nothing more, and others are organists and teachers.

14,350. Can you tell me the number of organists out of the 15—three or four?—Not so many, not more than two I think.

14,351. Where would those organists have received their musical education?—At Norwood.

14,352. Entirely?—Yes.

14,353. They have not been instructed in any other institution?—They got their musical education at Norwood.

14,354. Entirely?—Yes. There is one of the 15, a tuner, who did not receive his training altogether at Norwood.

14,355. But the others received their education at Norwood?—Yes.

14,356. Did those who went to Norwood get scholarships?—We have no scholarships in Scotland.

14,357. Who sent them to Norwood?—Some of them were paid for by the Glasgow College Committee; I suppose most of them were paid for through that source.

14,358. You have three blind missionaries among your 183, were they educated in Scotland?—I do not know that they received any special education for the situations they now fill; two of them were clerks before they lost their sight.

14,359. Were they educated in Scotland?—One of them was educated in Ireland, and the other two in Scotland.

14,360. With regard to those of the 183 who are shop keepers or earning their living at selling various commodities, and those who are employed in public works, were any of them educated at all in any blind school?—None of them were trained in institutions; they all lost their sight in after life.

14,361. All the special knowledge that they got as blind men they got through your society?—Yes.

14,362. Are you in any way connected with the large society in England which is called "The Home Teaching Society for the Blind"?—No.

14,363. You have told the Commission that you have had some conversation with blind workmen in institutions about this memorial; have you any idea whether the blind are desirous of having a voice in the management of public institutions for the blind?—I believe so, some of those that I have interviewed on the subject do express a desire to have a voice in their management.

14,364. Is that because they consider that the blind are not sufficiently represented upon the committees of the existing institutions?—Yes.

14,365. Is that the general feeling in Scotland?—I cannot speak to the general feeling in Scotland, but I know that it has been expressed by some—to what extent the opinion prevails I am not aware.

14,366. What is your own opinion about it?—I think that so far as our Glasgow Institution is concerned it is very well managed, we have on the committee of management representatives from various corporate bodies, the Merchants' House and the Trades House, and so on.

14,367. Have you any blind men on it?—We have no blind men on it. I do not know that the feeling exists so strongly in Glasgow that there should be blind men on the committee. It might possibly be an advantage to have blind men on it, but I have no definite opinion upon the subject.

14,368. The memorial contains this suggestion: "With reference to the management of existing institu- "tions, we suggest that such management should be "placed in the hands of gentlemen selected from the "benevolent subscribers, and from public bodies, and "also that the workers in such institutions should have "the right to nominate one or two gentlemen on the "board of management." With your knowledge of the requirements of the blind in Scotland, do you think that that is the general impression amongst the blind?—That matter was brought under my notice by those whom I understood to be representative blind men, beyond that I cannot say how far the impression prevails among the blind generally.

14,369. And you do not agree with that portion of the memorial?—Not to the extent of urging that point very strongly.

14,370. Have you heard any opinion expressed among the blind workmen in the various institutions that there is more sighted labour employed in institutions than there ought to be?—Yes, that has been very strongly expressed.

14,371. What is your opinion upon that question?—I think that the less sighted labour there is in the institutions the better for the blind people.

14,372. On what grounds do you arrive at that conclusion?—The institution exists for the benefit of the blind, and if you make it a general workshop you take away the character of the institution for one thing, and if the blind can do the work that the sighted are doing, why not give it to the blind to do. There may be, and I believe there is in blind institutions, certain parts of the work that the blind may not be able to do, but I believe it is a very general impression amongst the blind themselves that there is more sighted labour in some institutions than there ought to be.

14,373. Is that your own opinion?—Yes.

14,374. Do you think it would be desirable to employ the deaf and dumb as sighted people to help the blind in workshops or in institutions?—Yes, I think that would be a very good arrangement. I know that that is done to some extent in one institution.

14,375. You think that would be a desirable thing?—I do not see anything to prevent the adoption of that suggestion.

14,376. (*Dr. Campbell.*) As you hold such strong opinions that it is better for the blind to be among the seeing when they are young, do you not suppose that there are some disadvantages in keeping them congregated together in workshops; would it not be to the advantage of the blind men working in workshops or institutions if you had a certain proportion of sighted help?—My view is that instead of having very large institutions, and having the blind gathered together in such institutions in large numbers you should have them in smaller workshops where there would not be so many of them together; and further, if you allow the blind to live in family as is done in Scotland, you reduce the evils of the congregate system to a minimum.

14,377. If you keep a great many blind people together when they get old do not you think they become clannish?—Yes, possibly they do.

14,378. You have advocated very strongly that we should have all the blind children educated under school boards rather than in institutions. I suppose in advocating that mode of dealing with blind children you have taken the institutions in Scotland as they exist at the present time, and you have not considered whether it would be possible to improve those institutions so as to make them far better for the blind children than they are at present?—I have taken the institutions in Scotland, generally, as they now exist.

14,379. Suppose there was a school for blind children with proper playgrounds and apparatus, and with every facility for teaching the blind, can you not conceive that it would be better that blind children should be taught together in such a school than for them to be placed in an ordinary school to take things as they come?—I do not think so. We have such a school in Edinburgh, where the education department is entirely separate from the industrial; I had that in view when I gave my opinion.

14,380. Do not you consider that blind children in order that they may be prepared for their future career, and in order to enable them to stand in after life on an equality with their sighted competitors, require much special instruction, and that they must have a special school for the purpose?—Not in their elementary education.

14,381. You limit it to elementary education?—Yes.

14,382. Would you fix a limit of age at which they should leave the board school?—I would fix the limit that the Education Act fixes, to pass through the Education Code.

14,383. Is not it the fact that it is very difficult to train blind children to become skilled mechanics if they pass a certain age without having been trained in the use of their fingers?—We have found that the pupils whom we have sent to the Blind Asylum to learn a skilled trade have been able to settle down to their trade equally well and perhaps better than those who have been trained in institutions, that is to say, who have received their elementary education in a special school. I hold this opinion, that a blind child should be treated exactly as a seeing child. I think you should attend to his elementary education first, and it will be time enough for him to settle down to learning a trade when he has received his elementary education. Why should we treat a blind child differently from a sighted child?

14,384. Is not it the fact that blind children may be in a sighted school, and may live with sighted people, and yet be unconscious of the most apparent things about them all the time?—That may be, but it is not generally the case with us.

14,385. Have not you found even very active and intelligent blind children to be ignorant of the most apparent things that ordinary seeing children would know all about?—That may be quite possible if the child is not of a very inquisitive turn of mind, or if its companions are not very communicative.

14,386. When a blind child is with sighted children in the playground, for instance, do not you find that unless the blind child is very active he goes to the wall and that he is incapable of joining in the play of the others?—That is not our experience. A blind boy that I went to see in Kilmarnock Academy had a number of his class-mates playing at horses with him—he was the driver and he had a number of his companions as the horses. They ran round the playground, he driving them—he took them into the stable and went through the process of shoeing the horses and then started on a new journey.

14,387. No doubt you may find many exceptions?—That is the general rule with our children.

14,388. You think that as a general rule blind children are in such a condition that they can go into the playground and play with sighted children?—That is our experience.

Mr. J. Macdonald.

6 Dec. 1886.

14,389. (*Dr. Armitage.*) You told us that there were 34 people whom you visit working in public works, can you tell us how many of those are employed in shipbuilding yards?—I have bracketed together those who are in public works, the 34 includes those who are not actually in shipbuilding yards. I find from the previous statistical table, which is two years old, that there were 18 employed in shipbuilding yards.

14,390. You tell us that you have one blind teacher; how long ago is it since he was appointed?—About four or five years ago.

14,391. Do you prefer a seeing teacher to a blind teacher?—We found that our former blind teacher was most successful, and the district of our present blind teacher perhaps shows the highest per-centage of readers amongst the blind—that is one test of his work.

14,392. What are the circumstances that prevent your employing the blind generally as teachers?—My directors are not quite so favourable to it as myself.

14,393. You yourself favour the blind being employed as teachers?—In the city. I am not quite sure whether I would employ blind teachers in the country districts. The plan of employing blind teachers was tried in one county, not under our care, but it turned out a failure, for what reason I am not quite sure. As to the city I could say confidently that blind teachers would do equally well with seeing teachers.

14,394. What salary do you give your teachers?—From 80*l.* to 100*l.*

14,395. Does that depend upon the number they visit?—Not upon the number they visit, but rather upon their length of service.

14,396. Can all your seeing teachers read Moon?—Yes, and Braille also.

14,397. Can they all write Braille?—Yes.

14,398. Do you adopt any means of testing their writing, so as to ascertain whether they know the system well?—We have had examinations amongst ourselves, and I have asked them to write out two or three pages of Braille Magazine, to keep up their proficiency in writing and also in reading.

14,399. You told us that you had about 70 or 80 Braille readers; can you tell us how many volumes in Braille you have in circulation?—We have now about 180 volumes, I should think, in Braille.

14,400. Are most of those parts of the Scriptures?—About one-third are portions of the Scriptures.

14,401. Is the number of Braille readers increasing?—It is increasing just now.

14,402. After the children have been through the board school and have obtained as much elementary education as is considered desirable or possible, what do they do?—They generally get drafted either to the Normal College at Norwood or to institutions; and in the case of girls, who perhaps have no means of getting to a blind asylum to learn anything that might be taught there, they are taken into our own class-room and taught knitting by our own female teachers.

14,403. Does a paid teacher teach knitting?—We have a paid teacher and an assistant.

14,404. Do any ladies take it up?—They visit the blind females at their own homes, and take the full management of the Auxiliary Society.

14,405. But do any ladies teach knitting?—Not the ladies, the teacher does it alone.

14,406. About how many have you learning knitting?—We have 90 knitters on the roll altogether, and a few of those are learning; and they are always being added to, of course.

14,407. Can you give the Commission an idea how many attend the class for learning?—There will be an average of from 18 to 30 daily.

14,408. Do you know of any men or women living at home who have been educated at the workshop and taught a trade, and who are exercising at home the trade that they learnt there?—There are only three.

14,409. What are they?—Basket makers, all of them.

14,410. Are they earning their living?—One of them, in Ayrshire, is doing very well, but he is favourably

Mr. J Macdonald.

6 Dec. 1886.

situated at home. I am not quite sure whether he would be self-supporting were it not for the help that he has at home from his parents. A second one, in Glasgow, makes a fairish living mostly by doing repairs. The other one in Lanarkshire is not doing very well at all, indeed he is often in very poor circumstances.

14,411. Why does not the third man that you mention go into the workshop?—I am not quite sure whether he would be taken back; he is a good tradesman, but he is not very steady in his habits at times.

14,412. Do you approve of inter-marriage amongst the blind?—We do not, we strongly disapprove of it.

14,413. On what grounds?—In the first place, as a matter of earning their livelihood, the united wages of a blind man and a blind woman will be very limited, and unless they have some other means of income they will not be able to support themselves comfortably; and in the matter of house-keeping and bringing up a family we think it is not very desirable. It is not from any feeling or opinion as to the perpetuation of the evil in the family; I have had no experience of that; but it is more as a matter of domestic comfort.

14,414. Are you speaking from your own experience or from the experience of your missionaries?—Both from my own experience and from that of our missionaries. We have a few blind couples around us.

14,415. Can you tell us how many blind couples you have?—I should say that in Glasgow there might be 12 or 15 couples.

14,416. Can you tell us about how many of the women out of that number are able to keep their houses tidy, and to educate their children properly?—There are two that I know whose homes are as tidy looking as those of sighted women, but the others are not so.

14,417. I understand that your principal objection to the blind inter-marrying is on account of the blind women not being able to look after their homes properly?—Yes, and from the fact also that the blind husband's wages being so small the wife is not able to employ help to assist her.

14,418. In answer to a question put by Mr. Johnson, you said that many of your people wrote with pencil, and you further said that they wrote by Guldberg's system; do you know what Guldberg's system is?—I must have misunderstood the second part of the question, as I do not know the Guldberg system.

14,419. What do you mean by pencil writing then?—On a frame with raised lines for guiding the hand.

14,420. Raised lines writing with a free hand in pencil?—Yes.

14,421–22. Have you any blind women who have married seeing husbands?—There are a few, seven or eight I think, who have married seeing husbands.

14,423. You have a good many blind men, I suppose, who have married seeing wives?—Yes.

14,424. Do you approve of that?—Yes, I do.

14,425. (*Chairman.*) Has there ever been any proposal to amalgamate your institution with any of the other institutions in Scotland?—No.

14,426. One of the Commissioners pointed out that when you spoke of the blind being examined in the same subjects as the seeing, of course you excepted drawing from that; do you think that some more liberal grants should be made to the blind in consideration of the fact that they would not be able to qualify in one of those extra subjects?—We recommend that the Government grant should be doubled for a blind pupil for the reason stated, and also in consideration of the extra time and trouble in teaching.

14,427. You said that the blind should be examined in the same subjects as the seeing, and you now say that you think they should get double the grant?—I was not referring to the Government grant then, but inspection.

14,428. Of course drawing must be excepted from that?—Yes.

14,429. You think that where the seeing pupils get a guinea the blind pupils should get two guineas?—Yes.

14,430. Do you think that a grant of 10*l.* per head should be given to meet the educational requirements of your institution?—No, we do not, because the whole drift of my evidence goes to show that there is no need for these educational institutions.

14,431. Then supposing that from a variety of circumstances, for instance, some children being more delicate than others, the blind not being all equally strong, they would not be able, in many cases, to go to school; would there not always be a residuum that would have to be dealt with in an institution for the blind?—We think that there might be arrangements made for such solitary cases (we do not think that there would be very many) without maintaining large and expensive educational institutions for the purpose.

14,432. But do you think that for these cases there should be some Government grant proportionate to the additional expense of maintaining them in these institutions as well as teaching them?—If they were maintained out of their own family some grant from some source would require to be made; but we would recommend that in such cases the parochial authority should adopt the boarding-out system or some modification of it, as they do for seeing pauper children.

14,433. What do you mean by the "boarding-out system"?—Orphan or deserted children who are chargeable to the parish instead of being brought up and educated within the four walls of the poor-house are boarded out with respectable families in the country, where they are brought up. That is the custom in Scotland.

14,434. I thought that had been discontinued in Scotland?—From the last report that I had from Mr. Skelton, 75 per cent. of the orphan and deserted children chargeable to the parish were boarded out.

14,435. Those are seeing children?—Yes.

14,436. Do you recommend that the boarding-out system should be carried out with the blind instead of having separate institutions?—Yes. Where the home arrangements are such as will not permit of their being brought up in their own homes.

The witness withdrew.

Miss NEIL examined.

Miss Neil.

14,437. (*Chairman.*) You are teacher at the Asylum for the Blind at Glasgow?—Yes.

14,438. How many years have you been there?—Eleven years.

14,439. Were you educated in Scotland?—I was educated in Glasgow at the E.C. training college.

14,440. Are you a certificated teacher?—I am.

14,441. Has your school any Government grant?—Yes; for the last four years we have been under the Government and have received a grant.

14,442. At what age do your children come into the school?—Now we take them from six years of age.

14,443. Do you think that they ought to begin at the age of six?—Yes, I should think so.

14,444. As early as possible?—As early as possible.

14,445. Do you think that they ought to be taught anything before they come to the school, if possible?—If there is any opportunity for these children to begin reading or the like they might be taught; but we always find that they come with no learning at all.

14,446. Do you think that there ought to be an infant class preparatory to the larger institutions?—Yes, if we had sufficient scholars between the ages of five and eight I would make an infant class.

14,447. And you think that the Kindergarten system should be more generally used than it is now?—Certainly; it is imperatively needed in the case of the blind.

14,448. Do you think that it should be recognised in the Education grant more distinctly than it is?—Yes.

14,449. The Kindergarten is not recognised by the Government inspector as part of the education of the blind, except for the infant school?—It is not.

14,450. But you think that it should be recognised in all the classes, more or less?—Yes, I think so, in the case of blind scholars.

14,451. You think it ought to be used and recognised even beyond the infant school?—Yes.

14,452. And of course for the blind you would be in favour of physical training as far as possible?—Yes, very much.

14,453. You have not yet got a gymnasium, I think?—No, we only give them private lessons.

14,454. But your directors hope soon to have a gymnasium?—Yes, we expect to have one in the future.

14,455. You would be favourable to Government inspection, of course?—Yes, with modifications.

14,456. Do you think that there should be an inspector especially devoted to the blind, and not a general inspector?—No, I do not think so; but the requirements of the Scotch Code now are being raised so that it will become very worrying for blind scholars.

14,457. You think that they should be treated on the same principle, but in a somewhat more elastic and liberal manner than the seeing children are?—Yes, with the last Code we can do very well with a little leniency.

14,458. Do you think that the blind schools should have a higher grant in proportion to the difficulty of teaching the children as compared with seeing children?—I think so.

14,459. Of course the books and other educational appliances of the blind are more expensive than those of the seeing, are they not?—Very much more so, and then they require individual training in those appliances.

14,460. Have you at all made up your mind as to what should be the amount given by the State for the blind schools?—It occurred to me that as the people are taxed with school rates for sighted children whether there could not be a little more laid on for the education of blind children.

14,461. Do you mean that the Government should give a larger grant, or that the ratepayers in a town should pay an additional rate, which might be called a blind rate?—I think that the ratepayers might pay a little more for the education of the blind children.

14,462. How much more?—I have not considered exactly the amount, but I thought that blind children might have free admission for board and education into institutions.

14,463. Do you mean that the ratepayers should provide board and education free for the blind?—I thought so.

14,464. At present in your school how much is paid by the parents or by the parochial boards in the case of each child?—Twelve guineas.

14,465. How many of the children are free in your school?—Only those who are foundationers have bequests.

14,466. Are there any partially free?—Blind children not inmates are educated on payment of a moderate fee; if unable to do this they are taught gratuitously.

14,467. You have lately had an opportunity of visiting some of the blind schools in America, have you not?—Yes.

14,468. Did you find them well found and well furnished?—Very much so. I visited the Philadelphia school, where there are 200 children, and I thought their system was very good because the State keeps up those blind schools; the children are sent in free, being paid for by the State, and they remain there for a certain number of years and receive a very thorough education, and they are trained in a trade as well.

14,469. Then the trade shops are a department of the school?—Yes.

14,470. Did you see them at work in the school and also at their trades?—Yes, both.

14,471. Do they work at all on the half-time system there?—Yes, the boys do.

14,472. Do you know at all what were the ages of those in the school?—Now they are admitting them from eight years of age.

14,473. Do they remain there eight or ten years?—They remain seven or eight years; they are largely taught on the Kindergarten system, and they have a gymnasium.

14,474. Are boys and girls taught in the same school?—No, they are taught separately.

14,475. What do they do with the infants there?—They teach them in the Kindergarten.

14,476. Do they give them object lessons there?—Yes, very much so; that is very largely gone into.

14,477. Do they give them any secondary education there of a higher class than the ordinary elementary education?—They have music, and they train them as musicians.

Miss Neil.

6 Dec. 1886.

14,478. Was this a school where they were also maintained, or were they living with their parents or friends?—It was a boarding school for the state of Pennsylvania; they are all boarded in those schools.

14,479. Did you visit many other schools in America?—I visited the New York City school and the Boston school.

14,480. Did you find those schools to be of the same character?—Yes. I was very much impressed by the Boston school, they seem to have every apparatus and appliance that could be adapted to the wants of the blind there, and the training seemed very excellent.

14,481. Did you find a better system of books for the blind than in England?—I saw that they used the Roman type for reading. At Boston they have a printing press and they print the Roman character there, and they have a large collection of books,—almost every author. But with that they have other type certainly; they have Braille.

14,482. They have a mixture of types?—They have.

14,483. Are you acquainted with the working of the out-door mission for the blind in Glasgow?—We come in contact with it a little, and I know a little about it.

14,484. Do you ever get in your institution any who have been taught partially by the missionaries?—We get them sent in to us paid for by this mission, but that is all. This is not an educational mission; if there is any teaching it is only reading I understand.

14,485. I suppose you have seen the blind children taught in the board schools in Glasgow?—Yes, only of late. I visited those schools where they were taught.

14,486. Do you think that they can be successfully taught in those schools?—I do not think so.

14,487. Will you say why?—One reason is that the pressure of work is too great in an ordinary board school for the teacher to be able to attend to the wants of blind children.

14,488. But is it not a fact that the blind children pass the standards the same as other children?—Yes, they can in some instances, but they require a great deal of help.

14,489. Then do you think that so far as the interests of the blind children are concerned, they are better looked after in an institution than in a board school?—Certainly.

14,490. Have you observed any increased self-reliance in those who are taught in the board school?—No, I almost think the opposite in some respects.

14,491. Do you think that they are petted by the other children?—Not so much that, but they are made pretty much of by others, by patrons as it were who have them there. I have seen instances of it.

14,492. There have only been, I suppose, one or two cases in each school, and therefore they are treated quite exceptionally?—Yes. I went to call on those head masters who have experience of teaching the blind in sighted schools, and one gentleman told me that, in his opinion, it could not be done at all.

14,493. We have had evidence that it has been done?—I had a visit from a very respectable woman, who came up to see my school, accompanied by a little blind girl. This little girl had been in a board school in Glasgow for over a year, but her mother was not at all satisfied with her progress, and she came up to see the system of teaching with the blind. I asked the question what teaching she got, and it turned out that she got nothing, she had to sit throughout the teaching in arithmetic and writing, and the teacher was not able to give her any of those subjects, and she only heard her in reading when she had time.

14,494. Are you aware whether in that school the child took its chance with the ordinary seeing children, and had no special pains bestowed upon it?—This child had a slate which was part of the apparatus, but she did not bring it to school, the teacher did not understand it, and, besides, the teacher had not time to do it, it was not the teacher's fault.

14,495. Can you give us the name of the school where that occurred?—Crookston Street school.

14,496. How long ago was that?—It was last week.

14,497. Have you had any children sent to you from the board schools who, like this child, had failed in

Miss Neil.

6 Dec. 1886.

learning at the board school, and came to your school to be taught?—Yes, I have had several instances of that. I have had the case of one boy lately who had deficient sight.

14,498. He was not quite blind?—He was not quite blind, but his sight was of no use to him whatever in the way of education. He had been in a sighted school, but they did not make much of him. Certainly he was a very unsettled boy, and he was sent to me by Mr. Macdonald to try to settle him. Before that he had been a year with a grocer as a message boy, and then he was sent to me. He was in a very wild state when he came in, but since then he has settled down and become more like the others.

14,499. I suppose that there will be always among the blind a certain number who would not be able to profit by teaching in an ordinary school, and who would require special care either from deficient or moderate intellect or else from delicacy of health?—Yes, we have many cases of that description.

14,500. I suppose blindness is often accompanied by general weakness of health, which requires more than ordinary care?—Yes.

14,501. Is there anything else with regard to the education of the blind that you would like to mention to the Commission?—It is my opinion that there ought to be special schools and special homes for blind children. By special homes I mean institutions.

14,502. You do not believe in the board school system being able to be universally adopted for blind children?—No, it cannot be adopted in all cases.

14,503. You admit, of course, that it can be adopted in certain cases?—Yes, in some cases certainly.

14,504. (*Mr. Johnson.*) I suppose in your school you employ principally the Braille system, do you not?—Yes, now we employ the Braille system.

14,505. And formerly, in Scotland, you employed the Roman system?—Yes, at one time.

14,506. Is it your opinion that there should be only one system for the blind, or that two or three systems should be employed?—I would say that the Braille system ought certainly to be employed in teaching the young reading and writing, but I would teach them all types.

14,507. The Moon and the Roman?—Yes, the Moon and the Roman if we had it properly raised and embossed. The fault with our type was that it was not raised enough.

14,508. Do you think it would be a desirable thing with the object of placing the blind as near to the seeing as they could be by means of writing, that they should write the ordinary writing of the seeing?—Yes, we give them pencil writing, and if the directors could afford it we should give them type printing.

14,509. But you would give them the ordinary writing of the seeing?—Yes, certainly, and we do each it.

14,510. Do you think it ought to be made a *sine quâ non* in the education of the blind that they should write the writing of the seeing?—I think so. I would teach them as much as possible in the way of writing and reading, and put them as nearly as possible on a level with the sighted.

14,511. What is your opinion with regard to the Moon type?—I find the Moon type very good for those who have lost their sight in early years, or for those again who have been trained in Braille after they begin to work and the skin of their fingers has become hardened. For those and for older people the Moon type is very good.

14,512. During the time that you were in America did you find that there were many blind people who read and wrote by the ordinary Roman type?—Yes, in hose schools that I have mentioned, they do.

14,513. That is in Boston, New York, and Philadelphia?—Yes, and in Jacksonville.

14,514. What system of Braille do they employ?—In Philadelphia and Boston they have the ordinary Braille, and in New York City they have the New York point system.

14,515. Is that Braille full of contractions, such as are used in England, or not?—They have contractions as we have.

14,516. Exactly the same as we have in England?—I think so; so far as I could see it was the same.

14,517. I believe that all the contractions are not always the same in different schools; is not that so?—I was not aware of that.

14,518. You are strongly of opinion that blind children should not be educated in board schools?—Yes.

14,519. (*Dr. Campbell.*) In regard to the books used in New York, do they use any books printed in any other type than the New York point?—I think not; they all seem to have the New York point system. I remember so minutely because the teacher told me that she pitied me because we adopted the Braille system.

14,520. (*Mr. Mundella.*) Have you ever seen any children taught in board schools by competent teachers of the blind?—No, I have never met with such.

14,521. You have never seen the influence of any teaching in board schools by persons, for instance, who have been at the Normal College or elsewhere?—No. Some years ago when I visited London I was taken to visit a class of scholars in the London board schools, and there was a blind teacher there who had been trained in the Norwood Normal College.

14,522. What was your opinion of the effect of the teaching?—I thought it did very well in a large city like this where a number could be gathered together in one district.

14,523. But Glasgow is a large city, too?—Yes; but we have them more scattered somehow over the districts, and it seemed to me as if it would be rather a failure in Glasgow.

14,524. Your difficulty would be to get a sufficient number of children to one centre?—Yes.

14,525. Of course, if that was a matter of difficulty in Glasgow it would be a still greater difficulty in small towns and in rural districts?—Certainly it would.

14,526. Do you not think that every certificated teacher might learn sufficient of the teaching of the blind to be able to teach the blind in elementary subjects up to 9, 10, or 12 years of age, until they are fit for industrial training?—Yes, any certificated teacher could come to know all the education that the blind would require; but she would not be able to give them the special attention that they require in the hurry and pressure of a board school.

14,527. It would entail a good deal of additional labour upon any elementary teacher to have two or three blind children to teach?—Yes, certainly.

14,528. And, therefore, you think that the more economical plan is to gather them at some centre, either in an institution or a school, where a considerable number are brought together?—Yes, I think so.

14,529. As a matter of economy?—Yes, and in the interest of the blind children.

14,530. You have inspected the London board schools; do you not think that there are many advantages in having the blind children taught with the sighted children?—I have never known what the amount of success attending that school would be. I saw that for the moment it might do, but I do not know what the eventual success might be.

14,531. In answer to the Chairman, you said you thought that the Kindergarten system should be taught to children who were in the standards; that is to say, above the infant school. What part of the Kindergarten system do you think should be taught?—I would say making various little articles for the training of the fingers.

14,532. Your advocacy of the Kindergarten system would extend, I suppose, to sighted children as well as to blind children; you would carry on the Kindergarten work much higher in the school?—I would carry on the Kindergarten system later with blind children than with sighted children.

14,533. Because it is more necessary to teach blin children to be useful with their fingers?—Yes, and we have so many children coming in after the ages of infant scholars.

14,534. That is to say, the compulsory powers of the Education Act are not carried out in the same way in Scotland as they are in England, and you do not compel the children to attend at the age of five in Scotland, and they do not come very often till they are seven?—In some schools; but now they are coming at the age of four and five.

14,535. At the same time it is the fact, is it not, that there are not half the number of children attending the infant schools in Scotland that there are in England?—No, not at present.

14,536. They do not enforce the compulsory attendance even according to the requirements laid down by the statute?—I suppose not.

14,537. That is, I suppose, on account of your climate and the distances which the children have to come in the rural districts of Scotland to get to school; is not that so?—Somewhat that, I think.

14,538. You think, on the whole, so far as your experience goes, that blind children are better taught when they are taught separately than when they are taught with sighted children?—Yes, I think so.

14,539. (*Mr. Arrol.*) Have you visited the St. George's and Dennistoun schools?—I visited St. George's school.

14,540. What do you say as to the success of the teaching there?—Mr. Wilson, the head master, told me that he had experience of two, and he certainly said that they got on very well, and he thought it was easy enough to teach them; but he saw that they could never be taught on the Kindergarten system in a sighted school, as the amount of work and attention that they would require could not be given to them.

14,541. But all other branches of teaching can be quite easily given in sighted schools, according to his impression?—He thought that if they came from good homes, and could get plenty of assistance, and were intelligent themselves, they would get on very well. That was his opinion.

Miss Neil.

6 Dec. 1886.

14,542. (*Rev. W. Blomefield Sleight.*) You have an assistant who is blind, have you not?—Yes.

14,543. What part does she take in the education of the children?—She can teach the younger children in Standards I., II., and III., of course under my supervision.

14,544. Does she have anything to do with the music?—No, nothing.

14,545. Then you teach music to the children yourself, I suppose?—No; I teach singing, but only to this extent: I am required by the Scotch Code to prepare the children with eight songs for the inspector.

14,546. Then you are able to earn the portion of the grant that has reference to music?—We do not call it in connexion with music. We have a separate music teacher; but I mean to say that the Government Code requires me to have eight songs ready for the Government inspector, and he chooses one when he comes.

14,547. You say that you have a separate teacher for music; where did she receive her education?—In the Norwood Training College, London.

14,548. Where did your blind assistant receive her education?—From myself.

The witness withdrew.

Mr. John Holland examined.

Mr. J. Holland.

6 Dec. 1886.

14,549. (*Chairman.*) You are at present practising as a tuner at Knutsford, are you not?—Yes.

14,550. You were educated first of all at the Henshaw Blind Asylum?—I was.

14,551. How long were you there?—About eight years, almost to a month.

14,552. From thence you went to Norwood, did you not?—I did.

14,553. At what age did you go there?—I went to the institution in Manchester on my 12th birthday, and I left eight years after.

14,554. What knowledge of music had you when you left Manchester?—I knew a considerable amount of music to play, both organ music and piano music; but I know, I may say, absolutely nothing about the theory of music.

14,555. Did you know anything about tuning then?—Nothing at all.

14,556. Had you had any instruction in tuning in the Manchester Institution?—Not at all; in fact, so far as I remember, tuning was never mentioned to me.

14,557. I believe that at that time they did not pay so much attention to music as they do now?—I cannot say, because I have not been at the institution for many years.

14,558. You had a good general education then before you left?—I consider that I had a very good literary education there. I think, perhaps, that the schoolmasters who were there during the latter part of the time were not quite so competent as those who were there at first, from the time I was 12 till the time I was 16—that would be from 1865 to 1869. There was one very clever man, and I think he did me and others a great deal of good.

14,559. How many hours a week did you devote to music at Manchester?—It varied very considerably; but the latter part of the time, probably about 20 to 25 hours per week. I think I was a great exception there.

14,560. In respect of the time devoted to music?—Yes; I think few had as much time as I had; but I had very few lessons in proportion.

14,561. You practised a great deal by yourself, I suppose?—A very great deal; and I was left very much to myself too.

14,562. When you went to Norwood did you find that you knew as much music as you thought you knew?—I am afraid I found that I was very ignorant. I felt myself very much behind in the theory. I had been taught to play music, and I did play some pieces, I suppose, perhaps, fairly well, though I soon found out that I did not play them nearly so well as I thought I did before. But with regard to the theory, I was altogether at sea, and I found that if I had left the institution and had commenced in the world for myself to teach music I should never have got along at all. I, of course, did not know until then really how much behind I was, but I did then find out.

14,563. How long did it take you to make up the lost ground and to get a thorough grounding in music?—I was at the Norwood College about three and a half or four years, and I was away six months through ill-health; probably I could have improved if I had remained longer.

14,564. How many hours of music did you play there in a week?—To begin with, if I remember rightly, the hours were three-quarters of an hour; we had quarter-of-an-hour recesses; and probably had five or six three-quarters-of-an-hours of music per diem in one form or another. Some of that was from choice.

14,565. I presume that of your day's work the science of music formed no inconsiderable part?—When we were taught a piece of music at the college we were invariably taught the construction of it. We were taught where the phrases were, and we were taught how to phrase them. We were taught to understand what was the value of each of the bars, and how the bars were built up. I am afraid I had a very vague notion even of the rhythm when I left the institution at Manchester; perhaps it was partially my own fault; I do not mean to say it was not. I had a very vague impression of the building up of a piece, and I knew nothing in fact of the construction of a sonata. I had learnt one, but I did not know anything about the sequence of the movements or anything of that kind.

14,566. Did you pay much attention to other general knowledge at Norwood besides music, or did you give yourself up entirely to music?—I think I did. I have always felt that a blind person could not know too much, and whenever I got an opportunity I did improve myself in every possible way. I was fortunate enough too, while I was there, to still have a little sight, and to be able to read with a powerful glass.

14,567. Have you lost your sight now almost entirely?—I can see the sun if it is very bright, but not otherwise; I cannot see it if it is faint.

14,568. Do you in looking back upon your work there think that too much time was given to music?—I do not think so at all. We had literary classes interspersed with the others. I am not quite sure whether the younger people might not have had more time given to literature than we had, but I was 21 or so, and probably our principal thought that my time would be better spent if I gave it more to music.

Mr. J. Holland.

6 Dec. 1886.

14,569. How soon did you go out and play in public after you were at Norwood?—I have done very little playing in public; I teach.

14,570. How soon after you went to Norwood did you go and perform in the choirs that Dr. Campbell took out, or in public in any way?—I was looking in my diary the other day and I really forget, but I believe it was five or six weeks after.

14,571. You were made use of then as part of the choir?—Yes, but I may say that it was a very remarkable thing that I was not considered to have any voice at all in the institution at Manchester.

14,572. And you had a voice found for you at Norwood?—Yes, I was provided with one when I came up to Norwood.

14,573. (*Mr. Mundella.*) Was it supposed that you had a good ear?—Opinions differed about that. In Manchester, I believe I was considered not to have one at all, but I think they found that a mistake when I came to Norwood.

14,574. (*Chairman.*) Still I suppose you had not any very great genius for music?—I never heard that I had.

14,575. I wanted to know whether you might be taken as a type of one who with no very brilliant talents has been able to earn a competence for himself?—I have found many of those about me in the college and in the institution at Manchester who had naturally far greater facilities for music than I had; they seemed to have it more born in them; but I do not know that I felt myself particularly behind the generality, though certainly I did not feel that I had so good an ear as some that I have come across.

14,576. Then as soon as you left Norwood did you begin to earn something at once?—Yes.

14,577. What did you do after you left Norwood?—Directly after I left Norwood I went to my home in Knutsford, and commenced tuning when I could get any, but there I found my difficulty. I had had an education given to me, and I had been trained as a tuner and music teacher, and so on, but the connexion did not come. Of course I had to set about to find friends to help me, but from that time I may say that my tuning and teaching have steadily increased. In the first two or three months I earned very little indeed, but it has gradually grown: as I have done my work I hope people have found that I have done it satisfactorily, and I have got more of it.

14,578. You had to do all that for yourself; you had nobody to assist you?—I had no friends whatever.

14,579. You had some relations, I suppose, but not in a position to give you much help?—My mother and brother were there, and they supported me just till I was able to earn a living for myself.

14,580. Your efforts at the first were not entirely self-supporting?—No; I had no connexion to take over from anybody; I had to make it entirely.

14,581. Then you have been giving lessons and tuning ever since; that is some years ago now?—Yes; over nine years.

14,582. How long was it before you were able to earn your living?—I lived in the house and had no rent to pay, and had my friends to do little things for me, so that I lived cheaply; but I consider that I kept myself in about 12 months. I have regularly kept an account of all that I have earned, so that I could easily look up and find how much I have earned in the time. I have kept a diary now for 14 years, or something like that; but I believe I kept myself in about 12 months' time. Of course your Lordship knows that I have but a small town to work in.

14,583. You have no exceptionally favourable circumstances at all to work in?—Indeed I have not. If I had been in a larger town I should have had a larger connexion.

14,584. Have you any objection to tell the Commission about how much your earnings are now?—I should think my earnings, independent of the shop, are about 100*l.* a year, but I have a music shop, and of course it is very difficult to tell how much I get from the shop.

14,585. The shop brings in something?—Yes; and the shop I consider a very important item, because it is a constant advertisement.

14,586. You created that yourself?—Yes.

14,587. There was no such shop before in the place?—There was not. I was fortunately situated with regard to that. The premises belong to my mother, and my brother had had them before; he was made a partner in a business in Bolton, and he had to leave Knutsford. My mother tried to let the place, but she did not get a very good offer for it, so I persuaded her into letting me have it as a music shop. She was rather afraid that it might not answer, but she was kind enough to let me try.

14,588. One of the great wants of the blind is to be able to get some assistance after they leave the institutions where they have been brought up?—I think it is almost absolutely necessary; and not only that they should have a little assistance, but I think they should have a little overlooking. I think that a blind person should not be left to run wild.

14,589. How can that be carried out except by some supervision from the institution?—I think that is the best plan. The officials from the institutions ought to show some sort of interest in those whom they have turned out, and they are the most likely people to be able to recommend help; they would know best whether a person was worthy of it.

14,590. In your experience did any of those who were brought up with you, either at Manchester or at Norwood, and who were taught music, fail to earn a livelihood by it, and either fall back to some industrial occupation or take to playing in the streets?—I have had very little communication either with those who have left the institution or with those who are in the institution at Manchester at present; but so far as I can gather I am afraid that the music was almost an utter failure there. I know there are a few exceptions, but I am afraid that that is the case with a very large per-centage. In one or two cases where they really possessed natural gifts they seem to have been thrown away entirely. I am afraid that drunkenness on the part of the students had something to do with it.

14,591. Do you think that the blind have special temptations to fall into drinking habits?—I do; and on that account I think that they should have very strong total abstinence principles instilled into them. I am not a signed teetotaller myself, but for all that I have not taken anything for eight years, simply because I knew that if I commenced the probabilities were that I should very often come home much the worse for what I had drunk. People press drink upon blind persons in all directions. They cannot offer a sixpence or a shilling, but they can always offer a glass of beer or a glass of whisky or something of that kind. So that I found it was much the wisest to give up drink altogether, and I always tell people that I never take it, though I have never signed. I have seen many cases in which blind persons have given way to drink, and I think through their having too much offered them. In the Manchester institution and in the college at Norwood the pupils were kept from it and never had it at all, and when they could get outside to get it they looked upon it as a very great luxury, and they never missed an opportunity of getting it. I think that in those institutions it would be well if more time was devoted to instilling a horror of drink into the children. With grown up people, of course, it is a more difficult matter, but I think that with children it might be done.

14,592. Were those principles at all inculcated on religious grounds at Norwood?—Yes, most decidedly they were.

14,593. There was no distinctive religious teaching given there, I believe, in your time?—Not in any particular creed, it was on a very broad basis; there was no sectarian teaching at all.

14,594. Have you a fair amount of private teaching in music?—In Knutsford I have a fair amount, but I think probably I should get more if I laid myself more out for it; but I find that the tuning pays me better.

14,595. You think that unless you are a brilliant musician tuning is a safer and a more remunerative profession?—I find it so, most decidedly. One finds teachers almost everywhere; almost every girl that leaves school teaches music, and she teaches perhaps for half the price that would pay us.

14,596. Are you acquainted with the repair of the pianoforte, so as to be called in in cases where a pianoforte has something the matter with it?—Yes, small repairs I do.

Mr. J. Holland.

6 Dec. 1886.

14,597. You think it is useful to teach that?—Most decidedly it is. I think it is almost a pity for blind persons to be taught to do that which they really cannot do; it is a pity to undertake that which they are not quite sure of, because if a failure does come it stands for a failure and is not forgotten. I never undertake that which I am not quite sure about. If there is a repair required which I cannot do, I do not tell the people that I can do it, but I say I have my repairer, and I employ him.

14,598. Have you any facilities for getting books for the blind for yourself?—I have found that a very great difficulty indeed. Since I left the college I may say that, until within the last few months, I do not think I have read 50 pages of what anybody else has written or what has been printed. The books seem to me to be so expensive, and I felt that I had to be so economical that I left them alone entirely. I have always had a great weakness for books, and I have thought that if I began with them it might perhaps be a great temptation to me to spend more than I could afford upon them.

14,599. Do you think it would be a great thing for the blind if some of the free libraries circulated books for the blind?—I do, I think it would be almost inestimable.

14,600. They have at Manchester, I suppose, books for the blind in the free library?—Not that I know of. I used to get books from there to read, with a glass, when I could see pretty well, but I never heard that they had books for the blind. They may have by this time, but they are dreadfully expensive, and it is almost a pity I think to teach blind people to read books, if they can neither borrow or buy them afterwards.

14,601. With regard to music, do you copy it yourself in Braille?—I very rarely copy it out. I sometimes copy out the voice part of a song; in teaching a song I find it very useful to be able to run it over.

14,602. Do you teach entirely from memory?—Yes.

14,603. Do you manage to teach seeing people well?—I have not found any insuperable difficulty at all, perhaps there have been slight difficulties, but nothing that I could not overcome easily. Even with children I have got along I think very fairly.

14,604. Do you think that in institutions for the blind it is wise to have blind teachers?—I think it is wise to have them as far as possible. A blind person, it seems to me, can understand better where the shortcomings are and knows better how to put a thing to another blind person than a sighted person can. I think that sighted persons may become educated to teach blind persons, but it requires a very considerable education, and I am afraid that perhaps sometimes they lack a little patience in that way. I have found that I learnt from the blind teachers that I was thrown with a great deal more in a short time than I did from the sighted teachers. That is my experience.

14,605. Do you think that institutions sufficiently provide the blind with games which they can play, such as chess or draughts?—I think they do not. When the pupil's work is done, or when it was done when I was at the Manchester Institution, we were left entirely to our own resources, and we had no resources at all, and the result was very deplorable indeed. On Saturday afternoon from one o'clock till bed-time we had nothing to do; we only had the bare rooms.

14,606. Had you no gymnasium at that time?—No gymnasium at all.

14,607. Of course you know that there is one now?—I have heard so, but I have not been there since.

14,608. That would meet your objection then, so far as occupation is concerned?—A gymnasium would have provided a great deal. I used to wonder myself how the others existed through it at all, but I was exceptionally situated. As I said before, I found out after I had been in the Manchester Institution some four or five years, that I could read with a powerful glass, and I spent a lot of time that way. Chess, I think, is a splendid game for blind people, because a blind person may sit down with a problem on the board and work it out himself when he cannot get a companion.

14,609. Can the blind play chesse without difficulty by feeling the pieces?—I find no difficulty at all, I think it educates the mind, too. The first chess-board that I ever saw for blind people was at the college; it belonged to one of the pupils; and I was very much interested in it. I have always felt that I should like to have one, but that is another thing that I have denied myself, because I have wanted every halfpenny of capital that I had to keep on my shop. I commenced my music shop with only 28*l.* of capital, and I found that that was ridiculous. However, I managed to stick to it, but I have had to save every halfpenny of money from that time, and I have avoided buying anything that I could avoid buying. Of course now I am out of the schools I do not find much want; I find plenty to occupy myself with. I can turn out and go for a good walk in the country at any time, and enjoy it very much if I get a little time for it.

14,610. Can you say generally with regard to your stay at Norwood whether the pupils worked harmoniously together, and whether there was a good moral tone amongst them generally?—Among the pupils I am afraid that there was sometimes a lot of unnecessary grumbling, though I never could quite see what the grumbling was about. I think perhaps that blind persons are rather apt to become discontented with a little, and I think they are apt to magnify evils sometimes; I found it so there. They often wished to drag me into this complaint and the other complaint, but I really found very little to complain about. There was one thing that I did not like, but that could not very well be helped. When I was there the place was being got together, there was scarcely a building there, and we had to go through the warfare, as it were; there were a good many battles to be fought just then. I found it rather hard to work up for the concerts and so forth that were given, and to go on with our ordinary education, though I think our principal managed to make our ordinary education and that all one; what we learnt for the concerts proved useful to me afterwards.

14,611. (*Mr. Arrol.*) You said, I think, that the blind received education more rapidly from a blind teacher than from a sighted teacher; did you not acquire more knowledge in less time through the sighted teachers at Norwood than you did at Manchester?—I think I did, whatever teachers I was thrown with at Norwood I think I learnt better from them.

14,612. And in less time?—Yes, I think so. I am afraid that the teaching at Manchester during the last few years that I was there was carried on in a very haphazard lazy sort of way; I am afraid that there was no real go or life in it.

14,613. (*Mr. St. John Ackers.*) Have you formed any opinion as to what is the best profession or trade or occupation for the blind?—I think that piano-tuning is most decidedly the best, so far as I can make out. I, of course, have never learnt any handicraft like basket-making or mat-making, or anything of that kind, so that I cannot say anything about it; I do not even know what a blind person can earn at those trades, but I think that a blind person earns more in a given time by tuning than by anything else, if he can get a connexion.

14,614. Are you an organist?—I am not.

14,615. Is there a feeling in your neighbourhood against the employment of blind organists?—I am afraid that I was rather unfortunately situated there. Our clergyman promised me pretty definitely, I think about 12 or 13 years ago, that when I made myself competent he would give me the situation of organist at the parish church, or do his utmost to get it for me, but somehow, I think, I went out of his mind, or he did not remember me; and not only that, but I was still more unfortunate, for he got another gentleman in the town, after I commenced tuning, who advertised for tuning.

14,616. In your opinion can a blind organist be as good a choir master as a sighted organist?—Perhaps not so good, but I do not see why a blind person should not teach a choir, I am teaching one just now.

14,617. You do find that there is some difficulty which would not be experienced by a seeing person?—Yes, I think there would probably be difficulties. A blind person finds difficulties at every corner, but I think he may overcome most of them. I find it so, in fact, if I meet with a difficulty I think I have something to overcome, and not something to give in to.

14,618. (*Mr. Mundella.*) You have given such interesting evidence that I am anxious to have your opinion as to how far you think it is desirable to cultivate self-reliance and self-help on the part of the blind?—That is the basis of everything. It is possible, as I have already said, that a blind person may think that he can do too much. With regard to the repair of pianos,

Mr. J. Holland.

6 Dec. 1886.

for instance, if a blind person gets tampering with piano check actions and some other beautifully made actions, he may very soon do more mischief than the evils he rectifies; but if he is cautious I think self-help and self-reliance are the finest things for blind persons.

14,619. Then the whole education and training of a blind person should lead him to be self-reliant, and as far as possible independent?—Exactly. A blind person, if he is a boy, should be taught that he will be a man some day, and that he should act and have some strength of will. There must be no giving in.

14,620. Having trained him to some occupation by which he may earn his living, you said, did you not, that at the outset of his career he requires some sort of superintendence or overlooking?—I think so. In institutions the life is totally different from what it is out of doors. A blind person is protected in institutions by officials whenever he moves about. This rule checks him from doing this thing, and the other rule checks him from doing the other thing; and this face in this place and that face in the other prevent him from doing other things too. But when he gets outside he finds that he can do exactly as he likes; and when people have been confined for any length of time in institutions I think they are apt to run wild. They want a little supervision and a little help. It is impossible for a blind person like myself, if his character and his intentions be ever so good, to go into a small district and get up a connexion and keep himself at once; and if he cannot keep himself it is just possible that a man might be disheartened.

14,621. Then any assistance that is given by the State or by the public should be given to supplement the earnings of the blind, who should be encouraged to make strenuous efforts to sustain themselves without such assistance?—Exactly. If a blind person does not show any real anxiety, and, in fact, if it cannot be proved that he is doing his utmost and straining every nerve, I should most decidedly say do not give him a halfpenny.

14,622. (*The Rev. Mr. Owen.*) You said just now that, in your opinion, the institution ought to keep a connexion with the blind after they leave the institution; have you ever thought of any special scheme by which such a connexion could be brought into good working order?—I do not think that any particular plan has occurred to me.

14,623. (*Mr. Mundella.*) Have you ever heard of the plan that is in operation in Germany, and more particularly in Saxony, by which in every town a number of guardians are appointed for the blind, who look after their interests until they are self-sustaining?—I have not heard of it.

14,624. Does it not commend itself to your judgment that a number of the most intelligent and philanthropic persons should be appointed by the central association, or by the State, or by the local authority, as guardians of the blind, to look after their interests and report upon them and assist them as far as necessary?—I should say that that would probably be a very good idea; but I am very much afraid of blind persons not being made to feel that they must depend upon themselves. If they get too many props and supports the whole structure will give way. It does not do to be propping them too much.

14,625. (*Dr. Campbell.*) You spoke of your difficulties when you first started; you were limited to Knutsford, were you not; you could have had other opportunities, and there were those who would have helped you, only on account of your mother you were compelled to remain at Knutsford; your mother was not willing that you should go away from your own place?—You are quite right. I think that you offered me a situation in the college.

14,626. And on two or three occasions did you not decline anything else elsewhere, feeling that you were bound to work up a connexion there, because you did not want to leave your mother? That was always your principle, was it not?—I am afraid that I do not remember anything being offered to me afterwards. I confess that my mother has been a tie to me, my father being dead.

14,627. I approve of your action; I only want to bring it out that there were those who would have helped you, if they could have taken you away from your native place. It was not that the college neglected you, but that you were tied to that one point, and I believe your motive was good. You came to the college, and you stated very clearly what your condition was when you came. If you could have come, say five or six years younger, and have entered upon a very thorough course of training, do you not suppose that you could have risen in your profession to very much greater advantage?—I could have done better undoubtedly.

14,628. When you came to the college the college had not been quite two years in existence, had it?—I daresay not. I forget just when the college was commenced.

14,629. You entered in January 1874, did you not?—I did.

14,630. And the college was opened on March the 1st 1872?—And you were struggling with very great difficulties, I know, at the time, and I wish to make every allowance upon that account.

14,631. I think, if I remember rightly, there were very few professors even when you left there, only two or three, and that the college did not offer the advantages which it can now give to its pupils?—Mr. Hartvigson had been there some little time, and so had Dr. Hopkins; in fact, I felt that I was leaving the place just when I ought to have been coming to it; but of course I could not help that.

14,632. With regard to drilling choirs, of course, I do not know what your experience has been in that, but it is the fact, is it not, that some of those who have had the best training in the college are now succeeding most admirably as choir masters and organists combined?—It may be a fact, but I do not know. I have been living, I may say, in the backwoods, so that I cannot say. I have enjoyed the backwoods; I am not complaining of them by any means; I have enjoyed my life thoroughly.

14,633. Although the college, of course, was in its infancy when you came and our buildings were not completed, or our playgrounds or anything, still did you not find a spirit of animation through the whole which gave life and character, not only to the work, but to the individuals?—It was a totally different thing from the Manchester Institution. I felt that I was somebody when I was at Norwood, but in the Manchester Institution I felt that I was vegetating, or really scarcely vegetating. Of course I do not wish to say too much against the Manchester Institution, because it may be totally changed now, but certainly that is how I left it. It had very fine buildings, and no doubt it was very well off so far as I could gather; but the money I think might have been better invested in funds of some sort or another for a few years till the people had found out how to spend it.

14,634. With regard to music are you aware that large quantities of very excellent singing music and piano music and organ music can now be had cheaply?—I got a list about three weeks ago that I was very much pleased with. That is one thing, but I think it is a pity for a blind person to live entirely in a world of music. Music is a great deal, and he will probably make his living by it, but he may be a very wise man in music and a perfect fool in every other way.

14,635. Do you think it is very expensive if you can get a play of Shakspeare embossed for 3*s.*?—I certainly think it is very expensive when you can buy the whole of Shakspeare for 1*s.* for sighted people.

14,636. When I was a young man studying at college I should have had to pay a good many sovereigns for it?—I always felt very proud of Shakspeare, and I invested in a copy at a shilling.

The witness withdrew.

Adjourned to to-morrow at 11 o'clock.

6, Old Palace Yard, S.W.

Tuesday, 7th December 1886.

PRESENT:

THE RIGHT HON. THE LORD EGERTON OF TATTON IN THE CHAIR.

The Right Hon. SIR LYON PLAYFAIR, K.C.B., M.P.
The Right Hon. A. J. MUNDELLA, M.P.
ADMIRAL SIR E. SOTHEBY, K.C.B.
W. TINDAL ROBERTSON, ESQ., M.D., M.P.
B. ST. JOHN ACKERS, ESQ.
T. R. ARMITAGE, ESQ., M.D.
W. AUCHINCLOSS ARROL, ESQ.
E. C. JOHNSON, ESQ.
WILLIAM WOODALL, ESQ., M.P.
The REV. W. BLOMEFIELD SLEIGHT, M.A.
The REV. CHARLES MANSFIELD OWEN, M.A.
CHARLES E. D. BLACK, ESQ., *Secretary.*

MR. WALTER SLOW BESSANT examined.

Mr. W. S. Bessant.

7 Dec. 1886.

14,637. (*Chairman.*) You are head master of the Manchester School for the Deaf and Dumb at Old Trafford?—Yes.

14,638. The Commission have visited the institution, and, therefore, it will be unnecessary to ask you a number of questions with regard to the institution which otherwise we should have asked you. Perhaps you can tell us what the educational needs of the district round Manchester are as far as the deaf and dumb are concerned?—According to the Census Return of 1881 there are 556 children in Lancashire and Cheshire who ought to be under instruction—that is to say, children of school age—there are only 180 of those children in our own school, and 140 in the Liverpool school; there may possibly be others who go up to the London institutions, but our institution and the Liverpool one are the only two local institutions providing for that district. Out of the 180 pupils in our school a considerable number come to us from other counties than those mentioned, and this is probably the case with regard to many of the pupils in the Liverpool school. I think, therefore, we may safely assume that not more than one half the deaf and dumb children of school age in Lancashire and Cheshire are under instruction.

14,639. What is the number of deaf and dumb that you know of within your own district who are now not receiving instruction?—I sent round an inquiry with reference to that to all the school boards in our district, and the return made to me gives a total of 185 children of school age known to be in the district not at any school, but I think that is very much below what we should find to be the case if anything like an exhaustive inquiry were made.

14,640. (*Mr. Mundella.*) When you say your district, what area do you embrace; do you mean the Manchester School Board district?—No, not the Manchester School Board district; the returns are from Lancashire, Westmoreland, Cumberland, Cheshire, and Staffordshire; those are the counties from which we draw our pupils.

14,641. That would be a population of 5,000,000 or 6,000,000?—Yes.

14,642. (*Chairman.*) Did you communicate with all the school boards that you knew of in those counties?—Yes.

14,643. Will you state the number of school boards that you communicated with, and in what counties they were?—168 in the counties of Lancashire, Westmoreland, Cumberland, Cheshire, and Staffordshire.

14,644. Have they all answered?—No, they have not all answered. Replies were received from about 120 school boards and school attendance committees out of the 168 addressed.

14,645. To what number of children were you obliged to refuse admission at the last half-yearly election?—We have now 20 children waiting for admission who are left over from the last election; we have also 10 others who are coming forward for admission; we have also just received from the School Board of Manchester a list of 18 children within the limits of the Manchester School Board district, most of whom are not on our books at all.

14,646. Your building is already full, is it not?—No, we have only 180 children; we could take 200.

14,647. Your funds at present do not allow you to take the full number?—Quite so.

14,648. Therefore, to make your institution as useful as it should be you would require some external assistance?—Yes, to the extent, in the opinion of my committee, of 800*l.* a year.

14,649. You have seen the report by Mr. Oakeley, which has been laid before Parliament, with regard to the education of the deaf and dumb in Manchester?—Yes.

14,650. Do you agree with his suggestion: "That "the school authority of the district should be empowered to send their deaf and dumb children to the "Manchester, or some other institution (under inspection of course), and to pay to that institution a yearly "sum of 10*l.* for each child's education; the sum of 10*l.* "is not an arbitrary amount, but has been arrived at "after due consideration of the cost"?—I believe that is the view of my committee; that, of course, is only for education purposes; we should probably want a maintenance grant in addition to that.

14,651. How would you propose that the maintenance grant should be obtained?—We think that it would be much preferable to take it through the Local Government Board direct rather than through the guardians, as at present, because parents have a very great objection to applying to the guardians, and we find it very difficult to get the guardians to make a grant, except in extreme cases of poverty.

14,652. I see the Manchester School Board came to this resolution: "That in the opinion of this board the "Education Department might with propriety make "grants to institutions for the education of the deaf "and dumb, and of the blind, for such children as "apart from their infirmities would be required by "law to attend at public elementary schools, and that "such grants might be made either towards maintenance, as in the case of certified industrial schools, "or upon examination, as in the public elementary "schools." Would you prefer that such grants should come direct from the Education Department rather than from the school boards?—I should prefer their coming direct from the Education Department.

14,653. What supervision would you suggest if the money were given direct by a Government department?—The present maintenance grant is granted without any supervision whatever.

14,654. The State generally, as in the case of industrial schools, makes it necessary that the inspector should visit in all cases where Government money is granted; do you see any objection to that?—No, the committee would see no objection to that.

14,655. Of course, you think that the compulsory powers which exist with regard to other children should be enforced with regard to deaf and dumb children?—Yes, the suggestion of my committee with regard to a compulsory clause with reference to length of stay at school is this: "No child shall be considered to have "completed his or her education until he or she shall "have been eight years at school, or shall have attained "the age of 16, or shall have passed some definite "standard to be fixed."

14,656. Do you think that the age of admission in your institution should be earlier than it is; I believe the age at which you admit children is 9 or 10?—No, we take children of 6 years of age.

14,657. The average age is higher, is not it?—That is because we have not been able to get the children

Mr. W. S. Bessant.

7 Dec. 1886.

earlier. It is not that our rules forbid us to take them. I do not think that we should take a child 5 years old unless he was very intelligent and a big boy for his age. We would take him at 6; from 6 to 12, I think, is stated in our rules.

14,658. When your committee speak of a stay of 8 years in the school they contemplate the admission of children as early as 6 or 7 in order that they might stay till they were 14 or 15?—Yes.

14,659. It has been said that if a child is only to remain 4 years at school it is better to send him at the age of from 8 to 12. Your opinion and that of your committee, as I understand, is that a child should receive 8 years of instruction?—Yes.

14,660. And that the education should be compulsory at an early age in all cases?—Yes.

14,661. I may also say that your opinion is that if the oral system is to be introduced a longer time would be necessary in order to give it a fair chance?—Yes.

14,662. And also if a child is to be taught on the oral system it is much easier to teach the child if you take it before its vocal organs are stiffened and get rusty from want of use?—No doubt. It may be known to your Lordship that we took children at one time in Manchester at a much earlier age. We took them as young as 3 years of age; but the practice of taking them at that early age has been entirely discontinued, and it may be that some of the statements in our report on the point of age are not quite up to date. They have not been altered from that time, and therefore they might be misleading to any one looking at the report; but we do not refuse a child of 6 years of age if he or she is able to take care of himself or herself.

14,663. Do you think it would be possible for the School Board in Manchester to start day schools for the deaf and dumb advantageously?—No, I do not.

14,664. Do you think it would be impracticable to collect deaf and dumb children together, and educate them on the day school principle, or that it would be inadvisable to do so?—It would be impracticable, and I certainly think it is a most inefficient way of educating the deaf and dumb.

14,665. It would be less expensive, would it not?—I think not, comparing our expenses for education with the expenses of the London School Board for educating the 300 children in their day classes for the deaf.

14,666. You mean that in your institution you could educate the children more economically than if you grouped 8 or 10 deaf and dumb children together?—Yes, educationally; of course the London School Board are not boarding those children, but they are paying a good deal more for the education of those children than we are.

14,667. You think that the education of deaf and dumb children, if conducted in various centres, would be more expensive than if conducted in one?—Yes.

14,668. And there would always be a certain number required to be sent to a central institution from a country district?—Yes, undoubtedly. Some of the members of the Manchester School Board have been approached on the question of day classes for the deaf and dumb, and those members of the board were decidedly of opinion that it would be very difficult to get deaf and dumb children together or to secure regularity of attendance, and they have shown no disposition whatever to take the hint to form any class there.

14,669. Do you think that any grant-in-aid should be given to any institutions that would not receive educational inspection but would only be willing to place themselves on the list of certified schools?—I certainly think so, on the ground that they are already receiving a maintenance grant from the guardians, and if by some further legislation the power to give this aid should be taken from the guardians and placed in some other hands, those schools ought not to suffer upon that account; therefore any new legislation should provide for their receiving as much assistance in the future as they do now.

14,670. That is rather inconsistent with the answer you previously gave, that you thought all schools which received maintenance or assistance from the Government should be liable to inspection?—I did not mean educational inspection, but such an inspection as we have had at Manchester since we were placed on the list of certified schools.

14,671. I said, "As in the case of certified industrial schools;" you did not mean education inspection?—No; I was not then thinking of schools not under inspection at the present time.

14,672. (*Mr. Mundella.*) You think that schools that are not under inspection at the present time ought not to be brought under Government inspection?—No, not against the wishes of the authorities of those schools.

14,673. And if, in consequence of not being under inspection, any grants are withdrawn, you think that they ought to be compensated in some other way?—Precisely.

14,674. (*Chairman.*) I understand that your institution would have no objection to educational inspection?—No.

14,675. But you think that money should be given, as now, through the guardians, by the Government, without any inspection other than general inspection?—Quite so, to the authorities of those schools who would prefer it. Otherwise they will be placed in a worse position than they are now.

14,676. Do you know any schools which would refuse the Government grant if they had education inspection?—The authorities of a number of schools declined to take any part in our Manchester conference in favour of State aid, mainly on this ground, I believe. The schools so abstaining represented 1,200 children under instruction.

14,677. Those institutions who would object to Government aid would, I presume, object to it on the ground that they would have to fall in with some prescribed rule or method of teaching which would be distasteful or which they would think would be injurious to the general interests of the deaf and dumb?—In most cases, and also from the feeling that these institutions have always been benevolent institutions, and that they have been managed by benevolent people with benevolent ideas, and so on; and that any placing of them under Government would be altogether a change in that respect.

14,678. Do you believe that the receiving of a grant from Government, say in the case of your institution, would have the effect of diminishing the contributions of private benevolence?—I think it would affect them very much, and also I think if the institution were likely to pass altogether into official hands rather than to be managed by a committee of benevolent gentlemen who devote a great deal of time to it and take a strong personal interest in it, that it would be a disastrous change for the institution.

14,679. Then you think that in the case of any grant being given by Government, the Government should only see that the education which was given, was of an efficient character, and should not interfere with the details of the method of instruction or with the free action of existing committee?—That is quite my opinion. May I be allowed before passing away from this subject, just to say what is my own private opinion, as to the question of State aid, I am not now speaking on behalf of the committee. My idea is that instead of the State grant being an education grant it should be purely a maintenance grant, and then none of these vexatious educational questions would crop up; and I would make the grant in this way, that those schools which did not accept Government inspection should receive only 15*l.* per head for the children as they now do from the boards of guardians, only that that 15*l.* should be per head for all the children in the school, and should be given under a compulsory Act instead of under a permissive one as at present.

14,680. Irrespective of inspection?—Irrespective of inspection; and that those schools which would receive Government inspection, such as we at Manchester now have, that is, inspection of a sanitary and domestic character under the poor law board, should be entitled to the full 20*l.*; in my opinion that grant of 20*l.* per head would meet all the necessary demands of the case, even with respect to any new schools which might be required, because private benevolence and the fees paid by the parents would amply supply the other 5*l.* or 6*l.* which would be needed to cover the full cost of education and maintenance.

14,681. Your institution was visited by the Chief Inspector for the North-western Division, Mr. Oakeley?—That was not entirely an education inspection, I think.

14,682. He says: "It is perhaps outside my present "report to give an account of the instruction there "and the system carried out," but, he says: "There is "one excellent headmaster (Mr. Bessant), 12 teachers "on the oral system, and 2 sign teachers," so that he must have formed some opinion as to the character of the instruction there?—Yes.

14,683. You would have no objection to that sort of inspection as carried out by the existing inspectors?—No.

14,684. And you would have no objection to the grant being dependent on the general approval of the inspector of the system carried out?—My committee would have no objection to that.

14,685. If education inspection was required do you think that the inspectors should be persons with experience in deaf and dumb instruction?—Undoubtedly. I cannot see how the work could be efficiently done in any other way.

14,686. Do you think it would be desirable that the Government should prescribe whether the children should be taught under the sign and manual system or the combined system or the oral system?—No, I do not; I think the matter should be left to each governing body.

14,687. Do you think it is advantageous to have boys and girls under the same roof?—No, I do not personally think so. I have a very strong opinion the other way. I think that it is far better to isolate the sexes.

14,688. Have you found any evil consequences from the free intercourse of deaf and dumb boys and girls in schools and institutions?—Every now and then there is some unfortunate occurrence that results from this close contact of the two sexes. I think in the history of most mixed boarding schools that is so. I think it very much better that the sexes should be separated, that we should not have institutions where boys and girls are living together under the same roof.

14,689. Do not you think if they were separated it would increase the expense of the system?—I think not, because we should be able to have as large schools as we might require of either sex.

14,690. For instance, in Manchester, would you recommend that the existing school should be devoted to one sex, and a fresh school built elsewhere?—Yes, that is my opinion.

14,691. That the boys and the girls should not use common playgrounds?—Yes, and that they should not reside in one building under one roof, that the girls' school should be a separate establishment. Our boys and girls have never used common playgrounds.

14,692. Are not they kept apart as far as it is possible to keep them apart?—Yes, every precaution is taken in that respect; practically they are entirely separated except during school hours and meal times.

14,693. With regard to the system of education we have heard that in America the largest number of schools now are under what is called the combined system. Have you ever travelled in America?—No.

14,694. Have you formed any opinion as to whether the combined system is one whichght mi with advantage be generally adopted?—Yes, I have formed an opinion upon that point, and if by the combined system is meant the system of teaching by signs and the finger alphabet, as well as by speech, I certainly do not think it at all desirable to adopt that system. From my own experience in the matter, I certainly am very strongly of opinion that each system should be taught entirely on its own merits, and without any admixture of other systems.

14,695. Is not it the fact that those who have been taught on the oral system, when they go out into the world, all learn the sign and manual system?—They learn the finger alphabet, but I do not look upon that as the sign system.

14,696. Practically, most of them, even those who have been taught on the oral system, know, and sometimes use for purposes of convenience, the finger language?—Particularly among themselves; between the deaf and the deaf; not so much, I think, in their conversation with those who can speak and hear.

14,697. With regard to religious services, where you have a large congregation of deaf and dumb, is it not much easier to conduct the service with the finger language or the sign system than on the oral system?—Yes, where there is a large number attending the service; but why should we follow the present lines of religious services; we could adapt our religious services to our altered conditions of teaching and teach orally religious subjects after school as well as in school.

Mr. W. S. Bessant.

7 Dec. 1886.

14,698. That would add to the difficulty of giving religious instruction, would it not; if one man could give instruction to 100 in the sign and manual system you would require three or four to give instruction on the oral system?—My opinion would be that we should establish Bible classes and give religious instruction in that way; a great deal of that instruction would be given by voluntary effort, and would be very gladly so given, entailing no extra expense to the adult deaf and dumb societies.

14,699. The instruction in the oral system is carried on at Manchester quite separately from the instruction in the sign system?—Yes.

14,700. Do you find that that answers, as far as your experience goes?—Yes, we find it does.

14,701. You have not seen the combined system tried, I suppose?—Yes, I have seen pupils who have been taught on the combined system.

14,702. Do you think that the oral instruction under the combined system is not satisfactory?—I think it cannot be satisfactory when carried on under the combined system, nor do I think that the sign system can be satisfactorily carried on in connexion with the oral system. In my own school at Manchester, for instance, in the sign department, I never allow any articulation whatever to be taught. I think the teaching of articulation, unless speech is to be used as the sole means of communication, is tantamount to a waste of time, because the two systems cannot, in my opinion, be adequately taught side by side. One must suffer at the expense of the other.

14,703. Do you think that in Manchester there will always be the two systems carried on side by side, or do you think that eventually all will be able to be taught on the oral system?—I am afraid there will always be a certain per-centage of children who will require to be taught by the sign or silent system. I cannot say that I would advocate the teaching of the oral system and the teaching of the sign system in one institution, because I would rather that those who were taught by signs were located in a separate institution altogether, but we should always require to have a certain number of sign schools in the country to which we could send children who could be more efficiently taught by that system. The arrangement at Manchester, of course, is only one of convenience, simply because the committee of the school wish to educate all that come to them.

14,704. You say that there would always be a certain number, who from defective sight, or defective intelligence, would have a difficulty in learning the oral system?—Yes, I think so; and there will always be a certain number of children whose voices could never be trained to any pleasant enunciation, and it is a question in my mind whether it is advisable to send out into the world those imperfect specimens of pupils taught by the oral system. I think it is likely to give the public an unfavourable opinion with regard to the system.

14,705. You have not visited any schools abroad where the oral system has been longer at work than in England?—No; I have not.

14,706. When did you first begin to teach on the oral system?—About 10 or 12 years ago.

14,707. And you saw the teaching first carried out in London?—Yes; my first acquaintance with it was at Mr. Schöntheil's school, the Jews' home for the deaf and dumb.

14,708. With regard to the industrial training of the deaf and dumb, do you think that that ought to be begun at an early age while they are still at school?—If the children were allowed to remain in the school till they were 16—I would begin it in their 14th year.

14,709. Would you teach them any special trades?—Yes.

14,710. Is there any difficulty at present in getting them apprenticed to various trades?—No.

14,711. But still you think it desirable to give them some handicraft training before they leave school?—I think that would be very useful; it is very much called for by the boards of guardians who render any assistance; they often ask us whether we teach the children trades, they seem very anxious that the children

Mr. W. S. Bessant.

7 Dec. 1886.

should learn trades—I am speaking of those who come from the unions.

14,712. I suppose cabinet-making is one of the principal trades that might be usefully taught to the deaf and dumb?—Yes, and turning, and wood carving, and engraving, I should think, might usefully be taught.

14,713. You give them instruction in drawing?—Yes.

14,714. And you have some very successful pupils?—Yes, we have always had a certain number of successful pupils, many of whom are earning a satisfactory livelihood at artistic pursuits since they left the schools.

14,715. Do your pupils send up drawings to South Kensington?—Yes; we have earned a larger grant this year than previously.

14,716. What grades have your pupils who have been taught drawing passed in under the Science and Art Department?—The first and second grade of freehand and model drawing. One of our boys, who is only 14 years of age, took the second grade "Excellent" in model drawing this year. It is only in the last three years that the school has been affiliated to South Kensington, and each year we have earned a larger grant.

14,717. Have you a special master for drawing?—Yes, though several of our own staff are now qualified as teachers of drawing.

14,718. With regard to the training of teachers of the deaf and dumb, have you any suggestions to make?—I think it most desirable that we should have some method of training teachers for the special work of teaching the deaf and dumb, so that we should have something like a fund of teachers to draw upon in filling up our vacancies. I think the want of properly qualified teachers is a want felt by all schools.

14,719. Do you think the existing colleges for the training of teachers of the deaf and dumb are able to supply the want of efficient trained teachers?—I have not found it so as yet.

14,720. Do you expect that there will be a better supply of trained teachers hereafter as the result of the work of those colleges?—I hope so. I do not think either of the colleges have really proceeded quite in the right direction. I think it would be far better that those who are intending to become teachers of the deaf and dumb should be trained in connexion with some large institution where they would have to take a part in the actual duties of the institution during their course of training. My experience so far has been that the wrong people have been trained for this work, and that we find it very difficult in our institutions, where we are only able to offer moderate salaries, to get those who have been properly trained to accept a post in an institution on the conditions upon which we are obliged to offer it.

14,721. Do you think that each institution would practically have to train its own teachers?—That is not in my mind.

14,722. In addition to providing the means of training teachers in some institution, you would, I suppose, suggest that there should be an examining college which would test the capabilities of the teachers before they were allowed to teach in any large institution?—Yes; I think if a lectureship were attached to an institution for the training of teachers it would be a very good arrangement, and the teachers, after being trained in such an institution, say for two years, and taking part in the actual educational pursuits of the institution to which they were attached, should go up and be examined by some examining body.

14,723. Where should that lectureship exist; in London?—Either in London or in connexion with any one of the large institutions. All the institutions should contribute to the maintenance of this lectureship, and then according to their contributions they might *pro rata* draw teachers as they required them.

14,724. Is there any institution in the United Kingdom where higher education is given to the deaf and dumb?—Not at present.

14,725. Do you think that there should be, as in America, a college for the higher education of the deaf and dumb?—It would be most desirable to establish such a college.

14,726. Do you think that would be deserving of Government support?—Certainly.

14,727. In the same way as Government support is given to other colleges for higher education?—Yes

14,728. (*Mr. Mundella.*) Are you yourself a teacher of the deaf and dumb?—Yes.

14,729. How long have you been so?—I have been altogether about 18 years a teacher of the deaf and dumb.

14,730. Are you a trained teacher?—I entered as a pupil-teacher in one of the large institutions, the one at Doncaster, where I served under Mr. Baker, who was, I think, the head master of the greatest repute in England at the time. I was with him for five years and went through all the training of a pupil-teacher. Since then, I have been granted a diploma of the College of Teachers of the Deaf and Dumb.

14,731. The whole of your training has been in connexion with deaf and dumb schools?—Yes.

14,732. You have had no training in connexion with elementary schools at all?—None whatever.

14,733. And you were trained, I suppose, to teach the sign and manual system?—Yes.

14,734. You say that your first acquaintance with the oral system was 10 years ago?—Yes.

14,735. Do I rightly understand from you that you think that the oral system ought to be taught wherever the pupil is capable of receiving instruction in it?—Undoubtedly.

14,736. Where there are not natural defects which disqualify the pupil for instruction in the oral system, you consider it is undoubtedly the best, and you think it of the utmost importance that the pupil should acquire it?—That is my view.

14,737. You say that there is some difficulty at present about the training of teachers, you think there ought to be a lectureship at an ordinary deaf and dumb institution; do you think that that would meet the requirements of the case, do not you think it would be far better that the teacher should receive the training of an ordinary training college, and that he should at the same time have access to a practising deaf and dumb school attached to one of a set of training colleges?—I think that would meet my view better, that is to say, if the school attached to the college were really one fulfilling the same conditions as our ordinary institutions.

14,738. There are several training colleges in London for ordinary teachers; if in connexion with one of those training colleges there was a department for the training of teachers of the deaf and dumb, and they had access to a practising deaf and dumb school where the oral system, and the sign system if you like, were well taught, do you think that that would be a good way in which to provide a supply of teachers for the deaf and dumb?—Unless the institution was a resident one it would not supply good teachers for resident institutions. I was of opinion myself that the arrangement you are suggesting to me would be a very good one, and at the Doncaster Conference I proposed a resolution that that would be the best way of meeting the difficulty, but upon more mature consideration of the matter, I have come to another view, and feel that if we are to get teachers such as we want, who would be willing to take up the work in our institutions we must have them trained under similar conditions to those which exist in those institutions.

14,739. Your opinion is that those who were being trained as teachers of the deaf and dumb, should absolutely reside in the deaf and dumb institution?—Or that they should be attached to it and be constantly in it. I do not make a point of absolutely living in it.

14,740. Your idea is that they should be attached to it specially, say for one year of their training, in order to acquire the art of conveying the oral system and the sign system to the deaf and dumb?—That is my opinion. With regard to the question as to whether teachers of the deaf and dumb should be trained first of all in an ordinary training college. I am quite at one with you upon that point, if we could get teachers passed through the ordinary training that is given in an ordinary training college, and then if upon that we could graft the special knowledge required for teaching the deaf and dumb, we should have all that we require but unless we get adequate assistance from the Government we shall always be obliged to content ourselves with ex-pupil-teachers. I have always found myself that they make the best teachers of the deaf and dumb with a little special training.

14,741. You mean than an ex-pupil teacher is very much better than a person who has not had any training?—Yes.

14,742. But if that ex-pupil-teacher went to an ordinary training college, and if, at the same time, he attended a practising school for the deaf and dumb, and thereby acquired facilities for teaching the deaf and dumb, he would be a much better teacher than one who was merely an ex-pupil-teacher?—Undoubtedly.

14,743. You will admit that there is no teaching that requires so much patience and skill as the teaching of the deaf and dumb?—Certainly.

14,744. More than any other class, more than the blind even?—I am not able to draw a comparison between the two, because I am not familiar with the modes of instruction of the blind.

14,745. At all events, I take it, you will endorse what I say, that nothing requires so much patience, strenuous effort, and perseverance as the teaching of the deaf and dumb?—I quite agree to that.

14,746. Have you ever seen the German teachers at work?—Yes, those who are in England.

14,747. In what school have you seen them at work?—I have seen Mr. Van Praagh and Mr. Schöntheil at work.

14,748. What number of pupils have they?—Mr. Schöntheil has 40.

14,749. Divided in how many classes?—I think he had three at that time.

14,750. You had never seen a school with 200 in it, divided into 16 or 20 classes, with a master to every class, taking them up from grade to grade?—Our own school at Manchester somewhat fulfils those conditions. We have 15 teachers, including myself, and about 140 children who are being taught on the oral system, and three other teachers teaching the 40 sign pupils, *i.e.*, a staff of 18 teachers in all, dealing with a similar number of classes.

14,751. At what age do you begin to teach the oral system?—Directly a child comes in at six years of age or eight.

14,752. What is the best age for a child to come in, do you think?—Six.

14,753. A child ought not to come later than the age of six to begin the oral system?—I think not.

14,754. How many years would it take to complete the instruction?—Eight or nine; it would be better if we could keep them for 10 years. We ought to keep them till they are 16.

14,755. If you keep them up to the age of 16 you can give them not only a good elementary education, but a very fair secondary education, can you not?—I think so.

14,756. You said, in answer to the Chairman, that the parents object to applying to the boards of guardians for assistance for their children?—Yes.

14,757. Are you not of opinion that it would be very much better that the grant should be made through the local education authorities, whoever they may be in the future, whether the school boards or county boards?—We think so.

14,758. I understood you to say that you preferred it coming direct from the State?—Our committee is very anxious that the grant should not come through the guardians in the future.

14,759. You do not mind where it comes from so long as it does not come through the guardians?—No.

14,760. You expressed the opinion that the grant should be simply a maintenance grant and not an education grant?—That is my own private opinion, it is not the opinion of my committee.

14,761. Do not you think it is the duty of the State to see that these children are well educated?—I think so.

14,762. Do not you think the State ought to see that they get the best education that can be afforded to them?—Yes, I am quite myself in favour of an education grant with an education inspection. When I said it should be a maintenance grant, I was speaking with reference to what would be most likely to be acceptable to all the institutions.

14,763. How can the State secure the best education of deaf and dumb children without inspection?—I think certainly you would be likely to secure better education by inspection.

14,764. Do you think that the State ought to make grants for the education of deaf and dumb children without having the assurance that they obtain the results for which the grants are intended?—The State already makes that provision through the guardians.

Mr. W. S. Bessant.

7 Dec. 1886.

14,765. Do you think it ought to do so?—I think that the reports of the committees would be an assurance that the work was being carried on satisfactorily.

14,766. You said that you thought if State aid were given it would have the effect of diminishing the amount of voluntary contributions; are you aware that, so far as day schools are concerned, an increase in the Government grant has been coincident with an enormous increase in voluntary effort?—I am aware of that fact.

14,767. Why should the converse be the case where the class to whom the public appeals, has such a large claim upon their benevolence and commiseration?—Has not this increase of public support to ordinary schools taken rather a denominational form; is not it the case that it has not gone in support of those schools that are aided by the Government, but rather to schools carried on in accord with the particular religious opinions of the subscribers to those schools?

14,768. You expressed an opinion that day school education would be found inefficient as applied to the deaf and dumb?—I did.

14,769. Your opinion is that deaf and dumb education to be efficient must be boarding school education?—I am quite of that opinion.

14,770. And you think that the children should be required to attend school for at least nine years?—That is my opinion.

14,771. Would you make it obligatory that all deaf and dumb children should attend at some institution for 9 or 10 years, say from the age of 6 to the age of 15 or 16?—Certainly.

14,772. Practically you are in favour of the compulsory education of the deaf and dumb in institutions?—Yes.

14,773. Your opinion is that the State ought to make a grant, or that the State and the local authority combined should make a grant of from 15*l.* to 20*l.* a head towards the maintenance of deaf and dumb children?—Yes; I think it should be 20*l.* a head.

14,774. Surely where the child is taken off the parent's hands in the way of maintenance, the parent ought to contribute something, that is to say, as much as he is able to do?—I may say that in Manchester we receive as much as 12*l.* a head from the school fees.

14,775. What is the cost per head?—25*l.* The parents of the pupils in the Manchester schools do, in my opinion, pay to the full extent of their capacity. We have some cases where we have a great difficulty in getting the fees that we do from the children's parents.

14,776. Suppose you brought the whole of the deaf and dumb children of Manchester into one central institution, there would be a large proportion of the parents of those children who would be able to pay the whole cost of their education?—No; a very small proportion; I may say that out of the 180 pupils that we have at Manchester there are only 15 whose parents are able to pay the full cost of their maintenance. The Committee go very carefully into the case of each particular child; they make inquiries as to the number of children in the family, the average income per head of the members of the family, and so on, and they get as large a fee as they possibly can from the parents.

14,777. Have you been able to ascertain what proportion of children can pay full fees, what proportion can pay half fees, and what proportion can pay nothing?—

I may say on this point that our committee have just made the rule that no children can be admitted without a minimum payment of 3*s.* 6*d.* a week from the parents, that is 9*l.* 2*s.* a year. In all cases where the parents are not able to pay this 9*l.* 2*s.* a year, application is made to the guardians for the 20*l.* a year which is allowed by the Local Government Board to be paid for that purpose, and we have now 20 children waiting over from the last election who would have been taken in if their parents had been able to pay the 3*s.* 6*d.* a week.

14,778. Your contention is that the guardians not being a suitable education authority ought not to have the administration of these funds, but that they ought to come from those who are responsible for the education of the children, the school board, for instance?

Mr. W. S. Bessant.

7 Dec. 1886.

—My committee have never expressed an opinion in favour of their coming from the school board.

14,779. You expressed the opinion just now that the money ought to come from anybody but the guardians?—Yes.

14,780. Is not the school board responsible for the education of every child in Manchester?—I doubt whether my committee would like to be placed under the school board.

14,781. In what sense would they be under the School Board if they received grants from the School Board?—It remains to be proved how far the receiving of such grants from the School Board might involve their being placed under the machinery of the School Board.

14,782. You say there would be no objection on the part of good schools to Government inspection?—In the case of many schools there is a strong objection to Government inspection. We should have no objection to be placed under special Government inspection, that is to say, one suited to the case.

14,783. The Chairman asked you a question with respect to the religious instruction on the oral system. Have you found any difficulty in conveying religious instruction on the oral system?—We have no difficulty whatever in the schools in conveying religious instruction on the oral system.

14,784. You have weekly services or oftener in your institution?—Yes.

14,785. If the pupils learn the oral system in the school thoroughly and are accustomed to receive religious instruction orally in the schools, do they find any difficulty in listening to a sermon or a political speech afterwards?—Yes, decidedly, great difficulty.

14,786. Do you not know of any persons who have been taught the oral system who can attend a meeting or hear a sermon and afterwards give you a very good description of what was stated?—From what I have seen of the deaf and dumb who have been orally taught, I am of opinion that it is almost impossible for them to follow a speech at an ordinary meeting or a sermon in a place of worship where the service is not specially for the deaf and dumb.

14,787. (*Mr. Woodall.*) You gave us some figures with regard to the number of children who are supposed to be not under instruction at present, have you any further information which would enable us to conjecture how many more children than those shown by the official returns have been overlooked?—No, I have nothing except this return of these 185 children, because it is so difficult to get the information, nobody has sought it out.

14,788. From time to time you do find children whose existence had not been reported to you?—Constantly.

14,789. And from that you conclude that there is a considerable number of children not under instruction beyond the number that you have mentioned?—There is a large number of children who are not under instruction. Only a day or two ago I got a letter from the vicar of Preston asking me what was to be done about the deaf and dumb children in his district that were not under instruction, of whom he knew several, and I get the same application from all the towns round Manchester.

14,790. Then those figures which you have given us, which would show that there was only one child on the average in each school board district in your counties are altogether illusory?—I think so, quite.

14,791. The children who are overlooked presumably belong to the lower classes?—Yes, the majority of them.

14,792. Are there any statistics to show whether among the poorer classes the affliction of deaf mutism is more prevalent than among the well-to-do?—I am not aware that there are any statistics that would show that.

14,793. You have spoken of a rule laid down by your institution that there should be a minimum fee paid by the parents of 3*s.* 6*d.* a week. Is that, as a fact, paid by the parents, or is it not in many instances paid by societies on behalf of the parents?—Except in the case of children coming from your own district of North Staffordshire, those sums are paid by the parents direct to us.

14,794. The rule laid down by your institution would not preclude the fee being paid by a society like the North Staffordshire society?—Not at all. For districts outside Manchester the committee would prefer local organisations to be formed which would become responsible to us for the payment of those fees, but we have not, except in the case of North Staffordshire, any organisation that does pay those fees.

14,795. You told us that a comparatively small proportion of the deaf and dumb of the United Kingdom are under instruction at all?—Yes.

14,796. You, I gather, have admitted that the education given to those who are under instruction is not so satisfactory as you would like it to be?—One must admit that.

14,797. And that you attribute to the fact that the period of time during which the children are placed under your care is insufficient for the purpose?—Yes.

14,798. But you also said that the teachers generally employed did not receive the thorough training for their work which they ought to receive?—That is so.

14,799. Then, if the system of teaching is to be much improved, do not you think there would be a still greater difficulty in obtaining competent teachers?—There would be a present difficulty.

14,800. Do you suppose that that difficulty would continue to exist and be aggravated till some system was adopted by which State aid would be given for the training of teachers of the deaf and dumb analogous to that which prevails in the case of teachers for ordinary elementary schools?—I am quite of that opinion.

14,801. In the ordinary training colleges practically the whole of the cost of the training of the teachers is borne by the State?—Yes.

14,802. No aid is given by the State towards the training of teachers intended for the instruction of the deaf and dumb?—None whatever

14,803. Save, so far as it has aided in the instruction of pupil-teachers, because you have told us that you are glad to get an ex-pupil-teacher, because in carrying on the work which he has to do in your institution he brings to bear the experience he has gained in an ordinary elementary school?—That is so. In all the appointments I have made at Manchester I have selected teachers of that class for the work, and I give them such training as I am myself able to give in the special work they are engaged in.

14,804. The question of the expense of imparting instruction is, in your mind, a very important one?—Very.

14,805. Would it not still further add to the cost of instruction if there was to be an isolation of the two sexes?—I think not.

14,806. Surely where you have boys and girls together of the same age you are better able to grade them according to their degree of proficiency, are you not?—I think if you had 100 girls in one institution you would have all the facility for grading there that you would have in a school of 100 mixed children.

14,807. But suppose you have 100 boys and girls and divide them into two schools of 50 each, the cost of instruction would be greater, would it not?—Undoubtedly.

14,808. Is not there some advantage recognised in keeping the two sexes together and in keeping up in the institution something like family influences?—I am of opinion that that theory of the family character of an institution is scarcely capable of being carried out where you have anything like a large number of children, say 100 children, all coming from different families and in no way related to one another.

14,809. When we visited your institution some pains were taken by the matron to show that serious effort was made to maintain those influences?—We do make a serious effort to maintain them, undoubtedly, but the advantages of separation, in my mind, would greatly outweigh any slight advantage which might be gained in that way.

14,810. You think that the influence of one sex upon the other is not sufficiently important to outweigh other considerations?—That is my opinion.

14,811. You told us that you thought that it would be desirable in the case of those children who could be retained till they arrived at the age of 16, that industrial training should be imparted to them at the age of 14?—Yes.

Mr. W. S. Bessant.

7 Dec. 1886.

14,812. Are you aware that in the ordinary elementary schools in France, for instance, industrial training begins at a very much earlier age than that?—I am aware of that, but I am afraid that my views with reference to the undesirability of putting children to industrial work at too early an age are somewhat prejudiced by my early experience of industrial work in connexion with the deaf and dumb, where the system was that children immediately after school were marched into some closely heated shop and confined there some hours, and they got very little recreation indeed. My opinion is that the demands of education upon a deaf and dumb child are so great that he requires in the early stages of his education all the recreation he can possibly get.

14,813. Perhaps it would be well for you to explain what you mean by industrial training; do not you think that industrial training can be given in such a way as to be in itself a recreation?—Yes, I think so.

14,814. If you were told that that is the recognised and admitted experience of schools where industrial training is combined with literary instruction, you would probably see no reason why it should not equally apply in the case of the deaf and dumb?—But I still think that the early years of a deaf and dumb child's school life might be better devoted to a literary course than be divided between a literary course and an industrial course.

14,815. Are you familiar with the Kindergarten system?—Yes, we adopt it to some extent.

14,816. And you know that Kindergarten work embraces a good deal that is in fact training in handicraft?—Yes, modelling and so on.

14,817. And that kind of instruction is popular among children?—Undoubtedly.

14,818. Do you not think then that it would be expedient that children at an early period of their school life should have a pleasant training of that kind with a view to the development of their faculties in subsequent industrial pursuits?—I think so, that is to say, if you confine the industrial training to what you are pointing at, but I was speaking just now with reference to boot making, tailoring, and those occupations.

14,819. Dismiss from your mind for the moment the teaching of a particular trade, and understand that my questions with regard to industrial training refer rather to familiarising children with the use of tools, and instructing them in elements which would be equally capable of being applied in due course to any trade to which they might afterwards be devoted. Do you not think that it would be desirable that industrial training of that non-specialised kind should be associated with the other education that would be given in the institution?—Yes, I think so.

14,820. And as part of that instruction you would attach considerable value to the teaching of drawing?—Yes.

14,821. You said that drawing is at the present time taught in your institution, but I understood you that you did not go beyond the first and second grades?—So far we have not been able to travel beyond the first and second grades in freehand and model drawing, because we have not had the children at school long enough to carry it further. The average stay of a child in the school is scarcely five years.

14,822. You are aware that it is generally agreed that it is desirable that the teaching of elementary drawing should be carried out universally in the ordinary elementary schools?—Yes.

14,823. And you feel that that which is necessary in the case of the ordinary population, would be equally important or more important in regard to the deaf and dumb?—I think we should aim at making the deaf and dumb differ as little as possible from ordinary hearing children in every respect.

14,824. With regard to Government inspection which it may be taken would have to accompany the payment of Government grants, there is an uncomfortable apprehension on the part of the managers of certain institutions with regard to the character and effect of that inspection, is there not?—Yes.

14,825. And there is a fear that it might result in the enforcing of some uniform and bureaucratic system?—Yes.

14,826. But do not you think it would be possible to have a system of inspection which should recognise a variety of systems pursued in different institutions?—Yes, I think it would be possible.

14,827. Are you aware of the kind of inspection to which industrial and reformatory schools are at the present time submitted?—Yes, I have had it explained to me.

14,828. They are left very free to pursue a great variety of methods?—Yes; my committee had the facts with regard to the inspection of those schools placed before them, and they thought that some inspection of that sort would be satisfactory.

14,829. Do you know anything of the schools of the Christian Brothers?—No.

14,830. If you were informed that while the Christian Brothers feel themselves precluded from accepting Government grants in aid of their elementary schools because it would involve the acceptance by them of the Government system of teaching, they feel themselves free to accept a weekly capitation payment for such institutions as industrial schools and reformatories because the acceptance of such grant does not fetter their freedom as to methods of instruction, do you not think that a similar system of grants and inspection would meet all the difficulties apprehended by the institutions for the deaf and dumb?—From what I know of industrial school inspection, I think it should do so.

14,831. (*Rev. Mr. Sleight*). You stated that the age should be six at which children should be admitted; what length of time in your opinion is needed for the sign system and what length of time for the oral system to give a child a complete education?—I think myself the full term of 10 years should be given for the oral system, and I think the sign system should have at least eight years.

14,832. You have stated that the average time that your pupils stay in the institution is less than five years?—Yes.

14,833. Does that apply to the children who are taught orally?—It is so at present.

14,834. Then the children who are taught orally leave with an incomplete education?—In my opinion, decidedly.

14,835. With a less complete education than those taught by the manual system?—No, I think not.

14,836. It must be so according to your own statement?—As far as my experience goes we have been able to do as much with the children in the five years under the oral system as we have so far under the sign system in the same time; in some respects in my opinion, the result under the oral system has been more satisfactory.

14,837. Allowing that children could remain in your school for 10 years, to take your own time, in your opinion, could they all be taught with success on the oral system?—I think not.

14,838. What per-centage, do you think, could be taught with success on the oral system?—I have not arrived at any definite opinion upon that point, but I should say 20 to 25 per cent. of the children would be more usefully taught on the sign system. I do not say that they could not be taught on the oral system, it is a mere question of which is the system best adapted to the particular child.

14,839. Do the deaf children themselves prefer to communicate with each other orally or manually?—Manually, in the earlier stages of education, certainly.

14,840. How do those children who are taught orally communicate with each other in their hours of recreation?—By natural signs and the finger alphabet in my own school.

14,841. Do you ever find that the orally taught children communicate with each other orally?—Constantly.

14,842. In the playground?—Yes, in the playground.

14,843. Do not deaf and dumb children get a great deal of instruction from one another?—Yes, I think so.

14,844. And therefore, in your opinion, it is an advantage for them to be congregated together in an institution?—I think so; a very great advantage.

14,845. Do you find that those who have been taught on the oral system communicate with each other after they have left school orally, or do they resort to the finger alphabet?—I think between the deaf and the

Mr. W. S. Bessant.

7 Dec. 1886.

deaf the finger alphabet will always be more used than speech.

14,846. In some of our towns there are institutes for the deaf and dumb, are there not?—Yes.

14,847. And at these institutes they have discussion classes and debates on various matters?—Yes.

14,848. Do you know whether those discussions and debates are ever carried on orally, or are they always carried on by the finger alphabet?—I think a sufficient number of orally taught children have not yet been sent out of the schools to make it possible that those discussions could be carried on in any other way than by the finger alphabet.

14,849. In your opinion, could a discussion among the deaf and dumb be intelligibly carried on by the oral system?—I think so; but I think the deaf and dumb would prefer to carry it on by spelling.

14,850. (*Mr. Arrol.*) If the sign and manual system were adopted as the means of educating the deaf and dumb in a day school, might a measure of success attend such teaching?—I think so, undoubtedly, but not the same measure of success as could be attained in a boarding school.

14,851. For the teaching of the pure oral system it would be necessary, in your opinion, to have the child resident in the institution?—That is my opinion.

14,852. (*Mr. St. John Ackers.*) In answer to one of the commissioners I think you said that you thought the finger alphabet was chiefly used by the deaf in after life between themselves, but that it was not so much used between the deaf and ordinary persons?—Yes.

14,853. In your opinion, is it more advantageous that the deaf should be educated in a system which will enable them to converse amongst themselves or in a system by which they can communicate with the world at large?—Decidedly it is more useful to them to be educated in a system that will enable them to converse with the world at large.

14,854. Then, however pleasant it might be for the deaf and dumb to converse with one another by the finger alphabet, if they lived entirely in the institution for the whole of their lives, yet, for practical purposes, you think it desirable that every child should be taught on the oral system?—I think so, decidedly.

14,855. Have you ever been to a country where the schools are all upon the oral system?—No.

14,856. Then you have not personal experience of what would be the state of things as regards communication between the deaf and the deaf, or between the deaf and other persons in a country where the oral system only was taught?—No, I cannot say that I have.

14,857. You say that in the playground at your own school signs and the manual alphabet are used by the children amongst themselves?—Yes.

14,858. Are there any children in your school who have not only been orally taught, but who have been kept entirely separate from those who have been taught by signs and the manual alphabet?—None whatever.

14,859. The orally taught children are, in fact, taught signs and the manual alphabet by their schoolfellows? Yes, to some extent. I may say, perhaps, that the arbitrary signs are gradually dying out, and natural signs are taking their place.

14,860. You are endeavouring in the sign department to abolish arbitrary signs as much as possible, and endeavouring to use the finger alphabet in a great measure in place of a large number of signs which formerly were used?—Yes.

14,861. And you find that a great advantage in enabling the children to get a better knowledge of language?—Yes.

14,862. Because by the use of the finger alphabet instead of arbitrary signs, you follow the ordinary form of the English language?—Yes.

14,863. You were asked by Mr. Mundella whether you thought that any orally taught person would understand a lecture or a sermon, and you answered, No; but did you mean by that a sermon or lecture delivered to a hearing assembly or a sermon or lecture delivered specially to a number of orally instructed deaf persons?—I understood Mr. Mundella to be speaking of a sermon or a lecture delivered under ordinary circumstances to ordinary hearing people.

14,864. Then, will you state to the Commission why it would be impossible for an orally taught person to understand a sermon or a lecture delivered in the ordinary way?—Because of the rapidity of the utterance of the speaker and because the speaker would not always be placed in a proper position in relation to those who were looking at him; principally for those two reasons.

14,865. Then, supposing each orally taught deaf person to be able to see the mouth of the speaker or preacher, and supposing the speaker to deliver his sermon or lecture with not too much rapidity, would you be of opinion that such deaf person would be able to understand the lecture or sermon? That is to say, supposing the lecture or sermon to be delivered specially to a number of deaf persons orally taught, without any others in the room if you like?—I think a lecture specially delivered to 20 or 30 who had been orally taught would be very fairly understood by them.

14,866. Have you had any experience of deaf persons orally taught going to ordinary religious services, and having the sermons interpreted to them by their relations or friends who may be sitting near them?—I have heard that that has been done; in fact, I have myself done so with fairly satisfactory results.

14,867. For the training of teachers you advocated attaching a lectureship to one of the large institutions. A similar plan was adopted, I think, in your own institution, only in that case the gentleman who came from Ealing remained only one year?—Yes.

14,868. You suggest that the teachers should have a training of two years?—Yes; I would also suggest that there should be a definite number of students attending those lectures; that there should be a definite number of students apart from and in addition to the teaching staff, those students being prepared for taking positions in other institutions.

14,869. Not always in class with the deaf?—Not always in class with the deaf.

14,870. That comes very much to an ordinary training college for teachers of hearing persons, to which a practising school is attached, which is generally a large practising school. Would it not, in your opinion, be thoroughly satisfactory if there were a similar state of things with regard to the deaf; that is to say, if you could have a training college for teachers of the deaf to which a practising school was attached, in which college the whole of the time of the students should be devoted to hearing lectures, watching the practical teaching, and, in a later stage, teaching the deaf and dumb pupils themselves?—Yes, if the conditions of that practising school were similar to those of our large institutions. I may say that where I have found teachers deficient has not been in the discharge of their educational duties, but in the discharge of duties relating to the domestic affairs of the institution—the charge of the children out of school hours. Unless a teacher is attached to a large institution where he comes in contact day by day with the requirements of such institutions with reference to the duties of the teacher out of school, I conceive he is only partially educated or partially adapted to the work we want him to perform.

14,871. Then, in your opinion, there is practically as much to be gained by the teacher being with the deaf pupils out of school hours as by being with them in school hours?—Yes.

14,872. And you think that any training college that does not give facilities for enabling a teacher to gain that experience would fail to turn out properly-trained teachers?—Yes.

14,873. There is a difference of opinion whether there should be large schools or small schools for the deaf? Yes.

14,874. The opinion you have given you do not give as the opinion of the whole of the teachers of the deaf, but as your own opinion after many years of consideration?—Yes.

14,875. You said you thought that children who had not a pleasant or musical voice should not be taught on the oral system?—I referred to children who had an objectionably harsh voice—a voice which it would be extremely difficult to cultivate to anything like a pleasant intonation.

14,876. If it were a voice that could be understood, would it not be an advantage to the child that he should be taught to use his voice even if it were a little unpleasant to listen to?—Yes, I think it might be an advantage to him.

14,877. Of course we may assume that a child with such a voice could not very well be trained to become a clergyman or a lecturer or a public speaker, but if speech enables the deaf to make themselves understood by ordinary persons is not even a harsh and unpleasant voice better than no voice at all, and is not it worth while to go to the trouble and expense of enabling a person possessing such a voice to communicate with hearing people?—Yes, if we have sufficient time to devote to difficult cases of that sort.

14,878. In your opinion, in order to get the education of the deaf to anything like what it ought to be in this country, you must have, whether under the silent system or under the speech system, universal compulsion, and the children must remain a very much longer time in school then they do at present?—Those are two essentials.

14,879. (*Admiral Sir E. Sotheby.*) Have you met any deaf and dumb people who have been efficiently taught at board schools?—I have never met with any deaf and dumb person who has been efficiently taught in a board school.

14,880. What becomes of those children who are not admitted into your institution when an election takes place?—They stand over to the next election, and they eventually get in; we have never refused any children.

14,881. How long have they to remain out sometimes?—Up to within the last three years we have been able to receive every child that has applied; during the last three years we have found it difficult to do so, and they have stood over from year to year, I think not longer than two years.

14,882. Have you any knowledge of the deaf and dumb working with the blind at trade?—No personal knowledge.

14,883. Have you any gymnasium at your institution?—Yes, a very fine one.

14,884. Do you think that a deaf and dumb person who had only been taught orally would be placed in a state of isolation when he went out into the world?—I think he should be less isolated than a man taught by the finger alphabet.

14,885. Do you think that a deaf and dumb person taught thoroughly on the oral system would be able to understand a sermon preached by a clergyman in an ordinary church?—I do not. I do not think that an orally taught deaf and dumb person would be able to understand an ordinary sermon delivered to a hearing congregation.

14,886. But if that clergyman delivered his sermon by the sign and manual system, a person who had been taught that system would be able to understand him?—Yes, if he had been taught on the sign system, undoubtedly.

14,887. (*Sir Lyon Playfair.*) But the other people would not understand him?—No.

14,888. (*Admiral Sir E. Sotheby.*) Do you think it is possible to teach a deaf and dumb person by those who have not been trained?—No, I do not.

14,889. Do you know anything about the deaf and dumb school at Exeter?—I have never seen it. I have met the head master and I know something of its working.

14,890. (*Rev. Mr. Owen.*) In the arrangement of the school for instruction purposes, do you strongly recommend the class-room system?—Undoubtedly; we have tried both systems at Manchester. We formerly had all the children in one room, and we found that for oral instruction more particularly that that was a bad arrangement: we have now 12 class-rooms, and since we have adopted the class-room system I have found that the teaching goes on much more efficiently.

14,891. You said you had 140 oral pupils?—Yes.

14,892. How many have you in the manual department?—Forty.

14,893. In what manner is the selection of the pupils made; do you attempt the oral method with all children who enter, and in those cases where you find it unsuitable do you draft them into the manual department?—At present any child who comes in at the age of 10 is taken into the sign school without any attempt being made to teach it orally.

14,894. The child goes straight to the sign department on entering; how soon do you test the capability of that child to be taught in the oral department?—We do not attempt to teach a child 10 years of age orally.

Mr W. S Bessant.

7 Dec. 1886.

14,895. Take those much younger than 10?—We have transferred very few children indeed from the oral school to the sign school: the sign school has been kept up almost entirely by children who have come to the school after the age of 10.

14,896. (*Sir Lyon Playfair.*) You cannot teach children the oral system after a certain age, as I understand you?—It is a mere question how long the child is likely to be in the school; if he comes in at 10 years of age, when he arrives at the age of 13 his father will want him to work, and, in my opinion, it is undesirable to attempt to educate any child in the oral system who enters the school at the age of 10.

14,897. (*Rev. Mr. Owen.*) You do not attempt the oral system unless you think time and the capacity of the child are in favour of its being brought to some proficiency?—No.

14,898. Is the manual department as liberally staffed and equipped in proportion as the oral department?—We have one teacher to 10 pupils on the oral system, and in the sign department each teacher has 12 or 13 pupils.

14,899. Has the manual department a responsible head teacher with full liberty of action, or does the control of that department rest entirely with yourself?—The control of it is under my direction, but the head teacher is practically responsible for the teaching that goes on.

14,900. The statement is constantly being made that the most successful cases which oral teachers bring forward are not deaf-mutes but semi-mutes. Do you believe such a statement to be well or ill founded?—I have not found it so in my experience.

14,901. It has been said that many of the oral pupils exhibited at Milan were semi-mutes; are your own most successful oral pupils semi-mutes or congenital mutes?—We have some very successful semi-mutes, but we also have some very successful congenital mutes, the most sucessful probably have been semi-mutes.

14,902. When they are brought forward for examination do you clearly state whether they belong to the one class or the other?—If the question is asked, one does not take up time in explaining unless explanations are asked.

14,903. You do not volunteer the explanation?—Not always.

14,904. Of course you recognise the vital and marked distinction between the two classes?—Yes, in each of my classes there is a statement taken from the returns to the institution of the causes of deafness, those returns are in a conspicuous place in every class and are always produced if asked for. Time would not permit us to go into details as to the conditions of each individual child.

14,905. Do you allow your orally taught pupils to converse with one another on the sign and manual method out of school hours?—We do allow it.

14,906. Do your teachers ever converse with the oral pupils out of school hours in the sign and manual language?—With some of the younger children who have not been taught sufficiently to be able to speak and understand articulate language, the teachers use the natural signs.

14,907. Do you yourself sign or spell to your oral pupils if you fail to make them understand in any other way?—Never; if the child is sufficiently educated and does not follow my lip reading I then spell the word in the ordinary form to the child orally.

14,908. Do you believe, speaking generally, that by the oral method the deaf may be taught to converse freely with all?—The pupil will always be less capable of reading the movements of the lips of a stranger than those of one with whom the pupil is familiar.

14,909. What per-centage of those who are born deaf would you say it was possible to instruct orally?—The majority, certainly.

14,910. Do you believe that 99 out of 100 of the deaf and dumb, roughly speaking, can be taught to speak orally?—I think it probable that 20 to 25 per cent. could be better dealt with on a sign or silent system.

14,911. Seventy-five per cent. could be taught on the oral system, you think?—Yes, and probably more

Mr. W. S. Bessant.

7 Dec. 1886.

when our knowledge of the oral system is more developed.

14,912. Do you think 75 per cent. are able to rely entirely upon their articulation and lip reading after they leave school?—I should say so.

14,913. Have you ever seen an orally taught pupil who could converse with the world at large?—Yes.

14,914. When we went over your institution I asked a simple question in the playground with my lips very deliberately, and I found that the children did not understand me; then I used the sign and manual language and they understood me directly; if such a simple communication from my lips when deliberately addressed to them was not understood how could they be expected to converse with strangers with any degree of facility or certainty?—It depends entirely upon what children you communicated with; if they were the infant children who had only been in the school a couple of years, or even three years, I am not at all surprised that they did not understand you.

14,915. It has been stated in evidence by Mr. White that oral pupils look with horror on signs; is this your opinion?—My opinion is that when a child is taught orally he comes to prefer that method very much to the sign method.

14,916. It has also been stated in evidence that all pupils who can be taught on the manual method can also be taught on the oral method; is that your opinion from your experience?—I have already stated that my opinion is that there will always be a certain number of pupils who might more usefully to themselves be taught on the manual method.

14,917. It has also been stated (by Mr. Van Praagh) that children who cannot receive instruction on the oral system cannot receive instruction on the manual system; is that your opinion?—I think there are some pupils who could be better taught on the sign system.

14,918. To what extent do you give religious instruction in your school on the oral method to individual classes?—The children recite their prayers on the oral system *en masse*, but religious instruction is given class by class.

14,919. Can you give me any idea of the age of the youngest child in your oral department to whom you impart religious instruction?—We commence to give religious instruction orally in the third year.

14,920. Are you aware that in his book on deaf-mutism, Dr. Hartmann, an upholder of the oral method, says that in most of the institutions in Germany religious instruction only commences in the fourth year?—I was not aware of that.

14,921. You think it is possible to give religious instruction to children orally as early as their third year?—Yes, to give them instruction in the elements of religion, certainly.

14,922. I think it is your opinion that no more than 30 together can be instructed either by sermon or lecture on the oral system?—I do not say it is impossible. I say that that would be the best condition for instruction in that way.

14,923. (*Mr. Johnson.*) I take it to be your opinion that there are cases for which instruction in the oral system is best fitted, and cases for which what you call the combined system is best fitted?—No. I entirely object to the combined system as I understand it.

14,924. What do you understand by the combined system?—The combined system, as I understand, means the teaching of articulation to a certain extent combined with the teaching of signs and the manual alphabet.

14,925. What is the system that you adopt in your school other than the oral system?—We have only two systems, the sign system and the oral system.

14,926. You think the sign system and the oral system ought to go side by side in the instruction of the deaf and dumb throughout the country?—I think both systems require to be taught, but I would prefer that they should be taught in entirely separate institutions.

14,927. You do not think it at all desirable that one system only should be established for the education of the deaf and dumb?—Not at present; we may come to it.

14,928. At present you think the system which is followed in your institution is the proper one to follow for the benefit of the deaf and dumb, some of the pupils under your care being instructed in the oral system and some in what you call the sign system?—Yes.

14,929. When we were at Manchester, I think I understood you to say, that unless you had a child before he arrived at the age of six, you would not put him to the oral system?—No, I did not say that I think, we should put any child to the oral system who came to us under the age of 10.

14,930. But it would be difficult to teach a child the oral system after the age of 10?—Yes, that is so.

14,931. Which method do you think produces the best results in a given time of these two systems which you teach?—The oral system certainly, if the period of instruction is more than four years.

14,932. Which method produces the best results in a given time?—If the given time is only three or four years I should expect the sign method if efficiently taught to produce a better result than the oral system, because one year of that short period must be devoted to teaching the elements of articulation. If the given time be over four years the oral system would, in my opinion, produce the best results.

14,933. Which system is attended with the most difficulties and the most expense, the oral system or the sign system?—The oral system.

14,934. With regard to the training of teachers for the deaf and dumb, do you think it would be a desirable thing that a college or a department should be set aside in each institution for the training of teachers for the deaf and dumb, or do you think it would be better to have a central college for training them?—I would not have a department for training them in each institution, I would have a central college attached to one of the large institutions.

14,935. You think having a school attached to a great institution would give the practical experience that was required?—Yes.

14,396. It would be a *sine quâ non* in instructing masters that they should have practical experience amongst the deaf and dumb children?—Yes.

14,937. Have you any statistics with regard to the causes of deaf-mutism amongst your children?—I have worked out a statement from the returns made by the parents to us as to that, and we find that out of the 200 cases examined, that is, the 180 now in the school and 20 that have recently left, there are only three cases in which there was any relationship existing between the parents before marriage.

14,938. What was that relationship?—In the first case the parents were distantly related, in the second and third they were cousins. The number of cases in which the deaf and dumb child had relations who were deaf, that is to say, fathers, mothers, uncles and aunts, and so on, were 10, that is to say, there were 10 cases of deaf and dumb relations out of 200. Then there were 17 cases out of the 200 in which there were more than one deaf and dumb child in the family.

14,939. How many were congenitally deaf?—I could not say, I could ascertain that and send it to the Commission.

14,940. Do I rightly gather that you think it undesirable that in the school educational work and industrial work should go on at the same time. I mean during the same period of pupilage?—My opinion is that at the age of 14 the child should become a half-timer; he should have half his time in industrial work and half his time in school.

14,941. Up to the age of 14 he should be at school?—Yes, at school and taking part in the ordinary domestic duties of the institution.

14,942. (*Sir Lyon Playfair.*) You went beyond that because in answer to Mr. Woodall you said that you had no objection to his acquiring a knowledge of tools during that time?—Yes, but I understood the term "industrial work" in the last question but one to have reference to the teaching of distinct trades. These, I think, should not be begun until the boy is 13 or 14 years of age.

14,943. (*Mr. Johnson.*) What is the practice at your school; do you carry on ordinary education and industrial training at the same time?—We do not teach any industrial occupations at present, except a little wood carving and fret sawing.

14,944. I suppose the comparative cost of education by the oral method and by the manual method is almost about the same, is not it?—We think the oral system is more expensive because more teachers are required.

14,945. But not so many more; you stated that you had one teacher to 10 pupils on the oral system and one to 12 pupils on the sign system?—Yes, but 12 pupils to one teacher on the sign system is a much less number than we used to have; formerly 15 and as many as 20 children were under one teacher, but I think that for efficient instruction even in the sign system one teacher should have no more than 12 or 13 children.

14,946. With regard to religious instruction, do all your children go to the chapel?—Yes.

14,947. Do you know whether any of your orally taught children take any part in the service—I do not mean the young ones?—I may say that about 20 boys and girls are furnished with Prayer Books and Bibles and hymn books, and follow the service very closely, and to some extent intelligently, and derive benefit from it.

14,948. Do you put those orally taught children in any different position in the chapel to those who are being taught on the sign system?—No.

14,949. Do not you require to put an orally taught person in close proximity to a person speaking in order to enable him to understand what the speaker is saying?—I do not say that they follow the clergyman when he is delivering his sermon, because they do not.

14,950. Then there is no interpretation of what the clergyman says in signs to the pupils?—None whatever.

14,951. (*Sir Lyon Playfair.*) You stated that the sign system in a given time produced better educational results than the oral system?—If the children are only a short time under instruction I think that more would be achieved by instruction in the sign system.

14,952. When persons taught by the sign system go into the world they have to depend on meeting persons who know something of the finger alphabet?—Yes.

14,953. When persons taught by the oral system go into the world, do not they meet with more persons who can communicate with them than the persons who have been taught by the sign and manual system?—Yes.

14,954. And does not that compensate for the longer time required in educating by the oral system as compared with the other? Might it not pay to keep a person longer upon the oral system if by doing so you enabled him to go out into the world with the means of communicating with many more persons than a sign taught person would be able to communicate with?—I quite think so.

14,955. (*Dr. Tindal Robertson.*) Have you any statistics of the causes of death in your Institution?—No, I do not think we have.

14,956. You have a medical man attached to the institution?—Yes, we have an honorary physician.

14,957. When any of your pupils have died in the institution have you ever had any post-mortem examination made?—I think there was one made a short time ago, but there have been very few deaths in the institution. I think, if my memory serves me rightly, during the whole existence of the institution there have only been eight deaths.

14,958. Have you any idea whether any of them were caused by brain disease?—I could not answer that question.

14,959. Will you give me your reasons why you put some of the children on entrance into the oral department, and why you put others into the sign department?—It would be on account of defective sight, defective intelligence, and the age at which they commence to receive instruction.

14,960. I suppose you have technical schools in Manchester?—Yes.

14,961. Do not you think it would be advisable instead of endeavouring to give your pupils technical instruction in your own establishment, involving more cost, that when they got to the age of 14 they should attend those technical schools which are established for the special purpose of technical training?—I think that system might certainly be given a fair trial before anything was done in the way of establishing separate workshops at the institution. We have found it very useful to send some of our children to the school of art in the town, and they have done very well there. I do not see why a deaf and dumb child of sufficient age, say of the age of 14, should not receive as much benefit at one of those technical schools as an ordinary child. The greatest drawback to such an arrangement would be the time occupied in going to and fro.

14,962. You were asked some questions as to the necessity for teaching the children drawing, do you not think that in the case of deaf and dumb children as in the case of other children there are some who have a special aptitude for drawing, and some who have no aptitude for it whatever?—I have not expressed the opinion that all our children should be taught drawing. I am of opinion that if after, say, one year's trial a child shows very little talent for drawing it would be better for him to be otherwise employed.

14,963. Is not it the case with drawing as with music that some children have a special aptitude for it, which others have not, in which case it would be a waste of time to attempt to teach them drawing?—That is my opinion, decidedly. At present we are not teaching all the girls drawing; most of the girls take sewing while the boys are taught drawing.

14,964. Do you teach all the boys drawing whether they have any aptitude or not?—Yes, at present.

14,965. I understand you do not think that advisable—No, I do not.

The witness withdrew.

Mr. Frederick Bellerby Illingworth examined.

Mr. F. B. Illingworth.

14,966. (*Chairman.*) You are head master of the Liverpool School for the Deaf and Dumb?—Yes.

14,967. You have been there since when?—Since October 1884 as head master.

14,968. Where were you previously?—For 11 years I was in the Edinburgh Institution, in Henderson Row, and I was for three months head assistant at the Liverpool School before I was appointed head master.

14,969. The Commissioners have visited the institution, and therefore there are many points that we have already taken a note of which I need not ask you about. I understand you have introduced the American system, the one-handed alphabet?—Yes, I have introduced it within the last two years for convenience.

14,970. Do you find that answers well?—It has answered well so far.

14,971. Is it as easy to learn as the two-handed system?—Yes, and it is useful when a deaf person has only one hand at liberty. A good many Americans visit the Liverpool School, and therefore I thought it would be an advantage if our pupils knew both alphabets, so that they might be able to communicate with those visitors.

14,972. What has been the action of the boards of guardians in Liverpool in relation to deaf and dumb children?—The Liverpool guardians behave very well indeed; they very seldom refuse to pay. I have only had two refusals in cases where I have made applications to the guardians. One I sent you notes of, a case at Birkenhead.

14,973. Do you think there ought to be a change in the law with regard to providing for the maintenance and education of deaf and dumb children? Do you think it should be compulsory on either the boards of guardians or the education authorities?—Yes, I think it should be made compulsory on the boards of guardians or the education authorities.

14,974. You have day scholars as well as boarders?—Yes, 42 day scholars at present.

14,974*a*. How does that answer?—As a rule we much prefer to have them as boarders than as day scholars, but there are exceptional cases where the parents possess more than the average intelligence, and where they take a great interest in their children out of school, and in those cases I think it is an advantage for the pupils to be day scholars, because they get a great deal of information outside the school that they could not get in it.

Mr. F. B. Illingworth.

7 Dec. 1886.

14,975. Are all your day scholars admitted free?—Yes, and they get a free dinner. But we have a few intermediate day scholars, who pay 21s. per quarter, and dine at the teachers' table.

14,976. Do the parents pay anything in the case of the other children?—The charges for resident pupils are 10*l.*, 12*l.*, and 14*l.* per annum, according to age.

14,977. Do you keep the children to any particular age?—We have no fixed age at which they leave, but they usually leave at the age of 16 or sooner.

14,978. You would desire that deaf and dumb children should come to school at as early an age as possible, as early as other children?—It would not do to take them at too early an age or you would have to provide nurses for them.

14,979. Might not you have an infant class, as in the elementary schools?—I should hardly think so. I think if they begin at the age of seven that is early enough, if they can remain eight years at school.

14,980. Do you think it should be compulsory by law that they should remain eight years at school?—I think so.

14,981. Would your committee have any objection to your school being inspected if it received a Government grant?—I am not in a position to answer that question.

14,982. So far as you are aware, would there be any unwillingness on the part of your committee to be interfered with in any way by the Government?—The committee have expressed that opinion.

14,983. Therefore, if they received a Government grant it would be on the understanding that they had free liberty as regards modes of teaching?—Yes.

14,984. They would not, I presume, object to have such inspection as takes place in the case of industrial schools?—I could not say exactly. I believe they have refused to have the school certified, at least they have refused to apply to be certified. There has been nothing said about the school being certified since my appointment, but I understand that the committee have always refused to certify themselves, that is in order that they may obtain the full grant allowed by boards of guardians under the Local Government Act. The guardians have to write to the Local Government Board, I believe, in each separate case.

14,985. Do you teach any industries?—No, with the exception that the children are engaged in household work out of school hours.

14,986. (*Mr. Johnson.*) Do you teach the oral system and the manual system in the same room?—We have only one oral class in the same room that manual pupils are being taught in; four of the oral classes are quite separate.

14,987. Do you think that mixing of the two classes of pupils in one room works well?—Yes, I think it works well, but it is desirable to have a separate class-room for each oral class.

14,988. Is your instruction generally carried on by the one-handed alphabet?—Not generally; occasionally. I am speaking of the silent pupils. In the oral classes we do not use either alphabet.

14,989. (*Rev. Mr. Owen.*) How long has the oral method been in operation in your school?—It has been in operation, I believe, about seven years, more or less; I have only been in the school about two and a half years.

14,990. The oral method has not been in operation long enough in the school to turn out any really good specimens?—Some of the pupils who are in the school now are as good as any I have seen.

14,991. Have you turned out any pupils who have been able to depend entirely upon the oral system as their means of communication with the outside world?—No; I have not been long enough connected with the school to have been able to do so yet.

14,992. Have you any idea what the opinion of the deaf and dumb themselves is upon the question which is the better system?—Generally it is against the oral system, because they have mostly been educated on the silent system.

14,993. What is your own opinion upon the question?—My own opinion is that, wherever it is practicable, the oral system should be taught, but there are cases where it cannot possibly be taught to advantage; that is to say, where it is much better to teach the child on the silent system.

14,994. Is that the opinion of your committee?—Yes; at any rate it is the opinion of most of the principal members of the committee.

14,995. You think that the oral system should be taught to those who show a capability of being taught by that method?—Yes.

14,996. (*Admiral Sir E. Sotheby.*) You understand what the combined system is?—Yes.

14,997. And you know what the pure oral system is?—Yes.

14,998. Which do you think is the best, the pure oral only or the combined system?—I think the pure oral rather than the combined. I would say adopt either the pure oral or the silent method, but not the combined system; by the combined system I mean teaching the same class by signs and by the oral system as well.

14,999. You would consider that a deaf and dumb person taught by both methods would have a great advantage over one who had been only taught the pure oral system, would you not?—A person taught on the pure oral system could very easily learn as much of the finger alphabet as any other deaf and dumb person in the course of a very short time. All the pure orally-taught pupils I have met are able to use the manual alphabet.

15,000. Would those who had been taught on the pure oral system, when they mixed in society, prefer to communicate by signs and the manual alphabet if they met with people who understood the manual alphabet?—So far as my experience goes they have usually preferred conversing by the fingers.

15,001. Even when they could talk well?—Yes; they seem to feel more reliance on the sign and manual method.

15,002. They are afraid perhaps of other people noticing their voice?—Yes, I think that has a great deal to do with it, and also they are never so sure that they are understood by the oral system as they are by the sign system.

15,003. Then if they were taught on the combined system they would not feel so isolated in society as they would if they were taught the oral system only?—I object to the combined system, because it does not give the oral system any chance at all. I mean the speech of children instructed under the combined system is not so good, and they will not depend entirely on lip reading; in a combined system class, if a child failed the first or second time to understand what was said, the teacher would resort to signs to explain what was said.

15,004. You would advocate that a gymnasium should be attached to schools for the deaf and dumb?—Yes.

15,005. For the sake of the mind as well as the body?—Yes.

15,006. (*Mr. St. John Ackers.*) You have just said that the deaf and dumb prefer using the finger alphabet to speaking in society, but you also said, did you not, that you were not conversant yourself with any orally taught persons who did not also know how to communicate by signs and the manual alphabet?—Yes.

15,007. You have not met in society, either abroad or in this country, any orally taught persons who were not able to communicate with others by signs and the manual alphabet?—There is one exception, Mr. Abraham Farrer. I have never seen him communicate with others by signs at all.

15,008. When he is communicating with you does he prefer to speak or to write?—During the short time that I was in his company he spoke entirely.

15,009. Your institution has given special attention to the question of defective eyesight amongst your deaf pupils?—Yes, our medical man is both an oculist and an aurist, and he examines all the children specially with regard to eyesight and hearing.

15,010. And that has been many years the case?—Yes, 6 or 7 years.

15,011. Will you send to the Commission a tabulated statement of the results of his examinations?—I will do so.

15,012. Does your institution collect and keep any statistics showing the causes of deafness of your pupils?—Yes.

Mr. F. B. Illingworth.

7 Dec. 1886.

15,013. According to your experience is that done in most of the institutions in this country?—Yes, in all the institutions with which I am acquainted.

15,014. Are those statistics kept in the same form as yours in all the other institutions?—In Edinburgh they are not nearly so complete as ours.

15,015. In your opinion would it be very advantageous, with the view of getting accurate information with regard to the deaf, that the Government should insist upon uniform statistics being kept in all schools that have the charge of deaf and dumb pupils, and also those which have the charge of blind pupils?—Yes, I think it would be very desirable indeed.

15,016. (*Mr. Arrol.*) Are those statistics collected by your aurist and oculist with a view to ameliorating the complaint that the pupil is labouring under?—Yes, that is the object in view.

15,017. Where the eye is defective, are means taken to remedy the defect, and are any mechanical or other means tried for remedying defective hearing?—Glasses are provided in the case of the eye, and the aural tube is used in some cases of deafness.

15,018. Do you take any surgical means to improve the defective organ?—We try to develop the hearing, where there is any hearing, by what I may call aural gymnastics, that is, where the deaf possess a little hearing the hearing may be developed in the same way as the muscles of the body may be developed, by exercise; and by the aural tube, which is a very powerful instrument, we are able to convey sound to the pupils, and in many cases they are able to imitate the sound. Though it is only an experiment at present, I think in time it is very probable that the hearing of those children may be improved.

15,019. Do you take any means to improve the sight, other than the use of glasses?—No.

15,020. (*Rev. Mr. Sleight.*) How many children attend your school as day scholars?—42 at present; of course the number varies, at present we have 42.

15,021. 130 being the total number?—Yes.

15,021*a*. Do you find that this arrangement of mixing day scholars with boarders is detrimental at all to the morals of the school?—I think not; if it is it is in a very slight degree.

15,022. Do you find that those children who are resident in the institution make better progress than those who attend as day scholars?—As a rule they do; much better progress.

15,023. Therefore you are in favour of deaf and dumb children being educated in an institution?—Yes, in preference to their attending a day school.

15,024. When you are teaching children orally, do you use the finger alphabet at all?—No.

15,025. Not at all?—Not at all; that is, it is the rule not to do so in the class. Occasionally, after a teacher has been repeatedly trying to get children to read a particular sentence from his lips, I have seen him spell a word or two; it is against the rules; it is a very occasional thing.

15,026. Are the children who are taught on the manual system and those who are taught on the oral system separated out of school?—Not in the least.

15,027. How do they communicate with each other in play hours?—By signs almost entirely; when I say by signs I should say by the manual alphabet or by signs; the orally taught children sometimes speak to each other, but as a rule they prefer signing.

15,028. The orally taught children do sometimes speak to each other?—Yes.

15,029. Is your committee in favour of the oral system or in favour of the manual system?—I think they are divided; most of them, I think, are in favour of the oral system so far as the head master considers it desirable to have it applied.

15,030. I have a note that the committee are not very strongly in favour of the oral system?—I know there is one member very much against it.

15,031. What per-centage of the children in your school have defective sight?—Not more than 30 per cent., but in many cases the defect is very slight, and though the children have had spectacles provided them they can see almost as well without them.

15,032. What is the average length of time that your children stay with you?—The average is 4½ years, that is much too short a time.

15,033. If that average is to be maintained, would you consider that children would make the best progress with the manual system or with the oral system?—I think if a child can only remain at school three years, or even four years, the manual system is the best, but where a child can remain over four years I would prefer to teach it on the oral system.

15,034. (*Chairman.*) Have you visited any of the schools in America for the deaf and dumb?—No.

15,035. How does your school differ from combined system schools, because you occasionally apparently allow your teachers to use the sign alphabet. Your pupils use the sign alphabet among themselves, and the two classes are not kept separate the one from the other, therefore you have not either the pure oral system or the pure sign system; what is the difference between your system and the American combined system?—As I understand the combined system, and as I believe it is generally understood, it is that children are taught chiefly by the manual system and by signs, but that articulation and lip reading are taught as a sort of accomplishment.

15,036. How far do you agree with the opinion which apparently prevails in America that it is expedient to incorporate the best portions of both systems together?—I had a long talk with Dr. Gallandet before he gave evidence here, and I found that my opinions were almost identical with his.

15,037. Then I will ask you what is the difference between the system adopted at your school and the American combined system?—It appears that the American combined system is not what we understand as the combined system in this country.

15,038. (*Mr. St. John Ackers.*) You said that you would rather have the oral system by itself than the combined system?—Yes.

15,039. (*Chairman.*) But you qualify that by saying that the combined system as understood in this country is different from what Dr. Gallandet has told us is the combined system in America?—Yes.

15,040. Have you any objection to the combined system if it is carried out in the way that Dr. Gallandet carries it out?—No, because, as I understand, he teaches all on the oral system who can be taught on that system, and that is what we do in Liverpool. If a child that comes to us cannot be taught on that system satisfactorily we teach him on the sign and manual system.

The witness withdrew.

Mr. George Frederick Healey, Hon. Secretary of the Liverpool Adult Deaf and Dumb Benevolent Society, examined, through the interpretation of the Rev. C. M. Owen, by the finger alphabet.

Mr. G. F. Healey.

15,041. (*Chairman.*) Does the document which you have sent us contain the evidence which you wish to give before the Commission?—Yes, it contains my views.

The paper forwarded to the Commission by the witness was read as follows:

"Your secretary, Mr. Black, has kindly suggested that as I am myself a deaf mute it would be convenient that I should write down generally my views upon the condition of the adult deaf and dumb, and my idea as to the means which might be adopted to improve their condition, both as to their education and their opportunities of obtaining employment in industrial pursuits.

"I am deeply sensible of the honour put upon me by the Commission, and I will endeavour to say what I wish in as few words as possible, so as not to encroach upon their time.

"Perhaps I ought just to say that I was not born deaf, but through an accident in my infancy I had a serious illness, which the doctors believed so injured the nerve of hearing as to deprive me of the sense of sound.

Mr. G. F. Healey.

7 Dec. 1886.

"I have been myself educated on the combined system, and am able to speak sufficiently well for the members of my own family and many of my intimate friends to understand all I say. I can also with freedom communicate, both by signs and finger language, with those who are unable to understand the oral language. I need hardly say, therefore, I am an earnest supporter of this combined system in all cases where it can be adequately carried out. Unfortunately, in the majority of cases, because the larger number are poor, time cannot be given for both systems, and in my view it is far better to give such children the largest amount of sign and finger teaching that may be possible, rather than attempt to combine the lip reading with it. Where there appears to be a quick apprehension and cleverness, of course the very utmost should be done, and longer time and special opportunities should be afforded, but in the average child I have found that progress on the silent system will be much more rapid and successful. I may cite one reason for this opinion, which is, that so many words have almost identical sounds, such as awl, all; soul, sole; told, tolled; glass, class; chip, ship; fan, van; bad, bat, and many others. The distinction between such words is so very nice that to my mind the oral system must fail, or at least be very tedious, and much time must be exhausted in the attempt to teach the difference, but the sign instantly exhibits it. It seems to me, therefore, that the sign and finger language is much simpler and more suitable for beginners. Lip reading may wisely be followed later on, particularly by those who have good vocal powers and sharp visual discrimination.

"I am in favour of compulsory education, both as to the blind and the deaf and dumb which, if needful, should be done at the public expense. The board schools should be empowered and compelled to see that each child, whether deaf and dumb or blind, be sent at the earliest possible age to the nearest available school. If this were carried out there need be no deaf and dumb or blind child neglected.

"It is much to be regretted that the board schools have not taken up the deaf and blind cases as they ought, especially as there need be little difficulty in the matter. It only requires the board school visitor or inspector to report any case that he comes across to the proper authority. Should there be any expense in reporting, the institutions would be only too glad to pay, and if the parents obstinately refuse to have their deaf and dumb children educated, why should they not be summoned and fined as other parents are?

"I think the State should provide suitable masters wherever there is no adequate provision already in existence, and where such provision cannot be voluntarily and fully made supplementary aid should be afforded.

"I would advocate that the position of the teacher be made attractive both as to salary and to status, so as to retain their services as long as possible. A change of teacher necessarily retards progress.

"I am in favour of the senior assistant teachers boarding out and being free to marry, and this may tend to keep them in their situations and prevent the constant changing which is so injurious. It is well known that a considerable number of assistant teachers during the last 30 years relinquished their situations in disgust before they had served their apprenticeship, there being no adequate inducement for their continuance.

"It is important that the head master's time should be devoted wholly to the educational work in the school during school hours; that he should not be called away by any such business matters as might be undertaken by other officials.

"There is a matter, which I think bears upon the after life of the children which I should like to press for consideration, and that is the advisability of establishing a system of industrial employment. I mean that there should be a workroom attached to each school, where the boys at any rate can be taught carpentry, wood-carving, printing, the use of the lathe, &c., &c., so that they may have some occupation and interest to engage their spare hours at home.

"I would also suggest that there should be special inspectors appointed for deaf and dumb schools, preference being given to those who have been originally teachers of the deaf and dumb, or highly educated deaf mutes.

"I hope I may be forgiven for saying so much upon the subject of the education of children, because I feel that upon it depends the success, or otherwise, of all subsequent effort.

"With respect to the adult deaf and dumb, my own experience leads me to believe that the best means of keeping touch with them after they leave school is by the establishment of deaf and dumb benevolent societies, having a house or institute where they can meet together for instruction and recreation. In large centres this is a very practicable mode, and is, I think, largely adopted.

"In Liverpool we have had such a society for rather more than 20 years, and at the present time it has 250 associates above school age. At the last census (1881) it was estimated that the whole deaf and dumb population of Liverpool was 370, so that, deducting from this the number of children, it will be found that almost the whole adult population is under the wing of the society.

"For the information of the Royal Commission, I hand in the laws of the Liverpool Adult Deaf and Dumb Society, and its objects, and it will be seen that there is special provision for religious services twice in Liverpool on Sunday.

"The larger proportion of the adult deaf and dumb are of the poorer class, and are dependent upon their own earnings; many of them are skilled workmen, retaining their situations for many years, *e.g.*, one member has been in the same employ for 45 years, another 30, and many from 5 to 20 years.

"There is no reason why the deaf and dumb workmen should not be as trustworthy and skilled as hearing men; unfortunately, there is a prevailing prejudice that they are exposed to accident and injury through their affliction, but from experience I may say that there is no just ground for this, for the fact is they are more observant through the loss of hearing, and I have not known one instance of serious injury to a deaf mute whilst engaged in his proper work.

"The difficulties of finding employment have been increased by the 'Employers Liability Act.'

"Other means are used for their moral and physical advancement; a lay missionary is employed, who visits them in their homes and distributes relief when absolutely necessary, as pauperising is greatly deprecated by the deaf and dumb themselves. There is also a lady visitor, whose work is specially amongst the women and girls.

"The Adult Deaf and Dumb Benevolent Society in Liverpool has also opened a night school twice every week, under the superintendence of the lay missionary, who is a well educated deaf mute. A penny savings bank has also been established since 1874 to promote thrift. This has proved a blessing to many of the deaf and dumb, who as a class are not very provident.

"If any plan could be devised by which the deaf and dumb and the blind could be assisted during their terms of apprenticeship, either by payment of premiums or by a fund for maintenance, it would be a very great advantage, as they would become skilled artisans instead of having to take the lower position of labourers.

"I must not longer intrude upon the time of the Commission. I have desired to express my views upon one or two practical points which I deem to be of importance in any attempt to improve the education and moral condition of the deaf and dumb, and if I have succeeded in enlarging the sympathy of the members of the Royal Commission to any extent towards my afflicted companions I shall be most thankful, and should the Commission desire to ask me any questions I shall be very glad to answer them to the best of my ability.

"I have omitted to mention in its proper place my strong conviction that in most cases the deaf and dumb poor children would be greatly advantaged by being placed in schools where they can be boarded and taken care of; their surroundings in their own homes are often unfavourable both to their moral and mental development.

"Allow me again to add one subject in my paper which I think has an important consideration; I mean that the adult deaf and dumb (the poor class) can not possibly receive any benefit from divine services orally delivered from the pulpits. The poor classes, as a rule, are not church and chapel goers; therefore the services and also lectures on interesting subjects, must be spoken to them in the sign and finger language. If the pure oral teaching be universally adopted, what the spiritual state of the adult deaf and dumb will become I hardly predict, and I should greatly deplore running any risk."

Mr. G. F. Healey.

7 Dec. 1886.

The witness withdrew.

Adjourned to Friday, 14th January 1887, at 12 o'clock.

6, Old Palace Yard, S.W.

Friday, 28th January 1887.

PRESENT:

The RIGHT HON. THE LORD EGERTON OF TATTON IN THE CHAIR.

ADMIRAL SIR E. SOTHEBY, K.C.B.
W. TINDAL ROBERTSON, ESQ., M.D., M.P.
B. ST. JOHN ACKERS, ESQ.
T. R. ARMITAGE, ESQ., M.D.
W. AUCHINCLOSS ARROL, ESQ.
EDMUND C. JOHNSON, ESQ.
ROBERT MCDONNELL, ESQ., M.D., F.R.S.
CHARLES FEW, ESQ.
The REV. W. BLOMEFIELD SLEIGHT, M.A.
The REV. CHARLES MANSFIELD OWEN, M.A.
CHARLES E. D. BLACK, ESQ., *Secretary.*

Mr. EDWARD A. ILLINGWORTH examined.

Mr. E. A. Illingworth.

28 Jan. 1887.

15,042. (*Chairman.*) You are head master of the Edinburgh Institution for the Education of the Deaf and Dumb, at Henderson Row, Edinburgh?—Yes.

15,043. The Commission have already visited your institution, and therefore many questions which they otherwise would have asked you it will not be necessary to ask you. Do you think that the age at which your pupils enter your institution should be earlier than it is, which I understand is from 7 to 15?—I think they might be admitted at 6.

15,044. Do you think that a school of the character of yours should have an infant school attached to it?—I thought so at first, but I have been making enquiries about infant schools attached to deaf and dumb institutions, and I find that one that was formerly at Manchester proved a failure, inasmuch as it was found that children between the ages of 4 and 8 did not learn any more than they would between the ages of 6 and 8. And another reason why it is undesirable to establish such infant schools is that children at the age of 4 have not got over all the different diseases to which children are subject. So many troubles arise from taking children so young.

15,045. When we visited your school you thought that an infant school might be advantageously started in connection with your institution?—Yes, I did.

15,046. You have altered that opinion for the reasons which you have given?—Yes; I have made enquiries about it since then.

15,047. Have you any difficulty in getting the parochial boards to send deaf and dumb children to your school?—In a few cases the parochial boards have refused to pay for them.

15,048. Can you mention any of those cases?—No. I do not remember any just now.

15,049. It is a fact which has been brought before you?—Yes, there are some boards that have refused to pay for deaf and dumb children.

15,050. What has eventually been done in the case of those children?—I have got the Ladies' Society in connection with the institution to pay for them.

15,051. Then they have done what in your opinion the guardians ought to have done?—Yes.

15,052. Can you speak at all as to the working of classes for deaf and dumb children in board schools?—I have only seen a class at Leeds; that seems to be working very well. That is the only one that I have seen.

15,053. Supposing the system of having classes for the deaf and dumb in board schools to become general, will there always be some to whom institutions will be more suitable?—Yes, I think so.

15,054. Your system I suppose may be called rather the combined system than either the pure oral or the pure manual?—Yes, we have just about half and half.

15,055. All the pupils are mixed together?—Yes, out of school.

15,056. Do you think it advisable that those who are being taught on the oral system should also simultaneously learn the manual alphabet?—Not necessarily simultaneously, but I think they should learn it before going out into the world.

15,057. Or that they should learn it previously to their being taught on the oral system?—I do not think it matters which so long as they do learn the manual alphabet before they leave school.

15,058. Have you been successful in teaching drawing?—Yes.

15,059. With regard to the industrial training, we saw that some of the boys had instruction in tailoring; how has that answered? Do those who have been taught tailoring readily find employment after they leave you?—Some of them do, but we find great difficulty in apprenticing boys residing in country places.

15,060. You teach some of them gardening?—Some of them do not happen to have a taste for gardening. Say a boy has a great taste for tailoring; perhaps he may not get an apprenticeship in the place in which he resides.

15,061. Still he might go to a town, might he not?—The difficulty is the parents being so poor that they cannot afford to board their children in a town.

15,062. After the children leave school there is a want of some provision for teaching them trades in the first year after they leave school?—Yes.

15,063. Is there any organisation for that purpose in connection with your school?—There is an apprenticeship fund, but I do not think that it has been used at all yet—it is a very small fund, and I do not think that it would be of very much assistance. At present I have a boy at school who should have left last year, but I kept him on because his parents were too poor to board him in a town, and there was no sort of employment for him in the place where his parents reside—that is in the North of Scotland. I have been speaking

Mr. E. A. Illingworth.

28 Jan. 1887.

to our Secretary about the apprenticeship fund, and we are going to do something towards assisting this boy when he does leave school, to get him apprenticed in a town.

15,064. Do you think it would be advisable to extend the industrial training in your school so as to give the children instruction in type-setting, for instance?—No, I do not think so. In a case like ours where the institution provides clothing, it is as well to have a tailor in connection with the place, so that the boys can do the mending, but I do not know that it is well to carry the industrial training further.

15,065. You are not in favour of industrial training in connection with schools for the deaf and dumb?—No.

15,066. Yet you say there is a difficulty in getting places for them; would not it be desirable to teach children of the poorer classes something that would be of use to them after they go out into the world?—It has been found that tailors will not take apprentices for any shorter period although they have received a certain amount of instruction in tailoring in our school.

15,067. Take other trades besides tailoring?—Tradesmen in different trades will not make any allowance for the knowledge the children have got while with us; they will not take them as apprentices for any shorter period than the usual time.

15,068. If they had some industrial training in the institution before leaving it, would not they be likely to be better workmen, and be better able to take advantage of the time in which they had to learn their trade in their apprenticeship than if they had not been so taught?—I think they would; but one reason why I am not in favour of trades being taught is because I think the children have so much time taken up in school, that they require all their leisure time for recreation.

15,069. Is it not recreation almost to some children to be put to some industrial trade after a certain amount of school work?—Certainly it is a pleasant change sometimes, but I was referring to out-door recreation.

15,070. Do you employ the boys in gardening to any extent?—Yes, the boys assist in gardening (digging and weeding).

15,071. How many hours a week are they employed in that?—One hour every other day in fine weather at noon.

15,072. With regard to State aid, have you any definite opinion about that?—I do not think that payment by results would be advisable for the deaf and dumb, because they require such a great deal of groundwork in teaching language, and I think if the aid were given in the form of payment by results, the masters would just cram the children, and they would not get the groundwork that they require—the whole aim would be to get a big grant instead of giving the pupils a thorough grounding in language.

15,073. You are in favour of a grant per head for general proficiency in the school?—Yes.

15,074. What amount do you think it should be?—I have not given that a thought.

15,075. You are in favour of State aid, and not in favour of payment by results, but you are not prepared to mention any figure per head?—No.

15,076. You think that it should be more than the ordinary capitation fee?—Yes.

15,077. Should it be, do you think, double the amount, or three or four times the amount, or what?—I think it should be three or four times the amount.

15,078. That, I suppose, would be simply for education and not for maintenance?—I think that institutions would be much better with a grant for maintenance as well as education.

15,079. The guardians now pay something for maintenance, do they not?—Yes, in some cases.

15,080. What is the most they pay?—10*l.* a year for our institution is the most—that is the general sum—each child costs the institution about 26*l.* per annum for education and maintenance.

15,081. I see you have a president, six vice-presidents, twelve extraordinary directors, and twelve ordinary directors, but who practically manage the institution—how many generally attend?—About three—two colonels, and Dr. Skene, an LL.D. Then there is another, one who takes a great interest in it; he is a Writer to the Signet in Edinburgh; but those two colonels are the ones that attend the meetings most regularly.

15,082. Have you ever any difficulty in making a quorum at the meetings?—There is not always a quorum, but we have very few meetings in the year—we have only about four or six.

15,083. Practically you are left for the general conduct of the institution very much to your own responsibility?—Yes, entirely to myself, I might say.

15,084. Are you aware whether there are many deaf and dumb children who are not sent to any school in Edinburgh?—I know of two or three children of well-to-do people whose parents will not send them to the Institution. The only reason they give is that they do not like the name of an institution for their children, and those children are not receiving any education at all.

15,085. Do you know that of your own knowledge?—No, I was only told so; I could let you have the names.

15,086. Do you think that all deaf and dumb children should be compelled like other children to go to school to receive instruction?—Yes, I think so.

15,087. With regard to teachers, do you train your own teachers?—Yes.

15,088. Is there any difficulty in getting trained teachers for the deaf and dumb, on either system?—No. I do not think so. I think most masters almost prefer to get teachers without any training, and train them in their own way.

15,089. Do your oral teachers receive any training except what you give them?—Only what I give them. Before I went to Edinburgh the oral system was not taught, but the teachers are now being taught the oral system there.

15,090. And they get their training in teaching the oral system from you?—Yes.

15,091. And you got your training at Doncaster?—Yes; I was teaching there for ten years.

15,092. That was the combined system, was it not?—The system at Doncaster now is entirely oral; but for the first year that I was there I taught the silent system, we had the two systems in the school for some time—it was the combined system then—but the silent system was gradually being worked out till the last year that I was there, there was not one class left on the silent system.

15,093. Having a knowledge of the working of the three systems, which is the system that you prefer?—I think the oral system is decidedly the best for the majority, but I believe there is a certain percentage of children who are not naturally very bright, who can be more beneficially treated by the silent system. I think the actual use of the fingers aids the memory very much, it causes the children to remember words more readily than they would if they were taught on the pure oral system. I have a few cases in my school now of children whom I tried on the oral system for a year, and they did not seem to learn at all. They did not appear to be able to remember any words. Then I put them on the other system, allowing them to use the fingers, and they are beginning to make some progress; I think the silent system is more beneficial to some than the pure oral system, but I believe that for the majority the oral system is the best.

Mr. E. A. Illingworth

28 Jan. 1887.

15,094. (*Mr. St. John Ackers.*) I see by your Rule 13 that you do not admit pupils below the age of 7, and the girls have to leave at 16 and the lads at 18. Do the average of your pupils remain in the institution from 7 to 16, or from 7 to 18?—No; the average time that they remain in the school is five years. A few remain till they are 16, but none of them remain till they are 18. There have been a few cases where boys have remained till they were 18, but those have been very few.

15,095. Do you find much disadvantage in children coming in at different ages?—Yes, very great disadvantage. They come in at the ages of 11, 12, and 13; and then I find that as soon as they are about 14 their parents are anxious to take them away to put them to some work; so that they have only commenced their instruction when they are taken away, and therefore the instruction they have received will be of no use to them.

15,096. Do you consider that it would be a great advantage if the same rule were applied to deaf as to hearing children, namely, that they must attend school at a certain age?—Yes; it would be a good thing if the parents were compelled to send them at 6 and to let them remain until they were 16.

15,097. That would be a ten years' course?—Yes; I do not think that that would be a bit too long.

15,098. Hearing children are allowed eight years in England provided they do not pass an examination sooner?—Yes.

15,099. And it is not unreasonable, you consider, to allow deaf and dumb children a longer time?—Certainly not.

15,100. Some of the parochial boards pay, you said, and some do not pay, but those who do pay do not pay the whole cost of the education of the children?—They just pay the £10.

15,101. How is the rest of the cost made up?—It is paid out of the funds of the institution; the institution is supported by subscriptions.

15,102. Are there not cases of children that you have received lately, or who are desiring to enter your school, where the parochial boards have refused to pay even so much as £10, and the balance has to be made up by private subscription?—Yes, sometimes the parochial boards pay £5, and the friends of the children will pay the other £5.

15,103. What is the reason the parochial boards only pay a portion; is it because they consider that the parents are able to pay a part?—I do not know the reason.

15,104. Will you ascertain what rule, if any, is followed by the parochial boards in Scotland with regard to the amount that they pay for deaf and dumb children at institutions, and send the information to the Commission?—I will endeavour to do so.

15,105. When were these rules, respecting the admission of pupils, on pages 5 and 6 drawn up since you have been at the institution?—No, I should think they were drawn up a great many years ago.

15,106. They were drawn up at the time when the sign and manual system was the chief system in use?—Yes.

15,107. I notice this rule on page 5: "No child "deficient in intellect can be considered as an object "of this charity."—When I went to Edinburgh I found several children who were completely imbecile; they roamed about the school, and we could not keep them still for a moment.

15,108. They had not received any apparent advantage from the education they had received?—None at all; I had to get rid of those children.

15,109. From your knowledge of the different systems, do you consider that the sign and manual system is a system by which you are able to teach imbecile children?—Not really imbecile children.

15,110. There must always be a number of deaf children whose intellect is such that they cannot be reached upon any system?—Yes, I think so. When I went to Edinburgh the sign and manual system had been exclusively practised, and there was a boy there who had been in the institution for four years, who was not able to make a stroke on his slate; he was completely imbecile, and had no idea of doing anything.

15,111. Was he quite deaf?—Not quite deaf.

15,112. Was he too deaf, if his intellect had been good, to have been educated in an ordinary school?—He might have been educated in an ordinary school he had a very fair amount of hearing.

15,113. What is the reason that the children at your school stay so short a time?—On account of their parents being so anxious to get them put to some employment to earn a living.

15,114. In England we hear a great deal of the appreciation of education on the part of Scotch people, and how glad and anxious they are to have their children sent to school.—Taking Scotland as a whole, Scotch parents allow their children to remain at school longer than they do in England, but in the case of deaf and dumb children they do not allow them to remain at school so long as we should wish.

15,115. Not long enough to enable them to become useful members of society afterwards?—No, only in a very few cases. The parochial boards are almost worse than the parents. Several parochial boards will cease paying for a child directly the child turns thirteen.

15,116. Even if the child has only been a few years at school?—Yes; thirteen is the age at which children are allowed to leave school, and the parochial boards will not support them after that age in some cases.

15,117. I see on page 9, the report says that: "Signing among the pupils is forbidden in the school-"room, and discouraged at all times, inasmuch as it is "very detrimental to the acquisition of written lan-"guage." Is that your opinion—that allowing the children to make signs is a hindrance to acquiring a knowledge of written language?—Yes, certainly, I make the pupils, who are not taught on the oral system, spell or write to me at all times, if they have anything to say to me, and if I say anything to them I always spell or write.

15,118. Then, in fact, you are in favour of the pure oral system for the large majority of the pupils, using the finger alphabet in the case of the rest?—Yes.

15,119. (*Mr. Arrol.*) Do you think it may be assumed that half the deaf in Scotland are born so?—I should think just about half are born deaf.

15,120. Can you suggest to the Commission any cause for such a large number being born deaf?—No, I cannot give any reason for it.

15,121. Do you believe that there are more deaf offspring due to the marriage of cousins, or do you believe that there are more due to deaf persons marrying deaf persons?—I think there are more due to cousins marrying. The missionary in Edinburgh drew out a table giving those statistics; I just looked it over, but from what I remember he got a list of cases where the father and mother were deaf and dumb. I forget how many families there were—I think 20 or 30 families—and those dumb parents had only amongst them four or five deaf and dumb children; whereas they had over one hundred children who could hear and speak. I will send you those statistics.

15,122. Could you send the Commission the corresponding statistics, showing the results in cases of the intermarriage of cousins?—I will send those also.

15,123. From your experience of teaching both the manual system and the oral system, do you think it is practicable to teach deaf and dumb children in the school board schools on the pure oral system with any likelihood of decided advantage being derived by the children?—I do not think so, for this reason: In a board school, as a rule, the children are dropping in all the year round; there might be a new child coming in almost every week, and that would make so many

Mr. E. A Illingworth.

28 Jan. 1887.

different grades, that one teacher could not manage all those children—some of them would be obliged to be kept back for the sake of others, whereas, in an institution where they are admitted at the most twice in the year, you can have them in special grades, and carry the children admitted at one time through with one teacher.

15,124. You would recommend the adoption of the pure oral system in institutions but not in board schools?—Yes.

15,125. You stated in answer to Mr. Ackers that the parochial boards cease to give any assistance when the child reaches the age of 13?—Yes, in some cases.

15,126. Do you say that from your own experience?—Yes. I may refer to the case of one girl especially, who came from Kirkcaldy—a very intelligent girl—directly she turned 13 the parochial board refused to pay for her; her mother was a widow and too poor to keep the child at school. The mother expressed herself very sorry, and said the child would have to leave; however, I got the Ladies' Society to subscribe 5*l.* towards her maintenance, and the mother is paying the other 5*l.*, whereas previously the parochial board paid 10*l.*, but immediately the child turned 13 they refused to pay any longer.

15,127. Was that case again brought under the notice of the parochial board with the view to get them to contribute something to the education and maintenance of the child?—Yes, I think the minister of the parish tried several times to get them to pay for the child, but they refused.

15,128. (*Admiral Sir E. Sotheby.*) As you are decidedly in favour of the oral system, why is not the oral system adopted generally in your school?—I have only been in Edinburgh for 18 months; when I went there the silent system alone was practised, and of course there were a great many children only likely to remain in the school a year or two, and I did not think it advisable to commence instructing those children on the oral system; but all the children who have been admitted since I have put on the oral system. When I went I picked out the youngest children, who had been previously taught on the sign and manual system, and formed a class with them for instruction on the oral system; since then all that have been admitted I have put in the oral classes. Now, I have two oral classes and two silent classes.

15,129. Do those taught entirely on the oral system pick up the sign and manual besides?—Yes, they pick it up very quickly.

15,130. You do not teach it, then?—No.

15,131. You do not encourage it?—No.

15,132. How do they communicate with each other?—By signs.

15,133. Those who have been taught on the oral system communicate with each other by the sign system when they go out of school?—Yes, the majority of them; that is mostly owing to mixing with the other children so much, and having been taught on that system previously.

15,134. Do you discourage that?—Yes, as much as possible.

15,135. Is your school under any inspection?—No, none at all.

15,136. You inspect it yourself and report to your Committee?—Yes, I hold periodical examinations for the children; every class do their work on paper. then I correct those papers and give them back to the children, and make a lesson of the mistakes; then I compare one lot of examination papers with another in order to see what progress is made.

15,137. Do you not give any public notice to your subscribers when you hold this inspection?—No.

15,138. They leave it entirely to you?—Yes.

15,139. Do the Committee attend?—Very rarely.

15,140. You appear then to have the sole authority?—Yes. We have a public examination once a year.

15,141. Is there no annual meeting?—Yes.

15,142. Who attends that annual meeting?—Some of the directors and the subscribers, and the general public.

15,143. How many attend on the average?—We have the schoolroom crowded to overflowing.

15,144. Have you any idea of the number of deaf and dumb in Edinburgh?—In Edinburgh and districts I forget the number.

15,145. What about would be the number?—I think in Edinburgh and the districts the number of deaf and dumb children is something like 50.

15,146. You take in children from Edinburgh and the districts?—From all parts of Scotland, from the very north of Scotland to the south of England.

15,147. I see that the number of your pupils in 1886 was 53, and you say there are 50 deaf and dumb children in Edinburgh, so that the number of your children would correspond very nearly with the total number of deaf and dumb in Edinburgh?—There is another institution in Edinburgh with a total of about 120 children—Donaldson's Hospital.

15,148. Do your children undergo a surgical examination of their ears before they are admitted?—No, the doctor comes after the children have assembled and looks through them; he does not take them individually.

15,149. He does not examine them to ascertain whether they can hear a little?—I do that myself with an instrument I have.

15,150. And you find some have partial hearing?—Yes.

15,151. Which if you had not made that examination might have been overlooked?—It might be readily overlooked unless I made that examination, some of them have a very little amount of hearing.

15,152. And you teach them by the oral system. do you?—Yes.

15,153. You do not attempt to teach than with a tube or by the aural system?—I have tried to teach them by these methods, but as a rule those children in my institution who have any hearing have bad ears, so that I could not put the instrument into them.

15,154. That might be cured probably?—I do not think so; but before I went to Edinburgh I had a class of eight or ten at Doncaster whom I took regularly on the aural system and trained them with the instrument and I found their hearing improved very much by it.

15,155. You were a teacher at Doncaster?—Yes.

15,156. Did the head of that institution adopt that system to any extent?—Yes, Mr. Howard, the headmaster was the one who introduced this instrument for improving the hearing.

15,157. Was the use of that instrument attended with much success?—Yes, he gave me a class to train and he instructed me how to proceed.

15,158. Do you think that the use of that instrument in institutions generally might be attended with great success?—Yes; children with partial hearing hear sounds, but they cannot associate them with any idea till they have gone through a variety of exercises with this aural instrument.

15,159. The religious service in your church is on the combined system is not it?—The children attend the ordinary Episcopalian church and the teacher that goes with them gives them the address by spelling it.

15,160. Not at all by the lip system?—Not at all.

15,161. Do you think that children taught thoroughly by the oral system would understand a sermon preached in a pulpit in an ordinary church?—No, that is what I think the oral system will never be able to do for the children; I do not think that the children as a body would be able to take a sermon or a lecture from a speaker's lips; those directly opposite and those who were near might, but I believe that after ten minutes or so it would become so tedious that they would not be able to follow what was said.

Mr. E. A. Illingworth.

28 Jan. 1887.

15,162. Have you ever attended a church where they have attempted to follow the speaker by lip reading?—No; when I was at Doncaster we used to give an oral lecture on a Sunday evening, and the most advanced pupils seemed to derive great benefit from it. I used to get them to write down what they remembered of the address, and some made very good attempts.

15,163. Do you think they should be opposite the speaker?—Not necessarily exactly opposite the speaker, but in a semi-circle round him, and there must be a good light.

15,164. They would not get those conditions in an ordinary church?—I do not think ordinary pulpits would be so situated as to allow of that.

15,165. (*Dr. Armitage.*) With regard to the statistics which you have promised to send the Commission, will you be so good as to send us not only a return of the children of couples who are both deaf and dumb, but a statement also of the number of parents who had been born deaf?—Yes,

15,166. And will you be good enough to give us a return of the number of deaf and dumb children and hearing children of such marriages?—Yes, I will send you a full table of them.

15,167. Are not the parochial boards compelled to assist deaf and dumb children, provided that their pauperism is proved?—They are not compelled to do so.

15,168. I understand you are of opinion that it would be desirable for the Government to assist deaf and dumb children at school by giving a capitation grant?—Yes, to enable them to remain at school a longer period.

15,169. Do you think that ought to be irrespective of their circumstances, do you think that the grant ought only to be given to poor children—to those children who cannot afford to pay for their education, or would you make it general?—I think those parents who could afford to pay for the education of their children should be compelled to send them to school, and keep them at school for a certain period; then I think the State aid should be given to those whose parents really could not afford to pay for them.

15,170. What advantage do you think would arise from the State doing that in preference to the guardians?—I do not think there would be any advantage, provided the guardians were compelled to keep the children at school for a certain period. Subscriptions nowadays seem to be falling off with institutions, and in Edinburgh, we are drawing upon our Reserve Fund; so I think in time we should get into debt, unless something in the form of State aid were granted. I think that would be the only means of keeping up these institutions—the same remark applies to all institutions.

15,171. (*Mr. Few.*) I understand your opinion to be that Board Schools are not suitable for oral teaching?—No, not so suitable as institutions.

15,172. You would prefer, then, deaf children being grouped together in an establishment by themselves, and taught in their several grades?—Yes, I think they can receive a much more thorough education in an institution, principally because they are always under the teacher's eye; when they attend a Board School, going home at night, I think perhaps they mix with people association with whom will not improve their education at all.

15,173. You would prefer their being educated at an institution?—Yes.

15,174. And to be lodged there as well?—Yes, to be lodged in the institution. I think children learn almost as much outside the school-room as they do in it.

15,175. I understand your opinion to be that grants should be made irrespective of results?—Irrespective of individual results—I think it would be better to have a grant on the whole school.

15,176. Would not that tend to idleness?—No, I do not think so; I think the teachers would work with just as much spirit as they do now; and I believe teachers work now just as hard as it is possible to do with respect to the deaf and dumb.

15,177. If a child knew that its pay was secured whether it was industrious or idle it might, on the part of the child, tend to idleness?—I do not think it would. I do not think deaf and dumb children would give that a thought.

15,178. Have you been at all brought into contact with deaf children after they have left school, and have gone out into the world to earn their own living as carpenters, or as tailors, or bookbinders, or dressmakers, or in any other trades; have you any personal experience of the way in which those who have been taught on the oral system get on when they go into a shop, to order a thing for instance?—Most of the deaf and dumb that I know, who have gone out into the world have been taught on the oral system. I went to visit one deaf girl who was educated at Doncaster, entirely on the oral system. She was in Crossley's Mills, at Halifax. She went as a designer, and she was earning very high wages. When I visited her I just spoke to her as I should to an ordinary person—she read my lips, and she told me the people in the works also spoke to her, and she could understand very readily what they said. There is also a boy in the same town, earning his living as a painter and engraver, he also speaks and reads the lips. I know several cases where children who have been taught by the oral system and who have gone out into the world are doing remarkably well. Then, again, I know a good many in Edinburgh who are earning their own living, who have been educated on the other system, and who are doing equally well.

15,179. Your opinion is that the average time that they get at your school of five years is much too short?—Yes, I think it should be double that.

15,180. You think that they ought to come in at six and stay till sixteen?—Yes, I do not think that would be a bit too long.

15,181. (*Rev. Mr. Owen.*) I find the following paragraph in page 8 of your report:—"Of late years there "has been great diversity of opinion as to which is the "best system of instruction for the deaf and dumb, but "it has latterly been acknowledged by the majority of "teachers that the 'pure oral system,' which is now "almost universally practised, is the most beneficial and "shows the best results." Do you agree with that?—So far as my experience goes I think the oral system shows the best results.

15,182. With regard to the statement that "the pure "oral system is now almost universally practised," are you aware that in the United Kingdom and in America the combined system is generally in use?—I remember you telling me that when you were in Edinburgh in October, but I did not know it before. I was under the impression that the oral system was the most practised of any system on the Continent and in this country. I thought the oral system was becoming more general now.

15,183. On what information did you draw up that paragraph in the report?—From what took place at the Conference of Head Masters a year ago last July. I thought from what came out at that Conference that the oral system was the most generally taught.

15,184. You say not only that the pure oral system is now almost universally practised, but that it "is the "most beneficial and shows the best results." You framed that paragraph without at any rate a thorough knowledge about the matter?—As far as my experience goes I think the oral system does show the best results.

15,185. When you said that the pure oral system is now almost universally practised," that is not so in

Mr. E. A. Illingworth.

28 Jan. 1887.

the United Kingdom and America—you were principally alluding to the Continent?—Yes, and this country; when I drafted that report I thought it was universally practised in the institutions of this country. From what I have heard most institutions are adopting it.

15,186. You say "almost universally practised;" on further consideration, I understand you to say you are not prepared to say it is almost universally practised?—No; not since I have heard what you say about America.

15,187. We have had evidence from America that in by far the larger number of schools the combined system is adopted?—I was not aware of that at the time.

15,188. And you were not aware that there are very few institutions in the United Kingdom in which the pure oral system is practised?—I was under the impression that it was practised in most of the institutions of this country.

15,189. Then, with regard to the statement that "the "pure oral system is the most beneficial and shows the "best results," on what experience did you make that statement?—When I went to Doncaster at first Mr. Howard was just commencing the oral system; previous to that the sign system had been practised, and the language the children used then was exceedingly faulty, not to be compared to the language used by other children after they had been the same length of time at school, taught entirely on the oral system. Then when I went to Edinburgh I was anxious to begin at once to make the children who had been taught on the silent system write down what they had to say, or spell it. I remember one boy, who had been at school eight years, and who was supposed to be a fair specimen of the children who had been instructed on the silent system, came to me one day, and signed a question to me. I told him to spell it, and he had not the least idea how to do so, so I asked him to write it down, and the result was "Bakers some bread "make feet."

15,190. You felt justified in making the startling statement that the oral system shows the best results from your experience at Doncaster, and the experience you had derived during the very short time you had been at Edinburgh?—I made the statement from my own experience, and from what Mr. Howard has told me. Mr. Howard has had 27 years' experience amongst the deaf and dumb, and he has told me that the results he has seen on the oral system are far superior to any he has seen on the sign system.

15,191. You said that the orally-taught children mixed a great deal at the school with the other children?—Yes.

15,192. Have you ever endeavoured to ascertain which system the deaf and dumb themselves prefer?—I remember when, I was at Doncaster, you could not give a child who was being taught the oral system a greater punishment than to threaten to send him out of the oral class into the silent class—they seem to prefer speaking, and to be very proud of being able to say a few words.

15,193. What proportion of those born deaf would be able to be taught lip-reading and speaking so as to be able to communicate with hearing persons in after life?—80 per cent. might be able to be taught lip-reading very well; I would not say that 80 per cent. would be able to speak perfectly intelligibly; but, if they were taught lip-reading, they might be taught the manual alphabet as well.

15,194. You are decidedly in favour of their being sent out into the world with the additional help of the manual alphabet?—Yes.

15,195. That is not the pure oral system; that is the combined system. You said just now you advocated the pure oral system, you say now that you advocate the combined system?—I say it would be an advantage for one orally taught to have a knowledge of the manual alphabet. I do not mean that I would advocate that it should be used in the course of instruction at school. I mean that I would have the children educated entirely in the oral system in the institution, but when they leave they should have a knowledge of the manual alphabet, so as to be able to fall back upon it in case they failed to read a person's lips. Then, deaf persons who have a knowledge of the manual alphabet have this further advantage, that, when they are in the dark, if they wish to communicate with one another they can communicate by that means.

15,196. You are of opinion that it is not safe to depend on the oral system entirely when you send deaf and dumb children into the world?—No.

15,197. Deaf and dumb children ought to pick up and acquire somehow the manual method, in order to fit themselves for the ordinary duties of life?—Yes, I think it would be decidedly better for them if they had a knowledge of the manual alphabet when they left school.

15,198. You would not advocate their acquiring that knowledge during the time of school work?—I should have no objection to their gaining that knowledge at the institution, but I would not instruct them in the manual alphabet in school hours.

15,199. Because you consider that instruction in the manual alphabet would militate against their advancement in the oral system?—I do not think that their acquiring a knowledge of the manual alphabet would do them any harm, because I think the manual alphabet is precisely the same as writing, but I think communication by signs militates against their advancement in the oral system.

15,200. Have you ever taken the trouble to ascertain to what extent orally-taught pupils rely upon lip-reading and speaking?—No, I have not. Mr. Howard made inquiries, and I believe, from the majority of the parents, the replies were that the children, after they left school, could understand what was said to them by their friends very well.

15,201. Your orally-taught pupils go to the Sunday services with the others?—Yes.

15,202. What they can pick up from the service they have to get by having it spelt to them?—Yes.

15,203. You use Canon Venables's numbered Prayer Book, I think?—Yes.

15,204. And you find that very beneficial?—Yes; we can just tell the child the number of the prayer or psalm, or whatever part of the service is going on, and he finds it without any trouble.

15,205. (*Mr. Johnson.*) With regard to your use of the term "pure oral system" in the paragraph of the report to which reference has been just made, are you aware that the pure oral teachers object altogether to the use of either signs or alphabet, so that when you use the term "pure oral system" you ought to have said "oral system"?—I did not know that there was that difference between the pure oral and the oral.

15,206. We have it in evidence that the pure oral system, as understood by teachers of the deaf and dumb, is a system in which all signs and alphabets are excluded, and we have also been told that it is an undesirable thing to mix children who are taught upon the oral system with children who are taught upon the sign and manual system?—I think that is a disadvantage.

15,207. And yet, when we were at Edinburgh, we saw in the same room classes that were being taught orally and classes that were being taught by the fingers?—We are obliged to have them in the same room. I would separate them if I had the means of doing so.

15,208. We are to understand that the orally-taught children in your school are associated with those who are not orally taught?—Yes.

15,209. Then, in fact, the instruction on the oral system in your school is damaged by your not having the means of isolating your orally-taught pupils from your silent pupils?—Yes.

Mr. E. A. Illingworth.

28 Jan. 1887.

15,210. You think that the combined system would be a good one for pupils who come under your instruction for a period of less than four years?—Yes, I think so.

15,211. And you think that for a longer period, that is to say, eight or ten years, the oral system would be the preferable one?—Yes.

15,212. That is to say the oral, not the pure oral?—By "oral system" I mean entirely by speaking and lip-reading.

15,213. Not using at the same time the manual alphabet, do you mean?—Not using it in the school.

15,214. I think, when we were at Edinburgh, you showed us your mode of instruction in one of the classes, and the children asked questions in writing and you answered on your fingers by the alphabet?—Yes.

15,215. Then in teaching the orally-taught children you use signs?—Not the orally-taught children. The class to which you refer was a class who were being taught by finger spelling.

15,216. How do you initiate your instruction in the case of a child who is going to be orally taught?—We begin first with simple words.

15,217. How do you communicate with the child in the first instance?—By drawing and actions.

15,218. By natural signs?—Yes, by natural signs.

15,219. Therefore, it is impossible to teach the oral system *ab initio* without employing signs to a certain extent?—Not without employing a set system of signs.

15,220. You must employ signs in teaching the oral system to begin with?—Yes, if you call such a thing as this a sign, if I write, "sit down," and I sit down myself.

15,221. That is a natural sign?—Yes.

15,222. You employ natural signs in initiating instruction in the oral system?—Yes.

15,223. Therefore your oral system, as I understand it, combines signs and oral teaching?—Yes, natural signs.

15,224. Then yours is the combined system?—I suppose it is.

15,225. Have you any other experience except what you have told the Commission with regard to the success of the pure oral system?—No.

15,226. And you gained that experience from the result of the conferences which you read of?—Yes, and my own practical experience.

15,227. Did you attend any of those conferences yourself?—Only the one a year ago last July.

15,228. You did not attend the one at Milan?—No.

15,229. (*Rev. W. Blomefield Sleight.*) You have informed us that the children learn a great deal from each other whilst they are in the playground or in their leisure time?—Yes.

15,230. By what method will they gain that instruction?—From one another by signs; they all sign to one another out of school.

15,231. You have had some experience of the pure oral system at Doncaster?—Yes.

15,232. How did the children in that school, who had received no instruction by the sign system, communicate with each other in the play-ground?—Some of the most advanced ones I have seen speaking to one another, but, when the teacher is not supposed to be about, they will sign a great deal to one another; they all seem to invent signs if they are not taught them. I have seen a great many of those that had gained a fair knowledge of language speaking to one another.

15,233. In your opinion could orally-taught children join in general conversation in a room with hearing and speaking people?—I have not had any experience of orally-taught children mixing with ordinary people; but when I have gone out for a walk with the children at Doncaster the most advanced pupils have walked along by the side of me and held a conversation with me, orally, and they appeared to enjoy it very much.

15,234. Did you not employ signs at all?—No, not at all.

15,235. Teaching by articulation is a more difficult and expensive process than teaching by the manual system, is it not?—Yes; you require more teachers with the oral system than with the sign system.

15,236. You spoke of being able to convey to the children, while service was going on, the number of the page in Canon Venables's prayer book; how would you communicate that number?—By giving the number on the fingers.

15,237. You employ, as you have just stated, natural signs in giving your first instruction to children taught by the oral system?—Yes.

15,238. Would you mind giving the Commission an example or two?—I generally begin with simple actions. First of all I would say, "That is a book," pointing to a book; then I would say, "Touch the book," and I would touch the book first; then I would take the child and make it put its hand on the book; then I would write down, "Touch the book." Then I would say, "Lift the book," and I would lift the book, and then make the child do that. Then in the same way I would teach them "Carry the book," "Bring the book," "Take the book," "Put the book on the table," "Take the book off the table," "Put the book under the table," and so on.

15,239. Are not those the same kind of signs that would be used in an institution where they taught on the sign system?—No; by the sign system, if you wanted to teach the child "Bring the book," you would do this, "Book," "bring" (*making signs*). Then, if the sentence were "Take the book," I would speak the works and write them, and I would motion to the child to take the book; whereas by the sign system it would be, "Book," "take" (*making signs*).

15,240. Did I rightly understand you to say that the pupils who are taught on the oral system are also taught the finger language?—No, they learn it from one another. I do not object to their learning it, but I do not teach them the manual alphabet.

15,241. (*Mr. Arroll.*) I understood you to say that you conveyed instruction to them through the manual alphabet?—I was speaking of those pupils who are not taught orally.

15,242. (*Chairman.*) You said that you used the fingers sometimes in order to convey the meaning of certain words to your orally-taught pupils?—In church we do; we never use the fingers in school; we do not use the finger language in giving instruction to orally-taught pupils.

15,243. (*Rev. W. Blomefield Sleight.*) You stated that you used natural signs in your first instruction of your orally-taught pupils?—Yes, I explained what I meant by "natural signs."

15,244. You stated that, in your opinion, it was an advantage to the deaf and dumb to have a knowledge of the finger language?—Yes.

15,245. Would not it be advantageous for them to learn it at school, so as to gain greater proficiency?—Yes, we do not teach it in the school-room to the orally-taught pupils at present, but, having the classes on the two systems in the same school-room, they learn it from one another without it being taught specially; those who are being taught on the oral system now, except those who were only admitted a short time ago, all know the manual alphabet, though it is not taught in the school they pick it up themselves—those taught on the sign system teach the others out of school.

15,246. (*Dr. M'Donnell.*) If you were starting afresh with a new school, which system would you prefer—the oral system, or the manual system?—The oral system decidedly.

15,247. (*Rev. W. Blomefield Sleight.*) Do you ever find that children that are taught articulation attempt

Mr. E. A. Illingworth.

28 Jan. 1887.

to teach children that are taught the sign language to speak?—In my institution in Edinburgh some of the pupils taught on the oral system would amuse themselves out of school by forming a class of the pupils who had been taught on the silent system, making them go through a lot of sounds. The orally-taught children would play at teaching the silent-taught children to speak; they would make them go through the movements of the mouth, the same as they were taught themselves.

15,248. (*Chairman.*) One question about the one-handed alphabet: do you teach it as your brother does it Liverpool?—No, we do not teach it in our institution.

15,249. Do you think that there would be any advantage in teaching it?—Speaking for myself I prefer the one-handed alphabet to the two-handed, because I think it is so much more convenient.

15,250. Why do not you teach it then?—Because the children all knew the double-handed alphabet when I went; and when the children know the two-handed alphabet I think it is sometime before they become very familiar with the single-handed alphabet.

15,251. I thought children could learn the single-handed alphabet in a few hours?—I think they would be a good while before they got to read it rapidly. I think it would be well to know both. When my brother told me that he had introduced it at Liverpool with success, I told him I thought I should begin to teach it at Edinburgh.

15,252. With regard to semi-mutes and semi-deaf, those with some remains of language and some remains of hearing, do you think they ought to be in a class by themselves, and always taught on the oral system?—No, I do not think it is necessary for them to be in a class by themselves, but certainly they should be in an oral class.

15,253. I suppose you have not paid any special attention to the higher education of the deaf and dumb?—No; because I have never had children under my charge to remain at school long enough.

Mr. Alfred Large examined.

Mr. A. Large.

15,254. (*Chairman.*) You are the head master of the deaf and dumb department at Donaldson's Hospital, Edinburgh, are you not?—Yes. It is not considered a special hospital for the deaf and dumb.

15,255. The age for the admission of children at present is from seven to nine years, is it not?—Yes; they are generally admitted at eight years old.

15,256. Do you think that they ought to be admitted at an earlier age?—I do not.

15,257. We have had evidence that it is desirable, in the oral system at least, to begin as early as possible—as early as the age of six; what is the objection to the children entering at the age of six?—I think that, considering that they are very delicate children, the strain that they would have to undergo in being removed from their parents so early would be too great.

15,258. But does it not make a great deal of difference in teaching the oral system, whether the vocal organs are used at an early age or not?—In my experience in teaching under the oral system, that is to say, teaching children to speak, I have not found any difficulty in regard to that. They seem to have facility in acquiring language at the time they enter the hospital—that is to say, at the age of eight.

15,259. Do you think that they ought to be in any infant school before they enter your institution?—That involves a question as regards the parentage of the children. Those of the children who are of the poorer class, I think, might benefit by being removed from parental influence, which, I consider, is almost an evil to them. As to the children of a more respectable class, on the other hand, I should undoubtedly prefer that they should go to other schools to be disciplined and moralised, rather than placed out in special schools; and the girls might be taught to sew and to knit, and the boys to write and to draw.

15,260. Do you use the Kindergarten system or not?—Not at all. We do a little exercise, but we do not consider that it is a special system called the Kindergarten system, although it may be applied to the Kindergarten system.

15,261. But does not the Kindergarten system tend to make the children more handy?—I have had no experience in regard to the practice of the Kindergarten system, as a system.

15,262. Do you think it is an advantage to the school that you have hearing children under the same roof as the deaf and dumb children?—I think there is a great advantage in regard to the deaf and dumb for several reasons; and one great reason I think is, that it draws the deaf and dumb out of that isolation to which, in their affliction, they are naturally so prone, and it is the first opportunity that they have of seeing that they are treated like other children. When they are at home they are altogether misunderstood and unjustly accused, and consequently unjustly punished; but if they mix with other children they see that no difference whatever is made with them on account of their affliction, that if they do wrong they are punished, and if they do right they are commended—and that, you may say, is the first true moral training that they ever get. The parents of the children, especially of the poorer class, do not punish them, because it brings upon them the blame and interference of neighbours.

15,263. Is it not an advantage for deaf and dumb children to have some experience of the outside world which they will have to encounter afterwards?—We consider that mixing them with the hearing children fits them better to enter into social life afterwards.

15,264. Have you ever heard any complaints on the part of the hearing children that they have to mix in an institution like yours with deaf and dumb children?—We have had no such complaint whatever.

15,265. I have before me a report furnished by yourself, dated from the Scotch Education Department, directed to the Secretary of the Educational Endowments Commissioners, and signed by Dr. Henry Craik, who says with regard to Donaldson's Hospital: "My Lords entertain considerable doubts as to the "expediency of associating speaking children with deaf "mutes as proposed in clause 33 of the scheme. As a "matter of practice, the association is only partial in "the present Donaldson's Institution, and it is doubtful "whether, in so far as it extends, it does not involve the "speaking children, even to an increased degree, in the "depressing influence ascribed to the hospital system "generally." Do you agree with that statement?—Not at all.

15,266. Do you know how often Dr. Craik visited your institution?—So far as I am aware once, and only for a very short time.

15,267. Has your opinion, or the opinion of any of the governing body of Donaldson's Hospital, been obtained by the branch of the Education Department which deals with endowments with regard to that question?—I believe not; I could almost positively answer "no" to that question.

15,268. Can you state what action the governing body of your institution have taken with regard to the proposed transfer of your deaf and dumb school to a separate institution, apart from hearing children?—No decided step has been taken on the part of the governors.

15,269. Do you think it advisable that some knowledge of trades suitable to the deaf and dumb should be acquired before the children leave school?—That involves the question how long they should be at school.

15,270. Do you think that, if the children come to the institution at the age of seven, they should be at least seven or eight years there, and leave at about the age of 14 or 15?—Yes, but I think it would be injurious to teach them trades at so early an age as 14.

15,271. Why?—I think that the time is requisite in order to give them an education; and, again, it is so very likely that the trades that they would be taught would be those that they would be best fitted for, and they would be drawn away from the regular recreation of the other boys, and would take a dislike to those trades; and when they left school they would enter upon other trades which were not so suitable.

15,272. But does not the fact of learning some manual trade better fit them to master any trade which they may hereafter take up than if they had not been so taught?—I have understood from those who have learnt trades at so early an age that the master would generally prefer to begin training them in the work himself, because they learn the trades in a slovenly manner.

15,273. We have heard from those who have deaf and dumb apprentices that those who have been taught in institutions very often have to relearn what they have learnt?—That is what I have heard.

15,274. But is not that the fault of the institution in not teaching the children according to the usual trade way, rather than a reason why that system should not be adopted?—I should be rather inclined to attribute it to commencing at too early an age.

15,275. Do you attach much importance to the children remaining at least seven or eight years under instruction, whatever the age of entry may be, supposing, for instance, that they enter at nine years of age?—They can get a passable education in the course of seven or eight years; and that again would involve the question of teaching trades. If they were allowed to remain up to the age of about 16, I would then consent to trades being taught for two consecutive years after they had reached the age of 14.

15,276. What is the practice now?—They have to leave at the fourteenth year of age.

15,277. Then what becomes of them?—The parents find places for them.

15,278. You do not find places for them?—No.

15,279. Is there any difficulty in the parents finding occupation, or apprenticeship, for the children after they leave the school?—The cases are very exceptional in which they do not find employment.

15,280. As I understand, one of the clauses in the draft scheme is that the governors shall have power to establish classes for deaf mutes above the age of fourteen years, either in or out of the hospital building, as they may deem expedient; do you think that it is advisable to have such a class either inside or outside the buildings?—Yes, certainly.

15,281. Higher class education, in fact?—Yes, for the deaf and dumb. That is the scheme of the Educational Endowments Commissioners.

15,282. But if this new scheme is for the higher education, or the further education, of those between the ages of fourteen and eighteen, do you see any reason why there should not also be an industrial training for those who wish to benefit by it, as well as a higher class of instruction for those who do not wish to learn trades; do you not think that those two should be simultaneous?—I have not given it full thought, but my opinion is that they should, after they are fourteen years of age, learn trades for a certain part of the time; not that their whole time should be taken up in learning trades.

15,283. You have an inspection of your school, have you not?—Yes, by one of her Majesty's Inspectors, Dr. Kerr; he is not a specialist.

15,284. There is no grant made, is there?—No, the hearing department some time ago had a grant from the Science and Art Department, but they considered that it was out of its power to allow grants to an endowed institution.

Mr. A. Large.

28 Jan. 1887.

15,285. Do you teach drawing?—Yes.

15,286. Do you get a drawing grant?—No, no Government grant.

15,287. (*Mr. Johnson.*) Did you apply for it?—No, it has never been applied for.

15,288. (*Chairman.*) Has it ever been suggested that you should apply for a grant for drawing?—It has been mooted, but it has not been officially suggested; it has been spoken of indirectly.

15,289. But, so far as your institution is concerned, you do not ask for any Government aid?—None whatever.

15,290. But you have no objection to Government inspection?—No. The Government inspector is engaged and paid by the Governors.

15,291. Do you think it is a disadvantage that there is no one uniform system of signs, either conventional signs or manual alphabet?—It has some advantages, but I think that they are outweighed by the disadvantages, if I may state them. One of the advantages of not having a uniform system of signs is that the pupils of the different institutions are not able to converse with one another so freely in those signs. If they have a uniform system of signs they will undoubtedly use those signs when they meet the pupils of other schools, and that will not tend to the acquisition of language. Whereas, on the other hand, if they were to have a uniform system of signs it would enable teachers to get transferred from one school to another more readily, and, unless there was a uniform system of salaries, this would be constantly going on, thus interfering very much with the schools.

15,292. Then you think that this difference is kept up in the interest of the different schools in order to enable them to retain their teachers, and to give them a sort of monopoly of them?—No, I do not say that at all. It would be a pity, I think, to have a uniform system of signs; it would be very disadvantageous, I think, for the children, and disadvantageous as regards the teaching staff.

15,293. But do not institutions exist for the advantage of the children, rather than the children for the advantage of the institutions?—I mean that it would be an advantage to the children not to have a uniform system of signs, and disadvantageous to have a uniform system of signs; because, if they had a uniform system of signs, as I have already said, all the pupils of different institutions, when they met, would converse by those signs, and if they converse in signs they do not acquire language so readily.

15,294. But if the training of the institution is good, and they have been taught to use language, they would surely use it rather than signs?—We do not teach them signs; we teach them by the medium of signs to use language.

15,295. But they still do use signs, even although you teach them the finger alphabet?—They will all do that, no matter how they are taught.

15,296. Therefore you have a system of signs which is not uniform, but which is still used more or less in different schools, in spite of all that you can do to prevent it?—Quite so.

15,297. So that, after all, there does not seem to be very much gain in not having a uniform system, either of signs or of the alphabet?—I think that it would be a great disadvantage to the children to have a uniform system of signs, for the reason that, when they met together, they would communicate in signs in preference to language, which would be more beneficial.

15,298. Do you use the one-handed or the two-handed alphabet?—The two-handed alphabet.

15,299. Are you conversant with the one-handed alphabet?—Yes, I know it, but I cannot use it with facility.

Mr. A. Large.

28 Jan. 1887.

15,300. Do you see any advantage in it?—I think that the one-handed alphabet would be preferable.

15,301. In fact, if you started afresh, you would have the one-handed alphabet?—I would.

15,302. But, of course, it would be a difficult thing to introduce it into an existing institution?—Yes. With regard to a uniform system of signs I think it would be disadvantageous, because we find that, when the children leave the institutions and go into the country, where they cannot mix with the deaf and dumb as a class, they are far more intelligent and have better ability in the use of language, because they associate with educated people who do not know signs, and who write to them or spell to them. It is for this reason that I would say that a uniform system of signs would be disadvantageous.

15,303. (*Rev. Mr. Owen.*) It gives them a knowledge of written language?—Yes. For that reason a uniform system of signs would be disadvantageous to the children, and the consideration should of course be for the children.

15,304. (*Chairman.*) Do you think that the semi-mutes and the semi-deaf should be put in the same classes as those who are absolutely deaf?—No.

15,305. Do you think that one retards the progress of the other?—Yes.

15,306. Do you think that the oral system should always be taught to semi-mutes and the semi-deaf in preference to any other system?—Undoubtedly.

15,307. And it is therefore better that they should be kept separate, in order to prevent them from relapsing into signs instead of encouraging them to use language?—Yes, instead of making the signs more general amongst themselves in conversation; although I would say that they would use signs, and the teachers would have to use signs, to a certain extent.

15,308. Have you taught that system at all in your institution?—No, not at present.

15,309. You are working on the combined system, as the one which is best calculated, in your opinion, to suit the majority of the pupils?—Yes, that has always been the system since the foundation of the hospital.

15,310. Do you teach everybody indiscriminately both systems, or do you teach them according as you think that either system is most applicable to the different classes of children?—The plan that I adopt is this in regard to the oral instruction: I take them according to their aptitude for oral instruction, and they are classified accordingly. In the other hours, when they are occupied in the manual system, they are reclassified according to their intelligence. By this means I believe that they are able to gain familiarity with language, and that gives them confidence in making use of speech; and thus I believe they make a greater advance in speech than they otherwise would.

15,311. Do you teach the finger alphabet to all those who are taught on the oral system?—Yes, they are all taught the manual alphabet.

15,312. In the school, or out of the school?—In the school; and they all acquire signs.

15,313. Then you do use signs as little as possible in the school?—After a certain stage of their education.

15,314. You do use signs to a certain extent?—Yes, to a large extent—the teachers use them for teaching.

15,315. Do you think that the oral system takes a longer time to teach than the finger alphabet?—The pure oral system undoubtedly does.

15,316. How many years do you think are required under the combined system to give a child such an education as a child on leaving an ordinary elementary school would have acquired?—It would depend upon the capacity of the child; but, taking the majority of them, I should say that it would require from seven to eight years.

15,317. But you only keep them now until they are fourteen?—We keep them, on the average, five years and a half at school.

15,318. Therefore, you do not keep them at present, on an average, as long as you think they ought to be kept, in order to give them a good education?—No.

15,319. Do you think that that time should be lengthened?—Undoubtedly.

15,320. Is there an objection on the part of the parents to a lengthening of the time?—The constitution of the hospital will not admit of its being lengthened.

15,321. It is not the wish of the parents that prevents it?—We have not ascertained that at all.

15,322. At the present time can the parents take the children away from the school when they like; supposing that a child has been three years at school, can the parents take it away?—We have never had them do so, but I suppose we could not stand against it.

15,323. Of course, it is the interest of the parents to keep the children at school for nothing?—Yes, we never had an instance of a child being taken away.

15,324. Do you think that in any reconstruction of your scheme it would be desirable that amongst the changes which should take place evening classes should be instituted for those who are working by day for their own livelihood, in order to enable them to keep up the education which they have gained in the school?—Yes, I think it would be a great boon to them.

15,325. Is anything of the kind done?—No.

15,326. There is no higher-class school for the deaf and dumb in Scotland, is there?—No.

15,327. Do you think that that is a great want?—Yes, I think so, but I do not know whether there would be many candidates for such an education in a higher-class school.

15,328. As I understand, there is a clause in this new scheme to enable them to give a higher class of education from the age of fourteen to the age of eighteen. Do you approve of that?—Yes.

15,329. Do you think that that should be in the building of the hospitals, or outside; have you any opinion upon that subject?—I think it is a matter of no importance, but I should think that it would be better to make another centre, so far as a centre is possible, for the deaf and dumb in the town. A centre, convenient to the majority of the deaf and dumb, should be ascertained.

15,330. Should that be, as far as possible, near to any workshops, where the deaf and dumb are employed?—Near the houses where they live.

15,331. Have you complete control of the organisation and domestic management of the whole institution, as well as of the teaching?—No; there is a house governor and chaplain attached to the hospital.

15,332. You are confined to the teaching?—I have the governor's night duties, as he lives out of the hospital; that is to say, the superintendence of the hospital after household prayers.

15,333. Do you know whether there is any change proposed in that respect?—No, I believe there is no change proposed. I think that the governors would have a preference for a resident house governor. They always had a resident house governor previous to the present house governor.

15,334. You think it unadvisable that the head-master should have any duties other than those of the school work?—That depends upon whether those duties would infringe upon his school work.

15,335. But in your opinion is it advisable that the head-master should also be the house governor?—No. If he were to give his whole attention to the school duty he could not undertake the duties of the house governor.

15,336. But, as I understand, you have been taking, to a certain extent, the duties of the house governor at night?—Yes.

Mr. A. Large.

28 Jan. 1887.

15,337. But you do not recommend that arrangement?—It does not interfere with the educational department; it is only during the night time. It is the responsibility during the night time.

15,338. You have to see that order is kept?—Yes; that the teachers return at proper hours in the evening. It is all night duty, from nine o'clock in the evening to nine o'clock in the morning. I think you have the rules of the hospital in which my duties are specified.

15,339. We have been asked to make some remarks upon the scheme. With regard to the teachers you have given us a very full account in the answers to our questions. I see that some of them are partially deaf and dumb?—There is one deaf and dumb teacher, who was educated at the hospital; when I say deaf and dumb, he can speak, intelligibly, orally, to the teachers. He is a semi-mute.

15,340. Some of your teachers hold diplomas of the college, do they not?—Yes.

15,341. Have you any remark to make with regard to the qualifications of teachers and the necessity for their having passed an examination?—I think that the examination, in so far as the intellectual part of it is concerned, is a great advantage, but that where it fails is in practical utility. I think that teachers, in order to become successful teachers, should be with the children, and mix with them, and ascertain their characters and their physical condition.

15,342. Do you think it is advisable that each institution should bring up its own teachers?—I have a preference for ex-pupil teachers, because they have a knowledge of teaching hearing children, and of the discipline of a school, and I find that they always turn out very successful teachers; at least, they always give me satisfaction. But regarding the examination of teachers, they make the centre in London. Now it is very difficult for the teachers of Scotland to go so long a distance to attend these examinations, both on account of the expense and on account of the time that is generally taken up by it. For instance, the examination is to be at the beginning of July this year; several of my teachers desire to be examined, but it happens at a very unfortunate time. It is the Government inspector's time of examination. I have written to the examining authorities on two occasions, requesting them to make Edinburgh a centre, as is done in the case of the Science and Art Department, and to send down written examination papers and to have an examiner present.

15,343. In fact, you think that there ought to be some examining body in Scotland?—I think that there might be other centres for examination besides London, because of the inconvenience and expense that it entails to attend examinations in London.

15,344. (*Rev. Mr. Sleight.*) How long have you been a teacher of the deaf and dumb?—Thirty-seven years.

15,345. How long have you been at Donaldson's Hospital?—Twenty-three years.

15,346. Have you taught the combined system ever since you have been there?—Yes, it was commenced in that institution. The hospital was founded in 1850, and the combined system was the system introduced there by my predecessor and colleague.

15,347. Your school is inspected from time to time by Dr. John Kerr, is it not?—Yes.

15,348. He is one of Her Majesty's inspectors in Scotland?—He is.

15,349. When did he last inspect the school?—Last July, I think.

15,350. In his report I observe that he makes this remark:—"I have had no opportunity of estimating "the results of the purely oral system, and my opinion "is therefore of little value, but I feel warranted in "saying that, with the exception of one or two pupils "in the hospital, there are none whose speech and lip-"reading are so free from disagreeable, and apparently "painful, effort that they could make use of them in "daily entercourse with the outer world." Do you endorse that opinion?—Not altogether. With a casual visitor like Dr. Kerr, of course, they could not get accustomed to his lips in so short a time; but there are about eight or ten children in the school at present who admit that they do use speech to their parents when they are at home, and a great number use it in a few words and phrases.

15,351. But they do not use lip reading in mixing generally with society?—No.

15,352. What is the great end that you have in view in instructing the deaf and dumb?—To make them useful and honest members of the community.

15,353. I mean in their education?—To make them self-supporting, useful and intelligent citizens.

15,354. In giving your first lessons to deaf and dumb children you always employ signs, do you not?—No, we do not. We commence by the manual alphabet, and we have pictures, and we refer them from the written word to the picture, and *vice versâ*. They have to point out the word on the board when they are shown the picture. Then we carry on the education gradually, and as far as we can without signs. Of course, the teachers are compelled to use signs after a certain stage, but we do not employ them more than we are compelled to do in order to explain matters to the children.

15,355. Do you believe that language can be better imparted to deaf mutes by the oral system than by the sign system?—No, I do not.

15,356. Does the chaplain of the hospital give religious instruction to the deaf and dumb?—No. All the education of the deaf and dumb devolves upon myself.

15,357. Does the chaplain conduct any religious services for the deaf and dumb?—None whatever; it all devolves upon myself, the head-master. The chaplain is not acquainted with the system of deaf-mute communication any further than that perhaps he can use the manual alphabet.

15,358. (*Mr. Johnson.*) Then how do the children get the religious instruction—who gives it to them?—The teachers.

15,359. Not the chaplain?—The chaplain has nothing to do at all with the education of the deaf and dumb. I open school with prayer every morning at twenty minutes to nine, a verse of a hymn, an explanation of a part of the Scriptures, and then an extemporaneous prayer followed by the Lord's Prayer.

15,360. And that is done by sign and alphabetical speaking?—Spelling and signing. It is first spelt and then afterwards signed.

15,361. Mr. Tait is one of your masters, is he not?—He is the senior teacher.

15,362. When we were at Edinburgh I think you showed us a class which Mr. Tait conducted; do you agree with what was then told us—that the natural sign is not taught, but acquired by the children; is that true?—Yes.

15,363. And that you proceeded by alphabet reading to written language?—Yes.

15,364. Then no articulation at all is employed up to that point?—It goes on simultaneously.

15,365. That is the combined system?—Yes.

15,366. Then when you speak of the oral system, you mean the combined system?—I always understand by the oral system a system where no signs are used at all.

15,367. Then you use articulation and signs which you have conventionally called oral, but it is not oral in the pure sense of the word?—We call it the combined system.

15,368. You do make use then of some conventional signs?—Yes, of a great number.

15,369. And you teach very little by articulation, I believe?—We have an hour a day for special classes.

Mr. A. Large.

28 Jan. 1887.

15,370. When we were at Edinburgh you told us that you could not very well teach geography by articulation. This is what Mr. Tait told me: "I believe the majority could be taught by it if they were "at school ten or twelve years." That would bear out, I suppose, your idea that the time for education is not sufficiently long?—Undoubtedly it is not.

15,371. If you turn to the report of Dr. Kerr which you have favoured us with, you will see on page 8 that he makes this remark: "One thing is certain, that "the oral system requires both more money and time. "Can this demand be complied with in respect of the "social class who are inmates of the hospital? I ven- "ture to quote from an address by Mr. Dalby, Aural "Surgeon to St. George's Hospital, who is a strong "advocate of the oral system. He says: 'Whilst "'having no doubt as to the advantages of the articu- "'late system, it has become a question with me "'whether for the labouring classes of the poorer sort "'this, the oral system, is applicable, not simply because "'of the expenses that are incurred during the educa- "'tion, but also on account of the number of years "'during which it is necessary to keep the child at "'school.'" Do you agree with that?—If that implies the pure oral system, I agree with it. I think that there is a confusion in the two terms which I should like to be guarded against; that is to say, the combined system includes some oral instruction, and the oral system excludes signs.

15,372. What you would wish the Commission to accept as your view of the oral system is that it is an articulate system together with signs?—Not. Without signs.

15,373. Is it the practice in your school that, if no promising results appear from any mode of teaching after nine months in the lip-reading, then you go to the sign and alphabet system?—We do not specify the time so markedly as that; but if we see a want of intelligence or a want of aptitude in from nine to twelve months we think it preferable that the children should be taught entirely by the manual system.

15,374. Is it your opinion that children can be taught articulation as well with sign-children as by themselves; do you think that isolation is required?—I think that they would improve better by isolation, but they can all be taught to a certain extent articulation under any system.

15,375. Has your school ever been examined by any specialist?—No.

15,376. Simply by the Government inspector, an ordinary school inspector?—Quite so.

15,377. (*Rev. Mr. Owen.*) Do you think that the inspector ought to be a specialist?—Undoubtedly.

15,378. On what system would you suggest that a grant should be given—on results or on capitation?—Not on results undoubtedly. It would be very unsatisfactory to the teaching staff, because there are children of such varying abilities, and some of them have such very poor capacities that I do not think it would be fair to the teaching staff to pay by results.

15,379. But if you had a specialist examiner he would make allowances?—If you had a specialist examiner he might take that into consideration.

15,380. Then, with a specialist examiner, you would look favourably upon the system of payment by results?—If it were understood that he would take those matters into consideration.

15,381. If he were a specialist he would be able to do so?—He would; but the question is whether he would do so.

15,382. Do you consider it advisable that every institution should have an apprentice fund?—Yes.

15,383. You contributed, did you not, that article on the deaf and dumb in the last edition of the "Encyclopedia Britannica"?—Yes; and in "Chambers' Encyclopedia."

15,384. Then you have always taught, to a certain extent, articulation and lip-reading?—Always at the hospital, during all my course.

15,385. From your Old Kent Road days?—Yes.

15,386. And the system that you now adopt is practically the same as you used years ago, is it not?—Yes, quite the same.

15,387. Then, when people look upon the oral system of teaching as a discovery, that is scarcely a correct word, is it; it is the old system that has been going on for years?—Yes; they generally say "Do you teach "upon the new system," and I have to correct them, and say to them, "I suppose you are referring to the "old system," and I generally find that that is the case.

15,388. It is substantially the same system as you taught years ago at the Old Kent Road?—Yes; I do not think that they adopted the lip-reading to such an extent in old Dr. Watson's time, in the year 1806.

15,389. How do your oral pupils speak to each other?—Generally by spelling or signs.

15,390. But I mean out of school?—By spelling and signs.

15,391. And they speak to the other children by the same method?—Yes; unless we make it a special lesson to speak by the lips.

15,392. Do you think that the orally-taught deaf and dumb are superior to the manually-taught deaf and dumb?—I have not met with any pure orally-taught, so that I have never been able to test the two really.

15,393. Do you think that the oral system is yet sufficiently promulgated in the United Kingdom to produce satisfactory tests?—No; I think that more can be done yet with the oral system.

15,394. At the Conference of Masters which was held in the year 1882 you stated that you considered the oral method impracticable for the majority, and unserviceable for those of weak intellects; is that your opinion still?—Quite so.

15,395. You would still teach articulation and lip-reading to semi-mutes?—Yes.

15,396. And only to those who are born deaf who have more intellect?—Yes.

15,397. You think that the difficulty of teaching those who are born deaf to speak in such a way as to be of any degree of utility in after life is very great?—It all depends upon the intellectuality of the congenitally deaf. I have found them in some cases acquire language better even than the semi-mutes. I would rather teach an intellectual child who was congenitally deaf than a semi-deaf child, because children of the latter class depend so much upon what they hear, and what they hear is imperfect.

15,398. Then, speaking generally, in order to educate the deaf and dumb for the ordinary purposes of after life, do you think that they ought to go out with a knowledge of the manual alphabet as well as of the oral system?—Yes; that is my opinion.

15,399. Then you do not consider that the oral system is by itself sufficiently adapted to fit them for after life?—As I have said before, I have never met with any case in which it proved sufficient.

15,400. (*Dr. Tindal Robertson.*) In answer to Mr. Owen you stated that the children would prefer to communicate with each other by signs in their play hours; but you teach them on the combined system, as I understand, and is it not natural that they should adopt the plan that is easiest?—Yes.

15,401. Therefore, is it not because it is easiest that they use signs?—Yes.

15,402. With reference to the employment of a skilled inspector, I presume you mean that he should be skilled in all senses—that he should have a perfect knowledge of all the systems?—I do not think that any of the teachers have a perfect knowledge of the pure oral system. They have visited schools which are taught under that system.

15,403. You do not quite understand me, I think. We were talking of inspectors and not of teachers. You said you preferred that the inspector should have a special knowledge; I presume you mean that he should have a special knowledge, not of one system alone, but of all the systems which are employed?—I think it would be preferable.

15,404. You stated also, I think, that you admit your pupils at the age of eight?—From seven to eight years of age.

15,406. Is it nearer seven or nearer eight?—It is nearer eight.

15,407. Do you not think that if the age of admission was much below that—say, six—the vocal organs would be more flexible, and that if they attempted to acquire the articulation they would be able to do it more easily? Does it not stand to reason that the vocal organs themselves, being begun to be used much earlier, you would have a better chance of teaching the children articulation?—I should think so.

15,408. You have stated that the habits of the deaf and dumb, by reason of their being kept at home, are likely to become worse than those of other children; do you not think that if they were admitted to school earlier that would give them a better chance of forming a good moral tone and good habits generally than if they were admitted as late as eight years of age?—A certain class of children, of the very poorest class, I think, would benefit by it; but the children of respectable parents would benefit more, I think, by being under the parental influence, and being sent to an ordinary school, so as to discipline them, and moralise them, and fit them to undergo the strain that they would have to undergo in a special school.

15,409. Would you wish, in the first instance, that they should go to an ordinary school and then come to you?—Yes, to be disciplined and moralised.

15,410. At what age would you have them begin at the ordinary school?—At any time, when they were able to learn anything at all—the boys to learn to write and draw, and the girls to write, draw, and knit.

15,411. As to the teaching of trades to the deaf and dumb, what trades, in your opinion, are best adapted for the deaf and dumb?—I have a list here of the trades that they have acquired after having left school. I think shoemaking, carpentering, tailoring, and carving are the best trades for the deaf and dumb.

15,412. In that case, supposing that you took them at an earlier age, and began their education earlier, would you not be able, towards the end of their time, to give them some manual dexterity with tools, and that kind of thing; and, if so, would not that stand them in great stead when they begin to learn those trades as apprentices when they left your institution?—I certainly would prefer that the time should be occupied solely in their education up to the age of 14, and that if they stayed after that then they should begin to acquire trades.

15,413. Would you not think that it would be an advantage to have in your institution, not a special department for teaching the deaf and dumb, but a special department for teaching them the art of using tools?—Yes, for their technical education.

15,414. (*Mr. Arrol.*) Do you not think that it would be advisable that the Act should make the education of the deaf and dumb compulsory at the age of six?—I think it would be very advisable if the School Board officials were empowered, as soon as they discovered a child to be deaf and dumb, to send it to a Board school; and also that they should be in communication with the master of the special school, so that he might suggest to the parents means of management, and modes of prosecuting their children's education, which would give every advantage to the children when they came to the school. I have some papers here such as we send out, and we have found very great advantage accrue to the children upon entering the hospital from our having issued these papers.

Mr. A. Large.

28 Jan. 1887.

15,415. Are the benefits of your institution confined to children of a particular name?—No; those bearing the names of the founder, and that of his mother, Donaldson and Marshall, have a preference.

15,416. Through what means do you obtain your pupils—by advertising?—Yes, we advertise.

15,417. Do you prefer to take pupils from other institutions?—No, the governors do not as a rule remove children from any other school; if they are under education they don't interfere.

15,418. In your institution do you adopt any means for the amelioration of deafness?—We have a speaking-trumpet. I have tried it, but I am afraid that it is of no great service to them.

15,419. Have you surgical advice and attendance for them?—Yes, and we have had an aurist who has examined them, but he is not an official of the hospital, he is not officially appointed as the aurist, but he examines the children, I believe, more for his own information than otherwise.

15,420. (*Mr. St. John Ackers.*) You have only one deaf teacher, have you?—A semi-mute.

15,421. Why do you not employ more deaf teachers?—The only reason why I employed this teacher was in order that he should maintain the conventional system of signs in its integrity.

15,422. Then it is your desire that that system should be so maintained?—Yes.

15,423. Do you think that he can in other ways teach as well as a hearing person?—I think that he should, on account of his affliction, be able to enter more into the psychical condition of the children.

15,424. Have you yourself noticed whether he teaches, for instance, the English language as accurately and as well as other teachers?—He might make a slip now and again.

15,425. Would it be more likely that he would make a slip than an ordinary hearing person?—I think not.

15,426. You think that your hearing teachers also make slips in grammar?—If you take it very minutely, in some points; for instance, I often hear one of my teachers use the words "shall" and "will" very indifferently at times.

15,427. May I take it from you that the teachers of the deaf in Scotland, at the present time, are rather below what you would think desirable than otherwise?—I should not think that that would be a criterion, because I have noticed, even with our ablest paper, the "Scotsman," sometimes misapplies those words "shall" and "will."

15,428. Do you consider that an accurate knowledge of language is a very great benefit to the deaf?—Undoubtedly.

15,429. Therefore that is one of the primary objects which you have in view?—Yes.

15,430. Have you more applications for admission than you can entertain?—No; but last year was the only time since the foundation of the hospital that we have not had sufficient to fill up the vacancies.

15,431. Do you know the reason why there are not so many seeking admission into your hospital as there used to be?—It would be only an inference, but I think that the Endowed Hospitals Commission did something to unsettle the minds of the people, and they did not know how long they would be able to stay.

15,432. You spoke of the old system and the new system in England; was the pure oral system ever taught in this country until the latter half of this century?—No, I think not.

15,433. Therefore what is now called the pure oral system is for this country a new system?—The pure oral system without signs. In the Old Kent Road, I

Mr A. Large.
28 Jan. 1887.

believe, they taught the old pupils of 1806 by speaking, but they did not teach so much lip-reading.

15,434. And they taught a certain amount of signs?—I do not know that they taught signs, but the children acquired signs.

15,435. They used signs and the manual alphabet?—Yes.

15,436. So that a master who did not use the manual alphabet could not in any sense be spoken of as using the old English system?—Is there a system by which they do not use signs?

15,437. I am not speaking of signs; I ask, is it possible to say that the old English system was a system which taught speech without the manual alphabet?—No.

15,438. (*Rev. Mr. Owen.*) So far as you are aware, is there any school in this country where children are taught entirely by signs, without any finger language?—No, I am not aware of any.

15,439. (*Chairman.*) Do the hearing children mix freely out of doors, as well as indoors, with the deaf and dumb children?—The deaf and dumb have to be stimulated to mix with the hearing, or they would never do it.

15,440. Is there any unwillingness on the part of the hearing children to mix in their games with the deaf and dumb?—No, I have never seen it.

15,441. Is it rather the reverse?—The deaf and dumb would separate themselves, if they were left to themselves.

15,442. Does the separation arise mostly from the unwillingness of the deaf and dumb to mix with the hearing, or from the unwillingness of the hearing to mix with the deaf and dumb?—I can hardly answer that question; it is reciprocal.

15,443. Is there any unwillingness on the part of the hearing to mix with the deaf and dumb?—We do not see it more so with the one class than with the other; but we have undoubtedly to encourage and stimulate the deaf and dumb to join in the games at all. The deaf and dumb are generally of a very morbid disposition, and do not at all care for athletics unless they are encouraged; and the presence of hearing children, and seeing them enter with such spirit into their games, has a very stimulating and beneficial influence on the deaf and dumb.

15,444. Then you think that the mixing of the two classes tends to make the deaf and dumb cheerful rather than to make the hearing children depressed?—I think so. If I may be allowed to do so, there are other statements that I can make with respect to the moral effect and influence which the association of the two classes has upon the hearing children. Those who are acquainted with the habits and the character of the deaf and dumb know that they are very liable to be ill-treated by all, and to be made the scapegoat, the butt, and the gibe of the village. But the fact of the hearing children mixing with the deaf and dumb produces in them a very marked sympathy for the deaf and dumb, which has of course a very good influence upon the hearing children. They learn to sympathise with the afflicted; and not only so, but the hearing also acquire the manual alphabet, and disseminate it through the country; so that in Scotland you would find that the people are more generally acquainted with the modes of communication with the deaf and dumb than the people in England. We have hearing children who are the brothers of deaf and dumb children, and we find that the dissemination of the manual alphabet, and the mode of communication with the deaf and dumb are more marked in Scotland than in England.

15,445. Have you ever had members of the same family in the institution at the same time, one hearing and one dumb?—Yes, there is a case of that kind there at the present time.

15,446. Have you any remarks to make with regard to the inconvenience of removing the deaf and dumb children from the hospital?—I think that it would be a great loss to the deaf and dumb if their separation from the hearing children ever took place.

15,447. But is there any objection to the place where it is proposed that they shall be moved; do you know where they are to be removed to?—I think that the architectural beauty of the hospital has a very good influence upon the minds of those in the condition of the deaf and dumb, as compared to the Orphan's Hospital to which they would be removed, which is not so palatial-looking. I have further notes of my opinions regarding the combined system, but perhaps they are too full for me to read to you.

15,448. We understand that you are in favour of that system?—Yes, I am strongly in favour of it. May I hand you a letter written to me by the surgeon of the hospital, who takes a very lively interest in all that concerns the deaf and dumb. He corroborates, I think, my statement. (*The Witness handed in the letter.*) The greatest difficulty, I believe, of the oral instruction is the want of confidence in language. I do not see how it is possible to teach any language unless the person who teaches it knows that language. With the deaf and dumb the key to their understandings and hearts is only by their own language, and that must be the language of signs.

15,449. In the hospital are both the hearing and the deaf and dumb in the same sick ward?—Yes; and that has a very happy influence upon the deaf and dumb.

15,450. Do the parents often visit their children?—Yes, but the children more frequently visit their parents.

15,451. Do they leave the institution and visit their parents in the town, or can their parents come to the hospital to see them?—They generally visit their parents and relations in the town on Saturdays. The parents of some of the young ones come for them to take them to their habitations. The deaf and dumb who have no friends in town are generally sent out in groups, in order to accustom them to the streets.

15,452. (*Admiral Sir E. Sotheby.*) Have you any knowledge of the blind associating with the deaf and dumb?—No, I have not.

The witness withdrew.

Adjourned to to-morrow at 11 o'clock.

6, Old Palace Yard, S.W.

Saturday, 29th January, 1887.

PRESENT:

THE RIGHT HON. THE LORD EGERTON OF TATTON, CHAIRMAN.

The Right Hon. A. J. MUNDELLA, M.P.
ADMIRAL SIR E. SOTHEBY, K.C.B.
W. TINDAL ROBERTSON, ESQ., M.D., M.P.
B. ST. JOHN ACKERS, ESQ.
T. R. ARMITAGE, ESQ., M.D.
W. AUCHINCLOSS ARROL, ESQ.
EDMUND C. JOHNSON, ESQ.
ROBERT MCDONNELL, ESQ., M.D., F.R.S.
The REV. W. BLOMEFIELD SLEIGHT, M.A.
The REV. CHARLES MANSFIELD OWEN, M.A.
CHARLES E. D. BLACK, ESQ., *Secretary.*

Mr. JOHN THOMSON examined.

Mr. J. Thomson.
29 Jan. 1887.

15,453. (*Chairman.*) You are the head teacher of the Institution for the Deaf and Dumb at Glasgow?—Yes.

15,454. How long have you been connected with the institution?—Over twenty-three years.

15,455. At what age do you think the education of he deaf and dumb should commence in a public institution like yours?—Not under seven.

15,456. Do you think it would be an advantage to have a preparatory infant school connected with the institution?—It might be an advantage.

15,457. Have you seen any of the classes of the School Board at Glasgow for the education of the deaf and dumb?—I have seen School Board classes, but there are none such in Glasgow.

15,458. Do you think it is advisable that that mode of teaching deaf and dumb children should be adopted extensively?—I believe they are doing a good work, but they do not give the training that we are able to give to deaf and dumb children.

15,459. You think that many deaf mutes are delicate and likely to be better trained in an institution?—Yes; better trained, better fed, and made more comfortable in every respect.

15,460. Do you attach much importance to the sanitary conditions which exist in an institution like yours?—It is a most important point.

15,461. And gymnastic exercises you think a matter of importance?—Yes

15,462. What is the average time that the children remain with you?—Four years.

15,463. Do you think that that is long enough to give them a good education?—It is barely half the length of time required.

15,464. What is the difficulty of keeping them longer?—Very often the parents, as soon as they are able to earn a little, take them away from us.

15,465. Do you think that deaf and dumb children should be compelled to attend school like any other children at an early age?—Yes.

15,466. Whether at a board school or at some institution?—I do not approve of School Board classes for the deaf and dumb, and consider it most desirable that they should attend an Institution specially appointed for their training and education, and where their peculiar necessities are thoroughly understood; and every facility offered for their proper physical and mental development.

15,467. Have you charge of the education only, or have you charge of the management of the institution as well?—I have charge of the whole—both the education and the management.

15,468. Do you think that advisable?—I think so.

15,469. Do not you find that your time is pretty well taken up by the education?—It is taken up pretty much; but I hold that the head of an institution ought to have command of things both outside and inside.

15,470. In the paper you have sent us you say that your teaching staff is both sufficient and efficient?—Yes.

15,471. Do you train your own teachers?—I do.

15,472. Do you think that plan better than that they should receive their training in some training college?—I would not object to anyone being trained out of my own schools, but I find that I get them better into my own way by training them myself.

15,473. I see you have certificated masters?—Yes.

15,474. And also those who teach drawing have certificates from the Science and Art Department?—They have.

15,475. Have you any difficulty with the parochial boards?—We have.

15,476. Do they refuse to pay for the maintenance of the children?—We find them very stiff in many cases.

15,477. Do they question the inability of the parents to pay?—In some cases they do.

15,478. And in those cases are the children eventually sent to you by private assistance?—Either by private assistance or we admit them for nothing.

15,479. Do you think it desirable that industrial training should be given in the school?—It is a very good thing, but I find that it takes too much from the educational training, especially with us, for we only have them for about four years on an average.

15,480. If they were to remain eight years you think industrial training might be well taught alongside of the ordinary education?—To a certain extent.

15,481. After what age?—As early as they could learn anything in that respect.

15,482. You would teach them to use their hands early?—Yes.

15,483. Have you introduced the Kindergarten system in your institution?—Yes; I think that is a very good thing indeed.

15,484. Have you any view as to what amount of Government aid should be given?—I think we ought to get substantial aid, if any, as any action by Government in this direction is sure to cripple the present sources of revenue. If the subscribers to the institution found that we were having Government aid I am afraid they would withhold their present subscriptions.

15,485. Do you think that Government aid should be attended by inspection?—Yes.

15,486. And inspection of a technical character—that is to say, by those who have been trained to teaching the deaf and dumb?—Nothing but that would do.

15,487. The ordinary inspection would not do, you think?—It would not do at all.

15,488. Have you anything to supplement to the very full answers which have been given by the chairman of your institution?—No.

Mr. J. Thomson.

29 Jan. 1887.

15,489. Do you follow up your pupils in after-life?—We do to a great extent.

15,490. Can you tell us whether they are able to get employment soon after they leave you, or to get apprenticeships?—They are apprenticed immediately on leaving us—we find them in every employment in the city, more or less.

15,491. You are able to get them employment?—Yes.

15,492 Do you ever give them grants?—Yes.

15,493. From the voluntary subsciptions I presume?—Yes, we very often supplement the wages of poor apprentices for a year or two.

15,494. Do you think it is very desirable that in all deaf and dumb schools there should be some funds available for that purpose, and that there should be some organised system for following up the pupils after they leave school?—Yes, I think it is a most important thing; it has been the saving of many of our poor lads.

15,495. Have you any deaf and dumb teachers in your school?—No.

15,496. Have you any objection to having them?—The only objection is that they cannot apply the oral system; the best assistant I ever had was a mute of our own training, but on the oral system he was of no use.

15,497. Do you call your school one on the combined system?—Yes.

15,498. Do you use the one-handed alphabet?—No, the double-handed; but the pupils and myself all know both.

15,499. Do you think that partially deaf mutes should be trained separately from absolutely deaf mutes?—No.

15,500. Do you think it advisable that partially deaf mutes—those with some remains of hearing and language—whom you can teach on the oral system, should be kept apart from the others and taught on the oral system, and not by the sign and manual system?—As far as possible.

15,501. You would admit, would you not, that those who are partially deaf, or have got any remains of speech, pick up the oral system quicker than those who are absolutely deaf?—Yes.

15,502. (*Mr. St. John Ackers.*) How many pupils do you consider it desirable to have in a class where the oral system is not used?—That depends a good deal on the intelligence of the children; 15 would be my own arrangement.

15,503. You would limit it to 15?—I would for thorough training.

15,504. (*Dr. McDonnell.*) I understood you to say that you did not approve of sending children under seven to such an institution as you are connected with; but you also said that it might be a good thing to have a preparatory school for children under seven. If you had a deaf and dumb child yourself, would not you commence to teach it something at a very early age?—Yes, as soon as it could learn anything I would teach it something.

15,505. You would like to have some machinery for beginning to teach a deaf and dumb child before the age of seven, though you do not think your institution is a fit place in which to give that early instruction?—Yes, I hold that the parents ought to begin the education of their deaf and dumb children very early, and train them in habits of order and regularity.

15,506. (*Mr. Arrol.*) What may your reason be for recommending that children should not come to your institution before seven years of age?—They require help in washing and dressing, and it would take up too much of the time of the officials of the institution, unless we had a very large staff, to attend to the requirements of the infants.

15,507. You said in answer to the Chairman that you had a difficulty with the parochial boards; is that in respect to obtaining money for the children after they have attained a certain age?—The difficulty is that the parochial boards will not educate the deaf if they can get rid of the burden by taking advantage of any point of law in their favour. Unless the parents are paupers they are not willing to send the children to us.

15,508. Do you find that the parochial boards decline to give you assistance when the child arrives at the age of 13?—We have had one or two cases where they have given assistance, but it is quite against the general rule for them to do so.

15,509. From your experience of teaching both the manual system and the oral system, do you consider it likely that success should attend the oral system in the school board schools?—That is a question that is merely on trial, and I would rather not give a decided opinion on it. They may do a great deal, but I hold that we can do more, unless the school boards provided thoroughly trained men for the work and had more time at their command. The few hours per day that the hearing children have for instruction in school are not nearly sufficient for the deaf; not only is it that the deaf require to get up their lessons under the care of qualified masters, but every sentence requires to be so thoroughly explained to them, that parents, while able to help ordinary children at their homes, can give the deaf but little assistance.

15,510. Do you think that there is more deafness arising from intermarriage of cousins than from intermarriage of the deaf and dumb?—I find in our own schools only two cases of deafness arising from intermarriage of cousins, and at present we have I think, five cases arising from the intermarriage of deaf mutes.

15,511. (*Admiral Sir E. Sotheby.*) Do you think there are many deaf and dumb children in your district who do not go to schools?—Not many in our district.

15,512. There are some?—There may be one or two; I think that is about the extent.

15,513. Is there any surgical examination of the children's ears before they enter the school?—Yes.

15,514. (*Dr. Armitage.*) Do you think it desirable to teach the finger alphabet to those who are orally taught?—We do not do so; I think it is not desirable.

15,515. Are the orally taught and those who use the finger alphabet completely isolated during school hours?—Not in our school.

15,516. Neither during school hours nor during play hours?—They are separated to a certain extent during school hours, but not during play hours.

15,517. Do all the orally taught children, as a matter of fact, learn the finger alphabet from their companions?—We cannot hinder them doing so.

15,518. Do they learn the signs?—They do not need to learn the signs; they come to us in possession of the signs.

15,519. (*Rev. Mr. Owen.*) Speaking generally, are you in favour of the combined system or the pure oral system?—I am in favour of the combined system.

15,520. And you say you do not think it advisable to teach the finger alphabet to those who are taught on the pure oral system?—I would not teach it as a matter of teaching, but we cannot help the children picking it up.

15,521. When they leave school do you think they will adopt it to some extent?—They invariably adopt it so far as I have seen.

15,522. Have you visited any of the pure oral schools?—Yes.

15,523. Have you been able to converse with the children there orally?—I have with some of them.

15,524. Have you ever met any orally taught pupils who can enter into ordinary conversation?—I have, but they do it with difficulty.

15,525. You have services in your institution?—We have.

15,526. Conducted on the sign and manual system?—By the sign and manual system.

Mr. J. Thomson.

29 Jan. 1887.

15,527. Do you think that that is the only way to impart religious instruction to any number together?—So far as I have seen there is no other way.

15,528. Your school, I believe, was inspected?—Yes

15,529. Did the examiner report favourably on it?—Yes; I think it was a very honest report.

15,530. (*Mr. Johnson.*) In the report of the Government inspector, Dr. Kerr, I see this paragraph: "I "have met with no cases where the deaf mute could "either speak with ease or interpret readily the ordi- "nary movements of the lips. I spoke to a number of "the children, and was understood. They replied, "and generally I made out what was said; but the "effort on both sides was so great as to make me doubt "whether such a medium of communication would "become habitual in daily life." Do you agree with that?—I do.

15,531. (*Rev. Mr. Sleight.*) You are entirely in favour of teaching on the combined system?—Exactly; the combined system is what I go in for. You may do all you can on the oral system, but my experience is that you cannot keep the deaf from using signs and the manual alphabet at some time or other.

15,532. Do you consider that, on physical grounds, it is better to teach orally than by the sign and manual system?—On physical grounds I certainly would say teach by the oral system; if you do not teach them orally, give them oral and gymnastic exercises as much as possible, especially in early years.

15,533. I see in the report of your institution you give a number of pieces of composition?—Yes.

15,534. Were the children who wrote those compositions taught on the combined system?—On the combined system.

15,535. In your opinion, could you teach children language so well orally in the same space of time as you could on the combined system?—I believe it is possible under proper conditions. Success in the education of the deaf is not so much a question of system as of the proper application of the system, our aim upon any system being to impart a knowledge of language written or spoken. The acquisition of speech is certainly a most valuable accomplishment, and where possible should never be neglected; at the same time written language, which is the mainstay of the deaf mute, may be thoroughly imparted on the silent system. I have always held that, in the hands of an expert, results as to the acquirement of written language upon any system should be equal, granting necessary conditions as to size of class and capacity of children.

MR. GEORGE CRICHTON examined.

Mr. G. Crichton.

15,536. (*Chairman.*) You are Chairman of the Govan Parish School Board?—Yes; Govan parish is a combination parish comprising parts of Lanarkshire and Renfrewshire.

15,537. You wish to make a statement to the Commission with respect to the education of deaf and dumb children under your school board?—Yes; the question grew out of the last school board election in the spring of 1885, when the education of the deaf and dumb was brought under the notice of the candidates by several of the ratepayers. Some of us promised that the thing should receive attention, and on October 12, 1885, a deputation waited upon us, and presented the memorial which the Commission have before them.

15,538. That memorial is signed by the Lord Provost of Glasgow and others?—Yes. The memorialists said that of course a great many of the parents would prefer to have their children with them at night, and they asked us to take the matter into our consideration, which we proceeded to do; and as we were taking a a school census shortly after (I think in the month of October or November) we found out that there were 27 deaf mutes in the parish, of whom 16 were boys and 11 girls. Of those 15 were being educated; 7 of the 15 were desirous of being educated at a school under the board, and, adding the 12 who were not receiving any education at all, made a total number of 19. We fitted up a class-room in Copeland Road Public School, Govan, and the class was visited by several members of the Commission when recently in Glasgow. Instruction began in the beginning of August 1886, and has now been proceeding five or six months. At the election I myself strongly drew the attention of the ratepayers to the fact that it would be unfair to the nation at large that the whole cost of that education should be thrown upon the Consolidated Fund. I thought the parents should do their very utmost to pay such fees as they could, and large fees where possible. From that position I have never receded. We have now seven in attendance at that class—there were nine, but two have left. We have seven pupils, and, with your permission, I will state the fees that we charge. There is one pupil pays 7*s.* 6*d.* or 10*s.* a quarter, another pupil pays 20*s.* a quarter, a third pupil pays 10*s.* a quarter, a fourth pays 7*s.* 6*d.* or 10*s.* a quarter (we have not quite decided which), another pupil pays 15*s.*, a sixth pays 10*s.*, and the seventh pays £2 a quarter. We investigated, as far as we could, the private position of the parents, and exacted from them or asked them to pay such fees as we thought from their position they ought to pay.

15,539. What is the actual cost to the board per head?—It would be about £12 per pupil: I believe a teacher can teach about 10.

15,540. If you had more than seven it would be cheaper, of course?—Yes. I have to state, for the information of the Commission, that the progress that these pupils are making is eminently satisfactory. The system on which they are taught is purely oral, and although personally I am not quite convinced that it is the best system, having no particular opinion on the matter, I must say I am astonished at the progress that these children have made.

15,541. On the pure oral system?—On the pure oral system. I was there, I think, in the month of December, and several of them understood what I said to them, after five months' tuition; and at the last board meeting, I think on the 17th of this month, a member of the board who happens to live close to the school said he had looked in that morning, and he was also astonished at the progress the children were making. I ventured to remark to the Commission when they were down in Glasgow, that as long as free education was not the law of the land, in my humble opinion, as a member of the school board, any grant which might be given, or might be recommended to be given, by this Commission for the education of the deaf and dumb, should be in about the same proportion to the total cost as in the case of the ordinary education grant which is given from the Consolidated Fund for ordinary tuition. The schools are maintained from three sources—fees, rates, and grants—and, roughly, the amounts from each are about equal. I think that the justice of the case would be pretty fairly met by something similar being obtained in the case of the deaf and dumb.

15,542. One third of the cost?—One third of the cost; perhaps it might be a trifle more.

15,543. That is education without maintenance?—Yes, of course we do not maintain the children.

15,544. You claim for your system the advantage of economy over the institution system?—Yes.

15,545. As far as the ratepayers are concerned?—Yes.

15,546. You believe that the statements made in the memorial are accurate?—I believe they are substantially correct.

15,547. As far as what is stated in the memorial is within your own knowledge, you believe that it is

Mr. G. Crichton.
29 Jan. 1887.

accurate?—I believe so. I may supplement what I have stated as to an imperial grant by saying that I think a £5 grant would be sufficient for us. I do not think we should go for too great an amount from the Consolidated Fund.

15,548. And of course you would have inspection?—Of course.

15,549. Skilled inspection; that is to say inspection by those accustomed to deaf and dumb teaching?—I think we should certainly have such inspection.

Mr. Joseph Kinlay examined.

Mr. J. Kinlay.

15,550. (*Chairman*). You are superintendent of the Bolton Schools and Workshops for the Blind?—Yes.

15,551. We know you have great experience in workshops for the blind; have you any suggestion to make as to the best way of disposing of the work of the blind when they are congregated in workshops such as yours?—I would like, if it could be managed, general stores to be established in certain centres so as to take work from so many workshops congregated round them. There are several workshops for the blind in Lancashire, and I believe that if, by the aid of benevolent persons or by any other means, stores could be instituted to take the overstock of the workshops, they might be the medium of getting rid of that overstock. The stores would be the receiving-place of the overstock, and they would be able to dispose of it very much better than the workshops themselves, for they would have persons who would set about that work and that alone, and the work could be easily disposed of without very much expense to the institution. By that means all the workshops might be filled with workpeople, the workshops could be carried on at a very much less expense than now, very many more blind people would be employed, and the thing, in my opinion, would be very much improved. I also believe that the Government might purchase articles from those stores that would suit them, and also railway companies and shipping stores, where they use a great many brushes and articles made by the blind. Those stores would easily dispose of the goods to an advantage, supposing all were thoroughly good and saleable. No defective goods should be received.

15,552. I understand you were originally brought up in the Liverpool School for the Blind in Hardman Street?—Yes. I was brought up in the Liverpool School for the Blind, and I commenced a workshop in Liverpool in my own private house in a very simple way. I earned my living at that time, after leaving the school in Hardman Street, at teaching music. I was connected with a lady, a Miss Wainwright, in Liverpool.

15,553. Were you tuning as well as teaching music?—I took tuning too, but pianoforte teaching was what I did principally. There were several blind people in Liverpool I knew who were very badly off, and I gave them one of my rooms. I made it into a workroom, and I used to buy materials and bring them home, and get two or three of these blind people to work in this room. Some of them learned there altogether with me. That was the beginning of the Liverpool workshop, and I then found a gentleman to come forward and join us, of the name of Mr. James Chambers.

15,554. What work was it that those blind men did—brushmaking or basket-making?—They made mats and baskets in my house, and those who had been taught to make other articles at blind schools used to make those articles at their own homes, and they used to bring them to my house and I used to dispose of them as well as I could, and so did this lady, Miss Wainwright, till they accumulated and the stock got so great that we could not get on any further. Then we got Mr. Chambers to come forward and join us, and we thought it would be a good thing to have a public sale-shop. Mr. Chambers, of Liverpool, took premises in Bold Street, and we got the loan of the schoolrooms under Hope Hall in Liverpool from the owners of the premises. We heard of Miss Gilbert's place in the Euston Road in London, and I went to London and remained there five or six months to make myself acquainted with the working of that institution. Then I returned to Liverpool, and the Liverpool shop has existed ever since.

15,555. With your experience, will you tell us how far the education of the blind is defective in industrial training?—I have found that since we have had to dispose of the work done by the blind to an advantage there is always great difficulty in disposing of the defective work done by blind people who have been in a school.

15,556. You are speaking of Lancashire, and the Liverpool school in particular?—Of Lancashire. There are two schools in Lancashire, one in Manchester and one in Liverpool. I have always found that when blind people have left the school their work has been very badly done—the work would not sell, it was defective.

15,557. Your opinion is that the industrial teaching in the schools for the blind at present is defective?—As far as I am acquainted with them. We have always had to teach the blind over again.

15,558. How would you remedy that?—We have remedied it in our workshop; we have no defective work in our workshop; we never have any bad stock.

15,559. You think the evil of which you are speaking is carelessness on the part of the teachers of the blind in those institutions?—Yes; and carelessness on the part of the blind themselves.

15,560. Do you think that they are careless because their ordinary education ought to have been carried further?—Not their ordinary education so much as their industrial training. I have always found that blind people imagine that if they do their work approaching that which is fair or pretty good they have done well; I have always had a great difficulty with blind people on that very account. I say, if it is not done right it is not done well; I insist upon it that it must be done right. They say, "It is very good for a blind "person." I say, "It is not; it must be done well. If "a person comes here and orders goods from us, he "wants the goods to be just the same as if he was get-"ting them from any other manufacturer." We have a very great deal of difficulty with the blind on that score, but we have always been able to overcome the difficulty, and I can certainly say that several blind people who have left our shop are able to go and work in any shop.

15,561. Do many of them leave you to work at their own business?—No, they go and work in ordinary shops with sighted men.

15,562. Is it easy for them to get into those shops with sighted men?—Not so easy—some employers will take them who are kindly disposed; but when they do take them they find that they are able perhaps to do as good work as any other man they employ, and in many cases better.

15,563. You can also speak as to the teaching of the blind in music; do you think that is generally efficiently taught in Lancashire, for instance?—I have always been opposed to blind people learning music unless they have a good education with it.

15,564. Because, without a good education, I suppose they are not able to become good musicians, in the first place; and in the next place, I suppose they are liable to fall into a lower grade of society, and to get their living by playing in public-houses and in the streets?—Yes, I believe music does them harm; it leads them into a vagrant way of living; but, if they were well educated, they could get their living in a respectable way.

16,565. You think there should be more central stores in various parts of the country for the sale of the

work of the blind?—Yes: central stores I should call them.

15,566. You think that the best recommendation you can make for the benefit of the blind?—Yes, I think so.

15,567. Would you propose that there should be established in London, Manchester, and other large towns such central stores for the sale of the work of the blind?—Yes.

15,568. And that workshops for the blind in the different smaller towns should send their work to be sold to the capital of the district?—Yes. It appears to me that if there was a central place—such as that we are now speaking of—we could have perhaps double the number of people working on our premises that we have now, and that would be an improvement in matters.

15,569. Do you think that all the blind children in your neighbourhood of Bolton go to school?—No. I think the blind children are neglected.

15,570. You think they ought to be compelled to go to school like other children?—Yes, I think they ought.

15,571. You supplement your workmen's wages, I suppose, according to their circumstances in life, not according altogether to the work they do?—That is so.

15,572. You have a certain number who are able to earn sufficient wages without supplementing them at all?—Yes.

15,573. (*Mr. Johnson.*) I think you told us when we paid you a visit that you knew of some blind men who had been with you who are now employed with sighted men?—Yes.

15,574. Can you tell me how many?—I could not tell you the number; they are up and down the country. I think there are two or three in Bolton at present.

15,575. There is not a very large number of blind persons whom you have turned out who are employed in sighted works?—Only a few.

15,576. Do you know whether you have any large amount of stock on hand?—We have; we have a pretty large stock of packing skips.

15,577. I understand that your directors still continue to employ the blind, even when you have no orders?—Yes, and that is a great drawback.

15,578. Do you ever put your people on half-time when no orders are coming in?—Yes, we shorten our time.

15,579. Has that been the case lately?—No, not lately; we have been able to keep our people going. In good times we could give our people rather more pay for their work, and perhaps allow them to work a little overtime too, which would improve their condition.

15,580. In what particular manufacture is your surplus stock now?—Cane and willow.

15,581. That is basketwork?—Yes.

15,582. Do you find that the machine for boring holes—your own spiral machine—is employed in any other institution than your own?—I have not heard of its being used anywhere else.

15,583. Yours is really the only blind workshop where brushes are made by that spiral machine?—Yes.

15,584. What is the amount of supplement that you gave to your workmen as a rule?—The supplement is not given on any fixed rule—it is given according to the circumstances of the individual.

15,585. (*Dr. Armitage.*) Do you think that blind basket-makers, if they were properly trained and thoroughly taught their business, could earn their living as a general rule outside the workshops?—No.

15,586. I mean at home or with seeing workmen?—They might with seeing workmen; but there is a difficulty, I think, in working at home, because when they make articles at home, if they have no stores or place to take them to, they lose a great deal of time in disposing of them. Their time is really money, and if they cannot sell the articles after they are made they have to keep them; whereas, if they work in the work shop, they have nothing to do with the selling of the articles they make. They commence on Monday and work to the end of the week, and they get their wages.

Mr. J. Kinlay.
29 Jan. 1887.

15,587. Do you know of any basket-makers who are working at home?—No, I do not.

15,588. Do you know any who have tried it and have failed?—Yes; I used to know some in Liverpool, but I have not known any in Bolton.

15,589. Do you know anything about the system that is followed in many of the Continental institutions of looking after the pupils after they leave school?—No; I could not speak particularly to it. I have heard some of the reports or parts of the reports sometimes read, but I am not very well acquainted with the manner in which the institutions are worked on the Continent.

15,590. It is a plan by which the pupils after they leave school, having thoroughly learned their trade at school, are allowed to send any surplus stock they may have to the institution.—That I consider a good plan.

15,591. And they are assisted by the institution in times of difficulty. Do you think if such a system were introduced here many blind persons might be able to work at home with success?—Yes, I do think so, because the blind people want some easy means of disposing of their goods. What you are speaking of as the plan adopted on the Continent is similar to that which I have been speaking of in reference to workshops, as affording a means for disposing of goods made by the blind; but I have generally found that the workshops themselves have a large stock—they are generally burdened with stock themselves.

15,592. You stated that the work done by the blind is sometimes defective; may not that account for the stock being large in some of the workshops?—That is one of the causes.

15,593. Do you think that is the chief cause?—It is one of the causes. The workshops would be greatly assisted by central depots if such depots were established. In our own workshop we are engaged in the manufacture of our articles during the week, and we cannot very well attend to the selling. We require a traveller—it is a branch of business that goes beyond us; to keep a traveller would be an expense. If there were a central store to receive our goods we would be relieved from all the difficulties connected with the sale of the goods; the travelling part of the business could really be done by those stores.

15,594. What you suggest is to transfer the expense and trouble attending the sale of the goods, including the expense of a paid traveller, from your institution to a central stores?—Yes.

15,595. You merely wish to shift the burthen to other shoulders?—I think such a thing would relieve the workshops very much, and would be an improvement; it would be a supplement to the workshops, which in my opinion would make them very much more complete.

15,596. (*Chairman.*) Would you have sighted travellers or blind travellers?—I would have sighted travellers; they would get over the ground better and quicker, and they would be able to do the work very much cheaper and more completely than blind people.

15,597. (*Dr. Armitage.*) Do you know that there are blind people in England who manage very large basket shops quite successfully, more especially Birmingham?—No; at the same time I believe many might. When I commenced our shop in Bolton I travelled myself, and I used to take orders for skips, and I used to measure rooms and floors of all shapes and forms for matting. I could not find many men in our shop that I could send out to do that.

Mr. J. Kinlay.

29 Jan. 1887.

15,598. Have you the same difficulty in disposing of brushes that you have in disposing of baskets?—No.

15,599. (*Mr. Mundella.*) I gather from what you have said that you wish to separate the manufacturing department from the commercial department really, and that the workshops should have nothing to do with the sale of the goods produced. Is not that your view?—No, the stores I allude to would not take the entire selling of the goods; for instance, the workshop might have a retail shop at which they might sell articles produced in the workshop, but the central stores would receive the overstock. Then if the stores received orders for goods which they had not in stock, those orders could be sent to any of the workshops, and the workshops would thereby be able to give more labour to the blind. That would help the workshops very much.

15,600. What you propose is that there should be one central store, say for Lancashire or the North of England, to which you could consign any of your productions, and that the managers of those stores should advise you as to the quantity of any particular goods they could sell, or as to the kind of goods that it would be desirable to produce, and that they should employ travellers and do everything they could to push the business and keep the shops well employed?—Yes.

15,601. That is dividing the manufacturing and the commercial departments, just as a mill in Lancashire sends its goods to its agents in Manchester, who dispose of them in the markets to the best advantage?—Yes.

15,602. If that system were adopted you think it would relieve the local institutions from a considerable amount of expense and difficulty which they are at present subject to?—Yes.

15,603. That being your way of disposing of your goods, would you not also have at the same central depot a stock of the raw material of which the goods were made, which any blind person in the district could purchase at cost price?—Yes, that would be doing good work.

15,604. Then that central depot should also advise the workshops constantly as to the class of goods that were most likely to be in demand, and as to excess of production in certain departments?—Yes, that would be a good thing.

15,605. You said that in Lancashire, in your opinion, the education of the blind was to a considerable extent neglected?—In industrial training.

15,606. It is not the literary education, but the industrial training that is neglected?—Yes.

15,607. They do get a proper intellectual training, you think, in Lancashire in the different towns and rural districts?—I think it might be very much improved.

15,608. Do you find that those who have received the best intellectual training turn out to be the best workmen in your workshops?—Yes, they are the most mechanical.

15,609. Your idea is that there should be in the first instance good intellectual training, and then, at as early an age as the child can receive it, he should have, conjointly with mental training, a certain amount of handicraft instruction?—Yes.

15,610. Do you believe it is important that the mental training of children should commence as early as possible?—Yes, and I also think that it would be all the better for blind people if they were mixed with sighted people.

15,611. You are of opinion that it would be better for them if they were educated with sighted people?—Yes.

15,612. Does that apply also to industrial training?—Yes, but not so much as in the other case, because when blind children are kept together in that way they get peculiarities, and those peculiarities become a difficulty which I would avoid.

15,613. You would think it desirable that a blind child should be trained to do everything that a seeing child does?—Yes.

15,614. And he should be so trained as to enable him to compete, as far as possible, with seeing children?—Yes, that is my view.

15,615. Then let us take the case of blind persons who have arrived at an age when they will be doing something to earn their own living, having been trained mentally and industrially; and let us suppose that in the district in which they are located there is a society in constant touch with them, ascertaining that their habits were good, that they were industrious, temperate, and persevering; and supposing it was found that their earnings required to be supplemented to some extent to enable them to maintain a decent appearance, do not you think it would be better to assist them by supplementing their wages than by pensions or by anything like doles or alms, or anything of that kind?—Yes, I very much object to giving blind persons alms or doles.

15,616. From your knowledge of Lancashire, are you of opinion that you might ascertain what the blind were doing in every town in Lancashire by means of local agencies, who might report to one central department in Lancashire that the blind in their particular district were conducting themselves temperately and respectably, and properly husbanding their resources?—Yes, I think it could be done very well. I think it would be an advantage if that mode of looking after the blind who were earning their living, or partially earning their living, were adopted.

15,617. If the blind were conscious that they were carefully looked after, and that their wages would be supplemented if their conduct was good, do not you think it would have the effect of keeping them in good habits and in good companionship, and making them industrious and thrifty?—Yes, I believe there are certain blind people who would not work if they thought there was any means of getting money without working for it.

15,618. You are of opinion that it is unwise to develop and encourage that state of things?—Yes.

15,619. (*Admiral Sir E. Sotheby.*) In what trade do you consider the blind succeed best?—In Lancashire, in the skip-making.

15,620. But, as a general rule, in what trade do they succeed best?—Basket-making. Every county has a different class of work, and of course it makes a difference in regard to the men's earnings who do that work; but if I had to manage a lot of blind people anywhere out of Lancashire—say in the neighbourhood of London, for instance—I would introduce amongst my blind people in the basket trade as many templates as possible.

15,621. Do you consider that it is necessary to have sighted teachers for the blind?—No.

15,622. You think blind people can turn out as good work without sighted teachers as with them?—As far as my experience goes I believe the blind have done very much better than the sighted. In the very shop that I am in now we employed a sighted man, a very good workman, who had been for some years in Henshaw's Blind Asylum in Manchester; we employed him to assist in the work, and we had him as a teacher or foreman in the basket or skip department, and we paid him 28*s.* a week, but I found by experience that I would pay us better to let him stop at home; though he was a good workman he was not a good teacher for the blind, and he had not the necessary tact and energy.

15,623. He was a bad teacher?—Yes.

15,624. If grants were given for teaching the blind music, do you think that grants should also be given for teaching them trades?—Yes, I think so. I would not give a blind music teacher a grant and withhold it from a blind trade teacher.

15,625. In Bolton do any blind people go about playing music in the public-houses and in the streets?—Yes.

15,626. Many?—Several of them earn a living in that way.

15,627. They find they can earn more in that way than by carrying on a trade?—They can get much more money at it.

15,628. Do you think that there is a prejudice among people generally against buying work made by the blind?—In many cases there is.

15,629. When your people are too old to work what becomes of them—have they any pension, or do they go to the workhouse?—Someone has to keep them when they cannot manage to keep themselves. I have never known of any that have gone to the workhouse.

15,630. How do they live when they become too old to work?—I cannot say; I have not had any cases of that kind. We have an old man who works at our place, but it is a kind of pastime for him; he is supported by his children and grandchildren.

15,631. Many blind people are not married, and have no children or grandchildren; how are they to live when they are too old to work?—I have not known any cases of that kind.

15,632. Suppose such a case?—If an old man was not supported by his friends he would have to go to the workhouse.

15,633. (*Mr Arrol.*) On the question of grants I will ask you this question: As blindness handicaps a man very much in the race of life, do not you think it would be advisable to give every industrious blind person some aid?—It is not necessary for every blind workman to have assistance of that kind, I think. Many blind people can live by their earnings, and if you established central depots in connection with workshops, so that the blind could be continuously employed, and so that some supplement could be made to their wages where the circumstances required it, I think it would improve the condition of the blind very much.

15,634. In respect to the blind who require to go to the parochial boards for relief, do you think that the blind might be allowed to remain at their own homes with their own families and receive relief from the parochial boards without being required to go inside the workhouse?—If I was obliged to apply to the parish for relief, I would rather have outdoor relief given to me than have to go and live in the workhouse.

15,635. You think, in the case of the blind, an exception to the hard-and-fast rule which is applied in other cases should be made, and they should be allowed to remain at home?—Yes, I think so.

15,636. (*Mr. St. John Ackers.*) Is there any Government inspection of your workshops?—We have never been inspected.

15,637. Are you not under the Factory Act?—As far as that goes, I think we would be under Government inspection.

15,638. Though you are under the Factory Act, as a matter of fact you have never been inspected?—No.

Mr. J. Kinlay.

29 Jan. 1887.

15,639. Can you give any reason why your workshops have not been inspected?—I cannot. Perhaps the inspector thinks we are not worth inspecting.

15,640. In your opinion, should not all workshops where people are congregated together, whether they be workshops for the blind or for seeing people, be under the same rule as regards inspection?—I think it would be a good thing.

15,641. You said just now that you considered that the technical education of the blind was deficient, but you also told us when we visited Bolton that the ordinary education of the blind was not what it ought to be. You showed us one of your pupils, fifteen years of age, who had never been in a school in his life?—Yes.

16,642. You also told us that the School Board of Bolton had refused, as you believed, to take in a blind child?—Yes.

15,643. Have you heard of any other similar cases?—No.

15,644. Have the School Board for Bolton any class for the blind?—No.

15,645. (*Chairman.*) How many of the blind have no occupation, and either beg or receive pensions, in Bolton?—I do not know of any that receive pensions.

15,646. How many beg or are of no occupation—how many are dependent on voluntary support?—I should think there would be 50 or 60 blind in and around Bolton of that description.

15,647. How are they living now?—It is difficult to answer that question. I do not know. There are blind beggars, but I cannot give you the number of them. I have known some who were employed in our workshop in the day go round to public-houses at night to beg. We were very much opposed to that, and we deal with such cases when we find them out; but we do not always find them out. I daresay there might be a score of such like persons that go about begging and getting their living in that way, not altogether publicly, but privately as well, but I am not sure about the number.

15,648. If these central stores were started would blind women be able to be employed as packers in those stores?—Yes, I think it would afford a great opening for the employment of blind women. I think that is what they would do neatly and well.

15,649. Do you think that the managers of these central stores should endeavour to find out new occupations and employments for the blind?—No, I think that should be left to others.

15,650. Who is to do that?—Some persons devoting themselves to that work expressly.

15,651. Who is to pay them?—It would have to be done in the same way as all such work is done now.

15,652. You mean there is an opening for a new charitable agency in that direction?—Yes; I think the whole matter would be very much better if there were not so many things clashing together.

Mr. John Henderson examined.

Mr. J. Henderson.

15,653. (*Chairman.*) You have been connected with the Mission to the Deaf and Dumb at Glasgow for some years, have you not?—For about eight years.

15,654. Have you any accurate knowledge as to the number of deaf and dumb that there are in your district?—In Glasgow and the district there are about 390.

15,655. Can you state whether the Census Returns are accurate as to the deaf and dumb in your district?—It is very difficult to decide within a few up and down, because there are changes in the population sometimes; but I should say that the Census Returns are generally accurate.

15,656. Your duty is to visit those 390 deaf and dumb persons from time to time at their own homes?—Yes.

15,657. How often, as a rule, do you visit each individual—that is to say, how long does your circuit take?—My work is of such a very practical nature and so widespread, there being so many deaf and dumb persons, that a great deal of time is taken up in visiting them—some of them perhaps a great many times in the course of the year, and some of them perhaps only once a year.

15,658. Then do you gather them together in different places for religious services or secular meetings?

Mr. J. Henderson.

29 Jan. 1887.

—We have Sabbath services and prayer-meetings regularly at Glasgow, also a number of secular meetings.

15,659. Are they sign and finger services?—Entirely sign and finger services. We have two services on the Sabbath at 11 o'clock and 2 o'clock, and one service at night for children at the institution at Glasgow. We have a prayer-meeting every Wednesday.

15,660. Then you are at Glasgow every Sunday?—I am, except when some one takes my place, allowing me to go to Hamilton or to Paisley, where we also have halls specially for the deaf and dumb.

15,661. As a rule, do you find that the deaf and dumb are fairly educated?—I find them fairly well educated.

15,662. Are they mostly earning their own living?—In Glasgow we have only two out of the whole number of deaf and dumb who are receiving any permanent relief—that is to say, from a parochial board.

15,663. After they leave school, do you assist in finding situations for them?—I find situations, I may say, for all of those who like to remain, after they leave school, in Glasgow or the district. As a rule, the parents do little in that way, but hand them over to me.

15,664. Are you aware of any similar machinery for the blind?—I am not particularly acquainted with the work of the blind in Glasgow.

15,665. Have you any blind deaf-and-dumb?—We have three entirely deaf, dumb, and blind, and five semi-deaf, dumb, and blind; they are not totally deaf or blind.

15,666. Do you look after those persons, or do those who look after the blind look after them?—Those who are thoroughly deaf and dumb, as well as blind, I look after, and the officials of the Blind Asylum also pay them visits and attend to them.

15,667. Are you often required to act for them in any way—as interpreter in any business that they have to do?—Yes, very frequently.

15,668. Do any of those whom you visit speak orally?—There are a number of them in Glasgow who speak orally, who have been taught at oral schools, and also taught orally by Mr. Thomson at the institution.

15,669. Are you able to speak to them orally, or do you use signs to them?—I can speak to them quite well, and they speak to me.

15,670. But do you speak to them orally?—I do speak to them when they are alone with me, several of them.

15,671. Without signs or finger alphabet?—Without signs to some of them.

15,672. And then you can make yourself understood by them?—Quite so.

15,673. And you think that, where there is capacity to speak, it is a great advantage that they should be taught to speak?—A very great advantage.

15,674. Do you find that they are able to lip read generally?—There are a few in Glasgow who can converse with me so freely that we can walk down the street together in an ordinary way, the conversation going on without any signs or fingers.

15,675. When they leave the Institution for the Deaf and Dumb, what knowledge have they, as a rule, of any trade or industrial occupation?—I seldom, if ever, find that they have a knowledge of any trade; there is no trade taught in the Glasgow Institution, which the majority of them come from.

15,676. Do you think that that is an omission which ought to be supplied, or do you think it better for them not to have any industrial training at the institution?—My opinion is that it is better that they should have no such training until after they leave school.

15,677. Are they apprenticed to a regular trade?—They are apprenticed to a regular trade, just as hearing people would be.

15,678. And there is no difficulty in finding situations for them?—I experience no difficulty in finding situations for them. I do not know whether Glasgow is an exception or not, but they have a good education and careful training at the institution; and masters, I find, are very glad to get them. The proof of this is the fact that in Glasgow there are several employers who have three, four, five, and six deaf and dumb persons in their employment, the second being taken on because the first gave satisfaction, and so on.

15,679. I suppose that the trades that the deaf and dumb are employed in are trades in which written instructions are easily given, and frequent verbal communications not necessary; is that so?—There are about 30 different trades in Glasgow that they are employed in. I have a list of them, which I am prepared to give you, if you desire it.

15,680. Would you read them out?—Lithographers, 14; glass-stainers, 2; bookbinders, 10; tailors, 5; masons, 4; blacksmiths, 2; sculptors, 3; carvers, 6; carpet-designers, 3; draughtsmen in a shipyard, 2; shoemakers, 3; carpenters, 3; boat-builders, 15 (this is accounted for by the fact of there being so much shipbuilding on the Clyde); compositors, 5; bakers, 3; ticket-writers, 2; artists, 3; designers and engravers, 6. There are females employed as millworkers, domestic servants, French-polishers, and so on, but I have not the exact number of them. I may mention that at some of the trades the masters tell me that the deaf and dumb are the finest workmen that they have. At the present moment we have some bookbinders who have done work for her Majesty the Queen, the Princess of Wales, and the Duke of Argyll, who have finished the book for those persons, so pleased were they with the work. Several of the lithographers are among the best in the City.

15,681. From your general knowledge of the deaf and dumb, are there any suggestions that you would like to make with regard to their position or education in relation to State aid or compulsion?—With your lordship's kind permission, I would prefer not to say much about the work of educating the deaf and dumb. As I have to deal more with the results, I do not feel qualified to do so. I have not taught any for about nine years, and there have been so many changes since then.

15,682. (*Mr. Mundella.*) You have given us a list of deaf and dumb persons who are employed in highly skilled and lucrative trades, and you say that they very often prove themselves very superior workmen?—They do.

15,683. And you have also told us that with some of the deaf and dumb persons in Glasgow you make yourself very easily understood in conversation in passing along the street, and that they can communicate as freely to you and to their employers as ordinary persons, as though they were not deaf mutes?—I beg your pardon, I did not say that they communicate with their employers, I said they communicate with me. I am perhaps better able to speak to them than ordinary employers or fellow-workmen could. I can converse with them, and I consider that that is a good deal arising from the fact of my frequent intercourse with them, and my knowledge after sixteen years' experience amongst the deaf and dumb. I am not prepared to say that any of their employers can speak to them so freely as I can.

15,684. Is it not the fact that any person who will take pains to speak slowly, and to accentuate what he has to say, can readily make himself understood by a deaf and dumb person who has been orally trained properly?—Speaking from my experience, I should say that that was not the fact in all cases where they are taught orally.

15,685. Is that from the fact that they are defectively taught?—There is perhaps nothing defective in the system, but there are so many differences amongst themselves. Some of them attain to much greater proficiency than others, and that makes all the difference.

15,686. That is to say, where they have continued to be sufficiently well taught and sufficiently long taught

to become complete masters of the oral system?—If they had obtained sufficient proficiency they would be able to converse with anyone.

15,687. Do you not find that some of those persons attend public meetings and hear sermons, and can tell you all that they have heard almost as well as a person who is not a deaf mute?—In my experience I have met with none who can make anything of an ordinary discourse spoken orally, or a lecture of any kind. It may be so in other places, but it is certainly not so in Glasgow.

15,688. Where are those that you come in contact with in Glasgow orally trained?—They have been trained by Mr. Van Asch of London, by Mr. Barber of London, and by Mr. Thomson at the Glasgow Institution.

15,689. How long has oral training obtained at the Glasgow Institution?—Mr. Thomson, so far as I know, has devoted special attention to it for perhaps the last four or five years.

15,690. But do you know how many years a person requires to be orally trained to become thoroughly proficient?—I should say that it would require at least six or seven years.

15,691. (*Chairman.*) But if they can be orally trained so as to be able to express themselves freely and effectively, you think that that is a great advantage, do you not?—A very great advantage indeed; so great an advantage that I think that every child who is deaf should have at least a trial of being educated by the oral system.

15,692. (*Mr. Mundella.*) Can you tell us what they are doing with the poorest children in Glasgow and the district who are born deaf and dumb?—The moment they are admitted into the institution their education commences on the oral system.

15,693. At what age are they admitted to the Institution?—From the age of six to, I suppose, the age of 14.

15,694. Does the Glasgow School Board enforce the education of the deaf and dumb children?—The School Board officer brings the cases of the deaf and dumb children under the notice of either myself as missionary, or of Mr. Thomson, the principal of the institution. Of course, I am not connected with the education of the deaf and dumb.

15,695. But you are of opinion that if their mental education is thorough and well done, if they are then apprenticed or taught a trade, there is no reason why deaf and dumb persons should not earn their living just as well as any other persons?—Quite as well.

15,696. They are practically, after the great difficulty of their education has been got over, under no disadvantages whatever as compared with other persons?—They are not. I find it often the case that one or more of the deaf and dumb in a family are in employment, while perhaps a brother or sister who can hear and speak, if trade happens to be dull, is unemployed.

15,697. And very often the deaf and dumb are more proficient in their particular department, owing to their habits of concentration, than persons who are gifted with hearing and speech?—I find it so repeatedly in Glasgow.

15,698. You would advocate, as I understand, the most efficient training that can possibly be given to a deaf and dumb child from its sixth year until its education is perfected and completed?—I would, under whatever system is found to be the most judicious and profitable.

15,699. And any assistance that you would give from the State should be given to encourage excellent training?—Exactly.

15,700. And after that would you put them on their own resources?—Yes; in addition, however, I think that there should be some means whereby the deaf and dumb, after they leave school in the ordinary way as they do at present, should have an opportunity of improving themselves in the way of education. There should be schools of some kind established for adults.

Mr. J. Henderson.

29 Jan. 1887.

15,701. (*Chairman.*) Do you mean night-schools?—Night-schools would do very well. I should say that a night-school would be a very judicious thing to have for the benefit of the deaf and dumb.

15,702. (*Mr. Mundella.*) But if they get good oral training and become proficient, they can then get education in the ordinary way as other adults do who have completed their education?—A few of them might, but certainly the majority, so far as my experience goes, would not. They would require a special teacher for themselves.

15,703. I gather from the trades you have mentioned that a good many of them are artistic trades and trades of a sedentary character, in which separate working can be carried on, such as lithographers, engravers, and carpet-designers?—Yes.

15,704. And can complete the work himself?—Yes.

15,705. And there are somewhere about thirty trades you say which are open to the deaf and dumb in your own district?—Yes, in my own district alone. As Mr. Mundella has referred to the lip system, I may say that I have here with me what I think is the best proof of the result of the oral system as compared with the other system. I took the precaution before coming here to pick out two or three of the best orally educated deaf that we have in Glasgow and say to them, "Now, "you have had five or six years' experience in the world "since you left school; what is your opinion about the "oral system of education or the sign and finger system?" and they each sent me a short note in reply.

15,706. Would you kindly read those notes?—Yes; I also have here a letter which I have cut out of the newspaper from the father of a deaf and dumb lad who was at considerable expense in the education of his son in London.

15,707. (*Rev. Mr. Owen.*) Are you referring to Mr. Foster?—I am. He is a most intelligent gentleman, in a very good position. His son, Mr. Joseph Foster, writes thus:—

"In compliance with your request, I have much "pleasure in giving my views and experience of both "the oral and finger systems. I was taught under the "former system by Mr. Van Asch, and have found it a "great blessing; by this means I am enabled to speak "to my friends and to understand what they say, though "not always. I have also found the finger system "very advantageous for the purposes of Sabbath ser-"vices, lectures, social meetings, &c., which under the "other system I consider to be impossible. In short, "after my experiences of them both for the last six "years, I consider it best that deaf mutes should have "the benefit of both systems. As to the mode of teach-"ing to be carried out at deaf mute schools, I do not "feel competent to give any advice; but one thing is "clear, that is, that the oral system should by all "means be taught. I may add that if I had to choose "which of the systems to be taught under, I should "decidedly prefer the finger system; but I am very "glad that no such necessity had arisen, for I prize the "blessings of the oral system very much."

15,708. (*Chairman.*) Can you tell me how long the writer of that letter was under training in the oral system?—So far as I know, I think he was under training between four and five years.

15,709. He did not begin at six or seven years of age and go on until he was sixteen or seventeen years of age?—No; the three cases that I am giving are the three best specimens of orally-taught pupils I have ever met. The next letter is as follows:—

"In regard to your question as to the advisability of "the oral system, which is at present not only a subject "of great controversy throughout the United Kingdom "but is being inquired into by a Royal Commission "appointed for that purpose, I beg to state that I was "taught that system for seven years in London. I find "it convenient in the family circle and among friends

Mr. J. Henderson. 29 Jan. 1887.

"that are accustomed to my company. For business "purposes in this busy world it is not of much use, and "at Sabbath services, lectures, meetings, &c., &c., *it is "of no use whatever*. I now find the finger and sign "language a great help in some ways, as talking with "those who have not been taught the oral system, &c., "&c. This opinion is shared by my former school-"fellows, and we also consider it as an accomplishment "only which can be of use to a few but not many."

The third letter is as follows:—

"I was educated by Mr. Van Asch in the oral "system, and consider it in a general way much "superior to the finger. But for church I consider "the finger system the best, as it can be seen at some "distance from the speaker, and can be seen by many "at the same time, whereas by the oral system each "individual would require to be addressed."

15,710. Can you give us the number of years that those persons were under training?—Except in one case, the letters state the number of years.

15,711. I have never yet found but one young man who has had a thorough training in the oral system in England whose training began early enough?—Mr. Foster speaks uncommonly well.

15,712. (*Admiral Sir E. Sotheby.*) Speaking from your long experience, will you be good enough to say whether you are of the same opinion respecting the oral system as the gentlemen who have written these letters?—One of them speaks, I should say, rather strongly; they are not all the same. I would go a little beyond one of them, but I would scarcely go so far as the other.

15,713. I see that you conduct your service in the finger and sign language?—Entirely.

15,714. In course of time do you propose to conduct it on the oral system, when the deaf and dumb in Glasgow are more advanced in that system?—Such a time may come, but I do not at all think so.

15,715. You do not anticipate such a time coming?—No, I do not. As a proof of this, I may mention a practical illustration, which I think is forcible, that last week I had the Rev. Dr. Fergus Fergusson, of Glasgow, giving an address to my members in a temperance lecture. Two deaf mutes, who have been taught orally and who can understand me speaking to them quite near them, were seated right in front of the doctor, who had taken a little interest in the education of the deaf and dumb. At the close of the lecture he asked whether there were any present who had been taught by the oral system, and I told him that there were two seated just before him. "Did "they know every word I said?" he asked. I was obliged to tell him that they never thought of looking at him or his lips, because they could understand what was said so much better from the sign and finger language into which I interpreted it. He spoke and I interpreted. Either of those persons might have been perfectly able to understand Dr. Fergusson if he had been down on the same level as themselves and speaking to them very carefully and slowly, but they would not understand him giving a lecture as a hearing person would understand him in the ordinary way.

15,716. (*Mr. Arrol.*) Amongst the 390 deaf and dumb persons in Glasgow and the district do you find that there are any attending ordinary classes in the evening?—There are none of them at present attending classes in the evening to my knowledge.

15,717. Do they not attend ambulance classes or any classes of that nature?—We had last year an ambulance class for the deaf and dumb at which about 25 were taught and examined, and they all passed and obtained certificates. This teaching and examining was all done in the sign and finger language. The medical man who was present spoke; in fact, he taught me and then I taught them.

15,718. It was a separate class for them, and they did not associate with the hearing?—They did not.

15,719. Do you find that out of those 390 there are many who have intermarried?—We have 59 married deaf and dumb couples in Glasgow.

15,720. Do you think that it is for their domestic comfort that the deaf and dumb should intermarry?—I should say that it was for their domestic comfort, although it has its disadvantges of course from the fact that the children suffer a little from the parents being deaf and dumb.

15,721. (*Mr. St. John Ackers.*) Do you know how many children, hearing and deaf, there are of deaf parents in your district?—Of the 59 married couples there are five who have one or more of the children deaf.

15,722. I did not ask that question; I asked how many children they had, hearing and deaf together; do you know the number of children that are born of those 59 deaf couples?—I have not calculated.

15,723. Because, of course, in order to get any valuable information as to the number that are born deaf you must ascertain how many in the families of deaf and dumb couples can hear, and how many are deaf, and also whether the parents are congenitally deaf, or whether they have become deaf from accident?—I shall be very happy to get those statistics for you, but I am not able to give them at the moment.

15,724. Are there many deaf persons in your district who have never received any education at any school?—In Glasgow and the district there are 11 who have passed the school age who are uneducated. They are all elderly people.

15,725. So far as your experience goes, do the deaf and dumb live to the same average age as hearing persons?—I am not prepared to answer that question with any degree of confidence. There are a number of them living to a good old age in Glasgow.

15,726. Do they suffer from any one particular form of disease more than another?—I find that a good many of them are afflicted with chest complaints and scrofula. Scrofulous diseases of various kinds are very prevalent among the children. It disappears very often in after years.

15,727. (*Rev. Mr. Sleight*). Do you find that the deaf and dumb who have been orally taught ever attend ordinary services, or do they always make a point of attending your service?—They may occasionally go with their friends to church, but I have attending my services regularly on the Sabbath those who have been taught orally, and now they are very glad and thankful that they can understand the sign and finger system.

15,728. If they have been taught orally how do they learn the sign and finger system?—From their intercourse with the deaf and dumb. Sometimes they have come to me, as Mr. Foster's parents did, and have said: "Mr. Henderson, my son has, I am afraid, fallen be-"tween two stools: he was at a *soirée* for the deaf "and dumb at which a great many hearing people were "present" (and I may tell you that we have a large *soirée* once a year, at which about 500 people are present), "and he could not understand what the "clergymen and others on the platform were saying; he "did not understand what was said from the sign and "finger system, and he went home very much vexed "and disappointed." Hence the anxiety of the lad himself, and his parents, to learn both systems.

15,729. I am quite ignorant of this case. Then you taught Mr. Foster's son?—I did not give him any special lessons, but I met him occasionally, and from watching the discourses that I gave them on the Sabbath, and at other meetings, he gradually came to have a knowledge of the sign and finger system.

15,730. Then in his case the oral method was a failure, so far as regards his being able to gather conversation from strangers, or to understand lectures and sermons?—It was, so far as regards lectures and sermons, but I should say that it was very far from being a failure in the lad's case; it is a very great advantage to him, and a very great pleasure to him.

When he comes to my house, or when we are taking a walk together, we always converse orally.

15,731. I did not say that it was a failure entirely; I asked you whether it was a failure as regards conversation with strangers and lectures and sermons?—Yes, that is so.

15,732. Do you find that the orally taught converse with each other orally, or do they resort to the manual alphabet?—I have seen them occasionally speaking to each other orally.

15,733. But do they make a practice of it?—I do not think they do.

15,734. I want merely to gather from you what use they make of the oral method amongst themselves in after life?—My experience is that they do speak to each other, but that they often have to resort to signs in order to get a full understanding of the conversation that is going on.

15,735. How do you find that the deaf and dumb, who have been taught on the sign and finger system, communicate with their fellow-workers and their employers?—Employers who have learnt the sign and finger system speak to them in that way. Those who have not learnt it write to them and in a general way, in nearly all cases, as life is short and business men have not much time, they adopt a system of signs.

15,736. (*Chairman.*) Natural signs?—Natural signs.

15,737. (*Rev. Mr. Sleight.*) Do you find that the deaf and dumb have any difficulty in making themselves understood in that way for the purposes of trade?—Of course they have more difficulty than hearing people, but they manage to get on. For the first week or two there is much more difficulty than there is with hearing people, but that is counterbalanced by the greater attention that they give to their work after they have been taught. So that, on the whole, before the apprenticeship is finished the master will say, "I have "not, on the whole, had more trouble with them than "with the hearing apprentices."

15,738. Then in your opinion, speaking from practical experience of the deaf and dumb after they leave school, you believe that the combined system is the best system upon which their education should be carried out?— I am not prepared to say that in every case.

15,739. For the majority of the deaf and dumb would you say it?—For the majority of the deaf and dumb I should say so.

15,740. (*Mr. Johnson.*) That is to say, if there was to be only one system, and you had to choose the system, you would choose the combined system?—If there was to be only one system, thinking of the welfare of the deaf and dumb as a whole, I should say that the combined system was the best.

15,741. Have you any experience as regards the causes of the deafness amongst this number of people that you have visited; in the great majority is the deafness congenital or is it from accident or disease?—I should say that, in many cases, it is from accident or disease, but in the majority of cases the deafness is congenital.

15,742. Has it been the result of scarlet fever sometimes?—Scarlet fever is a very common source of deafness; measles perhaps next; and after that in pretty equal proportions the various ailments that childhood is liable to.

15,743. The congenitally deaf are only a small proportion of the general body of deaf people?—Among the class of people usually termed deaf mutes the majority are congenitally so.

Mr. J. Henderson. 29 Jan. 1887.

15,744. Do you believe that, in educating persons on what is called the oral system, it is a necessity to isolate them from those pupils who are taught upon any other system?—As I explained before, I do not feel prepared to speak with any great confidence about the work of teaching the deaf and dumb. So far as my opinion and experience go, I should say that if a deaf child was found to be capable of being taught by the pure oral system you had better isolate it.

15,745. Then when you speak of the pure oral system you mean the pure oral system as defined in Germany—the German system?—I mean without the use of the fingers.

15,746. Without the use of the fingers or signs?—I am sorry to say that I have not yet been able to grasp how any deaf child could be taught without signs.

15,747. You do not think that even the oral system, in its purest form, could be taught without signs?—I think it is impossible.

15,748. (*Rev. Mr. Owen.*) You spoke of one or two orally taught, who could converse with you; were those born deaf, or were they semi-mute?—One of those three from whom I received those letters was born deaf; the other two were not born deaf.

15,749. Then two out of the three were not born deaf?—They were not. When you said "born deaf," I understood you to mean congenitally deaf. Mr. Foster might as well have been born deaf, because he was only a mere infant, about a year old, when he became deaf.

15,750. Speaking generaliy from your experience, are orally taught pupils, in their after life, as well informed as those who are taught on the manual or combined system?—In my experience I have found in Glasgow that those who have been taught by the sign and finger system have a greater amount of information and general knowledge than those who have been taught by the oral system.

15,751. Which class do you consider have a greater knowledge of language, and especially of written language, those taught on the combined system?—Those taught on the combined system have a greater knowledge of written language.

15,752. Have you made any special effort to ascertain from any large number of pupils which system they prefer, except those three whose letters you have quoted?—Those are the only three from whom I have specially asked a statement of that kind.

15,753. Have you reason to suppose that their views would be shared by the majority of the deaf and dumb—speaking generally?—I am sure that the great majority of the deaf and dumb would agree with those views.

15,754. (*Chairman.*) Are those, who were taught in London, the only ones that you know of, as having been taught in pure oral schools?—Yes, those who have been taught in London are the only ones I know of who have been taught on the pure oral system.

15,755. How many were those that were taught in London?—The three whom I referred to, and from whom I had letters, were educated in London. There is a school in Glasgow under Miss Griffiths who teaches by the oral system—she was taught by Mr. Van Asch—so that I understand that she teaches the pure oral system.

15,756. How many are taught by Miss Griffiths?—Seven or eight.

The witness withdrew.

Adjourned to Monday next at 12 o'clock.

6, Old Palace Yard, S.W.

Monday, 31st January 1887.

PRESENT:

THE RIGHT HON. THE LORD EGERTON OF TATTON IN THE CHAIR.

ADMIRAL SIR E. SOTHEBY, K.C.B.
W. TINDAL ROBERTSON, ESQ., M.D., M.P.
B. ST. JOHN ACKERS, ESQ.
T. R. ARMITAGE, ESQ., M.D.
W. AUCHINCLOSS ARROL, ESQ.
F. J. CAMPBELL, ESQ., LL.D.
E. C. JOHNSON, ESQ.
ROBERT MCDONNELL, ESQ., M.D., F.R.S.
CHARLES FEW, ESQ.
WILLIAM WOODALL, ESQ., M.P.
The REV. CHARLES MANSFIELD OWEN, M.A.
CHARLES E. D. BLACK, ESQ., *Secretary.*

Mr. JOHN HENDERSON further examined.

Mr. J. Henderson. 31 Jan. 1887.

15,757. (*Chairman.*) You spoke of having had some educational experience in former years; how many years were you a teacher at Donaldson's Hospital?—About six and a half years.

15,758. During that time what system was in use in the hospital?—The pupils were taught entirely by the sign and finger system. When I first went, there was a slight attempt at teaching them by the oral method, but to a very slight extent indeed; shortly afterwards even that was abandoned.

15,759. Were there any pupils when you were there who had remnants of hearing or speech which might have been developed if they had been put under oral instruction?—Yes, there were children who might have been helped very much by oral instruction, whose speaking powers might have been not only retained, but improved.

15,760. If they could have been retained, of course they must have had some speech?—Yes, they would have lost their hearing, perhaps, at four or five years of age.

15,761. To your knowledge they were not taught to speak?—They were not taught to speak.

15,762. (*Mr. St. John Ackers.*) To your knowledge were there any who, coming in with speech, lost that speech altogether?—Yes.

15,763. In what length of time did they lose their speech?—They began to lose it gradually, and after perhaps three or four years it would entirely disappear.

15,764. Do you know whether the parents of any of those children were unhappy and disappointed at finding that their speech was going?—I have no doubt that they would be somewhat vexed at finding that some words that they might have been able to speak at home had been lost, but I never knew of any case where the parents expressed any wish that the child should be taught by the oral system; they were very much pleased with the education they had received, and the amount of knowledge that had been conveyed to them. Their education was very carefully attended to, and some excellent pupils were turned out by the sign and manual system.

15,765. Have you ever noticed that parents, on visiting their children, were distressed to find that their speech had gone, or that certain words had gone?—I have noticed occasionally that a mother would feel a little vexed that her daughter had forgotten the way to pronounce the name of some little brother or sister.

15,766. If you had to begin your teaching life there again, would you consider it desirable to continue the system that was then adopted, or would you desire that the speech of those that had speech should be kept up?—I would most assuredly endeavour to keep it up. I think that a fair trial of the oral system should be made in the case of every pupil admitted.

Mr. THOMAS STODDART examined.

Mr. T. Stoddart.

15,767. (*Chairman.*) You are Superintendent of the Glasgow Asylum for the Blind?—I am.

15,768. At your institution, since we visited it, there has been a fire?—Yes.

15,769. Has the cause of the fire been ascertained?—As far as we can ascertain, it was through one of our semi-blind people dropping a light close to where a quantity of hemp was stored.

15,770. Was there any sighted supervision in the room?—It happened in the morning. The gaslight just adjoined the hoist. It was this man's duty to light it, and I think he accidentally dropped the match with which he lit it; at least that is the supposition.

15,771. Has your committee made any inquiry with a view to ascertain the actual cause of the fire?—They made inquiry at the time, but that is the supposition which they arrived at. The man himself thinks he put the light into the fire-bucket provided for it.

15,772. Did not they find out what he had done?—It was not quite clear; but that was the supposition that they arrived at.

15,773. With regard to the industrial training of the blind, how soon do you think that it should commence?—At about 15 years of age.

15,774. Do you think it should be in connection with the institution they are in or outside it?—I think it ought to be inside the institution.

15,775. Is there any difficulty in getting the blind out as apprentices?—Great difficulty exists in getting blind apprentices into sighted shops.

15,776. Do you think it advisable that they should be trained in certain trades before they go out as apprentices?—I think they ought to go into the workshops for the blind precisely the same as sighted apprentices would go into an ordinary sighted shop to learn a trade.

15,777. Would not you before the age of 15 give them any training, so as to teach them how to use their hands?—I think it would be advisable. Kindergarten ought to be taught in the school.

15,778. Not only in the infant class, but throughout the school?—Throughout the school.

15,779. Do you think that a wider field of employment might be opened for the blind?—Undoubtedly.

15,780. How would you attain that?—I have brought a model to show you a branch of industry that has been introduced and developed in our institution within the last year or so—the making of wire mattresses (*producing a model*). Then we have introduced hassock-making, which has answered very well.

15,781. Is the wire mattress-making a profitable trade?—It is a very profitable trade.

15,782. That, I suppose, would be a suitable trade for adult blind, and for women as well as men?—Yes, women's work is associated with it in polishing the frames.

15,783. Do you think it desirable that a special committee should be constituted to assist blind institutions generally, in finding work for them and finding new avenues of trade for them?—Whatever would tend to dispose of the work made by the blind in quantity I would approve of.

15,784. Do you think that there should be depots for the display and sale of goods made by the blind?—That is of immense importance in carrying on the institutions successfully.

15,785. Would you have central depots, fed by the various blind institutions, or would you prefer that each large institution should have a shop in the town for the sale of the articles produced in the institution?—I think that workshops for the blind should be established in all the large centres of population.

15,786. In connection with some institution, or independent of any institution?—There should be an institution and a sale-shop combined, in a central position in the large centres of population.

15,787. What percentage of the blind are capable of learning a trade?—I am not quite in a position to say that, as it is only those who are supposed to be capable of learning a trade that come to our institution, and whom I come in contact with.

15,788. You cannot speak of the teaching of music as an employment for the blind?—No.

15,789. Do you think that for the generality of the blind industrial trades are a more sure means of livelihood than music?—I think so. I think industrial occupations are the surest means of employment for the majority of blind people.

15,790. I suppose it is of advantage for a blind person, whatever profession or trade he takes up, to have as good an education as he can get?—As far as the people who pass on from the school to the workshops are concerned, an ordinary education, such as is required by the Government inspector, according to the Scotch Code, is quite sufficient; that is, up to the sixth standard.

15,791. Do you think that there should be skilled inspection of the blind schools, and that those schools should receive Government assistance?—I think there should be Government assistance, as far as pure industrial training is concerned.

15,792. And, I suppose, for education as well?—Yes, ordinary education as well.

15,793. In proportion to the expense of the education of the blind?—Yes.

15,794. Have you thought of any figure which the Government might be fairly expected to give?—I think £20 per annum would be necessary.

15,795. For teaching only?—For the teaching of the blind, if it was conducted economically.

15,796. Do you think that the blind are better educated in an institution?—No. I think it is advisable, where blind children have intelligent parents, that they should be educated, if possible, at the ordinary board schools; but there are, unfortunately, a number of blind children whose parents are dissolute, and many who are illegitimate, and they are not properly cared for; perhaps it would be well to provide a home for such. Of course the number of such cases would be comparatively small. I speak as regards Scotland.

15,797. With regard to the opinion of the working-men in Scotland, we found that the opinion of the working-men was generally in favour of their children not being sent to institutions, but being sent to board schools; is that an opinion which is largely shared by the blind?—Yes; I think so. Before leaving on Saturday I had a meeting with several representatives of our institution, and they quite shared the opinion with me, that one home possibly would be necessary in Scotland for that particular class of children which I refer to, and that the others might be sent to Board schools.

Mr. T. Stoddart. 31 Jan. 1887.

15,798. If you are going to do away with the training of the young in institutions, to what are the funds of the institutions to be devoted?—We would still have the industrial training of the young.

15,799. After they left their Board school?—Yes.

15,800. Instead of devoting the funds of the institutions to education pure and simple, they would be devoted to industrial education after the children left school—that is the view of those who had a conference with you before you left Scotland?—Yes.

15,801. Do you think that that would be practicable?—Yes.

15,802. You would only have one institution for the whole of Scotland, for those cases where, from debility or other causes, the children are not able to go to a board school?—Yes, it would simply take the place of an orphanage. Orphanages are provided for destitute sighted children, and it might be called an orphanage for blind children.

15,803. You have between 30 and 40 children in the school, have you not?—Thirty-one is the number.

15,804. What proportion of that number do you think were capable of being educated at a board school?—About one-fourth of that number.

15,805. With regard to the employment of the sighted with the blind, do you think that, economically, that is desirable?—I think so.

15,806. There is a great deal of jealousy, is there not, amongst the blind at having what they considered too many sighted workmen with them?—There is a little feeling, but the principal difficulty that we have to contend with is with the ordinary employers of sighted labour, who are carrying on the same business as we are in the institution.

15,807. Do you think that these workshops should be carried on not so much on charitable as on commercial principles?—Undoubtedly they should be carried on on commercial principles.

15,808. And that, as far as possible, subsidies should be avoided; that is to say, that each man should get his earnings, and that they should not be supplemented to any great extent?—Certainly.

15,809. Of course there may be cases where, from ill health, a man is not able to earn his livelihood; in those cases you would have to supplement his wages?—Yes, that is the rule upon which we go in our institution.

15,810. Do you think it would be possible to allow any of the working blind to take part in the management of any of these institutions?—Since I went to the institution I have appointed a blind foreman, who does remarkably well.

15,811. Does he have any control in the management of the institution under you?—Yes, he has control of his particular department, the brush department.

15,812. Do you think that the blind would be able to do more than that; would you think it desirable to put one or more of them on the governing body of the institution?—It is questionable whether it would be any advantage.

15,813. Is there any feeling among the blind that their interests are not well looked after by the committees of the different blind institutions in Scotland?—That is my experience; but that, in a great measure, has been got over.

15,814. There was that dissatisfaction?—Yes.

15,815. And you think that has been got over?—In a great measure in our institution. In our institution particularly some friction was caused through a deduction of ten per cent. off the wages of our workmen. There is a probability that very soon that deduction will no longer be made.

Mr. T. Stoddart.

31 Jan. 1887.

15,816. Was that a deduction from the wages of some of the workmen for the benefit of those who could not earn as much as the others?—No. It was before my time; but I understood that the deduction was made because the industries were not paying so well as the management expected; and also with a view to reduce the expenditure, as far as possible, as at that time, through elaborate buildings, the funds were low.

15,817. As to Government contracts, have you any suggestions to offer to the Commission with regard to the relation between those institutions which do industrial work and the Imperial Government as regards contracts?—In carrying on an institution such as ours we are met with a difficulty which ordinary employers of labour have not to encounter. An ordinary employer of labour during a time of depression simply pays off his hands—he reduces the production—we cannot very well do that; we must keep our people in constant employment, or give them sufficient to maintain themselves. I think that the Government might materially aid the institutions by giving them particular classes of work that blind people can very well do—basket-making, for instance.

15,818. Do not the blind institutions have a certain amount of favour shown to them?—I do not think so. We compete precisely on the same lines as an ordinary sighted establishment.

15,819. Have you had any Government contracts?—Yes; we have made a great many baskets for the parcels post.

15,820. Have those contracts been by open tender?—Yes, we simply got them, I understand, because we quoted the lowest price.

15,821. Are the directors of your institution connected in business with any of the trades that are carried on in your institution, or do you know of any directors of blind institutions who are so?—Not now, but last year we had a director who was a brush manufacturer; he retired at the last election.

15,822. Do you think that it is undesirable that any one connected with an industry carried on in the institution should be on the board?—I do not think it is desirable.

15,823. That is a thing that does not often occur, I presume?—I understand that in the history of our institution it has occurred on several occasions.

15,824. Of course, even if the institution did not suffer there might be a feeling that it might suffer?—Yes, even though the gentleman was actuated by the best motives there would be a feeling that it was not desirable.

15,825. With regard to adults working in your institution do you think that they should not be admitted beyond a certain age?—I do not think that they should be admitted, as a rule, beyond 40 years of age.

15,826. Then what do you think should be done with the blind beyond that age—those who become blind in after life, and who are infirm; have you any views with regard to provision for the aged blind?—I think that provision ought to be made for the aged blind.

15,827. By whom?—Perhaps by a consolidation of the funds at present available for the blind throughout the country.

15,828. There are no pensions I understand, practically, in Scotland?—No.

15,829. The only provision for the blind in Scotland is that provided by the parochial boards.—Blind people as a rule show great repugnance to parochial relief.

15,830. Do you think it would be desirable that the aged blind should be placed in the same position as others or in a more favourable position?—We have in Glasgow a home for aged men and women. The kind of stigma that attaches itself to people in receipt of parochial relief does not attach itself to the inmates of that home. I think that something of that kind might be done for the blind, because blindness is altogether apart from poverty brought on through improvidence.

15,831. Do you think that they should be provided for entirely by voluntary subscriptions, or that the guardians might fairly be asked to provide more favourable quarters for them, quarters apart from the ordinary poor?—I think it would be well to dissociate such provision for the aged blind altogether from the Poor Law authorities, but the rates might contribute towards it to the same amount as if those people were actually in the poor house, and voluntary aid might do the rest.

15,832. Private benevolence might provide the buildings, if the parochial Boards would give a grant in aid of the inmates of those institutions?—Yes, I think something might be arranged on those lines.

15,833. (*Mr. Few.*) You advocate the establishment of workshops in connection with institutions in large towns?—Yes.

15,834. Then, of course, if the workshops were established in the towns, the men or women who worked in them would have to go there daily?—They would.

15,835. And those workshops would not, therefore, be available to those who lived a considerable distance off?—Our institution is situated in an out-of-the-way place in Glasgow, and we have blind persons who come long distances to our institution. I do not think that that would be a disadvantage. We have people who come regularly a distance of from two to three miles every morning to work at our institution.

15,836. There must be a limit of distance?—Yes. I would strongly advise that the number of workshops should be increased, and the people who had to gain their bread at those workshops would gradually gravitate towards them, and take up their residences within a reasonable distance of those workshops.

15,837. (*Mr. Johnson.*) You have 114 blind persons in the workshops now; have they all been taught their trades in your institution?—Yes, they have all been taught their trades in the institution.

15,838. Do you admit any blind person who applies for work?—They are only admitted when there is room.

15,839. You take in men who are proficient in their trade who have been taught elsewhere?—There have been none taken in since I joined.

15,840. But it was formerly the custom, was it not?—No; I think it has always been the rule to teach people their trades in our institution.

15,841. I understand you have lately introduced wire mattress work, and I saw with great pleasure when we were at Glasgow, that you had also a large manufacture of articles made with wire, such as sieves?—Yes.

15,842. Do you find that is a profitable occupation?—Yes.

15,843 About what are the earnings of an ordinary skilled workman in that trade?—About 15*s.* a week.

15,844. And the lowest?—The lowest would be about 10*s.* a week.

15,845. Does that trade require a long term of apprenticeship to learn it?—Five years.

15,846. I suppose it takes the longest time almost of any trade?—No, basket-making takes longer.

15,847. How long does it take to teach an apprentice to make a perfect basket?—Six years.

15,848. Do you find that the two retail shops you have got are sufficient to dispose of your surplus stock?—Not nearly.

15,849. What efforts do you make to get rid of your surplus stock?—We endeavour to get rid of it by means of travellers, by the agencies put forth by an ordinary concern.

15,850. Do you find that travellers answer?—Yes.

15,851. Are you aware that some blind people in Scotland receive pensions from the London Societies?—No, I am not aware of that.

15,852. I may tell you that there are several Scotchmen who do receive pensions from London Societies; you do not know that of your own knowledge?—No.

15,853. (*Rev. Mr. Owen.*) You have three deaf and dumb men employed in your institution?—Yes.

15,854. Do they earn enough to keep themselves?—No.

15,855. How much do they earn?—Their average earnings, I think, are about 7*s.* per week; they are blind as well as deaf and dumb—at least they are not totally blind, but practically blind.

15,856. (*Mr. Woodall.*) You have expressed a definite opinion that it would be better for blind children of intelligent parents to be taught in the ordinary Board schools?—Yes.

15,857. As a matter of fact are they so taught at present?—I understand so.

15,858. You have stated that you think that such children ought to reach the sixth standard?—They must pass the sixth standard in our school before they are passed out into the workshops; that is the standard of our resident school.

15,859. As a matter of fact, are we to understand that the children taught in your ordinary school are examined in a standard equivalent to that of the Government sixth standard?—Yes, I understand that is the case; the same examiner, Dr. Kerr, who examines our children, examines the children in the ordinary sighted schools.

15,860. Then do you obtain result payments from the Government, as if the children were taught in an elementary school?—Yes.

15,861. But notwithstanding that fact, you think it would be better for the children if they were associated with ordinary sighted children in Board schools?—I think it would.

15,862. (*Dr. Armitage.*) You told us that you thought that the technical training of the pupils ought not to begin till they were of the age of 15; do you think that if any light work was introduced, like making straw envelopes for bottles, it would be desirable to begin at an earlier age?—I do not think so.

15,863. Do you fix the limit of age at 15 in order to give the children more time for literary training?—As a rule the limit of age for ordinary education is considered to be 15, and my reason for saying 15 is that I think it is a very good age for blind children to enter workshops as apprentices.

15,864. Do not you think it desirable that blind children, before they actually begin work at a particular trade as apprentices, should be taught the use of their hands in other things?—Undoubtedly, I think it would be a great advantage if Kindergarten was taught in the schools associated with their ordinary lessons.

15,865. You think it would be desirable to give them a knowledge of carpentering for instance,—in fact, to teach them the use of their hands?—Undoubtedly; whatever would aid them when they came into the workshops, I would certainly approve of.

15,866. Do you teach carpentering?—No, but Kindergarten work and making little baskets, and beadwork, and sewing.

15,867. What I was putting to you was this: whether, before actually becoming apprenticed to a trade, you think it would be desirable that the children should pass from mere Kindergarten work to some technical occupation like carpentering, or some occupation in which they would learn the use of their hands before actually entering the workshops?—It might be an advantage, but I do not think it is absolutely necessary as a rule.

15,868. Perhaps you have not fully considered that question?—I have not fully considered it.

15,869. Can you suggest anything to us by which Government contracts might be more easily obtained by blind institutions?—The only suggestion that I would make regarding that is that the Government might be a little partial to institutions for the blind.

Mr. T. Stoddart.

31 Jan. 1887.

15,870. Can you suggest any definite way in which that partiality might be shown?—I cannot suggest any definite way unless that in the event of a tender given in by an institution for the blind being a little higher than a tender from an ordinary sighted establishment, the Government might show a little preference to the institution.

15,871. You would not suggest that the goods should be supplied to the Government by any other mode than by tender?—I do not think the Government would take them in any other way.

15,872. With regard to a home for aged blind men and women, do you think it would be better to establish an asylum in which only old blind men and women were received, or do you think it would be preferable to have the blind associated with the seeing, under like circumstances?—I think it would be better to have the blind associated with the seeing if it could be managed; but a short time ago I made application on behalf of one of our own aged blind, for admission into the Old Man's Home, which is a benevolent institution in Glasgow, and the answer given was that they did not care about taking blind people into the Old Man's Home,—so possibly there might be a difficulty in the way of having a mixed home.

15,873. I understand that you propose that a home for aged blind men and women should be established, because there is a difficulty in getting blind men and women into existing homes for old people?—Yes.

15,874. If the objection which you say was raised in the case to which you refer could be got over, and the blind could be received in an almshouse, to which sighted people were admitted, you think that would be a better plan?—I think it would be a better plan if they were associated with the sighted.

15,875. (*Dr. Campbell.*) Supposing instead of having a home for aged blind men and women, the authorities could be induced to let them live with families, paying so much a week for them, do not you think that would be a better plan?—Yes, I am sure the blind people would favour that themselves, but I fear that the amount that parochial boards would allow would not be sufficient to keep them in that way.

15,876. Putting aside for a moment the question of expense, it would be far better for the blind, and they would be far happier if that mode of providing for them were adopted?—Yes, no doubt.

15,877. Are you aware that that is done in some parts of the world?—I am not aware that it is.

15,878. You are not aware that in America the authorities place blind people in families in that way, paying so much for them?—I am not aware of that.

15,879. (*Chairman.*) Would the amount which it costs the parochial boards now to maintain a blind person be sufficient to induce people to take blind persons into their homes and board and lodge them?—I do not think so. The cost for maintenance per head in the poorhouse is about 4*s.* 6*d.* a week; I do not think that would be sufficient to induce people outside to take blind persons into their homes.

15,880. (*Dr. Campbell.*) If the guardians would allow a sufficient amount to induce private persons to take blind men or women into their homes, that would be better for the blind persons?—Undoubtedly.

15,881. One or two questions with regard to technical training: Do not you think it would be an advantage to introduce into the school something in advance of Kindergarten work in the way of training the children in the use of all kinds of tools; do not you think that children so trained would be more skilful when they came to the shop as apprentices?—I should say that that would be an advantage, but I fear the cost would be too much.

Mr. T. Stoddart.

31 Jan. 1887.

15,882. It has been done in some places very successfully; if it could be done you think it would be advantageous?—Certainly it would.

15,883. With regard to this fire that occurred at your institution, was the partially blind man who had to light that gas in the habit of smoking?—No.

15,884. (*Mr. Arrol.*) Are you aware that the parochial boards in Scotland board young persons out at the rate of 7*s.* 6*d.* a week?—Yes, I know parochial boards have done so in some cases, I cannot speak to the amount that they allow.

15,885. Do not you think they might be asked to place aged blind people in private families in the same way?—The difficulty would be in cases where blind people were married.

15,886. In answer to the Chairman you stated that one fourth of your present pupils might have been educated at Board schools; what may be the reason why they have not been sent to Board Schools? In some cases because their parents are of opinion that a more thorough training is to be had at an institution; in other cases their homes are in the country and not convenient to Board Schools; the latter are in consequence under the necessity of being placed in an institution as well as orphans, children of the dissolute.

15,887. Then you recommended that a home should be established for those unfortunate children; would you recommend that at that home some one should be appointed to take charge of them and see that they went to a Board school for education?—Yes, if it could be done as economically.

15,888. (*Chairman.*) There are, are there not, some children who, besides the circumstances you have mentioned, would be prevented from going to the Board school from physical infirmities?—Yes, there are some of that class.

15,889. (*Mr. Arrol.*) You recommend that the blind when learning a trade should have some assistance given them; would you be disposed to recommend that all parochial boards should be authorised to pay a certain sum to an individual while he was learning his trade, till he had acquired a thorough knowledge of it?—That is of the utmost importance, particularly in the case of adult blind persons, who in many cases have dependents, I think it would be well that they should have a substantial grant during the time they were learning their trade.

15,890. Paid to them by the parochial boards?—Yes.

15,891. If you would recommend that for those who are being trained, would you recommend that the parochial boards should be empowered to give the industrious blind any assistance in after life—not only when they were beyond work, but while they were capable of working?—No; I think any assistance that is necessary ought to come from benevolent sources.

15,892. You stated that the wages of your workmen had been reduced some 10 per cent.; what may your success have been last year, financially?—We had a profit last year of 404*l.* 7*s.* 3*d.*

15,893. What may have have been the amount of wages paid last year?—Pure wages 2,341*l.* 4*s.* 2*d.*

15,894. So that, if you had reinstated your men on full pay, you would still have had a profit?—We would still have had a profit.

15,895. What was the financial condition of the institution before?—It has been very unsatisfactory for the last twelve years.

15,896. Can you give the Commission any reason for the success which attended you last year?—I think it was due to reducing the number employed at unprofitable occupations, and to the introduction of new industries suited to the blind, bearing in mind, when introducing new industries, that it is of the greatest importance to use materials that are low priced and where wages bulk largely in the cost of the articles.

15,897. You believe it is possible for a blind asylum to work at a profit?—I believe it is when the wages paid to the blind are based on the same rates as are paid to the sighted in similar trades and where due allowance is made for the extra loss of material associated with work done by the blind.

15,898. To add to your profit, have you bought any large stock of manufactured goods?—Yes, we have bought a fair amount of manufactured goods.

15,899. Did those manufactured goods give you much profit?—Yes, we had an average profit off those manufactured goods of about 17½ per cent.

15,900. (*Dr. McDonnell.*) Was the little model of a spring mattress that you placed before us made by a blind person?—No, it was simply made for the travellers to take about with them, to give purchasers an idea of the article.

15,901. Mr. Arrol referred to the allowance of 7*s.* 6*d.* a head that was made by the parochial boards in the case of children who were boarded out; do you think it would answer if, in the case of persons suffering from blindness the ordinary workhouse test, as we call it, was dispensed with, and outdoor relief, to a certain extent, was given to them, on mere proof of blindness?—I think perhaps that would have a demoralising tendency.

15,902. If it was generally understood that any person in this country, rich or poor, who was born blind, or who became blind in after life, would be entitled to a certain amount from the poor rates, merely on proof of blindness (which would be something in the nature of a national insurance), do you think that that would be demoralising to the blind?—No, if it was regarded in the light of a national insurance it would not be demoralising.

15,903. If every one was entitled to the relief on blindness being proved, it would cease to be parochial relief in the ordinary sense of the term parochial relief; do you not think that in the case of persons suffering from blindness, the ordinary parochial test might be dispensed with, and that outdoor relief, which would be in the nature of a national insurance, might be given upon mere proof of blindness?—I think so.

15,904. Under such a system as I am suggesting every blind person would be entitled to a certain amount of relief, which in early life would be expended in his education, and in later life in helping him to eke out the earnings derived from his own industry?—The mode of relieving blind people which you suggest is one which I have not had brought to my attention before, but it seems to me that it is one which might advantageously be adopted.

15,905. (*Dr. Campbell.*) You say that the wire-work requires five years apprenticeship; how long does it take to learn the spring-mattress branch?—Five years is the time an apprentice has to serve in a sighted shop, and we teach all the work connected with wire-working in five years, including mattress work.

Adjourned to Thursday next at 12 o'clock.

At 6, Old Palace Yard, S.W.

Thursday, 3rd February 1887.

PRESENT:

THE RIGHT HON. THE LORD EGERTON OF TATTON IN THE CHAIR.

ADMIRAL SIR E. SOTHEBY, K.C.B.
W. TINDAL ROBERTSON, ESQ., M.D., M.P.
B. ST. JOHN ACKERS, ESQ.
T. R. ARMITAGE, ESQ., M.D.
W. AUCHINCLOSS ARROL, ESQ.
F. J. CAMPBELL, ESQ., LL.D.
EDMUND C. JOHNSON, ESQ.
ROBERT MCDONNELL, ESQ., M.D., F.R.S.
THE REV. W. BLOMEFIELD SLEIGHT, M.A.
THE REV. CHARLES MANSFIELD OWEN, M.A.
CHARLES E. D. BLACK, ESQ., *Secretary.*

MR. ROBERT MELDRUM examined.

Mr. R. Meldrum.

3 Feb. 1887.

15,906. (*Chairman.*) You are missionary teacher of the Aberdeen Town and County Association for teaching the blind at their homes?—Yes.

15,907. What is the area of your district?—Aberdeen town and county and Banff town and county, with as much of Kincardineshire as lies north and west of Stonehaven.

15,908. Over how long a period has your work in connection with the Association extended?—Seven years; and thirteen years in connection with a kindred association.

15,909. Have you ascertained by personally visiting the district, as far as you possibly could, the number of blind in the district?—Yes.

15,910. What is the number?—At 31st December last the total number in my district on our roll was 242, being a slight decrease on the previous year.

15,911. In which year it was 247?—Yes.

15,912. How many of those can read?—Ninety-five.

15,913. How many are of feeble intellect?—I have no record of those who are of feeble intellect except the children, and of those there are three imbecile and three of doubtful intellect.

15,914. Are they receiving any education?—None of those six are receiving any education.

15,915. Has anyone ever tried to give them any education?—No; in the case of those six nothing has been done.

15,916. Why are they not sent to the National Asylum at Larbert?—I suppose because they are blind.

15,917. Have the authorities of the Asylum refused to take them because they are blind?—I am not aware that any application has been made in the case of any one of them.

15,918. Have you suggested that such application should be made?—No.

15,919. Is it anybody's business to see that they are sent there?—It is not anybody's business to see that they are sent there; that, I suppose, is the reason why they have not been sent.

15,920. It is not the business of the parochial boards to send them there?—I do not know that it is.

15,921. Out of those of school age, how many are at ordinary schools?—Seven.

15,922. And how many are not at school?—Four are receiving lessons at home for the present, who will probably be at school soon, three are imbeciles, three of doubtful intellect, three under school age, and one blind, deaf, and dumb, which makes 21 under 15 that we have in our district.

15,923. Is that blind, deaf, and dumb child receiving any education?—The schedule is filled up to send him to Craigmillar in Edinburgh, he is receiving no education at present.

15,924. Do your pupils all read Moon?—All my pupils read Moon, and some also read Braille.

15,925. Do you teach all the younger ones Braille as well?—Some of the children are taught Braille at school, but the old people are not taught Braille with us.

15,926. With regard to adults, what is the nature of your work; do you visit them and read to them?—I seek to enable them to read for themselves; that is my chief work.

15,927. Are there any that you have to read to who cannot read themselves?—Yes; as a missionary I read to those who cannot read themselves.

15,928. And what writing do you teach the blind?—Personally, I teach them to write in the ordinary characters, but two or three of the children are taught Braille.

15,929. You make use of the frame you have been good enough to show us?—Yes. I may add that I have another apparatus invented by myself for writing to my pupils, which would write any kind of embossed type; it would write Braille or Alston or Moon; for inventing that apparatus I received the Royal Scottish Society of Arts medal.

15,930. How many of the blind in your circuit are musicians or earn their livelihood by music?—About four—from four to six; it is a somewhat moveable quantity.

15,931. How many earn their livelihood by begging?—Two or three, not more.

15,932. What becomes of the aged blind, those who are too infirm to work?—A good many of them are found in the poor-house.

15,933. How are they treated there; are they treated in any way different from the rest?—I do not know that they are treated differently from other paupers.

15,934. They are mixed with the seeing paupers?—Yes, we do not regard that as a grievance, but the opposite.

15,935. Do you think that that is the best way of treating the aged blind?—No, I think the poor-house test should not be applied in the case of blind people.

15,936. As you say it is desirable for them to live with the seeing, how would you provide for their maintenance; would you do it by an outdoor grant to their friends to maintain them?—Yes, an outdoor grant on a more generous scale than that which is given to the ne'er-do-well who is a pauper because of his misdeeds.

15,937. Have you any suggestions to make to the Commission with regard to the education of the blind?—One suggestion which I should like to make is this, that the 69th section of the Education Act should be made more distinct, so as to throw the onus of the education of the blind unmistakeably upon the school board, and the liability to pay for it upon the parochial board; and another is that double grants should be allowed for blind children passing standards in ordinary schools.

15,938. Do you think it desirable that blind children should be educated as far as possible in classes in board schools rather than in institutions?—Yes.

Mr. R. Meldrum.

3 Feb. 1887.

15,939. You think they would get a better educational training in board schools?—Yes. I think it most desirable that blind children should be educated with the sighted.

15,940. In the same class with the sighted?—Yes, but I would leave methods to the teacher. I find when a blind child is admitted into the common school, if it is a child of ordinary intelligence, it will pick up its education whether it gets lessons in class or not.

15,941. Do you think that there is a feeling among working men who are blind that the training in an ordinary board school better fits blind children for their work in life afterwards than if they were brought up in an institution?—Yes. I do not know that the blind workmen are in favour of blind children being educated in a board school entirely on that account, however. I think they look at it in this way, that the education of the children in institutions takes away funds which would otherwise be available for industry. I believe they do think it is better that the children should be educated in an ordinary board school.

15,942. What grant do you think should be made for each blind child; would you say that a more liberal grant should be made than the present grant for a seeing child?—Yes, I think it should be about double in ordinary schools; instead of 10*l.* or 12*l.* a blind child should get 20*l.* or 24*l.* when in an asylum school.

15,943. As there would probably always be some blind children who from various causes—debilitated constitutions and so forth—would not be able to be sent to board schools, there must always be institutions for the reception of such cases?—Some special treatment would always be required in such cases.

15,944. Do you think that the parochial boards should be authorized to give a grant for the maintenance of such children at those institutions?—Yes, in the imperative mood. I am not sure that the time will not soon come, however, when the necessity for special schools will gradually wear out without any action being taken. I think by-and-by the difficulties will so completely be met by sending blind children to ordinary schools the necessity for special schools will disappear; but in the meantime, and so long as there are special schools, I would earnestly recommend that something should be given for the children.

15,945. In your opinion is the Amendment Act of 1883 sufficiently clear as to the education of blind children?—Not quite, but I think it has been helpful, so far as it has been understood and pressed on the attention of parochial boards and school boards. One of the clauses, Clause 12, is as follows:—"Where the school "board are informed by any person" (those words "any person" are valuable) "of any child in their "district, who is stated by that person not to be in "course of receiving elementary education by regular "attendance at some public or inspected school, or "otherwise, it shall be the duty of the school board "to take proceedings under Sections 9 and 10 of this "Act" (the Act of 1883 that is), "unless the school "board for reasons to be set forth in their minutes "think that it is inexpedient to take such pro-"ceedings." Having to write down in the minutes the reasons seems to operate favourably in the direction of getting the school boards to take action in regard to the education of blind children.

15,946. Do you know of any cases where they have refused to educate blind children, and have set forth the reasons in their minutes why they have taken that step?—No; but I know in the case of a blind boy, where I proposed to insist upon having the reasons set down in their minutes why they did not take action in regard to his education, and the boy was sent the next day to the asylum.

19,547. You think that the law ought to go one step further, and say that all blind children should be compelled to go to school the same as other children?—Yes.

15,948. Have you read the memorial which has been presented to the Commission by the industrial blind in Aberdeen?—Yes.

15,949. Do you agree with that, or do you wish to make any remarks upon it?—If it could be done, though I could not say in what particular way it is possible to be done, but if it could be done the industrial blind are greatly in need of a grant of some kind; that applies to those in institutions certainly, but it applies more particularly to the industrial blind outside; for I should like to point out this,—that unless something is done for the blind outside institutions the blind are practically not dealt with because it is only a very small section of the blind that are connected with institutions at all, so that unless something is done for the blind outside the institutions the blind of the nation have not been dealt with.

15,950. At present they are left entirely to private benevolence?—There is no provision for helping industrial blind men at their homes, except by private benevolence, that I am aware of.

15,951. Does private benevolence as a rule do much in that direction?—In some places there are associations whose purpose it is to bring those cases before benevolent people.

15,952. What associations of that sort are there?—In Scotland there are associations of that kind covering the whole country, corresponding to the one whose servant I have the honour to be.

15,953. You do not think they are able to give all the assistance that is required?—No; they are doing what they can, but with all they can do a great many of the blind are yet unhelped, many of them being willing and able to work.

15,954. How would you recommend that the State should assist those who wish to work, and are unable either to get employment or to obtain material for their work?—I cannot suggest any mode in which the assistance should be given, but what I wish to impress upon your lordship is this, that unless something like what I have suggested is done the blind have not been reached.

15,955. Do you think that the Government should start, or subsidize the starting of, industrial workshops for the blind in certain cases?—In my district I do not know that it would be of much use, but some of my fellow missionaries think so; our asylums are really workshops after all. A blind man that I have wrote me a letter the other day suggesting that assistance might be given in this way—that if he went to an institution he should get an apprentice allowance for a certain time, as an individual; and if the same thing could be applied to workers at their own homes that would meet the want, I think.

15,956. Who would you propose should see that the grant in such cases was properly applied?—The Government might perhaps entrust associations corresponding to the one whose servant I am with the application of it, just as they would perhaps entrust an institution where there were workers with the application of any grant for the workers there.

15,957. Do you think that parochial boards would be the proper bodies to assist in the industrial training of the blind?—No, they are more for the relief of suffering; in Scotland they correspond to the boards of guardians in England.

15,958. Do you wish them to be associated with industrial work?—I suspect, according to their very constitution as poor law authorities, it is beyond their province. We have no great faith in them in any way; their instincts seem to lead them to withdraw allowances when we initiate anything for the benefit of blind persons.

15,959. Do you know of any cases where the parochial boards have refused to provide for the education of a blind child when they have been applied to?—Yes. I know one case where they resisted for years, and successfully to the end, when a benevolent individual came in to educate the child.

15,960. Do you think that blind children should be as highly educated as they possibly can?—I think the three R's up to the Fourth or Fifth Standard would be quite enough of compulsory education—for the majority at least.

Mr. R. Meldrum.

3 Feb. 1887.

15,961. These blind working men suggest that the blind children should be allowed to compete for bursaries in secondary or college education, and that teachers should receive an additional grant for the efficiency of each blind child as a reward for extra care and attention bestowed upon it; do you approve of that?—The latter clause I approve of very heartily; I think the first one is somewhat Utopian, at present, I suppose they *may* compete for bursaries.

15,962. Do you know of anyone in your district who is gaining a livelihood by music, otherwise than by playing in the streets or in public-houses?—No. I do not know that any of *our* blind play in public-houses.

15,963. Where do they earn their livelihood by music?—On the streets.

15,964. I class together streets and public-houses. Do you know of any blind people who are gaining a livelihood by music other than those who play in the public streets?—Not in Aberdeen. We have a pianoforte tuner who has come recently to Aberdeen; he is only beginning.

15,965. Where has he been educated?—He had been in Edinburgh before coming to Aberdeen. He was not educated, I believe, in an institution.

15,966. Do you know any blind people in your district who receive pensions?—No, we are very scarce of pensions. There are one or two Army pensioners; they have pensions, by virtue of having been in the Army, for loss of sight, and one or two in virtue of coming under an old servants' endowment, applicable to sighted and blind alike, however.

15,967. With regard to literature for the blind, do you think that the Government could do anything in the way of giving grants towards the printing of books for the blind, or giving grants of books for the blind?—I plead for that very earnestly; it would be one of the ways in which the blind could be benefited. We want more books for the blind. I should like to repeat that unless something is done for the blind outside the institutions the blind, as a class, are not reached.

15,968. How do you propose that the Government should give a grant for the purpose of providing literature for the blind; would your institution ask for a grant from the Government in aid, and then would they be prepared if they got such a grant to retail their books at a lower rate than they retail them at the present time?—I dare say they would be pleased to have cheaper books, but our Association provides books free at present, on loan. It does not *sell* books to the blind.

15,969. Is that your proposal?—I have not thought of that, but I have thought of this, that those who produce our books, for instance, the British and Foreign Association for printing the Braille type, and Moon's establishment at Brighton, should be paid for stereotyping, and then we might be able to buy the books afterwards.

15,970. You mean that they should receive a grant from the Government?—Yes.

15,971. Is there any other point which you wish to bring before the Commission?—No, except that I might say that it has struck me that grants for adults learning to read might be given in this way,—that the upper age limit (which is 15 I believe) might be done away with in the case of blind people, and that all blind persons learning to read should receive grants, or such associations as ours, which teach them, should receive grants for such blind people. I am not at all satisfied that is a feasible thing. I merely suggest it, and doubt whether the Scottish associations would wish it.

15,972. Do you know of any night schools for teaching the blind and for keeping up the education that they have got those who are trying to earn a livelihood during the day?—No, we have such a small number of blind in one place in Aberdeenshire that I doubt whether it would be possible to establish such night schools.

15,973. I understand that you are not in favour of almshouses for the blind generally, that is to say, retreats for the aged blind?—No, that would be going back to the dark ages of asylumism.

15,974. You object to that?—Yes. I have jotted down a memorandum of what children I think it would better to send to asylum schools and what children it would be better to send to ordinary schools for the present.

15,975. You admitted that there always would be some for whom asylums would be best fitted?—For the present, but in the not very distant future I should hope that there would be no necessity for asylum schools after the others have had time. I think for the present the children who had better be sent to asylum schools are those whose homes are poor, or vicious, or poor and vicious, and that those whose homes are good should be sent to an ordinary school.

15,976. Have you examined at all carefully the census of the blind in Scotland, and can you speak as to its accuracy?—I have examined the census returns in the Blue Books, but it was some years ago.

15,977. Since 1881?—Not since 1881; but practically there is no difference between our results and the Government census as given in periodicals and newspapers.

15,978. Taking your district as a sample of the rest you believe that the census returns are fairly accurate?—Yes, I believe in the main they are fairly accurate.

15,979. (*Mr. St. John Ackers.*) You have just told his lordship that you think the census returns are fairly accurate. When certain members of the Royal Commission visited Aberdeen I took the following notes:—(1) That you consider the census returns rather under the real number; and (2), that with all the efforts of your Society you have not yet been able to find out all the blind in your district.—I think that was hardly my statement, that last part.

15,980. Will you kindly correct it?—I think I stated that we had got to the normal number of the blind in our district, but that we could not say—except just when we had completed our list—what was the precise number of blind in our district; practically we know the blind population in our district, and it nearly corresponds with the census.

15,981. Is the other note correct, that the census returns are rather under the real numbers?—Yes, I think so, and I think not only in my own district but other districts of Scotland it is shown that the Government census is slightly under the real number.

15,982. (*Chairman.*) You said, in answer to my question, that it was substantially accurate?—Yes, substantially.

15,983. You qualify that now by saying that, if anything, there is rather a tendency in the Government census to under than over estimate the number?—Yes, but substantially the two agree.

15,984. (*Mr. St. John Ackers.*) Can you give the Commission the reasons which were stated by the parochial board for refusing to help that blind child in the case that you referred to?—I have a note of the case in the little handbook before me. The reasons, if I remember rightly, were the non-liability of the board to educate blind children at all.

15,985. It was not that that particular child was not one that they desired to help?—In that particular case it was that particular child.

15,986. Had that parochial board assisted any other blind children?—Not that I am aware of; that blind child, however, was difficult to deal with on this account,—that the parents were unwilling that the child should be sent to the asylum—they flitted from one place to the other, and I chased him through the districts of three parochial boards, and I had to deal with those three parochial boards.

15,987. At that time was it compulsory on the parochial boards to educate the child?—Yes, just as compulsory as it is now.

Mr. R. Meldrum.

3 Feb. 1887.

15,988. You said the parochial boards considered that they were not liable?—They usually say that they are not liable till they are shown to the contrary.

15,989. Then the question is still in dispute?—It is often in dispute; whenever a case of a blind child arises they *begin* by denying their liability.

15,990. Do you find a difficulty in raising the full amount from the parochial board that is required?—Not so much that—indeed the charge for admission to the Aberdeen Asylum was originally 5*l.* and it was more difficult to get admission then than it is now when it is 10*l.*, for this reason, that the moment the inspector had an application for a child, 5*l.* being the admission fee, he set himself to find out whether he could get it out of the parents; now when it is 10*l.* or 12*l.* that is on the face of it impossible, and he does not attempt to get it out of the parents. Resorting to the parents always *delayed* the admission of the child, and delays are dangerous in these cases.

15,991. Was it your suggestion that the parochial boards should pay a stated sum of 10*l.*, and that the Imperial funds should give a grant to the same amount?—Yes.

15,992. You stated that there were 21 children in your district; does that include all those who are at school?—It includes those who are at ordinary schools, but not at asylum schools.

15,993. What is the number including those at asylum schools?—At our asylum in Aberdeen, I think the number is 13, which would have to be added to the 21.

15,994. Thirty-four would be the total number of children of school age?—Yes; though I have sent one to Inverness.

15,995. So that you have 34 of school age out of 242, which is the number of the blind in your district; is that about the usual proportion throughout Scotland?—I think that would be about the proportion, because if the area is at all large you would find that the proportion of the blind to the population, and the proportion of the blind to each other as regards age always correspond more or less.

15,996. Does the 242 include those that are in the institution?—The 242 does not include those in the institution.

15,997. Then you would have to alter the answer that you gave to me just now, because you said that 34 to 242 was the usual proportion of those of school age to the total number of blind?—I see that I *should* alter my answer.

15,998. To the 242 must you add the 13 children at the institution, and must you also add the number of adults in the institution to the total number outside to get the proportion?—Certainly.

15,999. How many are there in the institution?—There are in the institution about 60 adults.

16,000. Then the proportion would be 34 to 300, roughly speaking?—Yes.

16,001. Do you consider that the number of blind in your district comes to about 1 per 1,000 of all ages?—I think our proportion would show that result.

16,002. Is not that, in your opinion, rather beyond the usual proportion?—I think 1 in about 1,100 is nearer the average.

16,003. If it is 1 in 1,000, you have rather more blind than other districts?—Yes.

16,004. Is that on account of the dangerous occupations in your district?—Yes, to some extent. I think our iron ship building and granite works have to account for a good many cases of blindness; but in other places there are iron works and other kinds of works dangerous. I do not know that it is exceptional after all. We have an extensive seaboard, which is usually accompanied with a high percentage of blind.

16,005. (*Dr. McDonnell.*) I understood you to say you were not in favour of almshouses and asylums for the relief of the blind?—No.

16,006. I understood you also to say that you felt a difficulty about carrying out any proposal for the relief of the industrial blind?—Yes, the aim should rather be to aid them in their industry than to give them relief.

16,007. You are aware, no doubt, that one of the admitted blemishes of the poor law system, as it works throughout the United Kingdom, is that persons reduced to pauperism by improvidence and vice must be provided for?—They must be relieved under the poor law system.

16,008. Blind persons are not, as a rule, reduced to their condition of poverty by improvidence or vice?—No.

16,009. It is the result of blindness?—It is the result of blindness, and it is only in so far as it is the result of blindness that I am pleading for them.

16,010. Then I will ask you this question:—Do you think that the blind might be relieved or provided for without any application of workhouse test,—in other words, that the blind might be entitled, by the mere fact of blindness, to as much relief as is at present expended upon a pauper whose pauperism resulted from improvidence or vice? I will explain a little more fully what I mean. Suppose that an idle good-for-nothing person who has reduced himself to poverty is received into the workhouse, the expense of keeping him there might be possibly 3*s.* a week—he cannot be left to starve—the workhouse test is applied to him, and he is let into the workhouse and kept alive, but the expenditure upon him comes to, say, 3*s.* a week. Let us suppose that a blind person who is poor, without having been improvident or vicious, were entitled, as a matter of right, to get the same amount of 3*s.* a week, outside, to add to what he would be able to make by his own industry, do you think that would have a beneficial effect upon the industrious blind?—I think so. I think it would be a very great boon to them indeed, and for this reason, that sometimes when we have succeeded in putting a blind person in the way of earning a few shillings, the allowance is taken off, or some of it, and the knowledge of this deters others from making a beginning sometimes.

16,011. Do you think if all the industrial blind—the blind you speak of as being the mass of the blind, struggling for existence—were entitled as a matter of right to an allowance of that kind, that it would soon be understood to be something distinct from poor relief, and that there would be nothing demoralizing in accepting it?—I think it would. It occurs to me that that would be a very great boon indeed, and upon safe lines.

16,012. Do you think that a well thought of scheme of that kind might in a great degree meet the difficulties of the cases you have put before us?—I think it would, but I should like to say this: our parochial boards apply the poor-house test, not so much to have a cheaper result in the individual case, as to deter applicants; and those admitted to the poor-house cost twice as much as a rule as they would give in out-door relief. Suppose they were to give an outside pauper 3*s.* a week, or threaten to put him into the poor-house, then if they put him into the poor-house it would probably cost the parochial board 6*s.* a week. I think it might be conceded to the blind that they should get the same allowance as they would cost in the poor-house—that would be, say, 6*s.* a week.

16,013. Do you consider, as a rule, that 6*s.* a week outside the house would be sufficient to maintain the blind in their own homes independently of their own industry?—I do not know that I should say yes, but I think 6*s.* a week would be very acceptable; it would depend upon whether the recipient had a large family or not; if he had five or six in his family I would say no; if he had not any family I would say yes.

16,014. (*Mr Arrol.*) I suppose you are aware that parochial boards are in the habit of boarding sighted children out at the rate of 7*s.* 6*d.* per week?—I am aware that they board them out; I am not aware of the exact sum they pay.

16,015. Do not you think that the aged blind might be treated in the same way?—I think they might.

16,016. Going back to the question of the census returns of 1881, can you say what the proportion of blind to sighted is for Aberdeenshire?—Not exactly; I think it is about 1 in 1,000.

16,017. Have you taken the trouble to verify the statements in the census?—Yes; all the missionaries in Scotland have compared the census returns with their own results, and we are satisfied that the census is substantially correct.

16,018. Is it one of the objects of your Society to encourage the blind to exert themselves?—The stated objects of our Association are to search out the blind and visit them at their homes, teach them to read, and supply them with the Scriptures and other books free of charge; but practically we set ourselves to help them to earn something, and all the Societies now do that, I believe.

16,019. Do you find employment for any of your 242?—I think I sent in a list of 40 to the Commissioners; there are 40 who are doing something.

16,020. To prevent young blind people rising up without any industrial training, and becoming ultimately paupers, would you recommend that parochial boards should be compelled to pay the expenses of young people in an institution while learning a trade?—Yes, I believe they have *power* to do that at present.

16,021. Have you such cases?—We have some in the asylum paid for by the parochial board.

16,022. Is that during the first period that they are learning a trade?—It extends over the first portion of the time that they are learning, and it gradually decreases, I believe, as they are able to earn wages. Those wages are put to their credit, and the payment of the parochial board is correspondingly reduced.

16,023. (*Dr. Campbell.*) Have you compared the census returns with your own results since 1881?—I have not compared the returns from the Blue Books. I have seen statements of the results of the census in the papers, and I have taken those as being accurate. I have compared the previous census returns with our results.

16,024. Since 1881 you have not made any careful comparison, as I understand you?—Not any close comparison. I have accepted the newspaper statements as true, and I have found that they corresponded with our settled conviction that the census returns were in the main right.

16,025. I think you stated that the opposition of what we will term the working blind to blind institutions educating children is because they think, if they can have them educated by the school board, the entire amount of charitable funds now expended would be available for the teaching of trades and for distribution among blind workmen?—That is so. I do not say their opposition to the education of children in institutions is entirely on that account, but that would practically be the result of it.

16,026. (*Dr. Armitage.*) Is your preference for day schools to asylum schools founded on personal observation?—Yes, very close personal observation.

16,027. Could you tell us the facts upon which you form that opinion?—The most potent fact is that, in the case of the board school, Her Majesty's Inspector passes the children through the standards, which he does not in the case of the asylum school.

16,028. Then, if the asylum school was under Government inspection, would your objection cease?—No. I hardly do object, only I prefer the ordinary school.

16,029. Then what other grounds have you for forming the opinion that day schools are to be preferred to asylum schools for educating blind children?—One other reason for that preference is this,—I consider it a great aggravation to the affliction of blindness to congregate blind persons together of any age or sex, especially those of maturer age. This applies all round. It is a sound principle to go on—that the more they associate with the seeing and the less with each other the better.

Mr. R. Meldrum

3 Feb. 1887.

16,030. Do you visit the asylum at Aberdeen?—I do sometimes. I usually have to take the initiatory steps for the admission of children there. It falls to me, because I find the children at their homes, and I have to consider whether the particular case is a suitable case for the asylum or for home teaching. If the home is a respectable and decent one, then I say it is a case for home teaching and ordinary school, but if the home is very poor or vicious, or poor *and* vicious, then I make application that the child should be admitted into the asylum, because we have a very nice comfortable home there.

16,031. Do you know what is the result of the teaching at the Aberdeen Asylum, that is to say, what the general result is in the case of the children who have been educated in the school proper and passed into the workshop; is it good, or is it not good?—As far as I have seen I think it is good.

16,032. Have you any experience of children who have been educated in board schools who have also passed into workshops?—No, we have not had children educated in board schools for a sufficient length of time to have that experience in Aberdeen. I have only been there seven years, and it took some little time before I got any into the common schools.

16,033. You have no experience then of any children who have been educated in the day schools who have afterwards started in life?—No, I have not known such *as children*, but have known some who had been educated at an ordinary school and did well in after life, Miss Falconer for instance.

16,034. (*Admiral Sir E. Sotheby.*) How would you propose that the blind children in the country should be educated?—I would send them to the common schools with their brothers and sisters.

16,035. The common board schools?—Any ordinary school, either a board school, or a private adventure school, or a church school.

16,036. Is not it the fact that blind children kept at home are much petted, and that in consequence they become rather helpless?—I think the fact is the other way, they are more helpful if they are at home and taught with ordinary children.

16,037. Are they not very much petted if they are at home?—I do not know that they are.

16,038. You say that there are only four who earn a living by music?—We have four street musicians.

16,039. Out of how many?—Out of our total of 242.

16,040. Then you have only four musicians out of 242 blind people at Aberdeen?—That is so.

16,041. How do you account for so few learning music?—I do not know that they are learning.

16,042. They must have learned, I suppose, to be able to play?—They turn a handle.

16,043. Do you call a man who turns the handle of a barrel-organ a musician?—I call him a street musician.

16,044. Do you think that the blind in the area of the district that you visit are generally employed in some handiwork?—A very large proportion of them are not.

16,045. How do they gain their livelihood?—By their friends, the parochial boards, and others.

16,046. They are more or less paupers?—They are more or less paupers many of them.

16,047. How many out of the 242?—About thirty-five.

16,048. As far as you are able to judge, what is the best employment for the blind in order to obtain a livelihood?—The best employment outside institutions is selling things in a small way, tea and other articles.

16,049. What do you say to the employment of basket-making or brush-making?—At their own homes they cannot possibly make baskets, it is too difficult.

16,050. Why cannot they make baskets at home if they have been taught in institutions?—But they have not been taught in institutions.

Mr. R. Meldrum.

3 Feb. 1887.

16,051. They are merely hawkers, you may say?—Yes; I prefer putting it another way, I do not like the term hawkers quite, I would say traders.

16,052. Are there no tuners being brought up at Aberdeen?—We have one tuner just newly arrived.

16,053. He has come from Edinburgh?—Yes; I believe there was one once before.

16,054. (*Rev. Mr. Sleight.*) What system for reading do you find most serviceable?—Moon's system.

16,055. Could you teach Braille's to those becoming blind in later life?—No, not as a rule; we could to some of the clever ones, but we teach Moon's system to people of the most ordinary intelligence.

16,056. What number out of the 242 are really able to earn a sufficient livelihood for themselves?—Very few are able to earn a sufficient livelihood. I would not like to say that even our best workers earn sufficient inside or outside the asylum.

16,057. How do the blind in country districts dispose of their work?—Just as best they can, to neighbours and to those who get to know them. The Aberdeen Association has instituted a system of prizes for excellence in knitting and netting and small handicrafts. This advertises their work as well as produces greater excellence.

16,058. (*Mr. Johnson.*) I think you have told us that you have four men who turn organs?—Not four of them turn organs, one or two of them do. We have a singer as well.

16,059. How many of the four musicians get their living by turning an organ?—We have one that sometimes takes a turn at it, but we have one who has no other occupation.

16,060. Is there one organ between the four?—One habitually plays an organ and one occasionally.

16,061. One or two of them turn an organ?—Yes.

16,062. What do the others do?—There are two that may be said to sing.

16,063. They do not go about with any other instrument but an organ?—One comes round occasionally who plays an accordion.

16,064. What do those musicians earn on an average?—I have no idea.

16,065. Do you think they earn a better livelihood by singing, or playing an accordion, or turning an organ in the streets than they would by manual labour?—I should say that they earn more money by the street singing or playing; but I do not say that it is such a good way of earning a livelihood as by manual labour.

16,066. How many do you suppose gain a livelihood by handiwork?—I would not say they gain a livelihood, but we have 40 doing something for themselves; about 40 out of the 242.

16,067. What are the 200 doing?—Practically very little.

16,068. How are they supported?—By parochial boards and by their friends, and some of them have a little of their own.

16,069. Have you any idea what the grant of the parochial boards is to those of the 200 who are in receipt of parochial relief?—They only give about 2*s.* 6*d.* to some, and to some they give 3*s.*

16,070. Is 3*s.* the outside?—No. I have one case where there is 8*s.* given, but that is the case of a man who has a family of five or six and a wife.

16,071. What do you suppose is the average out-door relief?—Three shillings, if the person is single.

16,072. When they live with their families?—Yes. Sometimes I know one man whose family consists of his wife and two children, and he only gets 3*s.*

16,073. That amounts to 7*l.* 16*s.* a year?—Yes.

16,074. And if 6*s.* was given, it would be 15*l.* 12*s.* a year?—Yes.

16,075. Do you think that that amount should be given to all blind people, irrespective of their circumstances?—No.

16,076. What test would you apply?—The number of children would be one consideration.

16,077. The number of children dependent on the blind man?—Yes; the number of little children; and if his wife was unable to add anything to the earnings that would also be an element of consideration.

16,078. You would impose upon the parochial boards the duty of inquiring into the circumstances, and let them give a grant according to circumstances?—They do go into the circumstances as it is.

16,079. But they never give more than 3*s.* on the average?—I suppose the average might be that; perhaps it is more than 3*s.* When those having families are included.

16,080. You think it would be a desirable thing to make an exceptional grant to a poor blind man who was industrious, and trying to earn a living for himself and his family?—Yes, most earnestly I would concur in that.

16,081. You have told us that your Society finds Moon's system the most serviceable system for reading?—Yes.

16,082. And there are some of your pupils who read by Braille?—Yes.

16,083. Have you any experience at all of any other system?—I have no experience of *teaching* any other system. I know other systems, Alston's and others.

16,084. Are there any of your 240 people who read by the old Roman letter which was in vogue in Scotland?—I do not know of one now.

16,085. But you do approve of the use of the ordinary characters in writing as I understand?—Yes.

16,086. You advocate that every blind person should be taught to read and write the characters ordinarily in use among sighted persons, so that sighted people might be able to read what was written by the blind person?—I would, as far as possible, endeavour to teach the blind to write like other people. I do not call those dots which you have in the Braille system, which are arbitrary characters, writing; the system is useful for the purpose of imparting education, but it is not writing; it will not enable a blind person to give a receipt for an account, or apply for work, or address an envelope or the like.

16,087. That is to say, this system which you call a system of dots requires a key to decipher it?—Yes, only one in ten thousand can read it.

16,088. Have you any experience with regard to the education of blind children amongst sighted children at board schools?—Yes.

16,089. What system of writing and reading is employed in the schools that you know of?—They all read Moon's, and three write in Braille, Braille is very useful for educational purposes, two are writing also by Moon's tablet making the ordinary characters.

16,090. Very useful among the blind themselves?—Yes, very useful and very hurtful, both; it fosters a morbid clinging together, and they do sweethearting through it, I believe, which does not always result well.

16,091. Have you ever visited Miss Falconer's class or school in Aberdeen?—I have visited it frequently. Miss Falconer has given up that school, she has got an appointment in a public school as a teacher.

16,092. What system of reading or writing was used there?—The pupils wrote ordinary characters by Moon's tablet and could use Braille's apparatus, very nicely, and read Moon's and Braille's.

16,093. Have not the results arrived at in that school been very satisfactory, so far as you know?—Very satisfactory.

16,094. Do you think it would be advisable in great centres to establish classes or schools of a similar character that is to say, classes or schools for blind children exclusively, to which the parents of blind children, who were a little better off than the very poor might send their children for a certain small payment? As Miss Falconer's school succeeded so well in your town, do not you think that it would be a very good thing to establish such schools throughout the length and breadth of the country, where you could get a number of blind children together?—I do not think it would be so good as a board school. It would not, I think, be possible or desirable to establish classes for blind children exclusively on such a scale.

16,095. That is because you advocate that blind children should be educated with the seeing?—Yes, and it is because you have the machinery to your hand to begin with; you have the board schools already, you have not schools like Miss Falconer's.

16,096. Do you think that for teaching blind children sighted teachers are preferable to blind teachers?—With the exception of Miss Falconer I should say yes, but Miss Falconer is no ordinary teacher.

16,097. In board schools you think the education of blind children can be effected by sighted teachers?—Better than by blind teachers.

16,098. That is your experience of the schools that you have visited?—I have no experience of teaching by blind teachers, except in the case of Miss Falconer, though I have seen them teach, but I have often seen blind children being taught by the sighted.

16,099. Your opinion is that the sighted teachers at the board schools are capable of teaching the blind?—Perfectly capable.

16,100. (*Dr. Campbell.*) Do you know anything about the French machine which has been recently invented, which while it writes Braille also writes ordinary characters, so that they can be read by an ordinary person, a sort of type writer?—No, I have not seen that machine.

16,101. (*Chairman.*) Have you any experience with regard to the blind working in institutions, and living at their own homes?—Yes, I visit their homes sometimes, though that is hardly my function.

16,102. Do you think it is desirable that the blind should work in an institution, and live outside?—Yes.

16,103. You think that is better than their boarding in the institution?—Yes, much better.

16,104. So that as far as possible they should live with their own families?—Yes.

16,105. (*Mr. Johnson.*) How many of your blind people are living at their own homes and earning their own livelihood who are not connected with any institution?—There are 40 who attempt to earn something by working at their own homes, whether they are earning their livelihood I would not say—those are not connected with any institution.

16,106. (*Mr. Arrol.*) Those 40 are not carrying on any trade that they have learnt in an institution?—No.

Mr. R. Meldrum.

3 Feb. 1887.

16,107. They have not been taught any trade in an institution, or if they have they are not carrying on the trade at their own homes?—That is so.

16,108. (*Dr. McDonnell.*) Is there any considerable number of blind people in Aberdeen who have been taught trades in an institution who are now living at home and pursuing their trade and making livelihood?—I do not know one.

16,109. (*Chairman.*) You said just now that there are some working in their own homes and partially earning a livelihood,—out of those there would probably be some who have been taught in institutions?—I am not aware that there is one.

16,110. Are any of them pursuing general avocations, such as shopkeeping, or any other vocation which does not require any special training?—I think they are almost all working at occupations that do not require any special training; none of them seem to be working even at what they were working at before; some of them split sticks, one is a hot potato vendor, a few are street musicians. I should say there are one or two costermongers, then some are salmon-net makers (which seems about the best employment), and some splitting firewood on their own account and selling it in little shops. About half a dozen are tea merchants.

16,111. Are you acquainted at all with the wages which the blind receive in an institution as compared with the wages paid by tradesmen for similar work done in the town?—No.

16,112. Are you aware that there has been any complaint on the part of the blind that they do not receive in the institution the same rate of wages which tradesmen are giving in the town to sighted labour?—I am not aware that they put it in that form, or I have forgotten, if I was aware.

16,113. There is no general feeling of discontent on that score?—There is a general feeling that the wages are not enough, but whether they also say they are not getting as much as ordinary tradesmen get for the same amount of work done, I do not know. The average wages are 10*s.* a week, I believe, in our institution, taking them all round men and women.

Mr. George Walker examined.

Mr. G. Walker.

16,114. (*Chairman.*) You are conducting a class under the school board in the Blind Institute at Sunderland, are you not?—Yes.

16,115. How long have you been so engaged?—Four years on the 18th of last December.

16,116. You have taken an active part in the formation of an association called the United Kingdom Association of the Bliud, and as secretary of that Association?—Yes, I took an active part in it at one period.

16,117. Have you any connexion with it now?—Our Sunderland branch at present is almost out of existence, but that is only temporary.

16,118. Have you not met with the response that you expected to meet with from the blind in support of the Association?—No, I am sorry to say that we have not, and we are partly to blame ourselves.

16,119. In what respect?—For not throwing sufficient energy into it.

16,120. You have had experience of practical work in the various departments of the Sunderland Institute, have you not?—I have been through all the departments, with the exception of one.

16,121. You have been through industrial departments as a worker yourself?—Yes.

16,122. Did you have any special qualification, or training as a schoolmaster?—In regard to special qualifications I never discovered any, and I had no peculiar training as a schoolmaster.

16,123. The Commission heard you examine the school, and I think the school does you great credit. I only ask as a matter of inquiry, and not in any way as doubting your qualifications.—I answer in the same spirit as the question was put in.

16,124. Therefore your training has been rather practical than literary?—Yes, decidedly so. I have had no literary training.*

16,125. But what you have learnt you taught yourself, I presume?—With the assistance of a sighted gentleman.

16,126. The circular of the United Kingdom Association states that it is imperatively necessary that the blind shall energetically cultivate habits of self-help, self-reliance, and self-respect. Is the Sunderland branch of the Association mainly managed and supported by independent blind?—Among the members of the particular branch which issued that circular there are not only out-door blind, but also those who are workmen at the present time in the Sunderland Institution.

16,127. How far, in your opinion, do the blind in Sunderland support themselves?—Those in the Institute, to a very large extent, support themselves. The majority of outsiders are dependent.

16,128. And the Sunderland Institution is carried out, as far as possible, on business principles?—As far as possible.

16,129. I suppose that it is impossible for certain of the blind, from various causes, to earn the full

* For further information respecting examinations passed by Mr. G. Walker, *see* foot-note to Qu. 12,707.

Mr. G. Walker.

3 Feb. 1887.

wages that sighted people earn?—Wages vary according to ability.

16,130. Do the wages which are paid in this Institution depend entirely upon ability, or do you give any bonus to assist those who are unable from various causes to work up to the general average of the blind?—We endeavour to discountenance any bonus; we acknowledge no such thing in our Institution.

16,131. I find that we have had already, in the course of the evidence of one of our witnesses, a list of the examinations which you have successfully passed. Have you received any diplomas as schoolmaster?—I have received none.

16,132. Were those examinations which you have passed previous to your appointment as a schoolmaster?—All of them have taken place since I was appointed teacher, with the exception of the first, which was passed five years ago, the year previous to my appointment.

16,133. What are the trades which you think are most successful in the Sunderland Institution, and at which the blind can earn the best wages?—Bedding in all its departments, rough basket work, mat weaving in certain departments and cork fender making and also chair-caning.

16,134. Do you think that fresh employments should be found, as far as possible, for the blind, and that the employments now taken up by the blind are capable of extension?—In some particulars I think they are.

16,135. Have you tried wire mattress making?—That all goes under the heading of the bedding department.

16,136. Do they make wire mattresses at the Sunderland Institution?—No, no wire mattresses.

16,137. Do you think that a good trade for the blind?—It depends upon the locality as regards these particular businesses.

16,138. But would not wire mattresses sell anywhere?—They may sell in some places, but the Sunderland people do not seem to have a particular love for such things; therefore we do not endeavour to make them.

16,139. They have not been educated to use them?—No, we do not educate public opinion.

16,140. Is the work in the Institution mostly piecework?—So far as that principle can be carried out. There are certain departments in which it cannot be carried out.

16,141. You said that you do not give any bonus; but, as a matter of fact, do the people who work on piece-work earn more than they would earn if they did the same piece-work outside the Institution?—In mattress making and cork fender making they are paid at an advanced rate, but in basket making they are paid according to the rate of the market, though in some cases rather under it.

16,142. Have you at all followed up the after career of those who have been brought up and educated in the Institution?—Sufficient time has not elapsed to enable us to pursue that to any degree. One or two have left the school to go to other schools in other towns, because their parents have changed their place of abode. We keep a register of all.

16,143. And you propose to follow that up, as far as you possibly can?—As far as possible.

16,144. Have you any special views about the education of the blind that you would like to lay before the Commission?—I may say that on this particular I speak as a representative man for the district to which I belong; we are all opposed, so far as we can ascertain one another's opinions, to what is commonly called the asylum system. We are opposed to it to a man.

16,145. You prefer that the children should be taught in board schools, and that those who work together, supposing that they work together in an institution, should board out with their families instead of living in the institution?—We prefer the children attending special classes and living at their own homes. If I am at liberty to do so, I should like to make a qualification here in order to prevent mistake. We are as hostile to the idea of educating the young blind side by side with the sighted in the ordinary schools under the ordinary methods as we are opposed to the asylum system. We take a middle course.

16,146. You do not approve of what is done in Scotland, where blind children are put in the middle of a sighted school?—No, we are opposed to it.

16,147. On what grounds?—The first point is that we think that, that system is quite good enough for the exceptionally clever blind children with exceptional home privileges, having parents who are able and willing to push them in the evenings. But the average blind children with the average home surroundings, and those who are under the average, we know from experience would suffer for many reasons; and the first is that no ordinary teacher in an ordinary school has the time to give individual attention to an individual pupil; they work their classes all as one, and a blind child needs individual attention. That is one of the reasons, if more are required I can specify them.

16,148. But why should not a pupil teacher, or some one under the head teacher, assist in specially supervising the education of one blind child in a school?—We hold that that simply comes to appointing a special teacher.

16,149. It might only be a pupil teacher, and that would not involve additional expense. As a matter of fact it does not involve any extra expense at Glasgow, where we have seen the experiment tried. If it did not involve any extra expense, would you have any objection to it?—It is not the expense that we object to; the expense, in our eyes, goes for very little. We object on the principle that we think that the blind child would suffer, and that the last state of affairs would be worse than the first.

16,150. The first proposition of your Association is that the blind ought, as far as possible, to live under the same conditions as those who are sighted?—Quite; I subscribe to that now.

16,151. It would not come within your proposition to have blind children in the same class with sighted children?—We qualify that proposition by saying, as far as possible.

16,152. It is not impossible for the blind children to be taught in that way, because it is done in Glasgow; but we want to know what your actual experience is?—We prefer experience to any amount of theory. Our experience in Sunderland has been this, that the Sunderland school board system of providing a special class for blind and partially blind children at the Blind Institution, because it is central, has produced excellent results, not from a blind point of view only, but to the entire satisfaction of the Sunderland school board and their inspectors. The children have improved more rapidly than they would in an ordinary school; they have travelled at a greater rate than from standard to standard per year. In an ordinary school they would only have advanced one standard a year; now many of our pupils have advanced much more than that. Our pupils can take their lessons side by side with any ordinary children in the standard to which they may at the time belong, and they meet ordinary children on fair terms, and do not come off certainly second best. To put it more briefly, our results have been something to this effect,—that our blind children have advanced nearly two standards in a year, that is, taking the standards taught in the ordinary board schools, with the exception of drawing, which, of course, cannot be taught to blind children. But, allowing for that, we have advanced nearly two standards a year, and the blind children in the ordinary school would only, at the very outside, have advanced one standard a year. Their self-reliance has not been injured; they are as self-reliant as if they had mixed continually with their sighted fellows. Continual contact with partially blind children has tended to discourage the formation of peculiar blind habits; such habits have not had time to grow up, even if they were encouraged by the teachers and their surroundings; and the results, so far as the Sunderland school board can estimate, are highly satisfactory,—equal, if not superior, to that they have accomplished in their own schools. That is the testimony of the Sunderland school board; that is not my testimony as a teacher. I hope you understand that I do not wish to put forward my personal convictions here, because I am an interested party.

Mr. G. Walker.

3 Feb. 1887.

16,153. Have you any sighted supervision to correct those habits which the blind, you say, are liable to fall into?—I have no sighted assistants.

16,154. But do you find that the children suffer from the want of sighted supervision?—Not so far as my experience goes, and not so far as the experience of my employers goes. There have been no complaints.

16,155. Do you think that before the blind children come to a board school they should as infants have some teaching in Kindergarten work and similar work?—I am quite in favour of such tuition.

16,156. Do you think that that should be done by the parents, or, in the absence of the parents, by the school board itself?—The parents, so far as I know them in the humble walks of life, will not and cannot take such responsibility.

16,157. Therefore it must fall upon some public body?—Upon the school board, as the educating authority.

16,158. Do you think that children should go to an infant class at as early an age as three years?—Five is the specified age, I think; I quite agree with that.

16,159. And that they should enter the school board school at the same age as other children, that is to say, at the age of seven?—I include all under the school board authority; five, I believe, is the specified age, but we are willing to take them earlier.

16,160. And they would be treated exactly the same as the other children?—As far as possible. They are passed on from one standard to another as they show aptitude.

16,161. Do you know that under the London school board the blind children have half the day in class with the seeing children, and half the day of special instruction, in the afternoon and morning alternately; do you see any objection to that?—I am quite well aware of it, and I highly approve of it. That is the nearest approximation that I am prepared to make to educating the blind side by side with the sighted.

16,162. You think that that would combine the advantages of both systems?—Yes, and it would do away with many disadvantages.

16,163. Would not the sighted children correct those habits which blind children among themselves would be liable to fall into?—Sighted children, so far as my experience of them goes (though it is not very much), do not as a rule take sufficient interest in their companions. I have never found those extraordinarily sympathetic hearts amongst the young that we hear of in books and pamphlets. My blind pupils say that their sighted companions are not so very merciful to them, because they are blind, and, as I have said before, the blind have not time to acquire peculiar habits at school, if they were even inclined to learn them. They are only from nine to twelve by themselves, they go from twelve to two o'clock with their sighted brothers and sisters, they are in school from two o'clock till four again, and during that time the partially blind and the totally blind are at work side by side.

16,164. Out of those whom you have taught, how many have been partially blind, that is to say, not sufficiently blind to require a leader in the streets, but not sufficiently seeing to be able to read?—Fully two thirds.

16,165. Do you find any difficulty in arranging for the children coming to school, do they always get the assistance of some sighted friend?—Occasionally that is required with a very young child; but, as a rule, what we advocate is self-reliance, and that grows very rapidly.

16,166. You advocate their trusting to themselves?—Yes, as much as possible.

16,167. And you find that that succeeds?—Yes, except at very early ages and in very exceptional circumstances. With the great majority it has proved quite a success.

16,168. Is your school inspected by Government?—We are not strictly under Government inspection, for the simple reason that I am not a certificated teacher.

16,169. But have you had voluntary or extra official inspection?—The Sunderland school board have an inspector of their own, who examines all the schools to see that they are working up to the proper pressure, and he inspects our class along with others.

16,170. What religious instruction do you give in your school?—We have a specified course of religious instruction every year. This year we have the life of Samuel, four parables, four miracles, two psalms, and two hymns. We are to have a special examination in those particulars.

16,171. With regard to industrial training, do you think that there is a necessity for some organisation to assist the blind in learning a trade or in maintaining themselves during the first few years before their labour is remunerative?—There is a great necessity for some outside help in the time of apprenticeship.

16,172. Have you any plan for doing that systematically?—We apply to the guardians for apprentices.

16,173. Is the amount sufficient, and is the aid always given?—It amounts to 7*s.* per week when it is given, but it is not very readily given. It is given now more readily than it was at first. It was a contested point. However, we succeeded, and since they have acknowledged the responsibility they give 7*s.* per week.

16,174. Is that sufficient, or ought it to be supplemented by anything further?—I leave that to the judgment of every gentleman present. I am not an authority upon how much it takes to keep a man, but I should not like to live on 7*s.* every week.

16,175. Do you think that there should be any central place of sale for the work of the blind, and that if there were that would assist the blind in any way?—I cannot see how it would do so, it would entail the expense of branches sending their supplies to the central depôt; and the great obstacle to the sale of our goods in our own district is that we cannot produce them sufficiently cheap. Our goods are rather too dear in the district where they are made, and they would be dearer at the central depôt.

16,176. Have you any travellers to try and sell your goods?—We have to a certain extent; we cannot call them commercial travellers.

16,177. Have you any blind travellers?—We have one blind traveller, and the clerk does a certain amount of travelling besides. We have no special commercial traveller at the present time.

16,178. It has been suggested that by combination, or even by some voluntary aid, in a central depôt, arrangements might be made so as to relieve the different branches of such a central institution from the necessity of sending out travellers, and that the central depôt would do the advertising and the business that is usually done by commercial travellers, for the benefit of the various institutions with which it was connected; do you conceive that that would be workable?—That takes away the vitality which exists at present, and that is the weak point. We have not sufficient vitality in our local institutions, and we do not want it sapped by having other means provided to relieve them of their responsibility.

16,179. You think, then, that the only way to stimulate the energy and industry of the blind is to leave them to their own resources as far as possible?—As far as possible, with the assistance of workshops, those workshops being worked by local committees, and not subject to the assistance or to the overruling

Mr. G. Walker.

3 Feb. 1887.

of any central authority. There is one point that I should like to suggest here, if I have the permission of the Commission; it is with regard to the committees of institutions. There is a strong feeling at present that those committees would be greatly improved by the presence of one or two blind representatives of those who are receiving the benefit of these institutions. I hope no gentleman thinks that I am specially speaking of Sunderland in this particular. I am not picking out Sunderland as an example. I am speaking in general. We feel that our institutions lack the close correspondence between committee and men that ought to exist. The committees are composed in many instances of ladies and gentlemen who have all the generous impulses, but who unfortunately have not the necessary knowledge. They, to a great extent, ignore the suggestions that are put forth by blind workmen, and they act on this principle:—"You "do what you are told; if that is satisfactory, well "and good; if not, you know the alternative. We "cannot brook suggestions." That does away with the spirit that ought to be cultivated amongst blind people of thinking out the methods of work, and the creation of a spirit of rivalry amongst institutions. I mean by one institution trying to surpass its neighbour in quality of workmanship and in the extent of well-doing. Our men, whenever they feel that they have a direct feeling in the management of their institutions, endeavour to respond to that, and rise to it; but at the present moment no committee will entertain the suggestion that they should have blind representatives. We do not claim it as a right; we have no right to ask it, because these are voluntary institutions; we simply throw it out as a suggestion. We only think that it would be an improvement.

16,180. You put it very fairly,—that, of course, those who subscribe the money for an institution like to have the disposal of it; but you think that the real interest of the blind would be consulted if committees generally would take counsel with their blind workmen. You would probably not think that it would work very well to have a blind representative doing nothing else but sitting on that committee?—By no means.

16,181. But you would simply recommend that committees should take the advice of, say, the foreman, or some responsible person among those who are employed by the institution, on matters affecting the blind?—I misunderstood you there. I do urge that there be direct representation on the committees, that we should have the choosing of this representative, who should, however, not have any salary or remuneration for it, but should simply be the best man we could find in our own ranks, and one in whom we have confidence,—our leader in fact.

16,182. But such men could not do two things; they could not do the work and sit on committees at the same time; how would you meet that?—That is very easily overcome. As a rule the leaders of the blind in every district are not the men who are working in the institutions.

16,183. Then you mean that the blind workers in institutions should elect not one of their own body, but some one in whom they have confidence?—Not necessarily one of their own body; but if they so choose, let it be so. Committees only meet once a week for half an hour as a rule, and there would not be much time lost if there were only one blind man on the committee. Any man would do that for the sake of himself and his fellows. It is only a suggestion; we do not claim it as a right.

16,184. Do you think that the representative of the blind would work great changes in these institutions?—I do not think that we should bring heaven and earth together even if we had blind representation. I only think this, that blind methods would be more in vogue in institutions, blind ideas would be brought more quickly before committees; and if there were supposed discontent amongst the blind, that would reach the ears of the committees far more quickly than it does at present. It has to go through the foreman and managers, and then through secretaries perhaps, to the committees, and sometimes it does not reach them. That is the point I wish to urge,—to bring the committees and the blind closer together.

16,185. (*Dr. Campbell.*) Supposing that a workman was put on as a member of one of the committees, and supposing that in his work as a workman in the institution he did not conduct himself in a way that was satisfactory, how could he be dealt with as a member of the committee?—I would answer your question in this fashion,—that, so far as my experience of blind men goes, they would very quickly deal with the man who misbehaved himself; they would not ask a committee to do it. Their own interest, if no higher motive prompted it, would simply prompt them to dismiss that man without much ado, and they would not be long about it. I have known such things happen in the past.

16,186. But supposing that this man whom you elect on the committee misbehaved himself, what then?—I am speaking of a gentleman whom we might elect. We should simply withdraw our confidence at the first opportunity. Committees go by majorities, and the law of any committee must be obeyed, no matter whether it affects a member or a non-member. We go on the doctrine of majorities, as all committees do, as I understand. We do not claim partiality, and we do not give it.

16,187. (*Chairman.*) As I understand, you would wish to have a representative of the blind on the governing body of institutions generally, not in order to control the disposition of the funds.—By no means.

16,188. But so as to make known the views of the blind?—That is my aim.

16,189. You would not ask for anything that is unreasonable, because, in the first place, you would not be likely to get it?—We should not, and that is a sufficient guarantee that we should not ask it. Then there is another matter. The blind in general in our district think that we should be none the worse for Government inspection of the workshops; but that does not carry along with it the condition that the Government should also give money to the institutions; we do not ask for that, but only for Government inspection.

16,190. (*Mr. Johnson.*) You do not ask for any money at all?—We do not, from our district, ask in regard to workshops that the Government should vote money. I am not speaking personally; I am simply here as a representative in that particular.

16,191. (*Chairman.*) I suppose the Government inspector has a right to go into your workshops now, has he not?—We have never seen him.

16,192. He clearly has the right?—He does not exercise it then.

16,193. (*Admiral Sir E. Sotheby.*) You have a Factory Act in Scotland, have you not?—We have it in England also, but it is never exercised in regard to institutions. If such were the case, that would meet our objection to a great extent.

16,194. (*Chairman.*) Do you think that Government inspection would prevent anything being done which is now done, or would lead to an improvement in the workshops in any way; or are you only asking for it as a good thing in the abstract?—I am opposed to abstract doctrines, as a rule; I love the concrete; I never deal in mysteries. We do think that it would act as a bridle on certain expenses. The management expenses are in many institutions enormous, out of all proportion.

16,195. The inspectors would not interfere with the expenditure of the institutions, would they?—The mere fact of the inspector being a public official would act as a very good influence upon certain people.

16,196. Indirectly?—Yes; not directly, but indirectly. We only ask for these things indirectly, because we cannot demand them.

16,197. Does your Association make any other practical suggestion as to the relationship between the Government and these institutions in any way?—Our Sunderland branch disapproves of the doctrine set on foot, by the Scotch blind in particular, that the

Government should pension blind people. We oppose that; we think that that would act very injuriously.

16,198. You do not object to the education grant, do you?—No, only to pensions.

16,199. You object to a direct subvention by the State to a blind man as a blind man?—We entirely disapprove of that.

16,200. What do you think is the best way of dealing with what necessarily must be dealt with in some way, viz., the provision for the aged and infirm blind?—We hold that the aged and infirm blind are the only ones who have a claim, and that they ought to be provided for in some way or other, either locally or by the Imperial Government, and in that particular we are divided. Some hold that the guardians, or the local authority, have sufficient power already if they would exercise it, others hold that they have not. We have an open mind upon that question. Personally, I hold that the local authority ought to deal with it, and this is a point that I can speak upon from experience. In Sunderland blind people cannot get out-door relief, and they are told to go into the workhouse, and that there will be a special room set apart for them. They are all herded together like cattle to a great extent (it is a rough illustration, I am aware, but it meets the case), and they object to it. That is destroying what we are trying to build up, and the very poorest in our ranks objects on principle and from sentiment to enter the workhouse. We have men and women in Sunderland who would sell laces or halfpenny books at the street corners, or do anything they could, rather than go into the workhouse. That is from practical experience, it is not simply sentiment. They object to it, even the very poorest. One or two blind persons have 2*s.* a week as out-door relief, and the highest has 2*s.* 6*d.*, and that is simply wrung from the guardians. They say that blind persons cannot be trusted to live alone; that they might get burnt, or they might injure themselves in many ways; and that is the ground of their opposition to giving out-door relief. The blind, as far as possible, do not accept the in-door relief, they struggle on.

16,201. You think that out-door relief should be given, and given more generously perhaps?—Yes, that is my personal conviction; at the same time, I think that the Imperial Government should not be asked to contribute towards their support.

16,202. You think that whatever support is given to the aged and infirm blind should be local?—It should be local.

16,203. So that it would be administered by people who would be locally responsible, and who could not be imposed upon in any way?—There would be a chance of remedying it by force of local opinion then.

16,204. Have you anything to say with regard to the education both in Scotland and in London?—I wish to say that the London system is the beau-ideal, so far as our knowledge goes. In Sunderland we disapprove entirely of the Scotch system (though I am a Scotchman bred and born myself); we go for the London system, and, failing that, we fall back upon special institutions. But this is a further suggestion that I have to make, that all educational classes, whether they be classes or special institutions, should be directly examined by Government inspectors, and earn grants according to the results; and that the grant should be double what is given at present to ordinary schools, on the ground that there are so few blind people that the Government could well afford it. We want to have the Government grant given according to results, and that the schools which are not willing to submit to Government inspection should not receive the Government grant.

16,205. Do you mean grants by individual results, or by the general character of the education in the school?—Upon the same principle as is adopted in ordinary schools. We object to the principle that the education should be judged by the results years after the pupils leave school. If I am not wrong, there is a feeling in some quarters that it should be tested by the results in after years. We think that that ought not to be so, but that the results ought to be tested in the same way as the results in ordinary schools, and that the grant should be double what it is in the case of ordinary schools.

Mr. G. Walker.

3 Feb. 1887.

16,206. Do you think that that would meet the case?—We certainly do; and that there should be a special inspector, blind if possible, or, failing that, a man who is thoroughly in sympathy and harmony with the methods taught, and who understands them fully. A special man could do the whole country, we think.

16,207. Do you think that a blind inspector could judge as well as a sighted inspector whether the condition of the school was satisfactory?—We think so, because he would hold in his hand a key which no sighted man has to the opinions and sympathies of the blind in general.

16,208. You think that no sighted man can appreciate the difficulties of the blind?—Far from it; I do not say that, but we say that no sighted man can grasp blind questions as a blind man can, all other things being equal. We do not stick out absolutely for a blind inspector; we only suggest it. We should be glad to get an inspector, no matter who he may be, if he do his work well.

16,209. I suppose you will admit that there are cases where it would be desirable, on account of the debility and backwardness of blind children, that they should be sent to an institution where they could be maintained and looked after better than they could be looked after if they were either at their own homes or elsewhere in a temporary home, as in London in connection with the school board?—That is a very delicate question. For instance, I have a case in Sunderland of that kind, where the parent would be very glad to get rid of the child, though the parent, if she were willing, is sufficiently able to look after the child; but there is a want of willingness. I am sorry to say that she loves drink, and we know the effect that that has upon the home. She has tried all in her power to get rid of the child, and she has failed. As I say, it is a delicate question. The instant that you begin to relieve parents of their responsibility, you are bringing about anything but an improvement. There are cases in which it would be necessary to have such temporary homes, but only under very special circumstances.

16,210. Then you do not think that the Government or the local authority should give any assistance for maintenance, as is recommended, for instance, by the Manchester inspector?—Under special circumstances I should. Where it is proved that it is absolutely necessary to send the child to an institution, then the guardians ought to send it.

16,211. And ought to maintain it there?—Yes, that is my opinion.

16,212. Then, in your opinion, it should be left to the guardians or to the school board to decide as to the desirability of such a course being resorted to?—Exactly. That should be left to their discretion.

16,213. (*Mr. Johnson.*) I understood you to say there was a great difficulty in getting local out-door relief for your blind people in Sunderland?—Yes, very great.

16,214. Do you think that it would contribute to the comfort of the aged and necessitous blind, who have no homes, if homes for the reception of blind people were established; and do you think that the local authorities would contribute to the support of such homes?—I may say, in answer to the first part of that question, that I think it is a necessity. For those who have no homes, homes ought to be provided.

16,215. But not in the workhouse?—Not, as at present, in the workhouse.

16,216. Your objection, as I understood, to their being taken into workhouses was that there the blind were congregated together?—That is one of their great objections; but it goes further,—they entirely

Mr. G. Walker.

3 Feb. 1887.

abhor the idea of going into the workhouse. That is the plain English of it.

16,217. But they would not object to go and be associated with blind people, would they, provided that this institution or home for them were not called a workhouse?—I am not prepared to answer that question. I cannot speak for their opinions in the future.

16,218. You have no experience of what are called boarding houses for blind people as they have in Scotland?—No, I have not.

16,219. Do you think that it is necessary to have a hard and fast rule of education, that is to say, a special code with special standards for the blind?—I think that there should be compulsory subjects, and also optional subjects; that each school should be, for instance, expected to be up in all the elementary subjects.

16,220. You would not insist upon the ordinary school standards?—I should not. May I enumerate what I would have? Reading, writing, and arithmetic as far as you like to carry them; plain and practical geometry, grammar, and geography, and modelling and Kindergarten work as far as possible. That is what I should say is the elementary education required by every blind child to enable it to hold its own in after life.

16,221. Then you are in favour of giving a public grant according to the results obtained by a school?—According to the results of the individual pupils, as at present in vogue in board schools.

16,222. There has been a Report from one of Her Majesty's Inspectors, presented to both Houses of Parliament, and therefore it is public property; and I may ask you whether you agree to this:—"I am "inclined to think," says Mr. Fitch, "that in laying "down conditions of any public aid which it may be "proposed to give either to the instruction of the "blind pupils, or to the training of teachers for the "blind, it would be well to avoid all rigid and "inelastic rules, to abstain from formulating definite "courses of instruction and examination, and for the "present, and until experience shall have suggested "a better course, to encourage liberally any approved "method of teaching and training, and to judge of "their efficiency mainly by the results." Do you agree with that?—That is too indefinite for me to subscribe to. That gentleman's experience is wide in ordinary matters, but not particularly in matters concerning the blind. He is too indefinite, and I cannot subscribe to any indefinite hazy notion.

16,223. Do you know of any blind representatives from the working classes, or from the school teachers, who have a seat on any committee of any charity?—No. I know of none.

16,224. You think that there ought to be such a representative upon almost every committee of every great institution?—On all committees, I think.

16,225. Do you not think that the ordinary rule of a committee is to go about amongst the institution in which they are interested, and ascertain, so far as they can, the views and opinions of the workers?—Experience is against that theory.

16,226. In Sunderland?—You will remember that I said at the outset that I was not specially speaking of Sunderland.

16,227. Have you any great experience of other institutions besides that at Sunderland?—Not great experience, but nevertheless I have experience, and I have my peculiar channels of information.

16,228. Then your idea is that the blind ought, as it were, to co-operate with the sighted people?—Yes, exactly, and the sighted with the blind.

16,229. What are your principal objections to the asylum system, as you call it?—The objections that it breaks home ties, encourages peculiar habits, and saps self-reliance. Those are, in brief, my objections.

16,230. Then, as I understand, you would like to have classes for the blind children under the school board, but separate from the ordinary classes, and you would like children attending those classes to live at their own homes?—Exactly.

16,231. Supposing that their homes were so bad that it would not be a desirable thing for them to live in them, what would you do with those children?—I think that I have already answered that question by saying that there are circumstances in which it is absolutely necessary to send them to some institution, but that that should be left to the discretion of the school board and of the guardians.

16,232. You have great experience, I know, with regard to the trades which are practised by the blind. Do you think that music is a profitable occupation for the blind?—I think that it is a profitable employment for those who have sufficient capacity; but here again I would lay before you the opinions of all those among whom I move, that there is too much of a general musical education, and perhaps I may explain what I mean by that. The blind in general have suffered from superficial musical education, and also from the notion that every blind man and woman is a born musician. That has led many who have shown no peculiar talent for it to go through the routine of training, and it has wasted years of their lives which might have been more profitably devoted to the cultivation of trades, and, when they have got all they could out of it, they have only been able to degenerate into public bar players. We have dozens of them in the north of England, and this is the worst evil of the whole thing. When a blind man has sufficient musical power to play a piano in a bar he will not work in an institution. That has been put to the test. I am a blind man myself, and of course I come under the same standard; but blind men are just like ordinary human beings, and, to a great extent, they want as much as possible for as little as possible; and when they find that, by playing in public bars for a few hours in the evening, they can earn 12*s.*, 14*s.*, 16*s.*, and some of them 18*s.* a week, and have all the day to themselves, they will not work in institutions, because they say, "It is not "worth while to give up our 16*s.* or 18*s.* for the same "money when we have to work all day for it." Therefore music, to a certain extent, has been a curse to the men. Where special capacity is shown for music, then we hold that it ought to be specially cultivated, but that ought only to be done where special capacity is shown for it.

16,233. Have you had much experience of blind people who have succeeded in the musical profession?—Here again I will take our district. We had one blind man who was educated at the Newcastle school, but not thoroughly; he has had to learn his business since he left it, and he is better off than any other blind man I know who earns his living by music. We have three from the Royal Normal College. Mr. Willans is the only one who has been successful; Mr. Urwin has only recently come, and he has a certificate; but Mr. Muldoon has not taken his certificate. Those two latter ones are not succeeding, and their prospects are not promising. We had another man from Newcastle, a universal man, equipped to play or to make baskets; he is a failure also. We cannot find sufficient trade for piano-forte tuners in our district; that is our experience.

16,234. What do the piano-forte tuners usually earn in your district?—The exact earnings I cannot give. Mr. Cummings does the best; he is employed by an ordinary musical firm, and he has a special connexion of his own. Mr. Willans, until recently, was paid 1*l.* a week by the Institution, but now the arrangement has been altered, and he only gets what he works for, less 10 per cent. commission.

16,235. He did not make the 1*l.* a week there?—He did not, and therefore the Committee altered the arrangement because it did not pay.

16,236. Is he the only successful man as regards music in your experience?—Mr. Cummings and Mr. Willans are the two typical successful men in our district. I do not wish to go beyond that district, because I am sure of the facts in my own district.

Mr. G. Walker.

3 Feb. 1887.

16,237. Do you think that 1*l.* a week is what they could earn in the ordinary way?—I do not say that that is all they could earn; I think they could earn more, but there is such a great difficulty in getting work. We have such a superabundance of tuners, blind and sighted, in Sunderland, that they are cutting one another's throats. The supply is overlapping the demand.

16,238. I suppose I may take it as a fact that the ordinary work in workshops is a much more profitable thing in your experience than music?—For the blind generally. I would give the exceptional men all the opportunities possible in music, but those are the only men with brains sufficient to make their way with it; they force themselves to the front. Those are the men who have told in the past, and are telling now. But every man has not that gift, and therefore he should not be put to something that he is not qualified for, as unfortunately many are.

16,239. (*Admiral Sir E. Sotheby.*) You have 36 people at your Institution, I find?—I believe so.

16,240. How many blind people are there in Sunderland?—One hundred and fifty-four.

16,241. What would the other 128 do?—The great majority of them are over 60 years of age. There are more over 50 years of age than there are under 50 years of age.

16,242. What do those that are under 50 years of age do?—The great bulk of those under 50 years of age, who are fit to work, are employed in our Institution. There are several who could work, but who do not work.

16,243. But you have only 36 in your Institution; how do the others gain their livelihood?—I say that the majority of the blind in Sunderland are over 50 years of age, and unable to do work if they had it.

16,244. But if they cannot get work, what do they do?—They fall back, as I told you before, upon selling several things in the streets.

16,245. Can the majority of them get work?—It is not so with all of them; but certainly the majority are employed in our Institution, though often on short time.

16,246. You have 36 people in your Institution, you say; do you employ any blind people outside your Institution?—We do not.

16,247. How do those people gain their livelihood?—The great majority of the 154 blind people in Sunderland are above 50 years of age, and are unable to work. The great majority of those under 50 years of age who are able to work are provided for in our Institution.

16,248. But are there not more than 36 under 50 years of age?—I did not say that we provided for everyone under 50, but for the majority. If you add 14 to 36 that makes 50. Then, perhaps, you will want to know where I get the 14; those are children who are not able to work. That brings the total up to 50. That leaves 104 out of the 154. Now I go further, and I subtract three who have been at the Royal Normal College; we do not profess to provide for them; they say that they are quite able to provide for themselves; they are already fitted as tuners. That brings it up to 53. One is employed by a musical firm, that makes 54. One was trained by the Newcastle school, and is in business for himself; that makes 55. That leaves 99 out of the total number. There are several of those, however, not provided for; but I only said that the majority were provided for.

16,249. How do those people gain their livelihood?—Simply, I am sorry to say, by depending upon their relatives in the majority of cases.

16,250. You said that you would like to have a blind person to represent the blind on your committee. Would it not answer the purpose if you had a blind gentleman or a blind lady, because they would sympathise with people who are afflicted in the same way as they are themselves, and would they not find out from the blind workers everything that they require?—But there is a very practical objection to that. We have no blind ladies and gentlemen in Sunderland, so that that is impracticable.

16,251. That answers the question as regards the present time; but if there should be one hereafter, what I have suggested might be practicable, might it not?—That would depend, of course, upon what was the view of the general body.

16,252. You have spoken in a general sense of Sunderland, and you have said that you want a working blind representative, or more than one, on your committee. In London there are a great many blind gentlemen and blind ladies; if one of those blind gentlemen or ladies went on to the committee, would not that answer all that is required?—Where the general blind have sufficient confidence in that gentleman or that lady, by all means let him or her be upon the committee; but there are many blind ladies and gentlemen in whom I am bound to say that the majority of the blind people who know them would not have sufficient confidence, and, therefore, they would not vote for them. There are blind ladies and gentlemen who are not naturally fitted for such positions, and who do not know the wants of their less fortunate blind neighbours.

16,253. (*Rev. Mr. Owen.*) If you know it, do you allow any of the blind people who are connected with your Institution to spend their evenings in public-houses, playing and singing?—It is expected by our committee that no man or woman employed by it shall be guilty of playing or singing in public bars. There is one exception to that, where a harp player does play in a public bar; but our committee, in their discretion, overlook that. I am not prepared to give the reasons why they do so.

16,254. Do you know anything about the deaf and dumb who meet in institutions?—I am not immediately connected with the deaf and dumb, and I think that the deaf are people who know their own case better than the blind know it. I would not like to give an opinion about the deaf and dumb.

16,255. Do the deaf and dumb and the blind work together harmoniously?—We have one dumb girl working in our Institution, in the sewing department; she supervises, to a great extent, some of the work done by the blind girls.

16,256. She is eyes to the blind, in fact?—Yes, and they are of course voice to the dumb; but this girl is only employed as a sighted person would be. They give a preference, as they ought to do, to those who are handicapped. They find that an intelligent dumb girl can do the work as well as an ordinary sighted girl, and they give the dumb girl the preference; and she and the blind girls agree as well as can be, so far as I know.

16,257. (*Dr. Armitage.*) You said that you objected to any payment by results in after years, after the pupils leave the institutions; what is the proposal that you object to?—I know that it is the opinion of many blind people whom I have met that it should be the after results that should be taken into consideration. That is to say, that, supposing that I come to the Sunderland school to day, if I turn out two years hence a successful man, the school that educated me shall claim a grant. If, on the other hand, I turn out a failure, that is to be set down to the ill training that I have received at the Sunderland school, and therefore the Sunderland school does not get any grant. That is the opinion which is held by many blind people, but I am opposed to it.

16,258. Supposing that a school is under Government inspection, and that a payment is made by the Government according to the standard attained by the pupils, would you object if, in addition to that, a grant was made to the school for those pupils who were successful in after life?—I understand you to speak of two grants,—a grant for individual results while at school, and a grant for individual results after leaving school. I go for the first, as you already know. As to the second, that is to say, giving a grant for after

Mr. G. Walker.

3 Feb. 1887.

results, that is the point where I get into a difficulty. I will take myself as an example again. Suppose I belong to a very poor family, surrounded by anything but favourable circumstances, and I am not constitutionally strong. Through those reasons, and those are very powerful reasons with blind people, I do not make the progress which perhaps my natural ability suggests that I ought to have made. I say that the school that trains me should not suffer for my after circumstances, because they were not responsible for creating them. On the other hand, if I am surrounded with favourable circumstances, am of a strong robust constitution, and have plenty of friends who can form a connexion for me (and we know that blind people do that), then I say that the school did not create my constitution, neither did it create the circumstances, and therefore it has no right to the grant won by me. That is my position, so far as my knowledge at present goes.

16,259. Taking a hundred pupils, do you not think that an average would be arrived at, and that if a school trained well, they would obtain a higher average of success than a school that trained ill?—Undoubtedly I agree with that.

16,260. Do you not think that a school that trains well ought to be assisted to a greater extent than a school that trains ill?—There is one reason why I should object to that, and this is my objection. Your suggestion is that a school that trains well should be encouraged, and that a school that trains ill should not be encouraged. A school will not and cannot get the same encouragement if the training is ill, because it will not produce the individual results that a school that trains well will produce. A school that takes an "excellent" merit grant wins it because a certain percentage have passed the "excellent" standard; and a school that does not come up to the "excellent" standard does not get the "excellent" grant. Why? Because the training or something else has been at fault. Therefore the excellent school has got the "excellent" grant, and the non-excellent school has not got it. Why throw it over a number of years? That meets your objection, I think.

16,261. It does not quite meet it. The question of after result depends quite as much upon technical training as upon school training.—Unfortunately I used the word education in its wider sense, but under that single word I included both. I had in my mind's eye the Normal College, St. John's School, York and Edinburgh. Those are all typical schools, I am well aware. There they are simply educating the blind; you may call it technical or general education, it all comes to the one end. The great aim is to instruct and educate the blind so as to fit them for their after career. If the Norwood College and the St. John's School beat the schools at York and Edinburgh (I do not say whether they do or not, but I just take it as an illustration), they get the "excellent" grant, whereas, if the schools at Edinburgh and York beat the Royal Normal College and the St. John's School, they get it. What more have they a right to? They have no right arising out of the individual circumstances of individual pupils. The training of these pupils will tell sufficiently in their favour in their ordinary education, without carrying it over a period of years.

16,262. Do you think that Government inspection and Government grants upon results should continue after the pupil has passed from the school proper into the technical school?—Undoubtedly I do.

16,263. And that an inspector should be appointed to examine into the technical training, as well as into the literary training?—That is my opinion exactly.

16,264. (*Chairman.*) Up to what age would you continue that grant?—The age I would not fix, but I would fix the duration of time. I would not go beyond two years after they have left the ordinary school.

16,265. I did not quite understand whether you meant that in those schools which you have mentioned there should be a purely technical branch of education which should continue for two or more years after they have left the literary part of the school?—May I instance the Royal Normal College or the St. John's School? The Royal Normal College, as I understand it, does not have its scholars always working in the ordinary educational department, and at the same time working in the technical department. If I am wrong, Dr. Campbell will correct me.

16,266. We would not take that particular school, because that is not quite the case of an ordinary school, inasmuch as they remain there longer; but take an ordinary elementary school?—An elementary school is not a school where technical education will be given.

16,267. Where will it be given?—In the higher grade schools.

16,268. (*Dr. Campbell.*) In some of these schools, take the Manchester school for instance, at the age of 15 the pupils pass out of the school and go into the workshops; that is what you mean by a technical training, I suppose. You mean that, after they have passed from the school department into the workshop, you would still allow the grant to go on for two years?—In the sense in which you have explained the meaning that you attach to "technical," I do not mean that. I separate the purely industrial from what I would term the purely technical. I know in fact they are one, but what I thought his lordship meant by "technical" was the musical profession. That is the sense in which the word "technical" is generally used among blind people.

16,269. (*Chairman.*) The word "technical" is used as applying to music, is it?—That is the general acceptation of it in our peculiar circumstances.

16,269*a*. (*Dr. Armitage.*) What I meant by "technical" was the special instruction in music, trade, or anything else that is given after the blind person leaves the school proper to fit him for self-maintenance.

16,270. (*Chairman.*) I asked the question purely from an industrial point of view.—We always, I think, in blind circles, make a separation between "industrial" and "technical." A school which takes in a pupil to educate him should not have a grant for purely industrial instruction, or for purely technical instruction, after he has been for two years away from the ordinary branches of elementary education. I mean in the purely training instructions. We always speak of workshops as workshops where men come and get work, and of institutions pure and simple as places where they are trained. I simply attach this to training institutions and not to workshops.

16,271. (*Dr. McDonnell.*) Are you in favour of elementary training and then two years of industrial training, provided that it be given in the same institution, and that it be paid for after the pupils have finished their elementary education and before they go to the workshops; are you in favour of paying for their elementary training, and for two years' industrial or technical training, before they go to the workshops?—Yes. I do not wish to tie down a boy or a girl to two years of ordinary education in the elementary branches; but if it is a training institution, where they profess to give them a technical education, then I think that that ought to be continued. But the workshops, as a rule, just take in those who have passed the ordinary school age.

16,272. (*Dr. Armitage.*) Have you any experience at Sunderland of blind men or women coming to learn a trade, or to practise a trade, who have been trained at other institutions?—Yes, we have had several.

16,273. Is it your experience that, as a rule, they have been well trained, or have they to learn a good deal when they come to you?—I am sorry to say that, so far as our experience goes, they have had, to a great extent, to re-learn their business.

16,274. Can you tell the Commission, I do not say exactly, but about how many you have any knowledge of who have been trained at other schools?—I am speaking of those who have come to work in our Institution,—one in our basket department, one in our mat department, one in our chair-caning department.

Mr. G. Walker.

3 Feb. 1887.

16,275. Do you believe that their defect has arisen from bad teaching, or from their not having been at those other schools long enough to learn?—I do not think it was quite so much bad teaching, in the ordinary sense of bad teaching, as the endeavour to make them basket makers, mattress makers, and musicians at the same time.

16,276. But that is bad teaching according to your idea?—Yes, but I did not say that those special departments had been badly taught. Those special departments may have been sufficiently well taught, but the attempt to make one man learn the whole three has proved a failure. That was not the fault of the teachers of those particular departments.

16,277. Do you know of any pupil who has come to you, as an apprentice or journeyman from another school, who has been thoroughly well taught, so well that he can enter the shop and at once get the wages that he ought to get at his trade?—We have had a very limited experience in taking in men who have been trained in other institutions, simply because we have had so many in Sunderland wishing to be taught that we did not feel justified in taking men from a distance. We have had one basket maker who was taught in York; he came into our institution as a journeyman basket maker, and received his wages according to what he did. We paid him as a journeyman ought to be paid. He could do his work.

16,278. Have you any experience with regard to the intermarriage of the blind at Sunderland?—Yes, we have. Two cases have happened within the last four years, where blind men have married blind women, or women for all practical purposes blind, who had not sufficient sight to know a lamppost from an ordinary individual, but who, nevertheless, were not strictly blind, being able to tell the night from the day; but, of course, we class those as blind.

16,279. Are such intermarriages encouraged?—No; they are so decidedly opposed that one of the unfortunate men who married was threatened with instant dismissal. We have a rule prohibiting the intermarriage of blind people, but the committee did not carry that rule into effect in that case. Those are the only two instances that have happened in our Institution.

16,280. (*Dr. Campbell.*) In regard to the blind desiring to have one or more representatives on the committees of the institutions, I suppose the idea is that, if they cannot find a suitable blind man, what they want is someone whom they can elect; that it would be open to them to have a representative of their own choosing, but whether he should be a blind man or otherwise would depend upon their own judgment in the matter?—I stated that blind men want blind representation. We do not ask to have permission to elect sighted people on the committees; it is only blind people that we want, because we should be going against our own notions if we elected other sighted people. That would be simply saying that we have not confidence in those sighted people, who already form the committee, but that we have more confidence in other sighted ladies and gentlemen. Still, in exceptional instances, a sighted representative might be chosen.

16,281. That might happen, and quite rightfully too?—We do not go for that; we prefer blind representation.

16,282. Do you not think that it would be a very great advantage, in the case of the young blind, while they are being educated, even as young children, to have what we will term technical education, that is to say, some training every day to educate their hands and fingers in the use of tools, so that afterwards, when they came to work at a trade, they would be skilful in the mechanical manipulation of the tools?—I heartily sympathise with all that would develop the talents of children. I do not care whether you begin at a year or two years, but I would give them all the tools possible. We do it practically. I am as enthusiastic in that particular as any gentleman here present.

16,283. What I want to get at I believe to be of great use, and I think you would sympathise with my view. In institutions for the blind, would it not be very advantageous if the young children began to be taught to use tools very much earlier than they are taught now? This is a plan that is beginning to be carried out in some blind schools, and I, together with many others, hold the idea that it is going very much to increase the industrial earnings of the blind. I wanted to find out whether this subject had been brought to the attention of your Association, and whether it had received the support of the blind of Sunderland?—If the Royal Commission had sufficient time when they were in Sunderland, they would have seen for themselves that the younger blind children were continually using all the tools that they could lay their hands upon, and that they were encouraged by every branch in the Institution. We have not funds sufficient to make it a system; it is the lack of funds, and not the want of willingness, that prevents its being more generally adopted.

16,284. (*Chairman.*) Do you mean in the school board classes?—We do not teach it; but the children are continually, from twelve o'clock to two o'clock, roaming about the workshops, and the men all encourage them. We would teach it, but we have not funds, and we have not time. I am heartily in sympathy with the idea, because it is what we want.

16,285. Of the three pupils that you spoke of as coming from the Normal College, how long has the last one left the College?—I think I said that Mr. Urwin had recently come.

16,286. As yet, he has not had time to get started?—No.

16,287. And in regard to one other, of whom you spoke, who had no certificate, he left before the College authorities considered that he was qualified to do good work?—Yes. I carefully noted that he had received no certificate.

16,288. So that we have accounted for two out of the three not having employment immediately?—I do not think you have accounted for their not having got employment. Mr. Willans, for instance, who is a fully certificated teacher, from the Royal Normal College, has not sufficient employment to occupy one-half of his time. Therefore it cannot be the want of a certificate that prevents the others from getting employment; it is the want of employment.

16,289. But if a man is not qualified to do good work, he will not get employment even if work is to be had?—No, and I would not like to see him get it. It would be a pity.

16,290. (*Dr. McDonnell.*) You spoke of great objection being raised to blind persons playing in public bars, many blind persons earning an honest livelihood by playing at public bars, what are the objections to their so doing?—By playing at a public bar I mean playing at a public-house bar. The associations that they form there are anything but calculated to advance their moral welfare, and, as blind men, we are as much in need of healthy surroundings as other people. All the blind men that I know, with one solitary exception, who have played in bars, have sunk lower and lower. There has been one bright example on the other side, who has, in spite of his unhealthy surroundings, risen; but the general tendency has been downwards, and we want to discourage the blind playing in public bars.

16,291. Then it is the bars and not the playing that you object to?—Quite so. It is the lack of sufficient power to get positions as organists and other high class musicians; it is only public-house playing that is considered objectionable.

16,292. I understood you to say that out-door relief was seldom, if ever, given to the blind in Sunderland?—Seldom, if ever; and when it is granted it is very grudgingly granted.

16,293. Would you yourself be in favour of giving out-door relief more freely?—Yes, I would.

Mr. G. Walker.

3 Feb. 1887.

16,294. Would you be in favour of giving out-door relief in a way in which it could not be spoken of exactly as poor relief, but rather as a thing to which every blind person would have a right? Thus: you are in favour of giving money for the education of the blind in early life; would you be in favour of giving certain allowances to all the blind late in life, so as to supplement what an honest and industrious man could make?—I object to the latter proposal as to supplementing the earnings of honest and industrious men. I am in favour of giving money for an education to the blind; sighted people receive that, but so far as I am aware sighted people do not receive extraordinary grants when in middle or in later life.

6,295. The aged receive such grants.—I object to our getting anything because we are blind. The aged receive it from the guardians, but not from the Imperial Government, and the blind have the same right.

16,296. I am speaking now not of its being given in the way of relief, but of the proposal that every blind person should receive a certain allowance in the nature of an insurance; that inasmuch as we all contribute to the State funds we should all get back again for our children, in the event of their becoming blind, a certain allowance so as to place the blind man simply on a level with the seeing man. How would you view such a proposal as that?—I distinctly disapprove of that.

16,297. On what ground? Would you think an insurance on your life demoralising?—By no means, because I am insured myself. The ground of my objection is this, that people have no right, because they are blind, to ask the Government to provide them with what other people are not provided with.

16,298. I have tried to explain to you that it is not because you are blind. Supposing that we all paid a small sum annually to a fund which would entitle each of us to an allowance in the event of his having a son who was blind, how would you regard such an arrangement?—I am quite in favour of national insurance.

16,299. Now that you see the point, you see that out-door relief may very readily be made not a demoralising and improper thing, from your point of view, but something in the nature of a national insurance; would you object to aid (I will not call it relief) being given to the blind in the nature of a national insurance?—By no means. I am certainly in favour of national insurance in the case not only of blind people but of others.

16,300. (*Mr. St. John Ackers.*) You said, in answer to the Commissioner who last examined you, that you did not wish the blind to receive anything that sighted people did not receive?—Yes.

16,301. But that is hardly, is it, in agreement with a previous opinion of yours, that the Government should give a double grant for the education of blind children?—I am well aware that there is a blind consistency of view there.

16,302. Putting it in a practical way, I understand that you do not wish blind persons who are able-bodied to receive any assistance from the Government that ordinary seeing able-bodied people do not receive, but in exceptional cases of youth and old age and infirmity you would not object to it; is that so?—Before I answer your question, may I ask what I am to understand you to mean by old age and infirmity?

16,303. You yourself said that the majority of those who were over fifty years of age were not able to work?—As I have already said, I do not think that the aged blind have a right to special funds from the Government.

16,304. Then you make an exception in the case of the children?—Yes, those are the only ones that I am prepared to make an exception for.

16,305. How many blind children of ripe school age are there uneducated in your district?—My district is purely Sunderland. There are only two uneducated children in Sunderland at the present moment, so far as our knowledge goes, within the age at which they can be compelled to come to school.

16,306. And there are 14 blind children altogether, are there not?—Fourteen; that is including the two of whom I have just spoken.

16,307. There would be 12 at school, and two not at school?—Yes, two who ought to be at school.

16,308. So that one-seventh of the number of blind children of school age are not receiving any instruction?—Yes, but you cannot discover in a large town every blind child. Of those two to whom I have alluded one has only been discovered within the past month, and the other within the past four months; and this is the reason why she has not been brought to school:—The parents say that they are going to take her to a London doctor, and that has been regarded as a reasonable excuse. That is why the law has not been put in operation in that case.

16,309. We know, from the evidence we have heard, that in large towns a considerable number of deaf children escape the observation of the school authorities altogether. May it not be the same with regard to the blind, that the school authorities are not sufficiently vigilant in looking out for blind children?—I cannot complain of the Sunderland board, so far as my knowledge goes.

16,310. What proportion do the children of ripe school age bear to the whole number of blind persons which, I think, you said was 154?—It is 14 to 154.

16,311. In your experience, is that about the average throughout England?—I cannot answer for the rest of England; I have not sufficient material to enable me to do so.

16,312. Have you studied the census returns?—I have studied them; but in Sunderland the census returns have been discredited, because they have not agreed with our knowledge of the real facts. In many senses they are unreliable in Sunderland, and therefore we never do base our opinions upon the census returns for that reason.

16,313. Then your practical knowledge of the locality leads you to doubt the accuracy of the returns given in the census?—Yes, and I am not alone in that; I am speaking as a typical blind man.

16,314. Which way is the difference; are there more blind than are put down in the census, or fewer?—There are more than appear.

16,315. You spoke of your Institution being opposed to the marriage of the blind with the blind; can you tell us whether your Association of blind persons hold the same views upon that subject?—They do not, they are divided upon that question. It is the most delicate question that we have.

16,316. But they are divided in opinion; they are not opposed in a body to the views of the Institution?—The majority of the blind are opposed to the views of the Institution. The minority favour the views held by the authorities.

16,317. (*Chairman.*) Is there any other point upon which you wish to say anything?—With regard to the training of teachers, I think that teachers ought to be certificated; but I do not go further and say what the standard should be.

Adjourned to to-morrow at 11 o'clock.

At 6, Old Palace Yard, S.W.

Friday, 4th February 1887.

PRESENT:

THE RIGHT HON. THE LORD EGERTON OF TATTON IN THE CHAIR.

THE RIGHT HON. SIR LYON PLAYFAIR, K.C.B., M.P.
THE RIGHT HON. A. J. MUNDELLA, M.P.
THE RIGHT HON. SIR H. SELWIN-IBBETSON, BART., M.P.
W. TINDAL ROBERTSON, ESQ., M.D., M.P.
B. ST. JOHN ACKERS, ESQ.
T. R. ARMITAGE, ESQ., M.D.
W. AUCHINCLOSS ARBOL, ESQ.
F. J. CAMPBELL, ESQ., L.L.D.
EDMUND C. JOHNSON, ESQ.
ROBERT MCDONNELL, ESQ., M.D., F.R.S.
THE REV. W. BLOMEFIELD SLEIGHT, M.A.
THE REV. CHARLES MANSFIELD OWEN, M.A.
CHARLES E. D. BLACK, ESQ., *Secretary.*

Mr. WILLIAM HARRIS examined.

Mr. W. Harris.

4 Feb. 1887.

16,318. (*Chairman.*) You have taken a great interest in the question of the industrial training of the blind for the last 20 years?—Yes, for more than 20 years—nearly 25 years. I did not take it up as an amusement. I was asked to help in the work, and having the time, and means and opportunity, I undertook the work as a duty.

16,319. You are the honorary treasurer of the Leicester Association for promoting the general welfare of the Blind?—Yes.

16,320. You have visited the principal institutions in England and America?—Yes; 50 in England and Wales; 5 in Scotland; 8 in Ireland; 20 in America; 3 in Canada.

16,321. And on the Continent also?—And on the Continent also. I have visited 28 on the Continent, viz., some in France, Belgium, Holland, Prussia, Hanover, Saxony, Germany, Bohemia, Austria, Bavaria, Switzerland, and Italy.

16,322. And your attention has been principally turned to the best way of giving industrial training to the blind?—I would rather say industrial occupation. I have worked very heartily in this matter with Colonel Turner, and was compiler, with him, of each edition of the "Guide to Institutions and Charities for the Blind." Our idea at starting being that schools should be only places of *instruction*, and that workshops should be workshops, any other occupation coming under miscellaneous occupations.

16,323. With your experience, do you think that industrial occupations are the best for the blind—I mean as distinguished from other occupations, such as music?—I should say undoubtedly so, for the majority of the adult blind, and especially the friendless ones. But I would qualify that remark by stating that I would never wish to compel blind persons to go to work in a workshop. I would prefer that they should find occupations at their own homes, amongst their own people, in ordinary household or other employment; at the same time it is an advantage to most of them to work in a workshop. I remarked at the conference held at York in the year 1883, "It appears "to me that the *largest number* of the blind are "*poor persons*; and, that the *greatest good* we can "do them *does not consist chiefly in enabling them to* "*earn the largest possible amount of money*; we "have to think of their *general welfare*, their *health*, "their *home happiness*, their moral and spiritual "welfare. . . . The circumstances and places of "residence of the blind are very different; but, for "most of them, I believe such occupations as could "be carried on *in workshops* to be the best," and the advantages of workshops for the blind are thus stated by me:—"1. Workrooms, *suitable* as regards "space, ventilation, warmth, cleanliness, &c., are pro-"vided. 2. Proper tools are provided without cost "to the blind. 3. Good materials are provided with-"out capital, and without loss of the time of the "blind, and also without loss to the blind through "waste. 4. Companionship and conversation *with* "*those who can see*, as well as with blind persons, is "secured. 5. Daily exercise and change of air is "secured, which improves their health, and gives "them confidence in walking about. 6. Their work "is done at the right time of the day; is done better "and more quickly, therefore, larger earnings are "made. 7. *Regular daily work* of the same kind is "secured, and with it *regular income*. 8. The goods "when made are sold without loss of the time of the "blind, and without injury through delay of sale. "9. The sale of badly-made goods, and the con-"sequent injury to the cause of the blind, is avoided. "10. The blind have *always before them* an object in "life, and so think less of their infirmity. 11. Their "characters and circumstances are known, and as-"sistance when needed is more easily obtained. "Some of the blind have, through their connection "with our institution, received gifts, pensions, and "help of various kinds. 12. The blind receive some "instruction and consolation; each day's work being "commenced with the reading, *without comment*, of "a portion of the Bible, and the Lord's Prayer. "13. Begging, or the temptation to beg, is avoided." What we are endeavouring to do is to get the blind to help themselves. Let me emphasise those words "help themselves," for the blind have always needed the help of the sighted, and in my opinion always will need such help, they will always be to some extent helpless, and I can speak feelingly on that point, because I am myself afflicted with partial deafness, sufficient to make me very nervous, very irritable, and very ill at ease with those to whom I am a stranger either in public or in private. Through the indulgence of the Chairman, I have brought my brother with me to assist me in repeating questions which I may not be able to hear perfectly, and I may fairly say that my coming here has been a very great anxiety to me, and I had very little sleep last night, knowing I was going to be examined as a witness to-day. I only say this to show how an affliction like deafness or blindness can touch the nervous system of individuals. I have never been a strong person, and perhaps that is one reason why I have more sympathy with the afflicted and helpless than I should otherwise have had.

16,323*a*. You acted with Colonel Turner in starting the Cottage Home at Leicester?—I did.

16,324. Do you think that is the best way of providing for the aged blind?—Yes, for the aged blind under certain circumstances it is.

16,325. That is to say where they have no friends to look after them?—Yes, the helpless and friendless blind. The Home is really a cottage home, three or four living together, with a woman of their own position in life to take care of them.

Mr. W. Harris.

4 Feb. 1887.

16,326. You would object to a large institution or asylum for the aged blind, that is to say, an institution as distinguished from a home?—I should very much prefer cottages, though there are certainly some difficulties and trouble in overlooking them. We do not want a lady superior, and make a grand business of it, we want simply someone to drop in to see that all is right, and to cheer up the inmates. The cost would come to about 10*l.* a head.

16,327. For the blind, after they have left school, would you have workshops provided in central towns, and if you established such workshops would you have them supported by voluntary contributions, or at whose expense?—That is a broad question, my general views are set forth in the answer to question 16,323.

16,328. Have you any scheme for the establishment of workshops?—I have not any scheme for the establishment of such workshops, though I have some general ideas about it. In the first place, if they are conducted by private individuals from private sources it would not be fair to interfere with them; and, secondly, there is a very great difficulty in getting sufficient funds to work them. I think the great success in the American institutions is attributable to the fact that aid is given by the State to enable the institutions to get first-rate managers and overlookers. A small institution cannot afford that. At Leicester we can only give our manager 100*l.* a year. You cannot expect to get an experienced tradesman to take the position of manager for 100*l.* a year—he would want at least 200*l.* or 250*l.*, and we should consider ourselves fortunate if we got a good man on those terms. You want the best manager you can get. Then as regards the question where the means are to come from, if you defrayed the expenses of such an institution out of the public funds, I would put it under public management, like a school board: but I do not now wish to go into that question.

16,329. Still it is very important to consider how this system of workshops which you say is the best for the blind is to be provided and worked. Of course, if it to be provided by voluntary aid, it cannot be interfered with in any way by the State; but do you think that, after having given the blind an education in State schools (that is to say, in board schools, or in schools subsidised by the guardians in the case of the poor), it is so important to the blind that something should be provided for them in the way of workshops that the State should depart from its usual practice in their favour?—Undoubtedly workshops are needed, but I should be afraid now to go into the details.

16,330. You say that one of the advantages of workshops for the blind is that "the sale of badly "made goods and the consequent injury to the cause "of the blind is avoided." I assume you mean that it is of great importance that the work of the blind should be of first-rate character?—Undoubtedly.

16,331. And that is more likely to be the case in a large and well managed institution than in a small one with deficient funds?—Undoubtedly. Large institutions are under good supervision, and they have everything provided for them, and every opportunity of doing their work well. I will mention a fact connected with that. The workshops for the blind at Glasgow make baskets which they sell in Ontario (Canada); though there is an institution for the blind in Ontario where they make baskets. The Glasgow workshops can compete with the Ontario people—they make them, I suppose, quicker and better.

16,332. Have we much to learn from the industrial workshops of America and Canada?—Yes, certainly. We have to learn our own imperfections, and we have to discover where we can introduce improvements. They have not given so much attention to industrial work in America, except in some institutions, as to providing a good general education, such as is given to those who can see, to qualify them to be useful, intelligent, and agreeable members of society. They seem to have done what we have done—they have tried almost every occupation—they are seeking to get at the impossible just as we are seeking to get at it. They are trying to find something which would be perfect—something that will enable the blind to *compete with those who can see.* They have never yet attained that. Mr. Wait, of New York, gave me last year, the Report of a Special Committee of the New York Institution for the Blind, dated April 1885, which is called, "A Review of the Efforts of the New "York Institution for the Blind from 1831 to 1885," on page 5 of it is stated, "The Committee, after "considering the various attempts and failures of the "the past, concur in the conclusions so uniformly "arrived at by their predecessors as well as by "present superintendent, that it is not reasonable to "hope we may ever be able to teach the blind to hold "his own in mechanical pursuits, unaided, as against "the competition of the seeing man, backed, as the "latter is, by accumulated capital and concentrated "skill." I have never yet found any institution where they have made work produced by the blind pay for long together.

16,333. The conclusion come to in that paper is that there is no one thing in which the blind can compete in the long run successfully with the seeing?—That is so.

16,334. Do you think that the blind who are in poor circumstances require any assistance through the boards of guardians, for instance, between the time that they leave school and the time when they are able to earn a livelihood in the workshops? We have had evidence to the effect that that is the time when they most require assistance.—If they are skilful workers they ought not to need it, but there are some who fail just as the seeing fail.

16,335. We have had evidence to the effect that the industrial training in the institutions is not sufficient by itself to enable blind persons to earn a livelihood after they leave those institutions, and we have had evidence that they very often have to begin their training again in the workshops. Do you think that it would be desirable that at that time they should receive any public assistance, that is to say before they are able to earn their own livelihood? I am assuming, which is the fact, that in a large number of cases blind persons, when they leave the institution, are unable to earn their livelihood; have you any opinion upon that subject?—Your question I understand to imply a subsidy of some sort. I believe that would be needed in some cases.

16,336. What, in your opinion, is the best industry for the blind? Is there any one which is better than another, or would it depend upon the particular place where the blind were residing?—The circumstances of place of residence, social position, physical and mental power, and manners would be very different, so you cannot make a rule to apply to every case. I should never expect the blind to maintain themselves without the help of some devoted relative, friend, or servant who can see.

16,337. You want to give them habits of industry in order to enable them to earn as much as they possibly can?—Yes, certainly.

16,338. With regard to the literature for the blind, have you paid much attention to that?—Yes, I have.

16,339. Have you come to any conclusion as to the best type for books for the blind?—I have come to the conclusion that the type question will never be settled as long as blind people and the benevolent public go on *improving it*, as they call it. At a conference of the school board for London in the year 1876 (which I should like to put in as evidence) evidence was taken from those who could see as well as from those who could not see, and the board, composed of professional men and men of business, what I should call practical men, decided that the type used by the seeing was the best for educational purposes.

16,340. Your remarks at the conference which you are alluding to seem to have been partly in favour of Moon's type and partly in favour of Roman, and at the

Mr. W. Harris.

4 Feb. 1887.

end of your remarks you say, "In using their in-"fluence for the adoption of the Roman type the "board would use it in the direction of one universal "type, and in this they would be assisting the rich as "well as the poor." Though you speak very favourably of Moon's, you object to Braille on account of its contractions?—Chiefly on that account. Many of all ages and circumstances in life lose their sight after they have learned to read.

16,341. Are you still of the same opinion?—I should like to say a few more words upon that subject. If you will notice what I say about Moon's type you will see that I attribute its success to certain causes, one of them being that Dr. Moon had more books in the field than other people. I do not object to Braille, neither do I object to a Point system, but what I say is this, that almost every year there are some improvements suggested, and indeed there was a modified system discussed a short time ago, vizt., at the biennial convention held at Columbus, Ohio, 1878, when the subject of type was very warmly discussed. I am not going to plead for any special system. I do not believe the question, which is the best system will for many years be settled. One of the statements made by Dr. Campbell at that conference was as follows:—"Dr. Armitage said if the convention would adopt "this international system he (Dr. Armitage) would "be willing to give up Braille's." (*See* page 138.) There is nothing to prevent another system coming into the field. We have had other systems which have had their day and then died out. Take, for instance, the Scotch system—the Alston system; when the promoter of it died it practically died. Then take Frere's system—that went well for a time, but when Frere died it died with him.

16,342. Is there not this advantage in having a system of contractions such as Braille's, that you get books printed for the blind in a very much more portable form than if they were printed in the Roman type?—Undoubtedly; but it has its disadvantages, a character when written should be read without any doubt of its meaning.

16,343. Is not that a great advantage?—I should say, for educational purposes, it is not an advantage, I think children should have the plain, simple type, of large size, like that for sighted children, and for them you have no contractions. Talking of the education of the blind, let me remind you that there are about 13 per cent. under 10 years of age, and about 7 per cent. between 10 and 20, so that there are 20 per cent. to deal with. Then I say treat the blind as much as possible in the same way as you treat those who can see. A sighted child has to learn its A, B, C, and the letters you put before it are very large, with pictures in them sometimes, it has got toy books to help it, and it can be helped by its sighted relatives and friends. With a point system, whatever it may be, you have the smallest type possible. You expect the child to learn those very small characters, and in Braille type there are more contractions than letters, and you isolate it in its special training from those who can see, and the result is not satisfactory. I say, let us treat the blind as we treat those who can see, let them learn their A, B, C first, and then after that if they like to learn Greek or Chinese or any other form of letter let them do so, but first insist on their learning the ordinary A, B, C, which will help the teacher and help the scholar in the work of education. With regard to books for reading, many of the blind do not care much about reading to themselves; their ordinary, and most agreeable, inlet to knowledge is the ear; and, as a rule, it is only the aged and infirm who read such books as are printed in raised type themselves. Mr. Fawcett neither read nor wrote any type for the blind after he became blind.

16,344. He could afford to pay for some one to read to him?—Just so, now we are coming to the point. Those blind who have got on well in the world have been those who have had sighted wives or relatives who read to them, or who were able to pay for some one to read to them. They have been people who had ample means, people who had good health, and many of them were educated before they lost their sight. Mr. Fawcett neither read nor wrote any type for the blind. I know other persons who care nothing about it, they prefer to have readers, whenever they can get anyone to read to them. My belief is that books for the blind are very useful to the aged and infirm blind, but I think active persons do not care much about them.

16,345. Obviously current literature can hardly be translated quickly enough into type for the blind in order to enable them to read it?—Exactly.

16,346. The literature of the blind must necessarily be very limited?—There are some very good standard books in America.

16,347. Would you approve of the adoption of the system which is adopted in America of subsidising the printing of books and distributing them to all institutions connected with the blind?—Not till the question has been pretty well settled what the type should be. Before the Government subsidised the printing of books in America it was pretty well agreed what the type should be; it was not only one or two persons who came to the conclusion as to which was best, but a conference every two years for years together considered the matter and came to a conclusion on it, and the result was not arrived at without constant communication with Europe.

16,348. Your opinion is that no State aid should be given to the printing of books until some common type has been settled on in England?—That is my opinion. I presume that school boards have already power to provide books and teaching apparatus for their use.

16,349. Do you consider that it would be an advantage for the blind if the American type was adopted in which so many books are already printed?—I would rather not now give an opinion about the kind of type; my views are stated in the report referred to in my answer to question 16,339. I do not profess to know much about the technical characteristics of the various types, but with the Braille type I understand that you have to push your fingers up and down and right and left to discover what the characters are, whereas with the New York type you put your fingers on the characters and you feel the thing straight off—that is what I am told is one of the advantages mentioned by the promoters of that type; they say you can read it quicker.

16,350. Do you think that after the blind leave the institutions in which they have been educated, their condition in life and their circumstances should, as far as possible, be made known to the institutions with which they have been connected, and that the institutions should keep a register of them and assist them throughout their career in life as far as possible?—I should say that it would be unnecessary, for this reason. The blind do not care to be followed up and down and have, as it were, a policeman after them to know exactly how they are going on. They do not like to tell you all they earn and all about themselves. Moreover, if they are people of good character they will never be without friends in their own neighbourhood and amongst their own people. I believe in the kindness of people at large to the blind, in fact they are sometimes rather too kind to them. I would not follow them up, we can always get at them if we want them, and they can apply to an institution for the blind when they require help. Too much nursing is bad.

16,351. Do you approve of the way in which pensions for the blind are administered?—I think there should be a public register of all pensions and the recipients of them, for it has come to my knowledge that some persons have more than one pension.

16,352. Are there not some who have several pensions from different societies?—I have reason to believe so.

16,353. What is your opinion as to the best way of preventing pensions being given to those who do

Mr. W. Harris.

4 Feb. 1887.

not deserve them, and of preventing their being squandered recklessly by the blind when they have received them?—Information should be got from the neighbourhood where the pensioner lives. As a rule I believe that answers very well.

16,354. Would not it be advisable, instead of paying pensioners in the way they are now paid, that some local machinery should be used for distributing the pensions, either the clergy or the boards of guardians, or independent persons, who should pay the pensions either fortnightly or quarterly?—I should like them to be paid quarterly. I do not like the idea of a blind person receiving a small sum once a week, except under special circumstances.

16,355. The evidence we have had is that the blind necessarily must have a guide to take them to the place where these pensions are given, and that after having received their pensions the money is spent very recklessly and extravagantly in some way or other, sometimes in the public-house with sighted friends; is that a desirable state of things?—Certainly not; if they are not fit to be trusted with the money they should not have it.

16,356. (*Mr. Arrol.*) Do you approve of the young who are being taught a trade receiving assistance from the parochial boards?—Yes, if they need it; and the board has power to give it.

16,357. Do you think then that the parochial boards should be required to assist young people while they were learning a trade with the object of preventing them from becoming paupers?—Yes.

16,358. Do you consider it hard upon the aged blind that they should be required to go into the workhouse if they require assistance?—Sometimes it is very hard; but not harder than it is upon those who can see, many of whom are utterly helpless; the workhouse is the only place where they would be well cared for. I have heard of blind people who go into the workhouse in the winter and who come out in the summer and go begging, pretending to be hawkers, &c.

16,359. Do you not think that it would be better that they should receive a certain amount that would enable them to remain constantly with their friends?—Undoubtedly, it would be pleasanter for them. They have out-door relief in many cases where they are worthy of it.

16,360. On the question of education, do you think it is advisable that the young blind should be educated along with the sighted?—Yes, as soon as they are are able to be so educated.

16,361. (*Rev. Mr. Sleight.*) How far do you find that the deaf and dumb can act as sighted helpers in industrial workshops?—I have had no experience. They cannot help the blind, but they can do work which the blind are not able to do. To my knowledge it has only been tried in a few places, and I believe satisfactorily, but there is, I understand, danger connected with it. We are aware that deaf and dumb people are very irritable, excitable, and often passionate.

16,362. Are you speaking of deaf and dumb people who have been well educated?—I am speaking of the deaf and dumb as a body. I do not speak of individuals. I saw some deaf and dumb schools in America, though I do not pretend to have gone into the subject of the education and treatment of the deaf and dumb at all.

16,363. How do you find that the deaf and dumb communicate with the blind?—They would do it by the fingers, or lip reading through persons who can see. No doubt you are aware that there has been more than one case where a person who has been absolutely deaf and dumb and blind has become an intelligent person through careful teaching.

16,364. (*Mr. Johnson.*) You have been telling us something about the American books; will you state to the Commission what are the types in use in America now?—At the present moment I believe there are five or seven.

16,365. Will you tell us what they are?—The Braille, the New York point, the Boston, the Philadelphia, and Moon. I saw printing presses also at the institutions at Raleigh and Stanton, but I do not remember in what type the books were printed, and I believe modified forms of some of those I have named are also used.

16,366. Does the State subsidise the printing of books in all those types, or is a selection made of any particular types?—I believe the printing house issue, or profess to issue, works in the Boston line type and the New York point type. I believe if people wish it they may have others, but practically they do not issue books in any other type.

16,367. Is what you call the Boston type a type composed of the ordinary letters of the seeing?—Not exactly; it is a modification of the Roman type.

16,368. A type which anybody could read?—Yes.

16,369. I mean a type which a sighted person could read as well as a blind person?—Yes, certainly.

16,370. I see in the report of the conference of the school board for London, Dr. Campbell, one of the Commissioners, is reported as having said that the Roman type is learnt in 45 minutes; do you agree with that?—The period of learning varies with the individual blind person as it does with the individual seeing one. I believe the blind can learn, and do learn, any type and every type they please. In our own town there is a person who reads four. Since I came back from America I have had sent to me regularly the weekly Sunday school lesson of the International Sunday School Union, printed in the New York point type at the American Printing House for the Blind, Louisville, Kentucky. I gave that paper without the alphabet or any kind of help to a blind *young man*, and he took it home and brought it back, having very soon mastered the system and I now send him regularly the papers I receive. That printing society issues a thousand of those every week; some are in point type and some are in Boston line type.

16,371. Do you think that it would be an advantage that educational books should be printed in the ordinary Roman type, the type of the seeing, provided blind children were educated in board schools?—Undoubtedly; and that is what I should recommend for any blind person. A great majority of the blind lose their sight after childhood, and after they have learned to read the Roman type; if, afterwards, they care to learn any other they will soon do so.

16,372. You have had a great deal of experience with regard to workshops for the blind. Have you any suggestion to make to the Commissioners with regard to the mode in which the trade accounts are ordinarily kept?—As long as institutions are private undertakings (I mean so long as they are not under the State) I do not see how you can interfere with them; but, if they should ever came into the hands of the State, I should prefer to see the accounts prepared in a tabulated form, such as is issued by the Educational Department, so that, without going into all the minute details, they should give the expenditure under separate heads. My idea is that the school board system is a very good one in respect of management of every description. You can get sensible people on the board, and, if they do not do their duty, they are turned off and you get somebody else; the management does not get into the hands of one man, and you get fair play. I am not on a school board, but I am trustee and manager of more than one school.

16,373. The difficulty I believe now is to determine between the absolute earnings of the workers and the cost of sustaining them, and the material; as I understand many of the workers in the institutions are subsidised; do you not think it would be a desirable thing to divide the charitable portion from the actual trade portion?—Yes, I think that is often done. I can tell you the amount given to our blind people. I believe it is well to give it the form of per-centage, because it conduces to regularity and industry.

16,374. Then you are in favour of a subsidy by way of per-centage?—Yes, where it is needed; I do not think that a man with 1*l.* or 25*s.* a week should have any subsidy. You would gauge a man the first five or seven years, and you would soon ascertain what he could do. I do not think our people vary a shilling a week under ordinary circumstances.

Mr. W. Harris.

4 Feb. 1887.

16,375. You do not think that the blind can be entirely self-supporting?—The blind as a body cannot. Let us see what they get. A man, we will say, earns 10*s.* a week; very true, he did that amount of work, but what a tremendous cost there has been over it! Look at the supervision, the auditing of the accounts, the advertisements, the annual reports, and all the various incidental expenses, to say nothing about the voluntary work of those who look after the institution, and who go to it week by week or day by day. Then you have to divulge all your trade secrets. Directly someone finds that you are doing well at any trade brush-making, for instance, others are led to compete with you.

16,376. Do you think it would be desirable to have a central depôt in the different great centres where blind work could be sent for disposal, and also a central inquiry office where information could be obtained as to markets for the disposal of goods made by the blind?—Undoubtedly there should be a central inquiry office, or a sort of club-house, where anyone could go for information respecting the work of the blind, but with regard to having a central depôt where all things made by the blind should be sent, I should not, I think, advocate that. I should interfere as little as possible with other people, but I would have an office of record where each institution could get information at once. Say I had now a hundred dozen brushes that I wanted to sell. I would not send them to London, but I would write to this inquiry office and say, "Can you name to me any merchant "who would buy a hundred dozen brushes?" and the answer would come, "Yes, Smith, in Smith Street, "wants them." The office would put me in direct communication with the market in which I could dispose of my goods.

16,377. What organisation would you suggest to carry out such a plan?—I cannot in a few words describe my views and scheme. It would have to be well considered before being determined on. We have not yet learned all we can do. Till the conference at York in 1883 we never had a large representative conference officially reported where we could have free discussion about the best way of teaching and helping the blind; though in the year 1866 representatives from 10 institutions met at Birmingham for consultation, and a similar meeting was held in London the following year, and in the year 1876 the Charity Organisation Society, having made special inquiry, issued a very full report on the subject of benefiting the blind.

16,378. Would you have a voluntary organisation for carrying out such a plan?—Voluntary undoubtedly at first.

16,379. Are you in favour of State supervision of workshops as well as schools?—I apprehend that the workshops are already under the Government Inspector of Factories, and I understand that some schools are under the Government Inspector of Schools.

16,380. I will ask you the question in another way. Do the Inspectors of Factories inspect blind workshops?—Not that I am aware of.

16,381. Do you prefer the teaching of music to blind people rather than trades, or do you prefer trades to music?—It is a wide question, and I must ask your indulgence while I say a few words about it. In page 19 of the report which is before the Commissioners they will see my views upon the matter. I refer there to some words used in the paper read by Mr. Martin, namely, "the greatest good to the largest "number does not consist chiefly in enabling them to "earn the largest possible amount of money; we "have to think of their general welfare, their health, "their home happiness, their moral and spiritual "welfare." "The circumstances and places of resi-"dence of the blind are very different." I must draw your attention to the word "health." I believe it is the fact that blindness, like deafness, often arises from feebleness of constitution. It is so in my case. We are told that the blind have 10 or 20 per cent. less vital power than those who can see. You have to think, then, of their health. Will it conduce to the health of the blind man or woman to go into a hot room and sit there *for* hours together. The blind require plenty of fresh air and exercise, and everything which is likely to conduce to their health, and strengthen their body. Then your musician sometimes suffers very materially in health in another respect. After going from the hot room he is feverish and thoroughly unstrung, and he wants some stimulant, this, with late hours, often leads to intemperance, and inability to rise in good time the next morning. Then with regard to music, it is a very difficult thing to learn, I am told. I gather from reading the printed reports that to make a musician he has to practise many hours a day for several years. In learning tuning I am told it takes 10 hours a day; and that the boy should begin at 14; what will his health be after all this undue strain and exertion? With regard to success in music I am quite aware that some earn large sums, but I want to know whether it will last. We can all do well for a certain time, but we all know the Italian proverb, "Go "gently and keep it up." Music is the last new thing, the last fashion, and it is supposed to give a great deal of pleasure to the blind people who learn it, but how long will this state of things last? Then with regard to getting employment for them, we are told that 80 per cent. earn large sums of money, but if you extend the area over which you take your per-centage will you get the same 80 per cent.? and if you keep bringing forward blind musicians where will you find berths for them? Then I understand—I do not pretend to be giving facts at this moment, but I understand that many of those who we are told are earning large sums of money are teachers in institutions for the blind, but what becomes of the ill qualified or unqualified teachers? Say you have 80 teachers, and say that berths have been found for 40 through influential friends, what becomes of the others? What will be the state of things 20 years hence? So much for music; it is bad for the health of the blind, I should say, and it takes them away from home just at the time when they should be there, and may lead them into bad habits.

16,382. Have you any instances of great success or great failure amongst blind musicians at Leicester?—I knew a musician who conducted for many years the musical service in a parish church, where there is a choral service, he also performed at private parties, but through being overworked he took to drink, and he has lost his berth in the church, and lost his berth in the workshop. He is now doing what he can at his home.

16,383. Do you know any cases of itinerant blind musicians in Leicester who play in public-houses, or in the streets?—Yes, there are several who play in the streets and in the public-houses. I should not say they were professional musicians.

16,384. They are blind musicians?—Yes; I should like to add that music *in public places* serves as an advertisement; and in America is thought to be very useful as such—but, you must think of the circumstances of England. England is not like France, or Germany, or America. We have to deal with England.

16,385. (*Dr. Armitage.*) You say that Mr. Wait states* that every plan for employing the blind on a large scale in workshops has had to be abandoned,

* The statement referred to is as follows:—
"This 'working home for blind men' does a most excellent and needful work, but it is clear that such an establishment ought not to be attempted as a part of *educational work*. The Committee, after considering the various attempts and failures of the past, concurs in the conclusions so uniformly arrived at by their predecessors, as well as by the present superintendent, that it is not reasonable to hope we may ever be able to teach the blind to hold his own, in mechanical pursuits, unaided, as against the competition of the seeing man, backed as the latter is by accumulated capital and concentrated skill."

Mr. W. Harris. 4 Feb. 1887.

because it did not succeed; are you of that opinion?—I believe that under certain circumstances industrial occupations can be carried on with success in *workshops*, or with the aid of those who can see, but these circumstances exist in very rare cases; and I believe further that in dealing with the question we have not to simply think of the blind, but of the manufacturer or dealers; so long as a blind man likes to make a basket he can make it, but the question is to get somebody to buy it. At Indianopolis for more than 20 years—it is no longer an experiment, for it has been worked for 20 years—the workshop has been let to a sighted person who works it at his own cost and risk and for his own profit, which is proof that it can be done under certain circumstances and that both parties are satisfied in that case.

16,386. Did you visit the workshops belonging to the New York Institution?—Yes.

16,387. Did you find them making brooms?—I do not remember

16,388. Did Mr. Wait tell you that he had discontinued training the blind for broom making because it did not pay?—I do not remember that fact.

16,389. You know, however, that Mr. Wait did discontinue broom making in New York because he found that it did not pay commercially?—No, I did not know that.

16,390. Do you know that Mr. Hall of Philadelphia has a large broom making workshop for the blind?—Yes.

16,391. Have you seen his report?—I have seen it.

16,392. Do you remember the statement that he sold 100,000 brooms in a year in New York?—I do not remember that. I remember that there were some large sales. I know further that broom making is a trade which is very speculative; corn broom costs 200 dollars a ton one year and only 75 dollars another year, so you may lose a great deal; it is like growing hops in this country.

16,393. If those two facts are correct, that Mr. Wait discontinued broom making because it did not pay, and that Mr. Hall can sell 100,000 brooms in a year in New York and finds that the making of brooms does pay, does not that point to the fact that a good deal of the success or failure of a workshop depends on the manager?—Undoubtedly. I am not quite sure that Mr. Hall makes it pay.

16,394. He says he does in his report.—I do not wish to contradict him, but it seems to me that at the present moment there is a great controversy going on in America as to whether corn broom making should be continued or not, for very few States make it pay since the introduction of machinery.

16,395. You say that blind pupils, when they leave the institution in which they have been educated and enter a workshop, require some sort of assistance till they have finished learning their trade?—I think that some of them ought to have some assistance if needed.

16,396. Does the necessity for assisting young people on leaving an institution arise from the fact that blind pupils, trained in our institutions, as a rule have not learned their trade thoroughly before they leave the institution?—In some cases it is so, but sometimes it is from want of capacity or special circumstances; they are only received in the school for a limited time, and they sometimes leave before they are capable of working at a trade.

16,397. What is your experience at Leicester with regard to pupils who have been trained in schools; have you to teach them over again?—We have had to do so in some cases, but we have not had to do so lately. Some years ago, what we found was that those who had been at school were decidedly better, *i.e.*, more intelligent and capable than those who had not.

16,398. (*Chairman.*) Do you mean in schools where some industrial training was given?—Yes, where a certain amount of industrial training was given them as occupation to amuse them in a great measure, and to teach them how to use their hands

16,399. (*Dr. Armitage.*) How many are there in your Institution who had received their industrial training in a school before they came to you?—I cannot tell you from memory.

16,400. Have you more than half a dozen?—Yes.

16,401. Have most of those who come to you learnt their trade thoroughly before coming to you; would they be capable of earning journeymen's wages when they come to you?—Yes, those who have been in schools, but the adults have to be taught a trade.

16,402. Full journeymen's wages?—The question is what you call full; they would earn according to their capacity for work, some might earn only 6*s.*, while others might earn 12*s.*

16,403. As a rule, when blind persons come to you after they have been trained industrially in institutions for the blind, do you find that you have to teach them a good deal of their work?—I do not think that is the case now.

16,404. Then the industrial training in schools for the blind has improved of late years?—Undoubtedly: there are more sighted helpers; there are not so many blind teachers, and there is better supervision.

16,405. You account for many of the types for the blind becoming obsolete by the fact of their promoters dying, and you think there is a probability of other types now in use becoming obsolete when their promoters die?—Undoubtedly, but there are other causes also, which lead to this, *e.g.*, the introduction of new systems, and the supply of funds.

16,406. Do you know the date at which Braille died?—I should think it would be 40 years ago.

16,407. Do you know that the Braille type was not adopted officially in any institution, even in Paris or anywhere else, during the lifetime of its inventor?—I do not remember that fact.

16,408. Do you know that it is generally adopted now all over the world in blind institutions?—I believe some form of point type is in conjunction with the Roman or Moon's or some other type, but where there are so many abbreviations, more abbreviations than letters, you can scarcely call it a *fixed* system; and I know that, at the present moment, in America, there are people scheming for new ones or fresh modifications. When Dr. Moon dies, I believe his type will die. You may say he has put it in trust, so Frere's was put in trust, but that did not secure its survival.

16,409. Is not it the fact that Braille having died a great many years ago, his type is much more used since his death than it was during his life?—I suppose so; but it is because there are more people, and the education of the blind is better looked after.

16,410. Do you know that Dr. Reuss, the inventor of the New York type, died a good many years ago?—Yes.

16,411. Is the New York type more more used in America now than it was some years ago, or is it less used?—I suppose it is undoubtedly more used for the reasons stated in answer to No. 16,409.

16,412. In spite of the death of its inventor?—Yes, but that is no guarantee that it will not be changed or improved, or new systems take its place.

16,413. Do not you think it is possible that the reason that these types are becoming so generally used amongst the blind is that they suit the blind?—I believe some form of point type, some system by which the blind will be able to write for themselves, will be adopted, but I do not, for one moment, believe that perfection has been reached in any system. We find in writing frames new inventions are constantly being brought forward; I have had in my possession several, some of which have been invented in Leicester.

16,414. Where the question is what type should be used, whether for the seeing or for the blind, do you think it should be left to those who are *not going* to use it to say which type should be used, or do you think that those who *are going* to use it should be left to say which type they think best?—I should say that the instructor is better able to judge what is best for the child.

Mr. W. Harris. 4 Feb. 1887.

16,415. If the instructor is blind or seeing?—Yes; in either case.

16,416. You think that those who are not going to use the types are the best judges whether a type is suitable or not?—I think they are the best able to decide the question. Take the illustration of a case where a man is being tried for forgery; you have an expert to give evidence that the writing is forged, but the jury give the verdict, the judge having summed up first.

16,417. The most important question in considering the best type for the blind is whether it is suitable to the sense of touch; do you think that the seeing are the best judges of that or the blind?—I should say the seeing undoubtedly; but in forming a judgment, they should take the evidence of the blind of ordinary condition of life, with the ordinary amount of the sense of touch; and not simply of highly educated ladies and gentlemen. I know people who can read three or four different types. I think those who have to conduct the education of the blind ought to be the judges, and not the children.

16,418. Provided that seeing people determined that a particular type was the best type, it would be a matter of indifference to you whether the blind could learn it or not?—No, it would not, the blind can learn anything and everything, but we have to think of the instructors, and we have to provide suitable apparatus of all kinds and teaching power for the children.

16,419. With regard to the Roman type or Boston type, do you remember Mr. Wait's statement that in the American institutions he found that one-third of the children were able to learn to read it fluently, one-third by a process of slow spelling, and one-third not at all?—I have heard of that statement; it may be so, but if that were so, I should say that the success in learning would depend very much upon the teacher; the teacher has got his own hobby, and his own wishes and feelings, and he naturally pushes that which he likes best.*

16,420. You were referring in the early part of your evidence to the decision of the London school board at their conference; are you aware that they have altered that decision?—I am.

16,421. And that instead of using Moon until they can print Roman they are using scarcely anything but Braille?—I am aware of it; and I think I can tell you why it is,—they have put their teaching in the hands of the Royal Normal College for the Blind, where Braille is used; but I have yet to learn that the education of the blind in the London board schools has been a success, and I have also to learn whether they could not do it cheaper; for a blind teacher you have to find a guide, and you have to find all sorts of people to help him. When the London people cry out about rates and taxes it does not do to waste money.

16,422. Are you not aware that the London school board came to that decision before they employed any teachers from the Normal College?—I was not aware of that fact. I should suppose so.

16,423. Speaking of music as an occupation for the blind, I understand that you object to it partly because it is unhealthy?—Chiefly; but also because it does not give regular daily employment and regular pay, and it takes the blind to hot rooms at night when they would be better at home.

15,424. Do you think that the occupation of a tuner or of an organist in a church, or of a teacher of the seeing, is a more unhealthy occupation than basket making or brush making in a workshop?—I think the strain upon the nervous system of the tuner would be much greater; but I was speaking more of the adult blind generally, not of a few strong ones. I am not so much opposed to the occupation of tuning, as to music, if constant employment can be provided.

16,425. If it were the case that blind musicians suffered from the strain you speak of, would it not be the case that the length of life of blind musicians would be shorter than that of workers?—Not of necessity; they might be very infirm and yet live to a good age. Many sighted persons take honours at the Universities and never recover from the strain caused by their efforts, though they live a long time.

16,426. Is the period of life of blind musicians shorter than that of workers?—That I do not know.

16,427. You say that for a blind man to become a tuner he has to begin at the age of 14, and to work 10 hours a day; how long would that continue,—how many years must he work 10 hours a day?—"As long "as it takes him to learn;" that is the statement in the book.

16,428. About how many years?—Ordinarily, I suppose three or more.

16,429. Where do you get that information from?—The Report of the Convention of American Instructors for the Blind, held at Columbus, Ohio, 1878.*

16,430. Do you endorse that statement?—I know nothing at all about it; I only take the statement.

16,431. You touched upon a rather important question with regard to the institution at Indianopolis, in which case you said that the work of the pupils in the institutions was let out to a contractor; did you visit the institution at Indianopolis?—I did.

16,432. Did they tell you that they were quite satisfied with the way in which that system worked?—I believe they did. This is what Mr. Churchman says, who represented that institution at the Convention in 1878:—"I would like to speak of the "course we have pursued for some 17 or 18 years, "and from which we see no cause to turn. We now "pay neither our instructor nor anybody in our "establishment. We give him the use of the shop "and the use of the pupils, and he buys his own "materials and sells the products. Thus we are free, "not only from all the expenses and anxiety of the "management of it, but we never have a stock of "brooms accumulated. The advantages of this "system are many, but lest I should occupy too much "of the time of the association in explaining it, I "would refer you to our reports."

16,433. Will you be kind enough to give the Commission a sketch of the working of the system at Indianopolis?—The board of managers allow the contractor the use of the rooms and the use of the pupils, and he makes either profit or loss as the thing may turn out; he takes the whole responsibility, but the shops are under the inspection of an authority like our Government Inspector, I suppose, and the directors allow the workers some percentage on their work. I am not quite sure about that fact.

16,434. Did you hear this objection to the system raised by anyone connected with the institution, that

* I should expect the teacher to succeed best with the type which he prefers; moreover, I do not think the Roman or the Boston type as used is as clear and as good as it should be. It has been stated that in England the Roman type has been altered too little, and in America too much.

* I beg to give Dr. Campbell's own words (page 121). "Our pupils are made to understand that a place in it (the tuning "department) means at least ten hours a day of hard work, we "do not allow a pupil to work in it until I give him a certificate. "and we never promise them that it will take less than three "years to learn the business" (page 123). "How many "persons do you employ in your tuning department?—From "12 to 15 employed every hour of the day" (page 125). "We "did at first take them between 20 and 30; we have now "passed a rule not to take any over 18." "How much time "does he spend per day?—The whole time." "How long must "one of that age stay?—He must stay till he receives a certi-"ficate, as long as it takes him to learn." "How do you manage "to keep them at tuning ten hours a day when you are "teaching them anything else?—We begin with boys at 14 "years of age and give them but little tuning at first: but we "have those who do nothing else." W. H.

Note.—Dr. Campbell disputes the accuracy of the above report, which was not submitted in proof to him for correction. From the foundation of the College the rules have admitted pupils from 7 to 21, and since the establishment of the Technical School they have been taken as old as 25. C. E. D. B.

Mr. W. Harris.

4 Feb. 1887.

the contractor always puts the pupils on work that pays him the best, and not upon work that is best for them when they leave the institution and work at home?—No, but I should expect him to do so.

16,435. You do not know whether that is what the contractor does or not?—No.

16,436. In reference to the long hours that have to be devoted to the training of a blind tuner, when an apprentice enters the workshop how many hours a day does he work at his trade?—I think about eight hours; they come about 8 and stop till 7, resting for dinner and tea, but they are *adults*.

16,437. You say there are a good many blind beggars and itinerant musicians at Leicester?—Not a good many; there are some.

16,438. Can you tell us where they were trained?—I cannot from memory, but I am not sure that they have been in *schools;* they may have taught themselves.

16,439. Will you endeavour to get that information when you return, and send it to the Commission?—I will. There are five known at our institution who reside in Leicester, three of whom have been in schools for the blind, though I believe they were not trained there as musicians, but there are others who visit the town from time to time.

16,440. (*Dr. Campbell.*) Are you aware that in the training of pianoforte tuners very much of their time is spent, not in the actual tuning, but in training in various other mechanical ways, in the same way as if they were learning a trade?—I should suppose so; but there will be a great strain upon the system if they have ten hours' work day after day.

16,441. To put my question again. Are you aware that in the tuning department of the Royal Normal College there is a great variety of work, and that those who are learning tuning are only a comparatively short time at any one department, so as to avoid this nervous strain you are apprehensive they would be subject to?—I am not aware of that. I read the statement with reference to the ten hours a day in the report I have before me, but the details of how the pupils are employed during the ten hours are not there stated.

16,442. If that system of giving a variety in the training is carried out, and if the pupils have opportunities of getting fresh air and so forth, that would tend to counteract the evil which you are afraid might result?—I think the hours should not be so long as ten hours a day, unless some intervening time is allowed for recreation. In an ordinary school the children are allowed so many minutes from time to time to run about to shake themselves up; I do not know whether you follow that practice, but in no school they should be worked ten hours a day.

16,443. Are you aware also that that ten hours a day does not apply to children of 14 years of age, but to young men who go into the technical department, where we do not receive children at all?—I read that formerly you took them between 20 and 30, but now none over 18, and that you begin with boys at 14; that is the statement in the report.

16,444. At all events, this statement in regard to ten hours a day does not refer to children?—That, of course, would alter the case.

16,445. Then as to what you said with regard to musicians who have been employed as teachers in blind schools, can you tell me how many have been employed as teachers in blind schools?—I cannot.

16,446. Are you aware that there have only been two in this country?—I am not aware of that fact; it is not so in America—there they have more.

16,447. They claim 80 per cent. in America, do they not?—I do not know; they claim to do a great deal of good. In America the State provides for the blind as good a general education as is given in the public schools to those who can see, and the result is they make their blind people very useful; the young women are so well taught that they find sighted husbands, and that they very seldom do in this country.

16,448. How many did you hear of as marrying sighted husbands?—I cannot tell you from memory, but several; I am not sure whether they did not use the word "many."*

16,449. With regard to the quotation which Mr. Johnson read, in which I am reported to have said at the school board conference that the Roman type is learnt in 45 minutes, are you aware that what I am reported to have said is incorrectly reported?—No; I take it from you that it is so.

16,450. Though I was very much opposed to the Roman type, I saw I had very carefully tested it, and though I as a blind child learnt it in 45 minutes, I found it was not practicable for a large number of the blind. You do not remember me making that statement?—I do not remember it. I believe there has never yet been a good, well printed Roman type in this country.

16,450*a*. (*Mr. Johnson.*) Are you aware what systems of embossed literature are now adopted by the school board for teaching the blind to read and write?—I am not aware what they are; I have not been into their schools.

16,451. (*Chairman.*) A witness yesterday, a blind man, stated that he thought it would be a great advantage to have a blind working man, or a representative of blind working men, on the governing body or managing body of charitable institutions for the blind; do you think that a workable proposition and one which it would be desirable to carry out?—It is a matter of indifference, I think, whether you have such persons on the managing body or not; if you could get a good man I should have no objection to him; it might be useful; I should not object to it myself.

16,452. Have you any blind working men in the management of your workshops at Leicester?—No; when we began work we had a blind manager and blind teachers, and the institution was twice on the eve of being closed; since then under the management of sighted persons we have succeeded in carrying on the work and are now getting along pretty well, though we are extremely poor; our income is only 120*l.* a year, supplemented by legacies and donations at times. We have a debt of more than 5,000*l.*, which has been standing five years, but still we are not discouraged.

16,453. Have you had any experience of the school board classes for teaching the blind?—No; there have been none at present in Leicester—the deaf and dumb are taught by the school board, but the blind they have not yet taught. I have been consulted about it.

16,454. With regard to the advantages of children being taught in a school board class either by themselves or with the sighted, rather than in institutions; have you any opinion upon that subject?—That is a large question. In England we like the boarding school system, and send children away from home; in Scotland the parents do not like to part with their children except during the daytime. I think I should prefer myself the Scotch system—let the children go to school in the daytime and come home at night. I find Scotchmen generally do well wherever they go; they are well able to take care of themselves; their system of a day school answers admirably, and I myself should, I think, prefer it.

16,455. The blind may be taught in two ways in a board school—they may either be taught in a class by themselves, or in the midst of an ordinary class; or, as is the case in London, they may be taught in the morning with the sighted, and in the afternoon in a special class by themselves. We have had evidence that the London school board system is much

* Mr. Patten says, "Since leaving school our girls have "taken the matter into their own hands, and 16 *that I can "think of without referring to the records* have married seeing "men, and they have done so well that they have rather shaken "my theory. They explain this result by the fact that after they "have been at school and had some education and polish, and "go back home, they take the shine off the country girls and "get husbands."

Mr. W. Harris.

4 Feb. 1887.

approved by the blind; which do you think the better of those two systems?—The blind require special teaching by experienced certificated teachers at first by themselves, till they know a little; then when they know the names and use of things, they should mix with other children.

16,456. Do you think blind children should be taught in an infant class by themselves as far as possible before going to a school where the blind would be taught with the sighted?—I think that would be advisable at first, in many cases. We want first to teach them the forms of objects and so on; we want to teach them what an apple is, and then when you use the word apple they will know what you are referring to. There would be an advantage in so teaching them; you want a skilful teacher, one who would know how best to develop their intelligence, and who could correct the bad habits peculiar to blind children.

16,457. Do you approve of blind teachers for the blind?—No; I do not know of any blind person who employs a blind person in his own affairs; I know of no blind lady or gentleman who employs a blind teacher for his or her children, or a blind valet, or butler, or secretary, or anything else.

16,458. Perhaps you are aware that in many school board classes the special instruction is only given once or twice a week; do you think that is sufficient for the blind?—Certainly not. I should treat blind children as I should treat the sighted, whatever the sighted did the other should do.

16,459. (*Dr. Campbell.*) You said you knew of no instance where the blind have employed the blind; you are not aware that when I was having my own sighted child taught, I, in the first instance, employed a very high-class sighted teacher, and that he entirely failed to teach the child to read, and then I employed a blind teacher, who succeeded most admirably?—No; I am very glad to hear of it; that might be accounted for perhaps by the first man having drilled the child into shape, and then the blind man finished him off.

The *Secretary* read the following paper, which had been prepared by the witness (but not specially to be put in evidence; the original notes were commenced at the time of the conference held at Birmingham in the year 1866):—

Memoranda.—For establishing a Central Association for helping the Blind.

National, or Royal, or British and Foreign Institute, or Association for the Blind.

President.

Vice-Presidents.

Treasurer.

Secretary.

Bankers.

Office Address.

General.

1. A. Get information of all kinds.
1. B. Have a list of all institutions, eye infirmaries, and hospitals.
Ditto of all charities and societies, shops for sale.
Ditto of all books and pamphlets on the blind.
Ditto of books, in all types, for the blind, and with price of each.
Have a list of all instruments for the use of the blind.
Ditto of all articles made by the blind.
Ditto of games and amusements for the blind.

2. Send questions to each institution and charity for the blind.
3. Prepare a guide to "Help for the Blind."
4. Have a room (an office) and a secretary.
5. Have a collection of—
A. Books on the subject of the blind.
B. Articles made by the blind.
C. Instruments and appliances for the use of the blind.
D. Samples of material.
E. Report price list, form of application for admission, and all printed papers relating to each institution and charity for the blind.
F. A register, in which shall be entered all particulars about each institution and charity for the blind.
G. A register in which shall be entered the change of residence, town or village (or parish, if a large place), of each blind person (to prevent tramping).

6. Supply to each institution, charity, or society for the blind a register for the names of the blind, in their town or district.
7. Keep a register for the wants of any institution (*e. g.*, what stock is increasing, and what require to complete their order).
8. Keep a list of the best markets in which to buy material and sell goods, and, if desired to do so, buy for any institution.
9. List of blind who want employment.
10. List of institutions which have vacancies for pupils, or journeymen.
11. Make a note of anything written (in the newspapers, magazines, or otherwise) about the blind, and forward same *to any member* of the association who may order it.
12. Advertise. Ask for money, books, maps, models, preserved animals, minerals, musical instruments, appliances, &c., &c., for the use of the blind, which may be lent or given by this society, to the persons, or places, requiring the same.
13. Register of qualified teachers, foremen, &c., who want situations.
14. Issue a short report "occasional paper" from time to time, numbered and dated when necessary or desirable, to all members of the association.
15. Have a commercial traveller or commission agent to act for all, so that in time each institution may find it advisable to keep as much as possible to one class of work (trade).
16. Have a form of statement of accounts, and balance sheet for all institutions.
17. Try to get uniformity in reports.
18. Resolve upon some newspaper or magazine, which shall be the recognised organ, or means of intercommunication for the institutions for the blind, and arrange with the editor or proprietor to report in it all meetings, or information which he receives on the subject; this should be taken (paid for) by each institution.
19. Report any new trade or occupation which has been found, after fair trial for some years, to answer, or any which have failed.
20. List of persons who can and will speak at meetings on the subject.
21. List of all foreign institutions.
22. Register and file copies of all letters received.
23. Register and file copies of all letters sent.
24. The secretary should not be connected with any association for helping the blind.

16,460. (*Chairman.*) Is this supposed to be a scheme for a voluntary institution, to be started, say, by the Gardner Trustees, or by anyone who takes a large view of the wants of the blind?—That is what I would suggest; but the managing body should be thoroughly

Mr. W. Harris.

4 Feb. 1887.

representative. It would not be an institution for the purpose of educating or employing the blind so much as a sort of club-house, where people would get any information of any description relating to the blind, together with the use of a library, &c.

16,461. You think that the blind institutions suffer from want of sufficient correspondence with each other?—Yes, undoubtedly.

16,462. From want of combination in the trade which they practise, and from want of combination in selling their goods and bringing them more before the public?—Yes; we want, in fact, co-operation. We want to do for the blind what sighted people do for themselves. A sighted manufacturer has his works, and sometimes retail shops in different towns, and they are worked together. By that means he gets rid of his stock which is not wanted in one town by selling it in another. That system would probably grow out of this scheme.

16,463. Then you think that, in connexion with this central institute, there should be some organ of the press in order to give information generally to those who wish to assist the blind, and in which blind institutions might advertise and make their wants known?—Yes, that is just what I would suggest, a recognised organ for all matters relating to the blind.

16,464. Do you think that it would be very advantageous for the blind institutions to have every year a conference at which all questions affecting the blind, and the progress of the blind generally might be discussed, and interchange of opinion take place between the managers of the different institutions?—Yes, but not for the managers only but the public also; there should be plenty of publicity. Perhaps a biennial one, as in America, would be sufficient until the public are better acquainted with the subject.

16,465. Such a conference would, of course, be open to the public?—Yes, and a report would be published.

16,466. Do you think that the institutions which you have seen in America show evidence of greater power of combination and interchange of opinion between them than there is in England?—Yes, decidedly so.

16,467. Do you think that conferences of this kind and an institute such as this, would open out new avenues of employment to the blind?—Very probably, and also other ways of helping them.

16,468. This institute would be the means of communicating with all foreign institutions, and it would be a centre of information?—Yes.

16,469. This institute being a voluntary one, of course would have no compulsory power of obtaining information, but it must depend entirely upon the voluntary support of the various blind institutions?—Not entirely on the institutions for the blind; but also on those who have sympathy with the blind and wish to help them, upon the recommendation of this Commission, and when people are known to be working together, it would secure confidence, I think, and would have a great influence for good.

16,470. Is there any existing institution or machinery that you think likely to take up this idea; have you made it known to anyone, or applied to anyone to carry it out?—The details have never been publicly submitted, and I would prefer that it should not be taken up by any existing institution, though it might be taken up perhaps by the Gardner Trustees.*

16,471. Did you get any expression of opinion from them upon it?—I think they said that they were glad to have it, but nothing more than that.

16,472. (*Mr. Mundella.*) Your scheme then contemplates that all assistance to the blind shall be of a voluntary nature?—Yes, undoubtedly for the present, until the subject is better understood.

16,473. And you do not contemplate, in anything that is done for them, that the State shall step in?—Certainly not at present, it is not needed at present. You already have the Poor Law and School Board Acts.

16,474. How have you come to that conclusion? Are the funds at the disposal of the blind institutions in your opinion ample for all purposes?—I believe that when the public have confidence in a body in London, who will undertake to work it, there will be ample funds provided; recently, in one year, more than 110,000*l.* was contributed to the various charities for the blind. You ask me how have I come to that conclusion? to which I reply that, for more than twenty years, I have been studying this subject carefully. I have visited the Continent and America, and read almost all the books named in the Guide to Institutions and Charities, &c. for the Blind, of which book I was co-compiler; so I think I may say, that I am well acquainted with the subject.

16,475. You spoke of the importance, which is undoubted, of the co-operation of all the voluntary institutions of the kingdom, with one centre, that is to say, that there should be one centre with which they should communicate?—Yes, but only a place to obtain intelligence. I do not propose that all goods should be sent to London.

16,476. What do you want the commercial travellers to do, then?—That is merely a suggestion to be taken up if thought well.

16,477. You suggest that there should be a commercial traveller connected with this central institute, to act for the whole of the institutions; what do you want him to do?—I suggest that there should be a commercial traveller, or a commission agent; the latter would save all the trouble of travelling. This also is only a question for consideration.

16,478. To act in what way?—To help to sell the goods when made, and to be acquainted with all the institutions and proposed shops. If I had a hundred gross of brushes that I wanted to sell, he would find somebody who wanted them. If somebody else in another town had a great stock of some other goods, the commercial traveller or agent would discover a market for it.

16,479. But unless those goods are consigned to one depôt, how can the traveller tell what goods there may be for sale in all parts of the kingdom, or what are being sold at the very time that he may be selling them somewhere else?—By writing to this central office. A shipper at Birmingham wants a great stock of a certain article; he writes to London, "Where can "I get a hundred gross?" and they will say, "Try "Leicester," or "Try Derby."

16,480. I am assuming, for instance, that Leicester has a stock of any particular article, and your commercial traveller is informed that there is such a stock, and he tries to sell those articles in the country; in the meantime there is nothing to prevent Leicester from selling them while he is negotiating the sale elsewhere; so that unless the articles are absolutely deposited in a central warehouse or depôt, there may be a conflict of action; and, what is more, the commercial traveller or agent may be negotiating at one price, while you may be negotiating through another party at another price. You have spoken of the American system; do you know the American system?—The proposed commercial traveller would of course have definite instructions. I have lately visited 20 institutions there, and have read many of their official reports, including reports of all their biennial conventions, so I believe I have a good general knowledge of the principles on which they are conducted.

16,481. Do you know anything of the German system?—Yes; I have been to Germany also.

16,482. Have you visited Dresden?—I have.

16,483. Did you see Dr. Büttner and the institutions at Dresden?—I did.

* Such an institute was recommended by the conferences held in 1866, 1867, and 1883, also by the Charity Organisation Society in 1876, one was actually established in the year 1867; but for want of wealthy and influential supporters never got a fair start. The original notes from which it was prepared were made more than 20 years ago, and have been shown to several friends of the blind, also to the Charity Organisation Society and the Gardner Trustees. W. H.

Mr. W. Harris.

4 Feb. 1887.

16,484. Are you quite familiar with the Dresden system?—I believe I am.

16,485. What do you say to the working of the Dresden system?—I should say that there is too much nursing,—that there is a want of liberty and independence on the part of the worker, and that after all he needs and has, perhaps, more help, pecuniary and otherwise, than he would get under the English system; however well that system works in Saxony I think it unsuitable for England. You cannot compare the circumstances of social life in Germany, France, or America with that of England.

16,486. What do you mean by "nursing"?—Too much following up, and looking after and help.

16,487. When they become adult workers, do you think that they are too much cared for?—Yes, in one sense. Their independence is destroyed.

16,488. What do you say to the system in operation there, for the education and training of the blind?—I should say that it was pretty good of its kind.

16,489. You know, do you not, that it is compulsory now to educate all blind children in Germany?—I suppose so.

16,490. Do you approve of that system?—Yes, I should say that every child ought to be educated, undoubtedly, but how or when, or where, I am not prepared to say straight off, for circumstances are different.

16,491. Then you have not thought about that preliminary?—I have thought about it, but it is a very difficult question to pledge one's self upon its details straight off.

16,492. But have they not solved the difficulty in Germany?—I should say that they have only done so to some extent, but not entirely. All the institutions for the blind in the world, I believe, are in a transition state; they are all moving forward, but they have not got to perfection, and they never will get to it.

16,493. There is no perfection in this world; but have they not come nearer to it in Germany than anywhere else?—I do not know that they are any better than Berlin.

16,494. That is quite true; the two places are running side by side. Dresden is the older institution, and Berlin is copying Dresden, is it not, very much?—Berlin may be copying Dresden, you will find that the institution at Berlin is the older one. I may add that I consider that the principles adopted in America lead to more successful results than are attained in any other country.

16,495. They have both resolved that all blind people and blind children shall, as far as possible, be trained to earn their own living, giving them intelligence and handicrafts; is not that so?—Yes.

16,496. Do you not think that we ought to do that in this country?—Undoubtedly.

16,497. Without the obligation upon the localities to help those who cannot help themselves, and the obligation upon the parents that they shall not neglect their children, do you think that we shall ever accomplish that result?—I believe that the school board have the power to do it.

16,498. But they do not do it, do they?—I have heard of some which are to some extent doing it. It may be necessary to make their powers compulsory instead of permissive.

16,499. And you think it is desirable that they should be made compulsory?—Undoubtedly.

16,500. That if they have a blind child in any village in Leicestershire, for instance, of a certain age, that child shall not be neglected and allowed to grow up to be a probable burden upon the population, but shall be trained and made intelligent, so that it may earn its own living?—Certainly.

16,501. If the parents could not pay you would require the commune, or the locality, or the municipality to pay as they do in Germany and Switzerland?—Yes.

16,502. You would train blind children up to the age of 17 or 18 until they can be turned out in the world to earn their living?—Yes, so far as they are able to do so; but all should be so educated as to make them useful and intelligent members of society.

16,503. Then you want an institution to come in, you say, which shall have some relation to all the blind all over the country, and assist them to find employment, and to dispose of their products?—Yes; but the proposed institute is intended chiefly for the sighted who wish to help the blind, and the managers of institutions for the blind. Give the blind education, and if they have ability they will with the help of their friends take care of themselves. I find from observation that those blind persons who have got on best in the world are those who have not been nursed in institutions.

16,504. But do you believe that as a matter of fact the blind can produce their various kinds of wares, and at the same time sell them and distribute them, unless somebody else does the commercial part of the transaction, that is to say, assists them in the purchase of the raw material at a low price, at first cost, and also in the distribution of the articles at the best possible price when they are manufactured?—Undoubtedly they would not be able to get on by themselves; they are entirely dependent upon persons who can see to help them, and if they have no friends "workshops" would be needful for them.

16,505. Then they want what you speak of; they want in fact co-operation?—Yes, and help.

16,506. But that co-operation is the aid of sighted persons who will take an interest in the blind?—Yes, they cannot do without the sighted.

16,507. And carrying on your simile of co-operation further, you would have what they have in Manchester, viz., a wholesale co-operative department where they do two things, simply buy the raw material and sell the goods?—Yes.

16,508. (*Dr. Tindal Robertson, through the Chair.*) With regard to your proposal of having a newspaper for the blind, should that newspaper be simply printed for ordinary use for circulation with regard to advertisement and so on, or is it desired that it shall be also printed in blind type, so that it may circulate among the blind themselves, or both?—I was providing for the sighted in order that they might know what is being done to benefit the blind. For instance, I see in the proposed newspaper that Mr. Mundella is going to give an address somewhere; I think it will be worth while to go and hear it, and I go. Had I not seen the notice, I only see a short account of it in the "Times" which is not perfect, and I get a false impression of what Mr. Mundella said.

16,509. (*Mr. Mundella.*) You have said that you think that the blind in Germany get too much nursing. My friend Dr. McDonnell and I have both seen them working in Dresden, and I think Dr. Armitage too, and we are of opinion that there is no nursing there. There is registration, and the earnings of those who cannot make enough money to live upon are supplemented a little. But the voluntary principle comes in there; the State educates and the volunteers maintain and supplement. Is not that your experience?—No.*

* I believe they get very much more than the little help supposed, and I do not recommend that system for England. I would recommend the careful study of the paper officially communicated by Mr. Büttner, the Director of the Dresden Institution, for the information of the French Government, in it the following statements will be found:—

1. An outfit and assistance, *as far as needed*, is given when the pupil leaves.
2. It is found that blind children who do not begin their training till the age of 13 or 14 seldom become good workers.
3. Very few are trained as piano tuners as there is not much demand, and it is feared that this will oblige the blind tuner to seek custom from house to house which might lead to his degradation.
4. In rope making there is much exposure to weather, and the rope maker must possess a sound constitution.
5. The director looks out for some gentleman of position, respectability, and common sense, to watch over the interests of the blind pupil.

Mr. W. Harris.

4 Feb. 1887.

16,510. And if they are not well behaved they do not get the voluntary help?—That is so; but I was going to say further that where there is too much done for them the spirit of independence is destroyed, because they know that they will always get help. I went to see some of these Saxon people work in their own homes, and I will tell you what I saw,—there was a little shop where they lived, and in their shop window they were selling things made by the sighted.

16,511. Why should they not do so?—I do not say that they should not sell them; but as they were under the Saxon system I expected to find them making and selling their own goods. On asking "What can you earn?" the reply was, "So much, *if* I can get work," implying that constant employment was not provided.

16,512. But is not that the case with this country, too?—Not as a rule in workshops. In workshops, work is provided whether the goods made be sold at once or not.

16,513. I am afraid we have abundant evidence that the blind are sometimes put on half time because they cannot sell their products?—At Leicester constant employment with full pay is provided all the year through, and in addition to their earnings 2*d.* is given to the blind men for each shilling earned, and the women receive double what would be paid to sighted persons for the same work.

16,514. Do you not find that the Saxon system is a very strong stimulus to them to maintain their character and their respectability, and temperance and good behaviour, and to keep out of bad company, and so on?—Yes, there would of course be some stimulus of that sort, and employment in workshops leads to the same results.

16,515. They can always be free from it, can they not, if they choose to be independent, but then they do not get any help?—Exactly so, and on the same principle they are not compelled to go to the workshops; they go there because they like it, and if you turn them out they will do anything to get back again.

16,516. (*Chairman.*) Do you think that your system of workshops is better than the Saxon system?—I should certainly say so for the friendless blind.

16,517. You say that you always supplement what the blind make by their work?—Yes, the men get twopence for every shilling that they earn, and the women get about double what is paid to sighted persons.

16,518 (*Dr. Armitage.*) How many institutions in Germany did you visit?—I have visited 13 in Germany, also two at Prague, three at Vienna, and one at Munich.

16,519. How long did you take to visit all those institutions?—I do not remember. I have been in Germany several times, and did not see all during the same visit. A sighted person who is well acquainted with a subject, like a school inspector, can see a thing in a moment and arrive quickly at a good general opinion. An auctioneer or land agent will value an estate or block of buildings in a very short time if he has had twenty-five years' experience, and it has taken me nearly twenty-five years to get my experience.

16,520. Do you speak German?—No, but I always had a person with me who spoke German, and I found people at the institutions who spoke English.

6. *Very often the parents'* home is not convenient for carrying on the trade selected; A., so lodgings have to be found, and if necessary the directors guarantee the punctual payment of the rent for some time; B., a basket maker wants some place for soaking his willows; C., a rope maker will need a rope walk near his dwelling.

7. Where there is not likely to be a decidedly bad influence at home it is best to send the pupil *to board with* his parents.

8. The parish lays out the rope walk and gives the land.

Adjourned.

At 6, Old Palace Yard, S.W.

Wednesday, 11th May 1887.

PRESENT:

THE RIGHT HON. THE LORD EGERTON OF TATTON IN THE CHAIR.

ADMIRAL SIR E. SOTHEBY, K.C.B.
W. TINDAL ROBERTSON, ESQ., M.D., M.P.
B. ST. JOHN ACKERS, ESQ.
T. R. ARMITAGE, ESQ., M.D.
W. AUCHINCLOSS ARROL, ESQ.
F. J. CAMPBELL, ESQ., LL.D.
EDMUND C. JOHNSON, ESQ.
THE REV. W. BLOMEFIELD SLEIGHT, M.A.
THE REV. CHARLES MANSFIELD OWEN, M.A.
CHARLES E. D. BLACK, ESQ., *Secretary.*

The REV. HERBERT JOHN RANDALL MARSTON examined.

Rev. H. J. R. Marston.

11 May 1887.

16,521. (*Chairman.*) You are now rector of Icombe, in Gloucestershire?—Yes.

16,522. When were you appointed?—In October 1883.

16,523. Were you educated at the Blind College at Worcester?—After I lost my sight I was educated there.

16,524. When did you lose your sight?—I lost my sight when I was 11 years of age. I was just going to Eton. I had been prepared for Eton with the present head master of Harrow. After I lost my sight I was in abeyance for two years or rather more, and then I went to Worcester College. I got the rudiments of my knowledge at preparatory schools.

16,525. From Worcester, I think, you went to Durham University?—Yes.

16,526. And you became a fellow of the University of Durham?—Yes, I proceeded from Worcester to Durham, where I took my degree and where I obtained a fellowship, which is a title to orders, as no doubt you are aware.

16,527. Then from Durham University you went back to Worcester College as a master?—Yes.

16,528. Have you a curate now?—No; the population of my parish is only about 200.

16,529. You are able to visit all your parishioners without any difficulty?—Yes, perfectly, without any assistance.

16,530. Have you any remains of sight?—Yes; I can see this white paper before me.

16,531. Can you find your way in the streets?—I cannot in London, but I can in the village streets and even over a field. I can get on pretty well in the country roads within about two or three miles of my own house.

16,532. Can you speak to the present state of Worcester College?—I can only speak of the past. I have no practical knowledge of the present state of the college beyond what I get from private sources. I have an intimate knowledge of what the college was up to the time I left it in 1883.

16,533. Do you think that the college fulfilled its object of educating young men for the Universities?—Yes.

16,534. Were you taught the usual curriculum of a public school?—Yes, I was.

16,535. When you went from there to Durham what examination did you pass?—I took a foundation scholarship of 50*l.* a year. I was examined in high Latin and Greek classics, Tacitus and Horace, and I had to do Greek play.

16,536. Was the examination *viva voce*?—No; I dictated all my answers to one of the undergraduates.

16,537. Had you any difficulty in getting the books you wanted when you were at college?—A very great difficulty.

16,538. Had you any difficulty in getting on at Durham in the usual course?—None except those which a blind person necessarily has to encounter.

16,539. Was your blindness such as prevented your going about by yourself?—As a matter of fact, I never did go about Durham alone outside the college; but that was my own fault. I can go about Durham alone now when I go there to lecture and so on. Durham is a very easy place to get about in.

16,540. Were there any seeing pupils at Worcester when you were there?—Yes.

16,541. And did you engage in games with them as far as you possibly could?—Yes.

16,542. What games could you join in; could you see enough to be able to join in games of football with those who could see?—It was not so much that we blind boys joined in their games as that we got them to join in ours. We had a football which all the boys sighted and blind could play with; it was of a very large size with bells in it, so that it was very palpable and very audible too.

16,543. Had you a gymnasium there?—Yes.

16,544. I suppose you consider athletics and gymnastics of great importance to the blind?—I do. I do not consider drilling of much value. I do not consider ordinary drilling is much good for any boy. I hated it as much when I could see as when I could not see; it is stupid sort of work, I think; but I think gymnastics of the highest importance. Of course a blind boy can never so drill as to become a volunteer, and I think marching about and whirling your arms round are ridiculous and of no value whatever.

16,545. Were you able to take walks into the country?—Yes; all the boys walked out as far as five miles into the country, and the elder boys were allowed to go anywhere in the town.

16,546. What amount of supervision or sighted assistance did they have?—The elder boys had none, and as regards the younger boys who were blind—that is to say, boys under 14—the rule was that they were never allowed to go into the town alone—that is to say, not without being accompanied by a sighted boy.

16,547. Could the older blind boys go five miles into the country without a guide?—Yes. I have done it many times myself and I can do it now at home; so can my late pupil, Sandford, he has many a time walked five miles and paid a visit and come back without assistance.

16,548. He has some glimmering of sight?—Not as much as I have, I think.

16,549. With regard to the higher education of the blind, do you think it is in a satisfactory state at present in England?—Not at all.

16,550. You do not think Worcester College supplies the want?—No.

16,551. Have you formed any opinion upon the question whether the State should encourage the higher education of the blind in any way?—The fundamental view I take of the whole subject is that sighted and blind education should go precisely *pari passu* and on identical lines as far as possible.

16,552. You think the blind ought to go to the Universities with the seeing?—Yes; and in the case of the poor the strictest compulsion should be exercised in sending poor blind children to elementary schools. I think the blind of the upper classes should be left to shift for themselves as the sighted are, that they should not be State aided.

16,553. Do you think that the provision which is made for the education of the blind in the upper classes or the middle classes is satisfactory?—No.

16,554. Why do you think it is unsatisfactory?—Because I think that the Worcester school, which is the only school so far as I know that at all meets the want, does not meet the want adequately. I think it does not meet the want in point of teaching power, and I think it does not meet the want in point of efficient publicity; and there is also a want, I will not say of endowment, but a want of proper educational apparatus; there requires to be a certain amount of money laid out to provide maps and books, and so on.

Rev. H. J. R. Marston.

11 May 1887.

16,555. If such an institution is left to private enterprise it has to depend upon the demand for that sort of education?—Yes; I think it or a similar school should exist upon a public school footing.

16,556. I thought you said that your view was that the blind should go to the same colleges as the seeing; if that were carried out Worcester College would have to be abolished?—I think the blind should go to the same universities as the seeing, because the universities have charters for conferring degrees, but the blind in the middle and upper classes should have schools of their own, because the difficulties of teaching blind boys are such that they would not be met at Harrow or Eton, I think.

16,557. You start with the proposition that the seeing and the blind should be treated exactly in the same way?—Yes.

16,558. But you now say you would teach the blind in schools of their own?—All I mean by saying that you should treat them in the same way as the sighted is that you should treat them as much as possible as though they could see; you should minimise all reference to their blindness.

16,559. Would there be a sufficient number of blind of the class who would want higher education to keep up a college like Worcester?—Yes, I think so.

16,560. You say you think the reason why it does not meet the want is that there is not sufficient publicity, and because there is a want of completeness in the arrangements and in the educational apparatus?—Yes; a better house is wanted, and I do not think the teaching power is efficient.

16,561. Do you happen to know what Gardner's trustees have done for Worcester College?—I ought to know, but I am afraid I have forgotten. They gave some scholarships, I think.

16,562. There are five Gardner scholarships at Worcester College, which vary from 20*l.* to 30*l.*, and it seems that there is at present a fund of 60*l.* which is not utilized. Do you think that Gardner's trustees might be asked to do more than they do now?—I had forgotten the number of Gardner scholarships. I consider those adequate looking at the present number in the school, but I think with a school containing the number that I think ought to be there, perhaps Gardner's trustees might do more. I think poverty has been generally the seed ground of intellectual excellence, and not wealth.

16,563. When you are speaking of the shortcomings of Worcester College, you are speaking of the state of things in your time; you are not speaking of the present state of things?—No; I think we were very much hampered by the difficulty of getting books and maps and so on; the limitation of our space, the imperfection of our house, and so forth.

16,564. Do you think there should be scholarships specially for the blind at the universities, or do you think the scholarships should be open?—I think the Fawcett scholarship is a good move; I should be opposed to extending scholarships for the blind very much. We have got scholarships more than once from sighted men.

16,565. Do you think that all schools for the blind should be inspected by a public inspector?—Yes, I do, emphatically.

16,566. Do you say so having yourself inspected such schools, or only on general principle?—On general principle and from what I have heard. I have never inspected a blind school. I once assisted in a school somewhere in Manchester. I think it

Rev. H. J. R. Marston.

11 May 1887.

was Henshaws, in looking over some papers. That is all I have ever done in the way of inspection.

16,567. Do you think the inspector should be a seeing man?—I think if you are only to have one he had better be a blind man.

16,568. How could he inspect the details; how could he see whether the house was clean or not?—He could not see that.

16,569. You mean to say you would have a blind man to test the literary acquirements of the blind?—Yes.

16,570. Why could not a seeing man who had learnt the Braille type do that?—Because a seeing man would never be severe enough in demanding the full powers of the blind; no man who has not himself been through the course of education that a blind man goes through knows how much he can do and how much he might fairly expect.

16,571. Then you think there should be two inspectors?—Yes, I think that would be the best arrangement; that would be in every way desirable.

15,572. Do you think they should be appointed by the State?—Yes.

16,573. Do you think that our present system of Blind Asylums is a good one, or are you in favour of the blind gaining their livelihood in their own homes, as far as possible, after having gone through the usual curriculum in the elementary schools of the country?—I think the arrangement suggested in the latter part of your question is much better than the Blind Asylum system.

16,574. Suppose the blind have gone through the ordinary curriculum of an elementary school and then have to earn their livelihood, what provision would you make for teaching them a trade?—I do not think I can offer any evidence that would be of any value upon that point.

16,575. You have not thought that question out at all?—No.

16,576. You do not speak as the representative of the blind upon that point?—No, I have no knowledge of the poorer blind, and therefore my evidence would be purely empirical on that point, and would be of no value.

16,577. When you were at Durham you never visited the Newcastle or Sunderland workshops?—No, I did not. I understand that they are very useful institutions.

16,578. I was asking you whether you thought there should be some special place where the blind could be taught trades?—I should suppose so.

16,579. Of course they are at a disadvantage in learning a trade with other people?—Quite so.

16,580. You do not approve of asylums, but I understand you have not the same objection to workshops for the blind?—No, I do not regard them in the least in the same category.

16,581. I presume you think the blind should be taught as early as possible, at as early an age as other children?—Yes.

16,582. With regard to books for the blind, have you any suggestion to make? It has been suggested that the State should give some grants for books for blind schools, which must necessarily be more expensive than other books; have you thought that matter out at all?—I have never thought of that. I am not a great believer in State intervention in any of these things myself.

16,583. In what way would you enable the poor blind to get books, the price of which is necessarily high; it must either be by State aid or by means of voluntary societies?—Yes.

16,584. Which would you prefer?—The aid of some voluntary society, if it could be got. But is there not some other way? Cannot we, by educating the mass of the poorer blind of the country to be book copiers, make it a comparatively remunerative trade? I have taught Braille to several children in my school, could not we teach our blind children to produce Braille books?

16,585. Many books are produced in Braille for nothing, that is to say, they are produced by volunteers?—And they are also produced as a means of livelihood.

16,586. Do you know of any one who earns his livelihood at it?—I understand there are some who earn a livelihood by producing books in Braille. Books might be got at a much cheaper rate if the production of them were extended in that way.

16,587. Did you find any difficulty in getting the classical books that you wanted?—I found it excessively difficult to get them. You may get an "Agamemnon" of Æschylus for 6*d.*; it cost me a sovereign for a copy, and it is the only copy now extant, I believe.

16,588. You are in favour of such books being provided by voluntary means and not by the State?—I am.

16,589. Did you get the classical books which you wanted to study specially written for you?—I did; not all of them, but the majority.

16,590. At the present time I suppose the number of those who take up classics among the blind is so few that it would not pay to print any number of classical books?—It would not pay in the ordinary sense of the word, but if education of the higher sort was developed among the blind, so as to create a demand, we should probably get for 10*s.* what we have to pay a sovereign for.

16,591. It would require rather an extra amount of energy and self-reliance on the part of the blind to go through an education of that kind; is not it rather hopeless to expect that a very large number of blind would go through that course of education?—Quite hopeless; I do not think it would be a large percentage of the whole that would go through that course of education.

16,592. Do you know any blind young men who are at present studying for orders or for any literary profession?—I know three or four young men at Oxford who were pupils of mine at Worcester, and I know three at Durham who were pupils of mine at Worcester; I know one at Cambridge, and then there is one pupil of mine who has just gone into the law under Dr. Ranger.

16,593. Is there anything else you would wish to lay before the Commission with regard to the blind generally?—I do not know whether there is a public schoolmaster sitting upon the Commission, but my strong conviction is that those who teach the sighted are perhaps the best judges of how the blind ought to be taught; that would follow from what I said before; that is an opinion, of course, very much open to contention, but that is my opinion.

16,594. (*Mr. St. John Achers.*) At the present time is not there an effort being made to move the Worcester College?—I know an effort has been made to change it into a public institution instead of its being a private one; I do not know whether that would involve a change of situation, probably it would.

16,595. I may say I have been appealed to by one of the present pupils, and I saw a collection card and so forth?—The old buildings were not satisfactory, not only because they were too crowded and too small, but also on account of their situation

16,596. They were very unattractive to the parents of blind children who might wish their children to go there?—Yes.

16,597. If the school were moved and put into a better position, and made a public school, do you think the number attending it would be largely increased?—Yes.

16,598. What is the lowest payment taken from any pupil?—I have no official knowledge; I should say, as far as I can judge, they would have been taken at 30*l.* a year; that was by no means what was asked.

16,599. Was the number of pupils in the college less than it otherwise might have been because intending pupils, though they might have been able to pay more fees than in the ordinary elementary

schools for the blind, were not able to pay the fees demanded at Worcester?—I do not know.

16,600. You do not know whether there were many cases in your time where the applicants were not admitted because they could not pay the fees?—I do not think there were many.

16,601. Do you think there is great room for a school or schools of secondary education between the primary schools or institutions of the country and Worcester College?—I do; I think it would be a very great boon; it would render the education system complete.

16,602. (*Dr. Armitage.*) In the last report of Worcester College which I saw it is stated that nine of the former pupils are in the Church, is this still so?—I believe so; I could not have told you the number was nine, but I have no doubt that is correct.

16,603. Do you know whether most of them are, like yourself, in small livings?—Mr. McNeile has a population of about 1,200; his parish is a large country parish. Mr. Beresford has a county cure. I do not know whether Mr. Beresford's living is a large or a small one. Mr. Robins has, I believe, a town parish; he is at a place called Gillingham. I think the others are curates. Then Mr. Marsh has charge of a portion of a very large Nottingham parish, Mansfield, his cure consisting of some thousands of stocking spinners.

16,604. Do you know whether there is much difficulty made by the bishops in ordaining blind clergymen?—I think that a good deal depends on the clergyman and something on the bishop; I found no difficulty whatever.

16,605. Are there any bishops who refuse to ordain blind clergymen?—I do not think there are now. The Bishop of Worcester hesitated a good deal about me, but when I had taken my degree he did not hesitate to ordain me for a moment.

16,606. How do you manage in administering the Holy Communion; can you do it without assistance?—Yes, I did it last Sunday without the slightest trouble.

16,607. How many communicants have you?—I had eight or nine last Sunday; I never have more than 20. I administered the Communion in a church in Manchester the other Sunday, a church that was strange to me, and there were about 50 communicants there.

16,608. By yourself?—No, the rector was present; I was preaching there.

16,609. From what you know of other clergymen who graduated from Worcester, do you think there is any practical difficulty in blind clergymen administering the Communion?—Absolutely none; I do it myself, and Mr. McNeile does it to a very much larger congregation than mine. It would be very awkward if all the communicants were blind, but as only the minister is blind there is no difficulty, it only requires a little tact.

16,610. Have you any special arrangements, by means of a carpet or anything, to guide you in going round?—None at all.

16,611. You have to feel at the rails sometimes, I suppose, to know your distance?—Scarcely ever; I do not think you would know I could not see if you were watching the ceremony.

16,612. You know that is an objection that is often raised to blind clergymen?—Yes, I think I have heard it; I do not think there is anything in it. I should never dream of its being in any way an impediment to the ordaining of a blind man who possessed the necessary qualifications.

16,613. (*Chairman.*) Is not your case somewhat different from that of a man totally blind, because you can see a little?—I cannot see you in the least; I could just see a communicant if he was against a white wall, but I cannot see him in the middle of the communion table.

16,614. (*Dr. Armitage.*) Do most of the Worcester pupils who go to the universities go into the Church?—I think that the majority have done so hitherto; I should say decidedly the majority have done so, but I think they are not doing so now so much.

16,615. What other professions are open to them?—The law is one profession open to them; two have now entered the profession of solicitor, those two being Dr. Ranger and my late pupil, Mr. Sandford, who has gone as articled pupil to Dr. Ranger.

Rev. H. J. R. Marston.

11 May 1887.

16,616. I see in the report it is stated that a certain number have gone out as literary teachers; does that mean teachers at a blind college?—I could not tell you. I hold a readership in English literature at the University of Durham, and I have to lecture there four times a year. I do not know whether that is what it means.

16,617. Do you know of any who coach, seeing pupils for examinations?—I only know one, who was in his uncle's school at Eastbourne, which was a sighted school.

16,618. You do not know what sort of opening that affords in a money point of view?—No, I do not.

16,619. Can you give us any idea as to what opening the Church affords in a money point of view?—It depends on the glebe and it depends on agricultural depression; my glebe lets at 50*l.* a year at present. That is a question which it is rather difficult to answer.

16,620. What is your whole income from the Church?—I suppose nominally my whole income is about 150*l.* or 160*l.* derived from the Church. I have a rectory house and a fine garden, and so on.

16,221. You do not know the incomes of other blind clergymen?—No, I do not.

16,622. Do you think that a university training is generally a desirable thing for blind persons who have nothing else to depend on?—It depends altogether primarily on their social status. In the case of all such persons who, if they had their sight, would go to the university, I should say it is absolutely desirable that they should have a university training; in the case of other persons it would be an open question.

16,623. Worcester College professes to take the sons of gentlemen?—Yes.

16,624. Therefore they would be of the social status of persons who usually go to the universities?—Yes.

16,625. Do you think it a desirable thing for blind persons of that class if they have nothing of their own to go to a university and take their chance?—Yes; speaking generally, I do; but I would not say that a boy with a very great musical gift and no particular literary gift should go to a university; he had much better go where he could get his musical education best and quickest, and begin to support himself.

16,626. But there is a Worcester College pupil who is going in for his degree in music at Oxford?—Yes, I believe so. I do not know much about Worcester College now, but I believe young Wolstenholme has passed his entrance at Oxford; that I consider a good thing for him, because I suppose it is a good way of getting into the musical world. If I am right in that supposition, I thould say it is a good thing; if not, I should say it is not.

16,627. You were speaking of the blind writing out books. You are probably aware that it costs so much to remunerate the blind for that work that the books become very expensive when they are to be sold?—I suppose that is so.

16,628. Suppose the Gardner trustees instead of giving five scholarships to Worcester College, gave four, and gave the amount which would represent the other scholarship for books and educational apparatus, do you think that would be better for the college as it is now?—I should be inclined to think it would. That opinion of mine is not worth much, because I am not fully conversant with the present state of things at Worcester.

16,629. (*Admiral Sir E. Sotheby.*) You were at Durham?—Yes.

16,630. Were there any blind students at Durham when you were there?—One, part of the time that I was there.

Rev. H. J. R. Marston.

11 May 1887.

16,631. Do you know whether he took his degree?—Yes, he did.

16,632. What became of him?—He is a clergyman.

16,633. Do you know whether there are many blind students at Oxford and Cambridge?—Yes. I know three or four now at Oxford, and one at Cambridge.

16,634. Do they as a rule take their degree?—Yes, one is a senior op. I think the best man we ever had at Cambridge.

16,635. Do you take pupils?—Yes.

16,636. Are they sighted or blind?—I have two pupils. One is a blind boy, and the other can see pretty well but his eyes are affected; he can see to play cricket.

16,637. Do you feel yourself quite competent to take sighted pupils?—Certainly.

16,638. What remuneration do you get from your pupils?—I get 90*l.* a year for each of my boys.

16,639. Do you teach them mathematics?—I do not teach much mathematics.

16,640. You teach them classics?—Classics and history.

16,641. What is the age of the boys?—One is 15, and the other is 18.

16,642. Do you propose to keep them for any definite time?—I propose to get the one who is 18 up to Cambridge as soon as I can. I propose to send him in for the Fawcett scholarship at once.

16,643. Do many compete for the Fawcett scholarship?—It has never been offered yet. I believe it will be offered in September for the first time.

16,644. When you left Durham you went back to Worcester as a master?—Yes.

16,645. And there you saw ample room for improvements?—Yes.

16,646. Did you suggest that any of those improvements should be introduced?—Yes, I tried to introduce as many as I could.

16,647. Why were they not adopted?—Some of them were adopted.

16,648. You think Worcester College was on a better foundation when you left it than it was when you were a scholar there?—Yes, I think it has improved decidedly.

16,649. When you left there was still room for improvement?—Decidedly.

16,650. Which could not be carried out for want of means?—Largely owing to that, I think.

16,651. Principally?—I will not say principally. I do not attach primay importance to money in education.

16,652. Did the master object to introducing improvements out of the old lines?—I would not say he objected, but I think perhaps he was rather difficult to move out of the old lines.

16,653. Were there any other blind masters at Worcester besides yourself?—No, not till about three months before I left, and then the mathematical master came from Cambridge, who was blind.

16,654. You spoke of the great expense of these books. When a book is once in print it can be stereotyped to any extent, can it not?—Yes.

16,655. Then the price would diminish?—But then as the Chairman said, it is scarcely worth while to print the "Agamemnon," because perhaps only a dozen copies will be asked for in a dozen years; very few men read the "Agamemnon" even among those who can see.

16,656. In your parish you attend your school as most clergymen do?—I do, and I have taught the only sixth standard girl that there is in the school to read Greek to me.

16,657. Is she going to any college when she leaves school?—I am afraid not.

16,658. Do you know the greatest population that any blind clergyman ministers to?—I have not the least idea.

16,659. (*Mr. Arrol.*) You have expressed very strong opinions in respect to making no difference between the blind and the sighted?—I said that as possible, as far as circumstances would admit, I would treat them identically.

16,660. Would you be disposed to recommend that the blind should be educated along with the sighted in elementary schools?—Yes, I would strongly.

16,661. Up to what age?—I am not prepared to say up to what age; I would put no limit.

16,662. Then would you recommend that there should be special institutions for the training of the blind after they left those elementary schools?—I have never thought about that. I can give no opinion upon that that would be worth having.

16,663. You consider from your own experience, you having had your sight in your early years, that it is quite possible for the blind to take their place in a public school or a university alongside of the sighted?—You use the term now "a public school"; a public school and an elementary school are not the same thing; when in answer to your question I said I would recommend that the blind should be educated along with the sighted in an elementary school, I was referring to the children of the poor; when you speak of a public school I take it you mean a school in which children of the better class would be educated, and I am not in favour of sending blind children of the better class to a public school, because they would not get the attention there that they ought to have if they are to succeed. I do not wish to put blind boys against sighted boys until they get to college.

16,664. Why would you so keep them apart?—Because I know that if you sent a blind boy to Harrow or Eton the chances are that he would be very much neglected, because his books and his appliances would be a dead language to the masters.

16,665. Would not it rest very much with the pupil himself?—I think not; for instance, his reading would be slower than that of the other pupils; if he had 50 lines of Virgil to prepare it would take him three times as long to read it as it would the sighted; he would have no dictionary as the sighted would have. All those things have to be considered.

16,666. Those are difficulties which might be overcome?—I think they might be overcome, but I think practically they would not be overcome.

16,667. If you trained the blind in separate institutions, might they not when you placed them in a university be at a disadvantage?—No, I think not; I think that in every good public school for the blind there should be a sighted element.

16,668. You would require to assimilate the sighted with the blind?—Yes.

16,669. In answer to one of the questions put to you by the Chairman, you said that you had no difficulty in getting on at Durham except those difficulties which a blind person necessarily has to encounter; what were the difficulties to which you referred?—I mean, for instance, this, I had perhaps ten Greek plays to read for my degree; I had perhaps three embossed, and I had to get the other seven read to me.

16,670. In respect to your pastoral duties, do you make use of any system of writing in preparing your sermon?—I sometimes make a few notes in Braille; I never read my sermons.

16,671. You study your sermon thoroughly and deliver it extempore?—Yes.

16,672. (*Dr. Tindal Robertson.*) I think you said that you did not know that there were any coaches at Oxford who are blind?—I did say so.

16,673. Have you heard of Mr. Charlesley?—Yes, I had forgotten him.

16,674. You know that he has been a coach at Oxford for many years?—Yes.

16,675. Probably you know that he has followed his work with great success?—That I do not know; as he has been there some years I presume he must have been successful.

16,676. How do you communicate with your friends otherwise than by Braille?—I write with an ink pencil.

16,677. Do you think it possible that correspondence by type-writing could be carried out further than it is by the blind. That is to say, by means of a type-writer, so that what was written could be read by the sighted?—I think it would be a very useful thing.

16,678. You think it would be a good thing if that could be more systematically carried out in schools than at present?—I think it would be an excellent thing.

16,679. Dr. Armitage asked you, with regard to the pupils at Worcester College, whether you thought it advisable that they should go to one of the universities or not. I think you said that they might advantageously go to a university if they were in a social position to enable them to go there; but do not you think that many of them, though they might be in a good social position, would scarcely be able to go to a university unless they were largely assisted by funds from the Gardner trustees or from some other source?—Yes, I think so.

16,680. Still, though they did not go to the university, they might get a good education at the college itself?—Certainly.

16,681. The education they would receive there would be a great advantage to them, whether they went to a university afterwards or not?—I entirely think so.

16,682. Arising out of that, I would put this other question: I think it is in contemplation at the present time to put Worcester College in a different position; have you any suggestion to make as to the best way in which that could be done?—No.

16,683. (*Chairman.*) You said you could not speak of Worcester College as it is, you could only speak to it as it was?—That is so.

16,684. (*Dr. Tindal Robertson.*) I will put my question in a more general way; putting aside Worcester College for the moment, what, in your opinion, would be the proper constitution of such an institution?—I think simply this in general terms: a house should be secured which should be turned over to trustees, with a small amount of land round it for playing ground; a house that would accommodate 50 or 60 pupils, to which institution should be a master's endowment of about 150*l.* a year, or going up to 200*l.* or 300*l.* a year at the outside, and perhaps half-a-dozen scholarships, then the institution should be supplied with thoroughly good educational apparatus.

16,685. Probably you agree with most of us that physical training for the blind is most important?—Yes.

16,686. And therefore do you not think it would be advisable that such a college as Worcester College, or any high college for the blind, should be provided with the best possible means for giving that training?—I quite think so.

16,687. (*Dr. Campbell.*) I think from what you have already said you agree with me that the blind, if they are going in for higher education, should go to an ordinary university. I know that in America it is proposed to establish a special university for the blind; I myself think that the blind would be great losers thereby. Besides the value of the education which you get in a university, do not you regard the associations and friendships which are formed during a university course as of very great value to a blind student as well as to a seeing one?—Yes, I do indeed; that is an opinion which I share in common with all English gentlemen, I think, who have been to college; that is supposed to be the chief advantage of going to college. I agree with you in what you say about a blind university; I think it would be a great mistake to establish such an institution.

16,688. (*Rev. Mr. Owen.*) Do you know the services and prayers fairly by heart?—I always use a book.

16,689. With regard to occasional offices, weddings, christenings, and burials, you read from the book?—Yes.

16,690. You know a great deal of the services by heart, I suppose, so that you do not read the services so slowly as to be tedious?—I do not read slowly; I am supposed to read too fast.

16,691. Speaking generally, do you know the services by heart, or do you principally rely on reading by your fingers?—It is a combination of both; I read the lessons which I do not know by heart and the psalms too.

16,692. How do you write to sighted people?—With an ink pencil.

16,693. Do you use a frame?—Ordinary paper with a little bit of wire under it.

16,694. (*Mr. Johnson.*) I believe you were at Worcester in the time of Mr. Blair?—Yes.

16,695. He was the originator of the college, was he not?—Yes.

16,696. And most of those gentlemen who have succeeded in the Church, or in other professions, including one or two solicitors, received a portion of their education during the time Mr. Blair was there?—Yes, I think all of them, certainly most of them.

16,697. I suppose you are aware that Mr. Blair did all he could to make the college public?—Yes, I am; I do not know what steps he took, but I know that was his object.

16,698. Have you any knowledge that it was the intention of the committee of the college to solicit public subscriptions to rebuild the college. I am speaking of the time you were there?—No, I do not think I knew that; I know there was a continual talk of it.

16,699. You are not aware that plans were drawn, and that photographs of those plans were circulated, and appeals made to the public for subscriptions?—No, I was not.

16,700. The teaching power at the time that Mr. Blair was there was very efficient?—I should say very efficient.

16,701. It produced very satisfactory results, did not it?—Yes it did.

16,702. Was there at that time an admixture of the sighted with the blind in the college?—Not to any extent under Mr. Blair's reign.

16,703. During the time that you were there as a boy there were, as I understand, very few sighted boys associated with the blind boys?—Yes, there were a few, but the whole number of boys was small; there were some sighted boys in my time, two or three.

16,704. Is it the fact that sighted boys have been added lately so as to fill up the deficiency in the number?—No, that was distinctly not the object. When I first went back as a master from Durham the school was then flourishing, and boys were added not at all for that purpose. I think they were added to add to the income of the school, but partly also as guides and readers and writers and playmates for the blind.

16,705. Then the council thought it would be a desirable thing to associate the sighted with the blind?—Yes.

16,706. So as to aid them and teach them games, and so on?—Yes.

16,707. I think you told us that there was not very much supervision over the elder boys when outside the college?—Not when they went for walks along country roads.

16,708. Do you think that a desirable thing?—Do you mean on account of danger to themselves?

16,709. No, on account of danger to their morals?—That is a question that would appertain to the discipline of the school in common with all other schools, but *quâ* blind I say it is a desirable thing that they should be allowed to take those walks by themselves. I think there are certain boys to whom that liberty should not be allowed, but as a rule I think it should be allowed.

16,710. I suppose if there were sufficient means found there would be a sufficient number of blind persons who would avail themselves of a college of this kind?—Yes, to the extent of 50 or 60. I could not bind myself to the number; possibly there might be 100, but 50 or 60 is my idea of what the average number would be.

Rev. H. J. R. Marston.

11 May 1887.

Rev. H. J. R. Marston.

11 May 1887

16,711. How is it that so few apply for admission at the present moment?—I do not know. I do not consider myself that the state of the college, so far as I can gather, is satisfactory.

16,712. In what way do you think it is unsatisfactory; you told us you thought it could be improved if there was a better house, and if there were larger rooms and more efficient teaching power?—Yes.

16,713. In what way do you think the teaching power is deficient as compared with what it was when you were there?—I am not able to make a comparison properly. I have not followed the new circumstances, but I infer a deficiency in teaching power to be one of the causes, from the obvious falling off in the number of pupils—that is merely my judgment on the question—it is more inference than anything else.

16,714. I see by the last report of the college that there was a very satisfactory examination in classics, mathematics, and Greek Testament by regularly recognised examiners, and also in Hebrew; how is Hebrew taught to the pupils?—I think Hebrew is taught nearly entirely orally. I cannot speak to that.

16,715. As regards Greek books, I see the play of "Alcestis" is embossed?—Yes.

16,716. Is that made much use of?—Yes, far too much use of.

16,717. Among the educational books printed hitherto at Worcester there are some Latin works, are there not, and some Greek works?—Yes.

16,718. Are they printed by the college or by the society?—By the printing society.

16,719. Have you any idea whether they are extensively used as a means of education outside Worcester College?—Not extensively.

16,720. They are used to some extent?—Yes, my pupils use them a little.

16,721. There are other books printed by that society?—There are.

16,722. In what type?—A certain number are printed in the Roman type, and a certain number in Braille.

16,723. Have you formed any idea as to the desirability of continuing or discontinuing any of the types for the blind?—With regard to the subject of type, my own impression is that every blind boy and girl who aspires to be educated as an English gentleman or lady should know the common Roman letters. Then I think Braille is very valuable and a great help in all matters of education because it can be written and read by the same person, but I think that contracted Braille is one of the most mischievous things possible for young persons, because it has a tendency to ruin their spelling: at the same time it is a most valuable assistance when they have learnt to spell properly. I am very much against its being used in teaching young children because by its use they get into a bad way of spelling. I have found among the blind a great deficiency in many cases as regards spelling, and the use of contracted Braille is, I think, one of the causes. Then I think Moon is chiefly valuable for aged persons. The two types for educational purposes, I think, are Braille and the Roman, and above all the small American type which is a most beautiful type. The Bible in that type is in eight volumes, and I always read the lessons from it.

16,724. The Worcester Society does not print very much in that type, does it?—It prints nothing at all in that type.

16,725. But it does print in the lower case type?—In the Roman upper and lower case. I do not care which particular form of Roman type is adopted, provided the ordinary letters are used so that the blind shall read the type that the sighted use.

16,726. With regard to writing, you think it an advantage that the blind should be able to write the ordinary writing of the seeing?—Yes, if you can teach it to a blind boy; if not, then this type-writing to which Dr. Robertson referred is an admirable thing, because anyone can read it.

16,727. You write in the ordinary writing of the sighted?—Yes, I had learnt to write when I could see.

16,728. Do you think it a desirable thing to teach the blind to write the ordinary characters of the seeing?—No, I think not. I have not tried the experiment; I do not know how far it would be useful.

16,729. But you use it yourself?—Yes, I correspond regularly in it with all sorts of people.

16,730. You are not in favour of adopting one type as a universal type for the blind; you think that the Roman type for ordinary purposes, Moon for the aged, and Braille for educational purposes, should run in parallel lines?—Yes, to regard one type as having any inherent value over others is, I think, ridiculous.

16,731. In any grant that the Government might be inclined to make, you would propose that those three systems should be subsidised equally?—No, I do not think I would subsidise them equally. Of those three systems the most useful for writing and reading, and the most valuable in every form of education for all classes of blind, I should say was the Braille, and therefore I would give that the largest subsidy; but I should subsidise them all.

16,732. Have you any experience with regard to types that are mostly used by the blind?—No; I can read anything myself, so I do not speak from bias. I have very supple fingers, and I can read rapidly any type. I read Braille more than I do anything else.

16,733. Is it the case that one of your pupils was at Worcester College for some time?—Yes.

16,734. Were you able to judge from the state of his education when he came to you in what the college is deficient in point of teaching power?—Yes; I should judge from the state in which he came to me that the chief deficiency lay in want of discipline and teaching of the junior boys, and thereto I trace the decline of the institution; that is my inference, I may be wrong. When I say that there seemed to me to have been a want of discipline, I do not mean the boy is a naughty boy at all, but I should say the boy before he came to me had not acquired such intellectual habits as I would have done my best to enable him to acquire, knowing his abilities and disposition, had he been under my care to the age of 14.

16,735. Are the boys that are at the college at the present moment, whether sighted or blind, generally speaking in the same social position?—I do not know the boys who are attending the school at the present moment; but, speaking generally from my general experience, I should say they would be in the same social position.

16,736. What is the ordinary payment?—I do not know.

16,737. (*Rev. Mr. Sleight.*) Are the Gardner Scholarships at Worcester College open to the blind of the poorer classes?—It is a little difficult to answer that question. They are nominally for boys of a better or higher social position, but there is great latitude in the interpretation of that condition; it depends upon the examination.

16,738. Can any blind children from elementary schools present themselves for those scholarships?—Not unless they have received a very much greater amount of education than they get in an elementary school.

16,739. With regard to the Fawcett scholarships, the standard of examination would be the same as the standard of examination for the other scholarships?—I think it would be conducted by Oxford and Cambridge examiners.

16,740. But the standard for the Fawcett scholarships would be the same as the standard for the other Oxford and Cambridge scholarships?—I should suppose so.

16,741. Supposing your pupil who is going to present himself for the Fawcett scholarships is not successful, would you present him for other scholarships?—Probably not; he will perhaps be the only one to stand for the Fawcett scholarship, or perhaps he will have to compete against three or four who are blind like himself. There would be much less competition in the case of the Fawcett scholarship than in the case of the other scholarships. I would rather

he got the Fawcett scholarship than one of the others because it is a scholarship specially for the blind, and it would be a blue ribbon for him and for me for him to get it. If he did not get it he might perhaps try for any scholarship at Cambridge.

16,742. (*Dr. Armitage.*) With regard to what you said about contracted Braille, are you aware that in contracted Braille, with very few exceptions, every letter in the spelling of a word is expressed?—No, I was not aware of that.

16,743. (*Dr. Campbell.*) When you were asked about subsidising different types, you spoke of the beautiful American type, and you referred to a Bible in eight volumes, which you say is printed in that beautiful American type and which can be purchased, I think, for 4*l.*; would it not be advantageous rather to buy such books as are already printed in America so beautifully than to set up a printing press to reproduce them here?—That, of course, is a question of trade more than anything else. I am not sure about that. It would seem to me a very good suggestion.

Rev. H. J. R. Marston.

11 May 1887.

The Rev. N. F. McNeile called in and examined.

Rev. N. F. McNeile.

17,744. (*Chairman.*) Since when have you been Vicar of Brafferton?—Since 1876.

16,745. Were you educated at a college or at the university, or at both?—I was educated at the Cathedral school at Worcester.

16,746. Were you at Worcester College?—I went there between the terms at Dublin University. I went to Trinity College, Dublin, after leaving the Cathedral school.

16,747. Were you ordained from Trinity College, Dublin?—Not immediately I left it. I was ordained at Worcester, but it was a year or two after I left college.

16,748. Were you ordained by the Bishop of Worcester?—Yes.

16,749. What is the number of people in your parish?—About 900.

16,750. Have you any curate?—Yes.

16,751. Are you able to do all the visiting yourself, or do you depute that to your curate?—I do it myself.

16,752. Are you in the diocese of York or of Ripon?—I am in the diocese of York.

16,753 Do you preach extempore?—Yes.

16,754. In what type do you read the lessons?—In the American type of which I have a specimen here.

16,755. What sort of type is that?—This is printed in New York, I think.

16,756. (*Chairman.*) Are you able to read this type with facility?—Yes.

16,757. Is it generally used in England among the blind?—Not very generally, I think.

16,758. Is it difficult to read, or why is it not generally adopted?—I think one reason is the expense. We have to have the books brought from America, and the expense of carriage adds so much to the price.

16,759. What is the price of a Bible in England and what is the price of a Bible in America printed in that type?—The price of a Bible in America in that type is, I think, 4*l.* 2*s.* I cannot say what the price of such a Bible in England is for I never bought one; I have been content with this copy I have here. I have had parts of the Bible in other types, but they are more expensive than that.

16,760. The cost of printing the books is an element that enters into the higher education of the blind, is it not?—The cost is so great because being so little known at present, the demand is comparatively small for some of these books.

16,761. Have you any special views with regard to the higher education of the blind to lay before the Commission?—I am very desirous to see the higher education of the blind put on a permanent footing. There is now no permanent provision for it.

16,762. There is no higher education of the seeing provided now by the State; do you wish the blind to be treated in a different way from the seeing, and that the State should give special provision for the higher education of the blind?—Yes.

16,763. At present the State does not give any provision at all; would you begin from the elementary schools upward; would you wish them all to be subsidised by the State?—I would according to merit.

16,764. How would you judge of the merit?—If you can begin from the elementary education, I should judge of it by examinations in the same way as in the case of the seeing.

16,765. At present there is no provision at all made for the education of the blind directly by the State. Would you state what your scheme is from the beginning?—I think they should begin with the elementary education, and give grants in aid of the elementary education of the blind.

16,766. Do you mean in ordinary schools or in special institutions?—In both; I should say grants in aid should be given in ordinary schools if they could come up to whatever requirements are prescribed.

16,767. You would propose to give that in the ordinary elementary schools?—In ordinary elementary schools.

16,768. And in special institutions, I presume, where from various causes they are unable to be in elementary schools, from want of health or general backwardness?—Yes, or from the unwillingness of any elementary school to take the blind; for, I suppose, they could not be forced to do so.

16,769. Would you have any gradual stage from the elementary school up to a higher college in the way of scholarships, or how would you facilitate the higher education of the blind from the elementary schools where we left them?—By means of scholarships.

16,770. Should the State provide those scholarships in your opinion?—I think the State should help; I do not know whether we could ask the State to do all.

16,771. In what way would the State help; should it be in the way of grants?—Yes, in the way of grants.

16,772. Grants to colleges?—Grants to colleges more peculiarly suited for the higher education of the blind.

16,773. Do you think that the blind must always go to a special institution in order to get the higher education and not to the university?—No; they would go ultimately to the university.

16,774. Do you think they must go to special institutions as preparatory to the university?—I think, generally speaking, they must.

16,775. Then at the university, do you think that they would be able to hold their own against any comers in the way of scholarships?—Certainly.

16,776. Did you yourself get any scholarships when you were at college?—I got some prizes; I did not get any scholarships; I did not try for one.

16,777. Were there no open scholarships at Trinity College, Dublin?—Yes, and one was held by a blind man, who is, I believe at present a Member of Parliament, Mr. Macdonald; he was classical scholar of Dublin and did excellently.

16,778. Do you think that it is desirable that the blind should be taught in separate institutions between the elementary school and college?—Yes, I do.

16,779. But you say it would be an advantage to them to go to ordinary elementary schools if the elementary schools would take them?—Yes.

16,780. Why could they not go to ordinary colleges if the ordinary colleges would take them?—I think you have put the "if" in now. I do not think they would take them. If they would always taken them, and the blind count upon that, then I should certainly say let them go there.

16,781. Would it not be the best system that the blind should go with the seeing so far as they could *pari passu* and not have special institutions of their own?—Yes, I think so, if it is possible.

Rev. N. F. McNeile.

11 May 1887.

16,782. When you were at Trinity College you were in an open institution?—Yes.

16,783. And the Cathedral school at Worcester was an open institution, also, was it not?—Yes.

16,784. You yourself did not go to any special institution for the blind, I understand?—No, except making use of the one at Worcester and reading there during the Dublin vacations. But I may perhaps be allowed to mention that when I went to the Cathedral school there was great unwillingness on the part of the head master in the first instance to allow me to go there, and it was only because one of the under masters had known me for years before, and offered to be in a way responsible and took me into his boarding house, that the head master took me.

16,785. When you were there had you any difficulty in keeping up with the ordinary schoolwork?—No, none whatever.

16,786. What type did you use then?—I used the large and small letters, the ordinary type.

16,787. The Roman type you mean?—Yes.

16,788. Have you any opinion as to the desirability of having one or more types; will you state what your preference is?—I feel very strongly that the barrier between the blind and the seeing should be minimised as far as possible, and therefore that whatever the seeing read, the blind should be taught to read, whatever else they may learn in addition.

16,789. That means, as I understand, that you advocate the use of the Roman type in the first instance, with the addition of the Braille afterwards?—Yes, the Roman type is the elementary type in which all should learn. The Braille is invaluable as a means of communication.

16,790. Would you teach the Braille or the Roman first to a child?—The Roman.

16,791. Do you advocate the blind writing by some of those mechanical contrivances which enables them to write the ordinary current hand of the seeing?—Yes, certainly.

16,792. Rather than writing only in the Braille?—Certainly.

16,793. Do you yourself usually write in the ordinary handwriting in writing your letters?—Not to be certain of its being read. I never began to learn it when I was sufficiently young.

16,794. You have seen, have you not, several different mechanical means, such as the Moon and the Braille systems?—I have seen some for guiding the hands and writing in the ordinary way, but I do not systematically use them.

16,795. You have told us of the two types, the Roman type and the Braille; what is your opinion as to the Moon type, where would you place that?—I think the Moon type has been greatly overrated.

16,796. Has it any advantages over the Roman type?—I think not, if the Roman type is given in the same sized letters as the Moon.

16,797. In the same sized letters as this Bible is printed, do you mean?—No, I mean the same sized letters as the Moon is printed, quite large for hands that cannot feel the small letters.

16,798. You think that people who become blind in old age would read better in the type which they had been accustomed to all their lives than if they had to learn a new one?—I will not say they read better, but I know they can be taught it, and it seems to me that the advantage of their reading the same type as the seeing read is so great that it is worth even the extra pains, if that is necessary, to learn it.

16,799. On what grounds would it be such an advantage that the blind should read the same type as the seeing?—For this reason, that anyone could help the blind man with the book, if help is necessary, if it is in the ordinary type.

16,800. But surely almost any book which a blind man would be likely to have, such as the Bible, for instance, would be already in his possession in ordinary printing?—He must have a separate key in order for the seeing to read it and help him.

16,801. Is not the Bible much more bulky in this ordinary Roman type than in the Braille type?—I cannot say.

16,802. Have you never seen the Bible in Braille type?—I have only seen portions.

16,803. Judging from the portions which you have seen, and the size of the volume you have seen, would not a volume printed in the Braille type be very much less cumbrous to carry about than if it is printed in the type which you use now?—It would be less cumbrous than the large Roman type, certainly, but not than the American.

16,804. I suppose the American type requires to be very well printed in order to be legible?—Yes.

16,805. Is not the printing of the American type as regards the paper and the sharpness of the type much better than in the case of our ordinary type?—I think it is; we very seldom get such printing here.

16,806. Have you any difficulty at all in fulfilling the ministrations of the Church—in baptisms, for instance?—No, I have no difficulty.

16,807. Nor in the ministration of the Holy Communion?—No; occasionally when some stranger comes then there may be a little awkwardness. There has been once or twice a little awkwardness. I mean to say, perhaps, he has not come up at the right time, but there has been nothing to mind.

16,808. Do you take your full share of the service with the curate?—Yes, very often, I take it all.

16,809. Have you more than one church to minister to?—Yes, the church and a licensed building.

16,810. Do you read the prayers from memory or do you read them from a book?—Generally from memory, but I always have the book there.

16,811. Do you think the State ought to subsidise the printing of books for the blind in Blind Schools or Colleges?—Yes, I think that is a very important thing for the State to do.

16,812. Have you any views at all as to the treatment of the aged blind—I mean those who are too old to earn their livelihood and who become blind in mature years; have you any system to suggest in the way of pensions, or otherwise for making provision for them?—I have not thought of that point.

16,813. Is there any other point which you have thought of with regard to the blind which you wish specially to bring before the Commission?—I do not think so.

16,814. (*Rev. Mr. Sleight.*) Is the Prayer Book printed in the Roman type?—Yes.

16,815. In the the same type as the Bible you have there?—It is printed in the upper and the lower case; that is to say, the type they print at Worcester; it is not the American type.

16,816. Have you had any experience as to the aged learning this type; say, for instance, a man who became blind after he is 50?—Yes; we had a class at Worcester which used to meet every week, and they made very fair progress in doing it.

16,817. Was the progress as rapid as it would be with the Moon type?—We did not try them with the Moon type, we only tried them with the large Roman.

16,818. Have you any experience of the aged blind learning the Moon type?—I have heard men read the Moon type, and some of those men who read the Roman type at Worcester in the class I have spoken of could read as well as many whom I have heard read the Moon type, more than that I cannot say.

16,819. (*Mr. Johnson.*) After you left the Cathedral school you went to the Worcester College, did you not? I did, but not immediately.

16,820. During how many vacations were you at the Worcester College for the Blind Sons of Gentlemen?—From the year 1867 to the year 1871.

16,821. For four years?—Yes.

16,822. For how long were you there in each year; would it be three or four months?—About three months.

16,823. I suppose you are aware that they claim you at Worcester College as one of the brightest ornaments of your college?—Yes.

Rev. N. F. McNeile.

11 May 1887.

16,824. While you were at Worcester College, I suppose, you were aware of the presence there of Mr. Robins, were you not?—Yes.

16,825. He is Vicar of Gillingham now, is he not?—I believe so.

16,826. How many persons do you know who are now in holy orders who were your contemporaries at Worcester College for any portion of their time?—I could not say how many offhand.

16,827. Was Mr. Ranger there with you?—Yes.

16,828. He is a solicitor, is he not?—Yes.

16,829. Was Mr. Marston there with you?—Yes.

16,830. Mr. Marsh?—Yes.

16,831. Mr. Fawcett?—Yes.

16,832. Mr. Beresford?—Yes.

16,833. And Mr. Johnson?—Yes, six or seven, including Mr. Robins.

16,834. These are all gentlemen now occupying almost the same position as you hold, I believe; they are either curates in charge or else vicars?—Yes.

16,835. None of those gentlemen, according to your knowledge, have experienced any difficulty in administering all the duties of the Church, have they?—I believe not.

16,836. Have all those gentlemen to your knowledge gone to universities, some of them to Durham, some to Oxford, and some to Cambridge?—Yes, they have all gone to universities.

16,837. Have you ever heard of their experiencing any difficulty in their collegiate life from the fact of their being blind?—No.

16,838. They have been able, with the assistance, I suppose, of readers, to carry on the ordinary education, and the attendances required at the universities?—I believe so.

16,839. Were you at Worcester College at the time of Mr. Blair's superintendence?—Yes, I think he was superintendent to the end of my time.

16,840. Then you cannot speak of the condition of the college now, I presume?—I cannot speak positively in detail of its condition now because I have seen it only cursorily the last few years.

16,841. You have seen it cursorily, you say?—Yes, I have paid visits from time to time.

16,842. What is your opinion of the teaching power of the college at the present moment, or, at least, when you last visited it?—I think the teaching power is weak at present.

16,843. Will you tell us what that weakness depends upon in your opinion?—Want of adequate assistance owing to the want of funds.

16,844. Do you think the college suffers at all from the want of publicity?—Yes, I am confident it does.

16,845. You think that if there was more publicity and more teaching power—that is to say, more teachers and more money spent on the arrangements of the college, it would be more effective?—I should think it would.

16,846. Your opinion is as I gather that there is a nucleus of great success if there were more pecuniary resources?—Yes.

16,847. Do you think it would be advisable to have an inspector to inspect all the schools and blind colleges?—Yes, very.

16,848. Do you think it would be an advantage to have a blind or sighted inspector?—I should prefer to have both.

16,849. You would like to have them going on the same lines and inspecting together?—Exactly.

16,850. We have heard something with regard to the types for the blind; could you tell us anything about the amount of books that are available, in what is called the Worcester type, from the society that prints so much at Worcester?—I have brought the list here to show exactly what books are available.

16,851. There is a very considerable list, is there not?—A fair list, I cannot say it is very great; but there again, of course, the want of funds comes in.

16,852. Now are there, in your opinion, a sufficient number of readers in that particular type to justify the society in going on in printing books in that type?—Yes.

16,853. In your experience you prefer that type to any other type that is known, I understand?—Yes, certainly.

16,854. You prefer it to the ordinary Roman; you like the ordinary lower case?—I prefer it to the Roman.

16,855. Do you find that it is equally easy to learn with the ordinary Roman?—Yes, certainly in the case of children.

16,856. Do you put it in any comparison, so far as regards its being easy to learn with any other system which is now in use amongst the blind; for instance, is it as easy as the Moon type, and is it as easy as the Braille type?—I do not think it is quite as easy as the Moon except in the figures; the Moon's figures I never mastered myself, they were always very complicated to me, and it is not so easy as the Braille, that is to say—the plain letters of the Braille. When you come to the different signs and all those contractions, then to my mind an element of difficulty comes in.

16,857. I gather from you that you are in favour of a Roman letter, either the lower case or ordinary Roman letters, because it is the type of the sighted?—Yes, principally.

16,858. And you think that it is a desirable thing that the blind should approximate as nearly as possible to the sighted?—Yes.

16,859. May I ask by what system you write yourself in your ordinary correspondence?—Usually with a Remington type-writer.

16,860. That is a mechanical apparatus?—Yes.

16,861. Do you use any other means of writing, either by ordinary pencil writing or by the Braille system—I write by Braille to blind people.

16,862. And by the type-writer to your seeing friends?—Yes.

16,863. Have you ever formed the opinion that it would be desirable to have one type for the blind to the exclusion of any other, or do you think that the three or four types which are now in use should exist side by side, so that those who use one by preference can use it?—I think there should be a choice so that one man can use one and another another.

16,864. You would not extinguish the three or four types in order to make one permanent, you would let all four types run and let the blind man choose which he liked?—Certainly.

16,865. I see that in the report of the College for Blind Sons of Gentlemen there is Greek, Latin, and Hebrew taught; I should like to ask whether you have any experience of books embossed in the Greek character?—Yes, I have one here.

16,866. Do you find them of utility?—Yes, great utility.

16,867. Have they been very much used?—I am afraid not as yet, the undertaking is only in its infancy.

16,868. If the college were further developed you believe that the printing in Greek characters would be of much utility?—Certainly.

16,869. (*Chairman.*) Is the whole Greek Testament in print in Greek embossed characters?—Only portions of it.

16,870. (*Mr. Johnson.*) Portions of it are embossed in Greek character by the society at Worcester?—Yes.

16,871. Do you think that it would be desirable if there was a depôt in England where the books for the blind which are printed in every country, in every system, could be procured?—Yes.

16,872. (*Chairman.*) Do you consider this Greek type easier than the English to read?—Not easier, certainly. Some few years ago a number of us collected a special fund for casting the Greek type. Before that was done Braille was used for Greek letters; but then it was impossible to depict a great many of the Greek signs; there was no attempt at showing the accents for instance.

Rev. N. F. McNeile.

11 May 1887.

16,873. I take it that this type which you started at Worcester you considered to be preferable to the old way of communicating Greek to blind pupils by the Braille type, or else you would have printed it?—Certainly.

16,874. That portion of the Greek Testament printed in Greek characters you consider to be more important as an educational adjunct than the portions of Greek printed in Braille?—Certainly.

16,875. (*Mr. Arrol.*) I think you say you are in favour of the blind being educated along with the sighted?—Yes.

16,876. And you have expressed a belief that there is a difficulty in getting the blind admitted to sighted schools?—Yes.

16,877. May one of your reasons for the recommendation that the blind should have a grant in aid be that it would induce a schooi to admit a blind child?—Yes, that is one reason.

16,878. Do you not think it is desirable that it should be compulsory on all sighted schools to admit blind pupils?—Not unless additional qualifications are manifested in sighted teachers; otherwise it would be to the detriment of the other children, or, at least, it might be.

16,879. Should it not be the duty of the sighted teacher to qualify himself to teach a blind child?—I should give him an additional grant for doing so.

16,880. Do you think that it is advisable that the blind should be taught by a blind master?—Not necessarily.

16,881. I understood that you recommended an inspection by the blind and sighted inspectors, but you would not recommend teaching by blind teachers?—Not necessarily; it can be done.

16,882. (*Admiral Sir E. Sotheby.*) Did you feel yourself that it was a very great advantage to be associated with sighted people at your school and at college?—Yes, very great.

16,883. Have you at the present moment any pupils?—I have one.

16,884. Is he sighted or blind?—He is sighted.

16,885. What is his age?—His age is 16.

16,886. Do you instruct him in classics and mathematics?—My curate takes him in mathematics, I have taken him in classics.

16,887. Do you consider that blind gentlemen are more efficient in classics than in mathemathics; are they able to learn classics more easily than mathematics?—I would not say that as a rule.

16,888. I suppose you can find your way about your parish without help?—Yes, but I seldom try it.

16,889. At Trinity College were there other blind graduates besides yourself?—I think not contemporary with me; Mr. Macdonald, to whom I referred a short time ago, was senior to me.

16,890. A good deal senior, was he not?—Yes.

16,891. You do not know whether all the blind who go to Trinity College take degrees?—I cannot say as to that.

16,892. At Trinity College there were no books specially furnished for the blind, I suppose?—No.

16,893. At Worcester College the principal deficiency, I presume, is the want of endowment for the head master and others?—Yes, I think so.

16,894. You say the great deficiency at Worcester College is the want of funds; what would you propose as a good endowment for the head master at Worcester College?—Do you mean what should be his yearly income?

16,895. Yes?—600*l.* or 700*l.* a year.

16,896. Is music taught at Worcester?—Yes.

16,897. Did any of the blind arrive at great proficiency while you were there?—One pupil arrived at very great proficiency.

16,898. Do you know what his after life was?—I believe he has gone to the university—to Oxford, I think.

16,899. Was there not more than one who arrived at great proficiency in music; I suppose you all learned music more or less?—We all learned music more or less who had a taste for it, but I do not remember anyone else who arrived at great proficiency in music.

16,900. What proportion would that be, one out of how many?—One out of 20.

16,901. Did you learn Greek by book or orally yourself?—Orally.

16,902. Were you provided with any Greek books?—No; Greek was not printed in my time, I wish it had been.

16,903. Do you consider that the Greek books are so very expensive that it prevents many blind people from availing themselves of them?—I do not think so. I do not think they are sufficiently known.

16,904. If they were more known they might be cheaper?—They might be cheaper.

16,905. (*Dr. Armitage.*) You said that when you were at the Cathedral School at Worcester you used the books printed in Roman letters?—Yes.

16,906. What text books were there printed at that time?—When I was at school I had no embossed text books to help me beyond the Scriptures.

16,907. When you were at the Cathedral school at Worcester you read the Scriptures in embossed characters, but no other books?—Yes.

16,908. Was all the other teaching oral?—All the other teaching was oral.

16,909. Are you able to read and write contracted Braille?—Not contracted Braille.

16,910. You condemned the contracted Braille very much; what was the reason of that if you do not know it?—I should scarcely say that I condemned it; all I said was that it was complicated, and therefore became rather more difficult. What I desired to say was that the simple Braille letters were on a very simple system and could be learned easily, but that when we come to the many contractions elements of difficulty were introduced.

16,911. Have you ever spent half an hour in learning the contractions?—I have spent half an hour in trying to do so.

16,912. But without success?—Yes; I mastered some few of them.

16,913. Will you tell us what experience you have had in teaching adults. You said there was a class of nine blind adults in Worcester; how many have you known to be taught in Roman letters?—About a dozen.

16,914. What other experience have you of the power of the adult blind in learning Roman letters?—Only one or two isolated instances that I met with in Yorkshire, of people who learned by Roman letters.

16,915. Is the whole of the New Testament published in Greek characters?—No, not yet.

16,916. Are you the editor of this edition embossed in Greek characters?—No.

16,917. Do you know what number of copies were printed in the first edition?—I cannot answer that with certainty, not many.

16,918. Do you know what number have been sold?—No.

16,919. (*Chairman.*) Can you tell us what portions of the New Testament have as yet been published in embossed Greek characters?—The Epistle to the Galatians; the Epistle to the Philippians; the Epistle to the Ephesians; and I believe also the Epistles to the Thessalonians, but those I have not seen. That is all that is published to my knowledge yet.

16,920. That is all published at Worcester?—Yes.

16,921. (*Dr. Armitage.*) Can you tell us the price of that volume that you have in your hand?—I have a list here, and I find the price of the Epistle to the Philippians in the original Greek is 3*s.* 6*d.*

16,922. (*Mr. St. John Ackers.*) There are two separate societies at Worcester, are there not—there is the Worcester College and another society?—There is the Worcester College and the society for providing cheap literature for the blind.

16,923. Have they anything to do with each other?—Not essentially.

16,924. Are they both private venture schemes or is either of them public?—The society for providing cheap literature for the blind is public.

Rev. N. F. McNeile.

11 May 1887.

16,925. Is it supported by annual subscriptions?—Yes, to some extent.

16,926. Are you an officer of that society, honorary or otherwise?—I am on the committee.

16,927. Have you assisted in editing certain books for this society?—Not in editing any books.

16,928. I thought this book of the New Testament was brought out under your supervision, your name is on the front of it?—The reason my name is mentioned is because I was the chief one in collecting the funds in the first instance.

16,929. You had a certain amount of control over it, I suppose?—Yes, in that respect.

16,930. Could you tell us who would be best able to speak as representative of the society for providing cheap literature for the blind?—Mr. Forster.

16,931. Is not Mr. Forster the head of the Worcester College?—He is.

16,932. Then the two societies are somewhat connected?—Yes, but may I point out that I said "not essentially."

16,933. Will you kindly explain the position of the two societies, as there certainly is a very considerable amount of misunderstanding in regard to this matter on the part of a good many persons who are not connected with Worcester?—After the Worcester College began to work the need of some more literature than had been provided for the blind was very strongly felt. Hence it was proposed that a society should be started for providing cheap literature for the blind, and funds were solicited. The Bishop of Worcester was the first to come forward, and his donation was followed by other sums; and the society began to work at Worcester simply I may say from the accident of the need for its first existing at Worcester.

16,934. At what date was that?—1867 or 1868, I think.

16,935. Then Mr. Forster would be the best witness to examine, in your opinion, both with regard to the printing society at Worcester and with regard to the college?—Yes.

16,936. (*Dr. Armitage.*) Was Mr. Blair connected with the cheap literature for the Blind Society?—Mr. Blair was the original promoter of the society for cheap printing.

16,937. (*Mr. Johnson.*) All the credit of starting this printing society is really due to Mr. Blair, I believe?—Most certainly.

16,938. (*Chairman.*) Can you tell us what the actual cost of printing one of these books is, what capital do you require in order to start a thing of that kind?—We collected 130*l.* before the Greek type could be cast at all.

16,939. (*Mr. Johnson.*) Was it cast at Mr. Taylor's in London?—It was cast in London, but I do not recall the name; I think it was Besley.

16,940. Was it the same man who cast the type for your society?—Yes.

The witness withdrew.

Mr. W. Burnett.

Mr. W. Burnett called in and examined.

16,941. (*Chairman.*) You were at one time a member of the town council of North Shields, I believe?—Yes, from 1882 to 1885.

16,942. And you have also been a guardian of the North Shields township?—During 1882 and 1883.

16,943. Are you engaged in any business?—I follow the business of a night-caller that is to say—waking people in the early hours from 12 o'clock to 6 in the morning.

16,944. You are well acquainted, I presume, with the blind of the working classes in the North of England?—I am pretty well acquainted with those in Northumberland and the north part of the county of Durham, more especially those who have been educated in the Blind School of Newcastle.

16,945. Where were you educated yourself?—The principal part of my education was received at a village school.

16,946. With seeing children?—Yes.

16,947. Were you then seeing?—No, I have been blind from my infancy.

16,948. How did you learn in the village school?—I happened to get embossed books in the Roman capital first and then in the old fashioned common type, which was in use 50 years ago—I mean with the f's for s's. Then a counting-board was got for me, and I just read and worked with the other children in the school. When I was 13 I went to Newcastle.

16,949. Did you go to the blind school there?—Yes, at 13.

16,950. Do you think it is advisable that blind children should be taught in an asylum or in a blind or other school?—My opinion is that if they mix with sighted children generally it sharpens their wits a little more, and it tends to make them more like the rest of their neighbours generally, more especially if they want to keep up with the others.

16,951. Do you think that the education of the blind should be compulsory?—I do.

16,952. And do you think that in cases where the parents are unable to pay for the children themselves they should receive assistance without being made paupers; that is to say, that blind children should be treated more liberally than other children?—As a rule the present Education Bill provides that children whose parents cannot afford to pay for their education, where there is a School Board, can be educated and yet not become paupers, and therefore we have a right to the same privilege.

16,953. In your knowlege has there been any dispute on the part of the guardians with regard to the payment of fees for blind children whether the parents were able to pay or not?—I never knew a case where the School Board interfered in the education of a blind child, but in Sunderland they do sustain a teacher in connection with the institute there at 15*s.* a week.

16,954. Do you think that the School Board should be obliged either to send the children to school or to send them to some institution where the children should be taught?—I would make that subject to the circumstances of the case. If there were enough blind children in the locality to cause the teacher to give them sufficient attention to have them educated, I would let them form a class amongst the sighted children. At the same school where I was educated there were two other boys who were my senior in point of age, although they were not so far advanced in general education, because they had not been so long at school, and we got on well enough.

16,955. With regard to the children of the blind after they leave school, what steps should in your opinion be taken to teach them a trade?—In the majority of cases they would have to go to an institution of some sort for the blind, because few masters, except those who really were set to teach the blind, would go to the trouble of teaching them. I am satisfied that that is so.

16,956. Therefore you think that an institution is a necessity for teaching them a trade?—I think so.

16,957. Or a public workshop of some sort for the blind?—Yes, anything so long as they acquire a trade, so that they might be able wholly or partly to make their living.

16,958. Do you think that there is any particular trade for which the blind are most fitted; have you any opinion upon that subject?—In the north mattress making is the most lucrative trade.

16,959. Have you known many blind who have any skill in music such as could be developed into making them good musicians?—Yes, there were several educated in the Blind School at Newcastle. One is now practising as a tuner in Newcastle.

16,960. Do you know many who have maintained themselves by music?—Yes, I know three who have

Mr. W. Burnett. 11 May 1887.

entirely maintained themselves by music—that is to say, in a respectable way.

16,961. You do not mean in the streets?—No, of course there are others. We had a pupil or an inmate there who went to St. George's from Newcastle as an assistant teacher there for a time, John McCoan.

16,962. (*Mr Johnson.*) Has not John McCoan gone back to Newcastle now?—Not that I am aware of; he may have, but I have not heard of it.

16,963. (*Chairman.*) Do you think that after the blind have learned a trade they had better go to their own homes, or had they better work in common together at some institution?—Some blind persons are able, by extraordinary power of brain, to make a living where others cannot. I am quite satisfied that in a fairly populous district a blind person with brains of an ordinary quality could make his living by mattress making, and yet it would not do for all to be mattress makers. But when it comes to basket making he would do better in an institution than he would by working at home.

16,964. So he would at mattress making, I presume?—I should think he might. I would not prefer it myself. I would prefer working at home.

16,965. Would he have all the appliances and assistance at home?—They would not cost much.

16,966. Is there any recommendation that you would like to make with regard to the aged blind, as to the provision that should be made for them?—Where it was found absolutely that a blind person could not maintain himself it might be for the State to give him some little help, and at the same time have entire control over the various charities for the general good of the blind.

16,967. That is a very sweeping proposition. I do not quite understand what you mean. Do you suggest that all charities for the blind should be put into a common hotchpot, and that the aged blind are to dip into it whenever they like?—I do not intend that the blind should have the control by no means. I mean that the State should help them with control over the charities, that was my meaning.

16,968. Do you propose that the State should take possession of all the charities left for the good of the blind, and divide them as it likes? Surely people would not leave their money to charities for the blind if they thought the State would come in and apply it as it thought best?—The power of the State would certainly need defining in some respect, but I am quite of opinion that there is much money which has been rather misappropriated.

16,969. With regard to the pensions in the various societies, for instance, do you think the Government should interfere with them, and divide them among the blind?—I think that many kinds of pensions are, from misinformation which is supplied to the committee or trustees, sometimes misappropriated.

16,970. You think that there is no doubt that there are abuses in the existing system?—I think so.

16,971. Are you prepared, because there are abuses in the present system, to confiscate all the money that has been left in different charities under different control and place it all under the control of the State?—I would put it either directly or indirectly under the control of the State.

16,972. That makes some modification in your proposition. I quite understand your wish that the State should see that the funds are not misappropriated?—I had not much time to prepare myself for giving evidence before this Commission, and perhaps I have put it more strongly than I should.

16,973. Do you think that the aged blind should have some assistance from the State other than that derived directly from the Poor Law, for instance? Is that what you mean; or would you let the blind go into the workhouse in the same way as the other poor must do when they are unable to maintain themselves?—I can scarcely see why we should be privileged more than the rest of our fellow men. I certainly desire fair play, but I do not see why we should be privileged more than any other men.

16,974. We have heard it stated in Scotland certainly, and I think also in the North of England, that the blind should not be treated in the same way as the seeing; they should not be forced to go into the workhouse, but should have some assistance given to them directly and independently of the relief ordinarily given by the Poor Law?—I would scarcely go so far as that.

16,975. You only ask that the aged blind should be treated in the same way as other aged persons?—That is what I should like.

16,976. (*Mr. St. John Ackers.*) In answer to one question of the Chairman, you stated that you desired State help with State control over all the charities for the blind; and then in answer to a subsequent question, you said you thought that the blind should not be treated more favourably than others. What, then, is the State help to which you alluded in the previous answer?—If a person can partly make his living outside, I think the State might help him; but if he was aged and could not take care of himself, I think he would be better taken care of in the union than if he were left, perhaps, to the sometimes merciless hands of his neighbours or friends.

16,977. You distinguish between those who are able to work, but are not able wholly to earn a living, and those who are not able to work at all?—I should scarcely maintain that those who are quite broken down by age and infirmity should not go into the workhouse.

16,978. But the State does not give any assistance at present to those who are able or partially able to earn their own living?—I am not aware that the State gives any aid to the blind.

16,979. But I mean to others who are not blind?—Quite so.

16,980. What we want to understand is how the blind are to be treated in no way more favourably than others, and yet are to have State assistance?—I would certainly like every inducement given to them to work. As to these who can work outside I should say let them do so, because it is everybody's duty to do what he can to earn his living. I would not like them to be encouraged in entire laziness by any means, because that in time would do the class harm.

16,981. I understand your views to be this: that if a blind workman does his best and does not earn as much as would keep him in fair comfort, then his wages are to be supplemented by the State?—To the extent that the State thought he really required.

16,982. Is there any organisation of the adult blind in your neighbourhood?—No.

16,983. Do you know of any such society either in the North of England or elsewhere?—One did exist in Newcastle, but I do not think it is really in action at the present time.

16,984. Was there any benefit so far as you know to the blind from the action of that society?—None.

16,985. (*Dr. Armitage.*) Following up Mr. Ackers' question, do you mean that you know of no organisation in Newcastle conducted by blind persons?—I mean to say that an organisation did exist in Newcastle, which was subscribed to by the members in a small way (perhaps it would be a halfpenny a week), simply for the sake of communicating with various parties in the interests of the blind, in order to hear how things were going on; but no benefit ever arose from that to any individual, and, if I am rightly informed, the organisation does not exist at present.

16,986. Is there any workshop for the blind in Newcastle?—Yes, but I consider that an institution.

16,987. Is it conducted by the blind?—Certainly not. It has a committee of gentlemen who are none of them blind.

16,988. Do they meet?—They meet, but I cannot tell you how often.

16,989. Do you know much about the working of the workshops in Newcastle?—I have visited them at various times. I am not in a position to say what is the number they employ, but I would estimate it at something under 20.

Mr. W. Burnett. 11 May 1887.

16,990. You do not know much about them personally?—I am frequently there. When I am in Newcastle and have spare time I may look in.

16,991. Have you followed any trade yourself at any time?—I have followed a business of my own, but not the trade that I acquired at school. I acquired basket making at school, but I have not done anything at it since I left.

16,992. What made you not continue the trade of basket making that you learned at school?—Because I knew no one who had succeeded in it.

16,993. Do you consider that you were well taught; were you a good basket maker?—I was only half a basket maker, because to begin with I was satisfied that I was wasting my time and my energy was never thrown into it when I was at school.

16,994. You spoke of mattress making; do you personally know of your own knowledge of any blind person who works at home as a mattress maker?—I have known several.

16,995. Have you known any in Newcastle?—I have known some who have been educated in Newcastle and worked in Sunderland, Carlisle, and Durham.

16,996. Who work at home on their own account?—They did; they are not alive now.

16,997. Did they succeed in making a tolerable living?—The one succeeded for a time, and the fault was really his own when he failed. The other one succeeded very well indeed, and afterwards accepted a situation as home teacher at the Home Teacher's Society in Newcastle, where he did not make the same money, but it suited his tastes better. I believe he made much more as a mattress maker than as a teacher.

16,998. Do you think the bulk of the material is an objection to mattress making at home?—It could not be done in a small room where the rest of the domestic work is to go on; they would require a room to do it in.

16,999. Could you tell us whether you are still continuing your vocation as night caller?—Yes, I have had to get a substitute to do my work during my absence.

17,000. About how many persons do you call?—At present 50, but my business has been greatly in excess of that. I have had 160.

17,001. Is that reduction in the number in consequence of a wish on your part to reduce your work?—I retired altogether in 1876, thinking that I could be comfortable and rest from my labours; but it was an entire mistake. I could not sleep at nights; I was 10 months off duty, and I was glad to resume again and pick up what I could of the business after four other men had come into the field.

17,002. Are there four other men in the field in North Shields besides yourself?—Yes.

17,003. Can you tell us what they earn?—I cannot exactly, because I do not go so closely into their business.

17,004. Can you tell us what you earn?—Yes; I consider at the present time my earnings would be about 60*l.* per annum, but they have been between 180*l.* and 190*l.* for several years in succession.

17,005. How are you paid?—Sixpence per week per man.

17,006. Do you go by yourself?—Yes.

17,007. How do you find the numbers of the houses?—With my finger.

17,008. Are the numbers embossed in North Shields?—In North Shields they are, but in South Shields they are not. They are engraved upon the plates in South Shields, and I cannot feel them well; I hate to have to seek a house in South Shields.

17,009. How do you manage if the number is not embossed?—The number is embossed as a rule.

17,010. But in South Shields the number is not embossed, I understand?—I do not go to South Shields, except on other business.

17,011. Are there any night callers in South Shields?—Yes.

17,012. How do they manage?—They are not blind.

17,013. Are you the only blind night caller in North Shields?—No, there are other three who are blind, either entirely or partly engaged in the work.

17,014. Do any of those three frequent South Shields?—They could not do business in both and keep time.

17,015. I understand you to tell us that the numbers are not embossed in South Shields?—They are not.

17,016. What I want to know is whether in spite of that any blind persons follow the vocation of night callers in South Shields?—I do not believe there is one in South Shields.

17,017. How do you manage to call a person?—Supposing, for instance, John Thompson was to send and asked to be called at 12 o'clock, and he lived in 55, Middle Street; if I did not know the house I should have to feel the numbers on the doors till I came to it. I should have an idea of the position in which the number would be by my knowledge of where No. 1 was placed on the door, and when I got to the right number, I would call John Thompson.

17,018. How would you call him, would you ring the bell?—If there was not a bell, I could not; if he lived downstairs I would possibly tap at the window, or if he was upstairs, and I could not get at the window, I would have to shout out in the street.

17,019. Following out that imaginary case a little further: when John Thompson asks you to call him, would he tell you what room he lived in and how you were to call him, what particular bell you had to ring, and so on?—He would tell me where he lived, and the rest would be left to my discretion as to how I called him.

17,020 Would you find out which room he lived in for yourself?—He would tell me, or ought to tell me the room.

17,021. Do you know of any blind night callers in other towns?—I have been in company with one at Gateshead. I have heard of more, but I am not acquainted with them.

17,022. (*Admiral Sir E. Sotheby.*) Do you say that you failed in gaining a livelihood in making baskets?—I never tried it. I was taught basket making at school, but I never attempted it after I left school.

17,023. Were you instructed by a blind or by a sighted person?—By both.

17,024. Which do you think is the best?—There are many things in basket making in which sight is of great assistance. Of course a blind teacher has many ways of entering into the necessities of his pupils which would seldom strike a sighted man, but in basket making I would almost prefer a sighted teacher if he were a good teacher.

17,025. You say, that, as a rule basket makers do not gain a livelihood?—They do not at home. If they happen to be engaged with heavy work at a factory or at any place where heavy work is required, it is possible, I believe, for the blind to make a living; but if they have the fine ordinary domestic work I do not think it is possible.

17,026. Do you mean that there is no demand for their work?—There is not a demand to keep them constantly at it, and hence the remuneration from that source is not good enough.

17,027. Are you aware that some basket makers earn from 21*s.* to 25*s.* a week in their own homes?—Yes, with heavy work. I quite admit that with making hampers and other classes of heavy work blind persons may make a good livelihood, but if they are reduced to fine work it will not do.

17,028. I am only speaking of heavy work. In making hampers, for instance, a blind man can gain not so good a livelihood perhaps as a sighted man, but he can at any rate earn a livelihood?—Yes, I admitted that from the beginning. He cannot earn so good a livelihood as a sighted man, but he can earn a livelihood.

17,029. (*Mr. Arrol.*) In order to teach the young blind a trade it is admitted that they ought all to be

Mr. W. Burnett.

11 May 1887.

sent to institutions, and in those institutions there must be a charge for teaching a child; do you think it would be advisable to compel the Parochial Board to pay for that child's maintenance during its term in such an institution?—I do think it would, because the child as he grows up and takes his station in life has his share of the burden to bear, and he has to pay his proportion towards the School Board for education.

17,030. I think you misunderstand my question. I am not referring to the School Board, but the Parochial Board. Supposing that you had a child whose parent could not pay for its maintenance to the institution where it was learning a trade, what would you do with the child?—I think that both in the interest of the Board and of the child it is worth the Board attempting to put that child into such a position that he can maintain himself.

17,031. Would you be disposed to recommend that it should be compulsory on the Board to pay that?—I would assent so far as regards education; but I would certainly qualify it, because where the parents can pay for it, it is only proper that they should pay. But where they cannot I think they should have help from their respective parishes or townships with the view of bettering the child.

17,032. So as so make him in after years independent and self-supporting?—That is my idea.

17,033. You said that you thought the blind should not be treated more charitably than the sighted; but do you not admit that the blind man is handicapped and put in an unfavourable position which he has not come to by any ill act of his own life, and that on that account he should be privileged more than sighted people are?—There would be some difficulty as to how to do it, because it would have a tendency to hinder those from pressing forward who might do so if they were urged on by necessity.

17,034. In order to alleviate in some way the difficulties which blind men have to contend with, do you not think that it might be well that they should all have some fixed grant?—I would be strongly opposed to that because I think in many cases it would encourage lack of energy.

17,035. With regard to the aged blind going into the workhouse, do you not think that some license should be granted in allowing the blind to remain with their own people and to obtain outdoor relief?—It might be, but I think in many cases that I have known they would be as well attended to in the union. Of course there are cases where they have friends who would be faithful and good to them, but in many cases they would be better looked after by the guardians according to law than they would be if left to the indifferent and merciless hands of so-called friends.

17,036. Would you go so far as to say that if the aged blind did receive assistance from the Parochial Board it must be compulsory upon them to go into the house?—I do not say that I would compel them.

17,037. But I am asking you whether you would compel them?—I scarcely think I would; I think were I a guardian I should measure the merits of each case.

17,038. You would give the guardians authority to give outdoor relief if they found that it was advisable that the man should remain at home?—If they were satisfied that the individual could be made comfortable by their granting outdoor relief I would decidedly keep the man in the possession of his liberty if it were possible.

17,039. (*Chairman.*) Is there anything which you wish to add to your evidence?—I do not think there is. My ideas have been fairly drawn out on the various subjects upon which I have taken thought.

The witness withdrew

Thursday, 12th May 1887.

PRESENT:

LORD EGERTON OF TATTON IN THE CHAIR.

ADMIRAL SIR E. SOTHEBY, K.C.B.
W. TINDAL ROBERTSON, ESQ., M.D.
B. ST. JOHN ACKERS, ESQ.
W. AUCHINCLOSS ARROL, ESQ.
F. J. CAMPBELL, ESQ., L.L.D.
EDMUND C. JOHNSON, ESQ.
THE REV. W. BLOMEFIELD SLEIGHT, M.A.
THE REV. CHARLES MANSFIELD OWEN, M.A.

CHARLES E. D. BLACK, ESQ., *Secretary.*

Mr. WILLIAM SLEIGHT examined.

Mr. W. Sleight.

12 May 1887

17,040. (*Chairman.*) You have been many years at the head of the Deaf and Dumb Institution at Brighton; have you not?—I have been the head master 45 years next July.

17,041. Were you the first head master of that institution?—I was the first.

17,042. You have had very great experience, have you not, in the education of the deaf and dumb?—I have been a daily worker all that time in connexion with the deaf and dumb.

17,043. Have you much experience of what has been done in other countries; have you visited other countries to see what has been done there?—Yes.

17,044. Will you state to the Commission where the institutions are which you have visited, and how many years ago you visited them?—The first institution I ever visited was in Switzerland at Zurich in 1869.

17,045. Have you visited any deaf and dumb institutions in Germany?—Not in Germany, but I have visited the institution at Brussels and also those at Rotterdam, Liége, Geneva, Paris and Rouen.

17,046. Had you any opportunity of seeing the oral system at work either in Germany or in Switzerland, with the exception of Zurich?—No. I went to Italy, but the teaching of the deaf and dumb has made great strides in Italy since I was there. I visited an institution at Turin, and an institution at Genoa, but there was very little done I suppose in the way of articulation and so on at that time. My own opinion, if I am right in stating it, was that the

teaching of the deaf and dumb was not in a very flourishing condition at that time.

17,047. That was in 1869?—In 1869.

17,048. Do you think that the deaf and dumb children should be treated, as regards education (except of course where there is defective mental intelligence or any special physical defect in the throat and vocal organs), as far as possible as hearing children are treated?—I should certainly say treat them as much like ordinary children as you possibly can.

17,049. We have heard that in Italy they prefer to begin to educate the deaf and dumb at about six or seven years of age, and in some cases younger, even as young as five?—Yes.

17,050. In your institution what has your practice been with regard to the age at which you take the deaf and dumb?—The conditions under which I first went to Brighton are stated in Mr. Baker's article in the Encyclopædia, where he says that Mr. Sleight was appointed to take charge of a small institution at Brighton, and to take younger children than were taken into ordinary institutions. I took children two or three years younger than any institution admitted them at that time.

17,051. What was the usual age at that time at which education began in the other institutions?—The practice then was not to receive them till they were eight years of age; and the London institution did not receive them till eight and a half, and preferred putting off their reception till they were nine or nine and a half years old; but that is altered now.

17,052. What was your practice?—I received children at five or six years of age. In fact the institution was commenced with younger children than had been admitted to institutions before.

17,053. At that time the oral system was not known in England, was it?—Not the oral system as it is now taught; articulation was taught to some children.

17,054. May I ask how you began to teach these young children; did you attempt anything in the direction of teaching them articulation?—I did not attempt to begin by teaching articulation, articulation was quite a secondary thing. If we had a child who had become deaf, but had some remains of speech, or whose speech had perhaps nearly gone and could easily be brought back, we should try articulation; but as regards the school generally, articulation was not thought of. As regards the age, I believe that it was clearly proved at Manchester that if children are admitted very young, say, at three, or four, or five years of age, they are no better at 10, and perhaps not so good (and I think Mr. Patterson said that they were not so good) as if they went to school at seven or eight years old.

17,055. Supposing the object of education to be to teach speech, would it not be desirable to teach the children to breathe like hearing people, and to exercise as early as possible those vocal organs which must, if they are not exercised, become inefficient from want of use?—I do not myself think that articulation does much in that way. The children get some exercise in their play, for they shout and scream in the playground and in the yard, and make as much noise as any children in the world.

17,056. If they shout and scream does not that show that they have some power of speech left?—I think not. I think it shows they have a voice, and that they are as it were dumb with respect to language, but not mute in any other way as regards voice. They have as much power of voice, and it varies as much as other children. I should know one child's voice from anothers in the school or playground. The voice a child is born with is more natural and distinctive than the voice which you are able to develop by training.

17,057. Is it not the fact that if you let the voice, which does to a certain extent exist in the deaf and dumb, remain without training, it becomes harsh, particularly if you leave it so long as to allow the vocal organs to become inefficient from want of use?—I have no objection at all to the vocal organs being used.

Mr. W. Sleight.

12 May 1887.

17,058. Does not the voice become harsh if it is not used?—My own opinion would not have much value as regards the voice in that respect.

17,059. Do you believe that under no circumstances it is desirable to teach the deaf and dumb to speak?—By no means.

17,060. What are the circumstances when you think it is desirable?—I believe there are some deaf and dumb who can be easily made to repeat words. Some seem to have a predisposition to speak, and some children have learned at home from their parents before they came to us. Some parents try a good deal to make the children learn words; in fact you would be astonished to find how some of the children come to us with a string of sentences that their parents have taught them; but such cases are exceptional.

17,061. Would you in those cases attempt, in the education of the deaf and dumb, to continue that course of training?—I would.

17,062. And that has been your practice, has it?—I cannot say it has been my practice as much as I should have liked it to have been, because we were not able to supply teachers to carry it out. We have had a great deal of difficulty as to funds which some institutions have not had at all.

17,063. Your difficulty has been rather from want of proper qualified teachers than from any objection on your part to teach the children in that way, where there has been a predisposition in the child to speak?—Our difficulty has been rather from want of money to supply the teachers.

17,064. Were there properly trained teachers there if you had the money?—We have always trained our own teachers; I have always trained all the teachers I have had.

17,065. If you train your own teachers why was there any money difficulty; you might just as well have trained your teachers to teach the children upon the oral system?—I do not think you have time as a rule to carry out any two systems unless you separate them in some way.

17,066. Your system was the sign and manual system pure and simple?—The sign and manual system pure and simple; that is to say, we do not teach articulation as a regular rule although we do in exceptional cases, because there are some adults who articulate very well. I could show you one of my old pupils for instance at Ardingley, who was not born deaf but became deaf at such an early period that he became dumb, and he can articulate very well. I may say that those who have become dumb are not in the position of born deaf mutes; suppose for instance you began to teach them to say "bird," you could not draw "bird" out of them. When they begin to learn words it is most remarkable to notice how they remember what they spoke before they lost their voice.

17,067. Do you think that people can speak without being trained to use their lungs properly?—I should say that speaking must exercise the lungs certainly.

17,068. As a rule do the deaf and dumb take as long an inspiration and breathe in the natural way as other children do?—I should think so.

17,069. Have you ever tried it by any mechanical means?—I should say that they absolutely do, for they run a mile race at their annual sports with no more fatigue than other boys.

17,070. Have you ever tried by filling a bladder, for instance, to see whether they do?—No, I have not.

17,071. Do not the deaf and dumb generally breathe with open mouth?—There is a connexion between the throat and the nose, and you will frequently find that there is a stoppage there, but that is not necessarily from their deafness; that is caused sometimes by scarlet fever in childhood; you often find a stoppage there, and a great many become deaf and

Mr. W. Sleight.

12 May 1887.

dumb from that cause so far as we know. I think that is owing to that disease and not to the deafness.

17,072. The thickening of the tube would be one of the causes of their deafness?—Yes.

17,073. If you could by practice open that tube, would not that enable them to speak?—I should not say so, because the disease has caused that obstruction. There are some deaf and dumb that cannot breathe through their nose at all; the disease has brought on something that has stopped the nose.

17,074. Is not that rather a case for surgical treatment?—There is hardly a case admitted into the institution that is not taken to an aurist first; we do not undertake anything of that sort at the institution.

17,075. What medical examination is there at the entrance of the child and from time to time in the institution?—There is no medical examination at all; every child comes before the head master.

17,076. Is he the judge of whether they are deaf and dumb?—No; there is a form card filled up.

17,077. Is there a medical certificate before they enter?—Yes, there is a medical certificate appended; it is signed by a medical man and witnessed by the clergyman of the parish.

17,078. Is there a medical inspection from time to time to see whether those children are going on well?—We have a medical man.

17,079. Is there a periodical medical inspection?—It is not periodical; it is only when the child is ill. Of course the medical man comes in himself very frequently as he is passing, but there is no fixed period.

17,080. How many years do you keep the children at school?—We should like to keep them longer than we do. The average time is five or six years; I should say, perhaps, six. One of our great difficulties is that the children are removed from the school just when they are beginning to get on. The minds of the deaf and dumb do not develop at so early a period as in the case of hearing and speaking children. We commence, as it were, very much lower down in the teaching of the deaf and dumb; their memory has not been exercised at all by acquiring the mother tongue. The want of memory is one of our great difficulties. A deaf and dumb child's mind is at least three years behind that of a speaking child. A deaf and dumb child of 7 is not more advanced than a speaking child of 4 as regards the maturity of his mind.

17,081. You say that the deaf and dumb child is much more backward; what steps do you take to develop his powers of observation?—On the child coming to us we let him mix with the other children, and he soon begins to see the sign language. That sign language is the language of the house; every one speaks it in the house. You can tell a child by that language to do anything, and the children talk one with the other. You need not teach a deaf and dumb child the signs; you need only put him into the schoolroom, and in a remarkably short time the child begins to gather up, not only the names of individual things, but phrases; and so we let him go on, and do not trouble to teach him at first. Then after a short time we commence to teach him to write words of three letters. You may, for instance, take c-a-t, and then show him a picture, or, better still, show him a cat; and so on with other words. During all that time the child is acquiring without teaching this sign language as a mother tongue; it is the language that all the children talk, and they use that language as well as any children in the world can use their mother tongue. I say that it is a very important matter for a deaf and dumb child that he should get this mother tongue language. It is to him a living channel, the same as our speech is to us.

17,082. It is a living channel to those who understand it?—Yes.

17,083. Not to the outer world?—Neither is this English language of ours a living channel except to English people; it is their language, as the English language is our language.

17,084. You place them like foreigners in the midst of English-speaking children?—That is perfectly true, but what are we doing? We are trying to break through that foreign language and give them an English written language, so that by learning 26 letters you can spell anything to him.

17,085. Do you give all your instruction in spelt language?—In signs and spelt language.

17,086. You give, I understand, all your instruction in language by the fingers?—Yes.

17,087. Without conventional signs?—No, we use conventional signs from the first. We take the natural signs, as far as possible, as the groundwork, and then the conventional works in. I will give you, as an instance of what I mean by natural signs, the case of a little boy who, when he had been with us only a few months and before he knew any expression at all, was walking with his father (who was a detective in Brighton) on the King's Road, and as a gentleman, whom he knew to be a doctor, passed he pulled his father's coat, and, putting his tongue out and his finger on his pulse, he pointed to the gentleman. That was the case of a little boy who could not speak any English at all; he could not spell it with his fingers, because he did not know any English. When I speak of spelling, it will be understood that I mean simply writing (without using pen or paper) on your hands, either with the two hands or the one hand alphabet; we use both in almost all our institutions. If you see the children anywhere you will notice that they can talk with their hands behind them or before them, or in any position; they can communicate with one another as easily as possible; and it is curious to observe how little boys who do not know any writing can talk to one another. I can give an instance that occurred only last week of a little girl who knew no written language; she had been a short time in the school and only knew signs. A telegram came to us to say that her mother had died, and the work-mistress came to me to ask if she had better tell the child the news, and I said she had better take a proper opportunity to tell her if possible. The work-mistress only made two signs; she touched her ring (the wedding-ring is the sign for mother), and she made another sign indicating "dead," and the little child at once understood, as was shown by the fact that she went and sobbed in the corner. That shows the power of signs to reach children who do not know any written or spoken language.

17,088. As we hope to have an opportunity of visiting your school and of judging of details of management on the spot, I will only now ask you one or two questions with regard to general principles. Do you contemporaneously with the educational training give them any industrial training or knowledge of tools?—No, we do not. If I may be allowed I should like to say a few words upon that subject, as I have had considerable experience with regard to it. About 40 years ago it was thought that trades should be taught in all the institutions for the deaf and dumb, and the institutions of Exeter and Glasgow, and some others went to considerable expense to teach the boys trades, by which they could earn their living, as they thought. When they had given the boy a certain amount of instruction in a trade, we will say tailoring for instance, and had got him to use the needle pretty well, they found it was very seldom that the boy went to be a tailor.

17,089. Would not the knowledge which he had acquired be useful in other conditions of life besides tailoring?—It would.

17,090. Would not the knowledge of how to use an axe, or hammer, or chisel be useful to a boy though he was not going to be a carpenter?—Yes, I quite agree so far as that goes.

17,091. That is rather what I was referring to; would you give them such exercises as to make them accustomed to use their hands; do you think that is desirable?—Yes, I should think it was desirable, but it is certainly not desirable if it be done with a view of giving a boy a trade, for this reason; that in an

Mr. W. Sleight.

12 May 1887

institution you can never make a skilled workman. Of course I have taken a great interest with my boys in getting them apprenticed, and my advice formed on my experience has always been to the parent, "you "had better get a master for your boy, and put him into "the general field of labour, and he will make a "better workman in that way than if he is taught in "a private way." Then as regards the girls we have an experienced work mistress, who is a dressmaker, who understands the things that girls should learn.

17,092. Do they mend their own clothes?—Yes, and the boys' too; the girls make some of their own dresses.

17,093. Do they help in the different operations in the house such as cooking?—Yes, everything belonging to the children, boys and girls. The girls make the beds and sweep the floors, and wash. There is a table where each girls' work is put down.

17,094. Do they learn to wash as well?—Yes, but not all the girls; only those who are likely to become laundresses. As a rule we give them special training in laundry work. In domestic service laundry work is the service best fitted for them.

17,095. I suppose there is no difficulty in finding places for the girls who want to go to service?—No, but we always discourage their going to be servants unless they are going to be laundresses, because they cannot take their place with other servants, where they have to answer bells and answer the door; otherwise they make good servants.

17,096. With regard to the boys, do you know at all what trades those that have been through your school have taken in after life?—Yes; I have a copy of our report here with a table showing the different trades the boys have gone to (*handing in the report*). You will see that they go to almost every trade. There are plenty of our boys in London now, and my great surprise is the wonderful way they seem to get on in their trades.

17,097. I presume they have the usual games that boys have?—Our boys especially have. They have athletic clubs and such like, such as no other institution has had. They play cricket and football matches against hearing and speaking colleges and schools regularly, and they go out on the Downs for instance, which is a very important matter, and I do not think you will find that as a general rule. I do not approve at all of children, whether they are deaf and dumb or not, being kept in a playground within four walls. Our children go out every morning on the Esplanade or on the Downs. They have a half-holiday on Saturday and Wednesday, and very often they have cricket matches.

17,098. Then you do not overwork them; you give them a fair amount of holiday?—Plenty. I think the starting point of all education is good health and happiness, and that gives it; you cannot get that if you shut them up within four walls, I do not care how big the playground is.

17,099. Do you develop the study of drawing specially?—We give great attention to drawing, and many of our pupils have become engravers.

17,100. Do they take certificates from South Kensington?—Yes, one year six of them took certificates from South Kensington. Two or three have been sent up to South Kensington. But those certificates which we get from South Kensington are through the Brighton School of Art. We send a good many of our boys to the Brighton School of Art. A good many of my boys have been engravers in London, but unhappily engraving is now superseded by something else, so that some of the very best engravers were out of work last winter. The result of that will be a very sad thing for the deaf and dumb. Many of the deaf and dumb have become quite successful engravers. There is Mr. Hollick, who is doing the specimens of the "Challenger" for the Government; he does the most microscopical lithographs; I believe there is not one to surpass him. He has taken two of our boys as apprentices, and they are getting on very well indeed.

17,101. Does the number of your boys increase, or does it remain the same?—It has been very much the same for some years. The numbers of the boys and girls are about the same. We have taken them at much older periods of life than almost any other institution would take them. There are applications sometimes to admit boys 16 years old who have never been educated at all.

17,102. Is there any limit as to the class of life from which you take them?—No.

17,103. Is the institution purely for those who are poor?—No, we have had what we call three classes of pupils in our institution, that is to say the private pupils, the intermediate pupils, and the foundation pupils. There are no free children in our school. It has been the most self-supporting of any in the kingdom, as you will see if you refer to the balance sheet in the report. With the exception of this year, when there have been two legacies, our institution has been the most self-supporting and dependent upon its own work.

17,104. Do the profits go to capital account?—They all go to the committee; it is all shown in the report, every penny that is received and paid appears in that balance-sheet. The income and the expenses pretty nearly balance. We had two legacies this year, which is a very rare thing for the Brighton Institution.

17,105. What is the number of your teaching staff?—Five, that is to say four besides myself. I may qualify that answer by saying that we always employ some of our older pupils as monitors; it does them good to go through the vocabularies that they have passed through before. We have five teachers altogether with the monitors. There is myself, and my son is now with me. He was at Cambridge, but he was always among the deaf and dumb. Then Mr. Pearce, who has been 15 years with me. He is a speaking deaf; he speaks very well, but he is totally deaf.

17,106. Was he brought up in the school?—No, but he has been 15 years with me.

17,107. Does he teach on the sign and manual system as well?—Yes, entirely.

17,108. Is he able to communicate with you by voice?—Yes, perfectly well, but he is stone deaf. I do not think he could hear a cannon fire.

17,109. He learnt to speak before he became deaf?—Yes. I think it was through scarlet fever. I think scarlet fever takes away all power of vibration of the ear. I think those who become deaf in that way, are the deafest of all.

17,110. What sort of service do you have; do the pupils go to church?—We take all the pupils to church in the morning; they go to Saint Mark's where I am churchwarden; we have gone there for years. We used to go to Saint James' many years ago.

17,111. How do they understand the sermon?—They do not understand the sermon, but I have had a service myself for 43 years. I have conducted the service regularly for the adults, and for my pupils every Sunday afternoon, and then we prepare them for confirmation.

17,112. Do you read a sermon to them?—Yes, I have always had a sermon.

17,113. Was that entirely your own doing?—That has nothing to do with the committee or the institution; that is my voluntary work, and I carried it on till I had a very severe illness some two years ago, and my younger son has carried it on since. He was brought up amongst the deaf and dumb, and can talk with his fingers as well as his mother tongue. He was for five years one of the masters in Merchiston Castle, Edinburgh, after leaving Cambridge.

17,114. Have you been to America to see their deaf and dumb institutions?—No. But as regards America, I may say that following the first exhibition of 1851, Dr. Peet and his son the present principal of New York Institution stayed at the Brighton Institution two or three days, and he was very much pleased with

Mr. W. Sleight.

12 May 1887.

it, and I corresponded with the late Dr. Peet as I also do now with his son.

17,115. Are you aware of what goes on in America with regard to the deaf and dumb?—Yes; I get reports and I am aware that there is the same process going on there as regards changes as there is here.

17,116. Since you have been at work with the deaf and dumb has your opinion been modified by what you have heard or read about the education of the deaf and dumb; are you still of opinion that the sign and manual system is the only system to pursue?—It is not the only system.

17,117. You said, I think, that it was practically the system which you pursued to begin with, with very rare exceptions, I understand?—Yes.

17,118. Has your opinion been modified since you first began to work with the deaf and dumb in that respect?—No, so far as my judgment would go, I believe it gives the deaf and dumb a greater power with the outer world after they leave school, than the uncertain articulation of the deaf and dumb. If the deaf and dumb articulation could be depended upon as a channel of communication then of course you make a deaf and dumb child more like another person if you teach him articulation.

17,119. That is what is done in Italy; we have seen it done there?—Yes, I know that there are exceptional cases, but that is a very different thing from taking a general school. I myself have visited all the deaf and dumb institutions in England. I spent two hours not many weeks ago in an institution in London which I need not name, where I believe you would find that there have been pupils equal in that respect to any you will see anywhere.

17,120. Having seen all that, does your opinion remain the same or does that modify it?—It modifies it in this way. The two systems have always been, as it were, rivals more or less ever since I was a teacher of the deaf and dumb, and even in the time of Mr. Baker and Mr. Anderson, 45 years ago. The whole of this subject was thought over, and Mr. Baker began to teach articulation. The fact is when I first went to Mr. Baker he had some private pupils, and I was appointed to teach articulation to them for an hour and a half every evening; but Mr. Baker said at the second conference of teachers that the result both in time and cost was not such that he would consider it desirable to give the time to it.

17,121. Then you think, as I understand, that the parents would not allow the children to remain long enough and be prepared to undertake the expense necessary to teach the children the oral system?—Yes.

17,122. That is one of the grounds upon which you defend the sign and manual system as the best means of giving, within a certain time, a certain amount of education?—Yes, otherwise I say, do as much as you possibly can for their education.

17,123. (*Mr. Johnson.*) How many pupils have you got in your school now?—We have 90.

17,124. Can you tell us at all what the cost is per head?—About 20*l.* per head.

17,125. That of course includes all the expenses?—Yes, everything, except clothing and rent of building and absence during vacation.

17,126. From your experience what is your opinion of articulation as a means of instruction for the deaf?—Of course there are two systems of teaching the deaf which may be called rival systems. No one would say that the deaf could not be taught on either system. If you compare them, taking it all round, my opinion is that the sign and manual system is the best for the greater number of the deaf and dumb. I believe there are exceptional pupils who may be taught very well by the oral system. I may say with respect to that point that I have had considerable experience, having come in contact with those who can speak either. There are some ladies in London who have been educated abroad, and I have had intercourse with them and with a great many others who have been educated entirely upon the oral system, and I have never found yet that those who have learnt the oral system can communicate with one another so freely as those who have learned by the sign and manual system. This freedom of communication is a very important matter indeed with regard to the deaf and dumb. For instance, a few months ago I saw a group of eight boys in the playground who had all been taught upon the oral system; I never saw those boys speak to one another by lip; but I did see them use their hands; they stood and looked at one another, and I never saw them communicate with one another labially; I think that is a very important matter. Supposing you had eight deaf and dumb boys together who had been educated on the sign system, you would have seen them gossiping and communicating with one another as rapidly as by electricity. The sign system gives them a power of intercourse one with another, and I believe that intercourse that they have one with another becomes a living bond between two souls that no lip intercourse can ever come up to. I believe in the usefulness of that intercourse with contemporaries in their case as amongst ourselves. Do you suppose the child depends upon what he gets in school for all his knowledge? Certainly not. Unless you can say, "Here are eight boys educated "on the oral system, who can talk freely one to another "by the lip," you do not show me what the sign language has done for the deaf and dumb. Then of course comes the other argument, but what will the signs do when they go outside your school?

17,127. That was the question I was about to ask you?—What is the experience of all who have ever had anything to do with the deaf and dumb? they have never had a difficulty. I can give you as an instance, the case of one of our boys who is mentioned in the report. He was working as a diamond polisher at the exhibition last year, and his master told me that all the workmen could talk quite easily with that boy, and that there was no difficulty whatever. I send a boy with a bag with 20*l.* in it, and tell him to pay a Bill; I find no difficulty in sending the boys about anywhere; they go and take their tickets at a railway; if they want a third class ticket they will put down 3, and if they want a half they put down a ½, and go about everywhere quite easily. But if the orally taught child can go and speak to a person, and talk to him just as we do one to another, then I say you have given him a tongue with the outside world that the other fails to do. But can you get a perfect channel by the voice in that way with the mass of your pupils, and not only with one picked pupil. To take another instance, I was at a small party in London some weeks back, and there was a gentleman there who had been taught entirely upon the oral system. He did speak, and you could tell what he said generally, but there were occasional breaks that you could not gather up continuously. He was a young gentleman of 23 perhaps. There were two or three other gentlemen in the room; we were all teachers of the deaf and dumb. Dr. Gallaudet was there, I said I should like to try whether this gentleman can gather from our lips the subject that we are speaking upon. I said to the gentleman whom the house belonged to "would you mind that young "gentleman just sitting so that he can see us," "I "want to know if he can gather up, I do not mean "every word, but the subject of our conversation." This young man came and sat near us, and we began to talk, but he did not succeed, and if the oral system breaks down in that way what is the man to do who has learnt only the oral system. Suppose for instance a boy is a carpenter, and has learnt the oral system, and is on the top of a ladder; the voice is no use to him; he must see the lips, he cannot see the lips all that distance, but he could see a sign. Or take the boys at their games; you have a lot of boys in the cricket field, do you think the boy who has learnt the oral system could read anything by the lips when he is standing a considerable way off, and is told by the lips to throw up the ball; he would fail entirely, whereas our boys play cricket and take their part with other boys, and are in fact very much liked. Many of my past pupils for example are now earning their living in London, and they never seem to have any difficulty in making their way, it is marvellous how well those boys get on in after life. And after all, the test of the success of a system must be how does it succeed when a boy has to make his way in the world. That is what I look to.

Mr. W. Sleight.

12 May 1887.

17,128. We may take it that you are in favour of what you call the combined system, that is to say to use as much language as it is possible to teach a child, together with signs?—Yes, as much as possible.

17,129. That is the opinion that has been given by Dr. Gallaudet?—Yes; I believe Dr. Gallaudet is quite of that opinion, if I may gather from what he has written.

17,130. Then do you think it is possible to teach the two systems, the sign system and the oral system, I do not mean the pure oral system, together in the same school?—I do if you have the means to enable you to have special teachers for them. I am quite of a different opinion from some in that view. I think they would speak all the better.

17,131. You mean if they are taught in a combined school?—I think you should never deprive the deaf of the sign language. I take it that of course we would never deprive the deaf and dumb of this system of sign and manual language, which develops their power of language, and by which they learn to write the English, for spelling by the fingers it is practically writing without paper or pen.

17,132. In your opinion do the results from the oral method of instruction compensate for the time and expense which the learning of it involves as compared with other systems?—I should not say so.

17,133. Have you much experience of what is called the pure oral system?—Not much.

17,134. Have you ever seen any remarkable instance of proficiency under the pure oral system?—Not remarkable proficiency. I have seen remarkable failures.

17,135. You do admit that there are successes?—I admit there are successes, but not to the extent that many people say. It has been said, and I could show you it in print, that there have been ladies who can read a sermon. It was said, for instance, that Charlotte Elizabeth could do so, but Charlotte Elizabeth contradicted that and said she could not.

17,136. In the interesting case which you gave of a little girl having the death of her mother communicated to her by two signs, would it have been possible to have conveyed the intelligence to her by the oral system?—I should think not to a little girl like that. As a rule I should think it would take a much longer time. In fact I believe all the oral teachers admit that you get up an intercourse with the pupils by the sign language in a much shorter time than you can by the oral system.

17,137. Do you think there would be any advantage from a more careful medical inspection of the cases that come under the schoolmasters and directors?—There might be in some cases; but as a rule the children are generally as healthy as others. There is no special need of a doctor unless you intend to have some operation performed, and then I think an institution ought not to undertake that. If a parent wants an operation performed I should say take your child in your own care and take him to a specialist, and then you get every advantage that can be got. But we might get into trouble if we were to undertake that.

17,138. I did not mean to recommend that you should undertake operations. What I meant to ask was if there was more regular medical supervision in all the institutions, would it not be possible that some causes of deafness and muteness might be removed, and that as a result you would have a better material to work upon?—As regards that, I think a good many of the medical men as I have reason to know, hardly see what deafness and dumbness is. Many of them think it is two afflictions, but it is simply the deafness they suffer from. I should think an ordinary practitioner would not be of much use as regards a point of that sort. I think his attendance, to look after the general health of the child is very desirable, and I would not mind if he attended daily.

17,139. Do you think that the use of the sign and manual system leads to a thorough knowledge of language?—I do think it leads to a thorough knowledge of language, but there is a great mistake in the mind of the public generally as to the knowledge of language which the deaf and dumb can acquire. That is one of the difficulties that the teachers of the deaf and dumb have to meet with. I believe that the outside world think that the deaf and dumb know ten times more language than they really do as a rule. For instance, any one going over a school, and seeing the writing of the children, will expect a child in two or three months to answer questions in writing to which it would take him two or three years of training to be able to give written answers. People forget what power of language is required. The children have not only the difficulty of getting to understand any sentence, but they have a difficulty in retaining it in their minds after they understand it. It takes more years than some people would think months, to develop the memory and power of composition of the deaf and dumb. If you compare them with the blind for instance, which may be a helpful comparison, I should say that it would take a deaf and dumb child six years to learn to write a piece of composition which a blind child could learn to write in one year. A blind child has language, and will learn language practically like a seeing child, whereas a deaf child is cut off from language. An outsider who sees a child write well on a slate (and they are very quick at merely imitating writing when they see it before them) thinks that they will be able to answer questions in writing just as easily. But it is quite a different thing.

17,140. My question was rather this: is it your opinion that the sign and manual system gives a better knowledge of the English written language than the oral system has hitherto done?—So far as I have seen it does.

17,141. Do you think that under the oral system there is the same difficulty as to a limited vocabulary as there is under the manual system?—I think so.

17,142. I understand that there are some deaf and dumb missionaries at the present moment, have you any experience of any of them?—Yes.

17,143. Can you tell the Commission anything upon that point?—I can speak of Mr. Pearce. He was first licensed as a lay reader, and subsequently he was ordained by the Bishop of Winchester, he has a license for the whole of the Diocese of Winchester. He visits the deaf and dumb in the diocese of Winchester, and holds classes for the deaf and dumb.

17,144. Where was he educated?—He was 12 years with me as a private pupil.

17,145. Does he hold classes in the sign and manual system?—Yes.

17,146. Has he any knowledge or has he had any experience of the oral system?—No, he is a pure deaf mute.

17,147. Have you had any other person who was remarkable in these particular respects in the diocese?—There was a boy of the name of Brigden who was my pupil for a good many years, he made great progress in drawing, and I got him apprenticed to Messrs. Smith and Linton in Hatton Garden. I showed them one of his drawings and they took him without a premium, and he got on very well. Eventually, he began to find out the deaf and dumb in Deptford, and used to have a class in Deptford every Sunday of adult deaf and dumb pupils, and he got a schoolroom there, and he used to have them regularly on Sundays, and sometimes on week nights. Then he got an opening to go to Canada, and he now has and has for years had a regular service for the deaf and dumb in Shaftesbury Hall in Toronto, Canada There is a young lady there, who was educated by me, Miss

Mr. W. Sleight.

12 May 1887.

Martin, who is married and lives at Toronto, she says in a letter, "I have so much pleasure in "attending Mr. Brigden's services on Sunday after- "noon at Shaftesbury Hall, Toronto."

17,148. Is it your experience that the deaf who are taught by the sign and manual method, when they leave school, lose the language they have previously acquired?—No, that is not my experince, but the very opposite is my experience, namely, that they marvellously increase their knowledge of written language, and their use of phrases because they are thrown more upon the spelling than they ever were before.

17,149. A question was asked of another witness some time ago. "May I take it from your own "experience that the combined system with as much "vocalization as can be recommended is the method "that you would recommend," is that your view?—It is.

17,150. (*Rev. Mr. Owen.*) Did you ever find your pupils who are taught on the sign and manual method at any disadvantage with those taught on the oral method?—Never.

17,151. Speaking of missionaries do you consider their evidence is important as regards the adult deaf and dumb?—Most important, because they have so much to do with them.

17,152. Speaking generally and very briefly in your opinion, which system develops the faculties best?—In my opinion the system that develops the faculties best is the sign and manual system. It must develop the faculties much quicker, because the sign language develops so much quicker than the oral system can possibly do.

17,153. The sign and manual system reaches the mind quicker, in your opinion?—It reaches the mind quicker certainly.

17,154. (*Dr. Robertson.*) Reverting to a question which the Chairman put to you with regard to the exercising of the vocal organs, do you not think it is necessary that the children should be trained to exercise them properly, inasmuch as although they may use the voice in shouting in the playground, if they do not develop the muscles of the larynx itself by constant attention, they are not likely to get any good pure sound?—I do not see myself the value of that.

17,155. I presume that the muscles of the larynx are like other muscles, and that unless you use them you will not acquire such a good condition of voice?—I think that all the muscles of course are the better for being exercised and developed if there is any power of development. There must be an advantage in exercising them so far as that goes.

17,156. Even if you could teach the sign and manual system, it would be an advantage to cultivate as far as possible some voice power, would it not?—I think unless you cultivate the voice fully and go into it in a proper way, you do not do much good; and if you go into it thoroughly you take up all your time with that alone. I do not see how it could be well managed.

17,157. (*Chairman.*) You told Mr. Johnson that you were in favour of the combined system; now, as I understand, you say it is not worth while going into the two systems, unless you do it throughly?—I said that you should divide the classes. If I could take a certain number at a school who are specially fitted for it, I would teach those children, and do a great deal of good, by the combined system.

17,158. Would you divide the school into two halves and teach one half the one system, and one half the other; is that your explanation of what you mean by recommending the combined system?—There are a certain number of pupils in the school whom I should teach upon the combined system. I would not take away the sign and manual system from them by any means. But there are a certain number whom I do not think it would be wise to teach by the oral system; you would spend your time better by keeping them entirely to the sign and manual system.

17,159. (*Dr. Robertson.*) Supposing you had a school divided into two parts, and those pupils who were simply fit for oral teaching were taught orally, you would grant, I suppose, that the earlier their vocal organs were called into play the better?—I think by adopting that system they would lose ground in this way. I think that young deaf and dumb are all better for mixing with hearing and speaking children; it takes away that sort of clannishness from them. If I had a child who was born a deaf mute, I would prefer his mixing, for the first five or six years, with other children; that would do him more good than if you gave him special instruction either by the signs or the oral system previous to seven years of age.

17,160. That does not quite meet my question, which is this, supposing that you were going to educate children upon the oral system, would it not be advisable that they should be practised with regard to their vocal organs as early as they possibly could?—Yes, certainly; I think the mother should do it, or anybody who is with the child should do it.

17,161. May I ask if your medical man is paid?—No, he is an honorary medical man and always has been.

17,162. Do you tabulate the causes of deafness in the school?—No, except as to whether they are born deaf or not, and even that classification, I may say, is not to be depended upon, because very frequently the parents do not know themselves whether their children were born deaf, and they will tell you so. I had two sons from a medical man at Ramsgate, and he told me himself that in the case of his eldest son, the first child, he did not find out that he was deaf until he was nearly three years of age. I had the brother of that boy with me also, and that young gentleman has been 20 years in the Phœnix Fire Office, he is a pure deaf mute.

17,163. Is there any means, from the information in your report, of arriving at the causes which have brought the children into the school?—No.

17,164. Could not it be shown to some extent?—Yes, I am quite in favour of any improvement in that way that could be made.

17,165. We have been discussing the question of deafness caused by scarlet fever; is it not the fact that in a great many cases the deafness following scarlet fever arises from perforation of the tympanum?—I believe so.

17,166. And there are also cases in which the eustachian tube leading from the ear to the back of the mouth is closed?—Yes, those are frequent cases; and we also find frequent cases of discharge from the ear, which is sometimes very offensive and continues for many years.

17,167. Is it not possible that those cases could be diagnosed by a medical man before he sends the child to you?—It would be a very good thing if it could be done. I quite agree with you as to that. I quite think that you cannot have too much knowledge as to causes of deafness and the history of the children; but there might be some difficulty at the various institutions. In my own case for instance, I was appointed to the Brighton Institution when I was about 25 years of age, and I had not all the experience that would be necessary to draw up such tables as would be desirable in the case of a deaf and dumb institution.

17,168. If those cases were tabulated do you not think that you might in process of time acquire such information as would enable you in many cases to trace the deafness to causes which might be preventible?—I do.

17,169. Do you teach the girls cooking?—Some of the girls, those that are likely to benefit by it, not all of them.

17,170. I mean the poorer girls more particularly who are likely to have that kind of work in after life?—We do in some measure, but not as a regular practice in the training for each child. They help in the scullery and kitchen, and so on.

17,171. You believe, I understand, that physical training is most important?—Yes.

17,172. Do you think that the training which you spoke of outside the four walls of the playground, cricketing and so on, would do away with the necessity for any regular good gymnastic work?—If you can have a nice gymnasium I should say have one by all means. I am for athletics in every possible way. I suppose there is no institution that has carried out that principle to the extent which we have done.

17,173. If you had more means you would have a still better gymnasium?—I would have a very good one.

17,174. And you would supplement the athletic teaching in the gymnasium by athletic sports outside?—I would.

17,175. (*Mr. Arrol.*) You mentioned having a teacher at your institution who is deaf, namely, Mr. Pearce?—Yes; and I have a female teacher who is deaf and dumb, a pure deaf mute. Mr. Pearce lost his hearing after he had learnt to speak; he is a speaking deaf; he was not taught by articulation; he never lost his speech; he lost his hearing and became totally deaf, as many do.

17,176. You admit, I suppose, that he is a very good lip reader?—No, he is not; he has never practised it. He does not teach lip reading; he teaches the sign and manual system.

17,177. Does he hold conversations with ordinary individuals?—No, not by seeing them speaking; only by the manual signs and by writing.

17,178. (*Admiral Sir E. Sotheby.*) Do you know the nature of the surgical examination that takes place when the pupils are admitted to the institution?—There is no surgical examination; there is only a medical certificate sent with the child.

17,179. Do you think that if there was a closer surgical examination it might be found that some of the pupils had a greater power of hearing than they are given credit for?—Certainly. We do test their hearing a great deal ourselves after they have come. And there is a very curious thing to be observed as to the degrees of hearing. Some children will hear the least sound, but you cannot get the meaning of an articulate word conveyed to their mind by the ear, try as you like. They can hear vibrations, such as the clock striking, and small noises. They can hear some things almost as well as we do, but there is an imperfection in hearing which prevents them from distinguishing articulate words. I have tried many experiments in that way with a kind of funnel. With the hearing that they have you would suppose that they would gather the words, but you cannot possibly get articulate words through the ear.

17,180. (*Dr. Robertson.*) They have the nerve power but not the mechanical power?—That is it.

17,181. (*Admiral Sir E. Sotheby.*) This examination is of immense advantage, is it not, to find out what they can do?—Yes; but I think the teacher could do that better than the medical man.

17,182. Have you any sort of mechanical tube by which you try their hearing?—No; I merely made a sort of funnel for myself.

17,183. Are the pupils taught to swim?—They have been taught to swim for the last 30 years.

17,184. Do they swim as well as other people?—Yes, they are very good swimmers. I was a very good swimmer myself, and I used to take them.

17,185. Are they timid in the water?—They are rather the reverse. I do not think they have the timidity which ordinary people exhibit.

17,186. Do you know if there are any deaf and dumb children among the poorer classes at Brighton who are not educated?—I have a letter from the Brighton School Board, which says that there is only one.

17,187. Are any deaf and dumb children educated at the board schools at Brighton?—No; they are all sent to my institution.

17,188. (*Mr. St. John Ackers.*) What year were you at Genoa?—In 1869.

Mr. W. Sleight.

12 May 1887.

17,189. Who was the head of the institution?—I do not remember the name.

17,190. Do you remember anything of a teacher of the name of Pendola?—I did not hear the teacher's name.

17,191. You stated in evidence that you began by taking the children extremely young at your school?—Yes.

17,192. And now you take them at an older age than any other institution in the kingdom, do you not?—So far as I know we do. I take boys as old as 16 who have never had any education.

17,193. Do you also continue to take them at as early an age as you did at first?—No, we put the age two years later.

17,194. Would you state what reasons induced you to change the age?—The reason was that, so far as my experience went, it was better for the children to be put off a little. They made so little progress in the first two years that I thought it was better that they should remain at home with their brothers and sisters under the charge of their parents than be sent to the institution.

17,195. What age do you receive them at now?—Seven, as a rule.

17,196. You say, as I understand, that your numbers have not increased, why is that; is it because you have not increased your building?—We have increased our building three times.

17,197. And the numbers have not increased, have they?—Yes, the number has slightly increased, up to the number we have now.

17,198. I understood your answer to the Chairman to be that the numbers had not increased; does that mean within the last few years?—Within the last few years. Last year there were a few more than there had been before; from 80 to 90 has been the number for some years.

17,199. Am I to understand that in your neighbourhood the deaf and dumb are educated so far as you know, with the exception of the one referred to in the school board letter?—Yes, I believe so.

17,200. What is the district you take in under that answer?—The whole of the county of Sussex.

17,201. You spoke of Mr. Baker, of Doncaster; are you aware that Mr. Baker in his latter years regretted that he had not taught the pure oral system?—I am not aware that he regretted that he had not, but Mr. Baker was anxious to do anything that he could for educating the deaf and dumb. I never heard that Mr. Baker proposed in any way to take away the signs and manual system.

17,202. He had taught the oral system, but not the pure oral system, I think?—Quite so; Mr. Baker was very anxious to use all the means he could. I do not think there was a more enlightened man than Mr. Baker in the whole profession of teachers of the deaf and dumb.

17,203. He was one of those who urged me to take up the pure oral system about a year before he died, and you may remember perhaps that the last work he ever did in a literary way, was to publish a translation of Amman, which is the great standard work on the oral system?—I believe he did.

17,204. Could you furnish the Commission with the names and addresses of the ladies in London who were educated abroad?—I do not know their names and addresses.

17,205. Is it some years ago since you met them?—Many years ago, 25 years ago.

17,206. Do you take private pupils?—Yes, and always have done.

17,207. With a view to explaining what might seem to be a discrepancy between two answers you have given as to the system you would recommend for adoption, when you speak of the "combined system," would you tell us how you would define the word "combined"; do you mean that all the children in a certain school should be taught some

Mr. W. Sleight.

12 May 1887.

articulation; or do you mean that one portion of the school should be taught upon the signs and manual system altogether without articulation, and that the other portion should be taught by signs and manual with as much articulation as you can give them?—I believe one portion of the school should be taught entirely by signs and manual altogether; and if another portion gave evidence that the combined system was the best for their case I would teach that portion on the combined system, and let them have the benefit of the signs and the oral system too.

17,208. (*Chairman.*) That is the system which, you say, you would adopt if the circumstances permitted; but I understood from one of your former answers that at present you teach entirely upon the sign and manual system with some special exceptions, which did not really interfere with the general character of the school?—My practice is to use that combined system in assisting those who have become deaf after they have spoken; that is to say the speaking deaf.

17,209. You encourage them in the language which they have learned outside?—Yes, quite so.

17,210. You do not teach all the pupils on what we have understood to be the "combined system," that is to say the sign and manual system with so much articulation as can be taught concurrently with the sign and manual system?—No.

17,211. (*Mr. St. John Ackers.*) Do I rightly understand that the reason why you do not practice at Brighton that system which you think is the best is because you have not money enough to do so?—Exactly so. Many times the money has been too short. At one time there was only 10*l.* left in hand, and I had to send out circulars and try to get more money. We have had great difficulties. I used to have meetings to collect money, and do everything I could to get funds to go on with the institution. It is a very difficult thing to get the money for all these large institutions when the old friends are falling off as you go on year by year, and you cannot fill up their places. I worked the numbers up to 50 pupils by myself before the institution could give me one assistant. You have to be very careful about the expense. If you come to get into debt you take away your power of doing any good at all. It is the better way to do the best you can so far as your means allow, and that has been my principle throughout.

17,212. (*Chairman.*) If the Brighton school had sufficient means would you think it advisable to have oral teaching in that school; I mean combined with the sign and manual system?—Certainly, if I had the money I would have classes for the oral system.

17,213. Would you have some classes, if you had the means to do it thoroughly, upon the pure oral system?—I would so far as it can be carried out in a school where you have the signs and spelling carried on.

17,214. (*Mr. St. John Ackers.*) You find that there is considerable confusion in the public mind with regard to the names and terms in connexion with the different systems as you have pointed out?—Quite so.

17,215. Is not the term "combined system" used to denote many different systems?—It is.

17,216. Would it not be very advisable if the profession were to agree upon certain terms to be used to express certain definite things?—It would be most valuable.

17,217. (*Chairman.*) Do you have any classification of the deaf mutes according to their power of acquiring language in any way; do you put those who have any remains of language together in a class?—Sometimes we have three or four, or even six or seven such pupils, what I call the speaking deaf; and sometimes only one. We have only one at present.

17,218. If you had three or four, would you put them all together and teach them in a separate class?—Yes.

17,219. Have you ever had any children sent to your school and paid for by the guardians?—Yes; I have evidence of it in a letter I have here.

17,220. Does not that meet the difficulty as regards want of funds to some extent?—The attitude of the guardians has been very different recently.

17,221. When you speak of want of means you are not referring to recent years?—Not quite recently. At one time we could not get the guardians to help, but they have altered very much.

17,222. Is the grant paid by the guardians sufficient to cover the expenses?—Certainly not.

17,223. By how much does it fall short of the expenses?—They pay 12*l.* 10*s.*, and it costs us over 20*l.*, but the guardians clothe the children.

17,224. (*Mr. Johnson.*) The school board cannot do that, can they?—No.

17,225. (*Chairman.*) Seeing that your expenses are not covered by the guardians, have you ever applied for an increased grant?—We have done so many times. They give then rather less if the child's parents are earning so much money; for instance, we had a case not long ago where the father, who had seven or eight children, and was earning 24*s.* a week, and the guardians made him pay one half of their grant. Many of the parents pay part of what the guardians grant.

17,226. Then the parents do not pay in addition to the sum which you mention as what the guardians pay?—No, the 12*l.* 10*s.* includes what the parents pay. Some parents pay a shilling a week, or even up to 2*s.* 6*d.* a week in some cases.

17,227. Do the guardians ever pay you the 20*l.*?—No, they never pay us 20*l.* They pay 15*l.* for boys over 12.

17,228. Do they get part of that money back from the parents?—Sometimes they do. For instance, I will take the case of a labourer's child, the labourer pays 2*s.* 6*d.* a week and the union pays 2*s.* 6*d.*, that is a very common thing.

17,229. (*Mr. Arrol.*) You have instances, have you not, where the guardians pay the whole?—Yes, they pay the whole if the child is a child of the union; but they do not pay even then more than 15*l.* in our case.

The witness withdrew.

Mr. Edward Townsend called in and examined.

Mr. E. Townsend.

12 May 1887.

17,230. (*Chairman.*) For how long have you been head master at Birmingham?—Close upon five years.

17,231. Have you found any difficulty in getting the deaf and dumb children of Birmingham sent to school?—As a matter of fact I may say that at present in the Birmingham School Board district there are some 30 or 40 children of school age who are having no education at all. That is in the school board district alone, that does not comprise what I may call greater Birmingham. Some of the outskirts of Birmingham belong to other school board districts, and there are also in those districts, to my knowledge, other deaf and dumb children who are having no education.

17,232. Does that arise from the fact that the school board has not instituted school board classes for the deaf and dumb?—In a great measure I think it does; but I may say that the Birmingham School Board did pass a resolution to establish a school board class. Prior to the carrying of that resolution into effect, however, a deputation was sent to London to examine into the working of the London School Board classes. The deputation spent two whole days in visiting those schools, and on their return to Birmingham they made a very unfavourable report as to the working of the school board classes. They condemned the day school system, and they also disapproved of the method of teaching followed in the London School Board classes.

17,233. You mean the oral system?—Yes, they disapproved of the oral system.

17,234. In what year was this?—It occurred in 1885.

17,235. In consequence of that adverse report, no further action was taken then?—Not further than this: the matter again came up for discussion among the members of the board, and I suppose they felt that they would stultify themselves rather to rescind the resolution they had already passed about establishing the school board classes; so they decided upon suspending that resolution, and came to the decision that it would be better to send the children to such institutions as the one at Edgbaston.

17,236. Then I suppose the question came in that they have no power to pay for the maintenance?—Quite so, they have no power to pay for maintenance.

17,237. What did they do?—They then memorialised the Education Department, that was on the 6th March 1885, they asked the Education Department to introduce a Bill with regard to additional powers for dealing with the deaf and dumb and blind children. The department said that the memorial had been considered, but it was not proposed to introduce a Bill in Parliament as suggested. Subsequently to that, a deputation of the board had a meeting with the board of guardians to try and get them to take up the cases of those deaf and dumb children. But now I must turn to the action of the board of guardians. The Birmingham Board of Guardians have made a hard and fast rule, which they will not depart from, with regard to sending deaf and dumb children to school, a rule which I think is very ill judged and very short sighted, and the operation of which is most injurious to the deaf and dumb children as is proved by the existing state of things in Birmingham.

17,238. Have you any resolution of the board of guardians embodying the rule you refer to?—Yes. I can give you the actual words, I think. The rule they have made is this: that if the united earnings of the family, after paying house-rent, amount to 3*s.* per head, they will not take up the case of a deaf and dumb child in that family. Take as an illustration the case of a man and his wife with six children; suppose that man is earning 30*s.* a week, he pays 5*s.* a week for house rent, that leaves 25*s.* a week to keep his wife and his six children, that averages a little over 3*s* per head. I say that man could not afford to pay 5*s.* a week for teaching his deaf and dumb child out of the 25*s.* a week which he has for the support of that family. The consequence is, the man applies to the guardians, and the guardians will not take up the case themselves because the united earnings of the family average more than 3*s.* per head. There are large numbers of children without education in Birmingham because their parents cannot afford it. I am aware in the last few years of a dozen children at least who have got beyond the age for entering an institution and who are left uneducated, and I am further aware that there are a number of adult deaf mutes in Birmingham also without education.

17,239. Has any action been taken since 1885 by any public body to bring this matter before the Education Department?—Not that I am aware of, I presume that the Birmingham School Board is waiting to see the issue of this Commission.

17,240. In the meantime the children remain uneducated?—Yes. As year after year passes, more and more children are growing up without education.

17,241. The board of guardians have power to spend up to 20*l.*, have they not, upon deaf and dumb children?—In our institution that is so.

17,242. For maintenance?—For maintenance, education, and clothing.

Mr. E. Townsend.

12 May 1887.

17,243. Have you any cases of that kind?—In certain cases they are paying that.

17,244. How many cases do you know of?—I could not tell how many Birmingham Board of Guardians cases we have in our school at the moment, although I could tell by reference to my list. They do pay for some I know. I may perhaps mention this fact also: It has been proposed to rescind that resolution so far as it affects deaf and dumb children. That proposition was made by one of the guardians, but he failed to carry his point, so the matter remains in *statu quo*.

17,245. Do you think that it is desirable that there should be some compulsory powers given to the school board or the board of guardians which would enable them to educate and maintain the children in these institutions, or to provide day classes for the deaf and dumb children in their localities?—I think such compulsory powers are absolutely necessary. I should like to give my views as to how I think the matter could best be taken in hand with the idea of getting a successful result. The views I entertain are these: that a capitation fee should be paid to the institution of 10*l.* for all cases in the institution from the Imperial taxes.

17,246. By whom should that 10*l.* be paid?—So long as it comes out of the Imperial taxation I do not care whether it comes from the Education Department or from any other department, but as this amount would not cover education, but would be only for maintenance, probably it would come from another department than the Education Department. In addition to that I would transfer the permissive powers already enjoyed by the board of guardians to the school boards, or, in the absence of a school board, to any local corporate educational body, the managers of schools or whatever they might be, and I would make it obligatory upon them to have the deaf and dumb children in their respective localities educated. I would leave it with those bodies to determine whether the parents of those children were in a position to pay the 10*l.* per head for education, or whether they should pay such portion of it as they finally decide they can pay. Whatever the friends of the child are unable to pay of this additional 10*l.* for educational purposes, I would allow the school board to make up, if necessary out of the local rates, either out of the school board rate, or supposing that a school board does not exist in the district, from the other local rates. I would put the educational part in the hands of the school board because I think that is their special function.

17,247. Between what ages do you think that the children ought to be compelled to come to school?—I think from 7 or 8 years old with a minimum school term of seven years.

17,248. What is to become of the children up to 7 and 8 years of age?—I certainly would not advocate their being sent to institutions.

17,249. Not to infant schools?—No; the experiment at Manchester demonstrated the uselessness of that.

17,250. Uselessness in an educational point of view, do you mean?—I think it would be useless from an educational point of view; and, moreover, I think it would be a very expensive proceeding; if the children were resident it would necessitate so many nurses and attendants. Before you leave the question of guardians I should like to give you two or three typical cases of the action of the guardians.

17,251. I should like you, if you would, to give actual cases that you could quote where the guardians have refused to contribute, in accordance with the rule that you have mentioned, to the maintenance of the children in your schools, such cases as we can thoroughly identify. If you will hand them in you need not do more than allude to them. We would rather not have them down on the notes, but we should like to get them in a documentary form?—I cannot give them in documentary form; copies of the letters will be in the hands of the secretary of the institution.

Mr. E. Townsend.

12 May 1887.

He would retain press copies; I do not know what more you want than that.

17,252. Will you give us the names, so that we may be able to identify them, and in order that we may communicate with the local board?—Yes, I can supply you with full particulars, and I can vouch for the accuracy of them. The first case is the case of the Coventry Board of Guardians. At the present time in Coventry there is a family in which there are six deaf and dumb children. The father of the family is a machinist in one of the bicycle and tricycle factories. The work is very fluctuating.

17,253. If you give us the names we shall move at once, through the Local Government Board, for particulars from the board of guardians direct?—The man's name is Greenhall; he has six deaf and dumb children. We have had two girls at the institution who stayed, one, I think, only three and a half years, and the other four years.

17,254. From that family?—Yes, two from that family. They did not stay longer, I presume, because the parents either could not afford to keep them at the institution, or wanted to put them out to get their living.

17,255. Did the parents contribute to the maintenance of the children?—I am not aware of that.

17,256. In some cases that may be a reason why they wanted to get them out of the school?—I am not in a position to answer that; I really have nothing to do with the financial business of the institution.

17,257. Will you just mention the cases; that is all we want?—We have one boy from that family in the institution and now there are twin girls of an age to be admitted.

17,258. (*Mr. Johnson.*) All in the same family?—Yes; in fact, the mother told me she had lost a baby at Christmas, which would have been the seventh. The guardians were appealed to by a clergyman in Coventry who took an interest in the family, seeing what a sad case it was, to send the children to school; negotiations took place; and when the guardians found that we at that time were charging 6*l.* a year to parents of children, and 20*l.* a year to boards of guardians, they declined upon something like this ground: that they did not see why they should pay 20*l.* when we could afford to take them for 6*l.* per child when the payment is made by the parents. The matter dropped through then; but now a gentleman is interesting himself in Coventry to collect sufficient money to pay for the education of these twin children for five years.

17,259. (*Chairman*) As I understand, in order to explain the difference between the 6*l.* and the 20*l.*, it is that you ask the board of guardians to pay the full amount?—Yes, the maximum sum allowed by the Local Government Board.

17,260. But as a matter of charity, I suppose, you do take other children in at a lower sum?—When the payments are made either by parents or by friends who hold themselves responsible for the parents, the sum now charged is 10*l.* a year, but at that time the sum charged to parents was 6*l.*

17,261. Anyhow, a difference is charged in cases of charity?—Yes, there was a wide disparity between the two sums, and on that ground the board of guardians declined to pay. Before leaving this case it will perhaps interest you as members of the Commission to hear a very singular circumstance in connexion with this family. These six deaf and dumb children are not all children of the same mother. When Dr. Gallaudet was in England I was mentioning the case to him, and I asked him if he could cap it with another, and he said that he could not. The man has been married twice. By his first wife he had two deaf and dumb children.

17,262. Was she in possession of all her faculties?—Yes, both of them; the father and mother had their hearing. He had by this first wife two deaf and dumb children, and also some hearing children, I do not know how many. He married again on the death of his first wife. By his second wife he has four deaf and dumb children, and the one that I was mentioning as having died at Christmas would have made five. The woman herself had had a previous husband, by whom she had had hearing children; but whether she has had any hearing children by this husband I cannot say. Evidently therefore the taint is on the father's side; but to get at that taint I have hitherto been unable. So far as I have been able to ascertain, there is no case of deaf mutism in the man's family, so far as he knows.

17,263. (*Mr. St. John Ackers.*) Have you enquired whether the father is the offspring of a consanguinous marriage?—That is a point that I have taken great interest in, and I cannot find that it is so.

17,264. But you have not found that it is not so? So far as the man can tell me it is not so.

17,265. (*Mr. Johnson.*) The man tells you it was not so?—Yes. There is no match for that case. I am not sure that I asked that question about the parents.

17,266. (*Mr. St. John Ackers.*) It is the father's parents I mean, not his wife?—I cannot answer you positively; do not accept that as final.

17,267. (*Chairman.*) Have you any other cases with regard to the guardians?—Yes. A second case that I should like to bring under the notice of the Commission is that of the Cannock Guardians.

17,268. Cannock Chase?—No, Cannock.

17,269. (*Mr. St. John Ackers.*) In Staffordshire?—Yes, the Chase is a large district; Cannock is the name of a place. There is a family there of a miner, in which there are five deaf and dumb children. One child has grown up beyond the age of education; the second we have in the institution, and I believe the third. A lady pays for one, and the parents pay for the other. I urged the mother to go to the board of guardians, to ask them to take up the case of another child of an age to go to school, both the boys we have entering very late indeed. The mother went to the board of guardians, and the guardians decided to take up the case; but I presume they made enquiries of various deaf and dumb institutions to find out where they could send the child at the cheapest rate, and they decided to send the child to Bath. The father says that the child shall not go to Bath, and I think if I were in the place of the father I should be very likely to do the same thing myself; if I had two children in one institution, whom I could see from time to time, and found that they were happy at school, I should object to send a third a hundred miles away from home, where I could not see it perhaps from one six months' end or twelvemonths' end to another. The case has fallen through in consequence, and there is the child growing up without any education.

17,270. Then the guardians absolutely refused to send the child upon these grounds?—I presume it was on those grounds, that they found that they could send the child to Bath cheaper.

17,271. Have they sent the child to Bath?—No, the father refused to let the child go to Bath.

17,272. Then he has not sent the child at all?—No. Then only quite recently a case cropped up in connexion with a local school board. A lady member of this board happened to go into one of the board schools and found a little child standing by herself; she wanted to know why the child was standing there, and was told that the child was deaf and dumb. She made inquiries, and came to see me about the child. The father had been out of work for some time and the family were in a wretched condition. She has been to the chairman of the board of guardians, but he says that they cannot send the child to a deaf and dumb institution and pay for it unless the friends are absolutely destitute. I have placed her in possession of certain information which I hope will disabuse his mind of that impression; but there the matter rests at present.

17,273. Is that the action of the board of guardians?—That is what the chairman of the board of guardians said; but whether the matter has officially come before the board of guardians yet I am not in a position to state.

Mr. E. Townsend.

12 May 1887.

17,274. (*Mr. Johnson.*) Is that in Birmingham?—Close by; it is the Smethwick School Board. As showing the unwisdom of the board of guardians, taking only the lowest view of their action, I think it shows that it would be more expedient for them to take up the cases of these children, and pay for them for five years, from what I have been told of the Chesterfield Union. I was informed that in the Chesterfield Union they had five adult uneducated deaf mutes.

17,275. (*Chairman.*) Do you only know that from hearsay?—I was told that by the master of the Derby Institution. Application was made for these adult deaf mutes to be educated; but of course the application could not be entertained. When I had this information the five adult mutes had already cost the guardians 1,500*l.*, in maintenance I presume, at the union; and there they will be a permanent burden upon the rates until the end of the chapter. Taking the lowest ground I think one may say that it would be a good speculation for the board of guardians to take up the cases of these poor destitute children and send them to school where they can be educated, to become self-supporting members of society.

17,276. Do you suppose that there would be no difficulty in getting employment for the deaf and dumb?—Many of the deaf and dumb do very well. Just now many are suffering from the existing depression of trade.

17,277. In Birmingham to your knowledge is that so?—Yes; in Birmingham to my knowledge; and also from this fact; I have had men come to the institution soliciting help who they tell me that they cannot get work. I had two men from Scotland only recently who were wandering about in search of work.

17,278. What do you think should be done in that case; do you think that they should be treated more liberally than other people?—I do not see that more can be done for them than for other men who are thrown out of work. I think that if you were to begin to relieve them it would be a step in the wrong direction; it would be a semi-pauperising step; I would not counsel that.

17,278*a*. (*Mr. Johnson.*) I suppose that no part of the 300*l.* in each case was spent in education, but only in maintenance. I suppose that these five people had never been educated in any way whatever?—They had never been educated at all.

17,279. (*Chairman.*) Do you think it is desirable to teach the deaf and dumb the rudiments of any trade without actually teaching them a trade, as giving them some idea of the use of their hands?—That is rather a wide question. If you introduce trades then you must introduce workmen to teach those trades, and you introduce then an element into your institutions which is not always of a desirable character. I speak with some degree of experience upon that point. When I was a young teacher I was at the Doncaster Institution. At that time printing and book-binding were carried on in the institution. As they were carried on at that time I think it was to put it very mildly a great mistake. The children's school life became a kind of semi-slavery. It was school and work. Now I cannot see that the brightness and sunshine should be taken out of the life of a deaf and dumb child more than out of the life of a hearing child. I would teach it the use of tools, make it industrious, let it work in the garden, and do anything it can about the institution; but if teaching trades in an institution is to mean that the children are to go to school and to come out of school to go to work, then I should say keep trades out of the institution; but if it is used as a means to make the children handy and no more than that, then I would say teach them the use of tools. The experiment of having trades in institutions has been tried, and it has been debated at various meetings of the masters, and I think the consensus of opinion from what I have heard is that it is not desirable to have trades taught in an institution. If children were taught certain trades, perhaps the mere fact that those children are compelled to go to work when other children go and have a game, would give them a distaste for the very thing that they are put to at the institution.

17,280. Do you find that when the pupils leave school there is any difficulty in getting them apprenticed out?—There is a difficulty. There is a difficulty with regard to the money, and sometimes there is a difficulty with regard to the masters taking apprentices, especially when they have never had such apprentices before; but where masters have had deaf and dumb children as apprentices, they will take other deaf and dumb apprentices over and over again; they have been so pleased with them. In fact I might mention that I was in Hull last summer, and one of the members of the committee of the Hull Institution was telling me that if he had any particular work that he wanted attended to, requiring special care, he always sent a deaf and dumb man in his employ to do it. And there was one thing that I learnt there in connexion with the apprenticing of deaf and dumb children which appears to me to be an excellent thing. They have some apprentice fund in the town, not especially for the deaf and dumb but children in general, to which they can go for help for the deaf and dumb; in addition to granting a fee for the apprenticing of the children year by year, they make a grant for providing working clothes for these deaf and dumb apprentices, and I presume for others. At the expiration of the apprenticeship they give the apprentices money for providing tools, and they also give the master something on the satisfactory termination of the apprenticeship.

17,281. Is the system of education in your school entirely non-speaking?—No, it is mainly manual; but with children who show any aptitude for acquiring speech and the power of reading from the lips, efforts are made to develope that power, and they are practised in it.

17,282. Do you classify the children according to their ability of speech?—Yes; but we have no children who are taught exclusively by means of speech; in fact our school arrangements do not admit of such a thing; nor do I believe that the pure oral system is a system which is generally adaptable for reaching the mass of the deaf and dumb.

17,283. Are you speaking especially of the class of children that you have there?—I am speaking of the class of children that we have in our own institution and in kindred institutions.

17,284. Do you think that the system fails to give sufficient speech to make it of use to them?—Yes, I do; and the fact that the orally taught pupils in after life have to fall back upon manual means of communication is proof to my mind that that is so.

17,285. Do you not think it possible that the oral system has not been fairly tried in England in the way in which it has been tried in Germany and Italy?—It has been tried 20 years in England.

17,286. Do you know what the system of teaching in Germany is?—I do not know that; but I know this, that it is an admitted fact that the English language presents much greater difficulties than either the German or the Italian languages.

17,287. But I suppose the human voice is the same?—Yes, the human voice is the same, but the construction of words is not the same. In German the words are written exactly as they are pronounced, I believe. In our English language it is not so.

17,288. But you might very well have a vocabulary of words, all of which are pronounced as they are written?—I could give you four or five words which pronounced look exactly alike on the lips.

17,289. Yes, no doubt; but that means more care and more trouble?—Lip reading is educated guess work; that is the definition that Professor Graham Bell gives of it.

17,290. In English?—More especially so, I should say, in English.

Mr. E. Townsend.

12 May 1887.

17,291. (*Mr. St. John Ackers.*) Can you give us those four or five words which you say look exactly alike when pronounced?—Big, pig, peak, beak, and pick.

17,292. (*Chairman.*) I can see the difference on your lips when you pronounce them?—I am pronouncing the words audibly now; you must bear in mind that a deaf person has no idea of sound, it is nothin more than a lip action. I venture to say that if the Commissioners were to thrust their fingers into their ears, and I were to go and stand at the end of the room and select one of those words at random they might hit upon it, but they could not do it with certainty.

17,293. But then the language might go on very well without having a combination of all those difficult words?—I do not say that you would get those words.

17,294. If a person stammers over a particular word he does not use it, you know?—Yes, he selects another; but my meaning is, if one of those words were uttered in a sentence you could not pitch exactly on that word.

17,295. But the context would tell you?—It would help you no doubt.

17,296. And you are not likely to have more than one of those words in a small sentence?—Certainly not; but you might happen to pitch upon the wrong word. Then again, with regard to the difficulty of deciphering words from the lips, to take this word "once," the word as pronounced on the lips is what? You do not get the order of the letters; you get w-ŭ-n-s; that is how the word is formed; you do not see the word itself upon the lips at all, you see the powers of w-ŭ-ns, but not the names of those *letters*. There is an idea prevalent that this system of oral teaching gives the deaf and dumb speech as we understand it; it does nothing of the kind. It puts them in possession of another alphabet. They form their lips for the enunciation of certain letters, or rather the powers of those letters, and on the lips of other persons they see the formation of certain letters. When you see the formation of letters on the lips it is intensely confusing, because several of the letters have precisely the same formation. More than that, words are not spelt as they are pronounced, so that, as has been stated by an American writer, "A dull child will often produce a meaning-"less succession of English which proves upon "analysis to be exact lip reading." Now if I spell a word on my fingers, there is no possible means of mistaking what word is spelt. If I spell c o m e, the child, or adult, or whoever it may be, gets a distinct word and cannot mistake it; if I write "come" on paper, there is the word which a person cannot mistake; but if I say it to a deaf and dumb child it may be "come" or it may be "gum;" he does not see "come."

17,297. I see a difference as you pronounce it?—I venture to think that there is no difference except in the "c" and "g;" the only difference is this, that in the one case you have a non-vocal consonant and in the other you have a vocal consonant. Discard from your mind the names of letters "c" and "g," those are not the powers of the letters, those are not the values of the letters in pronunciation of words (*illustrating it*), and it would be difficult to distinguish what was said. If I say "gum" to you, you hear the hard sound to guide you; but put your fingers into your ears and then try and read from a person's lip whether it is "k," "g," or "c," and I think you would be fairly puzzled to know which it was.

17,298. (*Mr. Johnson*) I suppose you speak from practical experience?—As an enthusiastic teacher, I might almost say, of articulation. When I was in the Margate Institution, and in London in the London Institution, I was a teacher of articulation 18 years; and on my appointment from Margate to Birmingham I had charge of the highest oral class at the Margate Institution.

17,299. (*Chairman.*) Did you begin to teach your own oral system by teaching proper methods of inspiration and respiration?—No.

17,300. Do you not think that before you can produce proper sounds you must get the lungs to work properly?—I think they do work properly.

17,301. Have you ever tried the experiment of making a child, who is not in the habit of speaking, blow into a bladder and see the effect?—No; but as a matter of fact, I know that these pupils can be taught to speak and speak distinctly without any such preparatory exercise.

17,302. Is it likely that the lungs or the throat, if they are not exercised in vocal sounds can speak as clearly and intelligently as if they had been?—Is it not rather a question of the larynx than the lungs?

17,303. Do you think that a person who had not walked for 20 years, if he suddenly put his legs to the ground could walk as I do?—It is a matter of the larynx, not of the lungs.

17,304. But it is not used, is it?—I beg your pardon. If you were to go to the playground of a deaf and dumb institution, you would find that they are making a tremendous noise at their play; their lungs are exercised and the larynx too; it is a fallacy to say that the larynx is not exercised.

17,305. But no continuous sound is produced. You can make a sound which is not continuous without inflating the lungs; and you cannot continue a sentence without properly inflating the lungs; is not that so; is not there a difference between the cry of an animal and the speech of a man?—Yes, but in both cases, I think, whether you are uttering a sequence of words or merely making sound, the lungs and the larynx are exercised.

17,306. Then you think the exercise of the lungs and larynx does not contribute to pronunciation?—I will not go so far as to say that.

17,307. Your argument has been in that direction?—I think not.

17,308. (*Mr. Johnson.*) I think you ought to say that they go concurrently; you could not articulate unless you have your lungs, and you could not articulate with lungs and no larynx, or with a larynx and no lungs?—It is like blowing a current of air with a pair of bellows through an aperture, if you force sufficient air through you get a whistling sound; the aperture is the larynx and the bellows are the lungs.

17,309. (*Chairman.*) Is it not likely that the reason why a knowledge of the oral system is not so successful as it might be is that the children are not taught at the beginning to exercise their lungs or throat?—I venture to think not; I think it is the inherent difficulties of giving these children speech, and the difficulties they have of reading from the lips.

17,310. (*Admiral Sir E. Sotheby.*) You said that you knew persons taught on the lip system who in after life fell back on the sign manual; is that your experience or is it hearsay?—Did I use the words "I know"?

17,311. I understood you to say that you knew people who had been taught the habit of speaking by the oral system who fell back on the sign manual?—I think I put it that the proof was that they did so.

17,312. Do you know that by experience or from hearsay?—By hearsay.

17,313. Then that is no evidence?—I know it by conversation with those who have to do with these pupils who have been instructed on the oral system; that is to say the missionaries.

17,314. Then they have lost sight of the oral system and have cast it away?—They have cast it away because they found it insufficient for their needs.

17,315. Because they found the outer world able to converse with them better on the sign manual, is that it?—Yes.

17,316. You were a master, were you not, in the Margate School?—Yes.

17,317. And you taught there the lip system?—Not exclusively; it was the combined system.

17,318. But they had classes of the lip system?—Yes.

17,319. How long were you in the Margate School teaching them the lip system; how long is it since they have adopted the lip system at Margate?—Do you mean the pure oral system?

17,320. Yes.—About six years; but I was not in that oral school. The combined system of instruction has been pursued in the London Asylum for a great many years.

17,321. I am speaking of Margate?—They are one and the same institution; the London Asylum was transferred to Margate, and the teachers were drafted with the children from London to Margate. I was altogether in the London and Margate Institutions about 18 years.

17,322. And while you were in Margate you had a class on the lip system?—Yes, the highest class.

17,323. And from thence you went to Birmingham?—Yes.

17,324. When you went to Birmingham did they not teach the lip system at all?—Very little. There was a class, but the teacher teaching that class had very little idea how to proceed; she had had no direct instruction in the science of teaching speech to the deaf and dumb.

17,325. Did you not endeavour to bring that system more into notice?—I have brought it more prominently forward, but there has been very great difficulty in my way. I have three deaf and dumb teachers and we have only one schoolroom; so that speech has to be taught in a room where there is the din of 130 children at their lessons.

17,326. But you have screens, have you not?—No; it is an open room, as this might be.

17,327. Who are the managers of that school?—The committee.

17,328. Have they never proposed to have screens or class-rooms for the oral system?—In that matter, as in others, the money difficulty stands in the way.

17,329. What, at Birmingham?—Yes.

17,330. Indeed! You have mentioned several deaf and dumb children who are not receiving any education; do you know at all the number in Birmingham who are outcasts in that way, receiving no education?—In the school board district there are some 30 or 40 children who, if State aid were available, could be compelled to come in.

17,331. Are they not obliged to go to the board schools?—There are no board schools for that purpose.

17,332. But are they not obliged to go to the ordinary board schools?—It is useless; and moreover the child often upsets the whole school. If there is one such deaf and dumb child there the master or mistress can send him away; they can learn nothing but imitative work, writing on the slate, or something of that kind.

17,333. (*Mr. Arrol.*) Are you in favour of a law being passed to make it compulsory that all deaf and dumb should be educated?—Yes.

17,334. Would you recommend that they should be exclusively educated in institutions set apart for deaf and dumb children?—Yes; because by that means I think they would get what they do not get in day schools, viz., moral, religious, and social training, which they sadly need.

17,335. If classes were set apart for them in the board schools would not that accomplish the same end?—I think that the best answer to that is, that classes have been set apart in London and that it has been found that they have been compelled to supplement those classes by homes. Practically you have got the two sets of machinery here at work in London; institution life and school life; and I think it would be much better to have the children altogether in an institution, and have the whole machinery going on under one roof rather than under two.

17,336. You are in favour of the sign and manual system being taught?—It is the combined method that I am in favour of.

17,337. Would you say that, if in board schools the sign and manual system were taught, there would be any disadvantages in allowing the children to return to their parents' homes at night?—There is no disadvantage; only in many cases it is quite impracticable; and I think also that you would find it very dangerous for the deaf and dumb children to be coming a very long distance to school, in crossing the streets and so on.

Mr. E. Townsend.

12 May 1887.

17,338. You make some reference to five adult cases where they cost the board some 1,500*l.*; is there any physical defect which has prevented these adults from obtaining education?—Not that I am aware of. So far as I am acquainted with the facts of the case it is simply that they, like many others, have been allowed to grow up neglected.

17,339. But they have had means of communicating with their fellows through signs?—Through the natural language of the deaf and dumb, through signs.

17,340. That would deprive them of the opportunity of going to some trade, would it?—Yes, it would to a great extent. What means have ordinary persons of communication with an uneducated deaf mute except by natural gestures?

17,341. Are these five so totally ignorant of the power of expressing their thoughts?—An uneducated deaf mute is utterly incapable of expressing his thoughts except through gestures. To give you a case in point, some time ago I was told of a deaf and dumb young fellow at Nottingham who by some means or other lost his way; he did not get away from Nottingham more than 10 miles, but yet he was lost for more than a fortnight because he could not tell persons where he came from; so that people with the best wishes in the world did not know where to send him.

17,342. (*Mr. Johnson.*) Could he not write?—An uneducated deaf mute cannot write.

17,343. But he had acquired the sign language?—But that is not enough; it is a matter of education. A deaf and dumb child before education has no word to signify "boy," his only way of showing the difference between a boy and a girl is that one parts the hair in one way, and the other in another. He has no word to signify that he is a big boy; if he is a big boy he is so high (*describing it*), but he has no word to signify it; he is as ignorant of the language of this country as a boy from the heart of Russia would be if brought here now.

17,344. (*Rev. Mr. Owen.*) Is it from inquiries which you have made that you have reason to suppose that in other large towns in the Midland districts there are many deaf and dumb children growing up uneducated?—It is not from inquiries which I have made in those towns, but from the information communicated to me by my teachers, and by the information which the children themselves bring back, and also from the fact that I have children in school who have brothers and sisters who are deaf and dumb, for whom their friends cannot afford to pay.

17,345. You have great difficulty, have you not, in keeping children even as long as five years?—Very great.

17,346. Why?—Because their friends wish to take them away from school to put them to work, or because they are unable to keep up the payments. A further difficulty is the late age at which we receive children; during the last three years we have had 65 children admitted into the institution, but of those 65, as many as 35 ranged from 10 to 13 years of age on admission.

17,347. I believe that you have given some attention to the matter of consanguineous marriages?—Yes.

17,348. Did you not request that a question bearing upon this point should be inserted in the nomination form of our institution?—Yes.

17,349. From your long experience among the deaf and dumb do you think that there are more cases of deaf-muteism from consanguineous marriages than from deaf mutes marrying each other?—Most decidedly; the present state of things in our own institution proves it. We have only three children

Mr. E. Townsend.

12 May 1887.

who are the result of intermarriage; and it is not intermarriage of deaf mutes; we have two brothers the offspring of a hearing father but a deaf and dumb mother, and we have just got a deaf and dumb child who is the illegitimate child of a deaf and dumb mother; I believe the father is not known. The woman is uneducated, and her only means of communication with others is by gestures.

17,350. Do you know of many deaf and dumb couples in Birmingham?—Yes.

17,351. And are many or any of their children deaf and dumb?—Among those that I know they have not a single child deaf and dumb, they all have their hearing. I have heard of a marriage, but I do not know the case myself, where there are deaf and dumb children; but in these cases that I know (and I know several cases) the children all have their hearing.

17,352. I believe that you have often been an interpreter at deaf and dumb marriages?—I act as interpreter.

17,353. And you did not disapprove of them?—No, I think they are the most natural thing in the world.

17,354. Why?—Because of the sympathy, the mutual feeling and mutual interest very often; and more than that, I think it is much better for the deaf and dumb to marry and have children in wedlock than to have a lot of illegitimate children, which would inevitably be the case if they were not married.

17,355. (*Chairman.*) Do you think that that is the absolute alternative?—Short of prohibition. If the law prohibited their marriage all well and good, although I should entertain grave doubts as to the wisdom of any legislative enactment of that nature.

17,356. I do not see your point?—If a deaf and dumb young man and a deaf and dumb young woman become attached to each other, if they are not allowed to marry, I think that the inevitable consequence would be that in some cases, at least, there would be illegitimate offspring.

17,357. But the point raised is not that, but whether it is right to afford facilities for intercourse between the deaf and dumb, male and female, of a certain age when they would be likely to fall in love with each other; and you say that you see no objection to that?—I see no objection to that and I think results prove that the dangers are not so great of having deaf and dumb offspring in that case as of their being the result of consanguineous marriages.

17,358. That of course depends upon whether your search is sufficiently extensive to be of any material value?—I can only speak according to my experience and the attention which I have given to the subject.

17,359. (*Mr. Johnson.*) Is your experience rather large in that way?—I have given a good deal of attention to it.

17,360. I mean with regard to your personal knowledge of deaf and dumb people who have married?—No, I cannot say that it is specially large. I have been amongst them 25 years, and I have taken an active interest in them, and am, I hope, in sympathy with them. I do not find that very many of the married pupils have deaf and dumb children.

17,361. But some do?—Some do; you may find instances where there are deaf and dumb children.

17,362. (*Rev. Mr. Owen.*) You find, do you not, on inquiry that there are more deaf and dumb children among Jews than among others?—That is an acknowledged fact.

17,363. To what do you attribute that?—May I be allowed to quote in support of that something written in the "Nineteenth Century"?

17,364. (*Chairman.*) You had better quote your own knowledge; I do not think it is of any importance?—I cannot speak of that of my own personal knowledge; it is based upon my reading.

17,365. (*Mr. Johnson.*) Are you referring to Professor Dalby?—No; but the matter has been frequently dealt with in the American Annals of the deaf and dumb; in fact I have with me a copy of the Annals.

17,366. (*Chairman.*) We have a copy here; you can refer us to that, but we will not take it down; you cannot adduce a general law from a small number of cases?—Here are the American Annals (*handing in the same*).

17,367. (*Mr. Johnson.*) You say that it occurs amongst the Jews, from the knowledge which you have gathered?—Yes, from knowledge gathered from the special organs devoted to the deaf and dumb.

17,368. (*Chairman.*) But not from cases within your own knowledge?—No, because we have not children of Jews in our institution; but it is a matter of common knowledge. Hartmann, in his book on "Deaf-Mutism," gives the same statistics. I can give you that reference, too, if you would like it; it is a book of acknowledged credit and reputation.

17,369. (*Rev. Mr. Owen.*) Do not many of your pupils suffer from defective eyesight?—Yes.

17,370. What steps do you take to remedy that in your institution?—I get tickets from subscribers to the eye hospital, and I send the pupils down to one of the specialists at the hospital, to his private rooms, and then they are supplied with spectacles.

17,371. What do you say is the chief disease that they suffer from?—There is a disease found among them called *retinitis pigmentosa*, and that is a disease which has been noticed among the deaf and dumb, and also among the results of consanguineous marriages. Among those children who have been examined there have been nine found more or less affected with this disease.

17,372. It is almost incurable, is it not?—It is incurable. There is a chapter devoted to the disease in this book from which the quotation was taken about the Jews, "Hartmann's Deaf Mutism."

17,373. If any Government grant were made to deaf and dumb institutions do you think it advisable that any conditions should be laid down as to what method should be adopted?—Certainly not; I think that would be a great mistake.

17,374. (*Mr. Johnson.*) You told us something about the combination of home and school as adopted in the London School Board; in what way do you think it is objectionable to have homes established in connexion with day schools?—I see nothing objectionable in the thing itself, not actually objectionable. Why I disapprove of it is because you are really having two sets of machinery to carry out what one would effectually accomplish.

17,375. You are aware that in the London School Board the oral system has been adopted?—Yes.

17,376. And therefore isolation of deaf and dumb children from the rest has been recommended as the best means of carrying on that instruction, and homes accordingly have been established in connexion with those schools to prevent the scholars going from an isolated school to mix with their hearing brethren?—I am inclined to think that that is not the case from a letter that appeared in the "Times" written by Dr. Buxton; it was rather a question of the difficulty of getting to and from a school, and the danger which awaited those children who had to come a long distance.

17,377. Have you formed any opinion with regard to the question of whether they should be combined together out of school in the case of those who are being taught upon the oral system; you have had a certain amount of experience of oral teaching because you were at Margate, were you not?—Yes. Except in case of children who have lost their hearing after acquiring speech, I see no reason for isolating them. But those children I would not bring among deaf and dumb children, among born mutes; but as to the others I would allow them any and every means of intercourse either among themselves or among the teachers in order to lift them up to a higher level, I care not whether by speech or signs or finger alphabet, I would adopt every and any means that would give knowledge to those children.

17,378. I suppose you are aware that it is an admitted doctrine almost everywhere, that in order to teach the pure oral system it is necessary to isolate the

pupils from any other system?—Yes, I believe that in order to teach the pure oral system (if success can be attained in that way) it would be desirable to isolate them from the others.

17,379. But in your system, which I understand to be the combined system, there you do not think that there is any disadvantage in mixing the children?—Certainly not.

17,380. Have you ever found that the children taught upon your partially oral system communicate with their fellows out of school in any other system but the oral?—Yes, they spell and sign; but when they are at home with their friends they do communicate by word of mouth; that I have found to be the case.

17,381. But not in school?—No, nor out of school with their fellows; they will speak to me occasionally, but with their fellows they communicate by manual means.

17,382. In your schools have you any pupils who are deficient in intellect?—Yes, we have.

17,383. Do you teach them in the same classes as the others?—No, I should not attempt that.

17,384. Then what do you do with them?—We teach them on the manual system.

17,385. Entirely?—Entirely.

17,386. Do you find that those who are deficient in intellect are more easily reached by the manual system than by the combined system?—Yes; I think that the only way of reaching their minds is by means of gestures. As a German writer has put it, "Signs "are the windows by which we are first able to look "into a deaf mute's mind."

17,387. Of course, admitting that fact, signs must be employed in teaching any mute in the first place?—You do not want to teach a deaf mute signs; they come to you charged full of signs; they can talk to you by means of signs to a certain extent as soon as they come to the institution.

17,388. You say that you do know instances of children educated on the combined method who make use of speech at home?—Yes. One of the best lip readers that I have ever seen, and one whom some of the Commissioners have seen also, who is a teacher at Margate, was taught on the combined system. She lost her hearing, but she was taught on the combined system, and she is one of the most ready lip readers I have ever met with.

17,389. What do you think is the best way of testing the practical value of oral teaching?—By comparing the results as shown in the literary productions of those taught on the oral system with those taught on the manual system, and also the facility with which they are able to hold converse with people after they leave school.

17,390. Have you had any opportunity of getting the opinions of the deaf and dumb themselves with regard to the best system?—Undoubtedly the deaf and dumb themselves are dead against the pure oral system.

17,391. In your institution do you mean?—No, deaf and dumb adults generally; the most intelligent deaf mutes that you can meet with. As a matter of fact the subject came up at a debating society in connexion with Oxford Street Church. The debate was taken part in by pupils who had been orally taught and by pupils who had been manually taught. The result of the debate was that only two were for the combined system, all were for the finger and sign language, and none were for the oral system alone.

17,392. (*Chairman.*) At what date was that?—I am speaking from a cutting out of a newspaper; I have the cutting here; but I cannot tell you the date.

17,393. (*Mr. Johnson.*) Was it last year?—I should say it is more likely about six years ago. In connexion with that I have an extract here cut from "All the Year Round."

17,394. I would rather have it from the "Times" please if you have the evidence of the "Times" there?—I think the correspondence following upon that debate did not appear in the "Times" but in the "Standard."

Mr. E. Townsend.

12 May 1887

17,395. Then I will put it in this way: was it a really representative meeting, and was it numerously attended by deaf and dumb people?—That I could not tell you; but I should say so. I could not tell you positively.

17,396. Does it give the number of people who voted?—No, I was not there; these are merely cuttings from newspapers.

17,397. Have you formed your opinion of the feeling which the deaf and dumb people have for one particular system from the result of that particular meeting?—Partly by that and partly by what I have heard from the deaf and dumb people themselves.

17,398. Then your experience, we will say at Birmingham, and in London, and in the other school that you have been to, is that the deaf and dumb people themselves prefer sign language?—Yes, there can be no question about that. Not only is that the case in England, but, as was stated at the last conference of head masters in London, an assistant master who was present at that conference, had been at Antwerp, and by means of natural gestures alone he had got into conversation with some deaf mutes there, who had been educated on the oral system.

17,399. (*Mr. St. John Ackers.*) There was no pure oral teaching in that part of the world?—He observed that these were orally taught pupils.

17,400. (*Chairman.*) Is this from your own knowledge?—The matter was openly stated at the last conference of head masters; I can verify it.

17,401. There has been so much use and abuse of the term "oral system" that we do not know what it means; it means different things in the mouths of different people?—They were pupils of the Antwerp school.

17,402. (*Mr. St. John Ackers.*) That certainly had never had the "pure oral"?—That question arose at the last conference, and Mr. Elliott said that it was the "pure oral" system.

17,403. (*Mr. Johnson.*) To cut the difficulty I will ask you simply this: At the conference which was held of head masters, what was the statement?—A master said that he had got into conversation with these pupils, who had been educated on the so-called oral method, I will say; he got into conversation with deaf mutes merely by natural gestures; he did not know their language and they did not know his; but he got into conversation with them by means of natural gestures. He asked them if they had been taught to speak at school or were they also allowed to use signs there, and they said no, that was bad; he asked them whether they could understand the priest preaching to them and they said they could not. Then he asked to what extent they could understand speech, and they said so much (*describing it by the length of the forefinger*). He asked them how much they could understand by signs, and they said so much (*describing it by the length of the arm*). They liked signs, and they disliked speech.

17,404. In forming that opinion with regard to your combined system, have you ever had any good specimen of the pure oral teaching brought before you?—Yes. I have seen the man who I suppose stands head and shoulders taller than any of his fellows in oral teaching in England, and that is Mr. Farrar, and some of the Royal Commissioners also saw Mr. Farrar. He cannot wholly depend upon speech. More than that, I think it was a fair inference to judge from the readiness with which he was able to read spelt communications on the fingers that he is in the constant habit of reading such spelt communications. To my own personal knowledge something was said to him, nothing more than a common-place observation, at the Gallaudet dinner, and he failed utterly to take it from the lips. I believe that I myself uttered some words and he failed to take them from my lips; but he took them readily enough from the fingers.

17,405. Then that good specimen of oral teaching, which everybody seems to agree is a very fine specimen,

Mr. E. Townsend.

12 May 1887.

not only has been able to attain to perfection in oralism but also at the same time perfection in signs?—No, manual spelling.

17,406. Alphabetical spelling?—Yes.

17,407. Such alphabetical spelling, I suppose, as was employed by Mr. Stainer at that dinner in translating to the deaf and dumb the speeches made on that occasion?—Yes.

17,408. The object of my question is simply to find out whether it is possible that a pure oral example could be turned out, and at the same time that pure oral example use alphabetical signs as well as the oral system?—Yes; there is no great difficulty in acquiring the alphabet; but to acquire facility in the use of it, and facility in reading from other persons' fingers would require some practice.

17,409. Were any of your teachers trained at any of these oral colleges, at Ealing, for instance?—No.

17,410. For what reason did you not try to get the services of such teachers?—It is simply out of the question; we could not pay them such salaries as they demand.

17,411. Supposing that you had the means at your disposal, would it be desirable?—With the views I hold, and which my committee hold, such teachers would be practically almost valueless in my school.

17,412. Because you could not make the arrangements, under your convictions, to enable them to carry out their system?—No; they only understand one phase of deaf mute teaching, and I want teachers who understand more than one phase.

17,413. Do you find many of your people who lose their hearing at an early age before they have absolutely completed the learning of speech—At the present time I have not a single child in the school who has retained any speech, or anything worth mentioning; I had one boy a while ago who lost his hearing when he was 7 years of age, who was getting on wonderfully in lip reading; in fact, during the short time he had been at school, he had become so far proficient that I could understand and talk to him with an occasional resort to my fingers, but the poor little fellow died.

17,414. Were you ever present at any religious services conducted on the oral system?—I never heard of any.

17,415. You do not think they are practicable?—I do not; not lip reading services.

17,416. (*Rev. Mr. Sleight.*) May I ask how you received your education in teaching the deaf and dumb orally?—Under the Rev. Mr. Watson and Mr. Elliott in the London Institution.

17,417. What system of teaching do you pursue in Birmingham at the present time?—Chiefly the manual, but for some of the pupils we use the combined.

17,418. What method of instructing deaf and dumb people are you in favour of at the present time for the general mass?—For the great mass I am in favour of the manual system, and for those who show aptitude in learning to speak I should prefer the combined.

17,419. What is the opinion of your committee upon the exclusive adoption of the oral method?—I do not think they believe in the practicability of it.

17,420. And the visit of the deputation to the London School Board classes confirmed them in this opinion?—Certainly. I may mention that they have not come to this conclusion without making inquiries. The chairman and the deputy chairman visited the London oral school when it was in the Old Kent Road; the chairman some time since went to Fitzroy Square, and Mr. Owen, a member of my committee, has visited the London School Board classes; and the opinion of them all is certainly from what they have seen, that it is not desirable to change the method or system at present followed in the institution.

17,421. (*Mr. Johnson.*) In your institution do you mean?—Yes.

17,422. (*Rev. Mr. Sleight.*) You have not visited any of the German institutions yourself, I suppose?—No.

17,423. Has your committee taken steps to do so?—I believe not; but some years ago at the annual meeting a gentleman who had been on the committee, in fact I think he had been chairman, who had visited the German schools, stated at this annual meeting as the result of his visits to German schools, that he considered their system a miserable failure.

17,424. Do you find that your scholars when they leave school experience any difficulty in making themselves understood by the outside world; the scholars whom you teach on the combined system?—Do you mean by means of speech, or written or spelt communications?

17,425. Do they find any difficulty, by whatever means they can adopt?—Not with educated persons; those who could read spelt or written communications.

17,426. I will ask you a question which I want you to answer carefully. Do you find that your scholars lose language or improve in it after they are launched forth into the world?—That depends altogether on the intelligence of the people among whom they mix, mainly, if not altogether.

17,427. Do the results of pure oral teaching in England, so far as you have gauged them, justify in your opinion the adoption of this method for the general teaching of the deaf and dumb?—They do not.

17,428. You were with the London and Margate School for 18 years?—About that.

17,429. During how much of that time did you teach orally?—Purely orally, solely on the oral system, not at all; on the combined system more or less the whole time.

17,430. Were addresses given to the children on Sunday afternoon, or on Sunday?—On Sunday evening.

17,431. How were those addresses given?—In sign language.

17432. Never orally?—During my time I never heard of such a thing being broached, and I do not believe it would be practicable.

17,433. (*Mr. St. John Ackers.*) The oral system was not taught, was it?—The combined system.

17,434. But not the pure oral?—No.

17,435. (*Rev. Mr. Sleight.*) I am going to ask you whether you could obtain the number of cases in Birmingham of deaf mutes who have married deaf mutes?—I have not the full details.

17,436. Could you find out the number, do you think?—I could get the particulars approximately correct from the missionary.

The witness withdrew.

Adjourned to Thursday next at 2 o'clock.

Mr. E. Townsend.

12 May 1887.

PAPER HANDED IN BY MR. E. TOWNSEND.

INTERMARRIAGES among the DEAF-MUTES of BIRMINGHAM.

Names and Condition.	No. of Children Deaf and Dumb.	No. of Hearing Children.	Total.	Remarks.
1. Mr. and Mrs. G. (both D. and D.)	0	3	3	Mrs. G. died last year. She had a deaf and dumb sister, who is also dead.
2. Mr. and Mrs. W. (both D. and D.)	0	2	2	Mrs. W. has a deaf and dumb sister married to Mr. F. (*see* No. 3).
3. Mr. and Mrs. F. (both D. and D.)	0	3	3	Mr. F. has a deaf and dumb sister cohabiting with Mr. G. (*see* No. 4).
4. Mr. and Mrs. G. (both D. and D.)	0	4	4	Mr. G. has a deaf and dumb sister (uneducated).
5. Mr. and Mrs. A. C. S. (both D. and D.).	0	3	3	
6. Mr. and Mrs. J. (both D. and D.)	0	1	1	
7. Mr. and Mrs. G. (both D. and D.)	0	3	3	Mr. G. has a deaf and dumb sister married to Mr. T. S. (*see* No. 8).
8. Mr. and Mrs. T. S. (both D. and D.).	0	3	3	
9. Mr. and Mrs. G. (both D. and D.)	0	4	4	Mrs. G. has a deaf and dumb brother (unmarried)
10. Mr. and Mrs. D. (husband D. and D., wife deaf only, having lost hearing after acquiring speech).	0	3	3	
11. Mr. and Mrs. J. (both D. and D.)	—	—	—	Only recently married.
12. Mr. and Mrs. P. (both D. and D.)	0	4	4	
13. Mr. and Mrs. L. (both D. and D.)	0	4	4	Mr. L. has a deaf and dumb nephew.
14. Mr. and Mrs. F. (both D. and D.)	0	4	4	
15. Mr. and Mrs. F. (both D. and D.)	0	4	4	Mrs. F. had a deaf and dumb brother (now dead). Also has a deaf and dumb cousin.
16. Mr. and Mrs. G. (both D. and D.)	0	3	3	
17. Mr. and Mrs. C. (both D. and D.)	0	2	2	
18. Mr. and Mrs. W. (both D. and D.)	3	4	7	Both parents are uneducated.
19. Mr. H. (D. and D.), married to a hearing and speaking wife.	0	2	2	
20. Mr. H. (hearing and speaking) married to D. and D. wife.	0	2 or 3	2 or 3	
21. Mr. J. (hearing and speaking), married to D. and D wife.	0	4	4	Mr. and Mrs. J. are cousins.
22. Mr. W. (hearing and speaking), married to D. and D. wife.	0	5	5	
23. Mr. M. (hearing and speaking), (now dead), married to D. and D. wife.	2	3	5	Mrs. M.'s father was deaf and dumb. She has an aunt (her father's sister) deaf and dumb, Mrs. W. (No. 18). Another of her father's sisters (Mrs. V.) is very deaf. Mrs. V. has a deaf and dumb daughter who has an illegitimate child deaf and dumb. *Evidence is here afforded of the direct transmission of the infirmity for three generations in two collateral branches of same family, and in a third collateral branch for two generations, although the deafness varies in intensity.*
24. Mr. P. (hearing and speaking), married to D. and D. wife.	0	2	2	
Totals - - -	5	72	77	Thirteen of relatives were deaf and dumb.

6, Old Palace Yard, Westminster.

Thursday, 19th May 1887.

PRESENT:

THE RIGHT HON. THE LORD EGERTON OF TATTON IN THE CHAIR.

THE LORD BISHOP OF LONDON.
W. TINDAL ROBERTSON, ESQ., M.D., M.P.
B. ST. JOHN ACKERS, ESQ.
T. R. ARMITAGE, ESQ., M.D.
F. J. CAMPBELL, ESQ., LL.D.
EDMUND C. JOHNSON, ESQ.
THE REV. W. BLOMEFIELD SLEIGHT, M.A.
THE REV. CHARLES MANSFIELD OWEN, M.A.
CHARLES E. D. BLACK, ESQ., *Secretary.*

The Right Hon. and Right Reverend Dr. TEMPLE, Lord Bishop of London, examined.

The Right Hon. and Right Rev. Dr. Temple.

19 May 1887.

17,437. (*Chairman.*) You are a member of the governing body of Gardner's Trust?—I am one of the committee.

17,438. You are aware of the objects the trustees have in view in making an application to the Charity Commissioners for a partial modification of the trust. I have before me the proposed alteration, and I should be glad if you would furnish the Commission with the reasons of the Gardner Trust in proposing the alteration of the 4th paragraph in clause 7 of the scheme?—The alteration that is proposed is in the 4th and 5th paragraphs. The scheme we found restricted the amount of money that could be given in pensions more than we thought wise. At present we are allowed to spend six-ninths of the income in instruction (two-ninths of which six-ninths as a minimum may be spent in instruction in music), the remaining three-ninths being all that we are allowed to spend in anything but instruction, that is to say, out of the remaining three-ninths we can grant pensions or donations if we think it advisable to do so, and also make any other grants that do not come under the head of instruction, which we may think necessary. A great deal is comprised under the second of those two heads. A man who has been instructed in some trade will want a grant to supply him with materials and with tools before he can make use of the instruction that he has received, such a grant must come out of this three-ninths; we want to make a grant sometimes to set a man up in a small business in a shop; we want to make a grant sometimes to set a man up as a pedlar or a hawker, all those grants must come out of this three-ninths. A very little reflection will show that there are a great many purposes beyond those that I have already mentioned, which are of real importance over and above the instruction given to the blind towards enabling them to maintain themselves. And then, besides that, we find that there are a considerable number of cases where, as far as we can see, it is not possible to give any other assistance than a pension or a donation. There are cases where, for instance, people have become blind in later years, and when it is too late for them to be instructed in anything which will enable them to get their living; there are cases where it is not possible to give instruction owing to other circumstances than simply advanced years; in many cases, if we were confined simply to instructing the people, and then starting them in life, we should not be able to assist them at all, and those cases we find much more numerous than we might have expected.

17,439. Have you a list of applications for pensions which you have been obliged to refuse?—The number of applications for pensions on our books is 3,576; the number we have assisted out of this number of applications is 242; and I have not any doubt at all that very many more than 242 really do need that particular kind of assistance and cannot receive any benefit from Gardner's Trust except in that form.

17,440. Your object in asking for an alteration of the scheme is rather to extend the operation of the Trust in regard to pensions than with regard to the encouragement of trades or workshops?—What we propose is precisely this: we propose to give up the three-ninths to pensions and donations alone, and to remove the burden of making grants for tools or materials or grants of any other kind to the other six-ninths.

17,441. Then do you leave the amount devoted to instruction of music untouched?—Yes, we leave that as it is; a minimum of two-ninths must still be spent in instructing the blind in music, and moreover a minimum of four-ninths must still be spent in instruction either in music or in trades or handicrafts.

17,442. Has your practice been to extend the instruction in trades rather than in music, in consequence of the applications you receive?—I do not think so. I do not think that we have found that there has been any difficulty in that respect. Instruction in music naturally will take the lead for blind people. We have not at any rate found any difficulty in administering the grant as at present administered except that which I have mentioned about the pensions. I do not know whether the Commission would like to hear, or to have put in, some cases in detail which appear to us to be incapable of receiving assistance except in the way of pensions. I have a dozen such cases here. I will read one, and then put in the paper. Emily M. S———, London, age 52, blind four years, daughter of the late Captain H———, R.N. (died 1866), who left a large family without provision. Widow, no children, income less than 3*s.* 6*d.* a week. Gardner's Trust has made a grant of 10*l.* towards her maintenance this year. Her savings were exhausted during her late husband's illness. Recommended by the Charity Organization Society, and also by the Somers Town Blind Aid Society, which is giving temporary assistance. We have made a grant of 10*l.* to her.

17,443. Annually?—All our grants are made for a year, and only for a year, but practically this will will be an annual grant.

17,444. Where a donation of 10*l.* is given, is it all given at once?—The pensions are of the amounts of 10*l.*, 15*l.*, and 20*l.* a year; we do not go beyond that.

17,445. I think we have heard that pensions are sometimes abused when they are paid quarterly; that there is a tendency in the recipient to spend it all at once, or else the recipient gets it through a third party, who helps to spend the grant. Is there any security against that happening by its being paid direct, and in small sums, say weekly?—In certain cases we have paid the pension in small sums; in certain cases we pay through the Charity Organization Society; in certain cases we pay through the clergyman of the parish.

17,446. (*Mr. Johnson.*) Is not it paid by a warrant to the persons themselves, which is required to be signed by a magistrate or a clergyman in the neighbourhood?—The cheque has to be signed by a Clergyman, a Minister of Religion, Magistrate, or duly qualified Medical Practitioner.

17,447. (*Chairman.*) Do you propose in this altered scheme to grant any further scholarships for the higher education of the blind at Worcester College, or elsewhere?—That would come under the head of instruction, and we already have power to expend part of the money devoted to instruction in providing scholarships; this alteration would not affect that.

17,448. What is proposed would not relieve the fund that would be available for such scholarships?—No.

17,449. Then the alteration is mainly in the direction of an extension of the pension system?—That is the main purpose of it.

17,450. (*Mr. Johnson.*) The three-ninths it is proposed now to devote entirely to pensions?—Yes.

17,451. What portion of this three-ninths has hitherto been appropriated to any other purpose than pensions?—In 1886 we paid pensions to the amount of 2,520*l.*, and we made grants in other manners to the amount of 1,153*l.* 10*s.*

17,452. Making in all 3,673*l.*?—Yes.

17,453. I suppose your Committee take great care in investigating the claims of those people who apply for pensions?—We do the best we can in the way of making inquiries, not only in the first instance, but also every year. In the first instance, a form of application has to be filled up, and inquiries are carefully made, and then in every year in September all these pension cases are brought up again, and what is called Form No. 2 is required to be filled up; and if that is not satisfactory, if there is anything in it that is at all unsatisfactory, we immediately write to make inquiry, and in some cases the secretary goes down personally to investigate the case.

17,454. You make a personal investigation through your secretary?—Sometimes.

17,455. In the cases that you have any doubt about?—Yes.

17,456. You follow the same plan as they do in Day's Charity, of getting all the information you possibly can before you appoint a person to a pension?—Certainly.

17,457. I know your great experience with regard to pensions. Do you think the other pension societies in England are conducted in the same wise way?—I cannot answer that question. I know them only very generally. I have known cases of pensions which were very ill-applied certainly. I remember, when I was head master of Rugby, coming across some very strange cases of grants of pensions made out of one of the Coventry charities for the blind.

17,458. I suppose you are aware that the larger proportion of the pensions given to the blind are given by the city companies?—Yes. I am aware of that fact.

17,459. I suppose you are aware that very great care is taken by those city companies to follow on the same lines that you have laid down, namely, to make every inquiry that they can?—I am quite aware of that.

17,460. (*Dr. Armitage.*) I take it that the increase of pensions will necessarily diminish the grants of other kinds?—Yes, of necessity.

17,461. No doubt there is great need of increasing the pensions to the blind, but are there any other grants that you have been making hitherto which you think are not equally required?—I do not think that the other grants are so urgently demanded as the pension grants. At present we are able to make grants for instruction, grants for pensions, and grants at our discretion for materials, tools, and starting in life and the like. We desire now to remove the burden of making the last-named grants from the three-ninths at present devoted to those purposes and pensions, and to put it upon the six-ninths now devoted to instruction.

17,462. Do not you think that it is of more importance to instruct the blind in the way of earning their living for the remainder of their lives than to pension the old and helpless blind?—If you took any one given case and you had the choice which you would do,—to instruct the man to maintain himself, or give him a pension, of course you would prefer to instruct him; but if you are to compare the whole body of blind people who can be instructed with the whole body of blind people who can receive no assistance but pensions, I think in the present circumstances the assignment of two-thirds for instruction and only a part of one-third for pensions is giving too much to instruction.

The Right Hon. and Right Rev. Dr. Temple.

19 May 1887.

17,463. Have you proposed any definite proportions for pensions and other grants?—We do not propose anything further than to give the three-ninths wholly to pensions; we think, looking at the cases that come before us, one-third of the whole income is not too much to assign to the aid of those who under no circumstances could maintain themselves.

17,464. (*Mr. St. John Ackers.*) The payments are, as a rule, I understand, given direct to the recipients through a clergyman or magistrate?—Yes.

17,465. Is it a rule to give them in quarterly, half-yearly, or yearly sums?—The rule is to give them in quarterly sums.

17,466. That would amount to 20*l.* as the maximum?—20*l.* is our usual maximum for a pension.

17,467. Have cases been brought under the notice of the trustees of the recipients of those sums misspending the money they so received?—There have been three or four cases in which we have dismissed pensioners.

17,468. Do you, under certain circumstances, give the pension weekly?—In several cases we have given the money through the Charity Organization Society, and it is understood that they pay weekly.

17,469. Is it contemplated at all to extend that system and pay the pensioner through a clergyman or through some other person weekly instead of quarterly?—We have not contemplated it; we have not yet seen any reason for doing it.

17,470. Is there any communication between the different pension societies and the trustees of Gardner's Trust with regard to individuals receiving pensions?—We have not a regular arrangement with the other societies. We make all the inquiries we can.

17,471. There is no organized agreement and intercommunication between the different pension societies?—I am not aware of any.

17,472. Are the pensions given under Gardner's Trust in any way restricted to special localities?—They are restricted to England and Wales, that is all.

17,473. What special means, if any, are taken to inform the blind in different localities in England and Wales that they may apply for these pensions?—I do not know that we advertise the matter in any way; but I think it is very generally known that we give such pensions.

17,474. I am sorry to say it is very generally unknown in certain parts of the country?—There are advertisements from time to time with regard to the scholarships.

17,475. (*Chairman.*) What proportion of your pensioners reside in London and what proportion in other parts of the country?—There are 200 pensioners, of whom 23 receive 20*l.* a year, 60 receive 15*l.* a year, and 117 receive 10*l.* a year; the average age is between 53 and 54; 116 are men and 84 are women; 92 live in the London district and 108 outside.

The following statement shows the counties in which the pensioners are resident. London includes the suburbs, such as Acton, Dulwich, Stratford, &c.:—

England and Wales.—Bedfordshire 2, Berkshire 12, Buckinghamshire 1, Cambridgeshire 3, Cardiganshire 1, Carmarthenshire 1, Cornwall 14, Devonshire 3, Essex 5, Glamorganshire 4, Gloucestershire 7, Hants 3, Hertfordshire 2, Kent 3, Lancashire 3, Leicestershire 2, Lincolnshire 2, London 92, Middlesex 3, Norfolk 2, Northamptonshire 3, Nottinghamshire 1, Oxfordshire 3, Somersetshire 6, Suffolk 1, Surrey 1, Sussex 2,

The Right Hon. and Right Rev. Dr. Temple.

19 May 1887.

Warwickshire 3, Wiltshire 4, Worcestershire 6, Yorkshire 5.

The following statement shows the number of applications from each county:—Anglesea 2, Bedfordshire 17, Berkshire 66, Brecknockshire 2, Buckinghamshire 16, Cambridgeshire 7, Cardiganshire 7, Carmarthenshire 17, Carnarvonshire 10, Cheshire 30, Cornwall 214, Cumberland 56, Denbighshire 2, Derbyshire 18, Devonshire 119, Dorsetshire 28, Durham 40, Essex 66, Flintshire 7, Glamorganshire 56, Gloucestershire 104, Hampshire 72, Herefordshire 11, Hertfordshire 20, Huntingdonshire 3, Kent 85, Lancashire 174, Leicestershire 22, Lincolnshire 28, London and suburbs 1,424, Middlesex 64, Merionethshire 6, Monmouthshire 32, Montgomeryshire 4, Norfolk 25, Northamptonshire 17, Northumberland 12, Nottinghamshire 32, Oxfordshire 30, Pembrokeshire 8, Rutlandshire 1, Shropshire 28, Somersetshire 50, Staffordshire 67, Suffolk 32, Surrey 58, Sussex 72, Warwickshire 45, Westmoreland 2, Wiltshire 25, Worcestershire 86, Yorkshire 144.

17,476. Has it come to the notice of the trustees that boards of guardians reduce or refuse help to those receiving pensions?—Yes.

17,477. (*Mr. Johnson.*) Is it within your knowledge that a great number of the pension societies in England advertise either their vacancies or the result of their elections?—Yes, it is. Gardner's Trust publishes its report every year, and in that report it states the pensioners; that report is published in the "Times," the "Standard," the "Morning Post," and the "Daily Telegraph."

17,478. (*Chairman.*) Who is the chairman of the trust?—The chairman is elected annually. The chairman has been till lately Lord Kinnaird. He has just died and we have not yet filled up his place with a chairman for the year.

17,479. Have Gardner's trustees any idea of establishing a workshop or workshops for the blind in the metropolis or elsewhere?—No, they have not entertained any idea of that sort. We are at liberty to assist existing institutions by our scheme.

17,480. Your Trust does not propose to take the initiative in starting fresh workshops, but merely to support existing institutions?—Yes.

17,481. Since your secretary gave evidence, can you tell the Commission whether your Board have considered the question again?—No, they have not reconsidered it.

17,482. (*Mr. Johnson.*) But you do virtually assist workshops by giving them grants occasionally?—Yes, we have power to do so, but we have not started any of our own.

17,483. (*Chairman.*) Since your secretary gave evidence, there has been no other proposal to make any alteration of their Trust than that which you have indicated?—No, nor do I see any likelihood of their proposing any other alteration at present. Of course Gardner's trustees will necessarily be influenced very much by what this Commission may report.

The witness withdrew.

Dr. W. Moon examined.

Dr. W. Moon.

19 May 1887.

17,484. (*Chairman.*) You have been engaged for a very long time in work connected with the education of the blind, especially that of embossing books for the blind?—It is now 47 years since I first took to the work in connexion with the education of the blind.

17,485. What were the types in use when your type was first started?—Lucas's, Frere's, Alston's, and Gall's.

17,486. Have you any idea what proportion of the books printed for the blind are in your type?—There are more books in my type in this country than in any other type. We have altogether, large and small volumes, 490 in English; of those, 127 would be books of the Bible and single chapters. There are 183 foreign books, so that there are 673 English and foreign together; we have also portions of Scripture in 343 languages, sufficient for missionaries to teach any blind persons they may meet with abroad; as soon as they have learnt to read those portions of Scripture, we prepare chapters and so go ontill we complete a gospel.

17,487. Is your work carried on by the aid of voluntary contributions?—Entirely by voluntary contributions. I give my time to it quite free. All the buildings, plant, &c., I have put in trust. There are five trustees, namely, Lord Mount-Temple, Sir Charles Lowther, the Right Honourable James Lowther, and myself and daughter.

17,488. The premises and the machinery and all your plant are in trust for the benefit of the blind?—Yes; I have given a piece of ground worth about 3,000*l.* for extension of buildings; then the Gardner's Trust kindly gave 1,000*l.* to have the premises enlarged,—that is to say, the last enlargement that we had,—so that now we have sufficient room for some time to come. We stereotype everything we do, so that in case I was called away, the work would go on with the plates that have been already made. Then my daughter has rendered me very great help during the last 25 years.

17,489. Are the books at their cost price?—No, below cost price; that is to say, there would be nothing charged for setting the type, nothing for rent of premises, and nothing for wear and tear of machinery. Some of them would just clear the paper, embossing, and the binding.

17,490. Then there is no hope of books for the blind on your system being very much cheaper than they are at the present time?—No; there is nothing whatever of a commercial character about it; everything is of a charitable nature from beginning to end; for instance, supposing any book is wanted, the plates have to be stereotyped first, for which the money is raised, and then the books are printed.

17,491. Is the cost of setting up the new type considerable?—Our large size plates at present cost us about 3*s.* each,—that is to say, for material and the setting up,—so that a book with 100 pages would cost us 15*l.* for the smaller-size type, and 12*l.* 10*s.* 0*d.* for the larger type. This latter would cost 2*s.* 6*d.* per page. The book would be sold half bound for 3*s.* 6*d.*, the book consisting of 100 pages. It would not pay any printer to print and sell those books under double that price. Some years ago a Quakeress came to me and said, "I think your books could be "printed much cheaper if you were to let some large "firm in London print them." I said, "Very well, "if you think so I am quite willing to have it "tried." So I gave a firm an order for 25 copies (lending them our stereotyped plates), and when the bill came in the books that we should have sent out at 10*s.* 6*d.* they charged me a guinea for. I told this lady, "Now I have proved to you that other people "cannot print the books cheaper, you ought to pay "the extra money," but she did not see that. We have now more than 45,000 plates in English and in foreign languages. Suppose our plates were put out for a London firm to make of copper they would charge 8*s.* per plate after we had set up the type; we shall do them for something like 3*s.*

17,492. Do you know the American type?—Yes.

17,493. Do you prefer yours to that?—Certainly so. Four years ago I went to America and I heard there were 50,000 blind in the United States. I went to an institution in Philadelphia where they had about 200 inmates, and there were 30 adults at that time in the institution, not one of whom could read the

American type. I took over some books to give them as a present from Sir Charles Lowther. We unpacked the boxes on a Friday and gave the books out on Saturday, and the following Saturday there were 114 of the inmates able to read the books, and the 30 who could not read at all before were of that number.

17,494. Was that on account of the shape of the type being more easily tangible to the blind?—Yes, on account of the simplicity and clearness of the type. I can say confidently that out of the 50,000 blind in the United States, at the very outside you would not get more than 8,000 or 10,000 to read the American type. I consider that there are 40,000 blind in the United States requiring our books. I established a home teaching society in Philadelphia, and they are mailing the books to various parts of the United States, right across to California. We have another one at Chicago, another close to Pittsburg, and if we had only the means and I were to go over and work there, I have no doubt we should get home teaching societies established in a very large number of places in the course of a few years.

17,495. Do you think that there ought to be only one type for the blind, and that type yours?—I would not say that. I would say this, that out of 30,000 blind that we might have in the United Kingdom you would find that fully three-fourths of them could not read the Roman letter type, not in the size it is printed; but you would find that it is only quite the very aged and infirm blind that are not able to read ours; they read it up to 90 and 95. Last year I was with an old lady in very good circumstances residing in Edinburgh; she was 95 years of age, and had become blind at the age of 92. She learned to read my type in about half an hour; she had tried Braille, and she could not manage that, and she could not manage common letters, but she learnt mine directly. When I went to wish her good-bye, she said, "Never pray "for me to have my sight, so great has been the "pleasure and comfort your type has afforded me. "I never knew before what I now know of my Bible, "though I have read it all my life, and have been a "church-going person, yet it has never been to me "what it has been the last two years. I would "rather remain blind the rest of my days than lose "the comfort these books have afforded me." A lady who came over from Sweden two years ago told me the same thing.

17,496. Does she read English?—No, Swedish.

17,497. Are books in Swedish printed in Moon type?—Yes, I sent away 90 volumes about a fortnight ago.

17,498. Supposing Braille, which is used to a very great extent, and Moon type to co-exist, do you think the Moon type should be taught first, before the Braille type, to young people, or do you think that the Braille type should be taught first and the Moon type afterwards?—I find that they teach them Moon first generally, and then they learn Braille more easily. The Braille type is useful for children, but as soon as they come to work at basket-making or anything of the kind, that hardens the fingers, they are not so well able to read it.

17,499. You think the fingers become less sensitive as they get older?—Yes, then they must throw Braille aside.

17,500. You think it desirable that children, though they should be taught Braille, should also be taught Moon, and that they should be taught Moon first?—If they are not taught Moon when children, they will learn it when they grow older, because Braille would be of no use to them. If I thought Braille better than my own I would take it up directly, and throw all my efforts into it, but the blind would not allow me to do that, because at the present time I have not less than 1,000 volumes ordered that we have to supply.

17,501. Do you think that the State might be asked to give books to the blind gratis, as they used under the Education Acts to supply books to schools?—I should say it would be a very great boon, or if they could increase the number of volumes in the free lending libraries which have been established in connexion with the home teaching societies. I estimate that these societies lend upon the average something like 200,000 volumes a year in my type.

Dr. W. Moon.

19 May 1887.

17,502. All over England?—In Great Britain and Ireland. Take the London Home Teaching Society, for instance; they have taught during the last 10 years more than 2,700 persons to read, and more than half of them are over 50 years of age, some 70 and 90 years of age, and they have lent from their free libraries during that time upwards of 55,000 volumes. Now these very individuals, if you had given them Braille books, would not have been able to read them. I am not speaking against Braille. I do not wish to be understood to do that, because I believe Braille's is doing much good among the young blind, and such as have a delicate touch. A great many advocate Braille's who would not throw their strength into mine. Lots of things are taken up by people; they will work very hard at what is their own hobby, when they will not lend a finger to what is being done by anybody else.

17,503. The free libraries of which you are speaking are in connexion with the home teaching societies?—The home teaching societies in the different towns where they are established.

17,504. These home teaching societies from a small number have become a very large number?—Yes; we have more than 80 libraries altogether, and we are getting home teaching societies and libraries in connexion with them established in America, Australia, and Sweden. There is one great thing in our system, which is that there is the full orthography with the exception of the endings, ing, ment, tion, ness, so that there is a certainty in the reading of the type. Braille, unfortunately, is very contracted, which renders it not so certain in the reading; still blind children do read it remarkably well. Some children can learn anything.

17,505. What circulation is there on the Continent of books in the Moon type; is it large?—No, I cannot say that it is—not in France or Germany; it wants someone to travel there, and interest the people on behalf of the blind. I have been urged strongly of late to go to Paris, and start a home teaching society afresh there, as I did some 25 years ago; but when the war came on it had to be given up. In Berlin we started a home teaching society in 1862, and a blind woman, the first one I taught there, who had been trying to learn 18 years by the common letters and could not succeed, learnt my type in about half an hour. A Jew learnt next; he was started as a home teacher, and in about a year and a half he had 100 readers in Berlin. I learnt all the different systems that were out when I first went blind, the common letters, which I could read when I had my sight, then Lucas's, Frere's, and Gall's. I tried with a poor boy for five years, and I could not manage to teach him by Frere's, which I found to be the clearest type for the touch. During that time I made it a matter of frequent prayer, and in answer God put a plan into my mind, by which, in 10 days the poor child could read easy sentences. The next thing was to provide him with books. I soon found that it was an expensive affair to emboss them, and this also I made a matter of prayer, and God began to send in means, and from that hour to this the little stream has never stayed, and it has gone on widening and deepening, and the work has developed to a much greater extent than I ever thought it would, because no man that I am aware of before me had ever put embossed type into more than three languages, and here it is in 343 languages; the sun never sets on our books, so widely have they gone into the world. We are now preparing some in Hindostanee and Russian. We are doing a primer in Russian, and we have portions in nine of the Chinese dialects.

17,506. What number of people do you employ in your works?—Twelve. I hope you will not think

Dr. W. Moon.

19 May 1887.

me boastful in what I am about to say, but if I had the funds for it, we could find sufficient employment for 100 compositors for the next seven years to come, and take nothing new in hand, and we could find employment for 30,000 missionaries for the next 20 years to come, and at the end of the 20 years there would be as much for them to do in searching out the blind and teaching them to read as there is now, because by that time most of the blind of the present day would have died out, and others would have become blind. Take the United Kingdom, for instance; I should think that upon the average there are 3,000 blind people dying in Great Britain and Ireland every year, so that you see in ten years a number equal to the present living blind would have died, and an equal number of others would have lost their sight. There are not less than three millions of blind in the world, and not less than 300,000 die every year; and it is a solemn thought, that many hundred thousands must die before missionaries can reach their case. There would be plenty of employment for the next 20 years to come for more than all the missionaries of the various missionary societies in the world put together.

17,507. Have you any views with regard to the best education for the blind; a literary education is no doubt desirable, but do you think industrial education is useful for the blind?—I think it is a very great point to find some employment for those who are capable of working, but there are over 8,000 that are over 65 years of age, and it cannot be expected that they can work; then there are over 14,000 over 45 years of age. Blindness apparently begins as a rule when people are about 33 years of age; the number of blind that are young appear to be about 10 per cent. of the mass, under 15 years of age. I would say, then, if you take into consideration that one half of our population die under 10 years of age, you will see that a large proportion of that one tenth of young blind would die under the age of 10. It is a very great point to find some kind of employment for the blind, but then if they learn some trade, as they do at workshops and institutions, when they get home the difficulty is to get rid of what they have manufactured. Many of them are not likely to make baskets and other articles so well by themselves as when they had the teacher's eye upon them, while in the institution or workshop.

17,508. (*Dr. Armitage.*) You said that the blind when they grew old were no longer able to read Braille; are you speaking of your own experience?—I am speaking of a large experience I have had, derived from accounts from the blind themselves, also from the home teachers.

17,509. Are you aware that blind persons up to 80 years of age and even over have learned to read Braille?—I have known very few such cases.

17,510. You have known some?—I am wrong in saying I have known any at the age of 80. I have had this from several, that they have pored over Braille and have got quite out of heart about it, and that then they have met with mine and learned it in about a quarter or half an hour.

17,511. You know for a fact that some old people do learn Braille?—I cannot say that I have known or heard of half-a-dozen cases where blind persons over 60 years of age have learnt Braille. Do not misunderstand me. I do not say that there are not such persons, but I have not heard or known of so many as two such cases.

17,512. Do not you think that you would be always more likely to hear of failures than of successes?—No, I think not.

17,513. If an old person had set to work to learn Braille and succeeded perfectly and used it, would you be likely to hear of it?—I think it is possible I should, because I have a very wide correspondence with the blind; I receive applications for books every day. I do not want it to be understood that I am speaking against Braille. If I were to say all I know of Braille, and all I feel about Braille, I should run it down very much indeed, and could justify what I could say upon it, but I do not want to do that. I am pleased with anything that is done for the blind that people bring forward if it is only a little benefit to them.

17,514. If an old person learns Braille, and likes it so well as to use it exclusively, do you think you would be likely to hear of such a case; why should they write to you in such a case?—I beg your pardon; such a case would naturally get talked about by other persons who had met with it, and in this way reach me. A letter was received by me not more than a month ago from a woman in California who had learned to read Braille, but when she took to work she could not read it any longer, and then she thought she would never be able to read again; but some person met with her who read my books and who lent or gave her a book, and she learned to read my type directly; and then not knowing where to purchase my books in America, she wrote to me and asked how she could get them, and she told me what I have told you, that she was obliged to throw Braille aside because her fingers had got too hardened.

17,515. We have had it in evidence that there are many basket-makers who having learnt Braille at school continue to use it; do you know of any such cases?—Yes, I think I met with some in America. I did not hear them reading Braille, but I was told that there were some who did read it. I know that there are many of the blind who can write Braille, but who cannot read it after they have written it.

17,516. You were saying that owing to the contractions in Braille, it was not easy to make it out—that the contractions caused a great difficulty?—I know that is the case myself.

17,517. Did you mean by that the difficulty in recollecting the contractions, or that it interfered with the spelling?—The spelling is altogether imperfect in Braille; they do not profess to give orthography with any accuracy at all.

17,518. Are you aware that in contracted Braille every letter is expressed; that orthography is a thing that is particularly attended to in contracted Braille?—I cannot understand that, for this reason: there are special contractions in connexion with the Psalms alone printed by the Bible Society; therefore, if there are those additional contractions, there must be other contractions, and consequently, if you have such a variety of contractions, I do not see how you can have much regard to orthography.

17,519. Are you not aware that all contractions in Braille, with the exception of two or three, are orthographic contractions which express the full spelling of the word?—I cannot understand how that is, because if you only express about half the letters in a word, you cannot fully indicate the orthography.

17,520. Do you know how the word "them" would be written in contracted Braille?—No.

17,521. (*Chairman.*) Do you write Braille yourself?—No, I learnt it, but I gave it up. I do not know the contracted Braille.

17,522. (*Dr. Armitage.*) You do not know then that if you take the word "them" in the contracted Braille it is written with one sign for "the" and another sign for "m"?—Supposing you were going to write "themselves" what would you do?

17,523. Then you write the contraction for "the," then the contraction for "m," and then the rest of the word. The point I wish to bring out is that every letter is expressed?—I should like to look into that again when I am at home. I have a list of the contractions; as I understand, the whole of the letters are not expressed in the words, but there are a set of contractions for certain letters not expressed.

17,524. Do you believe if a child writing, in contracted Braille made faults in spelling, those faults could not be detected at once by a person who knew how to spell?—In the letters we get from people who write Braille the words are not all spelt alike; and if one person writes me two letters there are more contractions in the one than in the other.

17,525. The question of the value of Braille, or any other system, for educational purposes, depends upon this: whether an exercise written by a pupil in contractions can be tested as to spelling as closely and as certainly as if it was written without contractions?—I have no doubt you have the same thing in Braille that you have in Frere; there is the word "Iconium," for instance, that you may spell in 30 different ways, and not break a single rule, and yet not spell the word right.

17,526. Are you aware that Frere is phonetic and not orthographic?—Yes.

17,527. One is a system in which words are spelt according to the sound, and the other a system in which the words are spelt according to the letters?—Yes.

17,528. (*Chairman.*) Take the word "handy," which, we will assume, is writen by first a contraction for "hand" and then another for "y." Do you mean that different writers who write to you in Braille would have different contractions for "hand"?—Take that as an illustration, it is so; and moreover, they use the same contraction for more than one syllable.

17,529. You might have a contraction to be used with every word ending in "ation"?—Yes; I know that in this version of the Psalms in Braille, to which I have referred, which is printed and circulated by the Bible Society, there are special contractions that are not found in other books. They may go on contracting to make the books smaller, but then your readers must go on learning these new contractions. I could make my books a fourth of the size they are now by using contractions, but if I did that my books would be almost useless.

17,530. (*Dr. Armitage.*) You have begun to use contractions, have you not?—Very few. We have always had contractions for "ing," "ment," "tion," "ness," and for "Lord," "God," "Jesus," and "Christ;" the first letter in each of those words standing for the word; and now "t" with a dot over stands for "th" in a word, and "the," when standing alone; but not for the pronoun "thee," so that there is never a chance of any mistake.

17,531. (*Mr. Johnson.*) In fact the advantage of your type you consider to consist in this: that it is easy to be read and that there are fewer contractions than in Braille?—Yes.

17,532. You have been telling us a good deal about Braille; are you aware that there are several systems of Braille in use among the blind?—I know there are differences, because they are quarrelling about it in America. The Braille is no longer one system.

17,533. The Braille system that is used in France is not exactly the same Braille system that is used in England?—That I am not quite certain about.

17,534. I suppose that in your type you have printed a great many educational books?—Yes; we have Nelson's Royal Reader; the first four and a part of the fifth; we have also a book on astronomy, a history of England, a grammar, geography, a spelling book, and several other educational works, and a part of the public school primer.

17,535. Are those books used by the school board now for primary education?—They did begin to use them for a time in the London School Board, but Braille has superseded them, because the teachers are taught to teach Braille.

17,536. As I understood the School Board of London resolved that not only Braille should be taught but Moon. Is Moon still being taught in the schools of the London School Board?—I do not think it is. One of the teachers told me she taught Moon before she taught Braille, because she found it easier to work that way, but they have not ordered books from us for several years.

17,537. As I understand, lately the school board have passed a resolution that the children should be instructed in the Moon type?—I understand that there was such a resolution come to.

17,538. Were not you communicated with to supply books?—Yes, we stereotyped some books for the school board.

Dr. W. Moon.

19 May 1887.

17,539. You were asked by the London School Board to supply them with books for the purpose of instructing blind children in their schools?—We were, and they gave so much money towards stereotyping three books.

17,540. Are you aware whether they still continue to instruct the blind children in their schools in Moon type?—I do not think they do. I should imagine that they have nearly or quite discontinued the instruction of children by my type, because they order no fresh books, and the old ones must be much worn if still in use.

17,541. Have you any idea in your own mind why they should discontinue it?—Yes.

17,542. Will you tell us the reason?—I should prefer not, as I have no personal knowledge of the reason.

17,543. You told the Commission just now that the school board had made a grant to you for printing certain books; was that made to you direct from the school board?—Direct.

17,544. As an encouragement for you to print a certain number of educational books?—Yes, for their own use.

17,545. Did you print those books on receiving that grant?—Yes.

17,546. At the order of the school board?—Yes.

17,547. And for the use of the school board?—Yes.

17,548. Were the books for which you got the grant educational books which could not have been supplied in any other type but yours?—They were not in existence at that time on any other system that I am aware of.

17,549. The School Board of London were anxious to instruct their blind children in Moon's type in a particular set of educational books which were agreed on by the board to be used in instruction?—Yes.

17,550. They had not those books by them; they asked you to produce those books, and they gave you a grant provided you would produce those books?—Yes.

17,551. You did produce those books?—Yes, and supplied them.

17,552. And have you supplied those books to any other institution except the London School Board?—Yes, to the blind schools.

17,553. The school board considered that there was a necessity for printing books in your system?—They did consider so, because they gave a grant for it; and moreover one of our home teachers used to go to the schools at that time to give instruction to the blind scholars, also to the monitors as to how it was to be carried on till he came again; and moreover the school board went to extra expense and had the books illustrated with raised pictures. Furthermore, we had to print them not in our ordinary size and shape, but of a particular shape that should suit their desks.

17,554. You do not know of your own knowledge that your system has been discontinued and superseded by another system?—I know that the blind children in the schools are being instructed, and I know that they have not had any additional books from us, and that those books which they did have from us must by this time be greatly worn, because it is ten years ago or more. I have also heard from one of the teachers themselves that they teach Braille.

17,555. I understand you have all the books necessary for the first four standards printed on your system?—Yes, and part of the fifth.

17,556. Then your society could supply the preliminary educational books to any school board established under the present Code?—Yes, quite so; and if we finished the fifth and sixth then it would be complete from beginning to end.

17,557. Of course, you are an advocate for your own system; but supposing it was not your own system, should you say that there was a necessity that it should be continued in our elementary schools?—I should, for this reason: blind people must come to it

Dr. W. Moon.

19 May 1887.

sooner or later after they leave school, and moreover, they have the use of our books in the free libraries, many of which are books that they could not get upon another system.

17,558. You find that the demand for your publications is pretty steady and continuous?—If we had ten times as many books as we now have, there would be a demand for them. The blind are always crying out for more books.

17,559. What would be the ages of the greatest number of your readers?—I suppose we have more readers over 50 years of age than under; we have a great many under that age, but the majority would be over that age. When you find that 14,000 odd of the blind are over 45 years of age out of 22,000, that shows at once that we should have a larger number of readers that are adult than we should have of children. The children can learn my system quicker than they can learn the other, that is an undeniable fact. I do not say they do not learn Braille quickly, or that they do not learn the Roman letter soon, for a quick child will learn almost anything if you are patient with it. There is another thing I would refer to while I think of it. I think it is a very great pity that in the London School Board they do not teach the blind children the ordinary writing, but if they did that they must have sighted teachers to see how they did it. I do not say blind teachers do not teach well, but they could not tell how the children made the strokes with the pencil.

17,560. You have spoken about writing. You would advocate blind children being taught the ordinary writing of the seeing or the ordinary Roman characters?—Yes.

17,561. And you have invented a machine yourself which enables blind persons to write in the ordinary characters of the sighted?—Yes, I have here (*producing a machine*) eight different modes of writing. If a person does not like one he can take to another. This machine you can use for ordinary writing, for writing my type either with a style or with pin type, or for writing Braille. This is the tablet, and you can use either one of the eight systems you like with it. A quick blind child would learn to write by this mode quicker than a sighted child would by the ordinary mode.

17,562. That is to say, in the ordinary letters of the sighted?—Yes, writing letters as we write. This is so formed here that if you pass the pencil round so, you make the letter "o"; then after you make the "o" you draw the pencil down that side so, which makes an "i"; when those two are made you put the "o" and the "i" together, and that makes "a"; open this a little higher and you get "l"; add the "l" to "o" and you get "d"; then if you open this and draw it so, that makes the "j"; add that "j" to "o" and you get "g"; and so in that way a blind child learns to write quickly, but it must have a sighted teacher to see whether it does it right or wrong.

17,563. You think blind children should be supervised by sighted people in education generally?—Yes. Clever as a blind person may be, give him his eyes and it makes something more of him. I have been blind 47 years; if I had had my sight I could have done much more and done what I have done easier. It is very wonderful what some blind people do, but if you could give them their eyes they would do more still, and do it easier.

17,564. With regard to your printing society, it is entirely a charity, is it not?—Yes.

17,565. Did I rightly understand you to say that you have given the ground or part of the ground on which your establishment is built?—I have given 3,000*l.* worth of ground.

17,566. Ground upon which your establishment now stands?—Upon which part of it stands.

17,567. The plant was paid for, or rather subsidized partly by Gardner's Trustees and partly by Sir Charles Lowther?—By Sir Charles Lowther and others; the work has been going on now for 40 years.

17,568. Then your subscriptions go towards the expenses of working the establishment?—Yes, entirely so.

17,569. Are your accounts audited every year?—Yes, by a public auditor.

17,570. They are audited for your trustees?—Yes.

17,571. Are they published?—They are printed with the auditor's name.

17,572. You were good enough to give a large portion of the ground to the trust, and you merely live upon the premises?—I live upon the premises to manage the work, to which I give my time free.

17,573. You get no stipend?—No; but I could not give my time free to carry on the work if I had not my independent income.

17,574. You give your time and energy to carrying on the work without remuneration?—Yes.

17,575. You live in one portion of the building, and that is the only advantage you get?—Yes; I raised the money and put up the building. I had to bear the heat and the burden of the day in raising all that money. The work daily increases. My daughter writes quite two thousand letters a year for me, besides what my secretary and myself do.

17,576. You told us that in Berlin there are 100 readers of your books; have you any idea whether any blind people read them in France?—I cannot say how many read them in France, because I broke up the mission when the war came on. I had not funds to carry it on, therefore the work was given up. I have lately been written to by Miss Verner, who tells me there are 2,000 blind in Paris that want to be taught to read.

17,577. You have had great experience with regard to the blind generally; would you instruct them in trades generally speaking, in preference to devoting any large portion of time to instruction in music?—With regard to music I should say this: of the many directions in which effort has been made to teach the blind something with a view of enabling them to earn a livelihood, I think that music, previous to the time of Dr. Campbell taking it up with such thoroughness, cost more time and more labour, and produced less result than anything else.

17,578. I suppose you are in favour of teaching trades rather than music?—Yes; as regards music, let those learn music who have really a talent for it, and only those, and do not waste so much money upon it.

17,579. Do you think music gives a profitable return for the time and labour spent in teaching it; are there many people who are doing well in music?—There are some, but there are many who go upon the street and get their living there. According to the returns made by our home teachers, who have made a great deal of inquiry about it, it appears that there are a great many from one institution and another that have gone out on the streets to play music after they have left the institutions.

17,580. Playing in public-houses?—Playing in public-houses and in the street.

17,581. (*Rev. Mr. Sleight.*) Have you ever been a teacher of the blind yourself?—When I first became blind I learnt to read the different systems, then I purchased some books, then I wanted something to occupy my time, and I found several blind adults and children in Brighton, whom I gathered together at my mother's home in a class; the class gradually became formed into an institution, the Brighton School; that institution I attended for years, and then I gave it up because this other work occupied all my time.

17,582. What system was adopted at that school while you had anything to do with it?—My system, but they have now discontinued teaching it, and introduced Braille; but why or wherefore I cannot tell you. That was where my system had its origin. I am an honorary visitor of that institution, but I never go there now.

Dr. W. Moon.

19 May 1887.

17,583. Do you employ any blind persons in your printing establishment?—No, they would be of no service to us.

17,584. With regard to aged people, is not there some advantage in their learning the Roman system in addition to Moon, or even in preference to it, from the fact that it is the type of the seeing?—You cannot get them to learn it after they have learnt mine; they would not be bothered with it.

17,585. Is not it an advantage that they should learn the Roman system, seeing that it is the type by which they can communicate with their friends who have sight?—Yes; we make stamps with Roman letters at one end, with my characters on the sides that they can feel, so that they can stamp what they have to say in Roman letters and send it to their friends; they adopt that plan in Philadelphia and other places in America, and in Bristol and several other places in this country.

17,586. If the demand for books in your type for educational purposes was increased, would it not be possible to make your establishment commercially successful?—No, that could never be. The more we printed the more we would lose.

17,587. Did the grant that the London School Board gave for those books pay the entire cost?—It paid the cost of the material and the labour; that is to say, setting up the type and the material for the plates. It did not go beyond that.

17,588. Then could not you now issue the Royal Reader very cheaply?—We issue it now below its cost price. There is the paper and all the material to be supplied, and then there is the workmanship.

17,589. Will you tell us the price of the Royal Reader now?—The No. 1 Royal Reader is in two volumes, each volume 11*d.*; No. 2 Royal Reader is in four volumes, each volume 1*s.* 4*d.*; No. 3 Royal Reader is in three volumes of 100 pages each, and each volume is 3*s.* 6*d.* All our books of 100 pages are 3*s.* 6*d.*, half bound. Royal Reader No. 4 in five volumes, each volume 3*s.* 6*d.*, and the sixth volume is 2*s.*

17,590. (*Chairman.*) Could you furnish us with your correspondence with the school board?—I will send it to the Commission if I can find it. I have no doubt we have it, though it was 12 years ago. There was a conference held in London at the time, before the school board decided upon what they would do, Dr. Campbell was there and several others connected with reading for the blind, and I remember Dr. Campbell saying this, that when he was tired he turned to my books for recreation; he found the type so much simpler than the other.

17,591. (*Mr. Johnson.*) Was that remark of Dr. Campbell's reported?—I do not know. I was very much struck with it at the time, and he said it very heartily. If my system was not a more simple one, and better adapted to adult people, we should not be able to get on, they would all go for Braille or these other systems; instead of that, every year we are increasing; if we had ten times the number of books that we now have there would be a demand for all those.

17,592. You have so many orders that you could employ more workmen if you had the means?—Yes, without taking anything more in hand than I have already laid down. I could find work for 100 compositors for the next seven years to come. Some day I must die; when I am gone somebody else must take my place, and must be paid for what is to be done, and all that will add to the expense of the work.

17,593. (*Rev. W. Sleight.*) Do you know why it is that the Brighton school in which your system was first introduced has discontinued the use of it, and adopted Braille?—I have not the slightest knowledge of the reason. They were the finest readers in the country at the time I was there; they read as well as sighted people.

The witness withdrew.

Adjourned till to-morrow at 12 o'clock.

No. 6, Old Palace Yard.

Friday, 20th May 1887.

PRESENT:

THE RIGHT HON. THE LORD EGERTON OF TATTON IN THE CHAIR.

W. TINDAL ROBERTSON, ESQ., M.D., M.P.
B. ST. JOHN ACKERS, ESQ.
F. J. CAMPBELL, ESQ., LL.D.
THE REV. W. BLOMEFIELD SLEIGHT, M.A.
THE REV. CHARLES MANSFIELD OWEN, M.A.

CHARLES E. D. BLACK, ESQ., *Secretary.*

The Very Rev. HERCULES HENRY DICKINSON, D.D., examined.

The Very Rev. H. H. Dickinson, D.D.

20 May 1887.

17,594. (*The Chairman.*) You are the dean of the Chapel Royal, Dublin Castle?—Yes.

17,595. And you have all your life been connected with institutions for the deaf and dumb in Ireland?—Since I was a schoolboy. In 1844 I became connected with the deaf and dumb institution as a member of the juvenile committee. I have been connected with it for more than 40 years.

17,596. Two of the three principal institutions for the deaf and dumb in Ireland are in the neighbourhood of Dublin, are they not?—Yes; the Claremont Institution, the oldest, was founded in the year 1816; the Belfast Institution was founded in the year 1831; and the Cabra Institution for Roman Catholics was founded, for girls in 1846, and for boys in 1857.

17,597. You are probably acquainted with the census of Ireland of 1871, and with the report, which is a very full one, on the deaf and dumb in that country?—Yes.

17,598. Have you examined carefully that census return?—Yes.

17,599. Is it, in your opinion, and in the opinion of those best qualified to judge, an accurate return?—I think so.

17,600. It states that the number of deaf and dumb in Ireland was 4,747 in 1851, 4,930 in 1861, and 4,467 in 1871, and that it had decreased to 3,993 in 1881; do you think that there is a real decrease, or is it only that there have been persons included as deaf and dumb who ought not in the previous instance

The Very Rev. H. H. Dickinson, D.D.

20 May 1887.

to have been so included?—I think there is a decrease.

17,601. Have you any reason for that belief derived from your connexion with the different institutions?—Yes, on the whole.

17,602. Has the number of applications to the different institutions proportionately decreased?—It has. I usually write the Annual Report of the Claremont Institution, and in the last report I refer to that matter. Here is what I have said: "It would appear "to the committee that deaf-mutism has diminished "among the members of our own and kindred com- "munions. This may arise from a proportionate "decrease in the population, but partly, it is to be "hoped, from improved habits of living, better "sanitary regulations, less frequent and continuous "intermarriages, and consequent diminution in the "transmission of hereditary tendencies, and various "other causes." Deaf-mutism is frequently the result of scrofula; caused in some cases by scrofula affecting the drum of the ear; and in proportion as scrofula has diminished, deaf-mutism has decreased. Scrofula has diminished with improved habits of living, and also the hereditary tendency to scrofula diminishes with the diminution of intermarriages of mutes and others consequent on the facility of interchange of place by the opening up of the country.

17,603. It has been stated that congenital deaf-dumbness is greatest in certain counties; have you observed that to be the case?—I think so. I have the relative numbers, and I think it is borne out that it is in a great degree local. Wherever the habits of living are lowest, deaf-mutism is most to be found.

17,604. Do you think that deaf-mutism is caused at all by the consanguinity of the parents?—I have not found that deaf-mutism is itself hereditary, but the scrofulous tendency is, no doubt, hereditary. It may develop in other forms, but it is admitted that it is hereditary. The total number of deaf and dumb in Ireland was 3,993, and the number of the dumb who were not deaf was 1,143.

17,605. Are those idiots, more or less, who are dumb and not deaf?—Some of them are idiots, but not all, because I find that there are only 353 such persons unsusceptible of education in the whole of Ireland, that is to say, deaf and dumb idiots.

17,606. It is very often said that there is no such thing as a dumb person unless he is an idiot; that they are only dumb because they are deaf; have you many cases in which you can ascertain that they are dumb and not deaf, and yet are not idiots?—I do not myself know of many such cases, only three or four; and even then I think there is some mental deficiency, though they are not absolute idiots. They might be taught the use of their hands, and things of that kind.

17,607. Have you any cases of that kind in the institutions in Ireland?—Only one that I know of, and that was just on the border-land.

17,608. Supposing that they were idiots, would you send them to an idiot asylum, or would you keep them in your institution?—We could not keep them, our object being educational; and it is very difficult to get them into an asylum for idiots, because there are very few such asylums independent of the work-houses, and they would not select them, because they do not take in hopeless cases.

17,609. Have you any asylum like Earlswood Asylum, or the Northern Counties Asylum at Lancaster, for the reclamation and education of idiots?—Yes, near Dublin; it is called the Stewart Institution, and it is situated at Palmerston, Chapelizod, not very far from the Phœnix Park, in Dublin. That institution is for idiots in whom there is some capacity. I find that there are 3,037 uneducated deaf mutes in Ireland.

17,610. Do you agree with the suggestion which is made in the census return, which quotes a suggestion made by the Census Commissioners so far back as 1871, which is this, that Her Majesty's Government should make it compulsory upon the poor law guardians to send all deaf and dumb children in their respective unions dependent upon them for support to the institutions for the instruction of that class, or that some State provision should be made for their education, either by instituting special schools in connexion with national education, or by granting aid to those already in existence?—Certainly; I think that leaving such payments optional is a great gap in the whole system.

17,611. Do you find that the poor law guardians refuse to send to such institutions the deaf and dumb children of parents who are unable to pay for their children?—There is a very great difficulty in persuading them as to the duty and as to the economy of such a course. Poor Law guardians stand face to face with the question, "Shall these be pupils receiving "State aid for eight years, or shall they be paupers, "and possibly criminals for life?" and they, being short-sighted, prefer the present economy of saving the expenses of education, while they entail upon public resources a life burden.

17,612. I suppose there is great unwillingness on the part of the parents to part with children suffering from that infirmity?—No, I do not think the difficulty arises from that.

17,613. Does the difficulty arise from their unwillingness to pay?—Sometimes in Ireland it arises from their inability to pay. We had a case at our last committee meeting of a farmer in very reduced circumstances, as many farmers are in Ireland, and with several children, and he said that from local circumstances it was impossible for him to make application to the local guardians, who, he thought, would not grant it; so we took in the child wholly gratuitously, without any contribution.

17,614. In your institution have you many children who are sent by the guardians, and who are partly or wholly supported by the guardians?—We have 11 children, who are paid for by the guardians, but not wholly. The 15*l.* a year merely covers the cost of maintenance.

17,615. Is 15*l.* the maximum payment that is made?—Yes.

17,616. Can the guardians in Ireland, as they can in England, subscribe 25*l.* for the maintenance of a deaf and dumb child in an institution?—I do not think so; they never do. Of course 15*l.* does not cover the cost of education and maintenance.

17,617. Can you give the numbers in the different institutions in Ireland?—At Cabra there are 363; at Belfast there are 76; and at Claremont there are 40. Of course the great argument for giving State aid is that people in the same rank of life, if they had their full senses, would receive State aid through the National Board towards education, and they are absolutely at a disadvantage in consequence of what ought to constitute an additional claim.

17,618. Have the deaf and dumb children any difficulty in obtaining a livelihood after they leave your institution?—No, we have been enabled always to provide for the girls as domestic servants, and for the boys chiefly as tailors and shoemakers, and sometimes as printers.

17,619. Do you teach them any trade?—No, we tried to do so.

17,620. Did you find that it interfered with their education?—Yes.

17,621. Do you teach them in any way to use their fingers?—Yes, the girls are all taught needlework, and we have a farm, and the boys are all taught farming and gardening.

17,622. What acreage of land have you at your disposal at the school that you are speaking of?—We have not more than about three acres, I think, under cultivation. The average number in the institution that I am connected with was upwards of 100 every year; but ever since the Cabra Institution has been established the Roman Catholic deaf and dumb children have naturally been sent there. As long as ours was the only deaf and dumb institution in Ireland, the Roman Catholic children were sent to us. Of course we have no fault to find upon that score.

The Very Rev H. H. Dickinson, D.D.

20 May 1887.

17,623. How many years do you keep them in the institution?—We take them in at about six or seven years of age, and keep them on until they are about 15.

17,624. Do you think it is desirable that the deaf and dumb should have at least eight years' instruction?—I think so, especially under the oral system.

17,625. Of course they have the disadvantage of starting with very much less knowledge than children of the same age when they come to school, and therefore they require nearly twice as long a time as ordinary children?—Yes, about twice as long a time; the work of teaching is necessarily so slow.

17,626. Have you any difficulty in getting good teachers, either on the sign and manual system, or on the oral system in Ireland?—We have been very fortunate. Our last teacher was an Englishman.

17,627. Where were your teachers educated?—We had a master who was educated, I think, at Manchester; but the present man was educated under his father in our institution; and we sent a man named Payne to Swansea, who got all his teaching in Claremont, and he is now, I think, the head master of the Swansea Deaf and Dumb School.

17,628. (*Rev. Mr. Owen.*) He can speak, but he is deaf?—Yes, he is very clever. He was deaf, but not entirely dumb. He got deaf in childhood, when he was four or five years old, like Dr. Kitto.

17,629. (*The Chairman.*) Have you any teachers of the oral system in your institution?—Our present master educated himself on the sign system, but we sent him over to learn under Professor Schöntheil here in London, and he was here for three months, and he acquired under him a knowledge of the oral system.

17,630. Has he been successful in teaching it?—Not as successful, certainly, as Mr. Schöntheil. Perhaps it is that the children are still in the transition stage, some of them having learned the sign language, and having to be untaught.

17,631. Do you keep those separate at all that are learning under the oral system, or is your school a combined school?—It is not a combined school. He has transferred them all to the oral system. Some of them were taught the use of signs, but he discontinued the use of signs as far as possible, and I notice that those who had been taught the sign language have not been very successfully transferred to the other system. The most successful pupils are those who begin from the beginning under the oral system.

17,632. I suppose that a certain number of them having been brought up under the sign and manual system, there is a system of signs used in the school indiscriminately between all of them in play hours?—It is discouraged as much as possible.

17,633. Still, I suppose, as a matter of fact, it exists in the playground?—Yes.

17,634. It does exist in most schools on that system, I think, where you have not absolute separation?—Yes. The master does his best to discourage it, but I think the children will not be prevented from using the signs.

17,635. Do you endeavour to encourage the parents to send their children as early as possible to your institution?—Yes; so far as our institution is concerned, we sent notice to all the clergy of the parishes throughout Ireland, requesting them to forward the names of any mutes in their parishes. We send round on a little slip attached to the report the following notice: "The clergy and laity throughout the "provinces of Leinster, Munster, and Connaught are "respectively requested by the committee of this "institution to make inquiries in their several "parishes, with a view to ascertain whether there be "in them any deaf mutes between the ages of six "and twelve, and to report to the office, as soon as "convenient, the names and circumstances of each "mute, in order that they may be placed upon the "list of eligible candidates as soon as possible."

17,636. What system of class books have you in the schools; are they such as are used in the Irish national schools?—No; they do use to some extent the national school books.

17,637. Are the books that you use written specially for your school?—No, I think the master uses an eclectic sort of system, and gets books wherever he can; we have no definite system.

17,638. Is there any examination of those schools by the inspectors in Ireland?—There is not. These schools are not under the National Board.

17,639. Is it, in your opinion, desirable that they should be under inspection?—One of my principal reasons for wishing for State aid is because the Government inspection would follow as a corollary upon that.

17,640. What form do you think State aid should take; should it take the form of a grant per child, or the form of payment by results, as in the ordinary national schools?—The grants are given to our national schools, but there are result fees in addition.

17,641. What system would you recommend with regard to deaf and dumb schools?—I should recommend a combination of both systems. I think that each school should receive a certain per-centage per head, and that as a stimulus to the masters there should be result fees exactly on the national system.

17,642. A double grant?—Not a double grant, because they might be calculated upon the basis of a certainty and of a possibility. The attendance fees are a matter that can be ensured to the master; the result fees are conditional.

17,643. It has been suggested by some of the English institutions that if the State would give 10*l.* per head it would be a sufficient grant; that is in cases where maintenance is required?—That would be on the same principle as in the industrial schools; but they have more than that; they have 7*s.* 6*d.* a week, I think. I think that 10*l.* a year is under the mark.

17,644. I think the Manchester proposal was that there should be a grant of 10*l.* and a certain amount per head besides?—I should have thought that, in the case of the deaf and dumb, there should be a larger grant than industrial schools, and that 20*l.* would not be too much altogether. My calculation would be 20*l.*—10*l.* for maintenance and 10*l.* for education; considering that a special education is required.

17,645. Do you think that the deaf and dumb should be kept in special institutions in preference to having school board classes, or classes in national schools for their day education?—The plan of day schools is only practicable and only useful in large towns. A great deal of money might be wasted in that way. It would depend upon the number. I think it is only by grouping that you can reach them.

17,646. The inspector in the Manchester division suggested that the school authority of the district should be empowered to send their deaf and dumb children to some institution, under inspection, of course, and to pay to that institution a yearly sum of 10*l.* for each child's education, not for maintenance?—That contemplates the day schools.

17,647. That sum is, of course, in addition to the cost of maintenance which at present can be paid for by the guardians; but a school board have no power t present to pay anything for the maintenance of children at an institution. How would you regard such a proposition as that?—It would be much more economical for the State to group the children of this special class, the deaf and dumb, into institutions where they would not only be more effectively taught, but more cheaply taught, than to make a vain attempt to provide special teachers for children scattered all over the country.

17,648. I suppose there would not be a sufficient number of deaf and dumb children whose parents reside in Dublin to make up a class?—Not at all. There was formerly a day school for deaf and dumb in Dublin, and the experiment was tried for about 25 years; but the school was closed for want of

The Very Rev. H. H. Dickinson, D.D.

20 May 1887.

sufficient pupils, and they handed over the balance of their funds, about 500*l.*, to Claremont.

17,649. In your institution how is the religious instruction given?—By the teachers; and the clergyman of the parish also has a class, and goes over the religious instruction with them every week.

17,650. They are all Protestants in your institution?—Yes, they are all Protestants now; there used to be Roman Catholics also.

17,651. Had the Roman Catholic priests power to come in and instruct children of that communion?—No.

17,652. Was there a conscience clause?—No; we received no State aid, and it was entirely a denominational school. Of course, if we received State aid we should acquiesce in the conscience clause. I am, and have been all my life, strongly in favour of the undenominational system; but I think there is a difference between day schools and boarding schools, because boarding schools have to be conducted on the family system.

17,653. And where you have that system there ought to be some religious instruction?—There ought to be definite religious instruction, and the confusion does not tend, I think, to benefit. But I think that the conscience clause ought still to be maintained with reference to all day scholars, apart from boarding schools.

17,654. As the Roman Catholics have schools for boys and girls who are deaf and dumb, I presume it is not likely that you would have many Roman Catholics in your institution, supposing that it was under Government supervision?—I think it is not likely; and we are not likely to have many day pupils, inasmuch as we are about three miles from Dublin itself. But still, I think that the conscience clause ought to be insisted upon with reference to all day pupils attending such schools of a denominational character. In the national schools of Ireland no child can receive religious instruction to which the parents or guardians object.

17,655. Are there any Jews in Dublin?—Very few.

17,656. Are there no deaf and dumb Jewish children?—I do not remember a single instance. There are very few Jews at all in Ireland, which is one reason why we never persecuted them—because they were not there to be persecuted.

17,657. Have you any further remarks to make with regard to the census?—No, except to state the relative proportions of deaf mutes in the different religious bodies. There are 4,006 Roman Catholic deaf mutes; 627 Church of Ireland; 448 Presbyterians; 33 Methodists; and of all other denominations 22. That makes a total of 5,136. Deducting the 353 who are unsusceptible of education, that leaves 4,783. Of those there are educated 1,746, and uneducated 3,037. This is not in the census; there were, last year, in 1886, only 481 deaf mutes maintained out of the poor rates in asylums, out of the total of 4,783, which is a small proportion.

17,658. Have those who you say are not educated received no education whatever in the ordinary national schools?—No, because it would be of no use to them. The figures that I have given show that a very small proportion of assistance is given out of the poor rates.

17,659. Do you know whether the parents complain that they do not get any assistance from the State towards the education of their children; have they ever made any remonstrance to the guardians on the subject?—That I do not know. I know that often there has been very great difficulty in persuading the guardians to contribute. In the Claremont Institution we should not make that a ground for refusal. We think it is right to ask for assistance from the guardians, but whether it is given or not we take in the children.

17,660. You do not refuse a child although the guardians refuse to pay for it?—No, I think it would be very wrong to refuse them as long as we can take them.

17,661. Has there been any question of enlarging your institution?—No, I am sorry to say that our institution is too large for the present wants, because we used to have 111 inmates, and now we have less than half that number; we have only 40 now.

17,662. How is it that you cannot get them to come in?—The former number of 111 was composed partly of Roman Catholics. Those deaf mutes who are uneducated in Ireland are not of our communion; they are Roman Catholics.

17,663. May we assume that all those who are left uneducated in Ireland are Roman Catholics?—I think you must assume that, because we have taken for some years past all possible pains, by means of letters in the newspapers, and by announcements of every sort, to gather in all the deaf mutes who are Protestants.

17,664. I suppose you cannot say whether the Roman Catholic schools are full or not?—They are full relatively to their capacities, but, evidently, they bear no proportion to the necessities of the population. In Cabra there are only 363, and yet there are 4,006 Roman Catholic deaf mutes in Ireland.

17,665. Of school age?—No, one-fifth of that number, probably, would be of school age. There would be about 800 Roman Catholic deaf mutes who would be of school age.

17,666. Are there more deaf and dumb in the Roman Catholic parts of Ireland than there are in the Protestant parts, relatively to the population?—Very many more. In the Belfast Institution of deaf, dumb, and blind, there are only 76. We do not collect money in the province of Ulster, but we take children from Ulster. But, as a general rule, the Ulster children are sent to Belfast, and the total number there is 76. So I think that what I said in the beginning is true, that wherever there are improved habits of living, deaf-mutism is less, even less in proportion.

17,667. Do you know whether many deaf mutes intermarry in Ireland?—I do not think they do. I have once or twice performed the marriage ceremony between deaf mutes, and I have heard in those cases that the deaf-mutism is not inherited.

17,668. Not in those cases that you know of?—No.

17,669. Does your institution discourage the intermarriage of deaf mutes?—I do not think we interfere in the matter. They have no opportunity for matrimonial arrangements during their school life. If we were perfectly satisfied that there was no danger of heredity we should not discourage such intermarriages; but Dr. McDonnell would give better testimony about that than I can.

17,670. The census return says, with regard to the children of congenital deaf mutes, that the result in each census has been of a negative character, and that it was not considered necessary to repeat the investigation, inasmuch as it appeared evident that the deafness and dumbness of parents has no influence in propagating the defect; is that so in Ireland?—Yes, I think so, except that so far as scrofula is concerned, if the parents are scrofulous it is a bad thing that they should intermarry, no matter what the form of the development of the disease may be. I have some statistics about the blind, but I have no special knowledge on the subject beyond what is easily attainable.

17,671. Are you connected with the institution for the blind as well?—No, except that being almoner to the Lord Lieutenant, I have of course a good deal of general knowledge of all charitable institutions to which he sends subscriptions through me, because I make it my business to inquire about them. The only additional information that you have not got from the census is that the number maintained out of the poor rates in 1886 in asylums for the blind was only 354, out of a total of 6,011 blind in Ireland.

The Very Rev. H. H. Dickinson, D.D.

20 May 1887.

17,672. Is there the same want of instruction of the blind in Ireland as there is of the deaf?—I am afraid so. In workhouses there are 1,133 blind; of those 409 are educated and 724 uneducated. The number of blind children under 15 years of age who are uneducated is 105, and the number of blind children under 20 years of age who are uneducated is 167. The number of blind Roman Catholics is 5,004; of the Church of Ireland, 666; Presbyterians, 382; Methodists, 34; others 25.

17,673. Have you in Ireland any periodical or other means of communication between the different institutions for the deaf and dumb?—No, not printed in Ireland. We get those that are printed in England.

17,674. How is your institution governed?—By a committee. We have come under the Endowments Commission, and we are about to be incorporated as a governing body under that special Commission.

17,675. Have you gymnasiums in your institutions for the deaf and dumb?—No; not, at least, in Claremont.

17,676. They have out-door exercise in the way of gardening?—Yes, and ordinary games.

17,677. (*Mr. St. John Ackers.*) What is the general proportion of the Roman Catholics to the rest of the population of Ireland?—I suppose it is five or six to one at least.

17,678. I see that the number of deaf is 4,006 Roman Catholics and over 1,100 for other denominations?—Yes.

17,679. That would show, would it not, a very considerably larger proportion of deaf amongst the Protestants than amongst the Roman Catholics in proportion to the population?—Perhaps that may be so. The census will show you the relative proportions of the religions of the whole population.

17,680. I find that, according to the census returns, it is 1 in 989 for the Roman Catholics, and 1 in 1,074 for the Protestants. Is it not a fact that the Protestants intermarry more frequently than the Roman Catholics?—I do not know. Cousins who are Roman Catholics, of course, cannot marry in Ireland without a dispensation, and a dispensation cannot be got unless it is paid for.

17,681. And as a rule, the people being poor, it is not often paid for?—Probably that is so.

17,682. Then it must be referred to some other cause, because the general statistics of other countries show that where consanguineous marriages are most frequent, there deafness is greatest?—Yes, I think that is probably the case.

17,683. Then we must go back again to your former answer, that it is the extreme poverty in certain parts of Ireland which you think causes the great amount of deafness?—Yes, I think so; low living, crowded houses, and transmitted scrofula.

17,684. You have taken considerable pains with regard to the census returns; are they in your opinion perfect now as to the heads of deaf-mutism, or do they need some further classification?—I think they are as accurate as we can expect.

17,685. Are they as well sub-divided and classified as you would desire them to be?—The religious classification is not always complete, I think; I could not get it.

17,686. Did I correctly understand you to say that there are more blind than deaf in Ireland?—The whole number of deaf and dumb is 5,136, and the whole number of blind is 6,111, so that there is a difference of about 1,000.

17,687. Is there any special reason why the blind are so numerous in Ireland?—In the case of the older blind persons their blindness results from the neglect of vaccination in former times, and on the whole now there is less blindness resulting from that cause by reason of improved methods of treatment, and the increased scientific knowledge amongst the dispensary doctors in dealing with the blind.

17,688. Do you find that there is much infantile ophthalmia causing blindness in the early weeks, if not months, of life?—No; I was asking the day before I came away the head of one of the asylums in Dublin, and he said that there is a great diminution in infantile ophthalmia.

17,689. Are there any simple rules for preventing infantile ophthalmia, and also for preventing deafness, placed in the public elementary schools, or in the offices of the boards of guardians in Ireland?—No. With regard to ophthalmia there may be sanitary suggestions; I do not know that there could be any regulations tending to prevent deafness.

17,690. I did not say regulations; I said just a few plain rules by which parents and others could understand how to treat their children so as to prevent both infantile ophthalmia and deafness?—No, I am not aware of any such rules.

17,691. Is your institution supported in a pecuniary way as fully as you would desire?—Yes, I think it is fairly supported.

17,692. How many masters or teachers have you?—We have four teachers on our present staff, three males and a female teacher, not including the matron.

17,693. Are they all hearing persons?—Yes.

17,694. Are they all four there at the present time, or are any of them away from illness?—They are all there.

17,695. Have they been all there for some time past?—There has been a recent change. The second assistant is newly appointed.

17,696. Is it correct that a short time ago there were but two teachers, the head master and one assistant?—No, that was never correct. We had always, besides that, a female teacher. We used to have two female teachers; now we have one. We had never fewer than three teachers that I remember. One was a pupil-teacher.

17,697. Two regular teachers and a pupil-teacher?—Yes, and a work mistress; that makes four.

17,698. But for ordinary education you have two teachers and a pupil-teacher?—Yes, but the pupil-teacher is a teacher trained in a Training College.

17,699. In what training college?—In the church Training College in Kildare Place.

17,700. Was he specially trained for teaching the deaf and dumb?—No, not specially trained for teaching the deaf and dumb.

17,701. You spoke of a number that were dumb, not deaf; does not that include a large number of ordinary infants?—It was not intended to include them. I do not think that the census would take down children as dumb because they were unable to speak.

17,702. Has it not been done on one occasion?—I do not know.

17,703. It has been stated at any rate in evidence that such was the case with regard to the Irish census, and I wanted to ask you whether you can confirm, or whether you can of your own knowledge refute that?—I cannot refute it, but I think it is a highly irrational method of classification. I never heard of it before.

17,704. Are you aware of any other country in the world where the proportion of dumb, not deaf, is so great as is stated in the census returns?—No, I was surprised on seeing that.

17,705. You yourself are not able to say how it occurs?—No.

17,706. You stated, in answer to one of his Lordship's questions, that there should be twice as long a time given to the teaching of deaf children as is given to the teaching of hearing children; that, taken literally, would, I suppose, be sixteen years, because eight years is the ordinary time in Ireland as in England for the education of children, that is to say, from five to thirteen years of age?—Yes, but I would rather take the ages between seven and fifteen.

17,707. Then you would suggest that in any fresh scheme for the education of the deaf the ages should not be confined to those which are at present in the Elementary Education Act?—Yes.

The Very Rev. H. H. Dickinson, D.D.

20 May 1887.

17,708. But that compulsion should continue beyond 13 years of age for the deaf mutes?—Yes, I think that compulsion should be continued to the age of 15 in their case.

17,709. And, of course, that State aid should be given during that time?—Yes.

17,710. Are there specially trained teachers for the deaf as for the hearing in any of the institutions in Ireland?—Yes, the head teacher at Claremont was trained by his father, who was an admirable teacher, and he had special training in the oral school here in London.

17,711. That might be very admirable, but I did not mean that. He has not gone into any training college for a couple of years, the same as the ordinary teachers of the national schools have done?—No.

17,712. Do you not consider that some special training is desirable for teachers?—I do consider it of the greatest possible importance. But we had to get the best we could.

17,713. If your teachers were certificated in the ordinary sense of the word, as they would be if they were teachers of hearing children, could your institution then be examined by a Government inspector and get a grant?—Yes.

17,714. Then, in point of fact, it is the want of that certificate which at the present time is a bar to an examination by a Government inspector?—We have no State aid and we have no right to ask for inspection.

17,715. Take for instance Scotland, where a teacher is certificated, that is to say, where he could take an ordinary school for hearing children with a Government certificate; there the Government inspectors will, if asked, come and examine the children, and they get a grant according to the examination?—Yes, but he must be certificated under the National Board system.

17,716. If your teachers were certificated under the National Board system in Ireland, would your school be eligible for examination and grant?—Yes, and for inspection; but I do not know that the National Board system does at present provide for giving such a certificate in that special knowledge. It does not provide for any special examination of a qualified teacher for the deaf and dumb; it lies outside their range altogether.

17,717. (*Dr. Campbell.*) You stated that in your opinion the intermarriage of the deaf and dumb did not very materially affect the children of those marriages; are you aware that it is contended by some very scientific men in the United States that there is a growing population at this moment in the United States the result of intermarriages between the deaf and dumb?—Yes, I know that it has been said; and upon a matter like that one must simply bow to scientific knowledge and experience. I have not personally known of the transmission of deafness and dumbness by such intermarriages.

17,718. You also made reference to the want of vaccination; have you known any cases of deafness and dumbness occur from vaccination?—No, I have not, but I have seen in the institution for the blind in Dublin, and still more in former times I remember to have seen the majority of them pock-marked.

17,719. But have you ever known any children to be deaf and dumb or blind through vaccination?—No, never.

17,720. Would you be surprised to learn that there are children who have become blind through vaccination?—I should be very much surprised to hear it, and I should believe that in those cases it only resulted from careless vaccination, the infusion of syphilitic *virus* or something of that kind. Of course that might occur through careless vaccination.

17,721. (*The Chairman.*) That would not be true vaccination?—No.

17,722. (*Dr. Campbell.*) It is a fact that we do have such cases?—Yes, and very guilty they are who carelessly vaccinate.

17,723. You claim that there is a diminution in regard to deafness and blindness in Ireland; of course the emigration has been very great during the last forty years; is the diminution of deafness and blindness greater in proportion than the diminution in the population?—I think in the case of blindness certainly it is, because those who are more conversant personally with the statistics of the blind tell me it is so, and that it is due to improved scientific knowledge on the part of the country medical practitioners, cases of ophthalmia not being allowed to run on.

17,724. There is that improvement we all know; but I supposed it was the case that very many of the blind people had gone from Ireland. We have for instance, in Boston and New York, a very large number of Irish children in our schools. You were speaking about the conscience clause; as there are so many Catholic children that are not in any school whatever, and as you have plenty of room in your school, do you suppose that if you allowed liberty of conscience in regard to religious matters you would not fill up your vacancies with Roman Catholic children?—No, the priests in Ireland object as far as possible to children attending even day schools where there are conscience clauses, and do their best to keep them from them; and they would feel a still greater objection to allowing them to go into boarding schools, even with all the security of the conscience clause, however honestly carried out.

17,725. If they could be secure in regard to that, do you think that it would still remain the same?—Yes. On the part of the Roman Catholic clergy of Ireland there has been always, for the last 20 years, a determined opposition to the undenominational system, and I am sorry to say that a great many church people agree with them, and between the two I am afraid we shall have the denominational system.

17,726. That is much more so, I suppose, in Ireland than it is in England?—Yes; I myself have the strongest possible objection to the denominational system, but there is a great difficulty in a boarding school in having two systems of religion mixed up in the daily life. Personally, I should be very glad to fill the institution, even on the condition that you have named, of a conscience clause, but I am afraid that, in point of fact, it would not fill our institution, because the children would be kept from us, even with all the security that a conscience clause, however faithfully adhered to, might afford.

17,727. I suppose you would be surprised, then, to know that we have no difficulty with every denomination?—I am not surprised to hear it, because there is a difference between England and Ireland in that respect. The English people fail exactly to appreciate the special difficulties of Ireland in that matter.

17,728. (*Rev. Mr. Owen.*) The recommendation of the Census Commissioners was made as far back as 1871, as regards compulsory powers being given to the guardians; was any effort made on your part, or on the part of the authorities in Ireland, or of those who take an interest in the deaf and dumb in Ireland, to bring the matter before the Government?—No. Two years ago I came as a deputation, and urged strongly that its being left optional was a deficiency in the system.

17,729. During all these years nothing has been done?—No, we did not do it, simply because Claremont was sufficiently generously supported not to make it an imperative necessity.

17,730. Then you think that it ought to be taken up by the Roman Catholics, upon whom the necessity really presses?—Yes.

17,731. Have you any idea as to how many deaf and dumb persons are now being kept in workhouses in Ireland?—I have not the exact number that there are in workhouses.

17,732. You said that you would recommend eight years as the period during which the deaf and dumb should be educated in deaf and dumb institutions; do you make any rule in your school that the parents must allow the deaf and dumb children to

remain there for that full time?—We never oblige them to leave before they are 16, and until we can provide situations for them.

17,733. Do you put great pressure upon the parents and guardians to leave the children at your school for not less than eight years?—We oblige them to fill up a paper guaranteeing to leave the children at the institution till they are 15 years of age, and we reserve to ourselves the right to keep them longer if we can.

17,734. You admit them up to 12 years of age, do you not?—Yes, up to 12.

17,735. That only leaves five years for their training in the school?—Yes, but we are anxious to get them there younger. We should much rather, especially under the oral system, catch them as young as possible.

17,736. Do you keep a register at your school of the time when they enter the institution, and do you enter very detailed particulars about them?—Yes, we do, and the reports contain full information.

17,737. I mean as to the children's birth, and the circumstances which preceded it?—Yes.

17,738. Have you periodical medical inspection?—Yes; we have medical inspection, and an inspection also by an oculist and aurist, because a good many of them, being scrofulous, require the special charge of an oculist and aurist.

17,739. In the event of Government aid being given, would you consider it right that the grant should be made conditional upon any one system being adopted, to the exclusion of any other?—No, I have no objection to the adoption of a particular system being conditional on a decision by competent authority that that system, whether the oral system or the sign system, had the advantage; but that is a matter upon which I think I should defer to settled authority, as soon as the point was ascertained. If, on competent investigation, it were discovered that the oral system was not a success, and that the sign system ought to be used, I would, for my part, acquiesce in such a decision.

17,740. But would you not consider that the methods might be left to individual committees, provided that the general efficiency, which an inspector should test, was up to a certain standard?—I think it would be better, if a sufficiently large field of inquiry were opened, to have one definite system, for the reason that these deaf and dumb educated pupils intermix afterwards, no matter where they are educated, and it is well that the system should be uniform.

17,741. You have transferred your school to the oral system, as I understand; you handed over all the sign and manual pupils to that system, whether they manifested special qualifications for it or not?—We did, and I myself feel personally doubtful as to the success of the experiment.

17,742. You would think that there ought to be some discrimination exercised, and that only those should be handed over to the oral system who showed their capacity to acquire it?—Yes, just so. I have said to the master that, just as there are degrees of articulateness in speaking people, so there may be a capacity for receiving instruction in the oral system in some deaf and dumb pupils which there is not in others; and therefore, on that common-sense ground, I should think that perhaps the two systems might be necessary. It is not easy, and our master thinks it impossible, to combine the two systems, because of the constant temptation to the children to avoid the trouble of articulation by the substitution of a sign.

17,743. You say that regular religious instruction is given in your institution; how is it given to the pupils now?—It is given partly by writing and partly by speaking; and they have little books of simple instruction. The answering in religious knowledge is always very good.

17,744. On Sundays what service do they attend?—They attend the service of the parish church, and it used to be interpreted to them by the master in the sign language, but he does not do it now; and I fancy that now they do not get so much benefit out of the religious instruction of the sermon; but those who are able to read have their prayer books.

The Very Rev. H. H. Dickinson, D.D.

20 May 1887.

17,745. Then, so far as you know, the sermon is not in any way interpreted to the pupils?—Not now. They are left to gather the best they can about the matter from the movements of the lips of the preacher. They are accustomed to catechetical instruction by the teacher every Saturday.

17,746. Then you do not consider that they gather very much knowledge from the orally-delivered sermon itself?—I am afraid they do not.

17,747. Speaking generally, should you consider that the religious instruction which is given in the institution now is as satisfactory as it was before the oral system was introduced?—I think it is, if I may judge from the results. I have been present at examinations of the pupils.

17,748. Speaking generally, without reference to economy, would you consider the institution system in every way better than the day school system for the general training of the deaf and dumb, morally and intellectually?—I think so.

17,749. Have you had any experience amongst the adult deaf and dumb?—Yes; there is a deaf and dumb society with which I am connected for reaching adults, wherever they may have been educated; and there is a service for them every Sunday in Dublin.

17,750. How is that service conducted?—By a deaf mute.

17,751. On the sign and manual system?—On the sign system, because those adults have all been trained under the sign system. He is a deaf mute who was licensed by the late Archbishop Trench as lay deacon, and he holds a service in a room for the deaf and dumb; he has a congregation of about forty or fifty every Sunday. The deaf and dumb sometimes gather in my church for Holy Communion, because this lay deacon, of course, does not administer the Communion.

17,752. Have you any plan of keeping up a connexion with the old pupils from your institution?—No, except through this adult association. There are two adult associations, one for Dublin especially, and one for all Ireland.

17,753. Then your former pupils do not in any way come to the institution to any annual meeting or anything of that kind?—No, except in a scattered way.

17,754. And you do not think it advisable that the adults should mix with the children in the institution at meetings?—I think that would be desirable. But when they leave us they generally go to their own neighbourhoods, and they get scattered all over Ireland, wherever anyone will take them as apprentices. They do not necessarily settle in Dublin.

17,755. Do you find that the oral system is more expensive than the sign system?—No, we do not find the oral system more expensive, because we continue the same masters at the same salaries; but I suppose that if we lost our present master we should have to give a larger salary on account of the rarity of the acquirement.

17,756. (*The Chairman.*) How many have you in a class under the oral system in your school?—We have from 10 to 15 in a class. Our master thinks that that is too many, and that there ought not to be more than half a dozen in each class, if they are to be thoroughly taught.

17,757. Were the parents consulted when the change was made from the sign and manual system to the oral system?—No.

17,758. Have the parents expressed any opinion, favourable or otherwise, as to their children being taught on the oral system?—No, it has not been sufficiently long in use.

17,759. And the results are not yet sufficiently developed for the parents to express any opinion?—No; they were not supposed to be in a position to do it, nor are the committee really in a position to

The Very Rev. H. H. Dickinson, D.D.

20 May 1887.

pronounce absolutely; we are only trying the experiment.

17,760. Of course, having regard to the short time that the oral system has been at work, you cannot say at present whether the result has been satisfactory or not?—It is not so satisfactory as I anticipated when we introduced the system first. I came over here to see Professor Schöntheil's school, and I was delighted with that school; but comparing our own with it, I think we have not been at all so successful.

17,761. May not that be because your children were older when they began to be taught the oral system than they ought to have been, on the general theory that the teaching should begin as early as possible?—Yes, but now they are accustomed to see me often, and yet they fail sometimes in following me. I went into Mr. Schöntheil's school and spoke to the children there, and they followed every word that I spoke to them without any difficulty; and then, having spoken to them in English, I repeated a Psalm in Hebrew, and they all repeated it after me.

17,762. (*Mr. St. John Ackers.*) Is it not a fact that after this report in the Census Returns of 1871, an invitation was sent round to the different institutions in Great Britain and Ireland, with the view of a deputation waiting upon the Vice-President of the Committee of Council on Education in England, I think in 1881, upon this very matter?—Yes, a long time after 1871. I was a member of that deputation.

17,763. But I mean a long time before that deputation which his Lordship introduced?—I do not remember such an invitation. The only deputation that I recollect was that one at which his Lordship was present, and that we did send to.

17,764. (*Dr. Tindal Robertson.*) With regard to the question that was put by Dr. Campbell, I think I understood that you had large experience, not only of deaf and dumb but of blind children?—Yes.

17,765. Have you ever heard, within your own knowledge, or from the oculist attached to the institution, or from any other medical man, of a case of blindness arising from vaccination?—I know of no such case. I know a great many cases of blindness arising from non-vaccination.

17,766. I suppose you have statistics of the causes of deafness in your institution and in other institutions in Ireland?—Yes.

17,767. Do you remember that vaccination has ever been adduced, either by managers of schools or by medical men, and especially by oculists or aurists, as a cause of blindness or deafness?—I have never heard of any such cases.

17,768. May I ask who is the oculist attached to the institution?—Dr. Storey, one of the best oculists of Dublin, the oculist of St. Mark's Ophthalmic Hospital is our oculist and aurist.

17,769. Then I take it that, in your opinion, if vaccination had ever caused blindness or deafness, it would probably be in consequence of improper vaccination, the vaccination not having been carried out in the usual legitimate manner?—Yes, in consequence of vaccination having been performed in an improper manner—careless vaccination.

17,770. (*Rev. Mr. Sleight.*) You have stated that there are 3,037 uneducated deaf and dumb persons in Ireland; can you tell me whether those who are uneducated are able to support themselves?—I should think that in a few cases they may be able to support themselves by agricultural labour, but not in any other way.

17,771. But what becomes of them?—They live as burdens on the community.

17,772. And therefore they are an expense to the rates?—They are an expense to the rates in many cases, or an expense to their parents, who are, perhaps, just able to support them.

17,773. If those deaf and dumb persons had been properly educated, even at the expense of the State, would it not, in the long run, have been very much cheaper for the State?—It would have been very much cheaper to the State, in the proportion of perhaps eight years to 80. In the one case they are life-long burdens, in the other they are chargeable for eight years.

17,774. What at present is your charge at your institution?—We do not charge anything except this 15*l.* which is paid by the rates. In a few cases we ask the parents to pay according to their means. When they do not choose to come on the rates, they pay from 4*l.* to 8*l.* a year; but we always abate the charges in consideration of the circumstances of the parents, and we never refuse any, even if they can pay nothing.

17,775. You admit some free?—Yes.

17,776. Can you speak with regard to a report that was made by a deputation from the Claremont Institution, I think some thirty or forty years ago, which came over to England and visited a great many institutions and then presented a report?—Yes. I was not myself one of the deputation; I was a member of the juvenile committee at the time. The object was to see how far it would be possible to combine industrial training with literary education, and also to ascertain the dietary, and to inquire as to the question of mixing the boys and girls together in school hours. It was chiefly as to the possibility and expediency of combining industrial training with school training.

17,777. Can you briefly mention what was the opinion of the deputation upon that point?—That it was not practicable; that the average time for school teaching was all too little to train them to be capable of mixing with their fellows; and that the special technical training was better received by them at the age of 15, when they had been made intelligent, and capable of holding intercourse with others.

17,778. Could that report be put in?—I daresay I could let you have that report. The masters all think that there should not be industrial training. We have had a succession of masters, and they have always been of that opinion. That was the substance of the report, that it was considered that the industrial training would take up too much of the children's time, and that in the end they would go out half taught. The great object is to enable them to hold communion with the external world when they go out into it.

17,779. Have you found that there has been any difficulty on the part of those who have been educated in the sign system in holding communication with the outside world after they have left school?—It is always a one-sided communion. Only those people could speak to them who could understand the sign language. They could communicate very easily with people who could understand the sign language, but not with other people.

17,780. But was there any difficulty arising from their having been taught the sign language in their finding places in workships and with tradesmen?—Yes, because a great many people were not patient enough to master the sign language for themselves, so as to be able to give their directions to the deaf and dumb workers.

17,781. Will you state what were the reasons that led the committee to adopt the change of system?—The reasons were the various books that were published on the subject, and the experience of other institutions. What led them to the final adoption of the oral system was the personal visit of myself and another gentleman to Mr. Schöntheil's school here in London. Seeing the very great success that he had attained, we thought we might do better with the oral system than with the sign system, for the simple reason that under the oral system deaf and dumb children going out into the world, if they are able to speak well, can make themselves understood and can understand others and everybody; but under the sign system they can only communicate with those who understand the sign language. The great advantage of the oral system is that they can communicate with everybody.

17,782. Did you find that by means of the sign system a good knowledge of language could be given to the children?—Yes, quite as good I think; I believe they were quite as capable of learning language grammatically by the sign system as by the oral system.

17,783. From your experience at the end of four years, are you of opinion that the children are more advanced in language by the oral system than by the sign system, or not?—I think they are not, but that is because the experiment has not with us been carried out to its perfection. I should think it better to compare such a school as Mr. Schöntheil's school here in London with the best sign system school, than to draw any conclusion from ours, which is only in a transition state.

17,784. Do you think, from your knowledge of the matter, that children could ever be taught to read a lecture, spoken orally, off from the lips of the speaker, so as to understand it from beginning to end?—I do not know how far it would be possible for children to bear that continuous strain. Conversation is a different thing; but it would involve a great strain of attention,—more than sermons ordinarily receive, I think,—to interpret a whole discourse of half an hour's duration. It requires ceaseless watching.

17,785. Do you ever test the proficiency of the children by giving them a short address of five minutes, and asking them to write down what they have gathered of what you said?—I have tried to test them, but I must say that they are not capable as yet of standing that test. We have a public examination at our annual meeting, and I have asked if they could do this; but the master said that it was scarcely fair to apply such a test in public.

17,786. Did you find that the children who were taught by signs were bright and happy?—Yes.

17,787. Do you think that they are as bright and as happy, and that they gossip amongst themselves as much by the oral system as they did by the sign and manual system?—No, I am inclined to think not; I do not think they are as bright as they seemed to be before. My own mind is not at all clear as to the relative value of the two systems.

17,788. I notice that in this report for 1885 it is stated that, "In addition, orally taught children are "brighter and less animal in their ideas than sign "children"?—I have not noticed that. That is what the master says, but those are not my words.

The Very Rev. H. H. Dickinson, D.D.

20 May 1887.

17,789. Is that your own opinion?—No, I do not quite agree with him. We have put in his report as his report, but it does not quite accord with my experience.

17,790. The children themselves, you think, would prefer to be taught on the sign and manual system rather than on the oral system?—Very likely they would, but I should not take that as a test, because the sign system is so much easier. If you remember, in Dr. Kitto's life, he speaks of the great difficulty that there was in compelling him to speak—to keep up the habit of speaking—and how painful it was to him to make the effort; and he says that it was only under his father's rod that he was obliged to do it, but he thanked him in after life. The sign system is easier for the children than the oral system.

17,791. The sign system is more natural to them?—Yes.

17,792. Of course, in the case of Dr. Kitto, he would have some one near him who would take a deep interest in him; but in the case of many of these children of poor parents, do you think that the parents would take the same interest in keeping up their children's speaking in after life?—I do not think that the parents would. That is a matter that requires a good deal of intelligence and patience, and interest in the children too.

17,793. (*The Chairman.*) I rather gather from what you say, that you do not think that the parents take very much care in looking after their children?—No.

17,794. They hand them over to you, and they are quite satisfied with what you do with them?—Yes, and we do the best we can with them, I think. I should be very glad to have larger opportunities of visiting other institutions, and also of seeing and hearing their reports as to the relative advantages of the two systems.

17,795. (*Rev. Mr. Sleight.*) The children taught on the sign system were perfectly able to make themselves understood in after life by writing, were they not?—Yes, perfectly.

The witness withdrew.

Adjourned.

No. 6, Old Palace Yard.

Monday, 31st October 1887.

PRESENT:

THE RIGHT HON. THE LORD EGERTON OF TATTON, CHAIRMAN.

W. TINDAL ROBERTSON, ESQ., M.D., M.P.
B. ST. JOHN ACKERS, ESQ.
T. R. ARMITAGE, ESQ., M.D.
THE REV. W. BLOMEFIELD SLEIGHT, M.A.
THE REV. CHARLES MANSFIELD OWEN, M.A.
L. VAN OVEN, ESQ.

CHARLES E. D. BLACK, ESQ., *Secretary.*

Mr. ARCHIBALD WELSH examined.

Mr. A. Welsh.

31 Oct. 1887.

17,796. (*Chairman.*) You are a missionary to the deaf and dumb in the Oldham district?—Yes, in connexion with the Oldham and Ashton-under-Lyne Branches of the Manchester Adult Deaf and Dumb Society.

17,797. How long have you been at Oldham?—Two and a half years.

17,798. What was your previous training?—I had been a teacher of the deaf and dumb for about nine years previously, and I was also, before I became a teacher of the deaf and dumb, a teacher in a public elementary school under Government inspection.

17,799. Had you received any special training previously to your becoming a teacher of the deaf and dumb?—No.

17,800. In what school or institution had you been a teacher of the deaf and dumb?—In the Glasgow Institution for the Deaf and Dumb, and in the Manchester Institution for the Deaf and Dumb.

17,801. Why did you leave those institutions?—To better myself.

17,802. In those institutions was the instruction purely on the sign and manual system?—In the Glasgow Institution when I went there first the

Mr. A. Welsh.
31 Oct. 1887.

instruction was purely on sign system. Shortly the afterwards the oral system, or a combination rather of the sign system and the oral system, was introduced. They did not give the whole of the time to teaching the oral system, but part of the time was devoted to instruction in that system, the principal instruction, however, being given by means of the sign system. The same may be said of the Manchester Institution. During my residence there, however, a more decided step was taken in the working of the oral system, viz., the separation of the sign pupils from the oral.

17,803. Did you know the sign and manual language before you went there as a teacher, or did you learn it there?—I learnt it there. My training as a teacher in a public school stood me in good stead when I became a teacher of the deaf and dumb.

17,804. Have you been licensed as a missionary by anyone?—No.

17,805. Who appointed you?—The Manchester Adult Deaf and Dumb Society, the patron of which society is the Lord Bishop of Manchester.

17,806. You are not connected with the Old Trafford Institution?—No. Besides having charge of the Oldham district, I have also charge of the district of Ashton-under-Lyne and Staleybridge and the towns in the neighbourhood.

17,807. What number of deaf and dumb are under your supervision?—About 150 are known to me already, but from what I have experienced in the way of finding new cases, I believe three are many more.

17,808. How many of those have been trained at any school?—Fully three fourths.

17,809. Are there many of those who are quite ignorant?—There are one or two quite ignorant.

17,810. Are you teaching them?—I give them instruction if they wish it at our week-night meetings.

17,811. You cannot communicate with them except by the sign language?—Just so. I do not speak to them by spelling, but by signs. There are a number of deaf and dumb who have left school and who have been taught the oral system that come to our meetings, and I communicate with them by word of mouth as much as possible, resorting to signs when necessary.

17,812. You find that a certain number are able to speak; are those cases of persons who have partially or wholly lost their hearing when young?—They have lost their hearing in childhood through disease or accident.

17,813. Absolutely or only partially?—They are not absolutely deaf; they are what I call semi-mutes they can speak but they cannot hear; at least they cannot hear to understand what one says to them.

17,814. Have they all been at school?—Some have been to school, and there are others who have never been taught orally who can speak intelligibly to their friends, but, I believe, these cases are not congenital deaf-mutes.

17,815. Do deaf and dumb children come under your supervision as well as adults?—Yes, they all come under my supervision.

17,816. Can you state then whether there are any deaf children who are not sent to any institution at all at present?—I am sorry to say that there are a number in my district who are not sent to school.

17,817. What is the population in the district under your care?—Not much less than 350,000.

17,818. What is the number of the deaf and dumb in your district not under education who are of teachable age?—I might say that to provide education as far as possible for children not attending any school, nor likely to do so I started a small class on my own responsibility in Oldham. The total number of children not attending any school previous to opening this class would be about 10 or 12.

17,819. Is there a school board in Oldham?—There is.

17,820. Have you applied to the School Board to start a class for the deaf and dumb?—No. I have a local committee in Oldham to guide me and give me support, and I asked the consent of my committee to start that class.

17,821. Why did you not ask the School Board to do it?—I have only started the class since August this year, and the committee said it would be better for me to see how the experiment succeeded before making application to the School Board; and I have not yet made any such application.

17,822. Have you any teacher to assist you?—I have my sister.

17,823. Do you teach speech?—I teach the children to speak.

17,824. Are there any semi-mutes among them?—I have only four altogether in the class. They are all semi-mutes with the excep tion of one, who is a congenital deaf-mute.

17,825. With the exception of the one who is deaf and dumb they have some remnant of speech, but they are too deaf to join the ordinary classes in school?——Yes, two of them have been at the Board School.

17,826. I suppose there are many others who are not being taught?—Yes, many others. The class has not become known yet.

17,827. Do you think it is very important that the knowledge of language which those children who are semi-mutes have acquired should be maintained?—Certainly.

17,828. Have you any suggestions to make with regard to the best way of teaching children who are semi-mutes?—As regards children who are semi-mutes, I should say that their knowledge of spoken language should be kept up. It would be a great injustice for them to be taught on the sign system alone, because they would then lose what little speech they had acquired. I am certainly in favour of teaching the oral system so far; but as regards those who are totally deaf, I say let them be taught by signs.

17,829. Why?—Because the great majority would never be able to communicate by word of mouth.

17,830. Why do you say so?—From experience.

17,831. What experience?—My experience as a missionary amongst the deaf and dumb, and also as a teacher who has taught both systems.

17,832. Have you had any experience of those who have been taught in a good oral school?—Yes, in the Manchester school and London schools.

17,833. That is not an oral school. It is only lately that it has been even a partly oral school?—They say it is an oral school. I believe it has a purely oral department, and the oral children are strictly isolated from those that are taught by signs.

17,834. It is only a partially oral school, and the oral system has only been introduced there the last three or four years. No children have been turned out from the school yet who have been orally taught?—I believe children have gone and returned from this school who have been taught on none other than the oral system.

17,835. I am only asking you your own experience. You state that your experience of the oral system is that deaf and dumb children taught on that system are not able to speak in after life?—I do not mean to say that they cannot speak in after life, but they cannot carry on a conversation as you and I would carry it on.

17,836. You said that you would teach those who were totally deaf by signs, because the great majority would never be able to communicate by word of mouth?—What I mean is this: I have come across deaf and dumb persons who have been turned out of school as orally taught pupils who cannot speak intelligibly, or even express themselves properly in writing.

17,837. Those cannot be cases of persons who have been taught by the oral system in Manchester, because it has not been long enough tried there?—I am speaking of children who have been turned out of the Manchester school, and I have also met with a few, not any better, who had been to oral schools in London and on whose education hundreds of pounds had been spent.

17,838. But in the Manchester school the oral system has not been taught sufficiently long for them to turn out any children entirely taught on the oral system, because it has not been in operation there more than four years?—Still it has been taught quite sufficiently long for children to have been instructed under that system and to have left school. I have known children who have been to the Manchester school, and left it, having been taught on no other system.

17,839. How many years were they there?—The great majority never stay at any school that I know of longer than four or five years.

17,840. Your objection to the oral system is that the children after they have been taught four years under that system do not speak like other people?—Yes; they never will be able to speak like other people, in my opinion.

17,841. But if they went through a course of instruction on the oral system for eight years, do not you think it conceivable that they might be able to speak better?—Not deaf mutes. My view is that it takes so long for the acquirement of the most rudimentary knowledge of articulation that a child's school term would expire before he knew anything to his advantage of reading, writing, or arithmetic.

17,842. You have had no experience of that?—No, but it is reasonable to suppose that if semi-mutes find a difficulty in communicating with other people then deaf-mutes will be even at a greater disadvantage.

17,843. With regard to the employment of deaf mutes or partially deaf mutes after leaving school, is there any difficulty in finding them employment?—Yes.

17,844. In Manchester we were told there was no difficulty on the part of the Manchester school in getting them employment after they leave?—I find great difficulty in getting them employment in Oldham.

17,845. Do you think they would be more readily employed if some technical education was given in the deaf and dumb schools?—Yes; I think it would be a great benefit to them, and be some encouragement to a master, to take a pupil from a school if the master was told that the pupil knew something of handling tools and such things.

17,846. Are any of the deaf and dumb in your district chargeable on the parish?—There are a few who are; eight, I believe.

17,847. Are they chargeable on the parish because they are unable to work or because they have got into idle habits?—From various causes. Most of them in the Oldham Union are females. There have been one or two sent there on very little cause, I consider; I think partly because their friends have no desire to have them beside them.

17,848. You say that there are females in the Union who have been there all their lives?—One girl has never been anywhere else. I have heard that her father is a publican in a fair position in Oldham, or near Oldham.

17,849. With regard to those who are not in the workhouse, what are their employments?—There are spinners, reelers, winders, weavers, iron-workers, joiners, hatters, saddlers, cloggers, skipmakers, paper-bag makers, and last, but not least, a deaf-mute in the employ of a dairy-farmer, and with a pony and cart retails the milk to his master's customers just as well as if he could hear and speak. He is totally deaf and dumb.

17,850. You say it is difficult to find employment for them after they leave school; how long a time have you known elapse before you could get any employment for them?—I have known them go two or three months before they could get employment.

17,851. Have you tried to find employment for them?—Yes, I have gone round day after day trying to find employment for them.

17,852. That is part of your duty, is it?—Yes.

17,853. Then the institutions where those persons have been educated take no steps to find them work after leaving the institutions—they do not apprentice them?—Not in my district.

17,854. If they did, the duty of trying to find employment for them would not fall upon you?—No. *Mr. A. Welsh.* 31 Oct. 1887.

17,855. Do you think it is desirable that deaf and dumb institutions should, if possible, find occupation for their inmates before they send them out?—They might aid the adult societies if there were any such in their vicinity; if there were no such societies in their vicinity, then, I think, the institutions should take upon themselves to find employment for their inmates.

17,856. Do the deaf and dumb institutions communicate with your society when their inmates leave the institutions?—Not any further than sending the names and addresses to the missionary.

17,857. You hold services every Sunday?—Yes.

17,858. How do you work your district as regards holding services?—I take Oldham and Ashton-under-Lyne every alternate Sunday. On the Sunday that I am absent from one place another helper takes my duty. I am at Staleybridge once a month. My district is quite a new district and we have had a great deal of opposition and difficulty.

17,859. Have you any assistant at Staleybridge to take the other three Sundays?—No.

17,860. Is there anything further you wish to say about the education of the deaf and dumb in your district?—I should like to say that, in my opinion, in a large place like Oldham, or in other large places with the same population, day schools ought to be started in preference to boarding establishments.

17,861. Do you think that the deaf and dumb would be as well taught in day schools as in institutions?—Yes, every bit.

17,862. Is it the wish of the parents themselves to send their children to day schools?—It is; that is one reason why I started the class, another reason is that where the parents are too poor to pay the fees themselves there is great difficulty in getting the guardians to pay.

17,863. The parents do not like to send their children to institutions?—They do not. They keep their children at home in many cases till they are past school age rather than send them to institutions.

17,864. Do you think the education of the deaf and dumb should be compulsory like that of any other children?—Certainly; I do not see why they should be left out. In speaking to the late clerk of the School Board at Oldham he said it was not their duty to attend to deaf and dumb children. I said it was, according to the Education Act.

17,865. They have not done anything hitherto towards the education of the deaf and dumb?—They have not.

17,866. Is it the same at Staleybridge?—It is the same there, and at Ashton-under-Lyne.

17,867. Do you think the deaf and dumb are specially suited to any trades from your experience?—I think if they got a good knowledge of drawing they would make good draughtsmen.

17,868. You would recommend that drawing should be taught in schools for the deaf and dumb?—I would.

17,869. How many deaf and dumb children of school age would there be in Oldham at the present time?—Including the children at present at Old Trafford they would make a class of 20 to 25.

17,870. Would they be conveniently gathered in one centre?—Oldham would be a convenient centre for the majority.

17,871. You think Oldham would not be too far from their homes?—I do not think so.

17,872. Have you anything else to say with regard to the education or religious instruction of the deaf and dumb?—I might say that at the present time all the deaf and dumb children in my district who have been educated, no matter on what system, attend our services, and the services are conducted in the finger and sign language, mostly by signs.

17,873. Not in much finger language?—Not in much finger language, because we have to take into account those who are uneducated. If it were com-

Mr A. Welsh.
31 Oct. 1887.

pulsory on parents to send their deaf and dumb children to school, we would assume that we were dealing with persons who had been educated up to a certain point so that they would understand finger language; but in the meantime there are so many deaf and dumb who are uneducated or partly educated that the service has to be conducted on a mixed method with a greater preponderance of signs.

17,874. With regard to inter-marriages of deaf and dumb persons, have you any experience at Oldham of such marriages?—Yes.

17,875. Have the children of such marriages been born deaf and dumb?—No; they can hear and speak.

17,876. Is that the case not only where the deaf mutism of the parents has arisen from accident but where it was congenital?—The result is the same with congenital mutes; that is my experience.

17,877. You have never known a case of deaf and dumb children from the inter-marriage of deaf and dumb persons?—I have only known one in the whole of my experience. There was only one child in that case.

17,878. (*Mr. St. John Ackers.*) You just stated that you only know of one deaf child, the offspring of deaf parents; how many hearing children the offspring of deaf parents do you know in your district?—I should not like to state any particular number, I know there are a number of such children. I know several families where there are three or four children in each family and they all hear and speak. They seem bright and happy, just the same as others.

17,879. Do you know a thousand deaf children in your neighbourhood the offspring of deaf parents?—There are not a thousand deaf and dumb in my district.

17,880. Then it does not come to much, because the number that are born deaf and the number that become deaf by accident throughout the whole of the United Kingdom comes to about one in every 1,200 children. If you know one case in very much less than 1,000 the argument goes against the conclusions you have just been drawing. Do you remember any of the statistics that the late Rev. John Downing, who had the charge of Manchester and all that district, worked out on this subject?—No; I never heard of them.

17,881. Have you read the reports of the different meetings and conferences of those interested in the education of the deaf in this country.—I have read one or two.

17,882. Not all of them?—Not all of them.

17,883. You find that in one of the earlier ones. You said you met with great opposition and difficulty in your district?—Yes, in Oldham and Ashton-under-Lyne.

17,884. What was the opposition and difficulty that you met with in Oldham and Ashton-under-Lyne?—The opposition was chiefly in respect of a section of the deaf and dumb. Previous to my appointment to that district there had been no one to look after the deaf and dumb for nearly 10 or 12 years, at least to look after them properly; there had been some one sent to take a service there, but there was no control over the deaf and dumb, to look after them properly.

17,885. What was the difficulty you met with?—During the whole of that time they had been led away by evil influences and by bad example, and it was my place to begin and teach them better.

17,886. Does he belong to another society?—They formed a society of their own.

17,887. Are the two going on together?—Not now, though money for this other society is still being collected.

17,888. You mentioned that there are certain deaf and dumb persons in the workhouse because their relations do not want them at home, what reason is there for their not wanting them at home? You told us before that the parents of deaf and dumb children keep them at home much longer than they ought to do, but I understand from you that the parents in certain instances do not care to have them at home, can you give us any reason for that?—One case I had in my mind was that of a young woman who met with a misfortune; she had never been to school; she was sent to the Oldham workhouse, and when she got better she was returned home.

17,889. (*Chairman.*) What was her misfortune?—She had a child.

17,890. Is that the case in which the parents refused to receive the young woman back?—I do not know that she had any parents; she had a brother with whom she lived.

17,891. Her relations did not desire to take her back?—No, they did not wish her to remain with them.

17,892. (*Mr. St. John Ackers.*) Do you find that children who have been taught either orally or by the sign and manual system are able easily to communicate with their relations when they come back from school?—The parents think they can get along with them very nicely; they hold communication with their deaf and dumb children, but from my observation I do not think much of the conversation carried on. The parents sit very quietly, and let the deaf and dumb children amuse themselves as they like, and go out and in as they like.

17,893. Do you find that those taught on the sign system are better able to communicate with you or with their parents and relations than those taught orally, say they have been at school four or five years and they come home at the end of that time?—They (the sign-taught) are better able to communicate both with me and their parents.

17,894. In answer to the Chairman, you said you had not had much experience of orally taught pupils. In answer to a question I put to you, you said you had not read all the reports of the different conferences in England. May I ask you whether you have devoted much of your attention to the history of the education of the deaf, both past and present, in this and other countries?—No, I cannot say that I have; my duties are too many to admit of my making myself acquainted with all that has been done and is doing in that direction.

17,895. Are there any School Boards in your district that take in deaf children?—No.

17,896. You say they do not consider it their duty to educate the deaf and dumb, at least you said that a late clerk of one of the School Boards in your district told you that he did not consider that it was their duty to do so. Are there any deaf and dumb children sent to the board school who receive the ordinary instruction in classes with the other pupils?—I am only aware of one child having been so sent.

17,897. Is that child there now?—No; one teacher took an interest in her and gave her what instruction she could, but when the class got into a higher standard and were put under a different teacher that other teacher took no interest whatever in the child and sent her home.

17,898. You say you left the deaf and dumb institutions where you were previously to becoming a a missionary in order to better yourself, I take it for granted that your present salary is larger than it would have been if you had remained at those institutions?—It is not; but as a matter of fact I refused a much higher salary as resident teacher in another school.

17,899. If you had remained at either of those institutions, would you have received more than you are receiving now?—I might have done.

17,900. Is your present salary more than the amount that you received when you left?—Just the same.

17,901. What is the amount of the salary you are receiving?—80*l.* a year. I got a donation of 10*l.* from my committee this year.

17,902. Have you any extras, such as travelling expenses?—I have travelling expenses.

17,903. Have you any other extras?—No.

17,904. Were you trained in an ordinary training college?—I have never been to a training college. I have passed the examination entitling me to a provisional certificate, and I have also studied at Glasgow University.

Mr. A. Welsh.
31 Oct. 1887.

17,905. Does your experience lead you to think that the salaries paid in the ordinary institutions of this country, including the large ones you have named, Glasgow and Manchester, are such as to attract thoroughly competent and well-trained teachers for the education of the deaf and dumb?—I do not think the salaries are large enough to attract very good teachers, at least if good teachers do accept the situations they do not stay long, on account of the number of duties attached to the boarding institutions; I mean duties other than teaching. That was the main reason why I left the Manchester Institution, as I considered I had served long enough as a resident teacher, and the committee of the institution refusing an application from me to live out I sent in my resignation. Unless there is a prospect of being allowed to live out, I consider that competent teachers will never, as a rule, long submit to the duties and confinement of institution life, and will give up their situations whenever a good opportunity presents itself. To provide against this a pensioner or other person should be engaged for the duties now being done by teachers. It would certainly involve extra expense, but better teaching power would be got out of the teachers, who, I know from experience, are often too tired to do much good in their class.

17,906. (*Mr. Van Oven.*) You say there is a difficulty in finding employment for the deaf and dumb; do you find there is more difficulty in finding employment for those who can only speak by the fingers, and do you find that semi-mutes more easily get employment?—No, I do not.

17,907. You think it makes no difference whether they are absolutely mutes or whether they are semi-mutes?—The difficulty is not so much in the speech as in the matter of hearing.

17,908. You have a class of deaf and dumb yourself?—Yes.

17,909. Do you teach them by the fingers or entirely orally?—I have only four in the class, and three of them could speak a little before coming to me, and I thought it my duty to continue to teach them speech.

17,910. Do they read from your lips?—They read from my lips and they speak, but I do not call my system of teaching them purely oral; they are taught by signs as well. The three pupils I speak of are quite exceptional cases: one being able to speak almost as well and clearly as any hearing person, and the other two can hear fairly well, although unable to speak intelligibly.

17,911. You were a teacher in an elementary school; I presume you passed your certificate examination?—Not the full certificate.

17,912. (*Rev. Mr. Owen.*) You say you are in favour of the day-school system as against the institution system. Have you carefully considered the many extra advantages which children get by being entirely under one roof and under one system of discipline and one organisation, by which not simply the education but the whole moral training of the child is looked after?—I am not able at present to enter into all that might be said in favour or against the boarding school system, but I think that children taught in a day school would learn a great deal quicker and learn many things that children in a boarding establishment would not learn, because those that teach in institutions get into a certain groove of instruction out of which they cannot get, and the instruction which the children get year after year in some things does not much help them when they go into the outside world; when they go home they have very many things to learn over again from the commencement.

17,913. From what you know of the average homes of the deaf and dumb, do you think the parents or relations would take sufficient interest in their children to compensate for the loss of the advantages to which I refer which would be involved in the adoption of the day-school system?—Yes, I think they would take more interest in them.

17,914. You said that many of the adults who attend your religious and secular classes were formerly in the oral branch of the Manchester Institution?—A few of them were.

17,915. (*The Chairman.*) You are probably aware that the new building has only been completed within the last year?—Yes, I am quite aware when the new building was completed.

17,916. And it was only two or three years before that time that oral teaching was attempted to be carried out?—I went to the Manchester Institution in the year 1880 or 1881, and at that time there were a few pupils receiving oral instruction.

17,917. But there was no separate department at that time, was there?—No.

17,918. It has only been in operation about four years?—I was at the Manchester Institution when the change was made.

17,919. What year was that?—In 1882.

17,920. (*Rev. Mr. Owen.*) Has any effort been made on the part of those who take an interest in the education of the deaf and dumb to bring the question of their education before the School Board?—Not in my district.

17,921. Nobody has taken up the question?—No.

17,922. Therefore the School Board are not to blame for not having instituted some system of education for the deaf and dumb?—No, I do not think that they are.

17,923. Are your religious services under the auspices of the Church of England?—Yes.

17,924. (*Rev. Mr. Sleight.*) Will you kindly state what your service consists of?—The Sunday service consists of portions of the Church of England service taken from the prayer book. We should make the service too long for the deaf and dumb if we carried out the whole of the service, so we omit portions of it.

17,925. At what times are your services held?—In the afternoons and evenings.

17,926. Have you any adult Bible class?—Not at present. I should just like to say, with reference to the Sunday service, that it is in the main explanational; we do not read off the service word for word, at least I do not. I make it a point of explaining every difficult word, and not just giving a sign for it; so the Sunday service is both a class and a church in one.

17,927. What do you do for them during the week?—Try to find work for those unemployed, arrange differences which may arise between them and their masters, visit them at their homes, and act as their adviser and friend, and at the evening meetings instruct them in reading, writing, and arithmetic. The room is also used as a kind of club room. It is supplied with the daily, evening, and illustrated newspapers; and games, *e.g.*, draughts, dominoes, are also provided.

17,928. The adults do?—Yes, those who wish for it; they are not forced to take the instruction unless they like, and any explanation they may wish on any point I give them.

17,929. (*Chairman.*) Is that the only instruction they get through the week?—We have lectures in the evening during the season from October to March, besides the education in arithmetic and writing and reading.

17,930. (*Dr. Tindal Robertson.*) What are the lectures about, are they on religious subjects or secular subjects?—All sorts of subjects. I not only lecture myself, but try and get gentlemen to give lectures, and I interpret for them as the lecture goes on; the gentleman stands or sits by my side as if he were speaking to a hearing audience, and I interpret.

17,931. (*Rev. Mr. Sleight.*) Can you inform the Commission how many uneducated adults are gaining a livelihood by employment?—With the exception of those in the workhouse, they are all gaining a livelihood whether educated or uneducated.

Mr. A. Welsh.

31 Oct. 1887.

17,932. There are no cases in your district of adult deaf and dumb who are gaining a livelihood by begging?—No, not one.

17,933. The majority of the adults have been educated by the sign and manual system?—Yes.

17,934. Do you find that they have any difficulty in communicating with their employers or with their fellow workpeople?—None whatever, they communicate very readily with them either by sign or in writing, quite sufficient for them to know what is required.

17,935. (*The Chairman.*) Except in the case of anything very particular being required to be done, I suppose the ordinary conventional signs are quite sufficient between the deaf and dumb workmen and the master?—The signs may be very unconventional indeed because masters do not know the signs.

17,936. (*Rev. Mr. Sleight.*) With regard to the children under oral instruction, can you inform the Commission how, during their holidays, they communicate one with the other?—By signs.

17,937. Do any of those elder scholars attend your services during holidays?—Yes.

17,938. Have you ever questioned them as to the system they themselves like being taught by?—I never did so as a matter of gaining information, because I see them talking among themselves comparing the systems, and I can get information on the point, without specially asking for it, from their signs and from what they tell me themselves they prefer the sign language.

17,939. Do you find that those who are being orally taught keep themselves apart from the children that have been taught on the sign system?—No.

17,940. They freely mingle one with the other?—Yes.

17,941. How do they communicate one with the other?—By signs.

17,942. How do the orally taught children learn the signs?—That is a matter I cannot explain; children begin to sign at the very earliest period.

17,943. Signing seems natural to them?—Signing seems natural to them. I have a child of my own (not deaf and dumb), and through so many deaf and dumb people coming to my house to speak to me she is beginning to sign almost before she can speak.

17,944. (*Dr. Tindal Robertson.*) Are any of the deaf and dumb children, or adults with whom you come in contact, taught any kind of handicraft at school or after they leave school?—At school I am not aware that they are taught any handicraft.

17,945. When they go into the workshops or where they work afterwards they are taught in the usual manner with others?—Yes.

17,946. They go to the workshop absolutely ignorant in the first instance of any rudimentary idea of the work they are going to do?—Yes. In the cotton mills before earning wages they have to go as learners; they must have some friend, or the manager may appoint some one, to instruct them in the particular branch they may wish to learn, and during that time they receive no wages whatever; in fact, after they do learn the trade, if the mill is not short of hands, they do not get wages, no matter how proficient they may get; it is only when vacancies occur that these learners are promoted to the vacancies.

17,947. Then would it be an advantage that they should get some elementary technical education, before they go to the factory or workshop in order to avoid this loss of wages during the time of probation?—It would be to their advantage certainly, but then if the mill or workshop was full of hands they would not be taken on, they would have to go about idle. I think it preferable that they should be in a workshop, whether they were earning any wages or not, to running about the streets. I know that is the wish of the parents. Many have implored me to ask the masters to give their children anything to keep them out of the streets.

17,948. When you have tried to get employment for the deaf and dumb and could not get it, what have been the objections on the part of employers to taking deaf and dumb persons as workers?—Very few employers explain their reasons.

17,949. When you do get any reasons what are they?—Their deafness. There are others who simply say that they have no vacancies.

17,950. Is there any disposition on the part of those who are not deaf to resent the introduction of the deaf into the different shops or factories?—No; I never heard of any.

17,951. Do you know if there is any rule on the subject in any of the trades' unions?—I am not aware that there is any rule about it in trades' unions. One or two deaf and dumb have recently told me that the managers in the cotton factories have told them that they are not allowed to have them in their mills. I do not know of any Act of Parliament forbidding managers to take them in.

17,952. Does the manager act on his own responsibility in refusing to let them work in the mills where he does so refuse?—I expect he does. I do not know whether he communicates with the master or not.

17,953. Do you know whether any of the deaf and dumb people employed in the mills are members of trades' unions?—Many of them are.

17,954. The main objection you seem to entertain to children being in boarding schools is that they lose the habit of communicating with others. You think they are not so independent when they leave the schools, that they get into certain grooves, and that they cannot compete so well with the outer world?—Yes.

17,955. Suppose they went to day schools, would it be better that they should go to schools established specially for the deaf and dumb, or that the School Boards should establish classes for them in their schools?—There might be a class-room in a board school or denominational school so that the deaf and dumb children should be kept apart from the other children.

17,956. If they were kept apart from the other children, would not that prevent the very thing you seem to wish that they should be able to communicate with the outer world?—I would keep them apart during instruction, and let them mix in the playground and outside; they could not be taught together.

17,957. Do you think you know all the deaf and dumb in your district?—No; I am continually finding fresh cases.

17,958. Have you got a large majority of them?—Yes; since my appointment I believe I have found between 50 and 60 deaf and dumb who were previously unknown to the society.

17,959. Do you keep statistics as to their general condition, as to their age?—Yes.

17,960. And their employments and so on?—Yes.

17,961. Could you send to the Commission a statement of the number between certain ages and what they are doing?—I could send that to the Secretary.

17,962. You have been asked about the inter-marriage of the deaf and dumb, have you ever made any inquiry with regard to the result of the inter-marriage of blood relations?—I have done so.

17,963. You say you know certain cases where there are three or four in the family, in those cases do you find that the parents are blood relations?—No; before their marriage they were quite strangers to one another.

17,964. Are there any cases in which you have noticed that deaf and dumb offspring has been the result of the inter-marriage of blood relations?—No.

17,965. You do inquire, do you?—Yes.

17,966. And you were not able to find out any such cases?—No; I would make a note of such cases if I came across them.

17,967. (*The Chairman.*) Are you in communication with many other missionaries over England?—With a few of them.

17,968. Is there any conference of missionaries to compare notes and to take counsel together?—No; I am sure it would be to the mutual advantage of both

parties if the missionaries attended the Teachers' Conference.

17,969. You have never been invited to attend a Teachers' Conference?—No.

Postscript.

Since giving evidence before the Royal Commission, on the 31st October 1887, I have been enabled, through the courtesy and kindness of a gentleman interested in the education of deaf-mutes, to pay a visit to an oral school in London, viz., the School for the Oral Instruction of the Deaf and Dumb, and Training College for Teachers, Fitzroy Square, W. Every facility was afforded me of making myself fully acquainted with the method of instruction, and information on doubtful points was freely given by the director, Mr. Van Praagh. That no restraint whatever was placed on my movements may be inferred when I state that the master, Mr. Van Praagh, withdrew and allowed me to converse and examine the pupils alone.

This inspection extended over four days, viz., from the 19th until the 23rd November 1888.

As a result of what I there saw, my opinions, which were formerly against the introduction of the oral method, have been considerably modified, and I am now convinced that under certain conditions (hereunder noted) the oral method of teaching the deaf and dumb is possible of success.

I am also inclined to believe that had other opponents of the oral system had the same opportunity as myself of seeing the good results achieved by the system by a master of the art, they would also, I think, have altered their opinion in regard to it.

Like the sign system, I believe the oral method has suffered, not from any inherent weakness or defects in the system itself, but from the incapacity of the majority of its so-called exponents.

Mr. A. Welsh

31 Oct. 1887

Briefly stated, the oral system of teaching the deaf and dumb, to be successful, would require:—

I.—That all schools and institutions be placed under Government control and inspection.

II.—That children be under tuition not less than eight years, and attendance be compulsory.

III.—That training colleges (not merely examining bodies) for teachers, with school for children attached, be established.

IV.—That teachers be not under 17 years of age and be required to serve an apprenticeship of at least two years satisfactorily before proceeding to a training college.

V.—That teachers in boarding institutions be absolved from the onerous domestic duties which many are now called upon to perform.

VI.—That as the teaching of deaf-mutes is confessedly more laborious than teaching ordinary children the remuneration of teachers of the deaf and dumb should be proportionately greater.

N.B.—These conditions would be equally applicable to schools in which the sign system is used.

ARCHIBALD WELSH, Missionary,
Oldham, Ashton, and Stalybridge
Deaf and Dumb Societies.

30th November 1888.

Mr. JOHN WHITE NORTH examined.

Mr J. W. North.

17,970. (*The Chairman.*) You are superintendent of the Manchester Adult Deaf and Dumb Society, are you not?—Yes. That comprises the Central Institute and 13 branches.

17,971. Are your branches all in Lancashire?—Partly in Cheshire and partly in Lancashire, but chiefly in Lancashire; and they extend as far as Preston and Blackburn.

17,972. What number of missionaries have you under your control?—Four. When I entered upon my duties four years last February we had eight branches and two missionaries.

17,973. What had been your previous experience of the deaf and dumb?—I have a deaf and dumb brother, and I have been used to the deaf and dumb from childhood, and I have been also teacher at the Doncaster Institution.

17,974. Do you conduct services yourself?—Yes; practically, I am just as much chaplain of our Society as Mr. Rhind is of the London Society, only that I am not ordained; I hold a licence from the late Bishop Fraser.

17,975. Do you hold your religious meetings at Manchester only?—No, they are held alternately by me and my Manchester colleague. Perhaps I conduct a service at Manchester in the morning and at one of the branches in the evening, and he conducts it in the evening, and then we turn about. I am continually going round to the branches, but chiefly to Wigan, Stockport, Ashton, and Oldham. Our Blackburn missionary generally takes the Blackburn district, which comprises Blackburn, Accrington, Burnley, and Preston.

17,976. What is the number of deaf and dumb in your district?—According to the census of 1881 it is put down at 1,000; but I think the actual number is probably more, because I find generally that the actual number does exceed the census number.

17,977. What is the actual number?—I cannot tell.

17,978. What reason have you for supposing that the actual number exceeds the census number?—Because in Ayrshire the return was 110 and the missionary returned 130.

17,979. But what is the number that you actually know of in Manchester?—I cannot say positively. It is very difficult indeed to ascertain the number in Manchester.

17,980. You undertake to visit all the deaf and dumb in Manchester; do you not know how many you visit?—We do not undertake to visit all the deaf and dumb in Manchester. We undertake to visit any cases that are reported to us as being sick or in distress.

17,981. Have you no figures in your books which will enable you to answer the question?—I am really not prepared to answer that question.

17,982. You come to give evidence as to the deaf and dumb in Manchester, and you say that you do not know how many you visit?—The heading as to which I offered to give information was on the condition of the deaf and dumb as we find them, and by this I meant not only in Manchester, but in the various branches I visit.

17,983. But you say that the number of deaf and dumb persons in your district according to the census is 1,000, and that you believe it to be more, but you do not say what number you even visit. Do you visit 800 in your district?—I was not aware that I was going to be asked that question and I did not collect the information. I will try to ascertain the number as nearly as I can.

Number of Deaf and Dumb the names and addresses of whom we have.	
Blackburn district (latest account)	247
Manchester do.	181
Oldham do.	147
Stockport	28
Wigan	30
Bolton district (just received)	75
Rochdale	41
Bury	29
	778

We do not visit every individual. We could not possibly do so, considering the immense area over which they are scattered. We keep finding out fresh cases. Our Bolton missionary reports of the 75, nine are childen, three of school age, and application has been made to board and refused.

17,984-6. Then you do not visit all the deaf and dumb in Manchester?—We do not.

17,987. You have stated that you do not visit all deaf and dumb in Manchester; what is the number

Mr. J. W. North. 31 Oct 1887.

that you do visit approximately?—I am not able to answer that question.

17,988. What is the number of your congregation?—It varies from 20 or 30 to 50; we have had as many as 70 and 100 on one or two occasions, but those were special occasions.

17,989. Are all those men employed, or are any of them beggars, or are any of them in workhouses?—There are 12 whom the Blackburn missionary visits who are in the workhouse.

17,990. How many are in workhouses?—The following figures, supplied by our Blackburn missionary, I believe to be correct:—

Blackburn	12
Bolton	5
Oldham	5
Ashton	5
Rochdale	4
Chorley	4
Preston	3
Bury	1
Warrington	1
Burnley	1
Patricroft	1
Kirkham	1
Ulverstone	1
Ormskirk	1
Liverpool	1
Haslingden	2
Manchester	1
	49

Educated	12
Uneducated	37
	49

From Charlton I have not received a reply.

17,991. Are there none in the Manchester workhouse?—I do not know of any besides the one reported to me.

17,992. What are the occupations of the adult deaf and dumb?—They are of nearly all sorts.

17,993. Have they any difficulty in getting occupation?—They have more difficulty, of course, than hearing people; and they have more difficulty, not only in getting apprenticed as boys and girls, but also in getting adult employment.

17,994. Do you work in harmony with the schools at Old Trafford; after the young men leave Old Trafford do you obtain situations for them?—Yes. I sometimes go before they leave to ascertain what trade they would like, and then I am on the look-out for them.

17,995. Do you get employment for any of them in the trades where drawing is requisite, as designers or draughtsmen?—Yes, there is one that I got apprenticed just before the Conference, two years ago in June, and he is doing exceedingly well as a pattern designer. His master is not merely satisfied with him but pleased with him, and holds him up as an example to the rest.

17,996. Do you think it desirable that in the schools for the deaf and dumb the elements of technical instruction should be taught, not necessarily to fit them for any particular trade, but to give them knowledge of handicrafts generally?—I think that if, in the first instance, they show an aptitude for drawing, or if they have any talent, it is advantageous to have that talent cultivated.

17,997. Do you think it advisable that the deaf and dumb children should remain longer in schools than other children?—Yes, I do, certainly.

17,998. How long would you keep them in school?—I think it is desirable for them to remain long enough to pass a certain standard similar to the elementary schools. The great misfortune of the adult deaf and dumb is that they have not been to a school long enough as a rule.

17,999. You speak, I suppose, both of the sign and manual schools, and of the oral schools, too?—Both of the one and of the other; but I am speaking chiefly of the sign system. The sign system, in my opinion, has never had a fair chance.

18,000. In what way?—In this way; in the first place, the children have not been long enough at school; and in the second place they too frequently have not had competent teachers. I am not casting any personal reflections upon the teachers, but they have not been trained. As every gentleman here knows, the teachers in elementary schools have to undergo a course of instruction and training and pass an examination before they begin to teach; but the sign teachers of 20 years ago were simply raw youths of 15 or 16 years old who had had no proper training. It would seem very absurd to send me to teach in a German school if I had not been taught the German language.

18,001. Have you ever taught in a deaf and dumb school yourself?—I have; I have a deaf and dumb brother, and I was better qualified when I first went than many others to teach the deaf and dumb.

18,002. Did you teach your brother?—No.

18,003. Where have you yourself taught?—At the Doncaster school.

18,004. What was your experience at the Doncaster school?—I was there about three-quarters of a year.

18,005. Have you been a teacher in a national school?—No, never; but having had a deaf and dumb brother, and being used to him from childhood, I was better prepared for teaching the deaf and dumb than most who first begin. I learnt the manual alphabet and something of the sign language, too, before I went.

18,006. Do you conduct the service for the deaf and dumb entirely in the finger language or in signs?—A mixture of both. I adapt my discourse to the intelligence and capacity of the congregation. For instance, if I have a fairly intelligent and educated congregation, I prefer a mixture of signs and spelling as being more effective; but some congregations we have of whom I know nearly half have not been at school at all, and I know that in their case spelling is of no use, and that I must confine myself to signs.

18,007. Can you tell me how many among the deaf and dumb in your district have the remains of language, that is to say, are semi-mutes?—I have had several of that kind, but I cannot give the number. I keep meeting them occasionally. There is one case that I would like to give as being a very remarkable one. Of course when a child loses his or her hearing at five or six or seven years of age, there is nothing very remarkable to me in its retaining the faculty of speech; but it is a fact that there are some that speak exceedingly well, and indeed better than some of those who lose their hearing at five or six years of age, although they have either been born deaf or have lost their hearing before they acquired speech.

18,008. Are you speaking of those who have been taught in the oral system?—No, of those who have been taught on the sign system.

18,009. I am speaking of speech in the sense of language?—So am I.

18,010. You mean persons who speak without ever having been taught to speak?—I do. My brother does so, and he talks very much better than some I know who have been taught by the oral system. But this girl at Rochdale is the most singular case that I have met with. Her voice is sweet and natural; she talks with a slight lisp the same as her sister; I have often heard her speak and wondered that she could speak so naturally, and I took it for granted that she had lost her hearing after she had grown up and had acquired the faculty of speech. But I recently ascertained that she was not quite a year old when she lost her hearing.

18,011. Then she is probably not altogether deaf?—I believe she is entirely deaf.

18,012. I suppose she lip reads?—No, she reads from the manual alphabet. I converse with her by the manual alphabet, and she talks with me in return, and so distinctly that I can understand every word that she says.

18,013. And she has never been taught lip reading?—No.

18,014. Is not that a case in which lip reading would have been very valuable?—It might.

18,015. Is there any doubt about it?—She would certainly have been more capable of learning it than the generality.

18,016. She would be like other people if she had learnt lip reading, would she not, if she can speak?—Of course, I cannot express a decided opinion, but my opinion is that she would not. I have not met with any yet that could read the lips with much advantage.

18,017. I suppose you have not had much experience of those who have been taught under the oral system thoroughly?—I have not. In the case of the lad George Dixon, who was apprenticed to the pattern designer that I spoke of, one of the first questions that the master asked me was whether he was taught orally, and I said "No." He replied, "I am glad of "that; the other that I had was, and I found it very "tedious to converse with him, and I could converse "with him more easily in writing."

18,018. The master does not know signs?—He does not.

18,019. Do you think that a considerable proportion of the deaf and dumb children in your district of educable age receive no education at all?—Undoubtedly. At Appley Bridge, near Wigan, I found five in one family, middle-aged people, who had never been to school at all.

18,020. Have you made inquiries as to the number?—I have not the number, but I know of several cases. Practically, I am chaplain, superintendent, and secretary of the society, and we have had a great deal of extra work during my period of office, and I could not possibly give the time to visit from house to house to collect information.

18,021. Have you been only a short time there?—I have been there four years last February. In order to ascertain the number of deaf and dumb it is necessary to have an almost house-to-house visitation. I found out a great deal last year. There is one house that I had passed scores of times and I had no idea that a child living there was deaf and dumb, and she is now 15 years of age and her parents could well have afforded to send her to school.

18,022. I should have thought that if you had been in your present position four years, by that time you would have had some definite idea of the number of cases of deaf and dumb persons who are not educated?—There are two or three cases at Stockport that I know in which the parents are not in a position to educate their deaf and dumb children, and the guardians will not do it.

18,023. Do you say that advisedly?—I do.

18,024. You know, as a matter of fact, that the guardians have been applied to and have refused?—On this point I would remark that, without being able to cite cases where formal application has been made and refused, I know that while some boards do send children to school, others will not unless it be made compulsory. A year last summer I found two children in one family in Lincolnshire. I communicated with the rector, himself an *ex officio* member of the board. Last summer I was there again, and saw another member of that board, and found no steps had been taken. I cannot say in *this* case that formal application had been made. I know it has not, but the result is practically the same as far as the children are concerned. In my opinion compulsory education is *absolutely* necessary. If it be for hearing children, HOW MUCH MORE FOR DEAF AND DUMB?

18,025. Will you kindly give us those cases; what are the names?—I could give the names of the children; I could not positively state that any formal application had been made to the guardians, but there is one case in which I spoke to one of the guardians upon the subject. I know that there have been several cases, but I could not give the names of them just now.

Mr. J. W. North. 31 Oct. 1887.

18,026. Perhaps you will furnish the Commission with any cases, either at Stockport or elsewhere, in which you know that a formal application has been made to the guardians and has been refused?—I will endeavour to do so.

18,027. Have you a copy of the annual report of your society?—I have not.

18,028. Do you print one?—Certainly.

18,029. Then why did you not bring one?—I did not think of it.

18,030. Who are your employers?—The Bishop is the patron of the society; Mr. George Robinson, of Princes Street, is the president; Mr. Oliver Heywood and Mr. Richard Jones are the treasurers. I think your Lordship is one of the vice-presidents and the Dean is another, and Archdeacon Anson, Canon Stowell, and Canon Kelly are on the committee.

18,031. Is there any suggestion which you would wish to make with regard to the education of the deaf and dumb?—I have suggested in the first place that teachers, previously to going as teachers, should be trained similarly to the teachers in elementary schools. Of course I presume that every gentleman here present knows that there is not sufficient school accommodation to accommodate the deaf and dumb children in the first place. Then, in order to make the education effective, it must be compulsory, and the school attendance officer must visit the houses and find out the cases of the deaf and dumb, because it is impossible in a tremendous district like ours for me or any other person to do so. I would also suggest that I think there is not sufficient inducement held out to teachers of the deaf and dumb; that while teachers of elementary schools have a prospect of obtaining masterships and being in a position to marry, few teachers of the deaf and dumb have the salary required.

18,032. Do not the school attendance officers in Manchester know the number of children who are of educable age, but are not educated?—I do not think they do. There are two cases now in the Old Trafford school that I found out quite by accident, of two boys who had been attending hearing schools where, of course, they had been learning nothing. I met one on the tram one day, and I sought him out and he is now in the Trafford school*; there is another down Openshaw way.

18,033. Do you think it advisable that the deaf and dumb should be taught in day schools under the school boards, or in separate institutions?—In separate institutions. That is my decided opinion.

18,034. Is that on account of the size of Manchester, which makes it impossible to group them together into classes, or on other grounds?—In the first place, it is very difficult to secure anything like regular attendance, owing to the immense area over which they are scattered; and, in the second place, I think they are far better under the supervision of properly qualified teachers, because the discipline which they would receive at the board school would very probably be to a considerable extent neutralised by the laxity at home.

18,035. But I suppose the board schools would be able to secure good masters, would they not, as they do in the case of elementary schools?—What I mean is this: that the children are only a certain number of hours at the school, and then they go home and are free from that school discipline; whereas in such an institution as the Old Trafford school they are

* The mother of this boy told me that if the attendance officer saw him playing in the street he went to the house to inquire why he was not at school, but when he *was* at school he was not interfered with; but this was an *ordinary* school, where, of course, he was learning nothing of language. I believe these were the exact words used in my letter. I suggest that attendance officers in our district should be instructed to find out these cases and report them either to me or the secretary of the Old Trafford school.

Mr. J. W. North.

31 Oct. 1887.

constantly under the supervision of the teachers, who have proper command over them, and in fact they are constantly receiving instruction in school and out of school.

18,036. Do you think that would be equally applicable to a town like Stockport or Blackburn, or other towns?—Yes; I think it is applicable to any town.

18,037. You would not have an institution at Blackburn, I suppose, but you would subsidise the institution at Manchester out of public funds through the guardians, or in some other way?—Yes; our Blackburn missionary has been instrumental in getting a good many sought out and sent to the school. In his district, before he came we had the names and addresses of about 30 deaf and dumb in the whole of North-east Lancashire; he has now the names and addresses of, I think, 240.

18,038. Who are not at school? — He has the names of 240 deaf and dumb in his district, whereas only about 30 were known to our society before.

18,039. How many of those are children, and how many are adults?—His latest account gives—

Adults - - - -	190
Children at school - - -	26
„ not at school - - -	31
	247

18,040. Whatever accurate statistics you can furnish from your own knowledge or from the knowledge of the officers of your society, and which your society can vouch for, we shall be very glad to have unless your report furnishes all those details?—It does not give the number of educated and uneducated deaf and dumb children. In my letter to the secretary offering to give evidence I said that I had neither time nor opportunity for collecting statistical evidence, but that I should be prepared to offer practical remarks on the condition of the deaf and dumb generally as I found them.

18,041. (*Dr. Tindal Robertson.*) Is yours purely a benevolent institution supported by voluntary contributions?—Entirely; we are not endowed. We got a bequest of 500*l.* to our Oldam branch some time ago.

18,042. Have you any funded property?—We have not.

18,043. And you depend upon the subscriptions that you get from day to day?—Entirely. It takes a good deal of doing.

18,044. You publish a report, do you not?—Yes.

18,045. In that report do you furnish any statistics of any kind?—We furnish the number of services and of sick visits paid and other items.

18,046. But have you any account of the number of peoples under your charge?—I have not an account of the number in Manchester.

18,047. But have you not a register to enable you to show what people you go to, and so on?—No.

18,048. How do you conduct your visits, if you have no account of the people who are under your care?—We have the names and addresses of a good many of the deaf and dumb.

18,049. But you have not the addresses of them all?—Not of them all.

18,050. Do you visit these people at their own homes at all?—Yes.

18,051. On what principle, if you have no register of the names and the numbers, do you conduct your visits?—We visit them as we have leisure to do so; but we have much other work to do.

18,052. But how can you visit them unless you have a list?—We have the names and addresses of a good many.

18,053. (*The Chairman.*) What do you call a good many?—Perhaps 50 or 60, or more, I cannot say just now.

18,054. (*Dr. Tindal Robertson.*) When you put a person upon your books, do you take any account of what was his antecedent condition and his present condition?—No, we do not put that down.

18,055. Do you not think that that would be a very advisable thing in a society like yours?—Mr. Jones, my colleague, had been a missionary for many years under the late Mr. Downing, and any deaf and dumb that I do not know I ask him about, and he generally knows them and is able to give me information.

180,56. Have you any reliable history of any of these people written, so that you could give it to this Commission, or is your knowledge of these cases simply confined to yourself and your colleague?—I have not any written history of them except that I very often make a note when a deaf and dumb person comes from another district, from Glasgow or from Liverpool, or is a stranger to me; I book his name and the account he gives, and what I ascertain about him.

18,057. Do you do that in a regular form, or do you do it simply as it occurs to you at each time; do you keep any record of the answers that you get?—I do it simply for my own information that I may know him when he comes again.

18,058. (*Rev. Mr. Sleight.*) Will you state to the Commission in what form you conduct your services?—The form of service is a selection of the most simple prayers from the Book of Common Prayer, one lesson, one psalm of moderate length, a hymn, and a sermon.

18,059. Do you adopt much of the finger system, or do you conduct the service mostly by signs?—It depends upon the congregation. I prefer a mixture of signs and spelling where that is feasible.

18,060. Have you been brought much into contact with those who have been orally taught?—There is one boy whom I am just about getting apprenticed to a saddler, and I went to the school to ascertain, before he left, what he would like.

18,061. To what school?—The Old Trafford school. I find that he cannot understand the master, or at least very seldom. Sometimes the master speaks to him with the lips and he tries to read the lips, but shakes his head; the master tries again, and he shakes his head again; and the master has eventually to spell to him. This master knows the deaf and dumb alphabet, having had a deaf and dumb person for twenty years. This lad can articulate a few plain simple words, such as "Thank you," and so on, but, according to the master's account, not sufficiently to converse with him.

18,062. How long has this boy been under oral instruction?—The boy is 17 years old now, and he has been at Old Trafford for several years. I am not prepared to say how long he has been under oral instruction.

18,063. Do you find that in the case of the adult deaf and dumb who have been taught by the sign and manual system there is any difficulty in their communicating with those who employ them?—No, not generally; they are very quick to understand. There is a girl that I have just got apprenticed to the dressmaking, and the mistress told me that she did not need to write if she wished to tell her anything, but that if she showed her a thing she seemed to understand it at once.

18,064. (*Rev. Mr. Owen.*) How often do you visit the deaf and dumb at their homes, as a rule?—I and my colleague visit as much as we can.

18,065. Do you visit them two or three times a week?—Yes.

18,066. (*The Chairman.*) Do you visit each person two or three times a week?—No.

18,067. (*Rev. Mr. Owen.*) Part of the adult mission work of yourself and your colleague I understand to be to visit the deaf and dumb at their homes; have you a systematic way of going round, according to any book that you keep? I want to ascertain upon what principle your visits are carried on. Do you visit them once a month, or once in six months, or once a year, or once in so many weeks?—It depends upon circumstances. I cannot answer the question because we have so much other work to do.

18,068. Then you have no systematic visiting at all if you cannot say that you visit those whom you profess to visit once a year, or once in six months, or once a month?—If we hear of any cases of sickness or distress they are visited at once.

18,069. (*The Chairman.*) Then how often do you visit them?—For instance, I had a letter by the 12.30 post reporting a case of sickness at Stockport, and I was in the house at two o'clock.

18,070. Then you have no systematic visiting, but you simply wait until you are sent for?—No, we visit whenever we can.

18,071. (*Rev. Mr. Owen.*) Have you anything of what we of the clergy call house-to-house visitation*? Supposing that I am a deaf and dumb person in Manchester and that I attend your classes, and that I am not ill, humanly speaking, how many times in a year will you come and call upon me?—We do not profess to make any stated number of visits.

18,072. Do you keep a diary?—Yes.

18,073. (*The Chairman.*) Will you read out from your diary the statement of the visits made in any one week in the year?—I have not my diary with me.

18,074. (*Rev. Mr. Owen.*) When you go back to Manchester to-day or to-morrow or the next day, on what principle, supposing there are no cases of sickness reported to you, do you, as a matter of system, go round and visit the adult deaf and dumb?—I go round and visit them when I have the leisure to do so; but I am practically chaplain, secretary, and superintendent, and of course I must attend to certain duties before I can go and visit them.

18,075. As a matter of fact, supposing that I am an adult deaf and dumb person in Manchester, the chances are that if I am not ill or do not write to you with any special object requiring a visit for any special cause, I shall not get visited in the course of the year?—Some would not.

18,076. Do you keep a list or register of those who are regular attendants at your church services?—No.

18,077. Have you a list of your communicants?—We have not, but we know them all.

18,078. Are they visited more regularly than the others?—We really have not any systematic visiting.

18,079. I ask these questions because I have a great deal to do with mission work and want to see what system is adopted in Manchester. Do many come to your week-day lectures or classes?—We have not any classes. The rooms are open on Saturday nights for newspapers and so on, and on Thursday evenings for lectures during the session.

18,080. Have you a penny club or savings bank?—We have not.

18,081. Are we to understand from your experience in getting employment for the adult deaf and dumb that employers of labour prefer the deaf and dumb who have been taught under sign and manual system to those who have been taught under the oral system?—That is what the master told me.

18,082. In this one case?—In this one case, and in the other case that I spoke of, the boy that I am now getting employed as a saddler, the master cannot talk to the boy by means of lip reading.

18,083. Then in that case his oral instruction does not prove of practical benefit to him in his employment?—It does not.

18,084. What do the parents that you visit say to you about the system?—There is a young man who was three years under Mr. Arnold; he is perhaps two or three and twenty, and he is employed now as a watchmaker. He had three years' instruction under Mr. Arnold at Northampton. My brother talks better than he can, and his father has to supplement the lip reading with the finger alphabet. I have seen that young man trying to read his father's lips, and some things he can understand and some he cannot.

Mr. J. W. North.

31 Oct. 1887.

18,085. (*The Chairman.*) He had only three years' instruction?—He had only three years' instruction. He had previously been at the Old Trafford school, I believe.

18,086. That is a sign school?—It was at that time.

18,087. (*Rev. Mr. Owen.*) Then, practically, his method of communication with the ordinary world is by writing, or by signs now?—It is.

18,088. Have these deaf and dumb persons amongst whom you work given you their opinions in any way themselves?—Their opinion is strongly in favour of the combined system.

18,089. For what reasons?—They think that those who show an aptitude for articulation should be taught it just the same as a boy who shows a talent for drawing should be taught drawing, that the talent should be cultivated.

18,090. Then oralism is to be taught in these cases more as an accomplishment than as a method?—Yes. I should like your Lordship to understand that when I entered the society there had been two intervals without a superintendent, and I found it in a most wretched condition, and it took me a great deal of time to reorganise the thing, and I have got some missionaries appointed, but of course I have not had time to do everything. Unfortunately we have to spend very much time in raising the funds.

18,091. (*Mr. Van Oven.*) You say that your services are conducted partly by the manual alphabet and partly by signs, according to the intelligence of the congregation; have you any means of knowing how far you are thoroughly understood by the congregation?—Yes, I always know that.

18,092. But how do you know that?—I know that by the play of their countenances, and then they tell me at the close. When I first went I requested them to tell me if I used any signs that they did not understand, and I have been several times told how clearly I made myself understood.

18,093. Do you communicate with them individually so that you clearly know that your services are appreciated?—Yes; I have not the slightest doubt about that.

18,094. Referring to that particular case that you told us about, of this young woman who can talk but who cannot read from the lips, do you know at what age she began to talk?—I cannot tell. I had previously taken it for granted that she was grown up before she lost her hearing, because she talked so well; I was perfectly astonished when our Bolton missionary told me that she lost her hearing when she was not quite a year old, from fits in teething.

18,095. It would be exceedingly interesting if you could obtain some more particulars of that case, so that we might learn at what age she began to talk, and how she acquired modes of expression?—That is the only case of the kind that I have met with. My brother either lost his hearing when he was an infant in arms or was born deaf; but I think most probably he lost it through the report of a gun when he was an infant in arms. When the gun went off he sprang nearly out of his uncle's arms, and, as there have never been any other cases of deafness known in our family, I think practically that would be the cause of it. He seems to have an idea of pronunciation from the spelling of the words in the case of simple words; and some words that are spelt differently from the pronunciation, I have taught him by spelling similarly to the dictionary.

18,096. But how do you account for his knowing the sounds of the letters?—I cannot account for that at all. I only know it is the fact.

18,097. Do you not think that that comes from watching the lips; how else could he know?—I can-

* The deaf and dumb in the Manchester district are scattered over the large area of Manchester, Salford, Pendleton, Pendlebury, Swinton, Longsight, Gorton, Denton, Prestwich, and other suburbs. It must be obvious that it is utterly impossible for me and my colleague, with all the other work we have to do, to visit the same as clergymen in their parish, and in that parish a rector and one, two, or three curates. During the last two years, especially, it has been very hard work to raise the funds to carry on.

Mr. J. W. North.
31 Oct. 1887.

not say. It is one of those things that I cannot account for any more than I can account for the case of that young lady at Rochdale. There is another girl near Rochdale whom I have not heard myself, but who, I am told, articulates very well.

18,098. If you could gain any special reliable information upon those cases it would be highly interesting, because it seems to me very remarkable that a person born deaf should know the sound of letters without ever having heard them?—I will endeavour to obtain the information.

18,099. (*Mr. St. John Ackers.*) You stated, did you not, in your examination in chief that you had had very little experience of those taught upon the oral system?—I have not had much.

18,100. You also stated, I think, that you considered the amount of time devoted to the sign system to be too short?—I do, decidedly.

18,101. That amount is, I think, as a rule, four years and over?—Some have only been taught for three or four years.

18,102. Yet, in answer to Mr. Owen, you spoke of a young man 17 years of age who had been only three years in an oral school; do you consider that the case of a youth who had been three years in an oral school would be a fair test case?—I beg your pardon; there is a mistake there. Mr. Arnold's pupil was not the one 17 years old. It is the one that I said was perhaps two or three and twenty years old.

18,103. Am I wrong in supposing that you stated that there was a certain deaf and dumb person in Manchester, either 17 or 21, or whatever the age may be, who had been only three years in a pure oral school?—That is the one who is two or three and twenty years old.

18,104. But there is one?—Yes.

18,105. Do you consider that three years in a pure oral school would make that a fair test case of the success of the oral system?—Perhaps not.

18,106. You also stated, did you not, that he had been previously taught at a sign school?—Yes.

18,107. You also stated, I think, in reply to Mr. Owen, that the deaf and dumb, so far as you know, prefer the combined system; are any of those deaf persons in Manchester that you mentioned persons who have themselves been exclusively taught on the pure oral system?—No.

18,108. Then they have been all either taught upon the manual or upon the mixed system?—Yes.

18,109. Then they have no means of judging of any other system, have they?—I am not speaking as to whether they are capable of judging or not.

18,110. I want to know what is your opinion as to the value of their judgment. You would not expect that the opinion of a person would be of very much value upon a subject of which he knew nothing, would you?—I must leave you to draw the inference. There is one remark that I should like to make, if you will allow me, respecting the sign system as previously taught. I think that as regards the sign system, the system of teaching it has been wrong; signs have been used too much and spelling too little. I was very much struck with the remark of Mr. Goodwin, our late Bolton missionary, who was a teacher 35 years at Old Trafford and acknowledged to be one of the best sign teachers in the kingdom. He said, "Signs are like the scaffolding of a building, and "should be discontinued as soon as possible when the "pupil understands the meaning of words serving to "illustrate the meaning of others words that he "seeks to comprehend." If language can be conveyed in its proper form by the oral system, I do not see any earthly reason why it cannot be conveyed by the sign system.

18,111. (*The Chairman.*) Of course the oral system is simply the ordinary language?—Yes; but taking a sentence, such as "One man standing," is it necessary to sign "Man one standing"? Would it not be just as easy to sign "One man standing"? I do not see why it should not.

18,112. (*The Chairman.*) I quite understand that it is easier to understand the finger language than to understand signs, because when you make signs they may mean one thing or the other?—Many of the adult deaf and dumb have complained to me bitterly about the incompetence of the teachers. My colleague, Mr. Jones, was telling me about Mr. Goodwin's pupils. Mr. Goodwin, who was a very experienced teacher, and, being deaf and dumb himself, had a knowledge of the sign language to begin with, nearly all his pupils have been turned out with a fair knowledge of language. It is claimed for the oral system that it takes eight years to learn. If a child of ordinary intelligence were for eight years under a thoroughly competent sign teacher, I will guarantee that it would come out with a different amount of knowledge from the generality of the deaf and dumb now.

18,113. Is it not a fact that teaching on the sign system must necessarily limit the range of conversation of the deaf and dumb to those who are acquainted with signs?—I do not think so.

18,114. If you were to communicate with me by signs I could not understand you?—What I mean is that, as Mr. Goodwin said, signs are used too much and spelling too little.

18,115. Is it not a fact that the finger language must necessarily limit the intercourse of the deaf and dumb to those who understand the finger language, and that the majority of the world do not understand it?—They can communicate by writing.

18,116. But that is not the ordinary way of communication?—It is with those who do not understand the finger alphabet.

18,117. Is not that a drawback to men in society which, of course, language would enable them to overcome, if they could use spoken language?—I do not think so. I think that there would be very much less probability of their being misunderstood by using writing than by reading the lips.

18,118. (*Mr. St. John Ackers.*) I understand you to advocate the sign system being taught grammatically, that is to say, instead of being in the present inverted order, in the order of language; is that so or not?—I am advocating simply the use of signs, as Mr. Goodwin said as the scaffolding of a building.

18,119. You gave as an example "one man standing" or "man one standing"; do you advocate the grammatical use of signs?—I do; I was taught to sign in this way: "man one standing." It could not be done, perhaps, in a more elaborate sentence.

18,120. (*The Chairman.*) Why not; why can you not use signs grammatically always?—It would certainly be more difficult.

18,121. (*Dr. Tindal Robertson.*) Do you take any cognisance or keep any record of the employment of the people whom you visit?—No, not necessarily.

18,122. (*The Chairman.*) You know it accidentally or incidentally according to the inquiries that you make, but you do not have a regular tabulated form, "Visited so and so; occupation so and so; age so and so"?—We have not.

18,123. It would be very interesting if you conducted your work on such a system?—It would; but if you were aware of the amount of work that I and my colleague have to do, you would not be surprised at our not doing what you suggest.

18,124. (*Dr. Tindal Robertson.*) Do you interest yourself in getting employment for the deaf and dumb people?—Certainly, it is part of my work.

18,125. Are the wages which they earn as a general rule, and on an average, equal to those of other persons, or are they less?—They are not equal as a general rule.

18,126. About how much less are they?—I could not say. A printer working for Mr. Heywood is not allowed by the Typographical Society to work under 35*s.* a week, and one of the printers being deaf and dumb the master would not give him the full sum, and he consented to work for less, and when that was found out he was expelled from the Society, and he had to be expelled from the master's employ, too, or all the other men would have left him.

18,127. (*The Chairman.*) He was turned out of the Society because he worked at a less price than the other members of the Society?—Yes, that he told me.

18,128. Can you give us the name of that man?—His name is Francis George Jefferson. He is now in America. This was at John Heywood's in Manchester. The man told me the case, and I went to see the secretary to investigate the truth of it, and I found that it was true. The man is now one of Miss Groom's party in America. Respecting getting employment for the deaf and dumb, there is one deaf and dumb girl that I got apprenticed to a dressmaker, and she is doing very well; another (a lad) I have got apprenticed to a clogger and shoemaker; another I am about to get apprenticed to a tailor, and another to a saddler. Those have recently left the Old Trafford school.

Mr. J. W. North.
31 Oct. 1887.

18,129. The evidence that we have had from the Old Trafford school was that there was very little difficulty in getting employment for the deaf and dumb in Manchester?—There is. Of course there are several places where they could not employ the deaf and dumb. Some masters object to them among machinery; but I think that is quite an unnecessary fear.

The witness withdrew.

Mr. Humphrey Broom examined.

18,130. (*The Chairman.*) You are visiting inspector to the apprentices under the Old Kent Road Asylum, and also Sunday lecturer to the Royal Association in aid of the Deaf and Dumb in Oxford Street?—Yes.

18,131. How long have you filled those offices?—I have been connected with the deaf and dumb for 26 years; I have been connected with the Old Kent Road Asylum for 22 years.

18,132. Have you always been in the outdoor department there?—No; I was teacher for about 17 years in the Institution in the Old Kent Road.

18,133. On the sign system?—On the combined system.

18,134. Can you speak with regard to the difficulties of the deaf and dumb obtaining employment after leaving school?—With regard to the Old Kent Road pupils, there is not so much difficulty because the committee provide a premium for them; but with the other children who have been taught at different institutions there is a great difficulty.

18,135. Do you think that if the deaf and dumb had more technical instruction at school, that is to say, not so much instruction in any particular trade, as general instruction in handicraft work, they would obtain situations more readily?—I think not. If they had longer instruction, if their education were extended more than it is at the present time, they might do better. I think that the period of their education is too short.

18,136. But would not an extended system of education supplemented by technical instruction give them a better chance?—Yes.

18,137. You mean that the short time that they have would not be enough to give them technical instruction in, but that if they had a longer time then you might give them both technical instruction and further education?—Yes, I think so.

18,138. Do you think that that should be compulsory?—That is rather a difficult question to answer.

18,139. You must have formed an opinion whether it is desirable that the deaf and dumb should be obliged to be educated the same as every other person in England of educable age has to be?—Quite so. I think they should share the same benefits as hearing children.

18,140. Have you any opinion as to whether the deaf and dumb should be brought up in institutions or whether they should be brought up in day schools?—I think that the more they are divided the better. I do not agree with a large body of children being kept together as a family. The more they mix with the world I think the better for them.

18,141. Have you visited any of the School Board classes in any of the towns, in London or elsewhere?—I have been to one or two of the Board School classes in London. I visited the class at Bell Street, Edgware Road. It was at Bell Street, but I believe it is removed now to St. John's Wood Road.

Mr. H. Broom.

18,142. Is it Capland Street?—It stands partly in the main thoroughfare and partly in a side street, but I do not know the name of the street.

18,143. I suppose that in towns of a certain size, but not of sufficient size to enable them to get a class together, in all probability it would be almost necessary that the deaf and dumb should be sent to an institution?—I think so.

18,144. That is to say, there must be institutions for certain cases?—I think so.

18,145. Particularly for cases of delicate children? Quite so; and the cost of instruction, too, has to be considered. If there are only two or three deaf and dumb children in a certain neighbourhood it is not worth while to start a school.

18,146. But in large towns, like London, Glasgow, and Manchester, you think that it would be desirable to have classes?—Or smaller institutions.

18,147. Do you consider that the deaf and dumb have had as competent teachers as they should have had?—Well, I am an old teacher myself and it is rather a difficult question to answer. So far as my experience goes they have had competent teachers as regards the Old Kent Road, and Manchester, and Liverpool. I was at Liverpool for four years under Dr. Buxton before I went to the Old Kent Road.

18,148. You think that in some institutions they have competent teachers?—All that I have known.

18,149. You have had experience of adult deaf and dumb who have come from other institutions, do you think that, as a rule, the education of the deaf and dumb is as well conducted as it should be?—I can speak of the experience of the teachers in the institutions I have named.

18,150. But I want to know your experience of the adult deaf and dumb; are they as well educated as they should be?—They are not.

18,151. From various causes?—Yes; from want of mental capacity, many of them.

18,152. Instead of having less time than others they should have more time?—They should have more time in my opinion.

18,153. Are you aware whether there are many deaf and dumb children in London now of school age who do not receive any instruction at all?—I am not; I have no means of knowing.

18,154. You only attend to those who have left school?—I only attend to those who have been educated.

18,155. Have you had any experience in the case of semi-mutes on the combined system? Can you tell us what amount of language they have after leaving school, and whether it is sufficient to enable them to mix freely with other people?—A few have, but the majority have not. They have not sufficient command of language.

18,156. What do they have recourse to, signs or writing?—The partially educated principally have recourse to signs.

Mr. H. Broom.

31 Oct. 1887.

18,157. I suppose you know some well-educated deaf and dumb who have come from the Old Kent Road?—Yes, and from other institutions.

18,158. Do the educated ones mostly communicate in writing?—The semi-mutes will partly speak to people who can understand them. Some will speak to me, for instance, but others will not. They will prefer spelling on their fingers. But the more educated and better class, I think, generally write.

18,159. They write fluently and well, I suppose?—They write fluently and well.

18,160. Do you observe any difference in the writing of those who have been brought up on the sign system; is there any inaccuracy of language?—Yes; the natural failing of the deaf and dumb is to transpose their words to a great extent; but the better educated do not do so. There are many in London at present who are really well educated.

18,161. Can you give us the names and addresses of any who are earning a competent livelihood now in London?—There are several man in good positions in London; for instance, there is one Mr. Bather, at the Admiralty Office.

18,162. He was not at the Old Kent Road, was he?—No.

18,163. I am speaking of those who have been brought up at that school?—I meet those who have been educated at all the institutions, because they generally make for London. I as frequently meet them from the country as from the Old Kent Road.

18,164. You meet them at the Sunday services?—Yes, I meet them at the Sunday services, and I often attend to interpret *viva voce* lectures, and I meet them there.

18,165. But you did not answer my question as to what were the principal trades at which they are earning a good livelihood?—They are bookbinders, saddlers, and harness makers; there are engravers, but as regards the engravers I am sorry to say that their trade is dying out altogether; it has been superseded to a great extent by photo-lithography.

18,166. Would not a knowledge of drawing and a knowledge of working in leather be very useful to teach them at school?—The knowledge that they have now is of great advantage to them when they leave school. Many of them pass very high at the South Kensington examinations.

18,167. Do you know anything about the deaf and dumb in workhouses?—I do not. I know that there are several. I hear of them from time to time, but I do not know them personally.

18,168. As a rule, the deaf and dumb are not often in the workhouse?—I believe there are very few at present in London; but I think that the chaplain of the Royal Institution, the Rev. Charles Rhind, and the Rev. Mr. Sturdy, would be better able to answer that question.

18,169. Is there anything that you wish to lay before the Commission with regard to the educational requirements of the adult deaf and dumb?—No; I am ready to answer any questions that you may wish to ask me, but I have no particular information to lay before you.

18,170. (*Mr. St. John Ackers.*) You spoke just now of taking only the educated, but surely you give some instruction to the uneducated in your classes or lectures, do you not, as well; they attend your lectures, do they not?—Yes, I think that is a mistake. We take the uneducated. The lectures and services are open to all comers.

18,171. Do a considerable number of wholly uneducated deaf and dumb persons attend your services? Not that I know of. I never met one who had not been educated.

18,172. Are you aware that there are any wholly uneducated deaf and dumb persons in your district?—No; I know there are one or two in London, principally crossing sweepers and such like, and nothing more, but they are old men. There is one at the top of the Haymarket; he is always there.

18,173. But from your experience you must know that for a great number of years past, even if it is not so up to the present time, there has not been nearly room in the schools to educate all the deaf and dumb of the country. Therefore it is clear that a certain number must must grow up uneducated?—I am quite aware of that.

18,174. Does your society, the Royal Association, take any notice of the uneducated deaf and dumb?—I am only the Sunday lecturer of the society, but I believe that it looks after the uneducated, and sends them to different institutions.

18,175. But does it take any notice of the adults who have gone out?—Yes; they admit them to their lectures, and try and get them to their services on Sundays.

18,176. But you said just now that part of the object of the Royal Association is to get the uneducated deaf and dumb to attend lectures and services?—To get all the deaf and dumb that they possibly can, whether educated or not.

18,177. How is it, then, that none of the uneducated deaf and dumb attend your services?—I never met an uneducated deaf and dumb person at my services.

18,178. Have you taken any trouble to ascertain the number of deaf children the offspring of deaf marriages?—No, not particularly. But it has come under my notice frequently.

18,179. (*Mr. Van Oven.*) Have you not, under this society, any system of visitors to visit the various deaf and dumb who have not been educated in any special schools?—Yes; they have two chaplains and several missionaries.

18,180. And those chaplains and missionaries visit the deaf and dumb at their homes?—They visit the deaf and dumb in London and look after them, and if they are out of employment try to find employment for them.

18,181. Do they keep any account of how they are going on?—Yes; a regular diary is kept, I believe, by all the missionaries.

18,182. Your main employment is to look after the apprentices?—Yes.

18,183. Do you find any difference in the success of those who are able to speak as compared with those who are only able to communicate by signs and the finger aphabet?—No particular difference. I find as a rule that those educated on the oral system use their fingers just the same as the others.

18,184. But in the case of those who have been educated on the oral system as a rule, is there any difference in the way in which they get on with their work, and have they greater facilities in obtaining employment?—I believe not. One master told me a short time since, who has had them taught on both systems, that he would much prefer them taught on the old system. He has had them on the old system and on the oral system. He has had several apprentices, I believe half-a-dozen.

18,185. (*Rev. Mr. Sleight.*) Will you state who it is?—Mr. Guy; he is a cabinet-maker in Old Street, St. Luke's.

18,186. (*Rev. Mr. Owen.*) Your work in London brings you in contact with the former pupils of pure oral schools, I suppose?—Yes.

18,187. Which, in your experience, have the greater knowledge of written language, the orally taught or the sign and manually taught?—The sign and manually taught have a greater command of written language.

18,188. You say that a great many of the orally taught attend your services?—Not a great number, a few. They occasionally drop in.

18,189. How do they pick it up? They all seem to know the manual alphabet, and they all seem familiar with signs. In fact, signs are their natural language and they will use them.

18,190. Have you any knowledge of the views on the matter of the parents of the children who have been taught on the two systems?—The parents say that they cannot understand what the children who have been taught on the oral system say.

18,191. Then how do they communicate with the orally taught children when they come home for the holidays?—As a rule, the parents sign to the children. Very few will take the trouble to write to them.

18,192. According to your knowledge it is the exception, then, for orally taught children to communicate orally with their parents?—Yes.

18,193. (*The Chairman.*) Except, I suppose, in the case of semi-mutes, who have spoken before they were deaf?—Even then they will use the old system. I know a case where a lad was apprenticed for five years to a gentleman in Hatton Garden, and he had been three years with his master before his master knew that he could speak at all. He was a semi-mute, and he could really speak very well. He was at Messrs. Short and Mason, manufacturing opticians, in Hatton Garden. I called one day and he had the apprentice in, and I began to speak to him and he said, "I never knew till last night that he could speak. "As I was going out of the door I heard someone, in "a very peculiar voice, say, 'Good night, sir,' and I "found it was the apprentice."

18,194. You have had considerable experience as a teacher of the deaf and dumb and also by coming in contact with them in after life?—Yes.

18,195. Speaking generally, are you able to give an opinion as to which is the better system?—I think not. I should hardly like to give an opinion as to which is the better system.

18,196. (*Rev. Mr. Sleight.*) Did I rightly understand that you disapprove of all institutions for the deaf and dumb?—No; I think they would be better on a smaller scale.

18,197. Then we may take it that you disapprove of the action of the Old Kent Road Committee in building such a large school at Margate?—I cannot disapprove of their action as I am their servant, and it is not my place to give an opinion; but, so far as my private opinion goes, I think small institutions are better than large ones.

18,198. And that institutions are better than Board School classes?—Undoubtedly.

18,199. Can you inform the Commission what number of old pupils from the Old Kent Road you have on your list and whom you are now visiting?—Seventy-four at the present time.

18,200. Have they all been educated at the Old Kent Road?—Yes; and they are now apprenticed to different trades in London. I have nothing to do with the country cases, I have only to do with the London children.

18,201. How long do you continue to superintend those pupils?—Till their apprenticeship expires, from five to seven years. The majority are apprenticed for five years, but some few for seven years, because some trades, compositors, for instance, will not take an apprentice under seven years.

18,202. (*The Chairman.*) After the termination of their apprenticeship does your care of them cease?—Not always.

18,203. (*Rev. Mr. Sleight.*) After they have passed through their apprenticeship, if they happen to be out of work, does it come within your scope to find work for them?—They are generally told to apply to the Royal Association. I generally, as soon as their apprenticeship expires, or before, see their masters and try to induce them to keep them employed if they are worth keeping, and in five cases out of six the masters retain their services as journeymen.

18,204. What premium do you usually have to pay?—The committee of the Old Kent Road pays the premium, but frequently the friends of the children, if they are pretty well off, will add 5*l.* more; it depends upon the trade. The committee give 5*l.* for a girl, and 10*l.* for a boy. Occasionally, if they live in a poor, out-of-the-way neighbourhood, there is a difficulty because the masters prefer their living close handy.

Mr. H. Broom.

31 Oct. 1887.

18,205. Have you at present on your list any apprentices who have been educated wholly on the oral system?—Yes, I have one or two, I believe; but it is only a very short time since they left the institution. I have two boys apprenticed to basket-makers in Bermondsey, and a girl apprenticed to a dressmaker in Bermondsey, and I have also a boy apprenticed to a bootmaker; that is four, three boys and one girl at present.

18,206. In your opinion, are those doing any better than the children who have been taught on the sign system?—No; they seem to be doing about the same. Those four that I mentioned are fairly intelligent children, and we frequently get them very dull and stupid.

18,207. Can you tell us whether they were born deaf mutes?—Three of them were born deaf; the fourth was not; she lost her hearing when she was between six and seven years old.

18,208. For how long have you conducted services on the Sunday?—From nine to ten years.

18,209. In your opinion could a service be conducted orally so that it could be understood by a congregation of deaf mutes?—Certainly not.

18,210. By a congregation of a hundred, say?—I should say myself that it is impossible, but I believe it is done. I have read that it is done in America. So far as my experience goes it is impossible.

18,211. (*The Chairman.*) Have you ever seen a hundred purely orally taught deaf mutes?—No.

18,212. Therefore, the conditions which would enable you to form an opinion do not exist at the present moment in London?—No.

18,213. (*Rev. Mr. Sleight.*) Whether the congregation is 100 or ten, could it be done in a room the length of this room?—No, I think not. I do not think it would be possible. I do not think they could see the mouth sufficiently.

18,214. Under the most favourable circumstances, having a light thrown upon the speaker's lips, if you like, do you believe that a number of deaf mutes educated orally could understand an address given by your lips?—I believe not.

18,215. What is your opinion of the general condition of the adult deaf in London at the present time, are they in good work or not?—I believe that the majority are fairly at work at the present time. They frequently tell me that they are out of employment, but I have not heard many complaints lately. However, it is not my business to attend to that.

18,216. Have you ever conducted the service for the deaf and dumb at the Margate Institution?—Yes; we had to take it in turns on Sunday afternoons many years since.

18,217. But have you done it recently?—No; I have nothing to do with the Margate Institution, only outside.

18,218. (*Dr. Tindal Robertson.*) I understood you to say that there was greater difficulty in educating the deaf mutes because there was some defect of organisation as regards their general health; is that opinion founded upon any facts which you have observed?—I do not think I expressed that opinion.

18,219. (*Rev. Mr. Sleight.*) I think you said that the deaf and dumb were mentally deficient?—I think not. I said that they had too short a period of education.

18,220. (*Dr. Tindal Robertson.*) And in addition to that, that they were not so competent on the whole?—As a class, they are not so competent as hearing children.

18,221. Do you mean physically competent or mentally?—Mentally; they are not so intelligent; they are not so bright. As a matter of course, their senses are dulled. They have been kept in ignorance; they have only seen things, they have heard nothing.

18,222. I asked the question because the evidence we have had, as a general rule, tends to show exactly the contrary; that they are very bright and intelligent, and on a par with hearing people?—The majority are intelligent enough, but many are dull.

Mr. H. Broom.
31 Oct. 1887.

18,223. Is there anything in their physical condition which produces that dulness?—I think frequently they are the offspring of deaf and dumb parents; in fact, at the present time I know of a third generation.

18,224. Do you know any deaf and dumb who are the offspring of blood relations?—Yes, of first cousins.

18,225. Is that frequent in your experience?—It is.

18,226. Which is the more frequent, the parents having been deaf and dumb or the parents having been closely related?—I think, so far as my experience goes, the parents being deaf and dumb.

18,227. Have you any statistics on that matter?—I have not, but I believe there are some.

18,228. Could you refer us to them?—I do not think I could, but I have heard that there are statistics to that effect.

18,229. Have you any idea as to what the average wages of the deaf and dumb in London are as compared with those of an ordinary hearing person?—A good deaf and dumb mechanic will earn as much as an ordinary workman.

18,230. Is there any difficulty in his getting work in any particular trade; is there any tendency to exclude him on account of his deafness?—I think not, unless it is in a case where there is machinery. The masters will object to take deaf and dumb people where machinery is used,

18,231. Are there any cases where hearing men object to a deaf and dumb person being employed?—I think not. I think on the other hand that they sympathise with him.

18,232. Do you know whether the deaf and dumb belong to ordinary trade societies?—I believe not. In one or two instances they are bound to join a society.

18,233. Why do they not belong, as a general rule, to the trade societies; are they excluded?—No; I think it is not brought under their notice.

18,234. But it is brought under the notice of all other workpeople?—My experience so far as compositors goes is that they have to join a society.

18,235. Is it your experience that they have ever been excluded from any society?—No.

18,236. Do you know why the masters object to the employment of the deaf and dumb where there is machinery; is it on account of the Employers' Liability Act?—I believe not; I believe it is on account of their deafness.

18,237. (*Rev. Mr. Sleight.*) There is nothing in the Factory Act, is there, to prevent deaf and dumb children working where there is machinery?—Not that I am aware of.

18,238. When a compositor is a member of a trades' union can he work for less than the trade price?—I cannot say, because they would not be compelled to join the union till after they are out of their apprenticeship.

18,239. And then you would not follow them?—I do not follow them then.

18,240. (*The Chairman.*) Then you hand them over, as I understand, after their apprenticeship to the care of the authorities at the Institution in Oxford Street?—In case they came to the office and complained that they were out of employment, and said, "Could you help us in any way?" If I knew any master who wanted a man I would try and help them; but otherwise the Committee would say, "You had "better apply to the Royal Association, and their "chaplain will assist you; it is out of our province."

18,241. Is there a special committee to superintend your department at the Old Kent Road?—The General Purposes Committee attend to it.

18,242. May I ask what your salary is? Have you a separate salary for both those offices?—I have a separate salary for the Old Kent Road.

18,243. Have you any objection to say what the salary is?—No. The Old Kent Road Institution pays me 30*l.*

18,244. (*Rev. Mr. Owen.*) We are a little more liberal to you?—Yes.

18,245. (*Dr. Tindal Robertson.*) Then it does not take the whole of your time?—No; I am also employed by the Old Kent Road Committee as their collector, for which I get a commission. I have other duties besides.

18,246. (*The Chairman.*) Is there anything else which you wish to lay before us?—No.

Adjourned to to-morrow at 11 o'clock.

No. 6, Old Palace Yard.

Tuesday, 1st November 1887.

PRESENT:

THE RIGHT HON. THE LORD EGERTON OF TATTON IN THE CHAIR.

W. TINDAL ROBERTSON, ESQ., M.D., M.P.
B. ST. JOHN ACKERS, ESQ.
THE REV. W. BLOMEFIELD SLEIGHT, M.A.
THE REV. CHARLES MANSFIELD OWEN, M.A.
L. VAN OVEN, ESQ.

CHARLES E. D. BLACK, ESQ., *Secretary.*

Mr. JOHN RICHARD BROWNE examined.

Mr. J. R. Browne.
1 Nov. 1887.

18,247. (*Chairman.*) You are clerk to the guardians of St. George's-in-the-East?—Yes.

18,248. How long have you held that office?—Ten years.

18,249. You take a general interest in the education of the deaf and dumb and the blind?—I do.

18,250. Has it struck you that the lot of the blind and the deaf and dumb in workhouses is one that ought to be alleviated and improved?—I think it might be improved.

18,251. Can you speak of the treatment of the deaf and dumb and the blind in workhouses in London generally?—Before I went to St. George's-in-the-East I was at Bethnal Green. The afflicted classes of whom you speak have not the same privileges at Bethnal Green that they have at St. George's.

18,252. In your workhouse what is the number of the blind?—The number in the workhouse and the infirmary at the present time is 25, there being 13 in the workhouse, and 12 in the infirmary.

18,253. What are the ages of those persons?—45 and upwards.

18,254. Can you distinguish between the sexes of those persons?—Yes; there are eight males and 17 females.

18,255. Are both the males and the females generally those who have by some accident been deprived of their sight in middle life?—The greater number of them are.

18,256. Is there, to your knowledge, any provision in London for the blind who by some accident are deprived of their sight except the workhouse?—No.

I may mention that in August 1886 a man named Downey, who was 23 years of age, came into our workhouse, and I have been trying ever since all over England to get that man into an institution, and I have been unable to do so. I have had 20 or 30 letters in relation to his case, and in fact I am trying now to get him into an institution. He is being kept at present by Mr. Crowder.

18,257. Do you think that the boards of guardians or the State should provide some asylum for the maintenance and support of those who have become blind in middle years by accident or otherwise, and who have no friends to support them?—I think so, decidedly. I think there ought to be an institution in London for such persons on the same footing as the asylums for imbeciles. Take a man 23 years of age; if he is in an institution he can be taught to help to maintain himself, whereas if he is in the workhouse we have no one to teach him. I think that the cost of the maintenance of such persons in such institutions should be a charge upon the Metropolitan Common Fund, the same as the asylums for imbeciles.

18,258. Are any of the inmates of your workhouse those who have been born blind and who have been brought up in any of the London institutions, and who, having, so to speak, learnt a trade, have been unable to earn a livelihood by that trade, and so have come to the workhouse through poverty?—No, I do not think so.

18,259. The majority of them would be those who by some accident or other have lost their sight, and who have had no teaching and could have had no teaching in those trades which are especially suited for the blind?—We had an instructor for them for three months, who used to come once a week; but it is difficult to teach them unless they are taught daily.

18,260. Are there also any deaf and dumb in your workhouse?—No; we have altogether only two deaf and dumb who are chargeable, and they are away; one is at Boston Spa, Tadcaster, and the other one is at Margate.

18,261. Are the blind kept as a class in your workhouse apart from the other inmates or are they mixed freely with the others?—They are mixed freely with the old and infirm; they are treated as old and infirm.

18,262. Is there any one to help them in various things in which they require help?—Miss Arden comes every Monday and spends, perhaps, a couple of hours there, and reads to them.

18,263. There is no workhouse provision made for them?—No; you find that throughout London, I think.

18,264. There is no provision of this kind, that those who are in the same wards with them, who can see, read to them?—If it is done, it is done by the paupers out of kindness to them.

18,265. Is it, as a matter of fact, generally or constantly done; that is to say, are those who are in the same ward with them willing to show kindnesses to them by reading to them?—Yes; they read the papers to them, and so on.

18,266. Are you prepared to state what is the number of adult blind in the London workhouses?—No. A return has been sent round to the workhouses for them to fill up, from which you will get that information.

18,267. Have you filled up that return?—Yes.

18,268. I see that you have five males and one female in special schools for the blind; what do you pay for their maintenance or education?—At Norwich we pay 6*s.* and provide them with clothing; at Nottingham we pay 3*s.* 6*d.* and find their clothing; at Liverpool 4*s.* 2*d.* and clothing, and at Sheffield 4*s.* 7*d.* and clothing. We have two at Nottingham out of doors. We pay 12*s.* a week if they are outdoor paupers. Those two would be between the ages of twenty and thirty.

18,269. Are they outdoors workers?—They were previously in a school, and they got too old for school and we sent them to Nottingham, and they are treated as outdoor non-resident poor.

Mr. J. R. Browne.
1 Nov. 1887.

18,270. Are they being taught a trade there?—Yes, they are outdoor pupils.

18,271. So you hope that after a time they will be able to earn their livelihood?—Yes, that is why we sent them there. The Nottingham board of guardians through their relieving officer pay some one where they lodge and we pay the Nottingham board of guardians back again.

18,272. As I understand, they are day workers in the blind school at Nottingham?—Yes, the Midland Institution for the Blind.

18,273. What do the blind cost you in the workhouse?—Their maintenance, food, and clothing cost us 6*s.* in the workhouse and 7*s.* in the infirmary; that does not include officers' salaries or building or anything of that sort. Including everything the cost is 32*l.* 10*s.* a year a bed; the average in London is 33*l.* 16*s.* 4*d.*

18,274. So that it costs you as much to keep them doing nothing in your workhouse as it does to keep them in some institution where they can be thoroughly trained to work?—Yes. If you take the Darenth Asylum for Imbeciles the average cost is 34*l.* 14*s.* At Leavesdon the cost is 8*s.* a week, including food, clothing, firing, officers' salaries, building, and everything; and at Caterham the cost is 8*s.* 3*d.* Where these children are sent to institutions a long way from London the guardians are put to great expense. If a child goes to Liverpool, we will say, the single fare is 16*s.* 6*d.*, then an officer has to go with the child, and there is his fare there and back so that altogether it costs 49*s.* 6*d.* to take a child there. Then, again, when the holidays are on the institutions are closed, and the children have to come up and go down again, so that it is a great expense to the parish when you have a number of children out at institutions a long way from London.

18,275. In order to avoid that would you recommend that a Metropolitan Industrial Training School for the Blind should be established?—Decidedly.

18,276. You think that would be more economical than sending children to Liverpool and other places?—I am sure of it. Then, again, there are children in the parish whose parents will not let them come to us who would be far better in an institution.

18,277. Do they object because it would be receiving relief from the parish?—No; they object because the institution to which we might send their children is such a long distance away that they could not see their children as often as they wished.

18,278. Do you consider that there is an objection on the part of those who, from no fault of their own, have become blind from accident to being placed in a class with those who are receiving parish relief and who, perhaps, have become paupers from their own fault?—Yes; no doubt some have that feeling; whereas if there was an institution to which they might go they would not look upon it as relief.

18,279. They would not look upon it as being in connection with the poor law?—No. Take Leavesdon and those other institutions, they look upon them as asylums and not as workhouses. There is not the workhouse taint attached to them.

18,280. You think that there would be less objection on the part of parents to send their children to a place of that kind, or on the part of individuals going there, than there would be to going to a workhouse?—Certainly. Then, again, there is another objection to the present system. When the children come home for their holidays we have seen them begging in the street. Of course their parents like to take them for the month's holiday that they get, but it undoes in a great measure the good which the institution has done them.

18,281. Cannot you prevent them from begging in the street?—No; we cannot keep the children in the workhouse. The parent turns round and says: "I won't have my child in the workhouse." All that we could do with the view of preventing them from begging would be to say: "Mrs. So-and-so, if your child is seen in the street again we will not send it to

Mr. J. R. Browne.
1 Nov. 1887.

an institution"; but the child is found begging nevertheless. Then there is another objection to these institutions being a long way off, and that is that the guardians are not empowered to visit them. They cannot go to Sheffield or to Liverpool and charge their expenses on the rates, and they will not pay them out of their own pockets. The boy Downey was at the Catholic Institution in Brunswick Street, Liverpool, and he said he would not stop there because he had not enough to eat. I do not know how true it was. We did not go down to inquire into that; we had only to take his word for it.

18,282. Did you make any inquiry as to the truth of that statement?—No; perhaps he had a better appetite than many of the others. Then, again, in travelling those long distances these blind children run a great risk; we do not send an officer down with persons who are over sixteen years of age; we only send down an officer with children; we put them in the train and give the guard, perhaps, a shilling to look after them; of course they run a certain risk. I may state with regard to the deaf and dumb that for the child at Boston Spa we pay 15*l.* a year, and for the one at Margate we pay 25*l.* a year.

18,283. Will you tell us how the treatment in other workhouses differs from yours?—We have special rules. This placard* (*producing it*) is stuck up all over the building. When I was connected with the Bethnal Green board of guardians the blind were not classed as infirm; they did not receive infirm diet.

18,284. This gives some occupation to the blind because you allow them to attend certain classes; who are those classes held by?—By voluntary associations.

18,285. Are they supplied with books by voluntary agency?—Yes.

18,286. You allow Miss Arden to read to them or to teach them to read?—Yes; and a blind man comes about once a month. I am sorry to say it, but at times they come back the worse for drink when they attend these classes. Up to October 1884 we had no special rules with regard to the blind inmates. Mr. Crowder, of Portland Place, is a member of my board, and I believe he consulted Dr. Armitage before the drawing up of these rules.

18,287. On the whole you think it would be to the advantage of the ratepayers, from an economic point of view, to have an institution for the blind in London both educational and industrial?—I think so, most decidedly.

18,288. And it would relieve the rates by making their labour profitable so far as it could be made profitable?—Decidedly.

18,289. Keeping them from idleness and begging in the street?—The blind prefer to have some something to do to occupy their time.

18,290. Are you aware whether there are any deaf and dumb children in your district who are not sent to school at the present time whose parents either refuse to send them or do not send them to school?—I could not say.

18,291. Do you know whether your school attendance officers are aware whether there are any such children in your district?—We do not practically give outdoor relief, so we have no school attendance officer appointed by the guardians; we only give about 4*l.* 10*s.* away a week in outdoor relief; in fact, we have only about 35 outdoor poor chargeable, and they are very old people.

18,292. Do you not pay any school fees?—No; we say the best way to treat the children is to take them into our own school. We say by giving them a small pittance it does them more harm than good.

18,293. What are your rates in the £?—The last quarter they were 6*d.* in the £; that is poor rate only; that would be 2*s.* a year.

18,294. (*Mr. St. John Ackers.*) How is it that you only pay 15*l.* at Boston Spa for the deaf?—That is all they charge us.

18,295. Have you any reason to suppose that the deaf are treated differently at Boston Spa and at Margate?—Margate is an infirmary, as I understand, in connexion with the Old Kent Road Institution.

18,296. Have you any reason to suppose that the deaf and dumb children are treated in a more expensive way in the one institution than in the other?—They are sent to Margate for the benefit of their health, I take it.

18,297. The institution at Margate is simply the institution which used to be in the Old Kent Road?—I was not aware of that.

18,298. Are you aware of any difference of treatment in the two cases?—No.

18,299. (*Rev. Mr. Owen.*) Are many applications, so far as you know, made to the guardians to send deaf and dumb poor children to school which they refuse?—No.

18,300. So far as you know no applications are refused by your board?—Certainly not.

18,301. (*Rev. Mr. Sleight.*) With regard to the two deaf and dumb children that you mentioned, the one that was sent to Boston Spa and the one that was sent to Margate, were they children in the workhouse, or were they children of parents who applied for help?—They were children who had become chargeable, perhaps, from the father dying and the mother being left with three or four children.

18,302. In the case of a child being admitted into the workhouse who was deaf and dumb or blind and who was of the age for education, you would place it in an institution?—Yes, decidedly. We have no children in our school infirmary or workhouse deaf, dumb, or blind.

18,303. In your opinion would School Board classes do the work of the education of the blind and the deaf and dumb better than institutions?—No; I should say that an institution was the best, most decidedly.

18,304. (*Mr. St. John Ackers.*) With regard to the blind who go to these classes and then sometimes come back the worse for drink, who takes them?—A guide.

18,305. One of your own guides?—One of the paupers.

18,306. A guide is not provided by the society who holds the classes?—No; the guide is a pauper.

18,307. Does this lady who reads to the blind in your workhouse belong to any society?—I could not tell you. She does it herself out of love of the thing, I believe. Of course we have other visitors who visit the sick; she takes the blind.

* Saint George-in-the-East.

Rules regarding the blind inmates of the workhouse.

1. All not sick shall be classed as "infirm," and dieted accordingly.
2. They shall be allowed to be visited by friends and visitors at all reasonable times.
3. They shall be allowed to leave the workhouse in charge of friends during the day time, provided that such friends engage to bring them back at the proper hour for inmates to return.
4. They shall be permitted to attend classes outside the house, also entertainments, at all reasonable times, on application to the board, also the Joseph Street Mission Room Service on the third Wednesday in each month, from 6.30 p.m. to 7.45.
   Times at which the Pott Street Classes are held: for men, Tuesday and Thursdays, 10 a.m. to 12.30. For women, Tuesdays and Wednesdays. 2.0 p.m. to 4.30.
   Dinner to be provided for the men on their return.
   Guides for the above purposes to be provided by the master.
   They shall also be permitted to attend a weekly reading to be given at the workhouse by lady or gentlemen visitors.
5. They shall be allowed to be visited by visitors from the Indigent Blind Visiting Society, 27, Red Lion Square, and the Home Teaching Society, 31, New Bridge Street, who may teach them to read and lend books to them.
   These visitors to be conducted to the wards to visit those who are not able to be taken to them elsewhere.
6. A register of all blind inmates shall be kept by the master, such register to be open to the inspection of visitors on application to the master's office, and to contain all resolutions of the board affecting the blind.

N.B.—All partially blind, incapacitated from work by reason of such infirmity, shall be included in the term "blind," subject to any exceptions made by the Board or the special committee.

By order of the Board,
John R. Browne, Clerk.

31st October 1884.

18,308. (*Dr. Tindal Robertson.*) Is it compulsory upon the guardians to send these deaf and dumb and blind children to institutions or permissive?—Permissive.

18,309. Do you know any union where they are not sent?—You can see them walking about the street begging, which is very objectionable.

18,310. In your union they are sent to institutions or schools?—Yes.

18,311. Do you know whether there are some unions where they are not sent?—I could not say. The return will show you if in the case of any particular workhouse there are any in the infirmary or the workhouse or the schools.

18,312. In your opinion would it be advisable that it should be made compulsory upon the guardians in all unions to send these children to schools or institutions?—I certainly think so.

18,313. (*Chairman.*) Have you ever had any interchange of opinion with the other board of guardians in London with regard to the providing of better instruction and accommodation for the blind in workhouses?—Yes; I was speaking to the Chairman of the Bethnal Green board of guardians upon the subject on Sunday, and he is quite of my opinion.

18,314. Have the board of guardians in London ever laid before the Local Government Board any proposition of the kind?—Not to my knowledge.

Mr. J. R. Browne.
1 Nov. 1887.

18,315. Are the views which you have expressed the views of your board of guardians or only your own views?—They are the views of my board of guardians.

18,316. Have they communicated these views to other boards of guardians and obtained any expression of opinion upon them preparatory to laying the matter before the Government?—No; they have not. I told them that I was going to give evidence before this Commission and I told them my views about it, and they quite coincided with the views which I have expressed.

18,317. Would your board of guardians from your knowledge of their views have any objection to the present permissive power being made compulsory?—No, because we send all the children to institutions that we possibly can.

18,318. (*Rev. Mr. Owen.*) Are you aware that in the case of parents of deaf and dumb children who are not themselves chargeable to the parish the Act permits the guardians to send their children to schools without making the parents paupers?—That is so.

Mr. George Benjamin Davis examined.

18,319. (*Chairman.*) You are clerk to the Birmingham School Board?—Yes.

Mr. G. B. Davis.

18,320. How long have you been acting in that capacity?—Since the passing of the Elementary Education Act, nearly 17 years.

18,321. Are you aware of the number of deaf mute and blind children in Birmingham at the present time?—Our visiting officers have collected those particulars for us from time to time and they keep them now pretty fairly posted up; the last return, which was about six weeks ago, showed that between the ages of 5 and 13 there were 55 deaf and dumb children and 14 blind children.* We take the ages of 5 and 13 because they are the ages between which children are, under ordinary circumstances, subject to the Education Act byelaws. The numbers do not vary very much from year to year. In 1885, the total number was 64 deaf and dumb and blind together.

18,322. You say the last return showed that there were 55 deaf and dumb children and 14 blind children between the ages of 5 and 13. How many of those are under 8 years of age?—There are 20 under 8 years of age.

18,323. How many of them are likely not to require assistance from the rates?—Taking it generally, about one third: we can never get the exact number, because some of the poorest people are helped by benevolent friends and people for whom the parents may happen to work.

18,324. Are the remainder at present sent to school?—Oh, no; there is a considerable number of them at home, and many of them, I may say, getting no education at all. A few are visited by a sort of home mission.

18,325. What in your opinion is the remedy for this state of things?—The School Board have had this matter before them for some years past, and they came to the conclusion long ago that the only effectual remedy would be for the School Board to have the power to send those children to residential institutions. They have come slowly and by steps to that conclusion, but they think they have strong reasons to justify it.

18,326. One reason, I suppose, being that the children cannot be properly instructed in the ordinary elementary schools, and another reason being that they ought to be instructed like other children?—Yes, just so; they think that instruction cannot be given in day classes satisfactorily. They think that the time is too short and the attendance is too irregular.

18,327. In London, Glasgow, and other places there are classes formed of deaf and dumb and blind children in day schools?—We made some inquiry into that system in 1885, in the first place by correspondence; and then the Board appointed one of its members and myself to come to London and see the classes and to make as full inquiry as we could as to the results. The result of our enquiries was that we did not think the day-class system was one to be imitated. I may give the reason why we thought so. We found, in the first place, that in the day classes in London there was a great deal of difference between the results shown by different children, and we found that those that produced the best results were, as a general rule, if not entirely, children who were residing in Mr. Stainer's homes and therefore were continually under his care. We did not find many cases showing good results, if any, where the children were residing at home with their parents and only coming to the school as other day scholars.

18,328. You are speaking with regard to deaf and dumb children?—Yes; we saw no blind classes, only deaf and dumb classes.

18,329. There are separate classes for the blind provided by the School Boards in several towns; have you any objection to that mode of dealing with blind children?—That would be almost impracticable, or quite impracticable, with us because we have so few.

18,330. The distances that the children would have to come would be great?—Yes; we could not bring those children to any one centre. For geographical reasons we should require to have at least four centres; and to divide so few children amongst four centres would be a most expensive process.

18,331. The evidence before us tends to show that the advantages of mixing the blind with the seeing,

* Between the ages of 5 and 13 there were:

Deaf and dumb	55
Blind	14
Total	69

Of the 55 deaf mutes, there were:

Under 8 years of age	14
Idiot	1
Paralysed	1
Able to be provided for by the help of friends	4
Total	20

Of the 14 blind, there were:

Under 8 years of age	3
Idiot	1
Able to be provided for by the help of friends	1
Total	5

Thus, there were unprovided for but eligible for institutions:

Deaf and dumb	35
Blind	9
Total	44

Mr. G. B. Davis.

1 Nov. 1887.

especially in the case of children, are undoubtedly very great, for various reasons?—I may say at once that I know practically nothing about the education of the blind. We have made no inquiry into that matter, because, as the numbers were so few, every one in Birmingham felt from the first that they must go to residential institutions if they were to be taught at all.

18,332. In the deputation to Mr. Mundella the question of the correspondence between the Birmingham School Board and the Department arose; we should like to have your official account of the matter. There was a correspondence between your Board and the Education Department?—Yes; we sent an application in March 1885 to the Education Department asking them to introduce a Bill to empower School Boards to pay for the maintenance of these children in residential institutions.

18,333. Was that in consequence of any difficulty you had had with the guardians from their refusing to pay for the adequate maintenance of such children?—I can scarcely use the word "refusing," but it was because they did not do it.

18,334. You mean there was a certain amount of friction between you and the boards of guardians?—No, I can hardly say that, but they did not seem inclined to pay for these children. The guardians came to the School Board in August 1884, and asked the School Board to open day classes for these children, so that they might be rid of the whole matter of sending the children to institutions at the cost of the rates. That was the cause why the School Board took steps to inquire as to the working of day classes and their efficiency, and the result was that in January 1885 the Education Committee of the Board reported to the Board that they had come to the unanimous conclusion that these children could only be satisfactorily taught in residential institutions; but at the same time they thought it better for the School Board to take up the matter than leave it in the hands of the guardians. That was the cause of the memorial or letter being sent to the Education Department, but the Department declined to introduce a Bill. After that, in May 1885, the School Board sent a deputation to the Birmingham board of guardians, who explained to the guardians what they had done and how they had failed and why they had failed, and urged upon the board of guardians, as they were the only body having the power to pay, that they should pay liberally and promptly in cases where the parents were too poor to pay themselves. After that, in September 1885, the School Board sent a deputation to the Aston board of guardians. I should say that the borough of Birmingham is divided between three parishes. The central part constitutes the old parish of Birmingham; on the eastern side is part of the parish of Aston-juxta-Birmingham; these comprise the town population; and the western part is the West End in all senses, and does not come into our consideration at all. The Aston board of guardians did not pay fees at that time for children attending day schools, and we knew they were averse to paying fees for anything, and we delayed our deputation to them till September 1885. They did not seem to be aware that they had the power to pay. That was pointed out to them; they wrote to the Local Government Board, and the Local Government Board made it clear to them that they had the power, and since then they have paid for one or two. Although the Local Government Board allows our guardians to pay at the rate of 20*l.* per year, we find at the present moment that there are as many deaf and dumb and blind children out of school as in school belonging to this poorest class. There are all sorts of difficulties in the way of getting education for these children. Some of the parents do not like to apply to the board of guardians, and others who do apply find it very difficult indeed to get their applications granted and the payments made.

18,335. Are many respectable poor people unwilling to apply to the guardians because they feel it to be a step towards pauperism?—Yes, that is so.

18,336. How would you obviate that?—They would not feel so much reluctance if they had to come to the School Board. And another consideration comes in. Not only would they feel less reluctance to come to the School Board than to go the guardians, but they are necessarily brought into contact with the School Board. The School Board visitors visit their homes, discover the cases, and talk to the parents about them, and where the parents say that they are not able to pay for the education of their children they can at once bring them to the School Board, just as they do in the cases of ordinary children attending day schools; but the boards of guardians do not look them up; they know nothing about the cases till the parents voluntarily make application to them, and that they are very loth to do.

18,337. You said a little while ago that you advocated making it compulsory on the guardians to pay for the maintenance of these children, but now you say you think that this power should be transferred from the guardians to the School Boards?—That is the opinion of our School Board.

18,338. You would advocate the adoption of either one or the other course, but of the two you prefer the latter?—Very much; we think it would be very much better for the education of these little children.

18,339. And you think it would be the means of avoiding a great loss of time which is now involved by the two authorities being concerned in the matter?—I am sure it would. We see that in our daily experience.

18,340. The School Board find out these cases and report them to the guardians, and then application must be made by the parents to the guardians to pay for the maintenance; therefore there are two authorities instead of one?—Yes, and the parents have to be induced to make that application.

18,341. Are the board of guardians rather exacting in their standard of poverty?—I am afraid they are. I judge so from the number of applications that these poor people have to make and their want of success in getting their applications acceded to.

18,342. There are a certain number whom the guardians do not admit to be paupers who would be unable to pay for the necessarily expensive education of deaf and dumb or blind children?—That is so.

18,343. Viewing it from an economic point of view, I presume you think that it is not in the interest of the State or the ratepayers that deaf mutes and blind persons should be brought up in ignorance any more than anyone else?—Certainly not.

18,344. Because they become a burden to the ratepayers, and they are likely, perhaps, to become added to the criminal class?—I may say emphatically that as regards those children of parents who are too poor to pay for them at these institutions, if they are not educated they have no means of getting a living in after life, and they must, therefore, become either beggars or paupers.

18,345. Has your School Board at all considered the particular form of education which is most suitable to deaf and dumb children?—In one respect we have not gone into that, but in another we have. As regards the question which system is the best for children who can be taken at an early age and kept in good residential institutions for a considerable number of years, and especially if the cases can be selected, the School Board has not formed any opinion about that; it is rather outside our work, and it appears to be rather a matter for experts; but as regards the question which system the School Board ought to introduce if they were to establish day classes, the result of our visit in connexion with the question was that it would not be advisable to adopt the oral system as the main means of instruction, we might or might not try to add a little of it, but we came to the conclusion that the main instruction must be on the sign system.

18,346. I suppose you are aware that there are a good number of partially deaf mutes who have some remains of language; you would not allow them to lose what knowledge of speech they might have, would you?—No.

18,347. Wherefore under the system of day classes it would have to be a combined system, would it not?—I think so; if it were possible to collect such cases together, I should say certainly, they would be the very children upon whom to try the oral system.

18,348. There would be no doubt on your part as to the advisability of giving them oral instruction?—No, but we should have to collect all the deaf and dumb children into classes.

18,349. If you adopted the system of instruction in institutions there would not be that difficulty, because those who had some remains of speech would be sent to oral institutions, according to your view, and those who had not, might or might not be sent to oral institutions, as might be decided from time to time?—Yes. With regard to day classes for all deaf and dumb children collected together, I think the difficulty would be that the cases could not be selected, and that we could not guarantee a sufficient number of years' attendance.

18,350. Did you come to any conclusion as to the time that ought to be given to the education of the deaf and dumb on either system?—We only had regard to the time we were able to keep children under instruction according to the Education Acts. The Education Acts limit us to the ages between 5 and 13 and the institutions do not receive children till they are 8; so that it would be from 8 to 13, or at the most from 8 to 14, taking the 1876 Act. With regard to the oral teaching, I can only give the results of my inquiries; I cannot give anything from my own knowledge, but we were told that in cases where the pupil managed to talk sufficiently to carry on some amount of conversation, 9 or 10 years' tuition had been required. Of course we could not guarantee nine or ten years. Some of these children come into our school at the age of 10 or 11.

18,351. In any alteration of the law, do you think it would be desirable to give a longer period of instruction to the afflicted classes, the deaf and dumb and the blind, than is given in the ordinary elementary schools?—I do, but still there would be this difficulty, that many children would not be got hold of till part of their school life had gone. In Birmingham, for instance, there is a vast amount of emigration and immigration, and people who bring their children into the town, as a rule, have not had very much done for them. I am not speaking of deaf and dumb and blind children, but generally; they have received much less education than they would have received with us. We should not get hold of some children till they were 9 or 10 years of age.

18,352. If there were a general law applicable to all places those children who came into Birmingham from other places at the age of 9 or 10 would have received some education outside?—If the law was well enforced, which we do not find the existing law to be.

18,353. You think that the tendency of the poorer classes, to migrate from one town to another, is such that it would be very difficult to lay hold of many of these children till after they had been some time in the town. A year or two of their school age might, perhaps, elapse without their getting education at all?—That is my experience with children generally, and I see no reason for supposing that there would be any difference in the case of these children because their parents would belong to the same class.

18,354. You have no experience or knowledge of the blind in the workhouses in Birmingham?—None whatever. I think the blind children in Birmingham are sent to our Edgbaston Institution.

18,355. (*Rev. Mr. Owen.*) Our institution is large enough to admit all the blind in Birmingham?—I might add to that that the Deaf and Dumb Institution is being enlarged mainly through the energy of the Rev. Mansfield Owen, and we think there will be plenty of room in that institution for all the Birmingham children; all that is wanted is the means of paying for them.

18,356. (*Chairman.*) You suggest that they should be paid for through the School Board?—Yes.

Mr. G. B. Davis.

1 Nov. 1887.

18,357. (*Dr. Tindal Robertson.*) I gather from your evidence that you think that the attendance at school of these afflicted classes should be made compulsory as in the case of ordinary children?—I think so.

18,358. If the education of such children was made compulsory, you would of course expect that there would be inspection?—Clearly. I do not think you could make the attendance of deaf and dumb and blind children compulsory without providing a ready means of paying the expenses when the parents were unable to pay them themselves, and then inspection must necessarily go with that.

18,359. From your experience do you think that the inspection should be made by experts, or do you think it could possibly be done in any satisfactory manner by the ordinary inspectors?—That is a question I hardly expected to be asked. I do not know enough about the working of deaf and dumb and blind institutions to be able to answer it. I should think that experts would be better inspectors than the ordinary inspectors; those who knew most about the work would be best fitted to examine the schools.

18,360. If day classes for the instruction of the deaf and dumb and the blind were formed in board schools, or if the School Board had power to send such children to institutions, has your board formed any opinion whether it would be advisable to include technical education in their course of study before they left school?—They have not considered that question at all.

18,361. Have they taken that matter into account with regard to ordinary children?—We are doing all that the law allows in the way of giving technical instruction; our seventh standard children receive all the technical instruction that we are able as a school board to give them.

18,362. From your experience, if that is so, would you not say that it would be advisable that those children who depend so much upon skill in after life for their living should have the same kind of instruction given to them?—Personally, I think it most desirable. In the blind schools, I suppose, it is always given; it is at our Edgbaston Blind School.

18,363. Without unduly extending the educational course, you would think it advisable towards the end of the course to combine with the ordinary instruction as large a system as possible of technical instruction?—I think that in the later years the two should be combined, but the extent to which they should be combined I would rather leave to those who are more acquainted with the education of deaf and dumb children than I am myself.

18,364. Do you think that the education of the deaf and dumb in Birmingham at the present time compares favourably with that given some time since?—I think so; the Edgbaston Institution seems to have received new life. There are two residents in Birmingham who have done a great deal in developing that institution. The Rev. Mr. Owen, who is a member of this Commission, and Mr. Walliker, the Postmaster in Birmingham, have been extremely energetic, and they seem quite to have infused new life into the institution. It is now being enlarged, and in fact I know that the Rev. Mr. Owen devotes all the time he can spare to it.

18,365. As a consequence of those efforts, you think that the education of the deaf and dumb in Birmingham is of a higher type and better conducted than it was when you first became acquainted with the place?—I think so. It is only a general impression because I cannot say much about what the education formerly was. I visited the school some time ago and I thought it was doing as much as I supposed it was capable of doing; still there seems to be more life and more development of thought about it now.

18,366. Do your visiting officers find as many deaf and dumb and blind children still without education as when you first began to collect statistics?—Very

Mr. G. B. Davis.

1 Nov. 1887.

nearly the same number; the number is not much affected by the payments by the guardians.

18,367. Do you think it is affected by so much emigration and migration?—I do not think it is affected from year to year by that; if you take the statistics at any particular time you will find that the number is very nearly the same as when they were taken at any other time. It may be slightly affected by the payments by the guardians, but very slightly. One special reason comes in for that. The Birmingham board of guardians was a little more willing to pay some years ago than they have been since, through an alteration that was made by the managers of the Deaf and Dumb Institution. Their charge to the poor people if they offered to pay for their own children was 6*l.* a year, and for a time they admitted children sent by the guardians at the same rate, but their subscriptions are not at all abundant, their funds are low and they have been getting in debt; in fact, they did not feel justified in using their subscriptions to save the rates, though they did feel justified in using their subscriptions to help poor parents. Consequently they told the guardians that when they sent children they must look to them for the cost of maintaining the children in the institution, which was 20*l.* a year. The Local Government Board quite sanctioned that, and made an order allowing them to pay up to 20*l.* a year; but the guardians thought it a good deal of money to pay. Though they did not object to it on principle, they were anxious to avoid paying for any more cases than they could help.

18,368. There being this objection on the part of the guardians, do you think that if the opinion of the ratepayers was taken upon the question there would be any strong feeling in opposition to the payment by the guardians of the cost of the maintenance of those children in the institution?—I have no doubt whatever that the ratepayers as a body would be quite willing to pay, and that they would not at all object to the School Board having the power to pay for such cases.

18,369. (*Rev. Mr. Sleight.*) How many of the 55 children that you have stated are deaf and dumb and blind are at present being educated?—I have not that with me. I can give you the return for 1885. At that time out of 64 cases there were 40 over eight years of age, and 9 of those were provided for.

18,370. That is including blind?—Yes. Then of the remaining 31 there were three children who could not be provided for: one was partly paralysed, one was regaining speech, and the other had removed from the borough; that left 28 cases not provided for. I think the number would be pretty much the same every year.

18,371. In those 28 cases would the children be brought up simply in ignorance?—They would be brought up almost entirely in ignorance. There is a deaf and dumb missionary in Birmingham; I do not know who pays that missionary, and they most of them receive visits from him. The instruction that he gives amounts to very little in the way of education; they are practically brought up in ignorance.

18,372. The School Board making no effort to have them educated?—I can scarcely say no effort, but they are doing nothing themselves. All these inquiries in Board schools where deaf and dumb were being educated, the application to the Education Department for a Bill to be introduced, and their subsequent deputations to boards of guardians show that they were anxious that something should be done; but they did not want to establish an inefficient system, and they believed that day classes would be inefficient.

18,373. You say that in 1885 nine were provided for; how many of those nine where paid for by the guardians?—Four were assisted by the guardians and five were paid for by benevolent persons.

18,374. Did the guardians pay in every case 20*l.*?—Yes, in every case. Children are only admitted on those terms.

18,375. In your opinion would the expense of School Board classes for these afflicted persons be more or less than sending them to residential institutions?—The day classes would probably cost a little less, but not much. We found that it would be hopeless to start classes in fewer than four centres, and one teacher for each centre would cost 80*l.* a year. Then we should have to rent a room or build one, and there would be fuel, light, and the apparatus to provide; we could not put that at less than another 20*l.*, that would make the total 100*l.* a centre, or 400*l.* in all. Now 400*l.* would pay the total sum for 20 children in institutions, including maintenance; the number to be provided for is generally only about 25, and it is certain that the parents of some of those children could pay some part towards the cost, so that probably it would not cost much more than 400*l.*; at the outside it could not cost more than 500*l.* Then, if we established day classes, the blind would be left totally unprovided for, because we could not provide for them by day classes.

18,376. Why could you not instruct the blind in day classes?—Because there are so few, we should only have a small class if we could bring them all to one centre, and that would be a physical impossibility.

18,377. Do you think that the children would be physically better for being in residential institutions?—Very much better, I am sure of it. We are speaking of very poor homes, homes belonging to people who cannot pay 6*l.* a year.

18,378. Then by the residential institution system the children would be educated and maintained at very little more expense than it would cost to educate them in day classes attached to board schools?—Yes, and they would be very much better provided for, both as regards maintenance and as regards education.

18,379. In the case of parents applying for their children to be educated at the expense of the rates, do they have to apply to the Board in person?—Yes, and they also have to go more than once, in some cases many times.

18,380. The matter can never be settled by correspondence through the clerk of the School Board?—No; they have to lose a great deal of time. I should explain what I mean by that. I do not know that that is absolutely necessary by any orders of the Local Government Board or any law affecting the case. I only mean that it is practically required in Birmingham.

18,381. The School Board at Birmingham, we may take it, is perfectly satisfied with the education that is being given at the Birmingham Institution?—We believe the institutions, both that for the deaf and dumb and that for the blind, to be exceedingly good.

18,382. And the School Board are perfectly satisfied with the system adopted there?—Yes, so far as we know; we believe it is all that can be wished.

18,383. (*Rev. Mr. Owen.*) I believe that the guardians have power to send deaf and dumb children to school without pauperising or disfranchising the parents?—Yes, we had occasion to look that up when we had our interview with the Aston board of guardians in September 1885. I have not the Act with me, but it is so; the parent is not pauperised. The child becomes technically a pauper whilst it receives the relief but the parent does not become pauper.

18,384. (*Chairman.*) Supposing it is the fact that the parent is not pauperised, he feels that he is in a position which is a somewhat degrading one or one which is disagreeable to himself?—He feels it degrading if he is a decent man. The enactment that the parent should not be made a pauper makes very little difference practically except that the man does not lose his vote, because a man feels that he is a pauper when he goes to the guardians and the guardians do not care to remove that impression.

18,385. (*Rev. Mr. Owen.*) You would like the education of the deaf and dumb to be given through some other agency than the guardians?—Just so.

18,386. Then in your view if State aid was given it should be given either through the School Board or through some other local body and not through the guardians?—Yes, if I may give my own opinion with regard to State aid, I do not see why State aid should not be given direct to the institutions as it is in the case of industrial schools and ordinary day schools. In the case of State aid being given, of course the contribution from the local rates would be less.

Mr. G. B. Davis.

1 Nov. 1887.

18,387. You would advocate some system of payment by results?—If it were possible to apply a test.

18,388. When you visited the day classes for deaf and dumb children in the board schools in London, did you ask those who were responsible for the teaching whether they would care about submitting to a test with a view to a grant on results?—Yes, and I found that they were not prepared to submit to a test. The reason given was that they were endeavouring to work the oral system thoroughly, and they explained that it was a very slow process in the early years, and consequently they would not be prepared to pass their pupils through examinations; in fact, I was told very candidly not only by the superintendent of these classes, but also by one of his teachers who had been trained in the oral system, that it required nine or ten years of close care; and though the pupils made rapid progress after a number of years, they made very slow progress at first; indeed, they seemed to limit the rapid progress to special cases; they said it was not equally suitable for all cases, it seemed to be most suitable for non-congenital cases.

18,389. As the result of your visits to the London schools you reported to the Birmingham School Board against the oral system as adopted by the London School Board?—We did, and on this ground. These children would come into our care for, at the most, three or four years. During those three or four years our School Board would think it important to enliven the children's intellects, to give them some actual knowledge and make them as bright and intelligent as possible; and if they were taught on the oral system pure and simple those three or four years would be occupied in getting them to speak a very few words and sentences.

18,390. Did you and the member of the School Board who accompanied you examine the children yourselves by asking questions?—Yes, and we found that a very few children could answer a number of questions fairly if we spoke very slowly and gave them time. I must say the style of speech was not pleasant; it would not be likely to be agreeable, but still a few of them could answer somewhat brightly. We inquired with regard to those whether they were purely day scholars, and we found that the brightest of them came from Dr. Stainer's homes, so that they were really residential scholars. We were also told with regard to one or two who struck us as being particularly bright that they had not been born deaf and dumb. The most we could get from, I may say, half the scholars were answers to such questions as these: "What is your name?" "How old are you?" They answered those two questions in precisely the same form.

18,391. You consider the fact that Mr. Stainer provided homes as an argument in favour of the institution system as against the day-school system?—Yes; I know that that is Mr. Stainer's opinion; Mr. Stainer told me so himself. I have seen him several times since that deputation and had long conversations with him, and I believe it is because he sees the advantages of the residential system that he is multiplying his homes as fast as he can. He is quite an enthusiast and spends all the money he can get in establishing homes. It is reasonable to suppose that the children in the homes will progress much more rapidly than irregular day scholars.

18,392. Another of the reasons why you reported against the adoption of the oral system was because it was more expensive than the sign system?—Yes; we found it would be apparently quite as expensive, or nearly as expensive, if we had only one class at each centre, and then that admitted of no grading; besides which the classes for oral teaching must be small; not more than 10 children in each.

18,393. Another reason why you reported against the oral system was because you could not rely on regular attendance?—Yes. A teacher on the oral system has not a fair chance without regular attendance.

18,394. Did you ascertain what was the average attendance of deaf and dumb children at the London Boards schools?—The average was about 70 per cent. I believe that included children attending from the homes.

18,395. If it were not for the homes the attendance at the day classes would be even less?—Yes.

18,396. That you think another argument against the adoption of the oral system?—Yes; I do not see how we could enforce a regular attendance at day-school classes. No one would expect that such afflicted children should be sent through the streets with the same freedom as children who can take care of themselves.

18,397. To go back to the condition of things in Birmingham, are you aware that one of the female teachers at the Deaf and Dumb Institution has voluntarily undertaken a night school?—I did not know it.

18,398. Are you aware that on account of our new alterations we hope to be able to take in all the deaf and dumb in Birmingham who are uneducated?—Yes, I am aware that the enlargement is being made with that object.

18,399. Are you aware that at the annual meeting a few days ago we admitted all the applicants straight off?—Yes. I am a subscriber, and I received my usual form to give my votes and I found that there were no votes to give—that all the applicants were to be received.

18,400. One word about apprenticeship; would the School Board funds be available to apprentice deaf and dumb children after leaving school?—Not in the present state of the law.

18,401. Would you advise that the law should be altered to admit of that being done?—It is a difficult question, because you raise the question as to helping other poor children into the world.

18,402. Do not you think that the affliction under which the deaf and dumb and the blind labour should be taken into consideration?—Yes; but I am not sure that the duty of apprenticing deaf and dumb children, or blind children, should fall upon the School Board. I should not like to hazard a hasty opinion upon that.

18,403. The guardians pay 20*l.* a year for children admitted into our institution, as you are aware, and even those paid for by the guardians cost us 5*l.* a year in addition to what the guardians pay?—I have heard so. I do not know how far that might be reduced if the numbers were larger.

18,404. (*Mr. Van Oven.*) I understood you to say just now, in answer to Mr. Owen, that at the last election at the Deaf and Dumb Institution in Birmingham all the applicants were admitted without election?—Yes.

18,405. How is it that there are so many deaf and dumb children now in Birmingham who are not educated?—They are not applicants unless they apply in accordance with the rules of the institution. Somebody must be prepared to pay for them. If the parents are not prepared to pay for them, and the guardians do not pay for them, the children remain out; they cannot even be applicants.

18,406. You consider that because children are deaf and dumb they would not be able to attend school so regularly as the children who have hearing?—Yes; we think in the first place that they could not attend so regularly; and secondly, that if they did they would not be nearly so well educated as if they were sent into a residential institution.

18,407. Why are they not so able to attend; they labour under no infirmity as regards their locomotion because they have not hearing?—But I think the parents are afraid to send them out without some one with them, at an early age especially. If they are crossing a busy thoroughfare they will not hear the tramcars coming along.

Mr. G. B. Davis.

1 Nov. 1887.

18,408. I understood you to say that in 1885 there were 61 deaf and dumb and blind in Birmingham?—Yes.

18,409. About the same as at present?—Yes.

18,410. You said that out of those only nine were being educated?—Only nine of those over eight years of age.

18,411. Consequently out of those 64 there were 55 who were not being educated?—We eliminate first those under eight years of age because there is no provision proposed for them; therefore it would be nine out of 40 that were provided for.

18,412. Why is there no provision proposed for those under eight years of age?—I do not know any institution that receives them under eight years of age.

18,413. All the more reason why the School Board should supply education to them in the same way as it does to infants. You have infant classes, have you not?—Yes; but then comes in one of two difficulties. If we provided for the infants alone, we should not have enough to make a class in any one place; and if we provided for all the children from 5 to 13 at any centre, we must necessarily have some grading, and that would be very costly. We find it would cost nearly as much as sending the children to institutions, if we had only one class at each centre.

18,414. You say four centres would be necessary?—Yes.

18,415. And if there were 55 children to educate that would be about 14 to a centre?—Pardon me, we shall have to correct that 55. We need not reckon those children that would be sent by any means to residential institutions by benevolent people or friends; the number would be reduced to from 30 to 33 deaf and dumb cases. The blind cases I leave out.

18,416. Therefore you think in the present condition of affairs at Birmingham it is impossible to establish classes for the deaf and dumb?—I do. I am quite certain that if we took all those children from 5 to 13 we could not possibly educate them; if there were only half-a-dozen of them all in one class they must be graded; that would be extremely costly. It would mean a teacher for two or three children

18,417. You think even where you had a sufficient number to make a school it would be better in an economical point of view to send them to a residential institution?—We think so. We think we should get a better return for the money; that the children would be much better educated.

18,418. Therefore your idea is that you should have power to pay an asylum for the education of all the deaf and dumb whose parents were too poor to pay for themselves?—That is the great thing the School Board desire.

18,419. (*Mr. St. John Ackers.*) Have you any doubt that the Act of 1870 includes both the blind and the deaf?—In one sense I have no doubt that it does. I think we could say that the School Board have the power to require all children to attend school, but practically I do not think the Act gives them the power in the case of deaf and dumb and blind children, because a parent would have very good reason to say he ought not to be punished if he did not send his child to an ordinary public elementary school; if one parent said, "My child is deaf and dumb and therefore "he cannot profit by the education received there;" or if another said, "My child is blind and is not fit to "be running about in the playground with the other "children," no magistrate would convict.

18,420. We have heard that it is extremely advantageous to the blind for them to be running about with the seeing?—I should be afraid that the contrary would be the case.

18,421. You have not studied the question of the blind much?—No.

18,422. It has practically come to this, that in the opinion of the School Board for the Birmingham district it is better to keep children uneducated for 17 years—that is to say, some of them—than to avail themselves of such powers as the Act gives them in respect to the education of such children?—I think that is going a little too far. The matter has not been before the School Board for 17 years. There was an immense amount of work for the School Board to do, and we only get at these questions one by one. We had an immense amount of school provision to make; there were only about one fourth of the children of the town in average attendance in school; we had everything before us. This matter has been before the Board since the early part of 1884, and they have been making all the efforts they could to get the power to send these children to residential institutions. If they were told distinctly that it was impossible to send them to residential institutions, that no such power could be hoped for, then they might make the best of a bad case; but they do not want to establish a system which they do not think would be effectual.

18,423. For 14 years at any rate no effort was made by the School Board to educate the blind or the deaf; that is to say, from 1870 to 1884?—That I must admit.

18,424. It is the fact that the defective classes have not, for some consideration or the other, been treated as the ordinary children are?—If you put it in that form it would rather lead to a mistaken conclusion. If the cases of the deaf and dumb and the blind had been really before the School Board and the School Board had intentionally disregarded them, certainly it would have been a serious matter, and it might have been put in that form; but the School Board, starting with an immense amount of work before it and addressing itself to it, did not necessarily think of everything at once. These cases of the blind and the deaf and dumb cropped up gradually; they did not come before them at first.

18,425. The cases were comparatively few, and the School Board did not give the same consideration to them that they did to the others?—They did not come before them.

18,426. Are you quite sure that the question of dealing with such cases was not brought before the School Board of Birmingham in the year 1874?—I do not think it was so early as that; I cannot speak positively to the date. I know there was a letter written by one of the home missionaries in Birmingham to the School Board, and the School Board made inquiries as to what was being done, and they found that benevolent people were dealing with a number of cases, and the guardians were at that time paying for a few, though I think we found afterwards that they were the children of out-door paupers or pauper children, and it was hoped that private benevolence would meet those cases. At that time the School Board did not see their way to doing anything.

18,427. You were one of the first places to take a census of the blind and the deaf and dumb?—Yes.

18,428. But it is not till recently that you have done anything at all in the way of dealing with those cases?—Not until 1884.

18,429. What is the population in the School Board district?—About 421,000, I think that is the last estimate.

18,430. You say that you applied to the Education Department to bring in a Bill; what reason did the Education Department assign for not bringing in that Bill?—They simply said that they were not prepared to do it. I do not think they gave us any reason.

18,431. They did not say that you had the power which you sought for under your present Act?—Oh, no.

18,432. How did you ascertain the number of your deaf and dumb?—By the visits of our visiting officers. We have visiting officers all over the borough, each one having his own district, and those men are continually visiting from house to house, taking a census and especially noting those who do not go to school.

18,433. According to your population there must be a great many more deaf and dumb children than the number you have given us; do you consider that the rest are all over age?—I do not think you will find that there are more than I have stated between the ages of 5 and 13.

Mr. G. B. Davis.

1 Nov. 1887.

18,434. You stated that the Local Government Board allows 20*l.* a year to be paid by the guardians; do you mean to say that it restricts the amount to 20*l.* a year?—That is the maximum limit.

18,435. May I ask your authority for that; has an intimation to that effect been sent down by circular from the Local Government Board?—The board of guardians can pay under the Act such sum as the Local Government Board may approve. The board of guardians applied to the Local Government Board, and the sum of 20*l.* was fixed by a letter which was sent by the Local Government Board to the guardians. I had that from the clerk to the board of guardians.

18,436. We have it in evidence that the Local Government Board allows more than that?—That would be in other places.

18,437. Are there any special circumstances in the case of Birmingham to account for the sum allowed to be paid being less there?—No; it may be that if the Birmingham Boards were to apply for power to pay more the Local Government Board might allow it.

18,438. You stated that poor people (I am not speaking of paupers)who have blind or deaf and dumb children have to apply to the board of guardians when they want to make an application for their children to be educated, that is to say, they have to go to the union?—They have to go to the parish offices.

18,439. You are probably aware that in a considerable number of towns where there are school boards and boards of guardians those two bodies have joined together so that the poor should not have to go to the parish offices or to the union in such cases?—Yes.

18,440. Has any effort to bring about a similar arrangement been made in Birmingham?—Yes. In fact we are pressing the adoption of such an arrangement now with regard to the payment of the fees of ordinary day scholars, but hitherto the boards have not consented. The Birmingham board of guardians has, however, appointed a special committee to deal with those cases, and they deal with them separately from the ordinary applications for relief—they receive them at a different hour and in a different room but still at the parish offices. What the School Board would like would be that the board of guardians should form a rota to receive those applications at some other places, as is done in some other towns.

18,441. In connexion with the School Board?—Either in connexion with the School Board or separately, but in some place away from the parish offices.

18,442. You have stated in your evidence that in your opinion the deserving poor would consider it degrading to apply to the union or the parish offices; do they consider it degrading to apply to the School Board for relief from their payment of school pence?—Not nearly to the same extent. I account for that in two ways; in the first place, the School Board is not connected with what the people understand by the "parish," and in the second place, parents are invited to come and ask for relief from payment of school fees by our visiting officers. When a visiting officer goes to a house to find out why the children have not been sent to school, he listens to the parent's explanation and he gives the parent the best advice he can. If the parent says, "I cannot afford to pay," and if the house appears to be a poor one, the visitor says, "Come up to the School Board office and they will inquire into your case"; and the man is invited to come to the School Board by the visitor. There is nothing of that sort in connexion with the guardians. People of the class of which we are speaking do not like going to the workhouse or anything belonging to it.

18,443. It is not generally known probably that the law for a great number of years, probably fifty years, has been that the making of such an application to the guardians in no way pauperises the applicant?—The people do not realise that, and I think it is the view of School Boards and boards of guardians, and I think of most people, that it is as well that that disinclination on the part of poor people to apply to the guardians should exist. If they go to the parish offices to ask for anything which they are entitled to ask for without becoming paupers, it becomes an easy thing for them to go again and ask for something else, and therefore there is a danger of people who are on the very verge of pauperism stepping over it and becoming paupers whenever they feel the pinch a little tighter.

18,444. Is it not the fact that a very large number, or a considerable number, of parents feel no degradation in asking for their fees to be remitted by the School Board who would not apply to the guardians for the same payment?—That is so; we remit the fees of many who would not go to the guardians.

18,445. In cases in which the guardians would in all probability pay the fees if the parents went to them?—The guardians would no doubt pay them if they went to them. In Birmingham we are fortunately circumstanced in regard to ability to discriminate between cases, because there is a very small proportion of the population earning a living in such a way that we cannot test the income. They nearly always work for masters, and consequently we can verify their statements as to their earnings, and one great result of that is that in remitting fees a discretion is exercised in a very small per-centage of cases; they are nearly all settled mechanically by a clerk.

18,446. (*Chairman.*) Is it the opinion of your Board that matters should remain as they are with regard to the education of the deaf and dumb pending any legislation upon the subject, because of course you are aware that legislation is proverbially slow in all matters at the present time. You have disclosed to the Commission a state of things which shows that there are a great number of deaf and dumb in Birmingham receiving no education at all; you might remedy that state of things by starting day classes, though in the opinion of your Board it would be less economical than sending the children to institutions. If legislation does not take place upon the subject, would it be the policy of your Board to give some education to those deaf and dumb who are receiving no education, or do you intend to leave matters as they are?—We are hoping that there will not be a great delay; this Commission it is hoped will report before very long, any legislation on such a subject as this would be very simple and we hope that it would not be delayed beyond the session. If the School Board were to establish day schools knowing that the apparatus would be merely a makeshift for the time being, it would mean providing rooms, because we cannot find space for them among the other classes in the present schools. We should have to provide special rooms and furniture and teachers, and then we should be looking forward to being in the position, before we had done a year's work, of having to put out of use all that we had provided, because in the event of such legislation taking place as we have been speaking about we should send the children into residential institutions.

18,447. Then the action of the School Board would be an additional argument in favour of speedy legislation whenever the Commission reports?—Yes.

18,448. (*Rev. Mr. Owen.*) Do you not consider that one reason why so many deaf and dumb children have hitherto been uneducated in Birmingham has been because it has been well known for many years that our institution was too small to take any further candidates in?—That is one reason; then the money was not forthcoming.

18,449. You know that we cannot open till January next?—Yes.

18,450. Do you think that when it is well known that we have additional room, and that in all human probability we should be able to take in all the uneducated deaf and dumb at present in Birmingham provided that the money was forthcoming, great effort would be made by the public to provide funds in aid of whatever contributions might be got from the parents, so as to enable the institution to provide for those uneducated deaf and dumb?—Probably a greater effort might be made, but I think that if you did not look to other sources than private benevolence and

Mr. G. B. Davis. 1 Nov. 1887.

contributions by the parents many of them would be left in the cold.

18,451. So far as the case of Birmingham is concerned, the fact of there being an institution ready to admit the deaf and dumb who are at present uneducated would be an argument for speedy legislation on this subject?—Yes, because those children are now being brought up in ignorance.

18,452. (*Mr. St. John Ackers.*) There ought to be at least 70 deaf and dumb of school age in your population, that is to say, between the ages of 5 and 13, according to the average throughout the whole of England?—I am omitting those who are at a school now; those would have to be added. There are a number of Birmingham children in the institution, I know.

18,453. (*Rev. Mr. Owen.*) I see there are 38 in our institution?—We only give the children that we find at their homes. The 38 must be added to the 55 to find the gross total. All our returns are based on the Visiting Officers' lists of children found at home.

Adjourned to Wednesday the 9th instant.

No. 6, Old Palace Yard.

Wednesday, 9th November 1887.

PRESENT:

THE RIGHT HON. THE LORD EGERTON OF TATTON IN THE CHAIR.

W. TINDAL ROBERTSON, ESQ., M.D., M.P.
B. ST. JOHN ACKERS, ESQ.
T. R. ARMITAGE, ESQ., M.D.
F. J. CAMPBELL, ESQ., LL.D.
EDMUND C. JOHNSON, ESQ.
THE REV. W. BLOMEFIELD SLEIGHT, M.A.
THE REV. CHARLES MANSFIELD OWEN, M.A.
L. VAN OVEN, ESQ.

CHARLES E. D. BLACK, ESQ., *Secretary.*

Sir ARTHUR MITCHELL, K.C.B., examined.

Sir A. Mitchell, K.C.B. 9 Nov. 1887.

18,454. (*Chairman.*) You are one of the members of the General Board of Lunacy in Edinburgh?—Yes.

18,455. We shall be glad to have some information from you under two heads (I.) With regard to the treatment and education of idiots and imbeciles in Scotland, and (II.) With regard to aid from the State towards the education of imbeciles. Under the first head, will you in the first place describe what you regard as the condition of idiocy or imbecility, and in what consists the difference between idiocy and imbecility?—Mental unsoundness or mental defect, which dates from intra-uterine life or from an early period of extra-uterine life—that is, from infancy or childhood—is called idiocy or imbecility. The causes of the condition differ greatly, both when its origin is in fœtal life and when it dates from childhood. It is not of necessity a condition which is congenital, but it always begins in an immature or undeveloped organ. It does not represent the loss of something which had existed, but a hindrance to that something's coming into existence. This is broadly correct, though not absolutely so, because there is in some cases a certain amount of loss. This feature of the condition gives it certain characters, which are sufficiently distinctive to make a group, or a class, of those in whom it appears. I come now to the difference between idiots and imbeciles. According to the gravity of the condition, that is, the extent of the mental unsoundness or defect, the individuals showing it are called idiots or are called imbeciles. In other words idiocy is a deeper mental defect than imbecility. This view meets all requirements, whether for scientific purposes, or for purposes of medical treatment, or for practical purposes connected with care, management, and education. If it had to be determined regarding 1,000 idiots and imbeciles—how many should be called idiots and how many imbeciles—no two medical men, though experts in the matter, would agree, and the difference would probably be considerable. In other words, there is no clear line separating idiots and imbeciles. When the classification had one object, many individuals would almost certainly, and might perhaps properly, be called imbeciles, who would be called idiots when the classification had a different object. It seems to me important to keep in view these facts as to the condition which we call idiocy or imbecility, and as to the difference between idiocy and imbecility, because I understand the Commission not to concern itself so much with all forms and degrees of idiocy and imbecility, as with those forms and degrees in which education or training can be of service in lessening the mental defect. I understand that one of the objects of the Commission is to ascertain whether, in spite of their peculiar condition, the benefits of education cannot be made to reach imbecile children, though less largely and less plainly than in the case of ordinary children. That is my understanding of the nature of the inquiry, and I am desirous to make my evidence as direct as possible.

18,456. Will you state how children who are helplessly idiotic, are treated in Scotland?—A large number of children labouring under the deeper forms of mental defect may be regarded as completely ineducable. Careful nursing is all that kind-heartedness can bestow on them. Happily their utter helplessness seems often to draw out a mother's love, and to lead to great sacrifices of self on her part. I have never seen helpless degraded idiots so well nursed anywhere as in their homes—in the houses of the poor—and few can have a larger knowledge than I have of what happens to such children in their homes. But though this is true of many helpless idiots, it is not true of all. There are also many who have been found to be very badly cared for in their homes, and this may have had different causes. It may have been largely due to the extreme poverty of their guardians—by their guardians I mean their nurses and protectors—or it may have been due to their having lost their natural guardians, or it may have been due to the unfitness of the natural guardians, when these survive, to do what is right. This unfitness not rarely arises from the fact that the parents of idiots possess defects essentially of the same nature as those which appear in their children; such defects, however, being in a lower degree, and being evidenced rather in character and habits than in intellect. An effort

is made in Scotland to improve the condition of these badly cared for idiots, when they are paupers, without removing them to an institution. This is done in various ways, oftenest perhaps by transferring them to suitable guardianship. It must be remembered that no pauper idiot child can be under any private guardianship in Scotland, unless the arrangement has been sanctioned by the General Board of Lunacy. Every such idiot is visited by one of the Deputy Commissioners, who reports the results of his inspection to the Board. There are some idiot children so helpless and so degraded as to render it extremely difficult, if not impossible, to make any arrangement for their care and nursing in a private dwelling, which will be satisfactory. It is very desirable that some institution should exist to which such children may be sent. They cannot be properly cared for in ordinary asylums, even if their presence there would not be injurious to the adult inmates. It seems as right that such an institution should be provided as that ordinary asylums should be provided. The Commission will understand that I have paupers only in my mind at present, but such an institution is also desirable for many children who are above pauperism. When such helpless idiots require to be sent to an institution in Scotland, they are sent either to Larbert or Baldovan, which are the only institutions we possess for idiots and imbeciles. In other words they are sent to those institutions which serve as schools for educable imbeciles. It is not easy to see how, in a small country like Scotland, we can have separate institutions, but it certainly deserves consideration whether teaching and training would not be more efficient in institutions, which did not act as nursing hospitals for helpless, degraded, and wholly ineducable idiots, and which did act solely as specially organised and specially equipped schools for the education and training of educable imbeciles. My opinion is that such a separation as is here indicated, would increase the efficiency of the teaching and training in institutions acting as schools.

18,457. Will you explain whether there is the same law in Scotland as in England, which enables the guardians of the poor to pay for the maintenance of idiot or imbecile children at some public institution?—All the children of whom I have been speaking up to this point, are paupers; they are supported out of the poor rate, whether they are in their own homes or are sent to institutions, and a similar obligation lies on parochial boards (as boards of guardians are called in Scotland), to extend relief to these children as to extend relief to adult lunatics.

18,458. Is it compulsory on the parochial boards to extend that relief to idiot and imbecile children?—It is compulsory in the same sense as it is compulsory to give relief to adult lunatics.

18,459. Is it compulsory on the parochial boards to give relief to adult lunatics?—An adult lunatic who has no means of supporting himself must be supported out of the poor rate.

18,460. Then the law of Scotland, as I understand you, compels the guardians to do that which it only enables them to do in England?—I would not like to speak without accuracy. I can best tell you what is the case in Scotland. I would not have said that in England it was quite a matter of choice; I think boards of guardians in England must give relief to lunatics in certain circumstances.

18,461. The law in England now does not regard idiots and imbeciles as lunatics?—So I understand. The law in Scotland does. What would necessitate the giving of relief in Scotland to an adult lunatic, would necessitate the giving of relief to a juvenile lunatic. Age would not make any difference. All these children that I have been speaking of are intimated to the Board of Lunacy as lunatics.

18,462. Will you favour us now with any remarks you may have to make with regard to the education and training of imbeciles?—Educable imbeciles—fairly enough so certified—will certainly include many for whom very little can be done. There is naturally, and perhaps properly, a hesitation in certifying any imbecile child to be wholly ineducable. It is felt that, when there is no hope of the child's receiving the ordinary scholastic training, there may still be hope of important benefits from training, in the correction of bad habits and in general behaviour and self management. Even when little can be done, it seems right that that little should be done. What may be little from one point of view, may not be little from another.

Sir A. Mitchell, K.C.B. 9 Nov. 1887.

18,463. May we assume that some educable imbeciles would be capable of deriving great benefit from training in specially equipped schools?—Though imbeciles certified to be educable will certainly include many for whom little can be done, they will also include many for whom much can be done—many on whom training will confer very important benefits. These children seem to me entitled to get such education as they can receive. It cannot be given to them in ordinary schools, and it cannot be given to them cheaply. It can scarcely be given to them except in schools with special equipments. In the vast majority of cases, therefore, it involves leaving home.

18,464. But even where the training has been most successful, will the children still remain imbecile?—However great the improvement, every child leaving the best of institutions for the education of imbeciles, will still be imbecile. He may be much less imbecile than when he entered, but he will still be imbecile. This, however, is no reason why earnest efforts should not be made to do all that can be done, and it does not seem to me to weaken in any material sense the claims of imbeciles to get such education as they can receive.

18,465. What sort of education and training do you consider best adapted for imbecile children?—The extent of the good that can be done to imbeciles by training is not yet known, though enough is known to show that much good can be done. The character of the training of most value, and the things that can be most advantageously and successfully taught, are not yet fully determined. Progress in the matter is being made, but hitherto schools for imbeciles are too much like ordinary schools. There is too much effort to give the same sort of teaching in them. Reading, writing, and other such scholastic acquirements can be reached by an exceedingly small number of imbeciles, in such a way or to such a degree as to be of practical utility. Those who can arrive at such acquirements, in any proper sense, are quite easily picked out, and they, of course, should get all they can receive. But a great deal of time is often wasted in efforts to give this sort of education to all and sundry. It needs courage to abstain from these efforts and to avoid this waste, because it gratifies relatives and contributors to find the imbecile children beginning to do what ordinary children do, and they naturally hope that these beginnings will lead to the same endings as those to which they lead in the case of ordinary children. But they will not do so. It is of very little use to be able to read words of two or three letters, but it is of great use to teach an imbecile to put his clothes on and take them off, to be of cleanly habits, to eat tidily, to control his temper, to avoid hurting others, to act with politeness, to be truthful, to know something of numbers, to go messages, to tell the hour by the clock, to know something of coins, to enjoy and understand games, and a hundred other such things. To be taught these things is of far more use to the imbecile, than it is to be taught to know A from B. They can also be much more certainly taught. When acquired, they make the imbecile differ less evidently from his fellows; they increase his self-helpfulness, make him depend less on others, tend to keep him out of trouble when he reaches manhood, and generally lessen his imbecility. It appears to me that the first improvement in the education and training of imbeciles will consist in a concentration of efforts on the teaching of what is clearly useful, and in avoiding a waste of time and energy in efforts to teach all and sundry what cannot be taught with success, that is in a way which has

Sir A. Mitchell, K.C.B.

9 Nov. 1887.

any usefulness, except to a small number, who are easily recognised, and to whom, of course, those things should be taught.

All that I have as yet said about the teaching of imbeciles relates to what is preliminary to, or rather concurrent with, the teaching of occupations by which a living may be more or less fully earned, such as tailoring, shoe making, brush making, laundry work, &c. Here again, however, I have to point to a waste of effort. The number of imbeciles who can be successfully taught to work at a trade is very small, that is, of those who can work at it without unceasing guidance and with profit. Those who can be thus successfully taught are easily picked out, and it is of importance that they should get the teaching. But much time is often wasted in efforts to make tradesmen of those who obviously cannot be taught any trade with advantage to themselves or to others. The work which is exhibited as done by imbeciles is often not in a true sense done by them; it is done under constant guidance and with much assistance, and it is quite easy to understand how this assistance, without any intention to conceal, does not come to the front. Plain knitting—plain sewing—house cleaning—washing—digging—filling, wheeling, and emptying barrows—these and such things are what the many can learn to do in a way which makes them really more useful in after life, and which helps them to contribute to their own support. They are not showy acquirements, but they are solidly useful, and their importance seems to me to be increasingly recognized. More, however, in the direction of the training to which I now refer has to be done.

18,466. Do you regard recreation as an important feature in the training of imbecile children?—Play constitutes a most important part of the training of imbecile children. It is a question, indeed, if anything does more to strengthen and brighten their weak dull mental faculties. I refer to free play, and not to play which has a certain character of drill and discipline about it. I refer to the simple, unrestrained, easily understood games to which ordinary children take naturally, down even to those games which consist of little more than merry romping. Ample provision for this sort of play at all seasons should be a part of the equipment of every institution for the training of imbecile children. Arrangements for its full existence under cover in winter should never be wanting. No institution known to me, either in Scotland or out of it, has arrangements of this nature, which I should regard as of a sufficiently ample character. This free play is an essential part of the training of imbecile children. It should never be omitted, and it should be independent of weather. More thought should be given to this means of education and training than has yet been given. It tends greatly to the success of other means of training.

18,467. The education and training which you have been pointing to, would necessitate, I suppose, a large staff of teachers?—Yes. All I have said about the education and training of imbecile children indicates that the staff of an institution in which that education and training are to be given must be large, and must consist of persons with different qualifications. It seems to me that the school proper should be a modified Kindergarten. Teaching by specially designed object lessons undoubtedly does good, but these should be simple, and should as nearly as possible be always connected with every day life. In the selection of pictorial and other illustrations, which should abound, common sense should be largely consulted,—more largely than it sometimes is.

18,468. Whatever training you may give to imbeciles, you must, I suppose, expect to find that some will not turn out so satisfactorily as might be wished on reaching manhood or womanhood?—Imbeciles on whose training much labour has been expended, when they reach manhood or womanhood, and are of course no longer in school, often show a great and undesirable change of character. Ordinary children show a change, and sometimes an undesirable change of character in the same circumstances. With imbeciles, as might be expected, the change is more frequently a change to what is bad or unfortunate. Sometimes they show active, and, perhaps, dangerous eroticism, but much more frequently they simply become wayward, passionate, mischievous, and unmanageable. They are then readily and correctly certified to be lunatics and placed in asylums. This often constitutes a disappointment, and is held to look as if education and training had done no good. Disappointments of this kind will always be more or less frequent. Other things as well as the arrival of puberty may lead to them. This is nothing but a reasonable expectation, and it should not be allowed to discourage efforts to give imbeciles all the benefits which well directed education and training can give them. It should always be remembered that these benefits will be permanent in the majority of cases.

18,469. With regard to employments for imbeciles, do you think that agricultural work is peculiarly well fitted for them?—I do.

18,470. Not only because it is an employment in which an imbecile may be usefully employed when he goes out into the world to earn a livelihood, but is not it also the fact that many imbeciles have a great love for animals?—They have.

18,471. I understood you to say that in many asylums the trade shops are carried on perhaps for the advantage of the institution, rather than with a view of teaching the pupils a trade which would be profitable to them when they go out, though there are some cases where they are no doubt able to earn their livelihood by learning a trade. I gather from your evidence that your view is that instruction may be given in trades, but that those who are really able to profit by that instruction when they leave the institution are comparatively few?—That is true, except when they can work under guidance.

18,472. Still you would I suppose say that it was quite right that in those institutions they should be taught all those trades, because till they have been tried in those trades, it is impossible to say whether they will develope a turn for them or not?—Exactly. Those should learn trades who can learn them, but time should not be wasted in efforts to make those learn them who clearly cannot do so, but who can learn other useful things.

18,473. With regard to gymnastic exercises or games, did I rightly understand you to propose that they should always be carried on under cover?—No. I said that they should be carried on under cover in bad or cold weather. They should be carried on irrespective of weather. I refer to exercises and games which are play in a full and proper sense.

18,474. Are idiots more delicate than other children?—Idiots are of much lower vitality.

18,475. Do you find that the education that is given to these imbeciles and idiots ever produces acute mania?—I have never known any case in which an imbecile child has become maniacal in consequence of the training given in an institution.

18,476. We will now go to your second head, the assistance which the State gives towards education of imbeciles. How many institutions for imbeciles are there in Scotland?—We have only two institutions for idiotic and imbecile children in Scotland, one at Larbert near Stirling, and one at Baldovan near Dundee. Both of these institutions are licensed by the General Board of Lunacy, under the provisions of section 7 of 25 and 26 Victoria chapter 54. I attach importance to the fact that the institutions for imbeciles in Scotland are licensed by the General Board of Lunacy.

18,477. I gather from that statement that you do not think the law in Scotland requires alteration?—We get on very well with our law as it is.

18,478. Will you proceed with your statement with regard to the two institutions in Scotland for idiotic

and imbecile children?—The institution at Larbert is licensed to receive 180 children, and there are 181 now in it—that is, one child in excess of the number for which it is licensed. The institution at Baldovan is licensed to receive 70 children, and there are 50 children now in it.

The inmates of these institutions consists of three classes: (1.) Pauper boarders or pupils who are maintained out of the poor rate; (2.) Election boarders or pupils who are maintained out of the contributions of the charitable; (3.) Private boarders or pupils who are maintained by their friends. In considering the question of State aid, these three classes must be dealt with separately.

The pauper inmates of these institutions participate in the Parliamentary grant towards the maintenance of pauper lunatics. For each pauper child there is a grant in aid of 4*s.* per week, when the cost to the parish reaches or exceeds 8*s.* per week. When the cost is less than 8*s.*—in consequence, say, of part of the board being paid by relations,—then the grant in aid is one half of the cost. Before any pauper child can be admitted either into Larbert or Baldovan the sanction of the Board of Lunacy must be obtained. It is granted on a petition by the inspector of poor of the parish sending the child, the petition being accompanied by a statement of particulars and by two medical certificates in a prescribed form. These certificates must declare the child to be of "unsound mind," and also to be "capable of deriving benefit from training and "treatment in an institution for the training of imbecile "children." All the pauper children are thus certified to be in a greater or less degree educable. But the aid from Imperial sources may be regarded as given to them independently of the question of educability. They get it in consequence of being certified by two medical men to be "of unsound mind," which is enough to make them technically or legally "lunatics." Pauper idiots and imbeciles who are not in institutions, but who live, with the Board's sanction, in private dwellings under the care of relatives or strangers, also participate in the grant towards the maintenance of lunatics. They do so on the same grounds as those which lead to participation in the cases of pauper imbeciles who are in institutions.

18,479. Are those also educable children?—Some of them may be so. We would not willingly allow a pauper imbecile child to remain with relatives or strangers in a private dwelling who was clearly educable. Our sanction is needed, and we endeavour to secure a proper arrangement for the care and treatment of the child, but it is not always possible to do what would be best, especially in regard to those of the pauper imbecile children who live with their parents. Medical certificates have been granted which are sufficient to constitute them lunatics. Before any parish can receive the grant on account of an idiotic or imbecile child, whether he is provided for in an institution or under private care, the General Board of Lunacy must grant a certificate to the effect that the child was "necessarily detained and properly cared for" in the institution or house in which he was during the time for which the claim for participation is made. This, I think, is a special feature of Scotch administration—this is the form in which the claim is made, and this is the certificate (*handing it in*).

18,480. (*Dr. Campbell.*) Is that grant in aid of 4*s.* given in addition to what the parish has given, or does it relieve the parish of so much?—It relieves the parish of so much.

18,481. (*Mr. Johnson.*) It is an Imperial grant?—Yes. It is desirable to point out with reference to this certificate, that it is in no way special to these idiotic and imbecile children who have become technically lunatics; it has to be given in the case of every pauper lunatic, whatever his age may be and wherever he may be placed, on whose account participation in the grant is claimed. The grant of 4*s.* a week is never given to any pauper lunatic in Scotland without that certificate; it involves much work, but it is a useful check.

Sir A. Mitchell, K.C.B.

9 Nov. 1887.

18,482. (*Chairman.*) With regard to the second class, viz., election pupils, what is their position as compared with the pauper pupils?—As regards election boarders or pupils, the first thing I have to point out is, that they belong socially very much to the same class as the pauper boarders or pupils. By this I mean that their relatives could not afford to maintain them in institutions for the training of imbecile children. They are the children of persons in straitened circumstances—most of them the children of persons in very straitened circumstances. The main difference between them and paupers is, that they are maintained out of the contributions of the charitable, while the paupers are maintained out of a statutory assessment, viz., the poor rate. There is another strong difference, however, between their position and that of a pauper, and it is this,—the State gives assistance to the pauper boarders, but it gives none to the children who are maintained in institutions out of the voluntary contributions of the charitable.

18,483. Though they are of the same class, that is to say, children of parents in straitened circumstances?—Yes; and the question is whether it would not be as proper to give State aid to them as to give it to paupers. It would not be necessary, in their case, to give it to them as being lunatics, but it might be given to them as being educable children, whose parents are unable to pay for the costly educational appliances, which the exceptional condition of the children renders necessary.

18,484. If that principle were admitted, it would apply also to the education of the deaf and dumb and the blind?—Yes.

18,485. Because the conditions would be similar?—Yes; it would be a good thing in my opinion if the State gave this assistance, making it the same in amount as that given to pauper children.

18,486. In the event of State aid being given in respect of children of this class, would you give the State any means of ascertaining the educability of the children?—The elected pupils, under existing arrangements, are understood to consist solely of the educable, and no difficulty would, therefore, arise in connexion with such State aid if it were given, in dividing the elected pupils into educable and ineducable. They would all be educable.

18,487. Are there any such educable children who ought to be in an Institution for Idiots and Imbeciles prevented now from entering such an institution by reason of the inability of the parents to pay, and their unwillingness to be classed as paupers?—I have little doubt that state of things may exist to some extent. In Scotland there is practically no difference between the treatment of pauper and elected children when once they go to an institution.

18,488. If the parents can now pay for their children in such institutions, why should the State interfere and relieve the parents of their responsibility?—The State ought not to give assistance where parents can pay for a child's training and maintenance.

18,489. Then who is to judge whether the parents can or can not, they do not, *ex hypothesi*, come before the guardians as paupers. Is the Board of Lunacy to judge whether the parents are or not able to support their children?—Your question, as I understand it, is this:—Who is to determine with regard to an elected pupil that its parents were not able to pay for its education? A regulation would require to be made by which some clear evidence on that point would be given by the directors of the institution receiving the child—evidence which would satisfy the General Board who licensed the institution, or some such Board. I do not think you could get nearer a practical way of dealing with the matter than that.

18,490. Will you continue what you were saying with regard to giving the State the power of ascertaining the educability of the children of whom you are speaking?—The State would require to have

Sir A. Mitchell, K.C.B.

9 Nov. 1887.

the reality of the educability properly established, and I think that this could without difficulty be satisfactorily done. If these institutions were still left under the control of the General Board of Lunacy, it could easily be done. In one direction, indeed, the thing is already done with fair success.

18,491. In order to make it quite clear, let me ask you this question, under these altered circumstances, do you contemplate that the educable classes among the idiots and imbeciles should be kept in a separate institution?—I think that ought to be done when it can be done. It would also be proper that the State, before giving such a grant in aid of children whom benevolent people sent to an institution for the education and training of imbecile children, should ascertain from a competent authority that the institution in question was fully equipped, in other words, that it was provided with everything which would be of use in securing a maximum of efficiency, —with everything which would help in making the most of such mental powers as were possessed by the children sent to it. I think it would not be desirable to give a grant in aid to institutions insufficiently equipped.

18,492. The Board of Lunacy would be the inspectors and the judges of what was a proper equipment?—Yes; but, as I have said, there need be no certification of unsoundness of mind, that is, of lunacy, in the case of elected pupils. The aid to them might be given in consideration of the great cost of their education. The certification of the paupers, which is done in order to enable them to participate in a grant towards the maintenance of pauper lunatics, practically does no harm; but it would be better—chiefly, however, from sentimental considerations—if the State assistance reached the paupers also in consequence of the costliness of their education, and not on the ground of their being technically lunatics.

18,493. That again would be an argument for treating all classes whose education was of an exceptionally expensive character in the same way, would it not?—It would. I have said that at present both pauper and elected pupils may all be regarded as having been certified to be educable before admission into Scottish institutions. This, however, does not prove that they are all really educable.

18,494. There is a *prima facie* supposition that they are?—Yes. I have had all the pauper and elected pupils in Larbert and Baldovan recently examined, and their condition as to educability again declared.

18,495. Will you state the number of those whom you consider fairly educable in the Larbert and Baldovan Institutions?—There are at present 235 children in the two institutions (15 below what they are licensed to receive). Of these, 33 are private pupils, 83 are elected pupils, and 119 are paupers. Of the whole number, 50 are at this date tabulated as ineducable, 79 as slightly educable, and 106 as decidedly educable,—giving thus 185 out of 235 as more or less educable.

18,496. Would you apply what you have been stating to the whole of those cases?—In Baldovan and Larbert the three classes of pupils, private, elected, and pauper, do not give the same proportions of educable and ineducable. The pauper class gives 29 per cent. of ineducable, the private 21 per cent., and the elected 11 per cent. The proportions of the slightly educable to the decidedly educable do not differ much in the three classes. This examination, the result of which I am giving now, has been made with a great desire to be accurate.

18,497. (*Dr. Campbell.*) Is there a medical examination as to whether the child is epileptic; does the consideration that a child is epileptic, and that it will soon be hopelessly beyond the power of teaching, influence your judgment in admitting him or excluding him?—That is an important question. The accommodation for the training of imbecile children in Scotland being small, that consideration has in practice almost led in the case of elected pupils to the exclusion of epileptics. But there is no hard and fast line.

18,498. My question had reference to the case of pauper children, whether in their case epileptics would be considered as ineducable or partially educable?—With regard to paupers, there is also an unwillingness to receive epileptics, but not so decided as in the case of elected pupils. After the children, both paupers and elected pupils, have been a considerable time in the institution, it will turn out that a certain number of them who have been certified as educable are not educable, and a larger number of the paupers prove ineducable than of the elected cases. The figures I have given show that greater care and accuracy are exercised in certifying the elected pupils than in certifying the pauper pupils. This is nothing but what might have been expected. The important point is that the figures, as regards the elected pupils, show that before admission, the question of educability can be determined with reasonable accuracy. The error being only 11 per cent., I hold that it proves that the educability of the children can be determined with reasonable accuracy. It would be quite possible to secure the same degree of accuracy in the case of paupers.

18,499. Then supposing you had an institution specially maintained for the education of the educable classes, do you think there would still be a residuum, perhaps 10 per cent., the educability or ineducability of which class could not be ascertained before entering the institution?—There would be at least that amount of probable error.

18,500. Those would be drafted off?—Yes. That would be desirable in the case of an institution specially devoted to teaching or training.

18,501. After say a year or a certain limited time?—Just so.

18,502. (*Mr. St. John Ackers.*) Is it the same person who certifies in these different cases?—Certifying in these cases is not confined to one medical man.

18,503. (*Mr. Van Oven.*) Does not any special doctor belonging to the institutions examine the candidates for admission?—In the case of the elected pupils, I think the majority of the children before admission are submitted to the doctor of the institution. I do not think, however, that there is a hard and fast line in this matter, and I do not think there should be a hard and fast line.

18,504. (*Chairman.*) With regard to the State aid which you propose should be given in the case of these elected pupils, it would be of the character of a capitation grant?—Yes. I see no other workable way.

18,505. Irrespective of results?—It would be so much per head. In my opinion, a capitation grant is generally undesirable, especially when it concerns persons maintained out of an assessment, because it is apt to lead to extravagance and abuses. I do not see, however, that it can so easily have these effects, when it concerns persons maintained out of the voluntary contributions of the charitable.

18,506. I understand you to say that a capitation grant is necessary, because you could not go upon any other system?—No, I do not see how you could give a grant on results. There could only be a payment of so much per child, or a percentage on what was paid for the child. Or, there might be a fixed sum voted annually for the education of imbecile children, however many of them there were.

18,507-8. Of course the State would have to pay a capitation grant upon this 10 per cent. of failures, so long as they were inmates of the institution?—Yes.

18,509. (*Mr. Johnson.*) What capitation grant do you advocate, 10*s.* or 5*s.*, or what?—I do not advocate any special amount.

18,510. (*Chairman.*) On the subject of State aid, have you any remarks to make with regard to the third class of inmates of these institutions, *viz.*, private boarders or pupils maintained by their friends?—For the third class, *viz.*, the children maintained in institutions by their friends who are in comfortable or in affluent circumstances, no aid from the State is needed.

Sir A. Mitchell K.C.B.

9 Nov. 1887.

18,511. Can you state what number of educable imbeciles there are in Scotland?—The answer to that question must be more or less of a guess. The census of 1881 showed that there were 475 idiots and imbeciles of all kinds in Scotland below the ages of 10, and 1,266 between the ages of 10 and 20. These figures, however, cannot be treated as giving information of much value in this inquiry, and I do not know how or where figures of much value can be obtained. In 1860, 27 years ago, I reported on the question to the General Board of Lunacy, and I then said "An in- "stitution capable of receiving 250, I have every "reason to believe, would for many years be found "ample, if confined strictly to education, and not "used as a mere home or refuge. In forming this "estimate, I take into consideration the interests, "happiness, and capacity for improvement of the "unfortunates themselves, and also the moral obliga- "tion the country is under to do all that is right "and possible for the mitigation of their great mis- "fortune." That is what I said on the subject in 1860. It happens that Scotland at present possesses licensed accommodation in institutions for imbeciles exactly for 250 inmates, but this includes accommodation for the ineducable as well as for the educable. Since I made the estimate, to which I have referred, in 1860, the population of Scotland has risen from 3,062,294 to 3,949,393. Making allowance for this, and for a growing readiness to place imbeciles under training, I am of opinion that accommodation for 300 to 350 educable imbeciles, and for 100 ineducable idiots would be sufficient for the needs of Scotland for many years to come. It is difficult to show how I arrive at this estimate, and its value must rest chiefly on what may be thought of my general knowledge of the subject.

18,512. What are the ages within which you think education to this class may usefully be applied?—Under the powers which we have in connexion with licensing, we make a rule that children shall not remain in these institutions after the age of 18; this is not settled on any scientific ground; puberty is arrived at in the case of some imbeciles and idiots earlier than in the case of healthy children; in the majority of cases it is arrived at later; it was a rough calculation that 18 would represent the age of reaching puberty in the case of imbeciles as against 14 or 15 in the case of ordinary children; but if, when a child in an institution has passed the age of 18, the directors, or the friends of the child, or the parochial board, think it would be an advantage to the child if it were allowed to remain longer in the institution, and if it is thought that the child, though above the age of 18, has really not passed into manhood or womanhood, then these things are represented to us, and under our general powers we sanction a longer stay. I think the licensing power of great value. It seems to me a mistake, in such matters, to fix too many details by Act of Parliament. It is, I think, sufficient to entrust the licensing of such institutions to some body of good standing, and then to leave that body free to make whatever minor rules may seem to be necessary, instead of having rigid and inflexible rules which may be found useful for a certain number of years, but which, after the occurrence of some change that has not been anticipated, may be found to be undesirable.

18,513. In order to carry out your proposals, what alteration of the law would be necessary in Scotland?—We should require no alteration of the law in Scotland, but we should want money. If we separated the ineducable from the educable, that would mean providing another institution, and our institutions are not provided out of an assessment.

18,514. You think that the Board of Lunacy in Scotland has sufficient power under the existing law to vary the arrangements of the institutions and the training carried on in them, so as to carry out the objects which you have detailed to the Commission?—I think we could do all I have suggested if we had the institutions and the money.

18,515. As I understand there is no necessity for any change in the law with regard to compulsory payment by the parochial boards of the sum required for a patient's board and maintenance. The law at present enforces the payment by the parochial board of the sum necessary to maintain a patient in one of these institutions?—When an idiot child has a valid claim to relief, the parish must give relief, and must give it in the way which is best for the child. This is our aim, and we generally succeed.

18,516. (*Mr. St. John Ackers.*) Is that determined by the Board of Lunacy?—Yes.

18,517. (*Chairman.*) Then do you think there are no idiot children in Scotland who are not sent to these institutions either by their parents or by the guardians?—A state of society in which there are no imbecile children who are not sent to institutions is scarcely conceivable I think.

18,518. How would you meet such cases?—Just as we meet them in the case of adult lunatics. As we have power to put the condition of a neglected adult pauper lunatic right, so we have power to put the condition of a neglected pauper idiot or imbecile child right, because that idiot or imbecile child is technically a lunatic. It is not an arbitrary power, but it is generally sufficient, and greater power of interference on the part of the State scarcely seems desirable. Some of the deeply idiotic are better out of institutions. Indeed, in determining what ought to be done, the whole circumstances of each case have to be considered, and these circumstances vary greatly.

18,519. Is not there this difference between the two, that a lunatic cannot altogether be ignored if his lunacy is of a violent character, whereas an idiot child that is harmless and quiet, is not necessarily found out?—If the parents of the child are in receipt of relief for the child, or if the childs' own name is on the poor roll, the inspector of poor of the parish is bound to intimate this to the General Board, but the Board do not insist on people being put upon the poor roll who are able to support themselves—then do not press or call on parochial boards to make people paupers. When a person has been made a pauper, who is in any state of lunacy, the parochial board must intimate the fact to the General Board of Lunacy, who then deal with the case.

18,520. (*Mr. Johnson.*) You have nothing to do with private cases which are not getting relief?—With private lunatics, whether adult or juvenile, who are not getting relief we have nothing to do, unless something of the nature of cruelty is practised with regard to them, or unless they are kept for profit. This briefly shows the position of the Scotch Board of Lunacy in regard to such cases.

18,521. (*Chairman.*) I presume in Scotland every child who is capable of education is brought by the attendance officer to school, or an endeavour is made to compel his attendance, unless some adequate cause is shown, he is compelled to attend school?—Yes, I think that is so, as regards ordinary children.

18,522. Then the question is whether, if it can be proved that these imbeciles are capable of education, the same compulsory law should not be applied to them?—If these children are capable of education, I think they ought to get it, and those who are bound in law to provide for them, whether the parish or friends, ought to be made to pay for it, that is to say, those who can themselves pay ought to pay, and when they cannot pay, the poor rate ought to pay.

18,523. (*Mr. Johnson.*) I understood you to say that you considered it very necessary to divide those cases which could be educated, from those which could not be educated?—Yes; I think that institutions devoted to the education of educable imbeciles would be more efficient if they were not also nursing hospitals for helpless and degraded idiots.

18,524. Then I suppose that want would be met by the establishment of a school for those who were capable of being educated, and a couple of other asylums for those who only required to be taken care of?—By the establishment of separate institutions.

Sir A. Mitchell, K.C.B.

9 Nov. 1887.

18,525. Do you think that one school of that kind would be enough for Scotland?—Of course it would depend upon its size. I think that if we had, as I said, a school capable of receiving 350 children, we should have all that Scotland would require for a long time.

18,526. I suppose it would be impossible to educate idiots at all, at their own homes?—In the year 1860 I reported upon the education of imbeciles at home. That can occasionally be done, but very exceptionally It now and then is done in a very remarkable manner—that is, with remarkable success.

18,527. You think it is undesirable that idiots should be educated in their own homes?—I would not like to say that sweepingly, but I think it may be treated as practically impossible. Some remarkable cases of success have come under my observation, the outcome of great self-sacrifice; but such cases are so few in number that they really do not count.

18,528. Were those remarkable successes in the homes of the poor?—They were in the homes of the poor.

18,529. In what did the success consist?—The success consisted in what the success of the education of the imbecile ought always to consist—in what it ought always to have as its largest outcome, namely, in increased usefulness and manageability, and diminished dependence on others for help.

18,530. But not in what we call school learning?—No, there was little or no effort in those cases to teach school learning.

18,531. (*Rev. Mr. Sleight.*) Would you state to the Commission what number of imbeciles in the two institutions you have named, are deaf and dumb, or dumb only?—I cannot answer that question, but I have no doubt that I could obtain the answer.

18,532. If the dumb have their hearing and are decidedly educable, do you not hope to teach them to speak?—I assume that you refer to the inmates of institutions for imbeciles. Great effort is made to teach imbeciles to speak; that is part of their education. We have a certain number of children who do not speak on admission to the institution, and who learn to speak in the institution.

18,533. Are there amongst the imbecile class any who are dumb simply from deafness, and not from imbecility?—I cannot answer the question, but I should think there are, because among deaf-mutes there are imbeciles.

18,534. From your experience, do you consider that any cases have been retained in those institutions that were simply deaf and dumb cases, and not idiocy cases?—I say emphatically, no. A case of that kind coming to our knowledge would be instantly removed. The case that you are referring to, I understand to be the case of a child who is of perfectly sound and healthy mind, but in whose case one of the gates to knowledge is shut, and who is dumb in consequence solely of deafness.

18,535. I did not mean those of perfectly sound mind, but I would rather take the class which you specified as the third class, viz., those who were decidedly educable; amongst that class do you think there are any that are deaf and dumb who would be better educated in a deaf and dumb school than by being retained in your asylums?—If such a case came to our knowledge,—if there were a case of a deaf and dumb child being improperly treated as an imbecile child, we should order the removal of the child. I understand you to admit a certain degree of imbecility with the deaf-dumbness, and you ask me whether a deaf and dumb child with a small degree of imbecility would be better educated in an institution for deaf-mutes than in an institution for imbeciles. I cannot answer that question until the particular child is submitted to me; it is a hypothetical case, but I could tell you, if I had the opportunity of judging of the degree of imbecility, to which institution I should recommend the child to be sent. It has come to my knowledge that children were being treated in institutions for the education of deaf-mutes, who were imbecile, and whose imbecility made them incapable of education there, and such children have been removed from these institutions and have been placed in institutions for the training of imbecile children.

18,536. (*Chairman.*) And with advantage to the children?—With advantage to the children.

18,537. (*Rev. Mr. Sleight.*) Have you any knowledge of such cases as a deaf and dumb child, slightly imbecile, being retained in these asylums?—I have never seen a deaf-mute child in an institution for imbeciles in Scotland, whose imbecilty was not sufficient to justify its being there.

18,538. (*Dr. Campbell.*) Do parents sometimes apply to you to take their children when you think that the children would be better in a deaf and dumb school?—No child goes into an institution for imbeciles who is not certified to be imbecile, and to need the training suitable for imbeciles.

18,539. (*Rev. Mr. Sleight.*) I understood you to say that there was no case of a covered play room for imbecile children; I think we saw one yesterday at Earlswood?—There is one in Scotland in each of our institutions. What I said was that there was no covered playground attached to any institution in any country that I know about, which I would consider sufficient. I attach great importance to this part of the equipment of an institution for the training of imbecile children.

18,540. (*Rev. Mr. Owen.*) Does religion form part of your education?—Of course. But I may not know exactly what you mean by religion.

18,541. Do they receive regular religious instruction so far as their minds will allow them to apprehend it?—Certainly.

18,542. After imbeciles leave your institutions, do you find that many of them lapse into a state of helplessness again?—I spoke of one class of imbeciles who, on leaving institutions, fall into a state requiring their removal to an asylum, and I said that there were other classes who did not continue to show much benefit from the training they had received, as happens in the case of ordinary children leaving school. Such occurrences may be reasonably expected to be more frequent in the case of children leaving schools for imbeciles, than in the case of ordinary children leaving ordinary schools.

18,543. Have you anything to suggest to remedy that liability?—Nothing.

18,544. (*Mr. Van Oven.*) As regards the number of idiotic children who are not admitted to the asylum because they do not come under either of the three classes, whose parents are not able to pay for them, who are not elected, and who do not come in as paupers; does that arise from the parents being disinclined to apply to the guardians for the children to be admitted as paupers?—It would be difficult to give an answer to that question which would be satisfactory and complete. There are certain poor people who do not apply for aid, and who do not get aid, either from the poor rate or from the charitable. The charitable fund can only relieve a limited number, measured by the amount of the fund, and the non-application to the parochial board to have a child pauperised and placed in an institution as a pauper may arise from many causes. It often arises from the unwillingness on the part of the parents to let their child leave them, an unwillingness that ought always to be respected, although one may regret it.

18,545. Do you think that if there was some other provision made, so that the parents did not consider that they pauperise themselves by obtaining admission for their children by means of the guardians to the institution, they would more freely avail themselves of the benefit of the institution than they do?—No doubt. That is what I had in my mind when I said that considerations of sentiment would make it preferable if, instead of children getting State aid as paupers on the ground that they were certifiable lunatics, they got it on the ground that they were capable to some extent of receiving education of a

costly character, for which the parents could not afford to pay.

18,546. (*Chairman.*) Still I understood you to say, that it was the business of the overseer to report in any case where the family had recourse to the rates, quite independently of applying to the guardians for admission into an asylum?—The inspector of poor must intimate every lunatic to whom parochial aid is given.

18,547. Therefore the overseer ought to know all the paupers?—Yes, all the paupers. But he need not know the case that I put just now, because there has been no application for relief made to him.

18,548. Then that does not quite meet the question that I asked before, namely, whether there was any means of ascertaining the existence of such children, in the same way as the attendance officers all over England ascertain the children who do not go to school. I understood you to say that it was the business of the overseer to know all those cases?—I fear I have not expressed myself clearly. It is not the business of the inspector of poor to seek out people to pauperise them. He does not necessarily know of them till circumstances arise that lead to an application for parochial aid; the application is then considered, and, if the claim is allowed, the case must be intimated to the General Board of Lunacy.

Sir A. Mitchell, K.C.B.

9 Nov. 1887.

18,549. But there must be in Scotland, I presume, an attendance officer, to see that all those children who are capable of receiving education are sent out to some school?—You refer to the case of ordinary children.

18,550. Do you think it desirable that the same attendance officer should inquire into the existence of every child, whether it is sane or insane, and that then, if the child is found to be capable of education, it should be sent compulsorily to an institution for its education?—I have not asked myself that question. But it seems to me that it would be desirable, if it be admitted that all educable children ought to get such education as they can receive. I would not employ the inspector of the poor, however, in this work. I would employ the person who deals with ordinary children.

18,551. (*Chairman.*) Is there any other matter that you wish to lay before the Commission?—I think I have sufficiently expressed my views.

Mr. Alfred James Hipkins examined.

Mr. A. J. Hipkins.

9 Nov. 1887.

18,552. (*Chairman.*) You have taken some interest in both the deaf and dumb and the blind, have you not?—I have.

18,553. Can you speak as to the different systems of education of the deaf and dumb from personal knowledge?—Not from personal knowledge. I have a son who is so afflicted, but he was educated at the institution for the deaf and dumb in the Old Kent Road, before the oral system came up, and what he learnt in the speaking way was a mere accomplishment, and I am not able to say more about it than that. I think that the oral system is very desirable for health by exercising the lungs in speech.

18,554. Upon what do you base that opinion?—Many children who are deaf and dumb fall into consumption, and I cannot help thinking that the want of exercise of the lungs in speech must have a detrimental effect upon their health.

18,555. But have you any personal knowledge of such cases?—I have no personal knowledge of cases that I can cite. One does not preserve these cases always.

18,556. May I ask what your experience has been with your son after he left the Old Kent Road; what education did he acquire there?—He acquired a certain education. He can write hardly well, but he can read fairly well.

18,557. You mean that he can read to himself, not aloud?—To himself, not aloud. He is rather clever and intelligent; he is an engraver on wood, and he is known a good deal in society, but at the same time he has never pursued his education as he might have done if he had not turned to art, so that his general education is somewhat neglected, but he reads constantly. But what I want more particularly to say, is that I think that the influence of institutions is rather prejudicial. I should be very much pleased if I could see some way of education for the deaf and dumb in which they could be brought more in contact with hearing people in early life.

18,558. Do you know the school board system in London?—I do not.

18,559. How are they to get the oral teaching except in institutions, unless they have private means?—If they could be attached to schools, they could receive oral teaching.

18,560. What schools are there which would take one pupil and keep an oral teacher in order to teach him?—You could not do that. You must have several; but I do not think that they need be confined to an institution from the age of seven or eight, to the age of 14 or 15 or 16.

18,561. Do you know anything of the practical working of the teaching of the oral system?—No, I do not; but I think myself, that if these children could be put into schools where they could attend the educational course and then be free to mix with hearing children in the playgrounds and so on, they would make those acquaintances and inspire those sympathies which they seem to be very much deprived of now.

18,562. But how are they to speak to hearing children in the playground?—The children very soon learn that. I think that hearing children will learn any system of speaking very quickly, even the old fashioned plan of talking on their fingers.

18,563. But how is a boy to be taught in the middle of an ordinary school unless there is a teacher there who can teach him either on the oral system, or on the sign system?—That is a difficulty.

18,564. Unless there is a class of them, it would be very expensive, and if there was a class of them they would be a class by themselves, and exactly in the same position as if they were in an institution?—Not quite the same, because they would make the acquaintance of the hearing children in their ordinary life out of the class-rooms.

18,565. But you have no experience of any one who has been brought up so?—No, I have not.*

18,566. What is the evidence that you would like to give with regard to the blind; have you a similar experience with regard to the blind to that which you have with regard to the deaf and dumb?—No, I have not the same experience. The evidence that I want to give with regard to the blind, relates entirely to the Royal Normal College at Norwood, where many of the pupils are taught pianoforte tuning, so that they become as skilful as the tuners that are brought up in the best establishments in London.

18,567. May I ask whether you are a judge of pianoforte tuning?—Yes; I am the examiner in it, and can speak of it. I should like, if I might, to mention an instance where the deaf mutes were attached to a school; and in 1876 or 1877, at Ghent, they attached a school of about 100 deaf and dumb

* I since remember the well-known animal painter, Mr. Trood, was the only deaf pupil in a hearing school, and he had no other training. He had spoken previous to losing his hearing in early childhood by fever, and has retained his speech. He is ready at lip-reading, and is as well educated as the better educated deaf and dumb of his station.

Mr. A. J. Hipkins.

9 Nov. 1887.

boys to an orphan school of about 150 boys. I have never seen how that worked out, but it seemed an admirable idea.

18,568. Are you aware that they are going to do away with the deaf and dumb teaching on a somewhat similar plan at Donaldson's Hospital, Edinburgh?—I was not aware of that. At Ghent they remained until they were 18 or 20 years of age, that is to say, they were apprentices from the school, and returned to the school afterwards, and the school took charge of them till they became of age or nearly so, and they made, or were expected to make, friendships and acquaintances that would be useful.

18,568*a*. Were they in the classes with the others, or had they classes to themselves?—They were not in classes with the others but were in the same playground—that is essential.

18,569. (*Mr. St. John Ackers.*) Have you much knowledge of journeymen, deaf and dumb?—Yes, I have acquaintance with several of them. They are chiefly in my son's own position, among his friends.

18,570. Those would be in a higher position than the ordinary journeyman; does the ordinary journeyman deaf and dumb person get the same wages that are paid in the trade to those who are not deaf and dumb?—I think hardly so.

18,571. Are they obliged as a rule to join trades unions?—Not so far as I know. I never heard of any belonging to trades unions.

18,572. Do you know any deaf and dumb lithographers or printers?—I do not know any deaf and dumb lithographers or printers; I know engravers. I do not think that they have to do with trades unions.

18,573. Is there any objection on the part of masters or fellow workmen to the employment of deaf-mute journeymen, other than that they may not be such good draughtsmen as the hearing draughtsmen?—I think they are often as good draughtsmen, or likely to be as good draughtsmen, but I think there is some feeling against employing them, and also against being associated with them, unless it so happens that the master or person employing them or the person associated with them, has some one similarly afflicted in connexion with him, and then that creates sympathy.

18,574. Can you suggest any remedy for that state of things, which we must deplore?—No, excepting that of making acquaintances earlier in life, if it could be done.

18,575. Do you consider that any means, either such as you suggest, or a different system of education, which would tend to make the deaf mix more with hearing persons, and to keep them less a class among themselves, would be of advantage?—I think it would be of very great advantage. I feel that acutely; I think that is very desirable.

18,576. (*Dr. Armitage.*) Do you find that your son and others in the same position of life are able to mix freely with the hearing?—Oh, yes, I think so.

18,577. Do their friends learn the finger alphabet?—They learn it, or they can always use ordinary writing, which is to be preferred. The finger alphabet is rather hard to learn. I myself, although I have a son who is deaf and dumb, am not very proficient with it. It is easy enough to speak, but it is not very easy to read.

18,578. Then you think that, as affording facility of mixing with the ordinary hearing, oral teaching would be of great advantage?—It would be of great advantage, although there would be some disadvantage in that, because I think those who do speak, speak with unpleasing voices, and people will not give attention to them. I still think that writing is the best means of communication.

18,579. My question was rather this: given that which is an unavoidable evil, do you think that the persons educated on the oral system will be able to mix more freely with the general public than those educated on the sign system?—So far as I have seen I think they will.

18,580. Have you experience of that?—No, I have not much experience of the oral system. I have only seen it shown as a curiosity, that is all; but I think that the speaking must always be better with the mouth than with the fingers, which involves the slow laborious process of spelling out every word.

18,581. To turn to the blind, in whom you are also interested; you say that you are examiner to the Normal College?—I am.

18,582. Have you any special qualifications for examining in tuning?—Yes, because I understand it. I can teach a tuner myself; it is what I was brought up to originally.

18,583. Are you connected with any firm?—I am connected with Broadwood's, the pianoforte makers, where I have been all my life.

18,584. Are you a partner in Broadwood's?—No, I am not a partner; I am what is called an agent there, which is the next thing to it. I have no share in the property of the business, but I have a share in the profits of it.

18,585. Are you specially in the tuning department at Broadwood's?—It all comes under me, so that I see all their work, and if I found fault with anything it would have to be altered.

18,586. Are the seeing tuners at Broadwood's under you?—No, they are not immediately under me, but the people that they are under are under me.

18,587. That is to say, if the tuning in Broadwood's manufactory was not satisfactory it would come to your knowledge?—It would come to my knowledge and I should act.

18,588. Therefore, you have a very large experience of tuning?—Yes, I have. I do not think that anyone has a larger experience than I, so that I can speak as to the tuning at Norwood with great confidence.

18,589. From what you have seen at the college, would you say that the teaching is good?—I think the teaching is so good that the men that I pass tune as well as the most accomplished men that we employ. Their tuning would pass in any of our warerooms, and we could send them out.

18,590. Do you consider that the tuners whom you pass and give a certificate to at Norwood are equal as tuners to good seeing tuners?—Yes, they are equal to the average good seeing tuners.

18,591. And you would not pass them unless they were?—No, I should not, because I pass them as qualified tuners, and "qualified tuner" knows no exception, of course.

18,592. You pass them exactly on the same lines as you would pass a seeing tuner?—Just the same.

18,593. (*Mr. Van Oven.*) I understood you that your idea of the teaching of the deaf was that the oral system was preferable to the sign and manual system on healthful considerations?—I think so.

18,594. In what respect?—If a person never speaks from childhood upwards no action takes place from the lungs to the larynx, and such action must be very essential to the development of that part of the body. If it is neglected, and you never speak, the organs belonging to the throat and chest are likely to suffer for want of exercise.

18,595. I understand you further to say that you objected to the teaching of the deaf as carried out in the case of your son, because you thought it was prejudicial for the deaf to be always communicating with each other, and not with the outer world?—I think so.

18,596. Do you think that if the deaf were educated at day schools, and either lived at their homes or boarded with families, and consequently out of school hours were in the habit of associating with hearing adults and hearing children, that evil would be mitigated?—I think it would be mitigated.

18,597. You said, did you not, that the only objection that you had, and that you thought existed as regarded the oral teaching, was that the voices of the deaf who had been taught to speak were so unpleasant that people did not care to listen to them?—Yes; I think people will hesitate to listen to anyone who has a drawback of any kind, and an unpleasing voice is a thing that people will avoid.

18,598. Do you not think that the accomplishment of reading from the lips, even if a deaf person does not speak, would materially facilitate conversation?—Yes, I believe it would.

18,599. I presume that your son has never learnt lip-reading?—He has not; and my experience as to that is very small; but I think it must be a good thing *à priori*.

18,600. (*Rev. C. M. Owen.*) You said that you considered that the oral method would improve the physical condition of the deaf and dumb, but that is purely hypothetical. You have no experience with regard to that?—I have no experience. It is merely hypothetical.

18,601. Have you ever known an orally taught pupil who could communicate orally with the generality of people with whom he came in contact?—No, I have no experience of that kind.

18,602. I think you said you knew one case?—I knew one case a few years ago of a girl, who spoke very well.

18,603. Would she make herself understood by the generality of people with whom she came in contact?—She was only asked to make herself understood in certain set phrases. I could not tell about her power of making herself generally understood.

18,604. Could she lip-read?—She could lip-read from the people she was surrounded by.

18,605. People that she knew?—People that she knew. I cannot answer for other people.

18,606. (*Rev. W. B. Sleight.*) How long was your son at the Old Kent Road Institution?—He was there for six years. He was extremely delicate in childhood, and did not go there till he was 10 years old, and left when he was 16.

18,607. Do you find that he is able to communicate with the outside world?—In writing he can communicate with the outside world.

18,608. That education was given in the sign and manual system?—It was.

18,609. Is he able to make himself thoroughly understood by the outside world?—Yes, he gets on very well. I do not say that he would always make himself thoroughly understood; but in all the ordinary affairs of life he has no difficulty.

18,610. Is he able to gain a sufficient livelihood by his engraving?—Yes, he can do that.

18,611. (*Mr. Johnson.*) How do you arrive at the recommendation to the Commission that isolation in institutions is a bad way of educating the deaf and dumb?—By experience.

18,612. What is your experience?—My experience is that my son, to bring it home, is always more happy with hearing people; he is always in a much better frame of mind when he is associating with them than when he is associating with his own class.

18,613. Then your experience is based upon the result of the one single instance of your son?—And also his friends.

18,614. How many deaf and dumb people have you had experience of?—A great many in course of time: perhaps a score.

18,615. Did those people from whom you form this opinion speak orally or by signs?—They all speak by signs or finger talk.

18,616. What leads you, as you have that experience among so many deaf and dumb people, to the impression that the oral system is a better system than that employed by your friends?—I merely say *à priori* that it ought to be so for educational purposes; but I do not think that it will apply to all deaf and dumb people equally well; they seem disposed to put it aside, so far as I can hear, when they get with each other.

Mr. A. J. Hipkins.

9 Nov. 1887.

18,617. Amongst the persons with whom you have gained your experience, that is the opinion?—That is their opinion.

18,618. That is not your opinion, but the opinion that you have gained from a certain number of deaf and dumb people?—If my son were a child now I should put him to the oral system.

18,619. I want to know how you have gained your experience?—My son is now 35 years of age, and I have gained my experience from being constantly with him and seeing his friends, and hearing what goes on; and I do not think it is well that they should be together as much as they are. I do not approve of the Association of the Deaf and Dumb for this reason, although it does a great deal of good, because I think it also does a great deal of harm in keeping them too much together.

18,620. But after all you have no practical experience yourself, except that which you gain from what your son and his friends tell you?—And what I see. That is practical experience, I think.

18,621. You have been for some time examiner at Norwood, have you not, on the question of tuning?—Two years.

18,622. I understand that you are one of the superintendents at Broadwood's?—Yes.

18,623. Have you any blind tuners in your employ now there?—No, they will not have them there, but they assist them as much as possible.

18,624. You used to have some, did you not?—Not at the warehouse; we have had them at the manufactory.

18,625. But Messrs. Broadwood have employed them?—Yes, I think there is one there always.

18,626. Were there more formerly?—No.

18,627. Have you never had more than one?—No, I think not.

18,628. What sort of wages does that man get?—I cannot tell you. I think he was there as an improver only, from Norwood. We have not had them with us at the warehouse; they are considered to be in the way.

18,629. Your house consider them to be in the way?—Yes; and a good many houses would, no doubt, think so.

18,630. Have you any data to go upon from which you can say that other houses in the same high position in the profession do not employ blind tuners?—No, I do not know.

18,631. But they are considered in the way at Broadwood's?—Yes.

18,632. Then where would be the practical field for tuners to be employed?—In smaller places, the smaller factories, and smaller workshops.

18,633. Has it come within your knowledge that any are employed in the small factories?—Yes, and they do very well.

18,634. Could you tell us where?—I cannot at this moment, because I have no material to tell you from, but I hear of their being engaged and retaining their situations in London and the provinces, and doing very well.

18,635. Then being in inferior situations I suppose they would be with inferior makers?—They might be, but they would probably be as well paid. There is a certain rate of wages which a skilled tuner can command anywhere; but in our establishment the blind tuners are considered to be in the way because it is very large, and they require looking after.

18,636. Do you think that a blind man is capable of tuning very valuable pianofortes as well as a sighted man?—I think so.

18,637. Has it been the habit in your factory then to submit the very fine pianofortes, such as I have many times tried there, to be tuned by blind people?—They tune them at the factory when they are learning there and improving. We do not employ them, as I have said, at the warehouse.

18,638. (*Chairman.*) The improvers are not paid then?—No, I think not.

Mr. A. J. Hipkins.
9 Nov. 1887.

18,639. (*Mr Johnson.*) How many blind tuners do you know of now in the tuning profession?—I have given diplomas in the two years that I have been at the College to, perhaps, 12 or 14.

18,640. Have you any knowledge of what they gain or of what they are doing now?—No. I know that they are employed, and they say satisfactorily.

18,641. What do you consider satisfactory employment as a tuner?—If a man get from 2*l.* to 3*l.* a week.

18,642. Do you think that all those 14 are getting 3*l.* a week?—No, I do not.

18,643. What proportion of them do you think are getting it?—Perhaps three or four might be.

18,644. What do the rest of them get?—I do not know.

18,645. Are those that you know employed in London or in the provinces?—In the provinces chiefly; there is more employment for them in the provinces.

18,646. I presume you are an honorary officer of the Norwood College?—I receive a salary for examining, which I return to be given as prizes.

18,647. You are virtually there as an honorary officer?—Yes, actually I am an honorary officer.

18,648. The Commission would be glad to know what you receive as a sort of gauge of what is paid for a superior teacher?—10*l.* a year is what I am supposed to receive for examining, but I never have received it, because it is returned in the way that I have told you. It is Dr. Campbell's arrangement, and it is a very good one.

18,649. Have you anything to do with the management of the teaching department at Norwood?—No, I have nothing to do with the management, I am merely an examiner. I am a busy man myself, and I cannot spare the time, but I send a practical tuner, who sees the pupils do their work, and then I go afterwards and try the results, and know for myself that the tuning is done well.

18,650. (*Dr. Campbell.*) Are you aware that after we began sending tuners to your factory, by arrangement with your firm in Horseferry Road, the gentleman in charge there, Mr. Rose, offered to employ some of our tuners in the factory, but that at our request he did not employ them, because that would have stopped our sending our finishing tuners there, who are changed every few months?—I was not aware of that, but if you tell me so it is perfectly true, I am quite sure. This arrangement did not come before me.*

* I have since learned the following particulars. Mr. Frederick Rose has, for some time, given employment to a blind tuner who is not from the Normal College. Mr. Rose offered to engage, as well, at least one of Dr. Campbell's pupils permanently, but that gentleman wisely preferred to let a succession of the College tuners go to Broadwood's manufactory to gain experience—under the circumstances, without emolument.

Adjourned to December 2nd at 12 o'clock.

No. 6, Old Palace Yard.

Friday, 2nd December 1887.

PRESENT:

THE RIGHT HON. THE LORD EGERTON OF TATTON IN THE CHAIR.

ADMIRAL SIR E. SOTHEBY, K.C.B.
W. TINDAL ROBERTSON, ESQ., M.D., M.P.
B. ST. JOHN ACKERS, ESQ.
T. R. ARMITAGE, ESQ., M.D.
W. AUCHINCLOSS ARROL, ESQ.
EDMUND C. JOHNSON, ESQ.
THE REV. W. BLOMEFIELD SLEIGHT, M.A.
THE REV. CHARLES MANSFIELD OWEN, M.A.
L. VAN OVEN, ESQ.

CHARLES E. D. BLACK, ESQ., *Secretary.*

Sir HENRY ISAACS examined.

Sir H. Isaacs.
2 Dec. 1887.

18,651. (*Chairman.*) You have taken an interest in the education of the deaf in consequence of some members of your family being deaf?—Yes; two of my daughters are deaf.

18,652. Have you had them educated on the oral system?—Yes.

18,653. In this country?—No, at Rotterdam, where the system first came under my notice. I had a friend resident there, and I felt they would be safe if they were placed under his charge, and I accordingly sent them there as day scholars to the institution in which that system was taught.

18,654. How old were they when you sent them to Rotterdam?—One was six years of age and the other seven.

18,655. Were they both born deaf, or had either of them any remains of speech when they went to the institution at Rotterdam?—They were both of them deaf and dumb when they went to the institution. My impression is that the elder child had the sense of hearing originally, but while my wife and I were abroad the child was very much neglected by the nurse who had charge of her, and she took cold, which affected the tympanum of the ear. The second one, I have no doubt, was born deaf. My wife, who was pregnant at the time we discovered that the first child had lost the power of hearing, was much affected by the discovery, and I have no doubt that the second child was born deaf. The elder of the two is now 36 years of age and the other 34.

18,656. How long were they under instruction at Rotterdam?—One seven years, and the other, I think, about five.

18,657. Did they go to any other school after leaving Rotterdam?—No; they were taught for some time by Mr. Van Praagh.

18,658. Privately?—Yes, I brought them home, because Mr. Van Praagh, who was the only teacher in the Rotterdam Institution conversant with English, was coming over here, upon my recommendation, and I got him to continue their education after he came.

18,659. Did they begin learning language in Dutch, and did they learn English afterwards?—Yes. Learning the two languages was, of course, a great difficulty.

18,660. When they came from Holland were they able to speak Dutch sufficiently for all ordinary purposes of conversation?—Yes, sufficiently for the ordinary purposes of conversation.

18,661. As regards conversation in English, are they able to communicate with each other without the use of signs?—Yes; that is one of the points upon which I would like to say a word. They have now been under my observation almost daily for nearly

30 years, and I have never seem them exchange a sign. I have frequently come upon them when they have been together, and I have always found them speaking to each other audibly, except when they have been wishing to say to one another anything which young ladies ordinarily say in a whisper, and then they spoke to each other with the lips, but emitted no sound.

18,662. Do they lip-read with facility?—Yes, with the greatest facility—so much so that if I have a friend at dinner they follow the conversation, and very frequently indeed take part in it. They enjoy the theatre very much indeed, and appreciate nearly every word that is uttered. I have had opportunities of seeing a great many children who were pupils in the school at Rotterdam, in whom I naturally took an interest, and I never saw them exchange a sign. The use of signs is so strictly forbidden in the first instance that they regard it as *infra dig.* to use signs.

18,663. Are you acquainted with any other schools or institutions for the deaf and dumb in Holland besides the one at Rotterdam?—No. I do not think there is any other—at least there was not at the time that I took an interest in that particular institution.

18,664. Was that entirely a day school?—Yes.

18,665. I understand your opinion to be that the education of deaf mutes can be carried on quite well in day schools; that it is not necessary that they should be educated in institutions?—That is my opinion. I do not agree with the system of isolation in the case of deaf mutes, that is to say, I do not think they should be isolated from their speaking fellow creatures, but I think in the education of deaf mutes on the oral system they should be isolated, that is to say, they should not be educated with those children who are taught on the sign and manual system.

18,666. When your daughters left the school at Rotterdam, I suppose their governess endeavoured to keep up the instruction they had received there?—No, they had no governess when they left the Rotterdam institution. Mr. Van Praagh for some little time came to the house and gave them lessons, but they spoke to their mother and to me, and to all the friends who came to the house, just as you and I are speaking now.

18,667. Have you watched any of the pupils who have left Mr. Van Praagh's, and observed whether they are successful in keeping up conversation by speech and lip-reading?—No, I have not watched any of them. I was one of the first members of the Committee, and I may say that it was at my instance that the oral system was introduced here in 1865. I wrote a pamphlet on the subject which first called attention to it.

18,668. (*Mr. St. John Ackers.*) Notwithstanding that you wear a beard and a moustache, you are able to speak to your two daughters so that they can understand you?—Yes.

18,669. You do not find that they have any greater difficulty in reading from your lips than from their mother's?—No. It seems to me that the sense of sight and the faculty of perception are more acute in deaf and dumb persons than in the case of ordinary persons.

18,670. (*Dr. Armitage.*) Can your daughters lip-read from any one?—Yes.

18,671. Even from strangers?—Certainly; they enter into conversation with friends who visit me, to some of whom they are comparatively strangers.

18,672. Do they often make mistakes with strangers?—Very rarely.

18,673. Did I rightly understand you to say that they enjoy the theatre?—Yes.

18,674. Can they lip-read what the actors and actresses say?—Yes.

18,675. When they go to the theatre, at what distance do they sit from the stage?—I generally take stalls for them.

18,676. At what distance do you think they could lip-read what was said on the stage?—I think if they were in the dress circle they could lip-read what the actors and actresses said, and they have done so.

Sir H. Isaacs.
2 Dec. 1887.

18,677. Are they fond of reading?—Yes, they are very fond of reading.

18,678. Do you notice any difference in their literary tastes from those of ordinary young ladies?—No, the inclination turns to novel reading more than anything else, as in the case with most young ladies.

18,679. Do they dance?—Yes.

18,680. Are they fond of dancing?—Yes, very fond of it, they waltz and keep time splendidly. It seems to me a most remarkable thing, that they should keep time. I think vibration has something to do with it.

18,681. (*Mr. Arrol.*) You say that your daughters appreciate the theatre. Do they go to church, and are they able to follow the pastor in his discourse?—Yes.

18,682. Quite easily?—Yes; that is, if they do not sit too far off him, and if he does not declaim too quickly.

18,683. (*Mr. Van Oven.*) You spoke of your daughters having been taught Dutch and subsequently English; have they acquired a knowledge of any other language?—They know a few words of French.

18,684. They could not read French?—No.

18,685. Do they know anything of Hebrew?—Yes, they can read Hebrew.

18,686. Do you think from your observation that there is any greater difficulty in the deaf acquiring a knowledge of the English language than in acquiring a knowledge of French or German or Italian?—I do not think there is; certainly English would be acquired with much greater facility than Dutch, which is replete with gutturals.

18,687. Therefore you do not think there is any special difficulty in carrying out the pure oral system in this country on account of the unphonetic character of the English language?—No.

18,688. You say your daughters are able to follow what is going on on the stage, even when they are so far from it as the dress circle; do they use an opera glass?—Yes, when they are in the dress circle.

18,689. Without an opera glass they could not see the movements of the lips of the actors and actresses sufficiently well?—Not at that distance.

18,690. But in the stalls they could follow what was said on the stage without using an opera glass?—Yes.

18,691. (*Rev. Mr. Owen.*) You would consider that your daughters had had exceptional advantages in their instruction on the oral system. I suppose no money has been spared in their education?—They have had no exceptional advantages. The institution in which they were taught was a public institution open to the children of the poorest parents as to those of the richest. In fact, one may say that they laboured under exceptional disadvantages, inasmuch as they were originally taught the Dutch language.

18,692. Do I rightly understand that both of them are stone deaf?—Yes.

18,693. And have been so most of their life?—Yes; the second one was born so, I have no doubt.

18,694. You say you have every reason to believe that they read the lips of the actors and actresses at the theatre, and also of the minister at religious services, have you taken an opportunity of testing to what extent they have understood either the actors or the minister of religion?—Yes.

18,695. What has led you to suppose that they have thoroughly understood them?—They have given me the gist of the discourse or of the play.

18,696. Have they a book of the words when they are at the theatre?—No.

18,697. Do they go into shops and make purchases?—Yes, they go out alone with their maid for their shopping, and make their own purchases.

Sir H. Isaacs.
2 Dec. 1887.

18,698. Do you find that you have to place yourself in any particular position in the room in relation to the windows when you are carrying on a conversation with them?—No. Of course, if it is twilight, or approaching twilight, and the speaker is in the shade, they will find a difficulty; that difficulty occurs sometimes with myself, and they will ask me to move, or they will change their position.

18,699. Do you find that their way of speaking is unpleasant to a stranger?—It is not so musical or so flowing as that of an ordinary person who has hearing.

18,700. But nothing to be called unpleasant?—Nothing to be called unpleasant.

18,701. Do you know any other deaf and dumb persons who have been taught on the oral system?—Yes; pupils in the institution in which my girls were educated who were friends of theirs, and in whom I naturally took an interest.

18,702. Then the orally taught persons with whom you have become acquainted have been chiefly persons who have been taught in a foreign institution, not in an English institution?—In Rotterdam only.

18,703. You do not know any orally taught pupils who have been educated in England?—No.

18,704. Your knowledge of orally taught pupils is confined to Rotterdam?—Yes.

18,705. You do not, therefore, feel yourself qualified to speak of the oral system as taught in England?—Yes, I do, because I know the gentleman who introduced it here.

18,706. You do not know any of the pupils he has turned out?—No. I think, with Mr. Van Oven, I was one of the first members of the committee of the institution at Fitzroy Square, but I felt I ought to withdraw from it because I could not give sufficient time to the performance of my duties as a member of the committee, whose hours of meeting were most inconvenient for me.

18,707. (*Rev. Mr. Sleight.*) What length of time were your daughters under education altogether? You said that one was at Rotterdam for seven years and the other for five years, but you did not state how long they were under instruction in England?—Perhaps about 12 months, not more.

18,708. That was private education?—Yes. I engaged Mr. Van Praagh to give them instruction.

18,709. They were never at Fitzroy Square?—No, except as visitors; they were never pupils there.

18,710. During that 12 months that they were under the instruction of Mr. Van Praagh, did he teach them English?—Yes; he also taught them some English at Rotterdam; he was teacher at the institution at Rotterdam.

18,711. They were learning English there as well as Dutch?—Yes.

18,712. Have your daughters any friends amongst the deaf that have been orally taught?—Yes, one of their fellow pupils was a visitor at my house, and they spoke together without using any signs whatever; in fact, among themselves they speak with extraordinary rapidity and facility; they understand each other as well as you or I speaking in the ordinary way. The rapidity with which they speak, *inter se*, is remarkable.

18,713. You are only speaking of one visitor that you had?—Several of their fellow pupils have visited them from time to time, and what I have just said would apply to them. It just occurred to me to refer to that child as an illustration, she having been resident at my house as a visitor for some time. I could call to mind many similar cases.

18,714. (*Chairman.*) I understood you to say that your daughters mixed freely in the society of speaking people, and, therefore, they have not been thrown upon the society of those who are deaf?—Just so; they will go to a dance, and being both very good dancers, they are never at a loss for partners, they converse with their partners just as ordinary persons would; they do not make themselves understood with quite so much facility as other persons, but they make themselves understood, and they understand what is said to them.

18,715. (*Mr. Johnson.*) They understand what is said to them by lip reading?—Yes.

18,716. Have they had opportunities of mixing with many deaf people?—No.

18,717. How many do you think?—I could not say precisely.

18,718. Half a dozen?—I should think so; half a dozen who had been their fellow pupils in the institution at Rotterdam, and who have visited them.

18,719. They were taught upon what you call the pure oral system?—Yes.

18,720. They were not isolated?—No; that is to say, they were day scholars. As I said before, what I should recommend would be that orally taught pupils should be allowed to go home every day and mix with others who can hear and speak, but that in school there should be complete isolation.

18,721. After these young ladies came away from Rotterdam they had nine months instruction by Mr. Van Praagh in London?—Yes; it may have been 12 months.

18,722. Were they as proficient at the expiration of the period of his instruction as they are now?—No.

18,723. Then they have improved very much from association with ordinary talking people?—Yes.

18,724. Could you tell me at what distance these ladies sit from the preacher or reader when they go to religious services; are they a long way off him?—About 8 to 10 yards.

18,725. A shorter distance than they are from the stage when they go to a theatre?—Yes.

18,726. After having been to the theatre can they come home and give you a distinct account of what they had heard?—Yes, they will give me an outline of the plot.

18,727. Can they go and see one of Shakespeare's plays, for instance, and come back and satisfy you that they have realised something more than the impression that they would derive from the scenic representation, and that they have appreciated the beauties of the dramatist's language?—I should say not. The beauties of the dramatist's language would not be appreciated.

18,728. They would be able to give you a general idea of what they saw represented on the stage?—Yes, but the beauties of the language would be lost upon them.

18,729. Have they a good knowledge of written language?—Pretty good; not very good.

18,730. Then they rather depend upon their lip enunciation and lip reading than on writing?—Yes.

18,731. Have they ever been trained to carry on a conversation with other people by writing?—No.

18,732. They only carry on conversation by lip reading?—Only by lip reading.

18,733. Do you think the pure oral system is a practical system by which to teach the children of the working classes?—Yes; the combined system, that is to say, the oral and the manual, is, to my mind, not to be thought of for a moment; it is like mixing an acid and an alkali.

18,734. What was the number of pupils in the institution at Rotterdam at the time your daughters were there?—About 200.

18,735. Were there at that time many proficients in the oral system?—Yes.

18,736. Half of them?—No.

18,737. What sort of per-centage should you think?—I could not answer that question with anything like accuracy.

18,738. As large a per-centage as there is at Fitzroy Square?—I cannot say. I have no knowledge of the per-centage there.

18,739. You said you thought sight and perception were more acute in the case of the deaf and dumb than in the case of ordinary people?—Yes, that is the result of my observation of my own children.

Sir H. Isaacs.
2 Dec. 1887.

18,740. Your own children possess very acute sight, I presume?—Yes.

18,741. They do not find any difficulty with regard to lip reading in almost any position?—No.

18,742. But they read better if the person who is speaking is in a good light?—They must see the person who is speaking; if it is twilight, and the speaker is sitting with his back to the light, of course they cannot read what he says.

18,743. You do not find the moustache any hindrance?—Not the slightest.

18,744. I understand your view is that the deaf and dumb should go to day classes, and that they should not be isolated from society?—Certainly.

18,745. (*Dr. Tindal Robertson.*) Do these young ladies correspond with you when they are away from home?—Yes.

18,746. You said that their knowledge of written language was not very good; you did not mean to convey that they are not able to write tolerably well?—No, their writing is not imperfect.

18,747. Have they a pretty good knowledge of grammar?—Pretty good. Not very good, but pretty good. One detects grammatical errors in their writing sometimes, but that may be said of writers generally.

18,748. Have you any other children?—Yes; two others; two sons.

18,749. Are they in frequent communication with your two deaf daughters at home?—Yes.

18,750. Do your daughters carry on communication with your sons as easily as they do with each other?—Yes, quite as easily.

18,751. From what you saw of the system of instruction in the school at Rotterdam, do you think it is a good one?—Yes, I think it is a very good one. I presume it is the same now as it was when I knew it. I then thought it an exceedingly good one.

18,752. Is there any alteration in it that you would suggest, from your experience with regard to these young ladies, in order to make it more perfect?—No.

18,753. Do you know of any institution in this country which equals that institution in its teaching capacities?—My knowledge of similar institutions is very limited.

18,754. Speaking from your knowledge of Mr. Van Praagh's school, when you were one of the committee, was it conducted on the same lines as the school at Rotterdam?—Yes.

18,755. And did you think it equal to that school in its teaching capacity?—Its teaching capacity was very small when I had knowledge of it.

18,756. Have you had any experience of any other school in this country, either on the oral system or the sign and manual system?—Yes; I remember visiting on several occasions the institution in the Old Kent Road, with the view of inducing the managers of the institution to consider the question of the advisability of adopting the oral system; that was some years since.

18,757. (*Admiral Sir E. Sotheby.*) You say that in your opinion, it is not desirable to teach the deaf and dumb on the combined system?—Yes; most emphatically.

18,758. But suppose it is twilight, your daughters would not be able to communicate with other people?—In twilight, no. The same would apply to those taught Dactylology; they cannot communicate in the dark.

18,759. We know that there are many blind who are also deaf and dumb, and who are able to communicate quite freely with others merely by the pressure of the fingers; would not it be an advantage to teach the deaf and dumb on the combined system, so as to give them two means of communicating with their fellow creatures, one of which might be available on occasions when the other was not?—I am decidedly opposed to a combination of systems. I think one would neutralize the other.

18,760. You would not give the deaf and dumb the advantage of being able to communicate with others when there was not sufficient light to enable a person's lips to be read?—I do not think there is much in that idea.

18,761. (*Mr. Johnson.*) Take the case of a person who has finished his education under the pure oral system, would there be any objection in your view to teaching him the finger alphabet afterwards as an accomplishment, so that communication in the dark might be carried on?—I do not see any harm in that, but while the child is in a state of pupilage, I say distinctly, it should be isolation, so far as the manual system is concerned.

18,762. (*Chairman.*) You said you had never seen your daughters use signs. I suppose you meant the finger alphabet?—I have never seen them use any signs whatever.

18,763. (*Mr. Johnson.*) They do not know the finger alphabet, I suppose?—No.

Mr. Samuel Potts examined.

Mr. S. Potts.

18,764. (*Chairman.*) You are a bootmaker by trade?—A clicker.

18,765. And you have a deaf daughter?—Yes.

18,766. Was she deaf and dumb from her birth?—I cannot exactly reply to that for myself. My wife said she was not born dumb, but through a continuation of illnesses from the time that she was 16 months old till she was six and-a-half years old, we never heard her make any sound whatever.

18,767. Has she been educated on the oral system?—Yes.

18,768. Where?—At Mr. Van Praagh's school in Fitzroy Square.

18,769. What age was she when you sent her there?—I should think somewhere about eight years old.

18,770. Did you get some friends to send her there, or did you pay for her yourself?—I paid a trifle. I went to a doctor in Saville Row to endeavour to ascertain from him whether she would ever attain her hearing or not, and he gave me a letter to take to Mr. Van Praagh, putting before the managers of the institution exactly my position, and they very kindly took my daughter in at a very low figure.

18,771. How long was she there?—I think about 10 years—8 to 10 years—but during that time there were many occasions when she had to come home on account of illness.

18,772. She was not a boarder at the school?—No.

18,773. And while she was ill she had to discontinue her lessons at the school?—Yes.

18,774. Are you satisfied with the progress that she made?—I am. I can never repay the managers of the institution for the kindness that has been done to us.

18,775. Can you tell us how long it was before she was able to speak simple sentences?—I can give you the case of another child, which we had to board, and which went to the same school; this child was paid for by a lady, and I think she was at the school for about two years, and was just beginning to understand and to say a few words when the lady discontinued to pay for her, and the poor child was obliged to be taken away. I should think it was about three years before she was able to speak simple sentences. The first three years is, of course, the hardest time. They have a difficult task to teach a child at the beginning.

Mr. S. Potts.
2 Dec. 1887.

18,776. After your daughter had been at the school, say, five years, was she able to get on pretty well?—She was able to get on by degrees; you cannot exactly note the time when they begin to speak. She is well able to converse with me now.

18,777. (*Rev. Mr. Owen.*) When she goes to a shop to purchase anything, does she write what she wants?—No. She writes fairly well, but she would ask for anything that she wanted.

Miss Potts having been brought into the room, several questions were put to her by her father and by different members of the Commission, which were answered with varying degrees of facility. While some of the answers that she gave were not understood, she repeated word for word questions put to her by Mr. Ackers, and replied to them tolerably distinctly.

Mr. Thomas Scholfield examined.

Mr. T. Scholfield.

18,778. (*Chairman.*) You have been for some time the manager of the Industrial Department of the Preston Institute for the Blind, have you not?—Yes.

18,779. What was your previous training for that post?—When a boy I was educated and trained in Henshaw's Schools for the Blind at Manchester.

18,780. Will you inform us whether you think that the industrial training of the blind is, or was when you were trained at Henshaw's Asylum, of a complete and satisfactory nature?—It was very incomplete, insomuch that after I had been there seven years I found it necessary to spend at the least 12 months as a kind of apprentice with a practical man, a small master skip maker, so as to complete my knowledge of the trade. After that I started in business for myself, and was doing fairly well when I invented my first gauge for guiding the blind in forming their skips or baskets correctly, and to this invention I attribute my comparatively successful, and, I trust, useful life. The late W. F. Hulton, of Hulton Park, was a friend of mine, and he drew the attention of Mr. Tatton, of Withingshaw, who was then Chairman of the Manchester Schools for the Blind, to my invention; and Mr. Tatton insisted upon my giving up my business and taking a situation as foreman at Manchester.

18,781. And you became foreman at Manchester?—Yes; after learning at Manchester and completing my knowledge and starting in business for myself, I was appointed foreman at Manchester at the school where I originally learnt.

18,782. How long were you at Manchester as foreman?—About six years. Mr. Tatton had faith in me at that time, and I had faith in myself. If the cotton famine had not intervened, my impression is that we should at the present time have had in Manchester the largest business in the world for the blind. That was our intention.

18,783. How did the cotton famine interfere with your work, beyond, of course, temporarily diminishing the demand for the skips?—I went to Manchester at the commencement of 1859 as foreman, and I got a lot of men well trained, and the committee were convinced that they were practical and good men. They consequently built new workshops, and just when we got properly going in the new workshops the cotton famine intervened in 1862. At that time the workshop or out-door system was not generally practised in this kingdom, indeed it was new, and a large number of the committee were really opposed to it; there were only Mr. Tatton and a few others who were in favour of it. The cotton famine, which entirely cut off all demand for skips for several years, gave the opponents of the scheme the ascendancy. Consequently, having all the work entirely cut off through the cotton famine, they said, "One foreman "will be sufficient for what we have to do." So I went.

18,784. Did you go to Preston after that, or did you set up for yourself again?—After that I got employed at Mr. Abbott's skip manufactory in Bolton, amongst the sighted men. I worked just on the same conditions as the sighted men there for about three years.

18,785. Is it your opinion that the blind are or are not taught industrial work in the existing institutions as they should be taught?—I am quite sure that the blind have more wrong done to them in that direction than in any other.

18,786. Does that arise from their sense of touch not being sufficiently educated?—It does. The teachers in the institutions are not men who have been rubbed up by competition, and they do not know anything of trade; they are simply ordinary journeymen; they do not expect to live through the direct influence of their brain, but through the influence of their muscles, and they always have done so. Consequently they do not think much. When they get a situation in a blind institution, they neither know nor care about the blind, as a rule. They come there and teach the lind exactly on the same lines as they would teach sighted people.

18,787. Is it your opinion that but for the cotton famine you would have been able to find employment in the Manchester Institution for all the blind men in Lancashire?—For all who were disposed to work. I should like to give your Lordship some idea of the amount of work that there is in Lancashire in the skip and basket trade.

18,788. Do you mean work which the blind can do?—Yes. The millowners of Lancashire spend, certainly, not less than 60,000*l.* a year in skips, and there is a large general trade,—the same as they have in all other places,—of not less than 35,000*l.* to 40,000*l.* a year. Two-fifths of that are certainly paid in wages; that means something like 35,000*l.* a year in wages. If we could get one-third of that for the blind, it would employ 400 men at from 12*s.* to 13*s.* per week; and I believe that if the blind were taught on correct principles it would be a very easy matter to do.

18,789. Is it your opinion that that would be best carried out by having one central institution for making skips, or by having different institutions in the different towns?—I believe that a central institution, certainly, would answer much better for private individuals or institutions where they have a small turnover, because they must come into the retail market to purchase the material, whereas if you had one central institution or warehouse, it would buy on a large scale, and, therefore, advantage would result, either to the institution or to the individual. That is one of the principal benefits which we think would be derived from the centralisation system.

18,790. But would not the blind be open to competition from seeing men, as they are now?—Certainly; but if we got our material cheaper, we should be better able to compete.

18,791. There is no large institution at present for making skips, but it is done, by the blind in some cases and by the seeing in others, on a small scale, is it not?—Yes; there are some who employ as many as 50 men.

18,792. Do you think that they would employ blind men if they were equally as competent as seeing men?—I was the first blind man who was ever employed, to my knowledge, amongst sighted men on the same conditions. Mr. Abbot, after I went to him, employed nine blind men at the same time, and he said to me that, so far as their work was concerned, he should not care if all his men were blind. But they work by gauges; they have it reduced to touch. I hold that it is just as impossible for a blind man to make a basket correctly, unless he is guided by touch, as it is for him to read without touch.

Mr. T. Scholfield.
2 Dec. 1887.

18,793. Do you think that the average blind man would be able to do as well as you have done, who are, perhaps, rather above the average in general ability?—I do not expect that the average blind man would earn as much as I earned when I was at Mr. Abbott's. I earned from 22*s.* to 25*s.*, or 26*s.* a week. It all depends upon the individual.

18,794. You think that the average run of the blind men that you know would be able to gain a livelihood by such work?—They could earn 12*s.* or 13*s.* per week.

18,795. Is there any chance of anything being done in that direction further than is being done at present at Preston?—I do not think there is.

18,796. Do your committee share your views?—They do. But you will understand that Preston only acts for itself, and you cannot get centralisation.

18,797. You want centralisation?—If we have centralisation, the funds must come from an independent source. Manchester does not care for the people of Barrow, for instance.

18,798. Do you think that this institution could be started entirely by voluntary subscriptions, or would you require the State to assist in starting a workshop of this kind?—I hold very strong views about the State assistance; I myself scarcely think it would be fair. It is right for the State to educate children, but I do not believe that it is fair for the State to give money to help a man to get a prize which all are running after.

18,799. I am not expressing my own opinion; I only want to know what yours is. How is this to be started; in the ordinary trade way?—Yes; but my idea has been that if the thing was brought prominently before the public, it might cause legacies, or something of that sort, to be left for that special purpose.

18,800. Do you think that the State should inspect these workshops for the blind?—My impression is that either the State or some other agency would confer the greatest possible benefit upon the blind if it would appoint a thoroughly practical trades inspector to see that the blind were trained to touch.

18,801. To report upon the character of the education, industrial or otherwise, in the workshops or schools for the blind?—Yes. These trade teachers, as I have already said, are ordinary men without enterprise, or without hope, and who only work just for their wages. I would offer two or three prizes to the best men, the men who had their teaching the most complete; and I would give the prize directly not to the Institution, but to the man who had charge of the department.

18,802. Have any steps been taken to start the home for blind children that is contemplated?—No, they are awaiting the Report of this Commission before they take any steps in the matter.

18,803. The bazaar was successful in obtaining a large sum, was it not?—3,407*l.* clear.

18,804. Have you any acquaintance with the workshops for the blind in any other part of England?—I have visited the principal institutions of the kingdom at various times.

18,805. Do you think that there ought to be more intercommunication between them, in order that they may assist each other and work in harmony together?—There seems a very great jealousy amongst them. The teacher of one institution, if he finds that another institution is really in advance of him, will not copy from it, or acknowledge that he himself is inferior, and that he can be taught anything. That is the spirit amongst them. I believe that if an inspector were appointed whose duty it should be to visit every institution in the kingdom once a year and report upon them, giving rewards to those who held the best position, that would have a very healthy effect.

18,806. Do you think it an advantage that the blind should be taught industrial work by the blind themselves, or by the seeing?—If you can get a blind man who is competent to teach, I should say decidedly that the blind should be taught by a blind man.

18,807. But it would not be very difficult to get a blind man who is competent to teach the blind?—Of course the blind are only few in comparison with the seeing people; consequently you cannot find a large number amongst them who are competent to teach the others.

18,808. Therefore your argument would be that you must fall back upon the sighted teachers?—You are obliged to a large extent to fall back upon sighted teachers, but I would stimulate them, and by some means get a correct system afloat, and give a bonus to those who used the best system.

18,809. As I understand you, you think that the present sighted teaching is given to the blind too much in the same way as the seeing are taught, and not by a special development of the sense of touch which the blind ought to receive?—You are right. That is a mistake. The blind work on the haphazard principle; they have no certainty. At our place, if we give a man a skip or a basket to make, if he makes it wrong, he is never able to say, "I could not help it." We always say, "You knew better than that; why did you "not measure it? Why did you not keep to your "gauge?" If a man makes a defective basket, we can always say, "It is your own fault," and he knows it; and that is the principle upon which they should be taught.

18,810. Can you tell us what the average earnings of the blind in your institution are?—In our institution the average earnings are only small, only about 8*s.* per week.

18,811. That is principally earned, I suppose, in making skips?—Yes.

18,812. Then I gather that the smallness of the wages that the blind earn is the result of defective work and of defective teaching in the institutions where they have been brought up; is that so?—No; the principal point is that the blind who are working at our institution were men before they were taught their trade.

18,813. Those who had become blind in mature years?—Yes; and a number of them will go and play the violin, or some other instrument, and they get 5*s.* per night for playing it. They only earn at our place sufficient to make themselves comfortable, and they make it up in other ways. We do not drive them; we let the men earn just what they think proper; but if they required 14*s.* per week our men could average 14*s.* per week.

18,814. But they do not work sufficiently to earn as much as that?—No; they make the money somewhere else. We have had one man who earned over 1*l.* a week; he learnt his trade with us, and in 10 years he had saved 250*l.*, all the while supporting himself; and he was paid exactly on the same lines; they are all paid the same.

18,815. (*Mr. Johnson.*) Did the man save this money as a skip maker?—Yes.

18,816. (*Chairman.*) His savings were 10*s.* a week?—Yes.

18,817. (*Dr. Tindal Robertson.*) Were you blind from birth?—From early infancy, certainly; I could not say whether I was blind from birth or not.

18,818. Have you any suggestions to offer to the Commission as to the education of the blind?—My impression is that the Braille system, if it is properly applied, is all that can be desired.

18,819. Have you any supplementary suggestions to add to that, with regard to the education of the blind, as to teaching them in board schools, or teaching them together, or on any other points; because we want to hear what the ideas of the blind people are upon these things?—My impression is that where you can do it successfully, it is a benefit to the blind

Mr. T. Scholfield.

2 Dec. 1887.

to let them intermingle with sighted people as much as possible, and not to keep them by themselves so much.

18,820. Do I correctly understand that you would approve of the present system of putting the blind in asylums at an early age, and teaching them altogether away from the sighted children?—The conditions are different in different places. In the provinces, where the people are scattered, you could not possibly have the same system of teaching in board schools that you have in the Metropolis here, and, therefore, I think schools or asylums are a wise arrangement in the provinces. But I, myself, approve of the system of sending blind children to the board schools in London from five to ten years of age, after which it would be better to send them to the ordinary schools for the blind, where, according to my observation, they acquire a more hopeful disposition by mixing with those who have no natural advantage over them.

18,821. And, I suppose, you would say, therefore, that you would approve of the same system being carried out in the large towns, which are very much upon a par with London?—Where you can get a sufficient number to warrant your doing it, I should.

18,822. Will you give us broadly your idea as to the system of technical education which should be adopted for the blind?—I should be inclined to train the blind as far as possible on the same lines as sighted people.

18,823. But could you give us some idea as to how it should be done?—I have a difficulty in comprehending your meaning.

18,824. You have alluded to certain central places where technical education might be given, and where raw material might be bought, and so on; have you any idea in your own mind as to how that could be carried out throughout the country?—Take a place, say, like Manchester; Manchester should be made a centre for all Lancashire; there should be a trade capital of something like 15,000*l.* to conduct the business of the county, so far as the blind are concerned; two representatives from each of the nine institutions and workshops in Lancashire should manage this central store; and they should buy material, not only for the institutions but for private individuals, and supply them with it at cost price. The blind workmen who had learnt their trade should work at their own homes, and produce work there, and sell what they could in their own district, and the surplus which they were unable to sell should be sent to the general store, and they should have its value, either in material or money, whichever they preferred; and the agent of the general store should sell all that came to him, whether it was from workshops or from private individuals. That is something like the system which I should suggest.

18,825. Then this sort of joint stock company which you would have established would be the proprietors of the whole thing?—It would be in trust, of course. They would be the governors.

18,826. Practically the money would belong to them, I suppose?—No, certainly not.

18,827. To whom would it belong?—They would hold it in trust for the blind of Lancashire.

18,828. But they would practically be the administrators?—Yes, they would.

18,829. And they would have to pay the journeymen who did the work, I presume?—I should not have it done in that way. A man might be living in a village six miles from Manchester; I should supply that man with material, and let him work at his own home; there might be three or four mills near by which would take 60 per cent. of his work, and the remaining 40 per cent. which he could not sell in his own locality he might return to the general store, on condition that he worked on the approved system, and made his work good in quality.

18,830. You would let the man in reality do his work independently, and that part of his work which he could not dispose of by himself and for himself, you would let him send to the general store to be disposed of as well as it could be disposed of?—Yes, by the general agent.

18,831. I think you said that there were nine institutions in Lancashire, and you suggested that each of those should send two representatives to this council which you propose?—Yes, they should be the governors.

18,832. In your opinion should these representatives be gentlemen belonging to the committee, who would come at their own expense, or should they be workmen who would have to be paid to go there?—I think that they should be gentlemen belonging to the committee, men of position.

18,833. And to that council, composed of those gentlemen, you would entrust the whole of the management of this blind institution, as it might be called, for the whole county?—I would.

18,834. And do you think that if similar institutions were established in different counties in the country, there would be any advantage in having them regulated by a council for the whole kingdom, which might be established in the Metropolis, for instance?—A general council, certainly, could not no any harm.

18,835. And it would take cognisance of every matter connected with the affairs of the blind?—I think that would be a very good system. It appears to me that the system on which the blind are locked after wants unifying. We want a oneness of action; we want the best system of instruction, and we want that introduced throughout the country. If you have an excellent institution, where you have the blind taught on the best possible principle, and three or four other institutions where the teaching is defective and the work poor, they injure the good institution. Supposing that a blind man, or an institution, got an order from a millowner for 100*l.* worth of skips, and that he sent inferior skips to that millowner, if I went to the millowner, however good my skips might be, he would not give me an order. He would not know that it was on account of defective instruction that the skips were bad, and he would say that it was because the men were afflicted that the skips were bad; whereas, in reality, if a blind man is correctly trained, he can make as good a skip as a sighted man.

18,836. I have asked you about the education and technical training of the blind; what would you do with regard to the aged blind?—There is not any way of assisting the aged blind but by pensions.

18,837. With regard to pensions, have you any in your county?—We have several who receive pensions from London. In Preston we have three, I know.

18,838. But have you any pensions which are specially applicable to your own town?—We have not.

18,839. Do you find that, as a rule, the system of pensions is well known to all the blind in your part of the country?—Yes, it is well known; and my impression is that it would be a wise thing if in every large community funds of that kind were started. They only want starting; I believe it would be possible in a place like Preston, in 12 or 20 years from now, to have a dozen pensions of 10*l.* each for aged blind, and I think the Government might be fairly asked to encourage the formation of such funds by a grant of, say, 50 per cent. on the amount annually paid in each district.

18,840. That is to say, you think that funds could be raised from the locality itself?—I do; largely so. The thing only wants a good man and a really energetic man to start it. Why not start a bazaar and get 3,000*l.* for it as a commencement? You could do it easily enough.

18,841. Do you know, as a matter of fact, any people who are receiving pensions in your neighbourhood?—I know three who are receiving pensions from the Metropolis.

18,842. Do you think that in those cases of which you know, the pensions are well spent?—Generally speaking, they are.

18,843. Have you ever heard of any cases in which pensions have been mis-spent?—I am not in a position to answer for all cases.

18,844. Have you ever heard of cases in which sighted persons have obtained pensions for their blind relatives, and in which the money has been improperly got rid of?—No, I never knew a case of that kind. The blind in Preston have themselves had the advantage of the pensions in the cases with which I am acquainted.

18,845. Do you know any cases of aged blind poor in your district who have no pensions, and who go to the workhouse?—We have several in the workhouse now.

18,846. Do you think that it would be any advantage if the guardians, instead of taking them into the house, would give them some kind of relief outside the house?—In some cases that might do; but in some cases they are almost as well in the house as they would be out of it, when they get very old and have no one to take care of them, although it has a degrading tone in it. I would far away rather have a pension for the aged; I do not like their going to the workhouse.

18,847. But do you find that the blind themselves have an objection to go to the house if they can possibly avoid it?—I certainly do.

18,848. (*Mr. Johnson.*) I suppose the principal part of your trade is in these skips, is it not?—It is.

18,849. I see that last year there were sales to the amount of only about 360*l.* in the skip department, and that only 221*l.* was paid in wages?—That was so.

18,850. Does that include the wages of a foreman, or merely the wages of those who make the skips?—It includes the wages of all in the workshop.

18,851. Does it include your wages too?—Yes.

18,852. How many people have you employed now in making skips?—We have nine.

18,853. Are you able to supply the whole of the demand that you have?—Sometimes we are not; we have frequently bought skips from sighted manufacturers.

18,854. That is to say, you have only nine people working in your outwork department at skips?—Yes.

18,855. Do you know of there being, at Preston, any blind people who are not employed?—There are no blind people in Preston who are willing to work who cannot have work if they please.

18,856. Then I may take it that nine people represent the whole of the workers upon the skips in Preston?—Yes.

18,857. I think you said that the average earnings were about from 8*s.* to 10*s.* a week at Preston?—Yes.

18,858. Have any of those people any other means of subsistence, except playing musical instuments in the streets?—Not in the streets; we do not allow that, but they take engagements to play.

18,859. I suppose the principal portion of them play in public houses, do they not?—Yes, in public houses, or if there is a wedding, they will give a violinist 8*s.* or 10*s.* to play for them for a dance.

18,860. Of course, that does not occur every day or every week?—No, but such things come pretty often, and they help.

18,861. How many of those nine people are musicians?—Four.

18,862. Do the other five get any supplement to their wages in any way by pensions?—No.

18,863. Then, do you consider that they can live on 8*s.* a week?—No, I do not.

18,864. Then how do those other five, who do not get anything extra, live?—The others earn more. Those who play music frequently do not earn 8*s.*, and the others earn 12*s.*

18,865. Supposing that the other five earn 12*s.* a week, is that all they earn?—Yes; I do not know that they earn anything else.

18,866. And that is all that they could earn by making skips, is it not?—That is all they could earn; but the reason of that is that they were taught their trade after they were adults. If any man learns a new trade when he is 25 or 26 years of age, he is never thoroughly skilled at the work.

18,867. Then I understand that you never have any but adults?—We have young people if we can get them. We have had them, but we have not any now.

Mr. T. Scholfield.

2 Dec. 1887.

18,868. Do you not think that it is a desirable thing to have them young if you can get them?—I think it is.

18,869. You say that they should work on the approved system; what do you mean by the approved system?—We work to gauge.

18,870. That is to say, you think that all blind people who do not work to gauge as basket makers are not working on a good system?—I am certain they are not; they cannot make a good basket.

18,871. Are you aware that there are other institutions where they do not work upon this gauge principle?—I do know that, to my sorrow, and they handicap me a great deal.

18,872. Do you know, that at the large establishments at Glasgow, Edinburgh, Manchester, London, and a great many other institutions, they work without these forms, which you say are the approved system?—Yes, I know all that.

18,873. And do you not think that these establishments have a very large trade?—I do not; according to the number of the people that they employ, I know they have a very poor trade. If you will look at the report of these Institutions you will see, I believe, that, small as ours is, our skip department compares very favourably with theirs.

18,874. I am not talking of skips, but of baskets generally?—I myself was referring to the whole trade.

18,875. I am taking the statement of the accounts for 1886; the whole of your returns are under 600*l.* a year, are they not?—Yes; those are trade returns.

18,876. The amount for skips is 338*l.*, for cane seating, 35*l.*, and for your general show room, 257*l.* The greater portion of the contents of that show room are not manufactured by the blind, I believe?—That is so.

18,877. The consequence is, if we deduct that, that the whole of your trade return is not 500*l.* a year, for the whole of the institution?—It is principally among nine workmen, who, on account of reasons which I have previously stated, are much below average capacity.

18,878. It just comes to this:—that in the skip department (which, I know, is most wonderfully carried on in your institution, for I have seen it myself) the whole result is 338*l.* a year.

18,879. You state here, for the information of the Commission, that the work would be very much better if it could be done on an improved system?—Yes.

18,880. And that is your system, is it not?—It is any system which reduces it to touch.

18,881. I thought you want the form?—It is because it reduces it to touch.

18,882. Do you ever take people into your workshop from other places than Preston?—By the rules of our institution we do not profess to take anyone who resides beyond a radius of nine miles from Preston.

18,883. Then he has to come and live in Preston, I suppose, while he works there?—Yes, he has.

18,884. Do you ever give out work to be done?—Never.

18,885. You do not, I see, by your report, do much else except in the skip-making and in the cane-seating departments?—No, we only employ the blind in those occupations.

18,886. When you were foreman at Manchester in 1859, did they make skips?—Skips only.

18,887. Did you then have a better class of workmen, people who had been instructed earlier?—Yes, I had men there who went to work at Mr. Abbott's and earned a pound a week.

18,888. Was there any objection amongst the sighted workers at Mr. Abbott's to working by the side of the blind workers?—There is a strong feeling.

Mr. T. Scholfield.

2 Dec. 1887.

18,889. How many blind workmen were working with the sighted?—At one time they had nine blind men working there.

18,890. Why did they discontinue that?—I was not there when they discontinued it.

18,891. Do you think it a very desirable thing that employers of sighted labour should employ the blind in association with the sighted, if they can do so?—I do, but I believe that the principal reason why those men left Mr. Abbott's in Bolton was that there was a workshop for the blind started in Bolton, and also one in Manchester, and one in Oldham now, so that they have gone to the workshops in preference.

18,892. But they do not get the same amount of wages, do they?—I do not know. Mr. Abbott reduced his wages a good deal after I left.

18,893. Do you know, as a matter of fact, that Mr. Abbott paid as much as a pound a week to his blind workers?—I earned more than a pound a week myself there, and another man earned more than a pound a week.

18,894. Therefore, if sighted employers would employ blind labour, the blind would get larger wages under those circumstances than they would in an institution, would they not?—No, that does not follow. The reason that we earned more was that both I and the other man learnt when we were boys, and we had lots of energy in us at that time, and did not look for any money from elsewhere.

18,895. In fact, you were better workmen than the others?—We did not play a musical instrument or anything of that sort. We stuck to our work like men. I had a sighted man working beside me, and I did not like him to earn much more than I earned, and I tried to keep up with him.

18,896. You told us just now that if you got material cheaper you would be able to compete with the sighted; how do you get your material now?—We get it chiefly from Liverpool.

18,897. And that is bought by the institution?—Yes.

18,898. And it is dealt out, I suppose, to each worker?—I look after that. We buy perhaps six tons at once; but a general institution would buy as much as 150 tons.

18,899. Still it is bought in the best market you know, and at the lowest price for the small quantity that you buy?—Yes, we do not give a farthing more than we can help.

18,900. You would like to have the Government inspector that you have spoken of in the schools as well as in the workshops, would you not?—Yes, I would like an inspector for the workshops.

18,901. Would you like that inspector to be a sighted man, or a blind man?—It is quite immaterial; so that he takes an interest in his work and fully recognizes that, practically speaking, a blind man's eyes are in his fingers, and that unless he is supplied with a correct tangible guide to direct him in forming the basket or skip which he is making, it is folly to expect a satisfactory result.

18,902. I suppose it is reduced to touch in the case of all the baskets?—I mean that a blind man must have something whereby he can feel and know whether his baskets are going right or wrong. For instance, our skips are, say, two feet long in the bottom, and they spring to three feet at the top; that is 12 inches of flow. One corner of the skip might be springing four inches, and another might be springing eight inches, and the blind man cannot tell the difference. He must have something to show him whether it is springing eight inches or four inches, or whatever it is springing. A sighted man sets his skip out by his eye, but a blind man's touch must be guided, and unless it is reduced to touch he had better never start it.

18,903. Then you say that you would like the inspection carried on by a competent person?—Yes, and that it should be laid down as a distinct condition that a man who should be occupied as a basket maker, should be a man who reduced all his work to touch, so that he would be able to tell whether he was right or wrong. If a blind man has his work properly systematised and reduced to touch, he is as happy as a king when he is working. If you let it be at haphazard, he will spoil the work, and he is in purgatory all the time he is working.

18,904. Can you tell me anything about those men who get money by playing on the violin; have they been taught in any institution?—They have just picked it up.

18,905. Do you think that music is a good occupation for the blind?—Not now. There is too much music given. At churches you have people playing just for the honour of the thing.

18,906. You have a good deal of experience; do you think it is desirable to train a large number of blind persons for the musical profession?—Blind men are just the same as sighted men; nine out of every ten must earn their living by the muscle, and there are very few who are really competent musicians

18,907. And you think that one-tenth would be the greatest proportion of the blind who could do any good with music?—I do, and the other nine-tenths must work for their living. Give them a fair chance, do not let them both be blind and robbed of their opportunity by deficient teaching.

18,908. Then I gather that you think that trades are far preferable to music as an occupation for the blind?—Yes, I think that a far larger number would be able to get advantage from a trade.

18,909. But I suppose there would be the same competition in basket making as there would be in music?—But every blind man cannot make a clever musician, while almost every blind man, who is practically strong, can make a skip, if he is properly instructed.

18,910. (*Rev. Mr. Owen.*) When you speak of working by touch, do I rightly understand you to mean that the blind should use frames and moulds?—Yes, in small baskets, but in large baskets they require gauges, I mean that you must have some system which enables a blind man by his touch to ascertain whether his work is right or wrong. A sighted man can ascertain it by his sight, and a blind man must have some system whereby he can ascertain it by his touch; and if you cannot give him a system of that kind, you have no right to start him working.

18,911. That is to say, the blind should realise that they are handicapped, and should make up for their deficiency by the use of these frames?—They should. But it is not so much the blind who should realise that; it is the instructors of the blind. The blind suffer awfully. When I was young, I was taught on those lines, and I know how anxious I was if I had a large skip in front of me and was making it, knowing that there were ten chances to one that it would be wrong when it was made. Accordingly, I set to work on this gauge, and I never rested till I had it complete.

18,912. You think that with these frames and moulds the blind can really turn out work in competition with the seeing?—They can. If you will refer to our back reports for the year 1874, you will find, I believe, that our trade in the skip department amounted to something like 700*l.*

18,913. How many did you employ then?—We employed about 12 then. I have a motive in mentioning that. At that time we were so busy that I could easily have got work for 100 men. We bought a considerable quantity of skips at that time from sighted manufacturers, and we had more complaints at that time about the skips that we bought from sighted people than ever we had about all ours in 20 years. We have never had a skip of our own make returned as defective in all the 20 years that we have been in business.

18,914. Was it not rather from the bad material that was used that the skips which you bought from sighted people were complained of?—No, it was the slight work; they were not made substantial enough.

They required strong articles, and the sighted men slighted them,—what we call "blowing them up."

18,915. (*Mr. Arrol.*) On the question of education, I think you said that the education of blind children in sighted schools was not likely to be attended with success unless you had several blind pupils to go to the sighted schools; do you not suppose that it is quite competent for a master to deal with one blind child in a sighted school?—I do. My real point there was expense and convenience. If it costs you 50*l.* to educate one child, it costs more than it is worth; you had better have the child in an institution than go to such a large cost, just for one single individual. That is really the point.

18,916. It was simply upon the element of cost that you based your recommendation?—Only on that.

18,917. At what age do you think that blind children ought to be taught a trade?—Fourteen.

18,918. Do you recommend that while a young child is being taught a trade, the institution should receive some grant from the parish to which the child belongs, or from some official source?—No, I am not in favour of that. I am for education.

18,919. If you found that there was a child brought to an institution whose parents could not pay for its training, what would you do with that child?—I think that there should be some means of educating it independent of the Government. There is now; the parish often does it.

18,920. That is just coming to the point that I suggest. Do you not consider it advisable that all parishes should be required to contribute to the institution so much per annum while a child is learning its trade, with a view of relieving the parish in after years of the charge of a pauper?—The point is this: that the parish would have the child to keep if it was outside, and it simply supports the child inside the institution instead of outside. It is not paying, as it were, for the child's training; it is simply paying for the child's keep, which it would have to pay if the child was not there. My feeling is that in competitive trade the State has no right to help one man against another, but I do think that the school board or parishes should pay the school fees for a blind person when their parents or friends are not able to do so.

18,921. But during the time of the training, should not the institution be encouraged to train a child by getting support from the parish to which the child belongs?—My impression is that we have pretty nearly sufficient machinery and pretty nearly sufficient money to train all the blind in trades, if it was well used. If an inspector was appointed, a thoroughly practical man, who insisted upon the blind being taught, everything being brought to touch, as I have said before, I believe that 500*l.* spent in that direction would do more than 25,000*l.* in any other direction, and I hope that there will never be an attempt to extend the industries of this country amongst the blind until that is done.

18,922. Would you be in favour of institutions being encouraged to send their journeymen away from the institutions to commence work at their own homes as soon as possible?—Yes, I believe in that.

18,923. Have you formed any idea as to what means should be adopted to encourage the institutions to follow that course?—My thought is this: that it does not depend upon the institutions at all. If a man is worth his salt, he will not remain in the institution as a dependent. If he has it in him to earn his own living, he will leave of his own accord, and work for himself; he will not hang on the charity,—not he!

18,924. You are not inclined to encourage, or you have not hitherto encouraged, any man in working for himself at his own home?—Yes; I think I spoke sometime since in favour of men working at their own homes, and selling what work they could in their own locality, and sending the remainder to the general store to be disposed of by the general agent; and I believe in it.

18,925. If you have not a central institution, how is a man that works at home to dispose of his goods? If you have a workman working at home, what assistance is given to him to dispose of the results of his work, if he has surplus stock?—Not any. If a man starts in business on his own account, he depends upon his own energy and enterprise; if he is an energetic man, he swims, and if he is not, he sinks. But if you had a central institution, it could help in the way that I have indicated.

Mr. T. Scholfield.

2 Dec. 1887.

18,926. Do you not think that it would be prudent to recommend that those institutions should keep up a connexion with the workmen that have left, and should encourage them by giving them some grant, so as to assist them, and not allow them to lapse?—I believe it would be a grand thing, even if you had not a central institution, that any institution which trained a lot of workmen should let men go and work at their own homes and sell whatever they can, sending the remainder to the institution at which they had been trained, even if it was not a central one, for sale there. That would answer the same end; but you cannot do it until you have men who can produce saleable work. When I go to these institutions and touch the work it almost makes me heartsick, and I feel sorry for the whole job. And mark you this:—25 years since, when I was at Manchester, before the cotton famine, I could have got 100*l.* worth of orders as easily as I can get 10*l.* worth now; and the reason is that there are more workshops for the blind, and the blind at those workshops have ruined our custom by producing bad work. It is not their fault, poor fellows; it is because they were not correctly trained. I think it would be a very good thing if the amount of salary paid to the head masters of schools workshops for the blind depended to some extent on the business turnover.

18,927. Have you formed any notion as to what should be offered to the institutions, to induce them to look after those men and keep them from producing bad work?—If the institution does not train a man correctly, when he leaves, he cannot produce good work, it is the institution's own fault for not teaching him better.

18,928. Do you think it is advisable that the State should give a certain capitation grant for those workmen that they turn out quite qualified to work, and that after such workmen have left the institution should continue to receive a grant during the time that it keeps a supervision over them?—Personally I am not in favour of State aid. I believe that if the State comes in, you, to a large extent, kill private benevolence. That is my view. As regards education, you educate the sighted children, and I think it is only the duty of the State to educate the blind children. Give the blind children the same chances as the sighted children, whatever it costs. But when it comes to competitive trade or business, I believe that should be left to private enterprise and not to the State. I would not vote for its being done by the State myself.

18,929. With regard to the workmen making baskets, you are strongly alive to the necessity of their having models or shapes; do you know anything with regard to the amount of work done at the Glasgow Institution?—I know that it produces a very large quantity.

18,930. Do you know what system they adopt there?—No.

18,931. Do you know that they do not use models?—I think they do not use models.

18,932. Are you aware that they turn out very satisfactory work?—I am not aware whether it is satisfactory or not.

18,933. (*Dr. Armitage.*) I think you said that in general the blind are not well taught in institutions?—I did.

18,934. Do you think that it would conduce to the proper teaching of the blind if the managers and committees of the institutions were made aware that the after results were not satisfactory?—If the

Mr. T. Scholfield.

2 Dec. 1887

managers of the institutions do not know that the results are not satisfactory, I pity them; for I know, when I was at the Manchester Institution, when I was a boy, there was only about one out of every 10 who attempted to do anything which he had learnt at the Manchester school, and we thought that was a failure.

18,935. Do you think that, as a rule, the committees and managers of the institutions are aware of that fact?—The committees are not, I dare say, aware of it. We took steps to make the committee aware of it at Manchester.

18,936. Do you think it is likely that things would be better if it was brought home practically to the committee?—I do; and I believe that the way to bring it home would be to appoint an inspector.

18,937. Do you think that another way would be for each institution to keep in touch with its former pupils, so as to know exactly what they were doing?—I believe that the reason why they do not keep in touch with their former pupils is that the work which their former pupils turn out is simply so contemptible that they do not like to know about it.

18,938. Do you think that it would be desirable for the State to put a little pressure upon institutions to keep in touch with their former pupils?—They will not keep in touch with them unless they are creditable. If they are a credit to the institution, the authorities of the institution know where they are; but if they are a disgrace to it, as many of them are, the authorities are ignorant of them.

18,939. Have you ever thought of this: that the State, in their payments for educating blind persons, should consider the only real test of successful education, that is, the power of self-maintenance?—Yes, I have considered that. I believe that in the remarks that we sent in to the last return, you will find something to this effect: "If by education you increase the self-respect of a man, and then allow him "to wander as a vagrant, or spend his life as a "degraded pauper, you only intensify his suffering." I believe that the first thing that should be looked to should be to give a man the power of self-maintenance. However you educate a man, if you do not place that within his reach, he is a poor, degraded man. The first point should be to give a man a chance. If you give it him and he does not take it, you are not to blame; but give him a chance. The charitable public have attempted to give a chance to the blind of this country for dozens of years, but they have been robbed of it by defective training.

18,940. Do you think that it would be desirable for the inspectors whom you have recommended, to look after the blind who are working at home, and to see whether they are successful or not?—I think that would be a grand thing. It would not be a bad thing if the Government ordered from each institution a return of all its successful blind pupils.

18,941. That is precisely what I was coming to. Do you think it desirable that the Government should offer a direct money inducement to institutions, in proportion to the success in after life of their pupils?—No; I believe you could not induce the Government to pay for anything besides education; and when I say "education," I mean literary education. I do not believe that you could induce the Government to pay for training in trades.

18,942. Never mind for the moment whether we could induce the Government to do it or not; but do you think that it would be a good thing for the Government to test the success of the technical education given in institutions by the after results, the power of self-maintenance of the pupils who leave those institutions?—Yes, I believe it would be a good thing that that should be brought before the public in some form, certainly.

18,943. (*Chairman.*) Whether by the State or not?—It is immaterial, so that it comes before the public, so that you expose the institutions which have not done their duty

18,944. But, as I understand, Dr. Armitage is asking you whether you think that the State ought to give certain assistance under certain conditions; I understand you to say that you do not care by whom it is done; is it in your opinion work for the State to do, to give a subsidy on the grounds that Dr. Armitage mentions?—I believe that all trade teaching should be done independently of the Government; that is my impression.

18,945. (*Dr. Armitage.*) I am speaking of schools, not of workshops?—An institution or school taken blind children, trains them from the first by touch, cultivates the sense of touch as much as possible, and then passes them on to the workshops for making baskets or brushes or what not. After 10 or 12 years' work, whatever the time may be, the pupils go out into the world to earn their own living. I have understood from what you have said that you think that whether they earn their own living or not in after life depends upon the practical training that they have received at the institution?—Largely so.

18,946. My question is this: whether you consider it a good test for the State to apply to the education of that school, to examine whether the pupils after leaving are able to maintain themselves or not?—There is no better test. "By their fruits ye shall know them," certainly.

18,947. Then what is your objection to the State paying an institution by results, if that is the best result?—My only objection is this: in competitive trades, where all are struggling for money, those who pay the taxes pay them out of the money they earn; and if the State pays part of the money that I entrust to its care to another man, in order that he may be made strong to compete with me in the race, it is using my increment for another man's good in the competitive race.

18,948. Your answer shows that you have not quite understood my question. You have a large experience, and it is very important that we should get your ideas. The question that I asked you was not whether the State should pay the man, but whether the State should reward the institution or the school according to whether the education at the institution or the school was good or bad?—Yes, I understand you. You mean to say that if the institution or school has enabled a man to get a certain prize, which I should have got if it had not been for the institution making that man a qualified man, part of my increment should be taken to pay the institution for doing that. I do not believe in it.

18,949. It is in application in every ordinary school. The State pays on a certain scale for the education of the children. If those children had been allowed to grow up in ignorance, you would have had a better chance of earning your living?—You are right; only the education that is imparted in the elementary schools is not what I call a productive education; it is not like making skips, baskets, or brushes. Of course, indirectly it may be, but directly it is not, a productive education.

18,950. You stated that you thought that music was a bad profession for blind men generally to follow; what institution do you know in which music has been taught to the blind, and what are your grounds for that assertion?—I gave my grounds, I believe. I said that, as a rule, it was not a good profession now, on account of so many people playing the organ at places of worship for the honour of the thing—honorary situations—whereas 50 or 60 years ago music was not common among the people, and a blind man could get 30*l.* or 40*l.*, or 50*l.* a year, and pupils belonging to the congregation, and he made a good thing of it.

18,951. Is there not the same competition in everything?—But in music, people give their time to the church, and they play the organ for nothing.

18,952. Have you a practical acquaintance with what the after result is in the best musical schools, say in the Normal College, or in Paris?—The Normal College, I suppose, stands high, but the Normal College takes the cream of the kingdom, and if they could not make anything of the cream it would be a poor affair.

Mr. T. Scholfield.

2 Dec. 1887.

18,953. Are you speaking from experience?—Yes, both from experience and from observation, of course.

18,954. How do you know that the Normal College takes the cream of the kingdom?—I know on this account: that before a pupil goes to the Normal College from any of these branch institutions, he has to show excellence of capacity, and that they would not pay for him, nor would there be a scholarship set aside for him, unless he had shown some special capacity in music or something in that line. They would not send a dullard to the Normal College; he would not be worth the money.

18,955. Are you aware that special capacity in music is the very last thing that is required at the Normal College?—It is different from all other places then. I should require a man to have a special capacity for making skips, or else I should turn him away. If, at the Normal College, a man has a special capacity for music, they keep him.

18,956. Have you ever been to the college?—I have never been to the college, but I have heard its reports.

18,957. (*Mr. St. John Ackers.*) In the report sent by your institution, signed by the secretary, after recommending the appointment of a practical inspector, there is the following paragraph:—"He should also "have power to grant a reward, say of 50*l.*, 30*l.*, or "20*l.* to the three teachers who had the best system "of instruction, which would have the effect of con-"centrating attention on what we regard as the "greatest difficulty with which philanthropists who "devote themselves to this work have to contend—a "correct system of instruction." Are those your views?—They are, precisely.

18,958. Will you kindly tell the Commission how you propose that that inspector should be paid?—My idea was that the Gardner Trust might possibly appoint such an inspector.

18,959. Who should give the rewards of 50*l.*, 30*l.*, and 20*l.*?—The Gardner Trust.

18,960. Do you consider that those three rewards would be sufficient?—I do.

18,961. Should they be given for different work, or should they be confined to what you consider to be the best trade for the blind?—My idea was that they should be given to the skip, basket, and hamper trade.

18,962. You misunderstood my question. I wanted to know whether these rewards of 50*l.*, 30*l.*, and 20*l.*, might possibly be given, for examples sake, say, one to the Normal College, one to your institution, and one to a place where, say brushmaking, was the chief industry; that is not your intention?—Those who give the inspector his instructions might instruct him that that should be the case. It is immaterial to me, but my thought was that it would be a good thing if 100*l.* was spent amongst the teachers in skip and basket making, because that is the principal trade. Get the men efficient in that, and then you will put tens of thousands of pounds into the pockets of the blind every year.

18,963. Are your workshops inspected at the present time?—No, only by our own committee.

18,964. No Government inspectors ever come to you?—No, certainly not.

18,965. Are you quite sure that they are never inspected?—To my knowledge we never have an inspector.

18,966. Are you in favour of trades being taught at the same time as general education is given in schools and institutions?—After a proper age.

18,967. What age?—I should say after the age of 14; the same as in the case of a sighted boy. As far as possible, I would put the blind under exactly the same conditions as sighted people.

18,968. But the elementary education of this country does not go beyond the age of 14 with seeing children?—No. I should put the boys to trades when they were 14 years of age in all schools if I had my way.

18,969. Would you have the two branches of training carried on at the same time with children under 14, or would you keep them entirely to the ordinary general elementary education and not give them technical instruction till after they were 14?—I believe that a little technical instruction would be advantageous to the boys, so long as you did not make it a strain, and I believe it is now given in the elementary schools of the kingdom.

18,970. At what age would you, as a practical man, recommend that the elementary technical training should begin?—At the age of 10.

18,971. Do you travel for orders for your institution?—I do.

18,972. Do you go entirely by yourself?—No.

18,973. Who goes with you?—I take sometimes a boy and sometimes a man. In Preston, of course, I can go by myself.

18,974. When you say that you take a boy or a man, that is simply as a guide, I suppose?—Yes, simply as a guide.

18,975. You do the whole of the business work?—Yes; I only take his sight with me; he lends me his eyes.

The witness withdrew.

Adjourned to Monday next at 12 o'clock.

No. 6, Old Palace Yard.

Monday, 5th December 1887.

PRESENT:

THE LORD EGERTON OF TATTON, IN THE CHAIR.

ADMIRAL SIR E. SOTHEBY, K.C.B.
W. TINDAL ROBERTSON, ESQ., M.D., M.P.
B. ST. JOHN ACKERS, ESQ.
T. R. ARMITAGE, ESQ., M.D.
W. AUCHINCLOSS ARBOL, ESQ.
F. J. CAMPBELL, ESQ., LL.D.
EDMUND C. JOHNSON, ESQ.
THE REV. W. BLOMEFIELD SLEIGHT, M.A.
THE REV. C. MANSFIELD OWEN, M.A.
L. VAN OVEN, ESQ.

CHARLES E. D. BLACK, ESQ., *Secretary.*

MR. CHARLES SPENCER PERCEVAL examined.

Mr. C. S. Perceval. 5 Dec. 1887.

18,976. (*Chairman.*) You are Secretary to the Commissioners of Lunacy?—Yes.

18,977. You are aware of the reference to this Commission which enables it to take cognizance of educable idiots or imbeciles?—I am only partially aware of it. I have never seen it in print.

18,978. Can you at all distinguish between the different classes of idiots and imbeciles which are mentioned in the Census?—In no way.

18,979. Is the Census accurate, so far as you know?—I am quite unable to say, but I am told that the Registrar-General in the last Census, returns the enumerated number of idiots and imbeciles as 32,717, while he gives the estimated number as 41,940. *See* Report of the Census of 1881, Vol. iv., pp. 68, 69.

18,980. Is the statement that there were 8,782 imbeciles and idiots between the ages of 5 and 20, accurate?—I have no means of saying. We have no means of checking those returns in any way. The fact is that people who have idiotic or imbecile relatives will not return them as such.

18,981. Can you tell what proportional number may be considered chargeable to the poor rates?—No, I cannot tell you that. You might possibly get that from the Local Government Board, you could not get it from the office of the Commissioners in Lunacy, as they have only returns of those who are in county asylums or lunatic hospitals or licensed houses, which is a very small proportion of the whole.

18,982. When the Census of 1881 was taken, imbeciles and idiots were classed under the head of lunatics?—The Lunacy Acts define a lunatic as "a lunatic, an idiot, or a person of unsound mind." This definition continues in force.

18,983. By an Act passed the Session before last, called "the Idiots Act, 1886," some alteration was made in the law?—An alteration was made in the law by that Act, but it only comes to this really, that the Act alters the rules for the detention of such persons; it simplifies their admission into asylums, it practically does little more. There is this definition in section 17 of that Act, "In this Act, if not inconsistent with "the context, 'idiots' or 'imbeciles' do not include "'lunatics,' and 'lunatic' does not mean or include "idiot or imbecile."

18,984. Was not that an important alteration of the law as far as the parents of imbeciles were concerned, and also as far as the admission of children into institutions for the training of imbeciles was concerned?—I do not know that it made any difference in the status of the parent.

18,985. The Act was framed with the view of meeting the objection of a parent to sending his child to a place which was not a place under the jurisdiction of the Lunacy Commissioners?—That may have been the intention of the Act, but the Commissioners still retain some jurisdiction over these places.

18,986. You are probably aware that the 25th and 26th Victoria, chapter 43, which is "An Act to provide "for the education and maintenance of pauper "children in certain schools and institutions," empowers the guardians to send any pauper child to any school certified by the Local Government Board and supported wholly or partially by voluntary subscriptions, and the word school is defined by section 10 "to "extend to any institution established for the instruction of blind, deaf, dumb, lame, deformed, or idiotic "persons"?—Yes, but I would call your attention to a subsequent Act, the 31st and 32nd Victoria, chapter 122, which is entitled "An Act to make further amend-"ments in the laws for the relief of the poor in "England and Wales," the 13th section of which provides that the guardians may, with the consent of the Local Government Board, send idiotic paupers to an asylum or establishment for the reception of idiots maintained at the charge of the county rate or by public subscription, and they may with the like consent send any idiotic, imbecile, or insane pauper who may be lawfully detained in a workhouse to the workhouse of any other union and pay the cost of the maintenance of such person in such asylum, establishment, or workhouse. The asylums or establishments or workhouses to which such persons may be sent, are not necessarily to be certified by the Local Government Board. That Act enlarges the power of the guardians.

18,987. Are those asylums or establishments for the reception and education of idiots, or workhouses, whether certified by the Local Government Board or not, inspected by the Lunacy Commissioners?—Yes, all institutions registered or licensed under the Lunacy Acts for the reception of idiots and imbeciles are inspected by them, and they visit all workhouses where persons of unsound mind are detained.

18,988. Does that inspection by the Lunacy Commissioners extend to a supervision of the education given in those institutions?—No.

18,989. To superintend the education of imbeciles and idiots is not part of the duty of the Lunacy Commissioners?—It is not.

18,990. Is it anybody's business?—No. I do not suppose it is. I do not think that duty has been thrown by law upon any particular body.

18,991. There is no Government inspection of the education of educable imbeciles?—None. There is no general superintendence of the training and education of these classes.

18,992. Have the Lunacy Commissioners paid any attention to the subject of the education of idiots; have they come to the conclusion that idiots are educable?—I suppose I may say that it is generally acknowledged among the Lunacy Commissioners that a certain small proportion of idiots can be educated to a certain extent.

18,993. Can you state what proportion that would be?—No. I have heard it variously stated in conversation at from one per cent. to one-half per cent.

18,994. The Lunacy Commissioners do not make any report as to the state of education of the idiots under their supervision?—The instructors of the idiots are not under the control of the Commissioners, though the institutions in which the idiots are received are subject to their visitation. The Commissioners in Lunacy have no power to direct or to supervise any system of education of idiots or imbeciles.

18,995. You are probably aware that in Scotland they have the power?—The powers of the Commissioners in Scotland may be different from those of the Commissioners in England. At the same time the Commissioners in Lunacy on visiting institutions where idiots or imbeciles are received, consider it part of their duty to take notice of the means provided for their training, and to express their opinions in the entries they make in the books of the asylum or institution, with the view of bringing before the notice of the authorities who are responsible for the conduct of the particular institution, the suggestions which they make.

18,996. Perhaps we could have laid before us extracts from reports made by the Commissioners on their visits to such institutions commenting upon the system of training and education of the idiot and imbecile children contained in them?—I will have the entries searched for the last five years, and extracts shall be sent to you. *See Appendix* 39. In some years there may be no comments. Two Commissioners might go down to Starcross, for instance, on their annual visit, and they might think it unnecessary to make any comment whatever, because what they saw agreed with what their colleagues saw on the previous visit. It is only by way of suggestion that the Commissioners have any way of interfering in regard to the education and training of idiots and imbeciles.

18,997. Can you say how far the law is acted on which enables guardians to send idiot and imbecile children to these institutions?—I can scarcely say. There is a great difficulty in separating the real pauper class from the class immediately above them. There are really only two establishments now open which receive idiot paupers; those are the Royal Albert Asylum at Lancaster, and the Western Counties Idiot Asylum at Starcross, near Exeter.

18,998. Do not you include the Darenth Asylum in your list of such establishments?—Yes. I ought to include that, we visit it, and I have in my hand our last report upon it, that would make three.

18,999. That is in a unique position, because it is the only institution supported out of the rates to which idiot pauper children can be sent?—It is the only one in England and Wales. It is under the Metropolitan Asylums Board.

19,000. Is there any reason why the same principle should not be adopted over the rest of England?—None whatever, supposing there was the legal power.

19,001. There is at present no legal power to establish such institutions?—No. A special Act was apparently required to be passed in the case of the Darenth institution.

19,002. Have the Commissioners suggested the extension of that principle to the rest of England?—At the Warwick County Lunatic Asylum at one time a separate building was provided for idiots, not by the guardians or by any district board like the Metropolitan Asylums Board, but by the visitors; I am afraid there is very little being done in regard to those idiots at Warwick just now.

19,003. You cannot say what the result of that experiment was?—I think it was unsuccessful; for one reason or another, the idea of keeping a separate building for idiots has been given up there. The experiment is about to be tried at Northampton. The visitors of the County Asylum there have lately resolved to build a block for idiots and imbeciles as a portion of their asylum.

19,004. Can they legally do so?—Yes, certainly.

19,005. I thought you said it required a special Act in order to carry out a similar system to that at Darenth?—I said so, because it has been doubted whether the Lunatic Asylums Act of 1853 will permit two committees of separate counties, or of a county and a borough to unite for the purpose of providing an asylum, which shall not be a general asylum for all persons of unsound mind, but merely for one category of them, viz., idiots.

Mr. C. S. Perceval. 5 Dec. 1887.

19,006. Would you recommend that Boards of Guardians should have the power to send idiots to such separate institutions for idiots?—It would be most desirable. There are a number of idiots in the lunatic wards of lunatics asylums who are most unfortunately placed there, and it would be most desirable if accommodation suitable for that special class could be provided.

19,007. For educable idiots?—Whether educable or non-educable. I suppose every idiot is capable of a certain amount of improvement. I may mention that in the Government Bill for the amendment of the Lunacy Acts which has been introduced in three successive sessions, a clause was inserted expressly enabling unions to be made between counties or counties and boroughs to provide idiot asylums, so that the subject has not been entirely lost sight of.

19,008. You think that the guardians would be glad to send children, who are either in workhouses or in lunatic asylums, to some separate institution for the training and education of idiots?—I think so; my reason for thinking so is that frequently the Commissioners of Lunacy in visiting lunatic asylums, and also in visiting workhouses, find idiot children confined in those institutions and make comments upon them in their reports, and in the case of workhouses they sometimes recommend the guardians to send those children to idiot establishments. The guardians thereupon not unfrequently inquire for a suitable establishment, but at present the idiot asylums at Lancaster and Starcross being alone available, the recommendations must often fall to the ground from considerations of distance.

19,009. You have no means of knowing the number of children who ought to be in an institution for idiots or imbeciles, but who are now either not in any institution at all, or in a workhouse where they receive no instruction?—I have no means of knowing that.

19,010. Do you think the education in such institutions should be under the control of the Lunacy Commissioners?—The care and treatment of the children ought certainly to be; how far you can make the Commissioners in Lunacy inspectors of any educational system is another question altogether; the duty could not be undertaken with the present staff, certainly.

19,011. The duty of testing the education that was being given to idiots, would be one which the Commissioners would be quite capable of performing?—Certainly, as capable, that is, as other well-educated gentlemen.

19,012. It would only involve a longer time being spent in their inspection of the particular institution?—Yes.

19,013. It would be desirable that the inspection, both as regards care and management of the idiot children and as regards their education, should be in one hand?—I think it would.

19,014. Have you any suggestion to make with regard to the question of the education of idiots?—I have not had sufficient time to consider the subject to be able to offer any suggestions, but if any occur to me, or if the Commissioners have any to offer, I will forward them to the Secretary.

19,015. Have you brought with you any report made by any of the Commissioners after visiting an institution in which idiots and imbeciles were received?—I have brought one on the Darenth Asylum and schools, made by Dr. Reginald Southey and Mr. Bagot, on the 4th of June 1887, as a sample. They say, "An average number of 320 children appears upon "the school register, and of these again 286 attend "the school rooms both morning and evening, the

Mr. C. S. Perceval.
5 Dec. 1887.

"remainder working only half-days. The staff of "teachers consists of one school mistress, three "assistant school mistresses, and five school attend- "ants. We can express our entire approval of the "order maintained in the several class rooms, and "the attention paid by the children to their teachers, "many no doubt learn and retain something of what "they do learn, but perhaps the greatest good derived, "is due to the habit of self-control thus promoted."

19,016. (*Mr. St. John Ackers.*) In your opinion would it be desirable to establish throughout the country, institutions on a similar system to that at Darenth, or on a different system?—That is a difficult question to answer. I may be prejudiced, but speaking for myself purely, I would rather see an extension of such institutions made under the Committees of Visitors of County Asylums than under such a board as that which the Metropolitan Asylums Act established. I think you would get better management, that is merely my own individual opinion. By the clause in the Bill to which I have referred for amending the Lunacy Acts, Committees of Justices in various parts of the kingdom would be enabled to combine in establishing asylums for any particular class of persons of unsound mind.

19,017. Is that clause proposed by the Commissioners?—I think the clause was suggested by the Commissioners, at all events, they fully approve of it.

19,018. (*Rev. Mr. Owen.*) Are you aware whether there are any deaf and dumb idiot children who would be more fit to be educated in a deaf and dumb asylum than in a lunatic asylum?—I do not think I can answer that question. Every now and then one hears of deaf and dumb children who may appear to be idiots because they have not had any deaf and dumb education. It is obvious that a deaf and dumb child who has not had proper education, may pass as an idiot, whereas if he had been properly taught and instructed as a deaf and dumb child, he would not be reckoned an idiot, he might show mind enough not to be so treated.

19,019. Are any of your Commissioners conversant with the manual alphabet, so as to test whether deaf and dumb children in the institutions which they visit have had any instruction?—I do not know; I have heard of very few cases of deaf and dumb idiots.

19,020. (*Dr. Tindal Robertson.*) Do the Commissioners, when they report on the education of the idiots and imbeciles in the institutions that they visit, ever make any remarks with regard to their technical training?—They would notice it; they would say, We think there might be more boys in the carpenter's shop, or we think that the boys are doing very good work.

19,021. They have no power whatever to enforce any suggestion they may make?—None.

19,022. Then what is their function in inspecting these establishments?—Their primary object is to see that persons of unsound mind, detained in such institutions, are received and detained in accordance with law, are properly fed, and in every respect properly treated. Of course, when they come to a special institution like an idiot asylum, they cannot avoid commenting upon what they see in the way of training when they make their entries in the visitor's book of the institution for the perusal of the committee of the institution, and for the information of their own board.

19,023. When the Commissioners visit an ordinary lunatic asylum, and make any suggestions as to such matters as those, have they any power to enforce their being carried out?—No, they have not.

19,024. (*Mr. Johnson.*) Do I rightly understand that the Starcross Asylum, and the Royal Albert Asylum, and the Darenth Asylum are the only asylums to which pauper idiots can be sent?—Those are the only ones at present.

19,025. The Darenth Asylum is only for the Metropolitan District?—Yes.

19,026. Then for the rest of the country, the Royal Albert and Star Cross are the only two?—The only two receiving pauper idiots.

19,027. Do the Commissioners visit private asylums where idiots are?—Yes.

19,028. The Lunacy Commissioners inspect all the certified houses where idiots are kept, whether private or public?—Yes.

19,029. The six Commissioners do the whole of that work?—Yes. I might be permitted to say this, that at Earlswood, which is one of the institutions that the Commissioners visit, they are many elected charity cases, or most of which are really very little, if at all, removed from pauper cases.

19,030. You say that most of the elected cases are cases which are almost verging upon pauperism?—A large proportion, I apprehend. The great bulk of the patients in every public idiot asylum would be of the same class. The Eastern Counties Asylum, at Colchester, does not receive those who are technically paupers, but they take elected cases where the parents are very poor people.

19,031. (*Mr. St. John Ackers.*) You are now speaking of a class so nearly approaching to the pauper class that they would go, if sane, to board schools?—They would go to the board schools, no doubt.

19,032. (*Chairman.*) How many other institutions are there like Earlswood?—There are two others: the Eastern Counties Asylum at Colchester, originally a licensed house; there is the Midland Counties Idiot Asylum at Knowle, in Warwickshire, that is also a licensed house, it being licensed by the Warwickshire magistrates, but both of those are registered under the Idiots Act, 1886.

19,033. Therefore, they can take idiots from the guardians?—They could take them if they liked; there is nothing to prevent them from taking them. I do not think they lay themselves out to take paupers.

19,034–5. There is nothing to prevent them, any more than in the case of the Royal Albert Asylum?—No; it is a mere matter of byelaw.

The witness withdrew.

Mr. Arthur H. Bather (an Assistant Accountant-General of the Navy, and Honorary Secretary of the Royal Association in Aid of the Deaf and Dumb) examined.

[*Mr. Owen interpreted to the witness by the fingers the questions put to him by members of the Commission, and his replies were given principally in writing, part of his answers being sometimes given vivâ voce.*]

Mr. A. H. Bather.

Memorandum by Mr. A. H. Bather (Assistant Accountant-General of the Navy and Honorary Secretary of the Royal Association in Aid of the Deaf and Dumb).

I am honoured by the request of the Royal Commissioners for a statement of my views on the subject of the education of the deaf and dumb.

I lost my hearing by scarlet fever when I was four years old, but my speech has remained to me, although much deteriorated by the want of the check afforded by hearing.

I did not learn to use the finger alphabet nor signs until I was sent, in my sixth year, to the Manchester School for the Deaf and Dumb.

The atmosphere of that place imposed silence on me, and for the nine years I was at school I hardly ever spoke except during some formal lessons in pronunciation (which I hardly needed), and in "reading out" lessons at distant intervals.

As I had, fortunately, been taught to read before I came to school, I was able to continue in the grammatical use of language, and I learnt signs, as it were, only for amusement and as a ready means of communication with my schoolfellows, to most of whom a sentence at length would have been unintelligible.

Notwithstanding all these exceptional circumstances I was constantly shown as a result of the school teaching. As evidence of the possibility of teaching the deaf and dumb to speak, I recited passages in the Old Town Hall at Manchester. As evidence of success in the teaching of language I was constantly called upon to write impromptu essays on any subject suggested by casual visitors to the school.

I rebelled against these misleading exhibitions, and was indignant at the entire absence of assistance in Latin, Euclid, and such like subjects, common in ordinary schools, but exceptional in one for the deaf and dumb. Nevertheless my guardians appeared unable to devise any other means of continuing my education, and I remained under the same master (who meanwhile left Manchester and set up a private school at Rugby) until I was 15, when I was entered in a solicitor's office, and proceeded thence, the next year, to the chambers of Mr. Basevi, the conveyancer.

My entrance into the Civil Service took place seven or eight years before competitive examinations were thought of. An uncle who had been private secretary to the First Lord got me a nomination to the Admiralty, and it is mainly to the kindness and forbearance of those with whom I have had to work, and who have to put up with the difficulties of communication with me, that I owe my long continuance, for over 40 years, in that department.

These personal details of old date contain the bulk of my experience of schools and teachers of the deaf and dumb. They indicate the need, of which the Commissioners are no doubt already well aware, of extreme caution in accepting the show evidence of the schools.

I trust that the present generation of teachers has got out of the follies of former days and perceives that the courage to confess failure is the condition of progress. My observation was that every failure was concealed and every success magnified without regard to contributing exceptional circumstances, and that there was a blameable recklessness as to the extent to which the public might be misinformed respecting the capabilities of the deaf and dumb, and the extent of education possible.

Further, I noted that the expectations of the public and the standards of the teachers were low; trumpery achievements were regarded as marvels, superficial accomplishments as satisfactory, and no provision was made for the case of pupils who, though physically deaf, did not suffer the disadvantage and the numbing influence attendant upon absence of language.

The judgment on particular schools or systems should, in my humble opinion, take account chiefly of average results, and the extent to which the schooling is shown to be useful in after-life. This seems more particularly necessary when the object is to ascertain the pattern or system best for general adoption.

Patience, skill, and unstinted outlay may achieve wonderful results in particular instances with apt pupils, but I apprehend the problem before the Commission is to ascertain what system, within certain limits of time and cost, will give the highest average of general usefulness.

The deprivation of hearing or of sight cannot be allowed to take away the common rights under the Education Acts. Special arrangements are due, but within the speciality they should be as broad and as generally applicable as possible.

The practical mode of affording State aid, including in that term the aid from local school rates, is apparently not difficult to arrange.

I think the number of afflicted children in any particular board school district is too small for economical arrangements therein, and that it is rather a clumsy, though well meant, device to provide homes for such children in the neighbourhood of schools where special classes are held.

I would send all children to be boarded, lodged, and taught in existing institutions, which should be uniformly called *schools*, or to others established on the same general lines. I would require from parents the same contribution towards the education of their children as they would have to pay to an ordinary board school *plus* such sum as may be considered generally equivalent to the cost of subsistence at home. I apprehend the ordinary board schools could afford some organisation for the local collection, at short intervals in advance, of these sums due from the parents, and for transmitting them to the school.

I would endeavour to arrange with the Education Department for a scale of capitation allowances, payable on passing standards to be specially fixed with reference to the ordinary capacity of deaf and dumb and of blind children, and I would have examiners specially qualified to test progress and report results on which the grants would be based.

Abating these receipts and any others from funded property or charitable contributions, I would charge the excess cost of the schools, as ascertained on audited accounts, *pro ratâ* upon the parishes from whence the pupils may come, the charge to be accepted by those parishes as a liability on the *school* rate.

Throughout this paper I have desired to avoid appearing as a partisan of any particular system of educating the deaf and dumb. I do not feel qualified to give an opinion; I never saw foreign schools except that in Paris some twenty years ago and where the manual alphabet was then used. The three or four Swiss, Italians, and Germans whom I have met all conversed by that means. In England, outside of the schools, I have, I think, seen only three persons conversing by lip-reading. All were of the upper class of society, and the exhibition of the conversation on ordinary topics carried on with near relations or old acquaintances did not impress me as particularly wonderful or effective, but I often wish that I had been taught lip-reading in my young days, and I feel that, conjoined with the considerable facility of speech that remains to me, it would have given me a power and independence which I do not possess.

For another reason, as being the honorary secretary of the Royal Association in Aid of the Deaf and Dumb, I greatly desire to maintain a neutral attitude on this question. The association is for the benefit of all. I believe our missionaries would say that those taught on the oral system find as great need as any others for help and interpretation with employers of labour and in the business of life, and that they are often utterly isolated and dreary until they have learnt the manual alphabet and signs, and thereby get into free communication with other deaf and dumb persons—the free communication with strangers among hearing people being in fact never yet attained.

A. H. Bather.

14 Nov. 1887.

19,036. (*Chairman.*) You say in the memorandum which you have forwarded to the Commissioners, "The atmosphere of that place" (that is, the Manchester School for the Deaf and Dumb), "imposed "silence on me, and for the nine years I was at "school, I hardly ever spoke." If you were receiving instruction there now, you would be taught on the oral system?—No doubt, if the school has now adopted the oral system.

19,037. You had some remains of speech. Did they make no attempt to keep up your speech at that time?—Very little.

19,038. You say, "I was constantly shown, as a "result of the school teaching, as evidence of the "possibility of teaching the deaf and dumb to speak, "I recited passages in the Old Town Hall at Man- "chester," were you brought forward as a specimen of oral teaching?—Oral teaching was not known in those days as a system. I was brought forward as an instance of the possibility of teaching the deaf and dumb to speak. My master always professed to be able to teach certain of his pupils to speak, and I was put forward as an example.

19,039. Did they make any attempt to teach you lip reading?—No.

19,040. Have you taught yourself to lip-read at all?—Very little. I can sometimes guess from the lips. If I ask my wife a question to which there can be only two or three answers, I can read the answer; that is to say, if it is an easy answer to an ordinary question, such as "What time do we dine?" and so on.

19,041. Do you think that deaf and dumb children in London, for instance, should be sent to an institution where they could be boarded, or to a day school?—I would send them to an institution, but I should prefer that it should be called a school. I dislike the name "institution" or "asylum." You could not get

Mr. A. H. Bather.
5 Dec. 1887.

Mr. A. H. Bather.

5 Dec. 1887.

a sufficiently large class together for economical education in a day school.

19,042. What is the difficulty in doing so in London?—Say you have a class of 12, the whole 12 would not be going on *pari passu*, you might want four teachers even for 12 children.

19,043. Have you yourself visited any of the school board classes for the deaf and dumb?—No, I am not a witness in the sense of having lately seen anything connected with deaf and dumb education: I have not seen anything for many years.

19,044. (*Dr. Tindal Robertson.*) Would you think it an advantage that those who have some speech should be taught by the oral system?—Yes, if they have some speech, it would be an advantage to be taught on the oral system.

19,045. If they were born deaf mutes, would you think it most advisable that they should be taught on the other system?—Not in every case; you should discriminate between the cases. Among those who have lost their hearing, the more intelligent should certainly be taught on the oral system; among those those born deaf and dumb, there may be some so intelligent as to be entitled to be put in the same category.

19,046. What would you have done with those not in that category?—If I had the responsibility of deciding, I should teach them by the manual system.

19,047. (*Mr. Johnson.*) Have you much experience amongst persons who have been taught upon the oral system?—No.

19,048. Have you a great experience among those taught on the other system?—Greater, not great. My experience of those taught on the sign and manual system was among my school fellows, and latterly among those with whom I am brought in connexion at the Royal Association, but I do not associate with the deaf and dumb from any choice. The three oral subjects that I have seen are, Miss Godwin, sister of the Bishop of Carlisle, who said to me that she much preferred the fingers; a young Mr. Holland, who seemed unable to get on with anyone but his mother; and a pupil of Mr. Arnold's, whom I watched at the dinner given to Dr. Galaudet; he got on very well, but with only one person, who sat near him all the evening, as far as I could see.

19,049. With regard to religious services, do you attend sign and manual religious services?—No; I go to church with my family, and read a sermon during the preaching. I do not myself care for the services at St. Saviour's, but I know many quite as intelligent as I can pretend to be, say they like them exceedingly.

19,050. Do not a very large number of deaf and dumb go to that church and receive instruction by the sign and manual system which they could not receive by oral teaching?—Yes, certainly; there can be no doubt whatever about that. I should not support St. Saviour's unless I were sure of that.

19,051. (*Admiral Sir E. Sotheby.*) Are you in favour of the combined system?—I would rather not give any opinion as to the choice of systems, not having had before me the necessary facts whereon to ground one worth anything.

19,052. (*Mr. Van Oven.*) Since the oral system has been introduced into this country, have you never considered whether you might yourself be taught to speak and to lip read from others?—Yes; I was once in Mr. Van Praagh's school to see the instruction on the oral system, and I asked him if he could teach me. He said I guessed too fast; that I guessed the words, and did not read them.

19,053. Therefore, Mr. Van Praagh thought it impossible to teach you?—I will not say that he said impossible, but I could not give the time, and he considered the result would have been very doubtful.

19,054. You say, that you prefer a residential school, or what we call an asylum to day school classes; have you never considered the advantage of the children at Mr. Stamer's Homes going to a board school and mixing with speaking children in the playground, which is a very different thing from being in an asylum with none but the deaf and dumb?—I used to hold that view theoretically, but I doubt whether the education is as successful in a day school as in a separate school where the attention of the children is better concentrated on their lessons.

19,055. You say that Miss Godwin was orally taught; by whom was she taught?—I do not know. I think Miss Godwin was one of the first in England to be taught lip reading.

19,056. (*Rev. Mr. Sleight.*) Are the orally educated able to make themselves easily understood?—I have not much experience of the orally taught.

19,057. Are those taught on the sign and manual system, able to make themselves easily understood?—Yes, among those who can read the fingers, and by writing in other cases.

19,058. (*Mr. Arrol.*) Are you in favour of compulsory education of the deaf and dumb?—Yes; certainly.

19,059. At what age ought the education to commence?—At six years of age. I began at six.

19,060. And how long should it continue?—If oral, ten years; if manual, six or seven might suffice; five years is the usual time at the schools, but it is barely enough.

19,061. You are disposed to recommend the adoption of the institution system?—Yes; I would utilize existing schools.

19,062. Are you in favour of trades being taught at institutions?—No.

19,063. Why not?—Because no master will take a workman without an apprenticeship.

19,064. Is it not better that the young should know how to use their hands before going out into the world?—That is a different thing to teaching a trade. Teach them, by all means, to use their hands in carpentering, turning, &c.; but do not try to teach them to make boots and shoes or clothes, it would be a waste of time to attempt to do so, as we found in Red Lion Square in the early days of the Royal Association.

19,065. When parents cannot pay for the education of their children in an institution, who ought to?—The parish. The fact that a child is deaf and dumb or blind, surely does not place it outside the education laws. Many children are wretchedly ignorant or vicious, yet the country is compelled to educate them; there is no logical difference between the impediments arising from ignorance and vice, and those arising from loss of hearing or sight.

19,066. (*Rev. Mr. Owen.*) You state that when you were at school at Manchester, you were constantly put forward as an example of the success of oral teaching. Do you think that similar misrepresentations are made now?—Possibly. I daresay not in such a barefaced manner as it was done in my case. The world now knows better how to distinguish between those born deaf and dumb, and others.

19,067. Do you know of any orally taught pupils who can understand an ordinary sermon or lecture?—No; nor do I think it possible that any one could follow by the lips of a preacher or lecturer; which is, I suppose, what you mean.

19,068. (*Mr. St. John Ackers.*) First of all, I want to ask if you will explain the fifth paragraph of you memorandum, in which you say, "As I had fortunately been taught to read before I came to school, "I was able to continue in the grammatical use of "language, and I learnt signs, as it were, only for "amusement, and as a ready means of communication "with my school fellows, to most of whom a sentence "at length would have been unintelligible." Do you mean a sentence in writing, or a sentence vocally uttered?—They would not understand the grammatical construction of a sentence in what way soever the sentence might be given.

19,069. Those were children who had been taught under the sign and manual system?—Yes.

19,070. In the last paragraph but one, you say, "I "feel that conjoined with the considerable facility of "speech that remains to me, it would have given me "a power and independence which I do not possess," that is lip-reading. Are you of opinion that lip-reading added to facility of speech, makes the deaf independent?—Yes.

19,071. Have you seen persons taught under the pure oral system in Germany, Italy, or elsewhere?—No. When I say a deaf and dumb man who had been taught lip-reading would be independent, I do not mean that he would be absolutely independent as though he actually had his hearing and speech perfect, but he would be comparatively more independent than one taught on the manual system.

19,072. In answer to a question put to you by Mr. Johnson, you said that persons went to St. Saviour's Church, and received instruction there on the sign and manual system, which they could not receive on the oral system. Is any education given at the Sunday services at St. Saviour's?—They have the education of the sermon, and the incidental explanation of words and terms given by signs during the prayers and lessons. There is also the regular Sunday class in the afternoon.

19,073. Is not the Sunday service, including the sermon, intended for the adult deaf and dumb, or those who have left school. I am not now speaking of the Sunday class in the afternoon?—Primarily it is for adults, still it is generally quite within children's comprehension.

19,074. Is it attended by children who are receiving instruction on the pure oral system?—I have only hearsay statements about that; I am not there often on Sunday. I am told by our missionaries, that several taught in the school board schools, find themselves isolated, and so pick up signs, and I daresay they do come to our services. Our missionaries would tell them to come, rather than that they should go to no church whatever. I should be glad to be allowed to say, in relation to church services, that we heard of services being conducted for those orally taught. We did not clearly understand how they were conducted, but we at once wrote to the persons concerned in those services, and offered to put St. Saviour's at their disposal for a service every Sunday; the offer, however, was not accepted.

19,075. Do you think it advisable that the deaf and dumb should mostly associate together, or mostly associate with hearing persons?—Theoretically, they should associate with hearing people. I myself, and others like me, have a great distaste to deaf and dumb society; but, practically, I have found, during 50 year's experience of the London deaf and dumb, that they will associate together, and that they are utterly lost otherwise.

Mr. A. H. Bather.

5 Dec. 1887.

19,076. At your last annual meeting, as reported in the "Times," it was stated that your society was dissatisfied with this Commission, and that they did not look forward to any good results from it, because no deaf and dumb persons had been examined?—Yes.

19,077. Was that a correct statement?—It was my own idea which our Committee adopted. I did think it strange that no deaf and dumb person had been examined. I am informed that it was not strictly correct, and that one had been examined; but I should have thought that the Commission would have wished to see examples of the results of different systems of teaching as shown by people who had left school some five or ten years.

19,078. Do not you consider that sufficient deaf and dumb witnesses have been examined to satisfy, at any rate your society?—I have not watched the list of witnesses.

19,079. Perhaps you will look at the list of witnesses, and then state whether your society would desire to recommend any persons as witnesses?—I will do so; but speaking for myself, I have no extensive knowledge of the deaf and dumb.

19,080. (*Chairman.*) In the routine of your office, do you give your instructions by the voice, or do you give them in writing?—Many of the clerks understand my speaking, the principal part of the work however, is done by minutes and reports on paper.

19,081. If you could communicate with the clerks only by writing or by finger languages, would that be a disadvantage to you in the office?—No doubt it would be a disadvantage. The two former heads of my office understood my speaking as well as possible. They wrote back to me and we got on very fast; the present head does not understand my speaking, and I find it a great drawback.

19,082. Can you offer any suggestions as to the higher education of the deaf and dumb in England?—I think all higher education must be by individual tuition. The number of the deaf and dumb capable of it is so few the expense would be disproportionately great to give them higher education otherwise than by individual tuition; by higher education I understand classics, languages, higher mathematics, &c.

19,083. Are you aware that there is a college for the deaf and dumb in America?—I have heard of it.

19,084. Why not have a similar one in England?—I have not sufficient information to say, but I should like to know more precisely what they call higher education in America; all things are comparative, and what may be high for a deaf and dumb man, may be low for one not deaf and dumb.

The witness withdrew.

Adjourned.

No. 6, Old Palace Yard.

Tuesday, 7th February 1888.

PRESENT:

THE LORD EGERTON OF TATTON, IN THE CHAIR.

ADMIRAL SIR E. SOTHEBY, K.C.B.
B. ST. JOHN ACKERS, ESQ.
T. R. ARMITAGE, ESQ., M.D.
W. AUCHINCLOSS ARROL, ESQ.
F. J. CAMPBELL, ESQ., LL.D.
EDMUND C. JOHNSON, ESQ.
THE REV. W. BLOMEFIELD SLEIGHT, M.A.
THE REV. CHARLES MANSFIELD OWEN, M.A.
L. VAN OVEN, ESQ.
CHARLES E. D. BLACK, ESQ., *Secretary.*

DR. FRANCIS WARNER.

Dr. F. Warner. 7 Feb. 1888.

19,085. (*Chairman.*) From your position as a professor and a physician in London you have come in contact with many cases of children of the class who are physically prevented from attending the ordinary board schools?—My attention has been specially directed to the matter, and I have kept notes of cases the last 10 or 12 years in connexion with my work at children's hospitals and at the London Hospital.

19,086. Are the cases to which you allude cases which have come under your notice in hospitals?—Most of those cases of which I have notes are cases of children who have been in elementary schools and who have been admitted into the hospitals.

19,087. Have those children been dismissed from the elementary schools because, owing to some physical or mental defect they were incapable of being taught?—I have such cases in my notes. If I were asked what groups of children do we commonly meet with in the hospitals among our out-patients who, on account of their exceptional condition, are not attending schools, I would mention such cases as children who occasionally have slight epileptic fits, perhaps three or four in their life-time, cases of slight chorea, cases of children who suffer from repeated sick headaches, especially when attending school, and who, upon that ground, are exempted; children whose nerve system is completely exhausted and appears to have been so for months or years. Then there are cases of paralysis; then cases of defective development from birth, cases of defective development of body, with slight defect of brain (I do not mean idiots); cases of nystagmus, cases of squinting; cases of myopia; cases of rickets, specially seen about the head with frequent co-incident nervous symptoms; and cases of diseased heart and lungs; these cases seem to require an exceptional method of education.

19,088. Is the nervous exhaustion due to over-work in the school?—I can hardly say what the cause is. I am not prepared to say when I see a child in a condition of exhaustion that the school work did it, that would be an enormous assumption for me to make; but I maintain that children who are suffering from any of the defects I have mentioned ought to be under exceptional methods of education.

19,089. Are children suffering from those defects now excused from school attendance?—Certainly, they are often absent from school, a large number of them being absent apparently without any certificate at all; only a few get certificates from me when they are my patients. (One hears at the east end of London they can buy them at 2*d.* apiece.) It is only in a few cases that patients of mine who, according to Act of Parliament ought to be in attendance and who are absent, have asked me or any of my assistants for any certificate, and from inquiries that I have made in the schools I believe that they are often absent without any certificate at all.

19,090. Do you suggest any exceptional method of education for this class of children?—Yes, I would suggest that they should be educated in a separate class in each school. I may give an illustration of the class of children that I refer to: a little boy eight years of age, bright and intelligent in appearance, had lost both his parents; the mother died insane; he lived with his grand parents. He was liable to such strong and sudden outbursts of passion as to be uncontrollable both at home and in the day school from which he had eventually been withdrawn as unmanageable. When removed to the country his health improved and he became good and quiet, but when he returned to London and his grand parents the quasi-epileptic outbursts of passion returned. He had also suffered a few genuine epileptic fits, and his younger sister also. When last heard of the child was neither being educated nor properly controlled, and although at present harmless and capable of being taught self-restraint, he is likely on arriving at manhood to be a social failure if not an absolute danger to the community. That is a type of many cases.

19,091. Would you say that he might become a danger to the community on account of insanity?—I do not say that when he became a man any doctor would feel himself justified in certifying that he was insane.

19,092. The cases that we have to deal with are those which require exceptional treatment, as in the case of the blind, or the deaf and dumb; but the case to which you refer would not seem to come within that category?—It is assumed that these children are educated. Now, I say they are not educated, because they cannot be educated in large classes, and they are constantly sent away from school for a year together; they may be on the books for education, but they are not in school.

19,093. (*Mr. Johnson.*) Do you think if the boy you have just referred to had been properly educated, he would have turned out all right?—Yes.

19,094. You think that means could be provided for educating such children?—Yes, out of 10,000 school children probably something like 5 per cent. of the class to which I refer are not being educated. When once a fine for non-attendance is paid, no steps are taken to see that the child, who, from special circumstances, is unable to be educated in the ordinary school, is cared for in any way; consequently a large number of cases are destined to certain failure. Such cases as those to which I have referred form a special class, which could be easily picked out of the schools, and could be easily dealt with under trained teachers.

19,095. (*Chairman.*) None of the children to whom you refer would come under the class of idiots or insane?—No.

19,096. Do you think that one special system of education would be adapted for all the class to which you refer?—Yes. In the first place, instead of their having to pass an examination, they should be excused from the ordinary examination.

19,097. Would there be a sufficient number of such a class to justify their treatment by a special system of education?—As I say, there would probably be 5 per cent. of the number of those attending board schools of the class that I speak of.

19,098. (*Mr. Johnson.*) What tests would you apply to ascertain whether children in a board school really came within the class of which you are speaking?—When I go into a school to see whether there are any children in it of the class to which I have referred, as I have done many times, the first points I note down are the signs of development as indicated by the proportions and the form, and I note also any signs of defect. Now it is very common to see signs of bodily defect; you come across children with hare-lip whose brain is slightly defective, and who have been beaten in school so often that they will not attend any more, and then they are brought before a magistrate and a fine is inflicted. Other signs are the postures and movements.

19,099. Would you have a doctor go round all the schools, and pick out those who were suffering from the infirmities you have mentioned?—They could be picked out in two ways, first by an inspection twice a year, and secondly, by teaching the teachers and Her Majesty's inspectors to distinguish between those children who were not suffering from any of the defects to which I have referred, and those that were and who should accordingly be treated in a different way. It is highly desirable that those engaged in conducting primary education should be aware of the common forms of mental and cerebral defect in children. If a teacher noticed that a child had hare-lip and perhaps a little defect in his brain he would not beat that child. Children suffering from St. Vitus' dance are sometimes thrashed in school, and after a few thrashings those nervous children will not attend any more. As to whether teachers can be so instructed as to be able to distinguish these cases from healthy cases, I have been asked by the College of Preceptors, by the Education Society, by the Froebel Society, and by the University of Cambridge, to give definite instruction upon this matter to those who are teachers or who are about to become teachers.

19,100. (*Chairman.*) Could you tell us what percentage of this 5 per cent. are suffering from chorea or epilepsy, or hare-lip, which are more or less indications of defective organisation, putting aside such cases as those of children suffering from head-aches or nervous exhaustion?—I cannot give the per-centage of such cases.

19,101. (*Dr. Campbell.*) Is it your opinion that if there were special classes for the education of the class to which you are referring, those children would turn out all right, instead of becoming failures?—Most certainly. After selecting the children I would wish to see all those children together in small quiet classes in a class-room attached to the school, under a carefully trained teacher. As I have said, in our primary schools there is a class, consisting of something like 5 per cent., not capable of being educated under the present arrangements, and the conditions of those children are so special that they require exceptional methods of education.

19,102. (*Chairman.*) Would not there be only a few such cases in each school?—No; in a school of 1,000 there would be something like 5 per cent., which would come to 50, that would be about the average. I am speaking not of London only, but of Birmingham and Liverpool, and other towns.

19,103. What would be the exceptional methods of treatment that you would follow in the cases of these children?—I am not prepared to say how I would conduct a class of such children, because I am not a schoolmaster. If I understand rightly the letter sent me by the Secretary of the Commission, I was to be asked whether such children existed as a class, and whether it was possible to distinguish them. Now the great drawback to dealing with this class of children hitherto has been the difficulty of picking them out. It has been said, we might be able to deal with this class by exceptional treatment, but how in a school of 1,000 are people to know those who from special circumstances require to be dealt with differently from the others.

19,104. Would there be any difficulty in picking out those who were suffering from St. Vitus' dance or epilepsy?—I should be able to pick them out, and so would the teachers if properly taught, but many are not able to ascertain that children are so afflicted. I will refer to an instance; in the practising school of one of our training colleges two little children were presented by the teacher to the principal as being too dull for standard No. I. One of them was obviously very defective in its head, the other was a perfectly healthy, normal child; the teacher wanted them both to be exempted. The principal said he did not know whether it was his duty to exempt one or both, or not; so that neither the teacher nor the principal was able to judge between those two children, one of whom obviously ought to have been exempted, while in the case of the other there was no reason for exempting him at all. What I wish to put forward is that teachers can be instructed to diagnose cases of the class to which I refer; a diagnosis of the children must be first made before we enter into the question of what to do with them when you get them into a special class.

Dr. F. Warner. 7 Feb 1888.

19,105. To make that diagnosis would not you require a medical man in every school?—Certainly not; the teachers can be taught to distinguish such cases.

19,106. As I understand, the means of detecting cases of these weak-minded children has been reduced by you to a system?—Yes.

19,107. Is that a system recognised in the profession?—The work is one which I have specially undertaken and which I have carried out. As regards the scientific side of the work, the Government have been supporting it for several years through the Royal Society. As regards the value of the work it has been put before our medical societies, and I have also been asked to spread a knowledge of the matter through the College of Preceptors, the Education Society, and the University of Cambridge. I began to consider the matter 10 or 12 years ago, because I saw this class of children existing. I put before members of the London School Board and Members of Parliament and others the question of dealing with these children, but no good came of it, and none will till we have the means of diagnosis.

19,108. (*Mr. Johnson.*) You think that if there were medical inspection at the different schools a number of these cases would be picked out which are now overlooked?—Yes.

19,109. How would you get at this class with the present machinery?—I believe the best thing would be to spread a knowledge on the subject among the managers and inspectors of schools.

19,110. (*Mr. St. John Ackers.*) Are the ordinary medical men of the country able to form a judgment on the matter?—I think that hitherto there has not been as much attention given to the subject as it appears to deserve.

19,111. You say that medical men and teachers, and all connected with children, should have this special knowledge?—Yes.

19,112. (*Mr. Johnson.*) In fact at present, there is no machinery for picking out this class of children from the others?—No. You have had to deal with a class of children between ordinary sane children and idiots. Many of them are really bright children, though not capable of running through the ordinary curriculum. Some of them are what we term over mobile, they have plenty of intellectual power, but it is soon exhausted in the course of the curriculum work.

19,113. (*Chairman.*) How many of these children are brought into your hospital in consequence of having been sent to school, and having been overworked there?—I personally do not think there is a great amount of harm done to healthy children by school-work. The great evil I have seen is that children who are not capable of being educated by the ordinary methods are exempted from school attendance; that is to say, the treatment they get

Dr. F. Warner.
7 Feb. 1888.

at the school leads to their exemption and practically, they get no training at all, and they degenerate morally and mentally, until one traces many of them in the hands of the police. If you will allow me I will refer to one more case. A little girl came under my care who was suffering from chorea; she got well and was discharged; she came back a second time, she was cured and went away, a third time she came back; inquiries were made, and she proved to be the child of some gipsies; every time that the parents were hard up the child relapsed. She was then taken care of in a small home school, and all the nerve symptoms subsided. Shortly after she was at this school she began to steal in the school and at the home, and my opinion was asked again (I should have said that she had permanent heart disease, it was a case of brain defect), and after careful treatment all the tendency to steal had completely passed away. She has had one attack of chorea since, but she is now all right.

19,114. You referred to cases of nystagmus and squinting?—One sees any quantity of squinting cases; squinting, if not attended to, frequently ends in loss of good sight. Then we have many cases of nystagmus. A child with any signs of brain defect ought to be kept in a school and dealt with specially; instead of that it is often exempted.

19,115. Are any steps taken in board schools, so far as you know, to deal with the cases of children with defective eye-sight?—I have seen children going blind, and I have pointed it out to the schoolmaster; sometimes the children have been sent to a hospital to be treated, in some cases I have found that no attention has been paid to them. We frequently meet with deaf children in hospital practice who have remained utterly uncared for in any special way in the school; such children were found among the unplaced or in the lower standard.

19,116. Have you known partially deaf children in board schools to become more deaf in consequence of want of medical treatment?—In a school in Liverpool I said to the teacher, "Have you any special case to show me?" and he showed me a child that used to be a bright child, but which had distinctly deteriorated in brain power; when I looked at it I saw certain signs showing that the child was a subject of congenital syphilis that was attacking the organs of hearing, and the brain. We have not a few cases of congenital syphilitic disease of the brain or its membranes.

19,117. (*Dr. Armitage.*) There are a great many of this class of children in our blind, and deaf and dumb schools; you would consider it a great advantage if the teachers of the deaf and dumb, or of the blind, could be so instructed as to be able readily to pick out these children before going through a long process of attempting to teach them?—Yes. Mr. Schontheil said to me that that was the kind of knowledge that he and others in similar positions wanted.

19,118. (*Chairman.*) Is your system taught by a system of diagrams?—I have diagrams and casts; we know what signs to look for, and that can be taught. Mr. Schontheil said that this kind of knowledge was what they had been wanting for years.

19,119. (*Mr. St. John Ackers.*) What length of time should you consider it would take for an ordinary student who had been trained at one of the training colleges of the country to get a sufficient amount of this knowledge to be useful in after life?—Half a dozen talks to him and half a dozen demonstrations in school would give him the requisite knowledge.

19,120. You would not consider that it would be necessary to increase to any appreciable extent the time that he would have to be at the training college in order to get this extra knowlege?—I should think not more than six days.

19,121. You have been working at this, how many years?—Between 10 and 12 years.

19,122. Have you yourself given lectures at any training college?—I have given lectures at the Stockwell and the Borough Road Training Colleges and at others.

19,123. How long ago was it when you began to give the lectures?—I think I began to put this forward just at the time that Dr. Crichton Browne referred to my work, before the Health Exhibition.

19,124 Have you any experience as to the result of your teaching in the case of those students who have passed out of those training colleges; have they as far as you know been able to pick out children according to your rules?—I cannot say that any teahers have acquired the requisite knowledge in any training college to enable them to do that, because I have only met them once at each place; but private teachers have told me of several cases where they have been able to understand the condition of a child and to know what to do with it, through such instruction.

19,125. (*Dr. Armitage.*) What do you think would be the best way of giving this instruction not only to teachers in board schools, but to teachers of the deaf and dumb and the blind?—I think that classes might be formed for teachers. I think teachers would attend voluntarily.

19,126. Do you think that much could be done by printed papers, or would it be necessary to have a class before you and diagnose the case?—I think the best plan of giving such instruction would be (1) by lectures, and (2) by demonstrations in practising schools.

19,127. (*Admiral Sir E. Sotheby.*) With regard to those children who are not blind or deaf and dumb, but who are suffering from other defects or deficiencies such as you have mentioned, could the same instructor be taught to teach them altogether?—I think so. I think they could perfectly well be taught by the same teacher, 25 in a class in the same building in the same way as you teach all the blind together.

19,128. But these children have different deficiencies, some are suffering from St. Vitus' dance, some are bordering on idiotey, and so on?—They could all be taught together by the same instructor, I think.

19,129. Have you inspected the classes for the deaf in the schools of the school board for London?—Yes.

19,130. Did you find many there imbecile?—I found several cases of defective brain.

19,131. Did you suggest any course of treatment?—No, I did not suggest any course of treatment. When I go into a school, I do not make any suggestions.

19,132. Have you any idea what would be the per-centage of such cases?—No.

19,133. (*Mr. Johnson.*) Have you had much experience with regard to blind schools?—No.

19,134. You have no experience as regards special education for the blind?—No.

The witness withdrew.

Rev. Charles Henry Andras, M.A., examined.

Rev. C. H. Andras, M.A.

19,135. (*Chairman.*) You are chaplain of the Woolwich workhouse?—Yes.

19,136. How long have you been connected with any workhouses as chaplain?—I was chaplain of Lewisham workhouse for 10 years, and I have been chaplain of Woolwich workhouse for four years, 14 years altogether, with a break.

19,137. Have you paid attention specially to the condition of the blind in workhouses?—Yes; it has seemed to me that their condition is so sad that it is very desirable to help them in some way. The authorities do not seem to me to take that interest in them that they might do in giving them occupation, to enable them to pass the time away, or to be useful.

19,138. Have you known many blind inmates of workhouses, not only aged persons, but young persons, who were capable of doing work?—If they were taught.

19,139. Have you had any experience in any other workhouses besides Woolwich and Lewisham?—No.

19,140. You can speak of both those?—I can speak of both those with regard to the condition of the blind in them.

19,141. Was the same system pursued there with regard to the blind as is now pursued at Woolwich?—The system was no system at all; absolutely nothing was done for them by the guardians. They were treated exactly as the others. The supplying of their special wants has been left entirely to haphazard.

19,142. Does any visitor come to the workhouse from the Home Teaching Society for the Blind?—A visitor from the Home Teaching Society for the Blind has lately visited Woolwich workhouse once a fortnight, and of late, but only very recently, the board have made a small grant to that society in aid.

19,143. Was that on the representation of the society, or on your representation?—The representation came from both, I should think. I have taken a special interest in the blind, in the direction of teaching them to write.

19,144. Braille?—No, a system of my own. I have invented a board or writing desk for the use of the blind. It is useful not only for the blind, but for ordinary purposes.

19,145. What letters do the blind write with that board or desk?—The ordinary type of the sighted.

19,146. Do you teach them to read?—The teacher from the Home Teaching Society teaches them to read.

19,147. What system does he teach them?—Moon's type. He has a class of about 10.

19,148. Will you give us the ages of the older blind in your workhouse?—The ages are as follows: 82, 76, some 68, 66, 61, 60, 56, 54, several 50, 48.

19,149. How many are classed as able-bodied, and how many as infirm?—They would all be counted as infirm.

19,150. Would you tell us the ages of the younger blind?—We have a young man of about 25, a boy of 15, and a young man of 27, another 26.

19,151. Is nothing done either in the way of educating them, or teaching them a trade?—One has been sent out to the Greenwich Institution which has been lately established. The board have taken a little interest in the blind lately, and they keep one there at a time to be instructed; the others would of course be doing nothing.

19,152. How many blind have you got altogether?—26; there are 20 men, five women, and one boy.

19,153. What are the ages of the women?—50, 60, 61; one I have lately got into the Bright's Home for the Blind. I think it is a private establishment.

19,154. Is the blindness the result of accident or old age?—Both. One man was blinded by his wife by vitriol, and in revenge he assaulted her, and injured her so much that he was incarcerated for five years. He has just come out of prison.

19,155. That is not a case that would require exceptionally favourable treatment?—No.

19,156. They are all treated the same?—Yes; we occasionally get one from the criminal class like that.

19,157. Do you know anything of the blind in the London workhouses?—Very little.

19,158. Have you any from the London workhouses?—We should send them back again if they came to us under the Law of Settlement.

19,159. What do you advocate for the blind in workhouses?—No change which left them in the workhouses under the present state of the law, could in my opinion, alter their condition for the better.

19,160. You think that a workhouse is radically unfitted for the reception of the blind?—Yes. We have had many accidents to the blind, from their running against the iron gates. We have iron gates throughout all the corridors, and they are constantly running against them, and tumbling down the stone steps. There have been a variety of accidents in the last four years, not so serious as to cause death, but injury has resulted.*

Rev. C. H. Andras, M.A.
7 Feb. 1888.

19,161. You think the arrangements of the workhouse are not calculated for the blind?—Certainly not, neither as regards the classes into which they are thrown, nor the conditions under which a workhouse has to be managed. The guardians have to follow hard and fast rules under the Local Government Board, who seem generally very indifferent to charitable feeling, and the workhouses themselves are not built suitably. The chapel, for instance, is raised up over the dining hall, and approached by a great flight of stairs which the blind have to go up and down. All about the building there are steps up and down; the building is not suitably arranged for them.

19,162. The blind can go up and down stairs?—When they are led they can get up and down stairs; but there are all kinds of traps for them in such a place as that till they get well acquainted with the place.

19,163. You attach, perhaps, more importance to the moral atmosphere of the workhouse?—That is a most serious matter, that people brought up nicely are thrown in with those who have been brought up in a totally different way. They have constantly to hear the most shocking language.

19,164. I suppose indoor paupers are not a class that many of these respectable blind people would like to associate with?—No doubt that is the case.

19,165. Have you had any complaints from the blind themselves as regards the people they are obliged to associate with?—Constantly. As a rule the blind are a better class than the ordinary paupers.

19,166. The policy of the workhouse, of course, is rather to prevent paupers from coming in as much as possible?—Yes.

19,167. So that they should not have any of the comforts of life which the blind may very fairly claim to be provided with in their old age?—Yes, as a rule, I think the guardians look more to keeping the rates down than they care for the poor inside the house; they look to their election next year.

19,168. Do you advocate anything like a central home for the blind in large towns or in London, or what is your remedy for this state of things?—There should be, I think, some special establishment built or adapted for the blind in some way where they would have the society of decent people and people who would help them.

19,169. Do you think that a building of that kind might be provided under the Metropolitan Asylums Board?—That I am not able to say.

19,170. You are not prepared to suggest that?—I should not like to express an opinion as to what could be done. I do notthink the present system is right at all. With regard to infirmaries, for instance. Infirmaries would be much improved if they were made into hospitals on the same system as the London Hospitals.

19,171. Are the blind ever allowed out-door relief where they have friends?—No, I believe not.

19,172. They are forced to come in?—Yes, the guardians are very much against giving out-door relief.

19,173. Could not they be boarded out with friends?—That would be, I think, a most excellent system if they had friends left. Very often we have old people who are left without friends.

19,174. They come into the workhouse?—Yes; some of the blind have a pension, but it is not sufficient to support them. A soldier's pension varies from 12*l.* to 20*l.* a year, and it is not enough to support a man.

* *Note.*—This statement is contested by two of the Local Government Board Inspectors for the Metropolitan District. (*See* Appendix 10.)

Rev. C. H. Andras, M.A.

7 Feb. 1888.

19,175. You say that the blind are placed in the infirm ward?—All the blind are classed as infirm.

19,176. Have they any additional luxuries or any additional accommodation?—Not of any kind. The system is carried out by a hard and fast rule throughout.

19,177. Is not the diet that they get in the infirmary better than that in the ordinary workhouse?—Yes, but the blind are not put in the infirmary unless they are sick. There are four classes of diet subject to the doctor's arrangements; the diet is better and more generous in the infirmary than in the house, certainly, and the blind get that when they are in the infirmary. There is an infirmary, which is a totally separate building, and there is the infirm ward of the house. The blind are in the infirm ward of the house; they are not placed in the infirmary unless they are on the sick list.

19,178. If they are sick they are put in the infirmary and then they get a better diet?—Yes.

19,179. In the infirm ward they get no advantage in the way of diet over the ordinary inmates?—No.

19,180. Do you find that the blind are generally read to in the workhouse?—That is quite by haphazard, with the exception of the chaplain's visits; the ward is read to by the keeper of the ward; sometimes he will read from a newspaper.

19,181. Does anybody read the Bible to them except you?—Yes, there are one or two ladies and gentlemen who visit about once a fortnight, but as a rule their visits are few and far between. There is great jealousy on the part of the guardians as to admitting such visitors, and I was cautioned not to admit any more. The guardians are much against allowing any number of people to come in; they seem to think they get stories told them by the poor, and that they make mischief.

19,182. As to Lewisham workhouse, are the arrangements there now with regard to the blind the same as those at Woolwich?—It is eight years ago since I was at Lewisham, and the arrangements may be different now to what they were then; they wanted me to give my whole time to the workhouse, which I could not do, as I had a school to attend to, and so I resigned.

19,183. Do you give your whole time to the workhouse at Woolwich?—I give my whole time now, except occasionally writing for the press.

19,184. Have you any deaf and dumb in your workhouse?—Yes, we have one; I have to speak with him by means of a slate.

19,185. Has he gone through any school or institution?—Yes; there is a mission at Deptford to which he had been before he came to Woolwich. There is a clergyman there who is himself deaf and dumb.

19,186. Does anybody communicate with him by the fingers and signs?—I do myself, and some are able to do so, slowly.

19,187. What religious instruction does he get?—He gets instruction from myself, and from tracts.

19,188. He reads?—Yes. I let him have a printed sermon now and then to read. We have many stone deaf; in one ward, as many as eight.

19,189. That is from old age?—Yes.

19,190. Those old people are not dumb as well as deaf?—No.

19,191. (*Mr. Johnson.*) I suppose you think every person below the age of 20, even if he is in a workhouse, should be instructed?—Certainly.

19,192. Do I rightly understand you to say that in your workhouse there are no means at present of instructing blind persons under the age of 20?—The young are sent to Sutton as soon as possible.

19,193. What sort of work would you put a blind boy to, at your establishment?—I should like to put him to basket work.

19,194. What do you put him to?—Nothing. There is no mechanical instruction.

19,195. You give no mechanical instruction to any blind people?—No. I called the attention of the board to it some little time ago, but nothing has been done.

19,196. Might not they with advantage have those taught a trade who are capable of learning a trade so that they might work at that trade?—Most decidedly; that is the very thing I want to have carried out.

19,197. Then also you think that a certain amount of education should be given them?—Yes.

19,198. There being at the present time no education given to the blind in workhouses except by the kind visits of persons who belong to the Blind Home Teaching Society?—Yes, and of late the Woolwich Board of Guardians have made a slight grant to them.

19,199. But the education of the blind is entirely in the hands of that one society who come there by sufferance?—Yes.

19,200. You know of no instruction in any work house for the blind?—I cannot speak of other workhouses; I can only speak of those that I have been acquainted with.

19,201. Speaking of the workhouse with which you are connected, there is no occupation at all for the blind, nor are any means taken to give them an interest in what goes on outside?—Their contact with the outer world is limited to myself, and perhaps two or three other visitors, and they will perhaps have the newspaper read to them occasionally by the ward keeper.

19,202. But for the occasional visits of yourself and one or two others they would be completely isolated from the world?—Yes.

19,203. Do you find that that idleness tends to mischief, to unruliness, and changeableness of character; do you think it is a bad thing for them to have nothing to do?—I find that generally the blind are very patient sufferers.

19,204. Do you find that there is any sympathy with the blind among the sighted inmates; do you find that they do all that they can to help them?—Certainly. I have tried to induce them, with success, to help them, but it does not follow as a matter of course that there will be those in their ward who will help them.

19,205. Do you think it would be a good thing if the boards of guardians could establish a sort of union specially for the blind, where they might receive proper instruction and be under proper supervision?—I think it is of advantage for the blind to be with those who can see.

19,206. I am supposing that they would be put all together in the same building, where they would be supervised by persons who had sight; would it be possible to have a blind union?—I think you kill ll the birds with one stone if you divide the well-isposed classes from the criminal classes in workhouses.

19,207. I am talking about the blind now?—I think the blind should be associated with seeing people.

19,208. Do you think it would be a good thing if they were associated together for instruction, and if also workshops were established for teaching them trades?—Yes.

19,209. The aged persons whom you could not teach being relegated to an asylum?—Quite so.

19,210. Did you ever in you experience hear of the Poor Law Relief Bill which was before Parliament in 1860 for the relief of the poor in Ireland?—No.

19,211. I may state that it was a desire of some in Ireland to get an Act passed to make it lawful for the commissioners administering the poor law to establish such asylums for the blind, but it was not carried out?—The question of addition to the rates would enter largely into the question.

19,212. Do you think that that would be a good plan to carry out?—Most decidedly.

19,213. What do the guardians pay for that man they have got at Greenwich; is it 10s. a week?—I think it is.

19,214. If the guardians would pay 10s. a week for one man, it would be much cheaper to associate all the blind together, and have a master to teach them?—Undoubtedly, some co-operative system is required.

19,215. Suppose they made baskets in the workhouse, whatever profit they made would go to the guardians?—Yes.

19,216. Is your 27 year old man able-bodied?—He was a call boy first of all on board the river boats, and then he became mate; he lived along shore till he became blind. He is a strong able-bodied fellow.

19,217. He is allowed to remain perfectly fallow?—Yes.

19,218. Except what instruction he may get from the Home Teaching Society?—He cannot be induced to attend the class conducted by the visitor of the Home Teaching Society. His education was so neglected that he did not take to the class. He is not bound to attend it.

19,219. Your teaching of the blind would only come into operation when they were 16 years of age. If they were younger, you would have power to send them to school?—Some under 16 are waiting in the workhouse for various reasons, and those I instruct.

19,220. And in course of time you draft them off to the institution?—Yes, we send all our children to Sutton, and if they are Roman Catholics they go down to North Hyde.

19,221. As a rule do you find that the blind are a better class than other paupers?—Certainly, there is a better spirit amongst them.

19,222. They do not come from any better class?—No, their blindness seems to have attracted more sympathy and more notice from others. We find them generally more attentive to the duties of religion and more attentive to reading the Bible, and so forth. In fact, four or five of them read the Bible to the others. I am single-handed, and I appreciate their help.

19,223. It only proves that if more attention was given to them you would be able to educate them more?—Yes.

19,224. With regard to those who are from 60 to 70 years of age, have they become blind from disease or accident or old age?—They have become blind from atrophy of the optic chord generally (amaurosis).

19,225. Are they under medical treatment?—If they put their names down.

19,226. There is no attempt to treat them ophthalmically?—No, not systematically; frequently I give a letter to Guy's Hospital or to Moor Fields Hospital, and they go up and they are treated and sometimes benefited; cases of cataract, and so forth. The kind of attention that they get in these infirmaries is about that which they would get from an ordinary practitioner outside; there is no special treatment. The class of medical men who are appointed by the guardians are just the class of ordinary practitioners; that is why I advocate that all these infirmaries should be made hospitals and have a teaching staff attached to them. At present we have only one doctor for 230 people, and one assistant who makes up the medicines. I look upon that as totally inadequate.

19,227. Your view would be that on a blind person coming to the workhouse he or she should be sent off to a special hospital paid for by the rates, as a lunatic is sent to a lunatic asylum?—Yes, that would be a good plan in case of the sick or curable blind.

19,228. You think it would be a good plan also if the blind generally were more congregated together and taken more care of by sighted supervision?—I would not dissociate them from seeing persons.

19,229. If they were collected together, and if there were special readers to read to them under good sighted supervision and good sighted care, you would think that a good arrangement?—Yes, the workhouse is the wrong place for them altogether.

19,230. (*Rev. Mr. Sleight.*) Have you come across many cases of deaf mutes in workhouses?—There has been only one case in Woolwich since I have been there, and there was only one case that I can remember at Lewisham.

Rev. C. H. Andras, M.A

7 Feb. 1888

19,231. Do you think in the workhouses enough attention is given to educable idiots?—I only know of one case of an idiot since I have been at Woolwich.

19,232. (*Chairman.*) Where you have such a good idiot asylum as that at Darenth, they would all be sent there?—Yes.

19,233. (*Admiral Sir E. Sotheby.*) You say there is only one teacher comes from the Home Teaching Society to instruct the blind?—Yes.

19,234. And he only comes once a fortnight?—Yes.

19,235. Cannot he be induced to come oftener?—I daresay if the guardians were to pay more to the society, he would visit the workhouse oftener. At present they only give a very small sum.

19,236. How long would he remain?—One hour and a half.

19,237. You have 25 blind people?—Yes.

19,238. Then they cannot get much instruction?—Not very much; he holds a kind of service for them, he reads from Scripture, and prays with them, and then talks to them.

19,239. Have the blind people been brought up to any trade or profession?—None at all; that is the thing I complain of.

19,240. I mean previous to their coming to you?—No, we do not find that if they had been, they would probably not have drifted into the workhouse.

19,241. Are there any musicians amongst them?—We have an old man who has got his living till recently by making his own fiddle, and playing it in the streets.

19,242. Is he allowed to play the fiddle in the workhouse?—Yes, and he helps me very much when I go to hold a service; he plays my psalm tunes; he is a clever fellow; he is a half caste, half Indian.

19,243. You say you have 20 men, and five women who are blind?—That would be about the average.

19,244. How many are there under 35 or 40 years of age?—Four.

19,245. Then those four are capable of learning a trade?—Quite capable, and they are anxious to learn a trade; they have often talked to me about it, and asked me to do something for them.

19,246. The guardians have been generous enough to pay for one, but not for more?—Yes.

19,247. Has it been brought to their notice that these other men would prefer working outside at a trade?—Yes, the guardians are going on the principle of excessive economy.

19,248. Surely it is false economy to keep those men idle in the workhouse instead of their working at a trade?—That is my own private opinion. I suppose the guardians think differently.

19,249. Do you think the indigent blind are better in the house than they would be if they were boarded outside with their friends, their friends being paid so much for their maintenance?—I think it better to give them out-door relief if they have friends to live with; but in most of the cases they have no friends; that is the cause of their drifting into the workhouse.

19,250. Are there any blind who seek admission into the workhouse as casuals?—Such cases would be very rare. A blind man who would come to the casual ward would be one who was getting his living outside by begging or hawking. I remember a man who hawked who got an attack of rheumatism, and came in; he came into the infirmary.

19,251. That would be during his illness?—Yes.

19,252. That would not be like the case of a man who came and asked for admittance into the casual ward?—No, I never knew of such a case.

19,253. With regard to pensioners, is a man with a pension of 1s. a day allowed to come into the house?—Yes, the pension is taken from him. Army pensioners who have served their Queen and country are placed in the house and all their money is taken from them, and they are treated on the same terms as the others.

Rev. C. H. Andras, M.A.

7 Feb. 1888.

19,254. Are they not allowed anything for tobacco, and so on?—I believe if they have 16*l.* to 20*l.* a year they have 6*d.* a week allowed them.

19,255. Did I rightly understand you that all the blind are always classed with the infirm?—Yes, they are placed in the infirm ward; some are not naturally infirm.

19,256. They come under that head?—Yes.

19,257. Do you think blind people require more ventilation than the sighted?—I should think so.

19,258. Do you think the blind are happier at work than doing nothing?—Certainly.

19,259. Are they happier when they are mixed with sighted people than with all blind people?—I should think the blind enjoy very much the society of those who can see and can read to them. They enjoy their society more than that of those who cannot do so. I think the proper way of dealing with the blind would be to mix them with sighted people.

19,260. Are the blind children sent to learn a trade?—Only one has been sent.

19,261. Are they taught to read and write?—When we have blind children they are kept for a very short time; they go to Sutton. I do not know how they treat them at Sutton.

19,262. There is no special examination made of blind children when they are admitted into the workhouse?—No; the cause of their blindness is not ascertained, but sometimes they are sent up to Moorfields Hospital or to Guy's Hospital.

19,263. (*Mr. Van Oven.*) You have a deaf and dumb inmate?—Yes.

19,264. What age?—He is an old man, about 65.

19,265. Has he followed any occupation in life at all?—No; his wife was also deaf and dumb, and as long as his wife was alive I do not know how they lived; it must have been by charity.

19,266. As regards the blind you have only one who has followed any occupation as far as you know, that is this itinerant musician?—Yes.

19,267. If I rightly understand you, your idea is that the blind should be put in a separate ward, and that some of the superior paupers should be put with them?—Yes.

19,268. So that they might not mix with the general paupers, you do not advocate a separate institution, you advocate a separate ward?—Yes, I do not think it is well to throw the blind all together.

19,269. You think that the younger ones, those capable of work, should be taught trades in that portion of the building?—I do not advocate the young being kept in unions at all.

19,270. I do not mean children, I mean men of 26 or 27?—I should send them to some industrial school for the blind. The workhouse is the worst possible school for the young.

19,271. (*Mr. Arrol.*) Would you be disposed to recommend that the guardians should have power to give relief to the blind by boarding them outside the house?—If you separate them you are not able to instruct them together. There is an object in bringing them together.

19,272. My question had reference rather to the aged, or those past learning a trade; if the guardians were able to find homes for the blind, in which they might get the advantage of their labour, would you be disposed to recommend that course?—It might work well.

19,273. Do you think it is to the advantage of the blind that they should be congregated together?—Not entirely; I think they should be associated with seeing persons.

19,274. Do not you think that the system I indicate would be the best for the adult blind?—If they have learnt some trade. I think that they should be placed where they would have seeing persons round them whereby they might be forwarded in their trade.

19,275. As regards those who had not learnt a trade, it would be quite within their power to do some ordinary work?—Yes.

19,276. On that account would you be disposed to recommend what I have suggested also?—Unless you placed such a person with some one who could teach him a trade, you would not be improving his condition.

19,277. He might get some occupation without having a trade. You say you are not in favour of congregating the blind together?—There is no harm in partially congregating them together, but to put them entirely together without seeing persons with them would be a disadvantage.

19,278. Would you recommend that every parish should be compelled to send their blind young paupers to an institution to learn a trade at their expense?—Certainly, I think so, if there is no special charity or money provided for the purpose, if there is no other way of managing it. The blind are so few in comparison with the total community that the expense would make very little difference, and such a system could be well carried out without burdening the ratepayers.

19,279. You would be in favour of every parish being compelled to educate its pauper blind?—Yes.

19,280. (*Mr. St. John Ackers.*) You say you have now 20 men and five women; is that about the proportion you have noticed in past years?—Yes, there are more male blind than female.

19,281. It is four to one; is that about the proportion that you have noticed in past years?—I have not taken notice.

19,282. Do you remember what the proportion was at Lewisham?—There would be more men than women. I could not say the proportion.

19,283. Do you know whether there are many more women than men outside the Woolwich union who are blind?—That it would be difficult to say; many of the blind are cared for by their own relatives.

19,284. Is it your experience that there are more blind women than men cared for by their relatives?—I could not give you any statistics in answer to your question.

19,285. (*Chairman.*) Do you think that it should be compulsory on the guardians to send the adult blind that come into the workhouse to some workshop for instruction if the guardians did not provide it themselves?—Most decidedly; it would be such a small addition to the rates on the whole body of ratepayers that it would be inappreciable. I think it should be compulsory. I think unless the guardians were compelled to do it they would not do it.

19,286. It would be good economy really for them to do so?—Yes. I am quite sure they do not proceed on grounds of true economy in many cases, to break up a person's home and to throw him on the rates is worse than giving him that little help that would tide him over his difficulty and set him on his legs again.

19,287. I gather from your answers to questions which have been put to you that you are not indisposed to have out-door relief for the blind more extensively given than it is now?—Where there is some one to take care of them, but you find they drift into unions where they have no relatives to care for them. The relieving officer, in going round, finds out that they are in such a position that it is better for them to come into the house than to remain out, and he advises them to do so.

The witness withdrew.

Adjourned to to-morrow at 11 o'clock.

6, Old Palace Yard, S.W.

Wednesday, February 8, 1888.

PRESENT:

THE RIGHT HON. THE LORD EGERTON IN THE CHAIR.

ADMIRAL SIR E. SOTHEBY, K.C.B.
SIR TINDAL ROBERTSON, M.D., M.P.
B. ST. JOHN ACKERS, ESQ.
W. AUCHINCLOSS ARROL, ESQ.
F. J. CAMPBELL, ESQ., LL.D.
EDMUND C. JOHNSON, ESQ.
THE REV. W. BLOMEFIELD SLEIGHT, M.A.
THE REV. CHARLES MANSFIELD OWEN, M.A.
L. VAN OVEN, ESQ.
CHARLES E. D. BLACK, ESQ., *Secretary*.

Dr. GEORGE E. SHUTTLEWORTH examined.

Dr. G. E. Shuttleworth.

8 Feb. 1888.

19,288. (*Chairman.*) You are Medical Superintendent of the Royal Albert Asylum for Idiots and Imbeciles of the Northern Counties, at Lancaster?—Yes.

19,289. Will you describe to us the nature of the infirmity under which your patients are suffering, and distinguish which of them in your opinion are capable of education?—The children under care at the Royal Albert Asylum are idiots and imbeciles—I need not, I suppose, define what they are, as distinguished from lunatics—they are children of weak mind either from birth or from an early age, and require special educational arrangements to develop such intelligence as they have. Then comes the question you put to me as to educability, and in defining the education of imbeciles—(you will please correct me if I state it too broadly)—for myself I believe that the education of imbeciles includes not only what we are accustomed to regard as subjects of ordinary school education, that is instruction in the elements of reading, writing, and arithmetic, but also a good deal that in the case of weak-minded children is a necessary and essential preliminary to that sort of instruction. These children are not only dull in mind, but they labour under certain physical infirmities; they have dullness of their senses, and they have irregular movements of the body, and to sharpen the senses and to overcome those irregularities of movement is of course preliminary to their settling down to any ordinary school routine; so that I take it that the education of imbeciles involves in the first place the training of their senses, and of their muscles, to a much greater extent than in the case of an ordinary school child. Then again the successful training of imbeciles involves more than simply literary school education, such as reading, writing, and arithmetic, inasmuch as their successful training involves some skill in industrial work; therefore the school work passes on almost imperceptibly into industrial training. Those, I think, are the principal matters included in the education of imbeciles. There are of course other matters, which would be matters of nursing perhaps rather than matters of education, such as the improvement of their habits.

19,290. Can you draw any distinction between idiots and imbeciles?—It is merely a difference of degree not of kind. Idiotcy means a lower degradation of intellect, a greater deficiency of intellect, and imbecility means a lesser degree of such deficiency.

19,291. Are they both capable of education in some cases?—In some cases. Imbeciles are far more educable, speaking generally, than idiots are, but it is a matter of nomenclature very much. Medical men differ in the application of those terms; the one class shades imperceptibly into the other.

19,292. Should you be able to give us a table for any number of years since the foundation of the school, showing the proportion of those who were capable of education and whose education had been so successful as to enable them on leaving the institution to partly or entirely earn their livelihood?—I have those figures, including in the scope of education industrial training sufficient to enable them to earn their own livelihood. I can give particulars of those who have passed through the institution during the 17 years that it has been open. First of all I will give the Commission a brief statement of the general results as recorded in the books of the institution, and afterwards I will give you the results as obtained from inquiries of the friends of patients who have been discharged. The total number who have passed through the institution during the 17 years from December 1870 to December 1887 has been 1,151; of these 424 have been discharged, that is to say, sent home to their friends.

19,293. Do you mean that they have been discharged because you could not do anything with them?—No, discharged at the end of the period for which they were elected, or for some other reason. 1,151 have been admitted, 424 have been discharged, 181 have died, and there remained in the institution at the end of last year 546.

19,294. Out of those that have left the institution how many have been successes?—Of the 424 discharged, four have been returned on our books, and to the Commissioners, as "Recovered," that is to say, having no longer any such imbecility as would justify us in certifying them as imbeciles.

19,295. Four out of the 424 that have been discharged?—Yes; 546 remain in the institution; there is no description of those. Those four are returned as "Recovered," that means that there is no longer any residual appearance of imbecility. Then 355 have been returned as "Relieved," that is to say, improved in a greater or less degree; the technical term that we are obliged to use is "Relieved." Of those, roundly classified, there were 110 very much improved, 120 moderately improved, and 125 slightly improved only. Then 65 were "Not improved," many of these being confirmed epileptics or children who on arriving at the age of puberty have become insane; and some of them were unwisely removed by their friends before they had time to improve.

19,296. By their friends or by the guardians?—Yes; I say "unwisely" because the friends have themselves regretted it in many cases, and wished them to be returned to the institution. So that of the 424 discharged the per-centage comes to 1 per cent. who have absolutely recovered. "Recovered" is a misnomer, because they have never enjoyed a mentally sound state to recover to; that means that their intellect has been developed to such an extent as to render them not any longer imbecile. I merely use the technical term "Recovered" as used in the returns to the Commissioners. The 355 "Relieved" is equivalent to a per-centage of 84 per cent. improved. The 65 "Not improved" is equivalent to a per-centage of 15 per cent. These are the general figures taken from our books. Then I may state that it is our custom to send out periodically schedules and request the friends of patients to give us an account of the progress of the discharged patients since they left the institution.

Dr. G. E. Shuttleworth.

8 Feb. 1888.

I have not of course been able to trace the whole number by any means, and I do not think it would be fair to give an account of those who had not completed the whole election period in the institution when they left; but about 200 patients had completed the whole seven years period or upwards, and out of those 200 I know the history of 176. The account of those received after at least a year subsequent to their discharge is that 18 are, or have been, earning wages, that is equivalent to 10 per cent.; 9 are remuneratively employed at home, that is equivalent to 5 per cent. (remuneratively employed at home means that they are doing work which their parents would otherwise have to pay people for doing); there are 6 who are quite capable of earning wages, as their parents tell us, if they could only find suitable situations for them; that is equivalent to 3·5 per cent. Then there are 38 others who are more or less useful in small domestic matters at home, that is equivalent to 22 per cent.; there are 39 at home reported to be of little or no use, equivalent to 22 per cent.; there are 51 in asylums and workhouses, equivalent to 29 per cent.; and 15 have died since leaving the institution, equivalent to 8·5 per cent. So that, speaking generally, you may say that over 40 per cent. are favourably reported of, and I might well add 10 per cent. more from the asylum and workhouse contingent as patients who are really able to work if they have the opportunity, and in fact are working in those institutions. I must explain with regard to the 51 in asylums and workhouses that that includes a number of boys and girls who have been usefully trained in the institution, but their friends on receiving them home not readily finding situations for them have found it the least trouble either to send them to the workhouse or to get them into a lunatic asylum sometimes, not because they are in any way violent lunatics, but because the authorities are willing to send them there: in many unions they do not care about keeping persons who are called imbeciles, they would rather send them to a lunatic asylum.

19,297. Whatever may have been the case two years ago I thought that under the existing law there was a distinct line drawn between imbeciles and lunatics?—There is no law to prevent imbeciles being certified as persons of unsound mind, and then sent to a lunatic asylum, though they cannot be transferred from our institution under the certificates under which they are admitted now.

19,298. (*Sir Tindal Robertson.*) Would not it require two certificates?—Not to a pauper lunatic asylum, one is sufficient for a pauper lunatic asylum; two are required in the case of a private institution.

19,299. (*Chairman.*) In your opinion are some imbeciles sent to lunatic asylums who have been sufficiently trained in your institution to make them improper subjects for a lunatic asylum?—Certainly. I know several cases of boys who were working well on our farm or in the garden, or in our shops, who have been sent to lunatic asylums because their friends were not people who were capable of managing them, and finding situations for them; and I hear from the lunatic asylums that they still employ them in the sort of work that they had learnt to do with us.

19,300. Therefore it is not a case of their having relapsed, or losing the advantage they gained in your institution?—Not necessarily.

19,301. It is a case of their friends not understanding how to manage them?—Yes, or not being able readily to find them situations: it is not necessarily that they have become too violent at home; it is simply that being of the imbecile class they have been able to obtain admission into workhouses, and the workhouses have sent them on to a lunatic asylum.

19,302. What is your course of training?—Usually in the case of the elected patients, who amount to two-thirds of the whole number, we have them for a period of seven years. With regard to the payment and pauper cases it is a matter of arrangement between those who pay for them and the committee as to the length of time that they remain if they are considered suitable inmates of the institution.

19,303. Do you think that a large majority of imbeciles and idiots should be compulsorily educated by the State, in the same way as other children, as far as they are capable of education?—I think so, decidedly. I think it is the duty of the parents, and I suppose the State should enforce that duty, to improve imbecile children as much as they are capable of being improved; and in any general scheme of education the interests of the imbecile class should not be left out of sight.

19,304. You have told us that a certain per-centage are capable of improvement, and able to support themselves or to help their friends?—Yes.

19,305. Do you think, therefore, it is desirable on general economical grounds that that class should, as far as possible, be taught to earn their own livelihood?—Most decidedly on economical grounds.

19,306. Can you in any way distinguish between the congenital and non-congenital cases, and could you say, from your experience, how far either of those classes is more or less capable of improvement?—In my experience the congenital class preponderates very much over the non-congenital class, in the proportion of 65 per cent. of the congenital class to 35 per cent. of the non-congenital class. In our case books which now contain over 1,100 cases, I have accurate histories of nearly 1,000 of those cases; and with regard to the degree of improvement possible, my experience is that the congenital class are more susceptible to improvement than the non-congenital class, speaking generally; the reason of that probably being that the non-congenital class suffer from the effects of damage to the brain and brain disease, whereas the congenital class, of course, are deficient from want of development of the brain before birth, and by placing them in favourable conditions and subjecting them to proper educational processes, they may be improved in process of growth.

19,307. Then the non-congenital cases are less hopeful than the congenital cases, and if you could choose your cases you would give the preference to those who were of the congenital class?—As a rule; of course there are exceptions. Sometimes in non-congenital cases the damage to the brain is very slight, and then as the child grows up an improvement may take place; but where there has been either a severe fall yr some severe fit, which is one of the commonly assigned causes of non-congenital imbecility, the brain is very often irreparably damaged.

19,308. Have you traced the cause of the congenital cases to ascertain whether consanguinity of the parents has had anything to do with it?—Yes; I have paid considerable attention to that matter. I looked through our case books with a view of seeing what the percentage was, and I find that our case books do not give more than 5·6 per cent. (that is the last time that the number of cases was calculated) in which there have been marriages of consanguinity between parents or grand parents, that is including second cousins.

19,309. Do you find that any cases are attributable to drunkenness on the part of the parents?—Certainly; intemperance is one cause; according to my experience not so preponderating a cause as other authorities have stated. In 14 per cent. of our cases there is some evidence of intemperance. Of course, it is a very difficult matter to arrive at a true statement with regard to that; but I have taken some pains not merely to accept the statements of the friends, but to make inquiries from people who know the parents. We have facilities for making those inquiries through local committees, and so on. When we ask, as we invariably do ask, when admitting a case, whether there was any intemperance on the part of the parents previous to the child's birth, we are for the most part told, Certainly not; and we find afterwards (from other sources, perhaps) that the father is a notorious drunkard; but still, 14 per cent. is as much as I have been able to make sure of with the help of those inquiries, and that is a good deal less than has been calculated by some American and other authorities.

Dr. G. E. Shuttleworth.

8 Feb. 1888.

19,310. But for all practical purposes I suppose you would not make any distinction between the two classes of congenital and non-congenital cases, so far as regards dealing with them as being capable of some education?—No.

19,311. Do you think that there would be any difficulty in getting the parents to send their children compulsorily to some school?—There might be, in a certain number of cases. Of course it is to be borne in mind that these children are usually the offspring of not very strong-minded people; and the mothers who are mothers of imbeciles very frequently make some amount of trouble about parting with them; there is a very strong affection on the part of mothers towards their afflicted children. At the same time, I think if imbecile education came to be a recognised system a good deal of that objection would pass away.

19,312. You have told us something about the industrial education of these children; will you give us some information with regard to two other heads. What moral pressure do you find you can bring to bear upon them, and what are the best educational means of developing their intelligence?—With regard to the moral education of these children, that rather involves the question of care, not merely the instruction they receive in school, but their care out of school as well; it is necessary to have, therefore, a staff of persons who have the necessary kindness in their composition, and the necessary firmness to gain the confidence and obtain a control of the pupils. These children, like other children, can be taught the difference between right and wrong; there are, of course, a class of imbeciles who are more difficult to deal with than ordinary children; but that is a matter that should be borne in mind in any system of education; they should be taught by rewards and punishments the difference between right and wrong, and their duty towards their neighbour, and so forth. Some of them are very susceptible to religious feeling.

19,313. Do you find that most of them are able to take in elementary ideas of the Deity, and their duty to their neighbour, after a certain time?—Yes, a large number of them are.

19,314. Do you find that many of these children who come into your institution are of low vitality, and that they have not had sufficient nutriment to develop their intelligence?—Undoubtedly; that is the case, one may say, with nearly all of them; it is the exception that they should be of good physical development; they are of low vitality, and generally of defective physical organisation, and before the intellect can be developed it is necessary to develop the bodily powers; to give them good food and to train their muscles.

19,315. If these children were kept at home they would not get that good food in all probability in many cases?—No.

19,316. Especially in the poorer classes; and they would not get any physical training to overcome their physical weakness?—That is so; one sees it especially in the children who come to us from the large towns.

19,317. Do you regard that as an additional reason why the State should step in and prevent these children from getting from bad to worse?—Yes.

19,318. As they would do if they were allowed to grow up under the conditions I have mentioned?—Undoubtedly.

19,319. Is there a distinct tendency to relapse when they become 15 or 16 years of age in many cases?—I do not think so; a few become violent when they attain the age of puberty.

19,320. Not a very large number?—No, I do not know that the proportion is much larger than among ordinary persons. Many girls in whose families there has been any tendency to insanity will show symptoms of insanity on attaining the age of puberty.

19,321. In your school exercises how do you gradually begin to train the mind?—In the first place I may say we train the body as a preliminary to training the mind, by putting the children through various physical exercises which command their obedience, and so fix their attention, that is to say, drill and calesthenics of the simplest character. Then the senses have to be more or less exercised; and we have exercise of a simple character for the hands. Physical imperfections are often shown in the use of the fingers; some of these children have spasmodic affections of the fingers which prevent them holding a pen or pencil. Until those are overcome you cannot set them to write or to draw. We have had many remarkable instances of that kind. Such children when they came into the institution were not able to hold a pencil, but by a series of exercises, exercises very often such as putting pegs into holes in a board, which makes it necessary for them to grasp firmly, they get after a while the control of these unruly muscles and are able to hold a pencil or pen. We have some half dozen boys in the institution who can draw and write extremely well who were not able to hold a pen or pencil when they came in. I give that as an illustration of the usefulness of these preliminary exercises.

19,322. You look upon all the kindergarten exercises as useful?—All the kindergarten exercises are exceedingly valuable in the same way, and especially so far as they lead on to industrial work. There are a great many kindergarten occupations which are of great use, such as threading beads, laying sticks, paper plaiting, and so on. Those are very good preliminary exercises, leading to what is really useful work afterwards. This paper plaiting, for instance, is a good preliminary for darning stockings: we look to the practical effect of these school exercises. Then I need not say that every lesson must be presented as far as possible in a concrete form, that is to say, illustrated by objects or pictures. These children have very little imagination, and their imagination is apt to go wrong if they have not the meaning of things explained to them through the eye, or by touch sometimes.

19,323. Do you find that by taking lessons in the practical affairs of life, such as selling goods over the counter and counting over money, their intelligence becomes gradually developed?—That shopkeeping lesson is of great use to them, inasmuch as when they go to their friends, and are sent to a shop for common articles, they see that they get the right articles, and that they receive the right change.

19,324. What proportion of them go home to their friends for their holidays?—Last year 130 out of 550.

19,325. Did any of the guardians' cases go home?—I think only four out of over 100.

19,326. What is the number of guardians' cases that you have at present, or that you have had since you have been superintendent?—There are 112 to-day.

19,327. Is that about the usual number?—Our nominal limit is 100, but there is such a demand for the admission of pauper cases that the committee have allowed us to exceed it.

19,328. Have you refused pauper cases on account of the asylum being full?—Hardly on account of the asylum being full, but we have carefully selected the cases presented to us by the guardians, and we have refused some on the ground of their not being sufficiently educable; the pauper cases that we have are rather of a higher grade as far as intellect goes than the elected cases.

12,329. You endeavour to take as far as possible educable cases from the guardians?—Yes.

19,330. Do you consider that it is very important to have a staff of well trained teachers?—Yes, I think that would follow almost from the description I have given of the sort of school exercises necessary; it requires an immense amount of patience to be a good teacher of imbeciles. The ordinary idea that anyone would be able to teach imbeciles is not a correct one; a person must be a good teacher of ordinary children to be a good teacher of imbecile children.

Dr. G. E. Shuttleworth.

8 Feb. 1888.

19,331. How do you get your teachers?—They are usually persons who have gone through the pupil-teacher course in an elementary school.

19,332. Have they been certificated teachers in an elementary school?—Not necessarily certificated, but they have gone through the course which pupil teachers have to take; some of them are certificated.

19,333. I presume if any grant was given by the State, the State would require certificated teachers; would there be any difficulty in getting specially trained certificated teachers?—I do not think there would be any difficulty about it. I think it would be well to have them certificated specially, because the training we require for our children is something beyond what suffices for an ordinary school.

19,334. At present there is no place where they could get that special training?—There is no institution where they could get it. We have attempted sometimes to take persons who are called pupil teachers, that is to say, young teachers of 16, with a view of giving them that special training, It is always a question whether it would not be better that they should first have had some preliminary training in ordinary school work before they come to us. At present the number of institutions like ours is so small that I am afraid it would scarcely pay to establish any training institution. If the education of imbeciles became more general, of course it would be worth while to establish such an institution.

19,335. At present Darenth is the only asylum where pauper idiots are taken in and supported out of the public funds?—Yes; there is another institution at Starcross, in Devon, where they are mostly, if not all, paupers, but that was not primarily founded as a pauper institution.

19,336. In the case of some children whose minds have remained dormant for a long time, do you find that after a certain time of training, their faculties seem suddenly to be awakened?—That is so in a certain proportion of cases. I may say, generally speaking, one has to wait for one or two years to make up one's mind whether there will be an improvement or not; it is hardly safe to hold that there is no chance of improvement before that time. A good deal of perseverance is required before the child is understood. We have occasionally remarkable instances of children who have their faculties apparently dormant for six or seven years, and they then wake up and go on very well. We had a boy who was with us for seven years and who did nothing but mischief,—he used to tear his clothes,—and then at the age of 14 or 15, after an attack of scarlatina, he began to learn at school, and instead of tearing his clothes he now makes mats.

19,337. Do you keep the unimprovable cases, your worst cases, separate from the improvable cases?—We do as far as the arrangements of the building will permit; our building is in one large block.

19,338. I mean do you keep them in separate rooms?—Yes; but we have not the absolute separation that they have at Darenth.

19,339. Do you think it desirable to keep the educable classes from those who are apparently uneducable?—I think they should be kept in separate departments in the same institution, but the departments should be entirely separate, so that the offices which are necessary, and the playground which is necessary, should be distinct.

19,340. You think the separation should be carried even so far as the playground?—Yes, because the training of the children is a good deal affected by those they are associated with, and if a number of very dull children are sent into the same playground with the more hopeful ones, naturally they interfere with their recreation. Moreover, these dull children require a greater amount of care, and the conditions of playing are different with them.

19,341. Do you find that some who are not much inclined to take to book education become useful servants by industrial training?—Very frequently, in the laundry and other labouring departments of the place, in domestic work, in making beds and scrubbing floors, and dusting the wards, and in out-door work, in such matters as weeding, and wheeling barrows, and simple work of that kind. Many who do not make much progress in school are of considerable use in such simple work as that.

19,342. Do you find that many imbeciles attach themselves to animals very much, and can be trusted to look after stock?—There are a certain number who are very useful in that way; they require a certain amount of supervision to make sure that they do justice to the animals. When it is only a matter of dividing a given amount of hay amongst a given number of cows, they can do that much, but if they had valuable stock to deal with, they would require some supervision, to make sure that the stock was well fed; you could not rely on the judgment of imbeciles.

19,343. If the State were to require an examination, in the case of their giving a grant to schools of the character that yours is, on what sort of examination would you recommend that that grant should be given?—My own idea is that it would be better that the inspecting authority should report as to the general equipment and character of the institution, and the efficiency of the educational methods pursued rather than judge by an individual examination of every pupil; for this reason, that the pupils themselves are a very peculiar class, and they vary very much from day to day. I imagine it would be very difficult for a person coming as a stranger to an imbecile school to accurately gauge the knowledge of each pupil. Imbecile children, very much more than ordinary children, are upset by differences of atmosphere sometimes, but certainly by the presence of a stranger. And then again, a good many of the matters of education of imbeciles can hardly be put down on paper, the finger exercises, the exercises of the senses, and so on. I imagine it would be rather difficult to give marks for them.

19,344. Imbecile children would not be able to be classed in standards, in the same way as ordinary children are classed?—Not in the same standards.

19,345. Nor could they always be judged of by the literary standard, that is to say, their power of reading and writing?—No.

19,346. Because they might be good at industrial work, and not good at school work?—Yes.

19,347. What proportion of your pupils do read and write, and are capable of benefiting by the literary part of school instruction, reading, writing, and arithmetic?—I have paid some attention to that lately. I asked in the first place the schoolmaster and schoolmistress to give me their estimate of the number of boys and girls who were capable of learning to read and write, and they went through their list, and they marked them in three classes; first, those capable of learning to read and write; secondly, those capable of benefiting in a minor degree by school instruction and discipline; and thirdly, the ineducable class. After that I went through their figures and revised them after seeing the individual pupils, and the result that we arrived at with regard to their capacity for education is that about 40 per cent. are capable of learning to read and write (*i.e.*, 40 per cent. of those at present attending school); and that about 45 per cent. are capable of benefiting in a minor degree by school instruction and discipline; these learn useful matters in school which make them better able to be employed industrially; for instance, they are rendered more obedient and intelligent, and perhaps become able to discriminate colours, or tell the time by the clock, or practical matters of that sort, which, though not reading and writing, are very important to them in daily life. Then the ineducable, those that will not improve much, if at all, are set down as 15 per cent. of the present number. The foregoing is, of course, an estimate; it is not the actual proportion of results; but I have been through the records of the boys' school with a view of ascertaining what the results have been. The girls' school I was not able to

treat in the same way, because there have been several changes in the office of head mistress; but we have had the same schoolmaster from the first, and the same mode of examining, and I find out of 100 boys discharged after seven years' training there were 36 who had learnt to read, 14 well, and 22 fairly; 36 who had learnt to write, 21 well, and 15 moderately;—more can write well than can read well—and then comes the other of the three "R's," in which unfortunately our patients do not excel. There were only 20 who had learnt anything appreciable in the way of sums, four who could work sums in the four simple rules, and 16 who could work sums in simple addition only.

19,348. You have been speaking generally of boys with regard to industrial work; is there much difference between the boys and the girls in the way either of industrial attainments or in reading and writing?—As a rule, I think the girls that we have are not quite as good intellectually as the boys; they are somewhat inferior. I do not mean that all imbecile girls are, but probably the higher class of imbecile girls are not so readily sent to an institution as the higher class of imbecile boys; if a girl is not a very bad imbecile her mother may make use of her at home.

19,349. Supposing the education of imbeciles was made compulsory, would you draw any distinction between boys and girls being sent to school, founded upon the fact that girls will never be able to go into industrial work like boys, and also founded upon the fact that in poor families a girl is very often useful for household work though an imbecile?—I do not think I should draw a distinction more than in the case of ordinary boys and girls with regard to school education, because the girls are very much more likely to improve by being sent to an institution than they are by being with their parents, who have not the means of training them. I do not wish to imply that the girls are not useful in industrial work.

19,350. They are useful in laundry and other industrial work?—Yes.

19,351. You can get lower class places for them in industrial work in farm houses and so on?—Of the girls who have been discharged there are about a dozen, I know, who are working either for wages or assisting their relatives in the capacity of servants.

19,352. I have not asked you about the lessons in colours; that is an important element of instruction, is it not, in the first instance?—Very important; it is important in its relation to industrial work.

19,353. It cultivates the eye by training it to observe?—Yes; all these exercises independently of their direct effect have an indirect effect in training the senses.

19,354. What capacity have imbeciles for music?—They have generally rather a large capacity for music; nearly all the children enjoy music very much indeed, and some of them are capable of singing correctly in tune; and it is curious that some of the low grade cases that cannot speak at all can yet hum tunes very correctly, and we make use of that propensity for music to lead them on to speech. We give them simple nursery rhymes containing repetitions of sounds set to airs which are attractive to them. When they have gone on humming the air for weeks and weeks they will gradually put in the sounds, and so we begin with articulation. "Ba! Ba! Black sheep," for instance. Such simple rhymes as those are very useful for teaching children to speak.

19,355. In your report for 1886 you have a table of school attainments of patients, and another table of industrial occupations of patients. Have you later tables showing similar results?—This is the latest report, 1887 (*handing it in*).

19,356. I see that 203 could speak well in 1886, and in 1887, 197 could speak well. Does that vary very much?—These successive reports would not show the progress from year to year, because the improved children have been discharged in the meantime, and we have had fresh admissions of patients. Consequently, the reports merely give the actual state at the termination of the school year; they do not show the degree of improvement. But with regard to the matter of speech, I have made some calculation with regard to those who have been discharged at the end of seven years. Out of 100 who left at the end of seven years, instead of 36 speaking well, as I think was the case on admission, there were 50 who spoke well; 22 spoke fairly, instead of 23; 13 spoke indistinctly, instead of 15; and 15 only were unable to speak intelligibly, against 26 at the time of admission; that you would not get from these tables.

Dr. G. E. Shuttleworth.

8 Feb. 1888.

19,357. What per-centage of the imbecile are dumb on admission, and what per-centage remain dumb at the end of their training; that is to say, hopelessly dumb?—If I include under the term "dumb" all who cannot make articulate sounds, or only make a few articulate sounds, there are about 26 per cent. of those at the present time; as a general rule there are about 25 per cent. who are dumb in that sense of the term.

19,358. They are all dumb from imbecility, not from deafness?—A few from deafness; there are very few who are deaf also.

19,359. How do you treat them? Do you send them to the Deaf and Dumb Asylum?—No, the Deaf and Dumb Asylum will not have them, because they are also imbecile; that is a difficulty sometimes occurring, that the children who come to us have been in a deaf and dumb institution; they are undoubtedly deaf, but they are also imbecile, and, therefore, the deaf and dumb institution has discharged them, and there is no other place to send them to but to us. We do not admit them very freely, but when we do admit them we do the best we can with them.

19,360. Do you endeavour to teach them by the oral system?—Yes; our attempts at teaching them are not so good as they would be in a deaf and dumb institution; at the same time, owing to their mental incapacity, they would not be accepted as inmates of a deaf and dumb institution.

19,361. Have you any remarks to make with regard to the table of industrial occupations of patients, both for boys and girls?—With regard to industrial occupations, by looking at the tables you will find that about one-fourth of those who have been put to trades, that is to say, to handicrafts, shoemaking, and so on, do well; whereas, about half of those employed in out-door work do well, that is to say, out-door occupation is generally better suited to imbeciles than in-door handicraft occupation. Perhaps I may be allowed to say that that is borne out by what we find with regard to the nature of the occupations of the discharged patients, of which we get returns from time to time.

19,362. What do you think should be the limit of age for the education of imbeciles?—I think their education should be extended beyond the ordinary school age.

19,363. At what age would you begin to teach them?—Seven, I think.

19,364. And how many years would you keep them?—Ten years or more.

19,365. Would there be no difficulty in keeping the boys when they got beyond a certain age in an institution like yours, where necessarily you must have a great number of young boys?—I do not think there would be any difficulty in a well regulated institution at all.

19,366. By classifying them properly?—By classifying them properly, and properly supervising the classes. We have, of course, a number of girls of different ages in the institution, but happily, so far, we have found no practical inconvenience.

19,367. Do the females mix with the males from time to time?—Yes, at entertainments, dances and so on, in the hall. They do not play in the playgrounds together.

19,368. Do you think that entertainments such as dancing, and innocent recreations of that kind, in

Dr. G. E. Shuttleworth.

8 Feb. 1888.

which both the sexes take part, are useful as a means of educational training?—Yes.

19,369. Are your patients able to act at all?—Yes; we have frequent dramatic entertainments in which the children take minor parts; sometimes they take the principal characters. We had an entertainment called "Golden Hair, and the Three Bears" last winter. One of the boys, who was the young bear, did his part admirably; the two other bears, the father and mother bears, did not act any better than he did; he sang a song and went through his part remarkably well. Then sometimes, perhaps once or twice in the winter, a concert is got up by the patients themselves. One boy undertakes to get up a concert, and he gets his friends to put down their names for songs that they will sing, and they get up a little dramatic entertainment, and go through the whole thing without any assistance from the staff.

19,370. Such education as you give could only be given in an institution like yours; it could not be given in the ordinary elementary schools, even if there were a class for imbecile children in such schools?—No, to my mind the number of children called imbecile would be extremely small who would be benefited by classes at an ordinary school, because so much of the training depends on care out of school, and if they went to their own homes, where they would not have that care, I am afraid a good deal of the school education would be wasted.

19,371. Has your attention been drawn to the fact that in all our large towns there are a great number of children either weak-minded or bordering on the idiot class who are at school, which fact may perhaps account for a great number of the failures at school?—Undoubtedly. I have paid some attention to that matter. At a conference held at Manchester, where the subject of discussion was "Education under healthy conditions," that matter was gone into.

19,372. Did Dr. Warner speak on that subject?—No, Dr. Warner was not present. Dr. Ashby was there, but the conference was addressed by a great number of elementary teachers, who gave their own experience.

19,373. Has the fact that there are a number of weak-minded children, children of a class intermediate between the imbecile or idiot class and the sane, in the ordinary schools of the country, been brought to your attention personally by inquiries that you have made in Manchester or any of the large towns in Lancashire?—I have been informed that there are such cases, and I think auxiliary schools would be useful for such classes.

19,374. Have you visited any schools in Germany where they have such auxiliary schools or classes?—I have not visited those schools, but I have heard a good deal about them, and read a good deal about them. Dr. Hack Tuke has been to Germany, and he has given me information about them; he saw such an auxiliary school kept by Herr Kielhorn at Brunswick.

19,375. Is that a school for these feeble-minded children?—It is a school in connexion with the elementary school; children who are not capable of being promoted during two years, that is, moved up to a higher class for two years, are put into this auxiliary class or school. I advocated in Manchester that system of having a class or school for the children who were not equal to those of their own age in an ordinary elementary school: There are certain physical defects which disqualify children from attending ordinary schools, affections of the brain, and uncleanly habits, and debility of body. Those children, I think, would not make progress in those auxiliary classes.

19,376. Have you ever received any children that have been rejected by ordinary elementary schools?—Yes, we have. I believe we have had a good many who have been sent through the attendance officers.

19,377. Dr. Warner told us yesterday that these feeble-minded children can be recognised by certain outward and visible signs, which he thinks their teachers ought to know; does your experience lead you to coincide with the views of Dr. Warner upon that subject?—I think Dr. Warner has paid considerable attention to the matter of outward and visible signs indicating weakness of intellect.

19,378. Do you think that that would be a safe guide to go by in drafting children from one school to the other?—I do not think it would invariably. I think those signs would be only one indication amongst others that you ought to go by. I do not think anyone but a skilled and experienced observer would be able to make much of those signs.

19,379. You do not think you would like to give the power of selection by a knowledge of those signs to an ordinary teacher?—No. I do not wish to discredit Dr. Warner's observations in any way; they are very accurate, no doubt, but it would require, I think, a skilled observer to come to a proper conclusion with regard to those signs.

19,380. We have not anything to do with ineducable idiots, but I suppose you must necessarily take into your institution a certain number who eventually turn out ineducable, but whom you take in in the hopes of reclaiming them?—About 15 per cent. of those received into the institution.

19,381. Do you think that there should be all over England, in different centres, institutions where the imbeciles could be either taught or attempted to be taught, as they are at Darenth, supported by public aid?—Yes, that is my view. I will not say all of them supported by public aid; of course there is a class above the pauper class, but those for the pauper class should be supported by public aid.

19,382. There would still be room for institutions like yours at Lancaster for paying cases?—Yes, we think so in the north of England, for cases above the pauper class.

19,383. In addition to your institution, you think there is a necessity for another institution, say for the north of England, or for certain centres?—Yes.

19,384. You have had personal experience of institutions in other countries for the education of the idiot and imbecile classes?—I visited the institutions in America in 1876, but I have kept up my knowledge of what is going on in those institutions since.

19,385. Are those institutions carried on upon the same lines as your institution at Lancaster?—Very much, except that 11 out of the 14 are State institutions; they are supported by a grant by the State Legislature as part and parcel of the educational system of the State.

19,386. Of course free education is given to idiots as it is to anyone else?—It is in most of the States.

19,387. Are the results at all comparable with those that you have at Lancaster as far as your information goes?—They vary in different institutions; but in the best institutions they tally very much, I think, with those which have been mentioned to-day. When I visited those institutions 10 years ago, I noticed that the selection of pupils was made with greater care than is the case with our imbeciles; being State institutions, I suppose the superintendents had more power in selecting those that were considered educable than is the case with institutions supported by charitable contributions, where very often subscribers wish to get in a case deserving of sympathy. In fact I was jocosely told before I went to America that I should find the American imbecile about equal to an ordinary British school boy; but it was hardly so. At the same time I am bound to say that the educational processes I saw in progress in America were of very good character indeed; they seem to spare no expense in providing apparatus of suitable character, and also in having a large staff of teachers, a larger staff of teachers than we have in England, for the purpose of teaching small groups of children and individualising the instruction as much as possible.

19,388. Do you think it would be possible or desirable to divide the idiot and imbecile class of educable age into two classes and place them in separate institutions, that is to say, that those cases which appeared to be hopeless should be kept under surveillance more or less all their lives in one institution, and that those who were capable of education should be kept for a certain time in another institution till they were turned out?—I should think it quite possible; but that is a matter which my colleague, Mr. Diggens, will give information on better than I can.

Dr. G. E. Shuttleworth.

8 Feb. 1888.

19,389. Have you visited any institutions in Germany?—I have not personally visited any institutions in Germany.

19,390. You attach considerable importance to drill and gymnastic exercises?—Yes, I consider them a very essential preliminary to the training of the mind of the imbecile class. We have first to fix their attention and pave the way for their reception of any sort of instruction, and drill perhaps does that better than anything; it is an interesting occupation and it promotes physical development.

19,391. What is the longest time you have kept any case as yet?—We have a few cases which have been with us since the institution opened.

19,392. Do you intend to use the institution as a home for imbeciles?—That is a matter of arrangement and policy as the place is filled up, but hitherto as there has been no pressure for room (the funds have not allowed till lately of the place being thoroughly filled) we have not turned any out whose friends would pay for them. The elected cases have been discharged as a rule at the end of seven years. Sometimes the committee have increased the term to eight and even nine years when progress has been evident at the end of the seven years and there was a probability of its being continuous by extending the period. That the committee have done in many instances, and if a boy is learning a trade for instance at the time his election period has expired the committee often give him an extra year or two years; and a few patients have been retained for their services.

19,393. (*Sir Tindal Robertson.*) With reference to these auxiliary classes that you have mentioned, you do not suggest that imbeciles should be placed in them; they would simply be for those children who were very depressed in body and mind, and therefore not able to keep up with the other children?—These classes might take in a few doubtful cases, the cases with regard to which it is not easy to make up one's mind whether they are actually imbeciles or only backward children.

19,394. You have got information about a good many of your cases after they have left the institution?—Yes.

19,395. You have been asked with regard to their relapsing at a certain age; as a matter of observation do you think that when they have left you and when they get away from the surveillance of an institution like yours, they advance or remain stationary or retrograde in their general condition, their habits, and so on?—Much depends on their surroundings. If they have judicious parents and kindly guidance they continue to improve. Many of those who have left us are going on very steadily; they come to see me year by year, and I notice an improvement. On the other hand, if, as in a great many cases, unfortunately the parents themselves are ill-conditioned, weak-minded people, there is the fear of the children being dragged down by their surroundings, and losing a good deal of the benefit of the training they have received with us. I have known instances of that kind.

19,396. With regard to the question of heredity, you gave the per-centage of cases where the parents were intemperate; did you get any information to guide you in working out the problem whether the child's imbecility in most of these cases might be attributed to chronic intemperance in the parents, or to intemperance at the time of conception?—No; that is a problem that I have not worked out. Of course one cannot easily get reliable information on such a matter.

19,397. Have you noticed that the sense of hearing is particularly affected in imbeciles?—We have not more than four or five who are quite devoid of hearing out of the present number.

19,398. What per-centage have you of cases where their senses are deficient or absent?—The touch is on many cases very deficient; I am not aware that it is altogether absent.

19,399. As a matter of fact, I suppose the hearing is the special sense which is generally most affected in the case of imbeciles?—Sometimes the sight is also affected; that is the case very often in scrofulous cases. We have a large number of scrofulous cases amongst our imbeciles, or there has been some other disease which has destroyed the sight.

19,400. With regard to the question of compulsory education for imbeciles, you are of opinion that education should, if possible, be compulsory for that class?—If it is compulsory for other classes it should be for that class.

19,401. In that case would you see any advantage at all in giving such education in places outside institutions, or would you confine it entirely to institutions?—I do not think that the education of imbeciles out of an institution would be efficient; and, therefore, if a child were a downright imbecile I should make it compulsory to send him to an institution.

19,402. Have you formed any opinion as to what is the best thing to do with those confirmed imbeciles with whom nothing could be done in after life, who are at present turned out or would be turned out of your institution if you wanted the room?—To meet their case I think custodial asylums should be established and maintained either by the poor law or by charitable assistance, but the secretary will be able to say more upon that subject than I can.

19,403. (*Mr. Johnson.*) I see that in your report you say that there is an increasing proportion of epileptic patients; can you say upon what that depends?—It depends a good deal upon the fact of our being a charitable institution. Epileptic imbeciles command a large amount of sympathy, and great pressure is put upon the committee to break through the rule of excluding epileptics, and consequently a certain number of epileptics are admitted year by year. That is not the only cause. Epilepsy is very commonly associated with idiotcy, and in some cases patients are admitted into the institution who are not epileptic at the time of admission, or perhaps for a year or two before admission, but become epileptic after admission. I do not think it is the result of the education.

19,404. Epilepsy is not on the increase, you think?—I am not aware that it is.

19,405. Only you get a larger amount of epileptic cases brought into your institution?—Yes, that is because the committee have allowed them to come in to a certain extent; 25 per cent. of all imbeciles are more or less epileptic.

19,406. I understood you to say that you thought that the girls were not so intelligent as the boys?—Yes, I think the girls that we get are as a rule not capable of doing so much in school as the boys.

19,407. To what do you attribute hat?—Chiefly to the fact that the better class of girls are kept at home by their friends to a greater extent than the corresponding class of boys. Of course that is the reason of their slight scholastic inferiority, but with regard to the number, the number of girls in institutions is only half that of boys. That is the case throughout this country, and in the United States and other countries there seem to be fewer imbecile girls born than imbecile boys.

14,408. You have read Dr. Warner's book?—I cannot say that I have read it. I have conversed with Dr. Warner upon the subject. He stayed with me and he saw our patients.

19,409. He stated that in his opinion about 5 per cent. of the cases in the ordinary schools in London were weak-minded cases; supposing those children were selected out of the schools, and put in what you call an auxiliary school or class, in whose hands do you think such a selection of cases should be placed? I think it ought to be in those of some skilled medical adviser.

Dr. G. E. Shuttleworth.

8 Feb. 1888.

19,410. You do not think that a schoolmaster, however well instructed, would be able to select the cases which he thought ought to be put in a separate class or school?—I do not think he should be allowed to make such a selection without consulting with a skilled medical adviser; the skilled medical adviser must be guided very much by the schoolmaster, but the two should act together.

19,411. You think that it would be a desirable thing that there should be some medical inspector who should be appointed to inspect schools?—That is my own view.

19,412. Have you had any experience of ordinary schools?—Only a casual experience. I have taken care to go and see the ordinary schools in this country and in America, but I have had no practical experience of them beyond that.

19,413. Do you find that the sight is very materially affected in many of your imbeciles?—Yes. In a large number there are defects of vision more or less; there are a great number of cases of peculiar short sightedness, and a great number of cases of opacity. The sense of sight is defective, I think, in a large number; in some cases from want of brain power or deficient development of the optic nerve.

19,414. What should you say was the most frequent cause of idiotcy?—The most frequent cause of idiotcy is, no doubt, ill-assorted marriages; marriages of persons of the same morbid tendencies. A tendency to consumption furnishes the largest number of cases according to our statistics.

19,415. Do you find that many of your cases are the children of epileptic parents?—A certain number; but the per-centage of cases where idiotcy or imbecility has been found to be due to epilepsy in the parents is not nearly so large as the per-centage of cases where it has been found to be due to the marriage of consumptive or scrofulous subjects; 24 per cent of our children have a decided family history of phthisis; other observers have made the per-centage much larger than that.

19,416. Has any large per-centage of cases been traced to syphilitic taint?—A very small per-centage. That is a matter difficult to ascertain. There are not many imbeciles who have outward signs of hereditary syphilis; under 1 per cent., I believe, but altogether there is a suspicion of hereditary taint of syphilis in 15 cases out of the 1,000 of which I know the history, that is not more than 1·5 per cent.

19,417. Do you find any peculiar form of idiotcy or imbecility developed from that source?—Yes; my experience has been that it does not develop itself fully till the second dentition, and then there is a break down. The child is more or less intelligent, and is able to attain a certain amount of instruction in ordinary schools up to the age of 8 or 10; and then, at the period of the second dentition there is a gradual mental break down, and they become very hopeless cases. The commonest assigned cause is that of convulsions during teething; but to my mind, after all, that is only the proximate and not the ultimate cause in such cases; convulsions are said to account for as many as 33 per cent. of all our cases.

19,418. Did I rightly understand you to say that you did not think there was at present a sufficient demand for an institution for the training of masters for such institutions as yours?—I think at present there is not a sufficient demand for such an institution. Supposing the result of the report of this Commission should be to bring about any national system for the education of imbeciles it would be highly desirable to have properly trained teachers.

19,419. (*Rev. Mr. Sleight.*) You have mentioned one or two causes of imbecility; do you think illegitimacy is a cause?—Sir Arthur Mitchell has made out that it is a considerable cause in Scotland, where illegitimacy is rather common I believe, but our statistics do not show more than 2 per cent. of such cases as far as we know.

19,420. Have you any suggestion to make with regard to what should be done with the idiots discharged from asylums as incurable?—I think those cases require provision for life in some form; that is to say a simple custodial institution is required for them. I do not think that in this country they could be boarded out very well. In Scotland they board out a number of these children, but such an arrangement requires an immense amount of supervision to prevent abuse; people will take the money, but they will not always do the duty they owe to the children.

19,421. In your opinion are there many imbeciles in workhouses and lunatic asylums that ought not to be there?—A considerable number no doubt; I am unable to say how many. I have seen myself in some of the large unions in South Lancashire a number of imbeciles who are not trained in any way. They sit all in a row in the imbecile ward and do nothing, and it is highly desirable that they should be under some sort of training.

19,422. Can you tell us how many out of the 1,151 cases that you have received into your institution were deaf and dumb?—I cannot give you the number out of the 1,150. Out of the present number that we have, which is nearly 550, those who are more or less deaf and dumb are not more than 20; of course there are a great many who cannot speak. That does not arise from their being deaf, but from want of power of using the organs of speech, in the same way as many of them are not able to use their hands to any purpose; they require to be taught how to use their tongue and vocal organs. We have very few indeed who are absolutely deaf and dumb.

19,423. Have no deaf mutes passed through your institution who, you think, might have been sent to ordinary deaf and dumb asylums?—I think not one. We have cases which have improved very much; there are four that I have in my mind who have improved by oral teaching, such as we have been able to give them, and it has occurred to me whether it would not be desirable that they should finish their education at a deaf and dumb institution, but they have not altogether lost the imbecility which they had when they came to us, at present.

19,424. They have never so far recovered as to be fit to be sent on to a deaf and dumb school?—We have not sent them on to a deaf and dumb school; we have not considered it desirable, balancing one thing against another.

19,425. If classes for weak-minded children were established in connexion with elementary schools, do you think any children that you receive at your institution would be fit objects for such classes?—There would be very few indeed.

19,426. Are children slightly weak minded, in your opinion, better educated in an institution or in a school with other children?—I do not think that success is gained by educating these slightly weak-minded children with ordinary children, because the ordinary children leave them so far behind; they require to be with those of their own class; the slightly weak-minded children should have some healthy competition with those who are more or less on their own level. There are cases in which it is desirable, no doubt, to try the ordinary teaching for some time before sending them to an institution; if the ordinary methods do not succeed, then they should be sent to an institution.

19,427. Would you expect more favourable results if you received children at an earlier age than you do?—I think not, because the care of a mother over an idiot child, if the mother is at all a sensible woman and if she has time to devote to the child, is invaluable at an early age. I do not think that before the age of seven school education would be of much value.

19,428. Do you think that parents might assist in the work of education by beginning to train their children at home at an earlier age?—Undoubtedly, if they are informed of the method of doing it. I often have opportunities of advising mothers as to what they should do in the way of improving the habits of their children, assisting them to work, and helping them to speak, and in some instances that has been attended with a certain amount of success.

Dr. G. E Shuttleworth.

8 Feb. 1888.

19,429. (*Rev. Mr. Owen.*) Can you at all account for the fact that there are so many more males than females of the imbecile class?—I think the chief reason is that the difficulties of birth of a male child are considerably greater than in the case of a female child; the head is larger, and it is more liable to injury during birth. One of the commonest causes of idiotcy dating from birth is congestion of the brain. It is known pretty well that male children are more liable to damage at birth, and are also more liable to nervous disease in early infancy than female children.

19,430. Do you know what the proportions of male and female imbeciles were in the last census?—Looking at the Census Returns of 1881 for England and Wales there is no great disparity between the aggregate number of males and of females described as idiots and imbeciles; indeed the females are somewhat in the majority, viz, 16,612 as against 16,105 of the male sex. On analysis of the figures it will be found, however, that the excess in the number of females exists only in the groups of ages above 25 (*i.e.*, from 25 to 65 and upwards), and it seems probable that at these ages many demented persons and others not congenitally imbecile have been included in the returns. Under 20 years of age 5,351 male and 3,882 female idiots and imbeciles were scheduled for the whole of England and Wales, of whom 1,457 males and 1,078 females were resident in the seven northern counties.

19,431. Do any of your teachers understand the finger and sign language?—Our schoolmaster understands it; he was originally at the Doncaster Institution.

19,432. Does he use that mode of communicating with deaf and dumb inmates of your institution?—We prefer the oral system, but a few have been taught the sign system.

19,433. Some of them exchange ideas by that system?—Yes.

19,434. (*Mr. Van Oven.*) You say that six of those who have left your institution could earn wages, but are not in situations; have you taken any steps with a view of getting employment for such persons after leaving the asylum?—We have appealed to the local committees in various parts of the county to help in that matter, but we have not been able to effect very much.

19,435. You do not think you could do any more in that direction?—The only way in which employment could be found for such persons would be by the kind assistance of persons in the localities where they reside. Of course there might be an organisation for the purpose.

19,436. You say that a certain number of those who have left your institution are sent to lunatic asylums. I suppose they are employed in the lunatic asylums, and are as well off there as they would be in an imbecile asylum?—I do not think they are, because they are associated to a certain extent with people of a different class; I mean lunatics, violent lunatics sometimes. They are very imitative, and they are very apt to pick up the ways of insane people.

19,437. Then as regards teachers, I understand that you take teachers from the elementary schools. After a teacher had been three or four years in an elementary school, do not you think you could give him the special training requisite for the teaching of imbeciles and give him a certificate showing that he had gone through that training?—That could be done, certainly.

19,438. A teacher so trained by you would be well adapted to teach a class of children bordering upon idiotcy or imbecility that might be selected from an elementary school?—Yes, I think the training which such a teacher would get in an imbecile institution would be a great help.

19,439. If it was decided that there should be a special class in public elementary schools for weak-minded children, you think that the teacher of such a class ought to have received a special training in some idiot or imbecile asylum?—Yes, I do.

19,440. With regard to inspection and grants from the Government, I suppose your idea would be that what the inspector would look to would be the general improvement of the inmates of the institution from year to year?—Yes.

19,441. But there could not by any possibility be any fixed code?—No.

19,442. What the inspector would rely on, would be his general recollection of what such and such a one did from one year to another?—Yes, and he might have figures laid before him to show that a certain improvement had taken place in a certain per-centage of cases which he could verify.

19,443. It would be advisable that the same inspector should inspect the same institution from year to year?—Yes.

19,444. As regards the deaf mutes, do I rightly understand that you prefer that they should be taught orally to being taught by the finger alphabet?—I have no great experience of the matter, but so far as our own children are concerned, I think it is desirable that they should be taught orally.

19,445. Do you not think it would be desirable that some one of your staff should be sent to an oral school for a year or so, to receive a certain amount of training in the oral system?—I think it would be a great advantage.

19,446. (*Mr. Arrol.*) With regard to the elected children, you say that they only remain seven years at your institution, unless there are some special reasons why they should remain longer in the institution. Have the committee power to retain them longer, if they please?—The committee have the power of retaining them longer if they think proper, but they do not in practice like to do so to any large extent, because it might be said that it interfered with the subscribers' rights of election.

19,447. If a child were admitted at the age of five, would it return to its home at the age of 12?—You are putting an extreme case. Our rule is that children must be six when they are admitted, but it would be very undesirable to send a child home at the age of 13, and our rule being that the general duration of the training should be seven years, in my opinion it is very desirable that the education should begin at a later age than six: ten years is a better age than six or seven, because by the end of the election period the boy or girl will have almost grown up. I would say that I do not think that the limit of seven years for the training is a desirable one. That is a matter of finance, but in any general system the educational period, which includes industrial training, should be extended beyond that; it should extend to the age of 21, I think, imbeciles being of slow physical as well as mental development.

19,448. 424 have been discharged from the institution since its establishment. Do I rightly understand that a considerable number of the 424 remained in the institution more than seven years?—Yes.

19,449. Would they be discharged on reaching a certain standard, or on account of arriving at a certain age?—Sometimes owing to the wish of friends to take them home, sometimes because their friends have been unable to pay; that is a very common cause for those outside the elected list being taken home. If the committee find that the friends cannot pay for the child it has to go home. Then in a certain number of cases they have become more insane than imbecile, or they may develop epilepsy, and on that ground they would be discharged.

19,450. Of the 424 that you discharged you mentioned that a certain number had had to go to workhouses or lunatic asylums; would not it be better if those children could be boarded out in country districts in private houses or farms?—That is a matter that depends on the degree of supervision which can be exercised to prevent abuse. In Scotland they

Dr. G. E. Shuttleworth.

8 Feb. 1888.

appoint assistant commissioners, who go every few months to see how those cases are treated.

19,451. Do not you think that system might be more generally adopted in England?—It might do in some parts of England. I do not think it would do in the manufacturing parts of England; in those parts of England there are very few families where you could find proper homes for imbecile children.

19,452. Under the present circumstances you think it best for children to be admitted into a workhouse or into an asylum?—It is the best thing that can be done in the absence of any special institution. No doubt it would be better if a custodial place were provided where they might be kept under proper supervision.

The witness withdrew.

Mr. JAMES DIGGENS examined.

Mr. J. Diggens.

19,453. (*Chairman.*) You are the General Secretary of the Royal Albert Asylum?—Yes.

19,454. Since the visit of the Royal Commission to the asylum there have been considerable additions to the building, have there not?—There has not been any very considerable addition with the exception of the recreation hall, which is now being built, but which is not yet completed.

19,455. That is an important addition, is it not?—We hope it will be, and we are expecting that it may be opened this spring. The cost will be between 5,000*l.* and 6,000*l.*, of which above three-fourths have been already subscribed.

19,456. Can you speak generally as to the census of idiots?—It is very difficult to get any accurate statistics of idiots and imbeciles, and this the Census Commissioners themselves have very greatly deplored. We had some inquiry made in the year 1871 in the neighbourhood of Lancaster by the clerk to the union, who superintended the enumeration there; he was a member of our central committee, and being much interested in the asylum he gave special instructions to the enumerators. On going over their papers at the close of the enumeration he found that at least 25 per cent. of the cases in the neighbourhood of which he knew personally had not been put down at all; and he was a man very likely to know, having an intimate and thorough acquaintance with the Lancaster district and being highly esteemed there. He was, moreover, a great authority in poor-law matters, and was very frequently referred to by the President and by other officials of the Poor-law Board. The Census Commissioners state that having grave doubts with regard to the accuracy of the returns made to them at the last census, they inquired at one large institution (I presume it would be Earlswood, it was not at ours) as to the number of idiots and imbeciles admitted into that institution in the year of the census; and they found that not one-half of the patients admitted into that institution had been enumerated. The Census Commissioners take it that between the ages of 15 and 20 there is less probability of concealment than in the earlier ages, and I think that is very likely to be true, because, with regard to children under five years of age, it is not at all likely that parents would confess that their children were imbecile, and they are always consoled by the medical man with the idea that when the child gets a little older it may be found to be all right, and that any convulsions from which it suffers will probably cease; and so they cling to the hope that beyond the age of five the child may not be imbecile. And between the ages of 5 and 15 I think that the parents will not readily admit that their children are even weak minded. We have the utmost difficulty in convincing them on their application for the admission of their children into our institution, that they are not very superior to other children. The parents will insist in going round the institution that they see no children in it so good as theirs, though very often we find that their child is very much worse than even our secondary cases. So that I think it is very difficult indeed to get any accurate estimate of the numbers, but I will give the census numbers. In 1881 they are given as 32,717. Of these 9,233 were under 20 years of age, and the Commissioners just double that number to get an approximate estimate; they give 18,456, or only 10 less than the duplication. In the case of those of 20 years of age or upwards the census return gives 23,484, and the Commissioners give 23,484, the same number. I take it that the actual census will give the per-centage of persons under 20 years of age as about 28 per cent. of the whole number, and the Commissioners' estimate is 44 per cent. of the whole number of idiots and imbeciles. I think that if we attach any importance to the Census Commissioners' Report we are almost bound to take their larger number. They have made a fairly accurate estimate; we are not, as a public institution, in a position to do so. The special committee of the Charity Organisation Society did so, but I have reason to suppose that in taking 25 per cent. more than the census they simply followed the experience of the gentleman to whom I have already referred, the clerk to the Lancaster union, possibly, confirmed by the experience of the gentlemen who formed the committee.

19,457. Has the special committee of the Charity Organisation Society gone into this question at all?—They have.

19,458. What is the result?—The committee was held in the year 1876 and the year 1877, previous to the last census, but calculating on that basis the total number would be 35,756. They reckoned it in this way: they took 20 per cent. more for cases under 20 years of age, and 5 per cent. above 20 years of age to make up the 25 per cent. altogether. But I think Dr. Shuttleworth, who with myself has been connected with the institution from the beginning, will bear me out in saying that it is very difficult to ascertain what the number is, or to get the parents to admit that their children are really idiots or imbeciles.

19,459. Has the Idiots Act of 1886 had any effect in facilitating the sending of children to your institution?—I think it has had a very beneficial effect. The parents strongly object, especially those who have feeble-minded children, to have their children stigmatised as idiots.

19,460. But they had previously, had they not, to have a certificate signed under the Lunacy Act?—Certificates had to be signed under the Lunacy Acts. There were two medical certificates required and a statement from the parent, and that statement was a very absurd one; it inquired the date of the last attack and whether the patient was dangerous, and whether he was suicidal, and that rather shocked the parents when they wanted to make application for the admission of their children. The effect of the Idiots Act has been to facilitate the admission of children into our institution, and especially the admission of the higher grade of imbeciles, those whose friends would strongly oppose the idea of their being deemed to be idiots or lunatics. We have had parents of that class come to the institution formerly and feel, after an inspection of the institution, that they would like to send their children there, but when the forms of admission have been presented to them they have declined.

19,461. Do you know the number of pauper idiots and imbeciles in England?—They are estimated to be two-thirds of the entire number, but that estimate is chiefly based upon the proportion of pauper lunatics, of whom the Commissioners in Lunacy have knowledge, as compared with the total number of lunatics ascertained by the census authorities.

19,462. Do you believe that there are still a great number of idiots and imbeciles who are not sent to any special asylum or institution, and who ought to be so sent?—I believe there is a very large number. In the first place I do not think that these voluntary institutions are sufficiently known to the poorer classes. In the second place the parents, especially mothers have a strong reluctance to part with those children. I have often had cases, more especially in the more remote parts of our district, Cumberland or Westmoreland, where subscribers could not induce parents to send their children away from home, and in some cases they have actually lost their chance of being admitted into the institution at all through the delay arising from this reluctance.

19,463. How are the idiots admitted into your asylum?—We have a large number of cases, as you know, who are admitted by election.

19,464. Are they a little above the pauper class, or are their parents such that they would require some assistance from the State, but do not now receive any assistance?—Yes. I thought I might perhaps in the first instance give you the numbers of the various classes. We have 321 elected cases, and 197 reduced payment cases, contributing from 20 guineas to 50 guineas a year. Our ordinary reduced rate is 25 guineas a year, but very often we find that people, perhaps in a lower grade of society, are not able to pay the 50 or 60 guineas; and the committee will adapt the charge to the special circumstances of the case. We have only 26 full payment cases, making payments of 50 guineas and upwards. We have four life interest cases, and four presentation cases; that is to say where subscribers contribute 500 guineas they have the privilege of placing a child in the institution for seven years. The life interest cases are such as these: where the parents find that their child is likely to be an imbecile all the days of its life, and that there is a possibility of its being left to the care of strangers, they prefer to make an arrangement with the institution to retain the child for its life. Of course if the child were cured, the Lunacy Commissioners would discharge the case from the care of the committee, and if not cured the parents would consider themselves fortunate in having the child protected and cared for during the rest of its life.

19,465. (*Mr. Johnson.*) Is that a fixed charge?—It is not a fixed charge altogether, but we have one general charge for persons in very moderate circumstances. For instance, we have a boy, the son of a clergyman, and we make a charge of 500*l.*, or 500 guineas; but we have had cases which have paid 1,500 guineas.

19,466. (*Chairman.*) I wanted rather to get complete information with regard to the pauper class, or those immediately above the pauper class, who might fairly be expected to receive some assistance from the State, as they do in the case of those who send their children to the ordinary elementary schools; can you give the number of those?—We have 112 pauper patients in the institution, who are sent to us by the guardians of the poor, and the payments vary from 26*l.* a year to 35*l.* a year.

19,467. Are those payments made by the guardians?—They are.

19,468. Are they partially made by the guardians, or partially by the parents?—That I will come to directly. The charge is regulated pretty much by what the charge of the county lunatic asylum is to which the lunatics from their union would be sent, plus three guineas a year for clothing. That is roughly how we regulate it. But when the cases are admitted the guardians have to sign an agreement.

19,469. Is that an agreement for the whole term of seven years?—They are at liberty to remove the children whenever they please; there is no definite period fixed. They get 4*s.* a week from the Government, but we know nothing of that practically, because we receive our payments from the guardians; but I understand that the process is to apply to the Local Government Board for the grant, and the Local Government Board applies to the Treasury, and gets 4*s.* for every pauper idiot or imbecile that may be sent to our institution, and that is because the idiot or imbecile is considered still to be a lunatic in the eye of the law.

Mr. J. Diggens.

8 Feb. 1888.

19,470. He gets his grant from the State as a lunatic, and not as one capable of improvement?—No, not at all; it has nothing to do with it. If they send a pauper lunatic to any asylum they can have the grant of 4*s.* a week.

19,471. And they get the same in your institution as they would get in a lunatic asylum?—Yes, and by a prior arrangement to that, I think in the year 1868, boards of guardians were empowered, with the consent of the Local Government Board, to send idiots to idiot asylums, and pay the cost of maintenance, whatever it might be.

19,472. But at that time there were no asylums for paupers, were there?—No, there were none for paupers. They would be sent then to voluntary institutions.

19,473. At present, I believe, there is only one such institution supported by the State, and that is the institution at Darenth, under the Metropolitan Asylums Board?—That is the only one under the Metropolitan Poor Act, 1867.

19,474. Have you read the recommendations of the special committee of the Charity Organisation Society?—Yes.

19,475. Would you state what they are and how far you agree with them?—They recommend the establishment of schools for 500 imbeciles, and of asylums for adults.

19,476. In every county or in various centres?—In every large centre. Of course, in the larger counties it may be done; it could be done in Lancashire or Yorkshire, but there might have to be a combination in the case of the smaller counties. But with regard to the admission of paupers, I might say that they are received at the Western Counties Asylum at Starcross. In fact, they have no elected patients there now.

19,477. But they do not get any contribution beyond that 4*s.*?—They do not get any contribution beyond the 4*s.*

19,478. (*Sir Tindal Robertson.*) Where do they get the balance from?—From subscriptions; but it was started in the first instance more as a voluntary institution and for the election of patients.

19,479. (*Mr. Van Oven.*) Are any of the Starcross patients paid for by the Government?—They have the 5*s.* if they belong to the western counties, and this 4*s.* grant, making 9*s.*; and if they do not belong to the western counties, they get 8*s.*, and the 4*s.*, making 12*s.*; but they have no elected patients, as it was originally intended that they should have. Of course, they have subscriptions.

19,480. (*Mr. Johnson.*) The 8*s.* depends upon the geographical position of the union, does it not?—The payment depends upon whether the union is or is not in the counties associated for the asylum, those counties being, I think, Cornwall, Dorset, Devonshire, and Somersetshire. If the patients come from outside those counties, they have to pay 8*s.*

19,481. Is the 8*s.* a fixed sum?—The 8*s.* seems to be a fixed sum.

19,482. (*Mr. Van Oven.*) If I remember rightly it was 9*s.* inside the district and 12*s.* outside?—It was. That is the statement which I received this week from the secretary.

19,483. That is 5*s.* and 4*s.* in the one case, and 8*s.* and 4*s.* in the other?—Yes.

19,484. (*Chairman.*) What number of cases are cases which are just outside the pauper class, but in which the parents are poor?—I can give you exact figures with regard to that. I have taken them out from the date of the commencement of our institution in 1870 up to now. We have admitted 934 election cases in the 17 years, and of that number I have the occupations of the parents. No less than exactly one half, 467, belong to the artisan and labouring classes.

19,485. And therefore if the children had been sent to the elementary schools, they would have had a pro-

Mr. J. Diggens.

8 Feb. 1888.

portionate part of their education paid for by the State?—Yes, undoubtedly. My opinion is that for the elected cases there ought to be a grant made; and necessarily in the case of an institution that grant cannot be for education only, but must be for education and maintenance.

19,486–7. What is the actual cost to the asylum itself of each inmate?—It has been 11*s.* 7¼*d.* per week; that is our last return to the Lunacy Commissioners; and I understand from Dr. Beach that the cost of maintenance at the Darenth Asylum, where there are more patients than there are at ours (632, I believe), is 10*s.* 6*d.* per week. Then you have to bear in mind, in order to form a just estimate, that our institution is largely supported by voluntary contributions, and as your Lordship knows we have a very extensive and varied organisation, and there is a good deal of printing and advertising and so on. I have included all those expenses, and they come to 11¼*d.*, which would have to be taken off the 11*s.* 7¼*d.*

19,488. (*Mr. Van Oven.*) That makes it 10*s.* 8*d.* as against 10*s.* 6*d.*?—Yes, that includes all but building and furnishing sundries.

19,489. (*Chairman.*) The capital sum which has been spent upon building is very considerable, is it not?—Yes; but continuing my explanation of the cost of maintenance, if you refer to page 24 of the annual report, in which we have to give every penny which we receive and expend, you will find the charge there; and the little discrepancy that arises between what I have just stated and the Commissioners' report is owing to this: that our annual report is for the year ending the 30th of June, whereas the Commissioners' report always goes to the 31st of December; so that there will always be a little difference, but it is very trifling. I give in this annual report 11*s.* 6¼*d.*, and in the Commissioners' report for the year ending December 31st, 1886, it would be 11*s.* 7¼*d.*

19,490. You say in the report that the average cost of maintenance is 12*s.* 5¾*d.*?—Yes, that includes building and furnishing items, which amount to 1,368*l.* for the year.

19,491. But that ought to be taken in because that is in addition to the capital expenditure?—Yes, that is so.

19,492. (*Mr. Johnson.*) The report goes on to say that, deducting those items, the weekly cost per head has been 11*s.* 6¼*d.*?—Yes, we deduct those items because the Commissioners require it in the annual return; and there would be no means of comparing our institution with others unless we did so. At Darenth they have no official expenses like ours.

19,493. Does this include the expense of the staff?—It includes staff, clothing, maintenance, and everything. At Darenth they are not likely to include any charge for building or furnishing items.

19,494. (*Chairman.*) What has been spent altogether in building and furnishing in the case of the Royal Albert Institution?—In building and fittings some 74,000*l.* for 600 inmates; and the Darenth Institution cost 75,000*l.* for 500 inmates. That is the estimate of the committee.

19,495. (*Mr. Johnson.*) And you got that large sum entirely by subscriptions?—Entirely by subscriptions.

19,496. (*Mr. Van Oven.*) That includes the land, I suppose?—It does not; it simply includes the cost of the building.

19,497. The land, again, is an additional cost?—It is.

19,498. (*Mr. Johnson.*) The land is your own, is it not?—The land is our own. We have 105 acres of freehold land.

19,499. What did that cost?—The first portion of it cost about 150*l.* an acre; and for the other portion, which belongs to the Sustentation Fund, we had to pay 200*l.* an acre. It is within one mile of the town of Lancaster, and very eligible for building sites.

19,500. (*Mr. Van Oven.*) What do you reckon that the building and the land cost?—Nearly 104,000*l.* The land for which we paid 150*l.* an acre, cost 11,238*l.* 17*s.* 2*d.*; the land for which we paid 200*l.* an acre is not included in this amount, but it cost 5,966*l.* 11*s.* The asylum buildings (including farm buildings, lodges, workshops, laundry, boiler house, boilers, heating apparatus, boundary walls, gas and water mains, drains, &c.) cost 78,493*l.* 5*s.* 11*d.*, but we spent 4,000*l.* of that upon the original farm buildings. The cost of furnishing was 8,238*l.* 2*s.* 7*d.*

19,501. (*Chairman.*) But the farm building is a necessary part of the equipment for industrial training?—Certainly, but that was not included in the Darenth 75,000*l.* They have never published any statement, and I am merely going by the estimate; and I venture to say that the architect would be sure to exceed the estimate. It is very difficult to get any information from Darenth with regard to the cost; I could not have got it except by knowing Dr. Beach.

19,502. (*Mr. Johnson.*) Would not the Local Government Board give it to you?—No. I searched their annual report for it, but they do not give it. I might mention that our building was erected at a cost of just under 5*d.* per cubic foot.

19,503. (*Chairman.*) From your knowledge of the working of your institution, do you think that it meets a great public want in providing for the education, not only of the pauper idiot class, but of the idiot children of the artisan class, the class immediately above the pauper class?—I think it is as necessary for the artisan class as for the other, because I have met with many instances where poor parents would rather have starved than have gone to the poor-law guardians for relief, even though they had an imbecile child. I have in my own mind now a most distressing case of a poor widow in Manchester who wished to get her child into the Royal Albert Asylum; and this is confirmed by a gentleman who knew the history of the case. She was kept at home entirely by this imbecile child; she could not go out and leave him locked up in the house, and she could not pay anybody to take care of him, and she had to remain at home where she could only earn 2*s.* or 3*s.* a week by plain sewing, that being her only means of living. She told me that if she could only have her child admitted into the Royal Albert Asylum she would be set free and able to get a decent and comfortable living for herself, and she would also be able to contribute towards the support of this child. Of course knowing in what distressed circumstances she was, I did not encourage her to contribute more than she could really spare; I told her that a shilling a week would be quite sufficient and she kept up the payment of a shilling a week and maintained herself. Many such cases have come under my observation, and I feel sure that it would be a great gain both to the parents and to the State if such cases were provided for.

19,504–5. Do you think that the Darenth Asylum has been a success, that is to say, that it has been a great boon to the inhabitants of the metropolitan district?—I think it has, and I can give you this from information which I have obtained from Dr. Beach during the last week, that many parents have now got to know of the existence of that place, and of the benefit that it confers, and are applying for the admission of their children to Darenth. Although they do not strictly belong to the pauper class, they actually become pauperised in order to get their children admitted into the Darenth Asylum, because of the great difficulty and delay, and expense of applying for their admission into the Earlswood Institution.

19,506. Do you think that the question of admission and payment should be removed from the guardians in any way and vested in an educational authority, or how would you avoid applying to the guardians?—I do not see why the parents of imbecile children should be pauperised.

19,507. Or even that they should appear pauperised by application to the guardians?—I do not think they would regard that as being of any importance at all if they were not really pauperised themselves. I suppose the parents of blind children can get relief without being pauperised, and why should not the parents of imbecile children?

Mr. J. Diggens.

8 Feb. 1888.

19,508. Then you think that the imbeciles should be included in the same category as the blind and the deaf and dumb?—Yes, I do, because they are all exceptional cases whose circumstances and training cannot be met under the ordinary Education Acts.

19,509. You think in fact that this system of a public asylum like the Darenth Asylum should be extended to the provinces?—I do. The Lunacy Acts provide for the erection, if necessary, of more than one pauper lunatic asylum in a county, and I think that in the case of large counties like Lancashire and Yorkshire some pressure ought to have been brought to bear upon the visiting justices to provide one of the asylums for pauper idiots and imbeciles.

19,510. They have the power at present?—They have, but they will not exercise it, and you cannot get it exercised by merely permissive legislation; it must be compulsory. If it could have been done anywhere it might have been done in Lancashire and Yorkshire, because a very large number of magistrates are much interested in our work, and a great many of them are connected with the central committee of the asylum.

19,511. Has it ever been urged upon the magistrates that that should be done in order to relieve your institution?—It has been repeatedly urged upon the magistrates individually; I do not say that it has been urged upon them as a body.

19,512. You think therefore that the education of the imbecile or idiot class should be compulsory?—Yes, I do.

19,513. Do you think that a capitation grant towards the cost of education and of maintenance in an institution like yours, or in these county institutions, if they should be formed, should be given by the State on inspection?—Yes, I think it should, but it ought to be regulated by the attendance, by the efficient management of the institution, and by its being properly equipped. It could not be regulated, I think, according to the results. I know a great deal about this idiot asylum work because I was associated with the very earliest efforts in 1853 and 1854, and I feel myself the impossibility of submitting an idiot or an imbecile to examination. You can only judge of the fairness of dealing on the part of the officers of the institution in not submitting work of their own as the result of the work of the children. It might be open to the inspector, if he had any doubts, to institute a little test examination.

19,514. So far as the voluntary system has gone in creating these asylums and institutions, it has in your opinion worked well, but they are not sufficiently extensive to cover the whole ground?—That is just my opinion; they do not cover the whole ground. I should like to explain that in connexion with our asylum the election system has not the disadvantages that it has in connexion with the London institutions.

19,515. Canvassing is forbidden, is it not?—Canvassing is forbidden, and there is no trafficking in votes, and no public polling day. The institution represents seven counties, and if a child belongs, say, to the county of Lancashire, it is only the Lancashire subscribers who can vote for that case, and not the Yorkshire subscribers or the others; so that it is limited to a very large extent. In addition to that there is a county committee in each county, and we have a system of perpetuating votes. A subscriber of 10 guineas during his lifetime has two votes, and at his death one of those votes is perpetuated in the county committee. The consequence is that when an election takes place this county committee meets, and it can bring to bear some 2,000 or 3,000 votes, and concentrate those 2,000 or 3,000 votes, and so regulate or modify the ordinary election system, and by that means get in very deserving cases who might not otherwise stand any chance of being admitted, because they had not any influential friends, and also support cases from remote districts, where the subscribers being few would have very little influence. Then there is another thing that I should like to mention in justification of our election system. I have always urged the county committees never to let a case apply for admission unsuccessfully, and I do not remember a single case where an applicant who has had his name on the list has ultimately failed. So that we safeguard the election system in every possible way, and I would almost rather that the children were elected by the subscribers with those safeguards than have them elected simply by a board of directors who might be open to private influence and pressure.

19,516. Have you received any children who have been trained in elementary schools, and have failed to be taught there?—There have been several such cases, and Dr. Shuttleworth was rather of opinion (and he can state his own impression now) that in some cases it was really over-pressure with the children. We have had a case lately from Garstang of a boy who had attended the ordinary school, but had lost the ability to learn, and having become comparatively imbecile, had to be admitted to our institution as an imbecile. He was a backward child, with deficient mental power, who could not stand the strain of an ordinary school, and there must be many of the same class amongst the poor.

19,517. (*To Dr. Shuttleworth.*) Can you confirm that case from a medical point of view?—The history given by his friends points to the conclusion which Mr. Diggens has stated. I cannot say that I have investigated the case on the spot; it is rather an *ex parte* statement. There are other cases of a similar character of children who have come to us from ordinary schools who certainly have not been able to keep pace with the ordinary curriculum, and in some cases seem to have been injured by attempts to keep up with the ordinary children.

19,518. I suppose their brains must be either defective or liable to weakness from over-pressure?—I think that in most cases there has been originally defective brain power, but that has not been taken account of by the school authorities.

19,519. (*Mr. Arroll.*) Has want of nourishment nothing to do with it?—Sometimes of course it has been suggested that it is due to defective nutrition, want of proper food, and so forth.

19,520. (*Chairman, to Mr. Diggens.*) Can you tell what the inspection of the Lunacy Commissioners consists in?—The Lunacy Commissioners are required both by the Idiots Act and the old lunacy law to visit such places as ours, which are registered hospitals, at least once a year. They give us no notice; they see every child in the institution; they make all sorts of inquiries with regard to the management; and they see various books. At our institution they generally spend the whole day; it takes them from 10 o'clock in the morning till 5 or 6 in the evening.

19,521. Does the inspection by the Lunacy Commissioners extend to the supervision of the education given?—Not at all. They hear what report the medical superintendent has to make; they ask questions, but it is not their business to supervise the education, and they are not required to do that.

19,522. Nor is it their business to see that the industrial training which is carried out there is of a satisfactory character?—They see the boys in the workshops and in the schools, and if they were of opinion that the training was not being satisfactorily carried out, I have no doubt that they would refer to it in their report. They require to see the children at their occupations. The Lunacy Commissioners have a sympathetic interest, I think, in the work.

19,523. But they make no official report as to the education?—They generally refer to the occupations.

19,524. What is your provision for the education of private patients; is there any special provision for giving them a better education than the rest?—That depends upon the amount charged.

19,525. But I suppose the education does not depend upon the amount that is paid? Does the education differ in any way in the case of the private-paying patients from that which is given to the ordinary guardians' cases?—Not for ordinary private-paying patients who all go to school according to their mental grades. The difference is mainly in the accommoda-

Mr. J. Diggens.

8 Feb. 1888.

tion. If they are high-class paying patients contributing, say, 200 guineas a year, they have a private sitting and bed room and a nurse or attendant.

19,526. Do you think that your asylum could be well filled by paying and middle-class patients quite independently of the poorer cases which might fairly be sent to a county asylum like the Darenth Asylum?—I think so. We have 197 reduced payment cases, independently of the paupers and the election cases. A large majority of the elected cases would still come to our institution. We have also private patients. The payments for patients at our institution form about one half of our whole income for maintenance account, because we require everybody to pay that can pay. In the case of election patients, if their friends are so destitute that they cannot contribute anything, we make no charge; but out of 321 elected patients, we have 155 who do contribute from two guineas to 15 guineas a year; and they take a pleasure in it, and I am sure it is a very good thing both for the parents and for the institution. I know that it is a good thing for the institution because we receive about 737*l.* a year from that source. That is a departure from our old system. At first we did not make any charge or invite them to contribute. It is worked with a good deal of discretion; for instance, if the father is unable to work, or if there is sickness in the family, we suspend the payment for a time.

19,527. I presume that if any public institutions were founded by counties or groups of counties, the capital sum required for the building of such institutions would be raised in the same way as the funds for the building of lunatic asylums are raised?—It is raised for the building of lunatic asylums from the Public Works Loan Commissioners.

19,528. That would only be a reasonable charge upon the county rate?—It is spread over 30 years; I suppose they would charge about 3½ or 3¾ per cent., repaying the principal and interest; but for the Darenth Asylums, under the Metropolitan Poor Act of 1867, the money must be repaid in 20 years, and probably that would be taken as a precedent for other idiot institutions.

19,529. Do you think that the counties which send patients to you are fairly represented so far as their population is concerned, or do Lancashire and Yorkshire have an undue share in the representation?—Their share is given in exact proportion to the amount of the contributions from the county.

19,530. It is no doubt strictly given in proportion to the contributions, but is it in proportion to the population, because, of course, the population of the county must govern the proportion of idiots in the county. Are there not in all probability many idiots in several of those counties who are not sent and who might be sent to such an institution as yours?—No doubt it is so in the more remote counties. If you take the county of Westmoreland, for instance, and compare it with the county of Lancaster, I have no doubt that Westmoreland sends its full proportion according to the population. There are only about 64,000 inhabitants in the county of Westmoreland, and they send some seven or eight patients to the asylum which is a pretty good proportion, quite as great as that of any of the larger counties.

19,531. I suppose you only occasionally take patients from counties which are not within the Northern Division?—We have not more than three cases altogether not belonging to the seven northern counties, and we make those cases pay the full rate of 50 guineas.

19,532. Is there any other point which you wish to bring before the Royal Commission?—I do not think there is, with the exception of saying that I have been in communication with the officials of the other volantary institutions like the Eastern Counties Asylum, the Western Counties Asylum, and the Midland Counties Asylum, and they all concur in the great desirability of obtaining the grant of 4*s.* a week for election cases that is allowed for the pauper idiots. They think that it would be a very great boon.

19,533. Do you think that the 4*s.* a week would be sufficient for all those cases?—I think that it would be sufficient for a very fair proportion of the total number of cases. For instance in our case it would be about one third of the cost of education and maintenance. You could not expect the Government to pay the entire cost, but we ought to get contributions from friends and subscriptions in addition. That would be a great assistance to these voluntary institutions, and I have no doubt that it would prevent many a family from becoming pauperised.

19,534. What inspection do you think would be desirable in that case?—So far as idiots and imbeciles are concerned, considering that the school education cannot reach any high degree, and that other matters have to be attended to, as the general condition of the patients' health, and their industrial occupations, and so on, I think that the Lunacy Commissioners might continue to inspect. They have a sympathetic interest in the work from seeing these children about in the workhouses and lunatic asylums, and our institutions, and they would do the work better than any other body. I do not know whether I have already mentioned my opinion that there ought to be two classes of institutions established under public administration, schools and adult asylums. I think they have made a mistake at Darenth in this respect: that the adult asylum is not under the management of the same superintendent who has the children, and that they also send lunatics there. Our contention has been from the very commencement, founded upon the experience of some of the first authorities in the country, that idiots and imbeciles and lunatics ought not to be associated. The complaint made with regard to Darenth is that when the children are grown up and are transferred to the adult asylum, they imitate the lunatics and pick up habits which they had broken off in the schools, and which are very pernicious indeed. Of course imbeciles are very imitative, and they cannot distinguish when an act is committed or a word is said, whether it is the correct one or not, and they are just as likely to imitate the wrong one as the right.

19,535. With regard to your governing body, how often does your committee meet?—The committee consists of representatives from the various local committees in the seven northern counties, and of some 15 representatives resident in the neighbourhood of Lancaster. They form the central committee, the general governing body of the institution; and they meet monthly. Then they have a house committee for looking after the internal affairs of the asylum, and a finance committee, which meet about midway in the month, the central committee meeting at the end of the month; so that we have meetings fortnightly.

19,536. Who is responsible for the daily general conduct of the asylum?—Dr. Shuttleworth has the internal administration of the institution; and I take the external administration, as the farm and garden, workshops, laundry, and stores, also the financial management and the general organisation and business of the institution.

19,537. (*Dr. Campbell.*) Do you not think that there is some feeling on the part of the parents against applying to the guardians, and that they would avail themselves more readily of such institutions as yours, if they had no fear of becoming pauperised?—I do not think any such feeling would prevail with the parents to such an extent as to prevent their making application, but I think it might be better to have some other authority to apply to. The affliction is so dire that the parents would be only too glad to get their children into such institutions.

19,538. You say in regard to the payment that if the parent is out of work you remit the payment?—We suspend the payment for a time.

19,539. Does not that lead to a very great deal of work and book-keeping and so forth? When they apply to you for remission, do you have to get evidence, or do you accept the report of the parents on the subject as being satisfactory?—We are in a very good position in regard to making such inquiries as those, because

we have our subscribers within a limited area, and we have also a large number of local committees to which we can refer, and we have never any difficulty. If I had any reason to suspect imposition I should make inquiry upon the spot, but I generally know pretty well the circumstances of the parents from the investigations that I make at the time of the admission of the patient.

19,540. It does not lead to lengthy correspondence and a great deal of work?—No, it does not; and there is very little imposition indeed.

19,541. Have you the authority on such a representation being made, if you believe it is *bonâ fide*, to remit the payment for a time, or do you have to refer the matter to your committee?—My committee has given me absolute discretion in the matter.

19,542. (*Mr. Arroll.*) Are you in favour of the county collecting adult imbeciles into institutions?—My opinion is that the schools should be established in the first instance, and that the children should remain in them until they get beyond a certain age. I do not know that I should be particular to 16 or 18, for the reasons which Dr. Shuttleworth has already given; we have not much difficulty on the ground of puberty. I should let them remain in the schools until they are 21. Some of them develop very late, and they have to go through a certain elementary course of instruction in school, and to learn a trade in addition. I would then transfer them to an adult asylum; but I would have the two institutions under the same medical and general administration so that the medical superintendent might use his discretion; and his experience of a child would be valuable when that child is grown up.

19,543. Do you not think it would be preferable for the adult imbeciles to be sent out to country districts in place of being housed in a large establishment?—I am speaking now chiefly of the paupers. I should allow the children to be discharged whenever their friends were inclined to take them, but we find that there is very often a great change in circumstances while the child is in the asylum; the father or mother dies or is not able to take care of the child and the child's friends may be only too glad to have it retained in the institution.

Mr. J. Diggens.

8 Feb. 1888.

19,544. In the case of the adults, do you not think it is well, after they have been trained in these large institutions, that they should be sent to outlying districts and boarded out?—I am afraid that that might be liable to very serious abuses. An idiot or an imbecile is not in the position of a blind person or deaf and dumb person, who could make his grievances known. He would be very much at the mercy of others; a system of regular inspection would be necessary, and there would be numerous difficulties.

19,545. (*Chairman.*) Have you had any experience abroad at all?—No, I have not.

19,546. Do you think that in the proposed amendment of the lunacy laws there should be some clauses inserted which would give power to the Lunacy Commissioners to control and assist in supervising the education of those educable idiots and imbeciles?—I do not think you need do that unless the State intervenes and makes an additional grant.

19,547. The 4*s.* which you suggest would be for paupers?—That amount is now received for paupers, and we should like to get it for election cases also.

19,548. Placing it on the same grounds as in the case of children in elementary schools; that is to say, that the artisan class should have the power of sending their children to schools where they could be taught, aided by a grant from the State?—Yes and further because I think that idiots and imbeciles being stil legally regarded as lunatics tehy have a special claim upon the State.

19,549. Do you think that the education of imbeciles and idiots ought to be placed under the Education Department, or under the Lunacy Commissioners?—I think it should remain under the Lunacy Commissioners, unless there is some special body appointed to attend to the inspection of schools for the deaf and dumb, the blind, and idiots, and imbeciles.

The examination concluded.

Adjourned.

6, Old Palace Yard, S.W.

Wednesday, February 15, 1888.

PRESENT:

THE RIGHT HON. THE LORD EGERTON OF TATTON IN THE CHAIR.

THE RIGHT HON. A. J. MUNDELLA, M.P.
ADMIRAL SIR E. SOTHEBY, K.C.B.
SIR TINDAL ROBERTSON, M.D., M.P.
B. ST. JOHN ACKERS, ESQ.
T. R. ARMITAGE, E, ESQ., M.D.
F. J. CAMPBELL, ESQ, LL.D.
WILLIAM WOODALL, ESQ., M.P.
L. VAN OVEN, ESQ.
CHARLES E. D. BLACK, ESQ., *Secretary.*

Mr. PATRICK CUMIN, C.B., examined.

Mr. P. Cumin, C.B.

15 Feb. 1888.

19,550. (*Chairman.*) You are Secretary to the Education Department?—Yes.

19,551. You are aware that previously to the appointment of this Commission there were one or two deputations to Mr. Mundella with regard to the education of the deaf and dumb. I do not know whether there was also one with regard to the blind?—I am certain that there was one at all events with regard to education for the deaf and dumb.

19,552. Can you tell us exactly what is the legislation affecting the education of the deaf and dumb and the blind at the present time, and how far the deaf and dumb and the blind are included in the present legislation, in the opinion of the Department?—We consider that the word "children" includes all children, and that it therefore includes the deaf and dumb and the blind; we consider that they are in exactly the same position as any children suffering from any physical deficiency, as, for instance, the want of a hand, or the want of an arm, they might be summoned on the ground that they were not in attendance at school, and then they would have to satisfy the magistrate either that they were in point of fact attending some school or that they were receiving efficient education in some other manner, or that there was some excuse for their non-attendance. I apprehend that if the parents of a boy showed that he was deaf and dumb, and that there were no means in the elementary school of his receiving education, that would be a reasonable excuse for his not attending

Mr. P. Cumin, C.B.

15 Feb. 1888.

the school; but we know as a fact that there are arrangements made by the school boards both for the blind and for the deaf and dumb, and we know that that expense is paid out of the rates, and therefore we assume that the rates are legally chargeable with the education of the blind and the deaf and dumb if the school board find it reasonably convenient to supply that education, but we have never had a case put to us of this kind, "There are a certain number of children "in our parish who are deaf and dumb or blind; no "provision is made by the school board, or by any- "body else in the parish for those 20 or 30 children; "will you either issue a notice to compel the provision "being made, or if there is a school board already "there, will you declare the school board in default, "on the ground that they have not provided for these "particular children?"—That case has never arisen.

19,553. But has there ever been any application to give more liberal aid to deaf and dumb or blind children who are now taught in school board classes?—Yes, certainly; this is the last letter we have had on the subject, which is as late as the 18th of March, 1887, this is from the London School Board: "The board "have had under their consideration the question of "again applying to the Education Department to allow "grants for the instruction of deaf and dumb "children. On the application of the board in 1884 the "Education Department consented to allow grants "on the following conditions:—(I.) The deaf and "dumb children will be borne on the books of the "boys or girls departments (according to their sex) "of the schools to which the classes are attached, "and their attendances included in the total number "of attendances, for the purpose of calculating the "average. (II.) The children who are sufficiently "advanced for any standard will be presented for "examination. Her Majesty's inspector will be "assisted by the teachers in examining them. (III.) "Those who are not able to take the standard work "will be treated as exceptions, and entered on the "exception schedule. (IV.) The inspector will see "the class at work, and add to his report his opinion "as to the efficiency of the instruction. This appli- "cation was subsequently withdrawn by the board, "as they could not see their way to comply with the "proposal of the Department. The above conditions "have again been considered by the board, who are "still of opinion that the proposals are impracticable. "But, considering the great expense involved in the "instruction of deaf and dumb children, the board "would urge upon the Education Department the "desirableness of appointing a special examiner of "deaf and dumb children and of allowing a grant "upon his report." To that this answer was sent: "My Lords are not prepared to offer any special "grants for deaf and dumb children till the Royal "Commission inquiring into the education of such "children have reported."

19,554. Then, if it could be proved to the Department that these children can be educated, and that their education is more expensive than that of ordinary children in your opinion would that be considered a reasonable ground for giving a more liberal grant?—I feel a little difficulty in answering that question. No doubt it has been established, beyond any doubt, that the education of such children is more expensive.

19,555. Arguing by analogy in certain cases, larger grants are given for other children than those in ordinary elementary schools, not by the Education Department, but by the State, in the case of reformatory schools, for instance?—That is where the children have been convicted.

19,556. Take the case of industrial schools?—Still, in the case of industrial schools the child is sent to the school on the order of a magistrate. The cases which I would refer to as analogous would be cases of this sort, where the necessary expenditure for the purpose of producing the required effect is larger than in other cases, we give a larger grant. Take the case of infants; there are two grants for infants, one 7*s.* and one 9*s.*; the 9*s.* grant is given where the staff and the appliances are superior. I should venture to suggest that inasmuch as these deaf and and dumb children and blind children require special arrangements, and can only be taught at very considerable expense, there is as much ground for giving an extra grant in their case as there would be in the case of infants taught by means of superior appliances.

19,557. In dealing with deaf and dumb and blind children, would fresh legislation be necessary, or could the Department make such regulations and give such grants as they might think fit, without any further legislation?—We could certainly recommend a loan for building a room or rooms, or a school, for deaf and dumb and blind children, and I also think that the board could pay in respect of those children who are being taught. Of course the Department, without any legislation, could extend the Code to that extent.

19,558. The Department would construe the compulsory powers of the Act, with regard to deaf and dumb and blind children, precisely the same as in the case of other children, assuming the necessary accommodation and appliances were provided?—They would, but the ultimate compulsion of course rests with the magistrate. I do not know of any case of a blind child or a deaf and dumb child having been summoned on the ground of its education having been neglected. I do not think if legislation were contemplated there would be the least harm in its including those children; but we should not like to admit that there was any doubt about our powers in that respect.

19,559. Before going to the reports of your inspectors, I want just to be clear about the law respecting the education of deaf and dumb or blind children through the guardians?—I am afraid I cannot give you any information upon that point; that is a matter for the Local Government Board.

19,560. I should like to ask you whether you think it would be desirable to transfor certain powers now possessed by the guardians to the school board or the school authority?—I do not think the school board or school authority would require any more powers than they have now.

19,561. They say they do; the Act of 1862 (section 1) says: "The guardians of any parish or "union may send any poor child to any school "certified as herein-after mentioned, and supported "wholly or partially by voluntary subscriptions, the "managers of which shall be willing to receive such "child, and may pay out of the funds in their posses- "sion the expenses incurred in the maintenance, "clothing, and education of such child therein, during "the time such child shall remain at such school "(not exceeding the total sum which would have "been charged for the maintenance of such child if "relieved in the workhouse during the same "period)," and the interpretation section says that "the word 'school' shall extend to any institution "established for the instruction of blind, deaf, "dumb, lame, deformed, or idiotic persons." Many parents who are on the verge of the pauper class, who would require some assistance before they could bear the expense of sending their children to a deaf and dumb or blind school, do not like to apply to the guardians, and it has been suggested that in deference to their wishes the administration of such contribution should be taken out of the hands of the guardians and placed in the hands of the school board?—The question there comes in, whether the parent of a blind or a deaf and dumb child is to be put in a superior position to the parent of a child who is not blind or deaf and dumb? I do not see why a man who happens to have a child who is blind or deaf and dumb should be put in a different position with respect to education to a person whose child is not blind or deaf and dumb.

19,562. At present he is not in so good a position, because he cannot send his child to an ordinary

Mr. P. Cumin, C.B.

15 Feb. 1888.

elementary school; in many cases in country districts there are no means of forming classes for the deaf and dumb and the blind; in large towns where there were board schools the necessity would not so much arise, because the parent would have an opportunity of getting his child educated, but in cases where there were no school boards, and where there were no facilities for gathering together a class of blind or deaf and dumb children, it has been suggested that the school authority should have the power of paying for the education of such children instead of the guardians; do you think that a good suggestion?—The guardians of course only take notice of the pauper class.

19,563. But the expense of educating these deaf and dumb and blind children being greater than in the case of ordinary children, a parent, though he might be able to send his child to an ordinary elementary school and pay the fees there, might not be well enough off to pay the cost of educating his child in an institution for the blind or the deaf and dumb, therefore the necessity arises that he should go to someone in order to get some assistance to enable him to get his child educated in cases where there are no school board classes?—If he is not a pauper, the question arises, who is to determine whether he can pay the expense or not? or whether he is or is not a proper object of what I should call charity?

19,564. The question being whether the parent should be assisted in sending his child to an institution, do you think that should be decided by the school board?—I should think that a case for private charity.

19,565. There are hundreds of cases of children all over the kingdom who do not go to any school, and who are not educated simply because the difficulty arises to which I am referring. The Education Department in the first place is the authority to apply to to solve the difficulty?—If we had to solve it we should say to the managers of a voluntary school which I will assume has been established in the parish: Have you any deaf and dumb or blind children in your parish? They might say, Yes, we have 15; then we should ask, Have you any means of supplying those deaf and dumb or blind children with education? They might answer, No, we have not. Then we would say, Are you going to do it? And they would probably answer, No, we cannot afford it. Then we should say, Very well, we will have a board, and the board will set up a school to which these children can go.

19,566. That would not meet the case that arises, because in country districts there are not 10 or 15 deaf and dumb or blind children, and the school managers could not set up a class for one or two children; therefore there is a manifest want in the system, and the question is, what is the best way of filling up that want?—We endeavour to solve the difficulty in the way I have stated.

19,567. Is that a satisfactory solution?—It breaks down in an ordinary case where you have only three or four children.

19,568. That is the case which is the most likely to occur?—Yes.

19,569. You are not likely to have 15?—Unless the Government were prepared to supply education to the children of all deaf and dumb or blind people who chose to apply, I think there would be very great difficulty in distinguishing between one particular parent and his circumstances and another; but what you have suggested would no doubt be a solution, namely, to give deaf and dumb or blind children the right to be sent at the public expense to some institution; that seems to be the only complete solution.

19,570. I see that in the report signed by Mr. Oakeley and Mr. Sharpe with regard to the education of the blind, they recommend that "School boards "should have, as at present, power to establish "centres, and that for all cases that cannot be "materially benefited by centre teaching, an "additional grant should be paid annually which "would cover the difference between the contribu- "tion which is at present allowed to be paid by "guardians and the total cost of annual maintenance "at some institution, which we believe to be about "10*l.* annually." That grant, I presume, is intended to be from the Education Department, because they say "such grant to be paid on the certificate of one "of Her Majesty's inspectors for annual progress "made, on some principle similar to that laid down "in the standards of the Education Code." Do you think that a feasible suggestion?—Yes; but some difficulty might arise in this respect; of course where the guardians or the school board or the school attendance committee send a boy or a girl to a school, it is reasonable enough that the Education Department should contribute to the education of that child; but suppose somebody else sent them, suppose there were a lot of children in this institution, and they claimed an additional grant from us, their expenses at the present time being paid out of endowments or from voluntary contributions, of course you open a difficult question whether you would not end in this, that the whole of the deaf and dumb and blind institutions would be in fact relieved from the necessity of supporting children to the extent of our grant; but if it were simply confined to children who were ordered to go by some public authority, like the school board or the guardians, you would protect yourselves against that; the inspector would go to any institution where there was a child or a number of children who, you may say, were entitled to or claiming a grant, and he would examine this particular child or class, and he would say you are entitled to so much money.

19,571. In the case of children sent by the guardians, that would really be supplementing the amount given by the guardians?—Yes.

19,572. Are there not many parents of blind and deaf and dumb children, not exactly of the pauper class, but on the verge of the pauper class, who, from the circumstances I mentioned, that is to say, the greater expense involved in the education of their children in these special schools, cannot afford to send their children to such schools?—If you could get a certificate of the school board, or the school attendance committee that A, B, and C were first of all deaf and dumb or blind, and secondly, if the school board or the school attendance committee state that the circumstances of the parent are such that he cannot possibly meet the expense, I think in that case you could put that child on the list for an annual grant.

19,573. This recommendation which Mr. Oakeley and Mr. Sharpe make, on the supposition that the grant should be such as to cover such a proportion of the total maintenance as would be, roughly speaking, about 10*l.*, is of course, on the ground that the child is not one which could profit properly by the teaching in an ordinary board school from its physical weakness and delicacy?—Yes; but suppose this case, which would be an ordinary one: an institution for either the blind or the deaf and dumb is carried on by voluntary contributions, and you send three or four children from several parishes to this institution, the expense would be very slightly more than without those children, still, if a new teacher had to be appointed, of course 10*l.* would not be enough, but if these children were merely added to existing classes then a given sum per head would be enough. There would be the difficulty how much you ought to pay in respect of children sent to existing institutions.

19,574. I was asking you about the blind, there is a difference between the blind and the deaf and bumb, because it is more expensive to teach the deaf and dumb than the blind, so they have a stronger claim than the blind?—There would be the difficulty of settling the amount you would pay in reference to the child.

19,575. I am taking the report of your own inspectors. I want to know whether you think that what they suggest would be a reasonable recommenda-

Mr. P. Cumin, C.B.

15 Feb. 1888.

tion for us to make on the strength of their reports?—I should not like to bind myself to a sum, but I think it is reasonable with the conditions that I put in, namely, that the children should be sent by some public authority, in order to distinguish between a *bonâ fide* poor person and a person who could afford to pay for the education of his child.

19,576. It is assumed all along that the State does assist the education of those who are not paupers in the ordinary elementary schools, and therefore it is contended that they ought to give the same assistance to those children who require more expensive education; you admit that that is the liability of the Education Department, according to the principles upon which it acts generally?—Yes.

19,577. Then in page 7 Mr. Fitch says, "the supplementary training provided by the board for blind children as such involves an additional cost of 4*l.* 11*s.* 8*d.* per head." That, I fancy, is what the letter you read from the London School Board alluded to?—Yes.

19,578. Then he goes on to say, "the concession already made by the Department, in virtue of which attendances at the centres of blind instruction are allowed, as attendances at cookery classes are, to count in estimating the average attendances, and thus to contribute a little to the grant, is very small and inadequate. It seems reasonable that a portion of the heavy additional charge should be borne by the Parliamentary grant; and I venture to suggest that on a satisfactory report from an inspector, the board should be allowed to claim at each of the centres of special instruction an additional grant for every blind child who has attended the class during half the year, and who has also passed the standard examination. Such additional grant should not exceed one-half of the total extra cost of the blind child's instruction; and should be paid as part of the grant of the particular school to which the centre class was attached." That is only with regard to the blind, and he is speaking of the education of the blind, not in an institution, but in a board school?—Yes; he assumes, I apprehend, that the whole of the children in the class are blind. In that case, where you have a separate room and a separate teacher for a blind class, you could calculate the cost without much difficulty, but if they were mixed up it would be rather more difficult.

19,579. Returns of the accurate cost of instruction of each pupil in the schools, which could be easily furnished, would be a guide to the Department?—I do not know what the Chancellor of the Exchequer would say to it. I do not know what the amount would be: that would be for the Treasury to consider. I take it there would be no practical difficulty where you had a certain number in getting the arrangement carried out.

19,580. If you remember it was contended by the deputation that went to Mr. Mundella with regard to the deaf and dumb, that 10*l.* would be the amount that ought to be paid by the school authority of the district if the children were sent to a deaf and dumb institution. I need hardly say that the deaf and dumb must be treated, more or less, in a class, and in some cases they might require to be taught in an institution where you could not find such a class. Do you think the sum named by Mr. Oakeley and Mr. Sharpe is a reasonable one?—I have no means of testing it.

19,581. That statement has never been critically examined by the Department?—No.

19,582. The question of acting upon the suggestion has never been contemplated by the Department?—It has never been considered.

19,583. In the case of an ordinary child educated in an ordinary elementary school, what proportion does the grant given by the State bear to the total cost?—According to the report for 1886–7, at pages xl and xli, the total average cost in voluntary schools in England was 1*l.* 16*s.* 6*d.*, and in board schools 2*l.* 5*s.* 7¾*d.*; the Government grant in voluntary schools was 16*s.* 10½*d.*, and in board schools it was 17*s.* 10½*d.*

19,584. The grant is not quite half in both cases?—According to the last report maintenance is included in the figures I have given; that is to say, the maintenance of the school.

19,585. Then the question arises, whether the Education Department might not fairly be asked to give the same proportionate amount of the total cost in the case of the deaf and dumb and the blind?—That would depend on the view taken by the Treasury.

19,586. We are told that it requires a longer time to educate the deaf and dumb than ordinary children; that being the case would the board consider that it would be within their power to require the compulsory attendance of deaf and dumb children at school for a longer period than in the case of ordinary children?—It is not a matter for the board. Legislation says you cannot keep children in the school after the age of 14.

19,587. That leads me to ask this question: Could these compulsory powers with regard to the teaching of the deaf and dumb and the blind be carried out without an Act of Parliament?—You could not extend these compulsory powers with regard to the deaf and dumb and the blind without an Act of Parliament.

19,588. It has been suggested that the deaf and dumb and the blind ought to have technical instruction; do you think that, as regards such technical instructions, they ought to come under the same conditions as ordinary children, or do you think that the Department could give a grant for any special college for the deaf and dumb and the blind?—I think that is rather a question for experts in deaf and dumb and blind education.

19,589. The Department would treat them the same as other children?—The curriculum of instruction, over and above mere reading, writing, and arithmetic, is a thing which every local authority can choose for itself; technical or manual instruction is entirely left to the initiative of the local authority.

19,590. Is it in the power of the Education Department to do anything with regard to the higher education of the deaf and dumb and the blind?—The only education which you may call higher education given in board schools is that which is given in specific subjects; beyond reading, writing, arithmetic, cookery, and sewing, you have class subjects, and then you come to specific subjects, which may be anything you please.

19,591. Do the grants which are now given to the Welsh colleges come through your Department?—No.

19,592. The Education Department does not deal with higher education?—No; the grants for higher education are not upon our vote.

19,593. (*Mr. Mundella.*) They are on the Education Vote?—Yes.

19,594. And they are obtained through the Education Department?—Yes, "Public Education England and Wales" is one heading, in the estimates (chapter iv.), and then you come to "University Colleges, Wales;" but it is not in our vote, though it is under "Education."

19,595. (*Chairman.*) Do the grants to training colleges come under your vote?—Yes.

19,596. Is there any reason why such grants should not be given to training colleges for the training and examination of teachers of the deaf and dumb?—Not the slightest; it would be entirely within our power to give such grants.

19,597. Without any fresh legislation?—Yes.

19,598. Are such grants given as scholarships to those who are trained in the training colleges, or are they given as an annual sum to the colleges?—What happens is this: each year there is entered to the credit of a college 100*l.* for a man, and 70*l.* for a woman, and that is multiplied by the number of certificates issued in that year, a fund is constituted in that way, then out of this fund the Education Department pay 75 per cent. of the actual cost for the year.

Mr. P. Cumin, C.B.

15 Feb. 1888.

19,599. Then, as I understand, the teacher gets nothing directly; he gets more or less free education at the training college?—Yes.

19,600. (*Mr. Mundella.*) Is not it the fact that 85 per cent. of the cost of training all the teachers is paid by the Education Department?—75 per cent. I am speaking of the Code; there may be more actually paid; the grant must not exceed 75 per cent. of the expenditure of the college for the year.

19,601. (*Chairman.*) I think you spoke before the Education Commission of scholarships of 25*l.* a year?—That was a plan for establishing day colleges.

19,602. Of course, either a day college or a training college for the deaf and dumb or the blind might be started by the Department by a simple grant without any further legislation?—Yes.

19,603. With regard to inspection; suppose the State were to give such a grant as we have been speaking of to the deaf and dumb and blind institutions for the education of the pupils therein, it would be desirable, I presume, to appoint special inspectors to inspect them?—I think so, because at present our inspectors do not profess to be experts in deaf and dumb and blind education, and consequently they are obliged to rely partly upon the skilled experts in order to ascertain what the progress of the pupils is, but if special inspectors for the deaf and dumb and the blind were appointed they might be asked, if it was thought expedient, to give a certificate that the teachers teaching deaf and dumb or blind children were competent to teach them, because an ordinary certificate of course does not imply that they are specially fitted to teach that particular class.

19,604. At present you do not give any grant to a school where there is no certificated teacher?—No.

19,605. Would you be disposed to recommend that grants should not be given to a school in which instruction was given to the deaf and dumb, in which there was no teacher holding a certificate?—That is a doubtful question, because Mr. Fitch in his report says he thinks that inasmuch as the teachers of these children are persons who show a good deal of self devotion, if you put too much restriction upon them, you might deprive yourselves of very valuable people, who might be perfectly well able to teach the deaf and dumb or the blind, though they had not a certificate. Speaking of the Norwood College, he says, "the teachers have been attracted to this particular work by a strong sympathy with an afflicted class, and by a consciousness of a special faculty for helping that class. They have gained their success partly through experience, but mainly by means of enthusiasm and self-devotion. For work of this very exceptional character, these appear to me to be the highest qualifications. Other training might add to them, but it could never be an efficient substitute for them. I am inclined to think, therefore, that in laying down the conditions of any public aid which it may be proposed to give, either (1) to the instruction of blind pupils, or (2) to the training of teachers for the blind, it will be well to avoid all rigid and inelastic rules; to abstain from formulating definite courses of instruction had of examination; and for the present, and until experience shall have suggested a better course, to encourage liberally any approved methods of teaching and training, and to judge of their efficacy mainly by their results." This special inspector, if appointed, would be utilised in that way; he could certify that the school was efficient.

19,606. It has been suggested that Norwood College, or some other college, should be the means of training teachers for the blind, and that similar colleges should be utilised for the training of teachers for the deaf and dumb. Would it be possible for the Department to select an existing college, and subsidise it for the purpose of training teachers either for the deaf and dumb or for the blind?—I do not see any difficulty in saying to a college, If you teach so many of these people we will give you, say, a certain amount per year towards the expense you are put to by taking them in and teaching them. You would attach scholarships to the place, and say, We will pay so much money to your institution, provided it will turn out so many teachers.

19,607. In former days the Department used to make grants for books to schools?—Yes, that was before the Duke of Newcastle's Commission.

19,608. You are aware, perhaps, that the printing of books for the blind entails a very great expense. I think it has been stated in evidence that a Bible costs between 5*l.* and 6*l.* Do you think it would be a reasonable thing to give a grant for the printing of books for the blind?—I would rather increase the grant without going into details.

19,609. Have you ever had any application for assistance from the Worcester College for the Blind?—No.

19,610. Has any application ever been made to you to start free schools for the blind, or for the deaf and dumb?—No. By Act of Parliament you can only establish a free school where there is proof that there is poverty, and there is reasonable ground that it would be useful, but there are no free schools known in England at the present time.

19,611. (*Mr. Woodall.*) You told us that in the view of the Education Department, there is no distinction between blind and deaf and dumb children and ordinary seeing and hearing children?—We think so.

19,612. It is as obligatory therefore upon the school boards to provide for the education of the one class as for the other?—That is our view.

19,613. But as a matter of fact, do the attendance officers generally, so far as you know, pay the same attention to those afflicted children as to the others?—I believe in London there is extreme care taken with regard to them; the attendance officers make all sorts of inquiries into the cases of those afflicted children but I do not mean to say that that is the case in other places. I am not aware what the actual course of proceeding in other towns is, but in London there is the greatest care taken about them.

19,614. You told us just now that no case had ever been brought under the notice of the Education Department to lead you to expostulate with a school board or to declare it in default in respect of such children?—No.

19,615. But may we not take it for granted that by most of the school boards and school attendance committees the existence of those children is ignored?—I will not venture to say that, because I do not know.

19,616. You have not anything like an approximate census of deaf and dumb or blind children?—We have nothing beyond the ordinary census.

19,617. Is not it the case that those children have really been left to be dealt with by philanthropic people and societies?—Except so far as the school boards may have taken up their case, but I am not aware of any school board that has done so except the London School Board.

19,618. Under the Education Act school boards have not authority, I think I understood you to say, to send a child to an institution and to pay for its maintenance and education there?—No; the only thing they can do is to pay the education fee; they cannot do anything beyond that.

19,619. But school boards have authority under the present Act to establish special schools for the education of these afflicted children, have they not?—Yes, I apprehend they could set up a separate school for the deaf and dumb, or a separate school for the blind, and out of the rates they could pay the money required in order to conduct that school.

19,620. But I suppose they would only be empowered to spend such money as was actually required for the education of the children?—That would be so.

19,621. They could not contribute anything towards the maintenance of the children?—No.

19,622. The guardians, on the other hand, have the power to send those children to institutions?—Yes.

Mr. P. Cumin, C.B.

15 Feb. 1888.

19,623. And to pay a certain sum for their maintenance as well as for their education?—Yes, I believe so.

19,624. You rather implied that it would be difficult to distinguish between children of the pauper class and children bordering on the pauper class; but are you not aware that under the poor law aid given towards the education and maintenance of deaf and dumb or blind children does not entail the usual penalty of pauperism?—What I said I think was that the difficulty which I suggested might be easily got over by allowing the school attendance committees to certify that in a particular case the child ought to be educated at the expense of the rates in the same way as the guardians do, in order to get rid of what you may call the taint of pauperism by applying to the guardians.

19,625. You think it would be desirable to find some other authority than the guardians, if any other such authority could possibly be found through whom this aid should be given?—I think it would, and I think the school board is the proper authority where it exists.

19,626. Do you think it at all likely that under the pressure of the ratepayers the school board would voluntarily undertake this work?—What I venture to suggest is this, if there was an actual power on the part of a local authority like the school board to do this, and they did not do it, then the Education Department would be able to say to the school board, True we have never declared you in default for not supplying this education that we think ought to be supplied, because hitherto it has been somewhat doubtful whether the people could afford it, but now that we know you can get this money out of the rates and you decline to take action in the matter, we will declare you in default.

19,627. If it was obligatory upon the school boards to send these children to public institutions, you would contemplate that a Government grant should be given to the institutions which were compelled so to receive those children?—Certainly, but I do not think you could compel the institutions to take them in: I do not think you could go the length of saying to a Catholic institution, for instance, You have ten vacant places and we have ten Catholic children, we will compel you to take those children. You could not go to that length; but I think you could say, If you will take them in we will give you so much money.

19,628. Supposing the State practically accepted the responsibility of seeing these children well educated, you would have to devise some method by which the necessary education should be provided?—In a town there would be no difficulty, but if you want to educate all the deaf and dumb and blind children in a scattered district, if you cannot find a place for them in some existing institution, then you must set up a central institution to which all not provided for in existing institutions may be compelled to go.

19,629. School boards now are empowered to establish industrial schools?—Yes, under the Home Office.

19,630. Is there any limit to the amount they may expend out of the school board rate on such institutions?—I do not think so; I take it you could not surcharge a board for conducting extravagantly an industrial school.

19,631. The board receives a capitation grant through the Home Office, towards the maintenance and education of children in such industrial schools?—Yes.

19,632. Is there any reason why a similar method should not be adopted in relation to deaf and dumb and blind children?—I think deaf and dumb children and blind children have a stronger claim than the children who are put into industrial and reformatory schools, because the latter class are all persons who have been before the magistrates, but I understand the view to be that these deaf and dumb children and blind children are entitled to be educated by the locality, and that the locality is bound to supply the sort of education required for them, which can only be done by establishing a special school.

19,633. Given that this duty of the school board is recognized, and that these necessitous children are sent to an institution established either by the school board itself, or by some other body in parts of the country where the population was scattered, do you think that the analogy of the industrial school should be followed in regard to the proposed institutions. I mean in regard to the payment of a capitation sum from the State towards the cost of teaching and maintenance? In industrial schools that grant is paid without respect to results of examinations, for instance. The question of paying for maintenance comes in in those cases, that is the difficulty. If you have a school in a town of course the boy or girl can go home and live at home, but suppose you take away that child and say, You cannot get educated here; I am going to take you away from your father and mother and I am going to put you in this deaf and dumb school, or blind school, whether you like it not, then of course in that case you would have to maintain that child.

19,634. My question refers entirely to children treated as interns who have therefore to be maintained? That is a difficult question; you are interfering with the parental authority—you are taking the child away from the parent.

19,635. Generally speaking the willing consent of the parent would be readily obtainable?—That would get over the difficulty.

19,636. I want to bring you to this point, whether you think the general system of payment by results as indicated by examinations would apply in the case of these children as it does in the general case of distribution of Government grants?—So far as the education is concerned I should say so, leaving out altogether the maintenance.

19,637. Assuming that to be the case, do you think it would be practicable to pay by results on examinations without devising a particular code and without establishing some system that would involve the certificating of the teachers?—I think you must have a special code for these children.

19,638. You are aware no doubt that there is a considerable difference of opinion prevailing as to the methods of teaching?—Yes.

19,639. Do you think it would be possible to devise a code which should be so framed as to adapt your grants to different methods of teaching?—I can only go this length, that in point of fact we do administer a certain amount of money, and an examination is conducted and most successfully met by deaf and dumb and blind children in the schools in London and elsewhere. They are taught and they do well and show great ability and knowledge.

19,640. In examining those children a liberal interpretation is given of your ordinary code?—A sufficiently liberal interpretation to meet the case.

19,641. I am endeavouring to avoid, even in a question, anticipating the possible conclusion of this Commission in favour either of the sign system or the oral one, on the one hand, or any of the different methods of training the blind on the other. I am asking you whether you think a system of payment by results could be devised upon examinations which would recognize different methods of teaching the blind or the deaf and dumb?—I think so. I should put it in a very simple way. I should treat these deaf and dumb children as infants, that is to say, I would pay for them in the same way as infants; infants are individually examined in one way but not in another. We pay 7*s.* or 9*s.* a head according to the superiority of the arrangements in the school. I should pay for these special children exactly in the same way.

19,642–3. You have already referred to the report of Mr. Fitch in which he speaks of the enthusiasm and self-devotion which is so important in the case of those people who devote themselves to this particular work, and without which all the training in the world would be of little value; I understand you concur in what he says?—Speaking not as an expert, I do.

19,644. Given that these teachers gain their success partly by enthusiasm and self-devotion, you feel it would be very desirable that they should be as thoroughly trained as are those who go to ordinary work of elementary teaching?—Yes.

19,645. And you suggested that some kind of subvention might be given to existing training institutions towards the special education of teachers for the blind and the deaf and dumb?—Yes.

19,646. I take it that you hold that for the efficient training of teachers either for the deaf and dumb or for the blind it would be desirable for you to recognize such training institutions as have been established specially for that purpose?—I think we might say, We will give you so much money if you will turn out so many teachers for our purposes.

19,647. Very much upon the same principle as is followed in training teachers for ordinary elementary schools?—No, I contemplate mixing up the deaf and dumb teachers with others who might be educated for other purposes. I would rather give scholarships to those institutions than have the plan which exists in an ordinary training college of paying 75 per cent. upon the whole cost.

19,648. Why?—Because it would be a more convenient plan.

19,649. You would rather deal with the individual teacher than concern yourself with the general working of the institution?—Yes.

19,650. (*Mr. Mundella.*) It has always been considered, has it not, in the Education Department that blind and deaf and dumb children were to be educated under the Elementary Education Act, the same as other children?—Yes.

19,651. But no special provision was made for any special grants for those children?—No.

19,652. No special provision has hitherto been made for the training of teachers for those children?—No.

19,653. Your grants have been made under the Code, and the grants have been in accordance with the grants made for ordinary children?—Yes, that is so; we have allowed deaf and dumb and blind children to be exceptions, that is to say, on the exception list, if they were not up to the standard.

19,654. That is to say, they have been examined liberally by your inspectors?—Yes.

19,655. It is recognized, is it not, that the education which it is necessary to give to blind and deaf and dumb children to fit them for usefulness in life is considerably more costly than that for ordinary children?—Yes.

19,656. So far as making grants for such children from the State goes you think there is no necessity for any legislation?—I think not.

19,657. It only wants the consent of the Treasury on the application of the Education Department, and the assent of Parliament, to give so much per head for the education and maintenance of blind and deaf and dumb children in an institution quite irrespective of any statute?—I think so.

19,658. But a statute would be necessary to compel children to attend at the boarding institution till such time as their education was completed, would it not?—Yes, I presume you are referring to cases where they are to be taken away from home and put into an institution.

19,659. Yes, I was referring to those cases; but suppose they were not put into an institution, suppose it was possible to provide a day training school for blind and deaf and dumb children which they might be required to attend to a later age than that to which ordinary children attend, it would require a special statute, would it not, to compel their attendance?—If you went beyond 14.

19,660. Is not it the fact that a very large proportion of your children from the rural districts pass out as soon as they attain the Fourth Standard?—Yes.

Mr. P. Cumin, C.B.

15 Feb. 1888.

19,661. And the parent can claim the child when it has passed the Fourth Standard?—Yes.

19,662. Would not that be wholly inapplicable in the case of blind or deaf and dumb children?—So I understand; they take a longer time for their education.

19,663. If in addition to a better elementary education than is given up to the Fourth Standard, you require to give some industrial training to fit the child to earn its own living, you would require a statute to enforce the attendance of the child for that purpose, would you not?—Yes, but I understand that a great many authorities have expressed the opinion that you would not require perhaps a higher standard than the Fourth Literary Standard in the case of these children, but that they ought to be removed from the ordinary elementary school and put into what you may call a manual labour school, that their literary instruction should be continued beyond the Fourth Standard, but at the same time there should be mixed up with it instruction specially fitted for them.

19,664. To carry them on to the Sixth or Seventh Standard of education and at the same time to give them manual instruction?—Yes.

19,665. But you could not do that compulsorily, you could only do it by the consent of the parents, without an enactment?—Yes.

19,666. Then the difficulty is not the question of the grant that can be obtained from the Treasury and Parliament, but the difficulty is the want of an enactment making it incumbent upon the local authorities to give this education to blind and deaf and dumb children?—Yes.

19,667. At present that is not obligatory, it is only voluntary on the part of boards of guardians; it is not obligatory to give any instruction beyond the standard of elementary instruction which may prevail in the district?—That is so.

19,668. It is purely voluntary on the part of the guardians whether they pay the expenses of children in a blind institution or in a deaf and dumb institution, or not?—I believe so.

19,669. You said, I think, that you give no grants to free schools?—There is no free school at present. There is a well-known case at Birmingham, but that is not a free school; it is a school at which there is no fee paid, but it is a school which is only open to certain children.

19,670. You give grants to an enormous number of penny schools?—Yes.

19,671. And you have power to give grants to free schools if you like, have you not?—Yes.

19,672. You are not prevented by statute from giving a grant to free schools?—No.

19,673. Therefore if free schools were set up for blind or deaf and dumb children, what you do with respect to sighted children would not apply to those institutions?—No.

19,674. You could give your grants to free blind schools irrespective of anything you do with respect to ordinary elementary schools?—Certainly.

19,675. With respect to the training colleges for teachers, the whole of the training colleges are voluntary institutions, are they not?—All of them.

19,676. Set up by voluntary effort?—Yes.

19,677. You give grants towards the building?—Originally, no doubt.

19,678. Suppose a new training college was set up to-morrow, should you give any grant?—That would be a question for the Vice-President of the day whether it should be given or not.

19,679. You can give grants to training colleges—towards the building?—No.

19,680. You can give grants for maintenance after they are built?—Yes; 75 per cent.

19,681. I mean for the maintenance of the structure of the training college?—Yes, there are certain things which are considered maintenance; there is a dispute sometimes as to what is maintenance.

Mr. P. Cumin, C.B.

15 Feb. 1888.

19,682. For instance, putting a wall round a training college could be paid for by a grant of the Department?—I do not remember any such actual instance, but the Government do pay the cost of maintenance of a school.

19,683. Every year you make some grants for structural repairs?—For repairs; but we do not make a grant for a new structure.

19,684. You make grants for maintenance?—Yes.

19,685. Will you give us a statement of the total expenditure for these training colleges, including the Government grant and voluntary subscriptions, and let us see what percentage the Government grant is of the whole income?—The Government grant to 18 colleges, having 1,388 students in residence, and 26 colleges, having 1,871 students in residence, was 115,792*l.*

19,686. That was the Government grant. Now will you give us the amount of the voluntary subscriptions?—I will.*

19,687. That sum of 115,792*l.* is your grant to the training colleges; are there no other grants given to the training colleges?—They get a grant from the Science and Art Department.

19,688. They get a grant for all the science and art teaching?—Yes, they get a grant from the Science and Art Department. I do not know what the amount is.

19,689. For all the science and art teaching that is given in a training college they get a grant, plus the 115,792*l.* which you have just mentioned?—Yes, the Science and Art grant is quite separate.

19,690. But it is paid to the training colleges?—Yes.

19,691. I think you expressed the opinion that it is desirable that some local authority should possess the power of enforcing the attendance of these children at proper training schools, and should also possess the power to pay out of the local funds for their maintenance in those schools?—If a child is not living at home, if he is taken away and put into an institution, it seems to me only reasonable that the local authority should have the power to pay for his maintenance there.

19,692. You think it would be very much better that that power should be in the hands of the education authorities rather than in the hands of the boards of guardians?—I think so.

19,693. In the hands of the school boards or the school attendance committees, for instance?—Of course the school attendance committee is very much the same as the guardians; the school authority are the proper persons to give a certificate.

19,694. That is to say, you think that the education authorities of the district, whatever they may be, should be the parties who should be empowered to send a child to school and to pay the cost of its maintenance?—I think so.

19,695. Have you any doubt that if such power was possessed, for instance, in London and in the Midlands, and in Yorkshire, and the various great centres of England, suitable schools would be provided by a combination of school authorities, provided they already did not exist?—I should think so; that would be the cheapest way of doing it.

19,696. Is not that the course adopted with respect to truant schools?—Yes.

19,697. Truant schools are both education schools and boarding schools, are they not?—Yes.

19,698. Is not it the case that in a certain district a number of school boards contribute to a single truant school?—Yes.

19,699. And they send children from their district to that truant school?—Yes.

19,700. That is to say, Sheffield sets up a truant school and Nottingham and the districts all round will send their children to that school?—Yes.

19,701. Do you think if it was incumbent upon the school authorities to make suitable provision for the blind and the deaf and dumb, they would do the same thing with respect to them?—I think so; I do not see any other way of doing it, if they want to do it as cheaply and efficiently as they can.

19,702. At the same time, you see no reason why a grant should not be made to voluntary institutions or to endowed or partially endowed institutions already existing, provided they may themselves efficient?—None at all, only the board who paid the grant ought to see that the institution was efficient and really did supply what they were paying for.

19,703. But would not that assurance of efficiency be obtained in the same way as you obtain a knowledge of the efficiency of elementary schools at the present time; could not it be obtained by the inspection of a competent inspector?—This special inspector, I take it, would be the man to whom the board would look; he would certify that a certain institution was capable of receiving so many deaf and dumb or blind children to educate.

19,704. Did I rightly understand you to say, that you would make it obligatory on the part of the local authority to send deaf and dumb and blind children to an institution, and that you would also make it obligatory on the institution to take in such children?—I am not clear about making it obligatory upon a voluntary institution; but I should say if they would not take in the child, the child should be provided for by a public institution.

* Training Colleges, England and Wales, 1886.

The expenditure by the Managers of Training Colleges in 1886 was £167,642, that sum included the following purposes towards which the Education Department did not contribute, viz.:—

	£	£
Instruction of the students in Science and Art subjects	6,885	
Net cost of practising schools charged to the colleges	1,195	
Other expenses not recognised by the department under Article 131A of the New Code	3,374	
		11,454
		£156,188

Expenditure upon which the grants from the Education Department were calculated.

The grants actually paid by the Education Department were £115,792 or £1,349 less than 75 per cent. of the net expenditure. The reduction being due to the limits imposed by Articles 130 and 131B of the Code.

The income for 1886 was—

	£	£
(1.) Government Grants—		
(*a*) from the Education Department	115,792	
(*b*) from the Science and Art Department	6,546	
		122,338
(2.) Other receipts—		
Subscriptions, donations, &c.	16,660	
Fees and other payments by the students	27,465	
Endowment	1,699	
		45,824
		£168,162
The per-centage of the Government Grants to the whole income was		72·75
But if only the income available for the costs of maintaining the colleges be taken, the per-centage of grants to income is		74·78

Mr. P. Cumin, C.B.

15 Feb. 1888.

19,705. That is, if the locality has not made provision, you would make it obligatory upon that locality either to find the provision or to make it?—Yes.

19,706. You were asked something about payments by results; is not it the fact that at present with respect to schools generally a very large proportion of your grant is paid independently of results?—Yes.

19,707. And you see no reason why you should make a hard-and-fast code for the blind and deaf and dumb, making everything dependent upon results?—No, their is no single case where the grant depends altogether upon results.

19,708. In the case of infants, you give 7*s.* or 9*s.*, as the case may be?—A fixed grant amounting to 9*s.* if the children are taught as a separate department, under a certificated teacher of their own or as a class under a teacher not less than 18 years of age, approved by the inspector. In order that this grant may be made they must be taught in a room properly constructed and furnished for the instruction of infants. 7*s.* is given where these conditions are not satisfied.

19,709. You see no reason why an article in the Code might not be adapted to the blind and the deaf and dumb in the same way?—No.

19,710. All that your Code would have to provide for would be the subjects that they should be taught, and an examination to see that the children were properly taught in those subjects?—That would be all.

19,711. And if they were properly taught you might give an additional grant?—Yes, a merit grant.

19,712. And so if the teaching were reported "Excellent" you would give the institution so much more?—Yes.

19,713. You give the 9*s.* if the buildings are suitable, and 2*s.*, 4*s.*, or 6*s.*, according to whether the inspector's report is "Good," "Fair," or "Excellent"?—Yes.

19,714. There is no reason, is there, why that principle should not be applied to children in blind and deaf and dumb institutions, substituting pounds for shillings in the case of need?—No.

19,715. With respect to training colleges, the training of teachers is a matter which you would regard as of the first importance?—Yes, that is the important thing.

19,716. As all the teachers of England are at present trained in voluntary institutions, there is no reason, is there, why you should not make grants to existing voluntary institutions, provided that they were efficient?—No. I propose that scholarships should be attached to any institution you like.

19,717. There is no reason, is there, why some of the existing training colleges might not have a department for training teachers for the deaf and dumb or the blind, provided they had all the appliances requisite?—No, none at all.

19,718. Then all that is requisite to arrive at what I have foreshadowed is that there should be a short statute empowering the education authorities to educate the blind and the deaf and dumb efficiently in suitable institutions, and giving them power to pay out of the local funds, supplemented by Parliament, sufficient to educate and train the children?—Yes.

19,719. In addition to the powers which you already possess with regard to the elementary education of children, supplemented by industrial manual training, all you want is a short statute which shall extend the Education Act to cover the case of the blind and the deaf and dumb, and to cover the extended age necessary to give them a proper education?—That is so.

19,720. (*Dr. Campbell.*) Of course the practical object of all such education is to make the class of which we are speaking independent—to make them practical men and women in the world; and in order to do that there are certain methods of instruction which are applicable to the seeing and the hearing, which would not be useful for blind children or deaf and dumb children?—You might treat the blind or the deaf and dumb as you treat infants. There is no code for infants. An infant does not require to pass the First or Second Standard; he is not a standard child. An infant is a child that is put into an institution, and when the inspector goes there he does not examine the infants according to a particular code, he merely sees if they are properly instructed. I do not know what more you could have. The inspector would say, What plan do you follow in your institution? and he would take that as the system upon which the children in the institution were taught, and he would say whether he considered that that system was properly carried out or not; there would not be individual passes. There are no individual passes in the case of infants.

19,721. After the education of the blind or the deaf and dumb had been carried up to a certain point, would not it be well to have a code for them?—There may be half-a-dozen systems, but you must recognize the system that is adopted by the particular institution.

19,722. What I want to get at is this, would not the Government get more for its money, and would not this class of children, either the blind or the deaf and dumb, get more benefit, if, after all, a certain amount of regulation and requirement were absolutely insisted on (I will admit that it ought to be elastic). The question is, whether it ought to left so indefinite as you propose for infants, and whether we ought not to require more exact examinations and requirements in the case of the blind and the deaf and dumb, it being understood that they should be made applicable to their condition?—It would be competent for any institution to do that if they liked, but I do not know whether you could compel other institutions to do it.

19,723. Do you not think that any institution which receives assistance from the Government ought to receive from the Government a certain code, showing what the Government requires to be taught, and also that certain examinations should be required, in order to show that that code has been carried out, though it may be with elasticity, in order to make it applicable to the special class?—I think if there is a particular code which, according to the opinion of all persons who are experts in the subject, ought to be carried out and can be carried out, that is the best thing for the Government to adopt; but in most of these cases you find that every expert has got his own view of what he thinks the best plan, and I want to give as much elasticity as I can. If you could possibly make a code which should be accepted by all persons interested, I quite agree that that would be the best plan.

19,724. Do you not think that if the Government gave assistance to these institutions the Government might lay down as a condition that those experts should formulate something that should be accepted by all the institutions; that the assistance of the Government should be given on the condition that this was formulated and accepted?—That is a question for an expert rather than for me. I should leave that to the experts. If the experts could come to a conclusion such as you suggest with regard to a particular code, it would be a very good thing to adopt.

19,725. But would not it be very hard upon the class that they should suffer because the experts could not agree; do not you think the Government has the right to insist upon these people who are going to receive assistance coming to some conclusion that will satisfy the Government?—I think if they could get the experts to agree they should do so.

19,726. Would not it be the greatest blessing to the class with which we are dealing to force the institutions to come to an agreement. An agreement has been come to with regard to ordinary children,

Mr. P. Cumin, C.B.

15 Feb. 1888.

why should not an agreement be come to with regard to blind and deaf and dumb children?—There would be do no difficulty as soon as an agreement was come to upon the code.

19,727. Why should you wait for all the different experts to come to a conclusion; why should not the Government require to have some practical plan easy to be formulated, adopted, and then if any institution placed itself in proper relation to the Government it should be in a condition to receive assistance from the Government under proper inspection?—That course might be adopted, no doubt.

19,728. (*Mr. Van Oven.*) I think you said once or twice that no case had ever been brought to your notice of a deaf and dumb or blind child who was not receiving education, so as to lead you to declare a school board in default?—I do not remember any case.

19,729. Do you think that it would be advisable that there should be a test case brought forward; would that forward the object that we have in view?—I do not think so.

19,730. Then, as regard teachers for the deaf and dumb and for the blind, and the inspection of dead and dumb and blind schools, I think you agree that there must be special inspectors for both those classes?—Yes.

19,731. And they would require of course to have a certain insight into the modes of teaching adopted in the various schools and asylums for these afflicted classes in order to have the necessary knowledge as to how their inspection should be conducted?—Yes.

19,732. Then you think that the teachers should be certificated, I presume, after examination by the inspector?—After examination by the inspector.

19,733. Do you not think it would be advisable that the mode of obtaining such teachers should be by sending certificated teachers, who had already obtained their certificates in our public elementary schools, to certain special schools, in order to be instructed in the special mode of instruction necessary for the deaf and dumb and the blind, and that the special inspector should then give them a separate certificate enabling them to teach these afflicted classes?—I think that that would be a very good mode of supplying some of them; but I suppose it would hardly do to restrict the supply of teachers to persons who had actually got the ordinary certificates from the Education Department. Those classes that you speak of would be the best teachers probably.

19,734. Do you not think it desirable that the question of ordinary education should be eliminated from the examination for certificates for the special teaching of the deaf and dumb and the blind, and that the special training only should be recognized, and looked after by the deaf and dumb or blind inspector?—Yes, I think so; but I suppose that that would not apply to a case where the teacher was himself blind.

19,735. I should think it would?—If it would, it is the best plan, no doubt.

19,736. All other things being equal, of course?—Yes.

19,737. (*Admiral Sir E. Sotheby.*) Did I rightly understand you to say that you advocated separate schools for the deaf and dumb and the blind?—I said it was a matter entirely for the locality to settle themselves.

19,738. Separate schools, I presume, would be much more expensive?—Yes.

19,739. With regard to teachers you propose that they should be educated at some of the training colleges?—Yes, unless a special training college could be set up. As suggested by Mr. Mundella, you might in an ordinary training college have a class specially appropriated for deaf and dumb teachers.

19,740. After these teachers had been trained at these training colleges, who would be the judges whether they were efficient?—The inspector. There should be a special inspector who would give a certificate, not for ordinary matters, but for aptitude to teach these afflicted classes.

19,741. That inspector ought to be an expert, of course?—Yes Our inspectors have the assistance of Miss Green and Mr. Stainer, who are experts, when they make their inspections.

19,742. (*Mr. St. John Achers.*) I understood you to say that the guardians only take notice of paupers? They are the channel through which the fee is paid.

19,743. At present do not they pay for a large number of persons who are not paupers?—They are not paupers in the strict sense of the word.

19,744. Take the class above the pauperised class; the board of guardians do at the present time pay for the education of a considerable number of children who are not of the pauper class?—We find that, reasonably or unreasonably, there is an objection entertained on the part of people who are not actual paupers to going and getting aid from the guardians. We have nothing to say against the guardians.

19,745. As a matter of fact, you are aware that they do pay for a considerable number of children of those who are not paupers?—Yes, they pay the fees of children of parents who are not paupers, not paupers in the sense of getting outdoor relief.

19,746. I am speaking of the blind and the deaf and dumb; take the case of a person who could well afford to send his child to an ordinary elementary school, the guardians will send that child to a special school for the blind or the deaf and dumb, and pay the fees?—Yes.

19,747. At the present time there is a special code, of course, in existence for training colleges?—Yes.

19,748. The Commission has found that certain schools are unable to get grants because the teachers are unable to obtain certificates; for instance, a blind teacher is not able to obtain a certificate because he cannot pass through the drawing, which is necessary; it would be, in your opinion, absolutely necessary not only to remodel the code as regards the teaching in elementary schools, but also the code required of persons intending to become teachers of the blind and the deaf and dumb?—You may have anybody to teach though not certificated, provided you have at the head a certificated teacher. Occasionally in very big schools, take the case of the Jews' School in London, for instance, the head teacher is not certificated, but he has another man who is certificated.

19,749. Take for instance that central public school, which you suggest it would probably be necessary to start, if the other schools could not take in the whole number, the best person to be put over it might very possibly be a blind person; that blind person could not possibly get a certificate now because he could not pass through the ordinary routine of the training college. Is it your opinion that the regulations in that respect should be changed, and that they should be fitted to meet the case of a blind teacher?—Yes; this inspector, who I propose should give certificates, would no doubt act upon a new idea as to what conditions ought to be imposed upon these teachers.

19,750. Supposing it were not required that the teachers should be certificated, in your opinion ought not the Department to give the same grant as though the requirements of the Code were fulfilled, and the teachers were certificated?—Yes. Suppose Mr. Fitch's view were adopted, the grant would not depend on whether you had or had not a certificated teacher.

19,751. You have stated that in your opinion the best plan would be to give grants for individual teachers of the deaf and dumb and the blind, trained in the present training colleges; at present a teacher of ordinary children has to remain two years in a training college?—One year is enough, but it is too short a time. You can get paid half the money for one year.

19,752. Two years is the full time?—Yes.

19,753. In your opinion would not it be necessary to give a longer time in the case of the teachers of the deaf and dumb or the blind in a special training college, unless those teachers had passed in an ordinary training college, or had shown by some

examination that they were competent to teach ordinary children?—That is a question rather for an expert.

19,754. In your opinion should not teachers of the blind and the deaf and in addition to their special knowledge be thoroughly as competent as they would require to be if they had to teach the hearing and seeing?—Certainly. I should have thought two years was little enough for any teacher.

19,755. That being so, you think that the Department would be right in giving a grant in those cases for something more than two years, that is, that they might make a grant, we will say, from one year for going through the ordinary education, and for two years for special education, so that the Government might make a grant for three years to one who was being trained for the blind or the deaf and dumb, as against two years, the full time, for a teacher of hearing and seeing children?—I think so.

19,756. I wish to call your attention to one or two practical points which we have come across with regard to the difficulties which different schools have found in dealing with the Education Department; one is with regard to fees for children travelling to and from classes. You are aware that there is a certain radius for ordinary children, no child is compelled to attend school who lives beyond two miles?—That is so, but we do not recognize that as at all limiting us in requiring a school within two miles. In Wales, for instance, we may have a case of this kind: There is a railway level crossing here (*drawing a diagram*), and there is a school here, and another here; this school is not quite full; there is a population here, and the school board want to close that school, because they are within reach of this; we say, No, you must not do that, because if you do, the children will have to cross this dangerous level crossing.

19,757. It is much more difficult for blind and deaf and dumb children to come to school than ordinary hearing and seeing children?—No doubt, and therefore we should require a greater number of schools.

19,758. Would you think it advisable that the school authority should have the power of paying the travelling fees of children coming four miles to school?—No, I think not; in that case they ought to put up another school.

19,759. Take the case of Birmingham; suppose in that town there are 30 deaf and dumb children of ripe school age, how would you arrange if you did not pay the travelling fees to get them into suitable classes, because they would have to be graded?—I should say that the grant made in respect of children, whatever it might be from the Government, ought to cover that difficulty.

19,760. You think that there ought to be such an increased grant that classes might be started convenient for blind or deaf and dumb children?—Yes; if you chose to give the school board the right to pay the travelling fees, in some cases you would have to apply it not only to deaf and dumb, but also to other children.

19,761. Allowing that it is right that other children should have the same privilege, you would grant it at any rate in the case of deaf and dumb children?—Yes, I think myself it is a thing that ought to be done; where there is a difficulty of access there ought to be power in the local authority to pay the travelling fees.

19,762. Granting that power, I assume you would then extend the area of compulsion; at present they are only compelled to come for the two miles?—The limit varies with the byelaws.

19,763. Take a practical case: a school authority says, We cannot get blind children in over two miles; we can compel them all to come who live within the two miles, but we cannot compel those to come who live 2½ miles away, though in our school district. Granted the facility of paying the fees for travelling to and from school, do you not consider that the radius ought to be enlarged?—That the school board can do by altering their byelaw; there is a three-miles limit in some cases.

Mr. P. Cumin, C.B.

15 Feb. 1888.

19,764. I will put it over three miles; in your opinion should they have that power?—I should think so.

19,765. Mr. Mundella asked you whether it had not always been considered by the Department that the blind and the deaf and dumb should be educated as other children are educated under the Education Act of 1870, and you answered, Yes; but as a matter of fact, how long have the compulsory powers been enforced by the Department, take 10 years ago or 15 years age; suppose the school authority had not a school for the education of the deaf and dumb or the blind within its district, would the Education Department have put in force the compulsory powers?—I said, though we considered it the duty of the school board to provide for the deaf and dumb and the blind, we have never declared a school board in default for not providing for them, and, moreover, we have never called upon them to provide for the deaf and dumb and the blind. The duty, we contend, exists, but as a matter of fact we have never been called on to compel a particular school board to set up a school for that particular class. We have never been asked to do it.

19,766. Is it not the fact that since 1870 the Department has treated the education of the seeing and hearing as compulsory, but not that of the afflicted classes?—Yes; I think very lately there was somebody who complained that he could not get his deaf and dumb child taught. At all events we have never compelled any school board to set up a school for the deaf and dumb or the blind.

19,767. With regard to training colleges, you are aware that training colleges for the deaf and dumb educate others than those who intend to become teachers in elementary schools?—I believe so.

19,768. That being so, would the proportion that you would pay to such a training college be regulated by the ordinary requirements of that training college, or would be it be diminished to bring it down to what would be considered a right and fitting amount to pay for the persons who were being trained only for elementary instruction?—What I propose is that such a training college should be asked, "Now, we "wish to know whether you will undertake to train so "many persons as teachers; if you will, then we will "pay you so much."

19,769. (*Chairman.*) Your proposition was that instead of subsidising training colleges, as they are now subsidised for training teachers for elementary schools, you would give a certain number of scholarships for those who would undertake to qualify themselves as teachers, the grant going rather to the individual than to the college?—Yes, I should give scholarships; but of course the money would not be paid unless the teacher was going actually into the business of teaching.

19,770. (*Mr. St. John Achers.*) If he did not go out as a teacher, the training college would not receive the money?—Yes. You are aware that there is considerable difficulty in enforcing any penalty in a case where a person who has been trained as a teacher does not afterwards carry on the business of teacher in an elementary school; the only way in which it is done is this: we first of all call upon him to pay back the money expended on his training; if he does not pay back the money then we say, You shall not get employment in the Civil Service till you have complied with this condition; very often a man goes abroad, and we see no more of him.

19,771. A considerable number of those who have been educated and trained in these training colleges, and paid for as teachers desiring to become teachers of the deaf and dumb, go away and take other employments?—No doubt.

19,772. There is no penalty attaching, as I understand you, to the college; the penalty would be attached to the individual by that individual being

Mr. P. Cumin, C.B.

15 Feb. 1888.

refused employment in the Civil Service?—Yes, the college cannot compel a man to fulfil his contract.

19,773. You spoke about residence. In your opinion, should residence of the students in these special training colleges be made compulsory?—That is a question entirely open to consideration.

19,774. You would not make it compulsory necessarily?—No; I agree with the new view, that you ought to have two sets of students, one who reside in the institution, and the other who go for the day. If a man lived in London, there is no reason why he should not live at home and go to the institution and be taught.

19,775. Dr. Campbell asked you whether it would not be advisable for the Department to pay only for the best system. I understood that your answer was that the Department at present would be inclined, in your opinion, to pay for any system that was considered to be doing good work?—That is the principle that we adopt in the case of music. There is the Tonic-Sol-Fa system, and various other systems, but we do not give a preference to any particular system of teaching music, and it might be left open what system or systems should be accepted as the proper system or systems.

19,776. Take the case of music; is not it the fact that the Department refuse to give a grant to a school that is teaching music by ear, whereas a little while ago they did give a grant for teaching music by ear?—We do it now.

19,777. At all events you do not give the same grant that you give where music is taught by note?—No.

19,778. The Department considers itself justified in giving a less grant where music is taught by one system than where it is taught by another?—I do not call it a system. Teaching by ear is one thing, teaching by note is another thing; it is not a case of attaining the same object by different means; teaching by ear you do not attain the object of being able to read music.

19,779. The Department has altered its grants with regard to music insisting more than it used to do on the teaching of singing by note. It is the fact, is it not, that the Department does at present act on its own opinion as to what is the proper way of teaching certain things?—There is a grant for singing amounting to 1*s.* if the school is satisfactorily taught to sing by note, that is by the standard or any other recognized notation, or 6*d.* if satisfactorily taught to sing by ear; but we consider those two entirely different things; they have no connexion with each other: in fact teaching by the ear is not worth anything, it is not teaching music in any sense of notation. What I said in answer to Dr. Campbell was, that I thought it would probably be very difficult for the Government to lay down a particular system, and perhaps the best way would be to leave it open to the experts.

19,780. (*Chairman.*) There is one point that I wish to be clear about; you made a suggestion that instead of the guardians as such contributing to these institutions, this power should be vested in the school board and school attendance committees, which would in that way cover the whole ground of the country?—Yes.

19,781. I see the school attendance committees are to a certain extent under the Local Government Board?—To a certain extent.

19,782. Would there be any conflict of jurisdiction, in any way, if these powers were given to school boards and school attendance committees, school boards being under the Education Department and school attendance committees being partly under the Local Government Board?—The school boards really are not under our control except in a very limited way; we cannot surcharge them, for instance, for money they pay improperly, that is for the Local Government Board auditor; their expenditure we cannot touch, but the Local Government Board can touch it, that is the only real control there is over school board.

19,783. Are school boards and school attendance committees on a par with regard to their relations with the Local Government Board?—The functions of the school attendance committees are merely to compel attendance.

19,784. They appear to be a committee of the guardians?—Yes, but then the school board has authority not only to compel attendance, but to supply the necessary accommodation and to spend money upon the school, the school attendance committee has no such power.

19,785. If your suggestion was carried out, do you think that the granting of these subventions to institutions should be under the Education Department? At present, you told us, the school boards are partly under the Local Government Board, because they have the power of surcharging for improper expenditure; do you think that power should be given to the Education Department?—I should leave that power as it is.

19,786. Would you suggest any change in the way of putting greater power in the Education Department to see that these school boards and school attendance committees did their duty?—No; one of the great difficulties is with the magistrates. If a magistrate will not convict, everybody is helpless. Another question is this: Should the grant to these deaf and dumb and blind institutions be administered by the Education Department, or should it be administered by the Science and Art Department. The question of course would be; how much was ordinary education, and how much was technical instruction.

19,787. With regard to technical education, that is at present under the Science and Art Department?—Yes, so far as it exists.

19,788. If technical instruction is to form a part, more or less, of school work, that is, if the school age is prolonged, so as to allow of technical instruction, do you think it should be under the Education Department?—In the Bill of last year it was put under the Science and Art Department; one reason for that being this: if you put the technical instruction under the Science and Art Department then it does not come in as part of the Parliamentary grant, and therefore a school can get a larger sum by the technical instruction being administered by the Science and Art Department than it could if it were under the Education Department, because it is not part of the Parliamentary grant; and on that ground, drawing which used to be administered by us, was taken away and given to the Science and Art Department, simply to get a larger sum for the schools. When it was under us the schools would not take it, because they were deprived of a certain amount of grant; then the administration of drawing was taken to the Science and Art Department, the schools being examined by their inspectors, and the grants from the Treasury being increased.

19,789. Is it the same in Scotland?—Yes, the Science and Art Department distribute the grants for technical instruction there.

The witness withdrew.

Adjourned to to-morrow at 11 o'clock.

No. 6, Old Palace Yard, S.W.

Thursday, 16th February 1888.

PRESENT:

THE RIGHT HON. THE LORD EGERTON OF TATTON IN THE CHAIR.

THE RIGHT HON. A. J. MUNDELLA, M.P.
ADMIRAL SIR E. SOTHEBY, K.C.B.
SIR TINDAL ROBERTSON, M.P., M.D.
B. ST. JOHN ACKERS, ESQ.
T. R. ARMITAGE, ESQ., M.D.
F. J. CAMPBELL, ESQ., LL.D.
W. WOODALL, ESQ., M.P.
THE REV. CHARLES MANSFIELD OWEN, M.A.
L. VAN OVEN, ESQ.
CHARLES E. D. BLACK, ESQ., *Secretary.*

MR. HENRY CRAIK, C.B., examined.

Mr. H. Craik, C.B.

16 Feb. 1888.

19,790. (*Chairman.*) You are secretary to the Scotch Education Department?—Yes.

19,791. Under the present alteration of the law with regard to the Secretary for Scotland, the Secretary for Scotland is the Vice-President of the Scotch Education Department?—Of the Committee of Council on Scotch Education.

19,792. With regard to the Scotch Education Acts which bear on the education of the blind and deaf and dumb children, I believe there is no mention of the deaf and dumb in those Acts?—There is no mention in them of the deaf and dumb at all. In the 69th section of the Act of 1872, which gives power to the parochial boards to pay the fees of poor children, special power is given to pay the fees of blind children, but nothing is said about deaf and dumb children at all. What that clause means, or what additional power it confers, I have a difficulty in seeing. I think it would have been better out.

19,793. Because then those children would have been under the general law which, I suppose, would require them, unless some reasonable cause were shown, to attend school?—Yes. Under the Poor Law Act, power is given to pay the fees of poor children, that is to say, pauper children; but that, of course, applies to the case of parents who are paupers, and who have the penalties of pauperism. We believe that the only power of paying the fees of blind children without pauperising the parent is under the 69th section, and it might appear that the case of deaf and dumb children is not included.

19,794. In fact, one would rather infer that the parents of deaf and dumb children would be pauperised if the fees for their children were paid by the parochial boards, or else that the deaf and dumb are not educable at all?—Yes; but I am glad to say that the board of supervision with whom it rests, in the first instance, to approve the acts of the parochial boards, have held that this section gives a considerable power. Their view is given in the 37th Report; they say: "Having been asked for our opinion as to "the extent of the obligations of local boards under "the 69th section of the Education (Scotland) Act "in the case of blind children, we stated that, as the "provisions of section 69 of the Education Act "expressly applied to blind children, we were of "opinion that the duty of the parochial board to "blind children was precisely of the same nature as "to the other children specified in the section, and "that, when it was necessary, for efficient instruction, "to send a blind child to a blind asylum, the "parochial board of the parish of residence are "bound to carry out the requirements of the statute." That is as far as the blind are concerned, but I am afraid there are difficulties in this opinion which, perhaps, were not in the view of the board of supervision when they gave it.

19,795. You mean that there would be a difficulty in paying any extraordinary expenditure which necessarily would be incurred in teaching blind children?—No; I do not feel that difficulty, but I am afraid that the interpretation which the board of supervision place upon this 69th section would place us in some difficulty for this reason, that they seem to imply that the payment of fees by the parochial boards necessitates, if it is necessary, the sending of a child to some particular institution, and incurring expense in so doing. If that is the case with blind children, the same would apply to other children, and that would place us in very considerable difficulty. We have always held that there was no power under the Education Act for a school board to incur any expense in sending a child to school, or, in fact, for anything except for his education within the walls of the school. School boards have occasionally asked us whether they might make a bridge across a stream which was the only way in which the children could get to the school, and we have always refused permission to do that; then they have asked if they might pay for the ferrying of children across a river, and we have always refused to allow them to do that. I am afraid this opinion rather adds to the expenses of providing for education duties and expenses that are outside of education. I should rather have preferred to rest upon the law as it stood, and to say that, as these children were specially afflicted, you might pay the expenses of the education, and even of the board, of such children without pauperising the parent. I believe the courts of law would hold that that did not pauperise the parent.

19,796. Would there be any necessity for legislation in order to carry out any alterations in the education of the deaf and dumb and blind which would seem to be desirable, or could the Education Department in Scotland themselves, if they thought fit, give a more liberal interpretation to the existing powers under which they act?—I do not think it would rest with the Education Department in any way; it would be with the parochial boards and the school boards.

19,797. Can parochial boards, under the existing law, contribute to institutions for the education of the deaf and dumb or the blind?—The parochial boards, under the existing law, can contribute to institutions of that kind, but school boards have no power to do so. There is a school board in every parish in Scotland, and a parochial board in every parish in Scotland, but they are quite different bodies.

19,798. I gather then that legislation would be required in order to carry out a compulsory system of education for the deaf and dumb and the blind in Scotland?—I should be sorry to say that, strictly interpreting the law, compulsory education could not be imposed now upon the blind or the deaf and dumb.

19,799. That is an important point to settle?—Under the strict law I do not think they are exempted at all from compulsory attendance; but we must bear in mind what the decisions of the courts would

Mr. H. Craik, C.B.

16 Feb. 1888.

probably be, and I think it would be very difficult to get a conviction from a sheriff in Scotland for not educating a deaf and dumb child.

19,800. Would not this be the case, that no one could be compelled to send a deaf and dumb or blind child to school if no school existed, or if the parochial board, where the parent could not afford to send the child to school, did not offer facilities for sending that child to school. Facilities for educating these children must be at the doors of the parents, otherwise the law cannot be made compulsory?—That is true.

19,801. Therefore the question arises, What steps are necessary to bring that state of things about? All deaf and dumb children are not at present sent to school, are they?—No; the deaf and dumb children stand on a different footing from blind children,—blind children in some cases attend the ordinary schools,—but deaf and dumb children practically do not. I see in the return there are four deaf and dumb children who are in State-aided schools; but I have asked the most experienced of our inspectors, and he tells me that he never found any; they never are, so far as I know, presented to our inspectors.

19,802. We have seen a class for deaf and dumb children at Dundee, and one at Greenock, and another at Glasgow?—I think probably these deaf and dumb children are not presented for examination to the inspectors.

19,803. Why are they not presented to the inspectors?—I do not think that the deaf and dumb children could undertake the ordinary work of the school or pass the ordinary standards. I have no doubt whatever that the school board can pay the salary of a teacher for the deaf and dumb, and provide the apparatus necessary, but the payment of fees is a different question.

19,804. The school boards in Scotland do not pay the fees?—No.

19,805. Are not deaf and dumb children counted under the attendance grant in Scotland?—I have never been able to find that they have been. I do not know any instance. I think the classes referred to must be special classes.

19,806. We have here a report from John Kerr, Esquire, one of Her Majesty's inspectors, with regard to the deaf and dumb in Donaldson's Hospital?—That is not a report at the instance of the Department.

19,807. We have also been informed that at Glasgow a school was examined by Dr. Kerr, one of Her Majesty's chief inspectors of schools, and we have a summary of his report?—That is a blind school. We have blind schools to which we pay a grant, and they are inspected.

19,808. All the blind schools are not inspected in Scotland, are they?—I only know of two; one in Edinburgh, and one in Glasgow.

19,809. As the law stands at present, could all the education of the deaf and dumb and blind children in Scotland be inspected by State inspectors properly qualified to inspect the deaf and dumb and blind?—With the consent of the Treasury; and we would also hold that school boards could meet the requirements of such inspectors under the present law.

19,810. The Committee of the Institution at Aberdeen stated to us that they found great difficulty in getting parochial boards to act upon any uniform principle in paying for poor children. Is there any indisposition on the part of the parochial boards in Scotland to pay for the deaf and dumb, for instance?—Officially that would not come under our notice at all. I have never heard that there was any such difficulty. There are constant disputes, of course, in regard to ordinary schools as to the payment of fees; some are inclined to say that the parochial boards are too strict. But in regard to our Education Acts it may be useful to notice that there is a power of bringing before the sheriff the refusal of the parochial board to pays fees where the school board think that they ought to pay them.

19,811. It is a question very often of degree. In this statement made to us by the Committee of the Aberdeen Institution, they say that the sum paid for seven children was 72*l.*, that would not be a very large sum, a little over 10*l.* each?—That goes into a part of the poor law administration that I have no official knowledge of.

19,812. Is not the Education Department in Scotland to a certain extent responsible for the education of the deaf and dumb, or the failure of their education?—The fees for their education having to cover not merely education but board and lodging besides, the authority would be the board of Supervision in Edinburgh, and not the Education Department.

19,813. Do the school boards get any higher grant for the education of blind and deaf and dumb children?—No.

19,814. Would not it be reasonable that they should get a higher grant?—I think quite reasonable.

19,815. In consequence of the greater care and attention required, and the greater expense in obtaining teachers for that purpose?—Certainly.

19,816. To that extent would the Education Department be prepared to support such a proposition, and lay before the Treasury a demand for the necessary money for that purpose, if this Commission were to recommend that the school board should get such an increased grant for the education of blind and deaf and dumb children?—I cannot answer for the Department. I think if any fair proposal was put before them they would be glad to submit it to the Treasury.

19,817. I suppose there will always be a certain number of deaf and dumb and blind children who, from physical delicacy, it would be found almost impossible to send to ordinary board schools?—Yes, and I think it would be injurious to the ordinary board schools to send them there.

19,818. Therefore it is desirable, in your opinion, that facilities should be given to send those children to special institutions?—Yes.

19,819. And to subsidise those special institutions through the parochial boards?—I would give that power of contributing to the school boards instead of the parochial boards.

19,820. Then it would at once come under the education authority instead of, as at present, under the poor law authority?—Yes.

19,821. In that case, the objection which many parents might have of receiving direct aid from parochial boards would be removed. Though the existing law does not pauperise the parents of blind children, yet there may be some objection on their part?—That is a difficult point. I have the opinion of the counsel of the Department to the effect, that he thinks a court of law would not hold that a payment for the board and lodging of a blind or deaf and dumb child would pauperise the parent, and I understand that the board of supervision hold the same opinion; they say that the education of deaf and dumb children in an institution is an exceptional burden which the parochial boards are entitled to defray even in the case of able-bodied parents, and the courts would probably hold that such a payment does not pauperise the parent.

19,822. Independently of that, is not there also in Scotland, as in England, an objection on the part of parents to receiving any assistance from the parochial boards?—We often hear of that. I fancy, however, that you might have some difficulty with some of the school boards; they would object to have this payment handed over to them.

19,823. You think that they would object to the responsibility of undertaking the payment or raising the funds required for the maintenance of deaf and dumb and blind children at institutions?—Yes; certain boards have always objected to a very much more modified proposal which we have made, to hand over to them the payment of the ordinary school fees instead of the parochial boards. It has been urged that that should be done, in order to meet this feeling on the part of parents to which reference has been made. School boards have in some cases strongly resisted that, and I believe they would resist, probably even more strongly, the proposal to make them pay for the board of any children. Still, in my own opinion, I think it would be better that the school boards should have the power.

19,824. (*Mr. Mundella.*) Does not their objection apply rather to the establishment of the free-school system for ordinary children than to paying for the board of blind or deaf and dumb children in an institution. The school boards have no power in Scotland to remit fees; they are obliged to go to the parochial boards for any remission of fees, the fees having to be paid by the parochial boards, and the school boards object to have that power of remitting fees thrown upon them, because it would raise the whole question of free schools?—I think it is a little more than that. When I say school boards, I am speaking of one or two important ones, no doubt. I think they would object to the principle of board being paid by an education authority.

19,825. (*Chairman.*) Are you aware that there has been a memorial presented to this Commission from various representatives of blind institutions, in which they advocate the education of the juvenile blind as far as possible in the ordinary board schools with other pupils; has it ever been brought to your notice that they had memorialised this Commission?—No; I did not know that they had.

19,826. In our visit to Scotland we ascertained from deputations of working men that there is a very strong feeling in favour of blind children in Scotland not being educated at institutions, but at the board schools, on the ground that it assists the blind to make their own way in after life if they are thrown together with seeing children, instead of their being kept as a class apart; has that view ever been brought to the knowledge of the Department?—Yes; in many respects, no doubt, it would have advantages. A great part of the education of the blind is conducted on exactly the same lines as that of seeing children.

19,827. I gather that the idea is, that the funds which are now spent by private charity for the education of blind children should, in many cases, be spent for their technical training after they have left the board schools?—That suggestion has never been brought before us. On the other hand, against that argument, from the account given in the report of one of our inspectors, we think it might in some cases interfere with the efficiency of the ordinary training, and an objection to taking in the children on that ground could only be met by giving the board schoo. a higher grant.

19,828. At Aberdeen we were told that the directors are convinced that compulsory powers are required to secure the attendance of deaf and dumb children; has there never been a case of the compulsory powers being brought into force, as far as the deaf and dumb are concerned?—I am not aware of any; but I should be sorry to say that the law, strictly interpreted, does not apply to them.

19,829. The Aberdeen directors say that compulsory powers are required; they do not say that they do not exist?—I think that they exist, but there might be some difficulty in enforcing them.

19,830. I suppose the Education Department would not object at all to send inspectors to all those institutions where the deaf and dumb and the blind were trained?—If we were enabled to do so.

19,831. Then, with regard to the establishment and working of technical schools in Scotland, it has been suggested to us, that it would be very desirable that the deaf and dumb and the blind should have technical instruction, such technical instruction as would enable them after they had finished their education to take more readily to trades; how do you think that that technical instruction for the blind and for the deaf and dumb could best be carried out in Scotland under your existing Act?—Under the existing Act there is no special power in that respect.

Mr. H. Craik, C.B.

16 Feb. 1888

19,832. Would there be any objection to those technical schools when formed having departments for the education of the deaf and dumb and the blind in the particular trades suited for the deaf and dumb and the blind, or if the school boards did not themselves start such an institution would they be able to assist the existing institutions in carrying out the same thing under their existing management, and in their existing buildings?—In the first place, the present Act gives power to establish technical schools; no doubt a department of this sort specially suited for the deaf and dumb and the blind might quite legally be established under that Act. But it would be a very expensive thing; the schools would very often be of the nature of secondary schools with high fees, and I anticipate that there would be a considerable amount of difficulty in getting the fees paid in the case of deaf and dumb or blind children unless they belonged to the well-to-do class. Of course you are extending their school time. In these secondary technical schools, of which such a department would be a part, we would contemplate that there would be fees of a considerable amount to meet the expenses, and that poor and promising children should be able to attend those schools by means of bursaries, but I am afraid that neither of those cases would facilitate the attendance of the blind or the deaf and dumb. I think it would be better that the school boards should have that power of contributing to institutions which the parochial boards now have, and that they should deal with the technical education of the blind and the deaf and dumb in that way.

19,833. And the inspection of those institutions which is contemplated would ensure that this technical instruction was given in trades suitable for the blind and the deaf and dumb in those institutions?—Certainly.

19,834. You think that at those institutions proper technical instruction might be given to the blind and the deaf and dumb?—Yes. It is hardly conceivable that a parochial board at present should feel itself justified, though legally it might have the power, in contributing to a technical school. A school board might do so.

19,835. With regard to the question of the compulsory length of the instruction of the deaf and dumb or the blind, it has been suggested to us that for the ordinary education of the deaf and dumb, for instance, which is more difficult than that of ordinary children, they should have the very fullest time that is allowed, say eight years, only that that eight years should not only count from 6 to 14, but should be extended say from 7 to 15, or 8 to 16; would there be any objection or any difficulty in carrying out that compulsorily as things stand at present, or would compulsory powers have to be obtained from Parliament?—Compulsory powers would have to be obtained with regard to the attendance of the child after the age of 14, but it would meet the objection that we meet with in reports from inspectors, that the education of the deaf and dumb, and sometimes of the blind, is stopped exactly at the time that it might begin to be most useful.

19,836. Is there any limitation to the powers which school boards or parochial boards have to contribute to institutions; must the institution be certified by the Department?—I do not see any limitation in the section which gives power to parochial boards to contribute to such institutions.

19,837. But at the present time, as those institutions are not inspected, there is no guarantee that those institutions are properly managed, is there?—No, I do not know of any. The board of supervision might exercise a supervision in sanctioning those payments.

19,838. Do you think that the claim of the deaf and dumb and the blind to education should be treated entirely exceptionally, and that there should be special legislation for them?—I am speaking only as an individual, and not for the Department. I think they should be treated exceptionally.

Mr. H. Craik, C.B.

16 Feb. 1888.

19,839. With regard to compulsory powers legislation would be required, and the consent of the Treasury would be required to a higher grant for their education, in consequence of the difficulty and expense of education in the case of the deaf and dumb and the blind?—Yes.

19,840. In those two directions action would have to be taken in order to carry out that which has been suggested to us?—It is not quite so much that additional compulsory powers are required.

19,841. To extend the education after 14, compulsory powers would be required?—Yes, but what I am afraid of is, that unless you had a very wide power of defraying the expense, it would be impossible to put those compulsory clauses into force; and, further, it ought to be made quite clear that such payments did not pauperise the parent.

19,842. With regard to the efficiency of teachers for the deaf and dumb and the blind, is there any provision made at present for the qualification of those teachers?—Not by our Department.

19,843. There is no training college in Scotland for special teachers for the deaf and dumb or the blind?—Not that I am aware of.

19,844. What are the conditions as to the training of teachers in the ordinary schools in Scotland; is there a special grant made for the training of such teachers?—Yes, a grant of about 28,000*l.* a year.

19,845. Is it given to the individual or to the institution?—To the institution.

19,846. The institutions receive a subsidy of how much of the whole cost of each trained teacher?—We pay them three-fourths of the whole of the expenditure of the college; the other fourth is defrayed by the fees of the students.

19,847. (*Mr. Mundella.*) There are other grants besides the three-fourths, are there not?—I think not.

19,848. You pay for the attendance of students at the universities?—We count the attendance of students at the universities as part of the expenditure of the training college, and we pay three-fourths of that expenditure.

19,849. (*Chairman.*) What grants are made for higher education in Scotland in the ordinary universities or colleges?—I think there is a grant of between 20,000*l.* and 30,000*l.* paid for the universities.

19,850. (*Mr. Mundella.*) 40,000*l.* is it not?—That is if you include keeping up the buildings.

19,851. (*Chairman.*) Speaking individually with your knowledge of education in Scotland, do you think it would be unreasonable to demand that the deaf and dumb and blind children should have equally well-trained teachers with the teachers of ordinary elementary schools?—I think it would not be unreasonable that they should have the same grant in order to secure efficient teachers.

19,852. Assuming that it must be more difficult to teach the deaf and dumb and blind children than ordinary children?—Yes.

19,853. (*Mr. Mundella.*) The Scotch Education Acts are altogether on different lines to the English Education Acts?—In many respects.

19,854. In the first place, they are not confined to purely elementary education?—No, they are for the whole people.

19,855. It is the fact, is it not, that from your schools, from your public schools as they are called, large numbers are trained sufficiently to enter the universities every year?—That is so.

19,856. And you have in every parish in Scotland an education authority which you call a school board?—Yes.

19,857. Every branch of education from the lowest to the highest is in the power of the school boards of Scotland?—Yes, that is to say, up to the universities.

19,858. And you teach very much higher subjects in your public schools, for which you receive public grants, than under the English Education Act?—Yes.

19,859. You teach Greek and Latin, and mathematics, and give grants to the students so taught from the Consolidated Fund?—Yes.

19,860. And for the schools where the higher education is given, the school boards have the power of making grants from the rates, and they exercise that power?—Yes, with our sanction.

19,861. Also the whole of the endowed schools of Scotland are now under the control of the school boards?—No, under the control of the Department.

19,862. Under the control of the Department, but with representatives of the school boards upon the governing body of all the endowed schools?—Yes, I think there is a representation of the school board upon the governing body of every endowed school in Scotland.

19,863. So far as the universities are concerned, there is a grant, the extension of which, I believe, is now under consideration, 40,000*l.* a year has been offered and declined as being hardly a sufficient sum, has it not?—I think the last Bill submitted to Parliament gave 47,000.

19,864. What is the number of students in the Scotch universities, is not it between 5,000 and 6,000?—About that.

19,865. That is more than 8*l.* a head for every university student in Scotland?—Yes.

19,866. Then, practically, there is an excellent education brought to the doors of all the youth of Scotland, and provided for by local aid and State grants, from the elementary school to the university, except for the blind and the deaf and dumb?—Yes; perhaps you would allow me to guard myself in one way about the university grant, by saying that it is contended by the universities that that is merely a grant in return for estates which were formerly taken away from them.

19,867. It was a grant contracted for under the Act of Union?—Yes; there were a number of estates which were the property of the universities, and which were taken away from them in the 17th century.

19,868. But the practical effect is the same; out of the Consolidated Fund a sum of 47,000*l.* a year is now offered for education in the universities of Scotland?—Yes.

19,869. Then the powers given by the Technical Education Act for Scotland which was passed last year are to be exercised by the school boards of Scotland, and that Act applies to every parish in Scotland?—Yes.

19,870. You may make grants under that Act for industrial training in any special subjects sanctioned by the Scotch Education Department?—The Science and Art Department will make the grants.

19,871. But you sanction the subjects taught?—Yes.

19,872. Then, practically, there would be no difficulty with respect to special industrial training for the blind and the deaf and dumb in the Committee of Council on Education sanctioning special subjects for the industrial training of that class, and there would be no difficulty in making grants for them?—There would be no difficulty under the Act, if their Lordships thought proper, in sanctioning those subjects, and in grants being made by the Science and Art Department.

19,873. There would be no necessity for new legislation upon that subject?—No, it would be a matter of discretion.

19,874. If it was shown to their Lordships that a certain number of blind persons required training in brush-making or basket-making, or any handicraft, their Lordships could make grants for those subjects as solely applicable to the blind or the deaf and dumb, could they not?—I would rather answer only with regard to the sanctioning of subjects, which alone belongs to our Department; the grants would depend entirely upon another Department, the Science and Art Department; but there is nothing in the law that would prevent it.

19,875. You could sanction a grant, could you not?—We could sanction the establishment of the school, and the teaching of these subjects and the spending of the rates upon these subjects.

19,876. So that fresh legislation for education and training, putting aside boarding, is not necessary at all, so far as Scotland is concerned?—I think not.

19,877. In order to secure the thorough education of the blind and the deaf and dumb in Scotland in boarding institutions, would it not be desirable to transfer the power now possessed by the parochial authorities to the education authority?—Speaking for myself as an individual, I have already said I thought so.

19,878. Is it not the fact that some of the largest school boards desire that power at this moment?—I believe so.

19,879. You are aware that when I visited Scotland as Vice-President of the Council on Education, I had deputations from different institutions in Scotland with respect to that matter?—I think I remember that; I have an indistinct recollection of it.

19,880. The School Boards of Glasgow and Edinburgh, Glasgow being the largest, desired that power. Is not it the fact that Glasgow already possesses that power by a private Act; has not Glasgow separate powers with respect to industrial and truant schools, boarding schools, in fact, for ordinary children?—Glasgow has got a private Act which has enabled another authority to establish a truant and industrial school.

19,881. What is that other authority?—It is a board.

19,882. Irrespective of the parochial authority?—Yes, and irrespective of the school board also.

19,883. If the education and training and boarding of the blind and the deaf and dumb were transferred to the education authorities with wide power as to dealing with the fees, the funds, and the rates, and if it were made incumbent upon them that they should educate this class, that would accomplish all that seems to be wanting in the matter, would it not?—Yes.

19,884. It would secure, practically, the education of the class in which this Commission is interested, would it not?—I am a little doubtful whether the school boards are not at present under the law compelled to provide education for the deaf and dumb if they require it, though they are not required to pay for their board.

19,885. Therefore there is a failure in that respect?—It would be absurd for each board to establish a separate school.

19,886. It would be absurd for small local school boards to be called upon to educate one deaf and dumb child or one blind child; it is not practicable for them to do so without putting them into central institutions?—That is so, involving the necessity of contributing to those institutions.

19,887. If the power of contributing to those institutions was given, that would practically admit of the blind and the deaf and dumb being educated up to the point when they might enter an university?—Yes.

19,888. You told us that 28,000*l.* a year was granted to training colleges; those training colleges are all voluntary institutions in Scotland?—Yes.

19,889. There is no Government training college?—No.

19,890. How many students do they turn out a year?—They turn out about 430 each year.

19,891. And you have also day training colleges in Scotland where they do not board, have you not?—Almost all our training colleges are day colleges.

19,892. And the students board themselves?—The students board themselves in the town.

19,893. The number of trained teachers of the blind and the deaf and dumb that would be required would be very small; but is there any reason why any blind institution, or deaf and dumb institution, that trained its teachers thoroughly for the teaching of the deaf and dumb or for the teaching of the blind, should not receive a grant as well as the other voluntary institutions that trained teachers for sighted children?—Personally, I should be very glad to see any grant made that would help in the training of teachers for the blind or the deaf and dumb; but it is to be noticed that such a grant to an institution would be entirely different from the grants that we now pay to training colleges; those training colleges are not permitted to take any other pupils than those preparing to be our teachers.

Mr. H. Craik, C.B.

16 Feb. 1888.

19,894. (*Chairman.*) The training colleges have a school attached to them, have they not?—They have a practising school attached to them, but the grant to that practising school is entirely separate from the grant to the training college; it is simply treated as an ordinary school. I think, myself, that the only ground for assisting in the training of teachers (I have some doubts whether it is a good way of spending money at all) is that it is necessary to keep up separate establishments for training elementary teachers. If we are going to pay grants to other institutions which train teachers incidentally while they have other objects as well, then we proceed on a new principle.

19,895. (*Mr. Mundella.*) But what infraction of your principle would there be if any institution in Scotland, where there were a number of blind or deaf and dumb in course of training, were to use those children as a practising school for the teachers that were trained there; what objection would there be in connecting a training college with that institution?—I understand you to be putting the case of a training college devoted entirely to the training of teachers. Then that would be on the same principle.

19,896. The only difference would be that the teachers would board, and the children would board in the institution?—Yes.

19,897. Then, with respect to inspection, there would be no difficulty, I suppose, in Scotland; you not only inspect the elementary schools, but you are now inspecting the endowed schools?—We pay no grants to endowed schools; we inspect them.

19,898. And you inspect the high schools?—Yes.

19,899. Therefore you could inspect blind schools?—Yes.

19,900. And you would not contend, as you educate, train, and provide teachers for all those who are endowed with all their faculties, that this small and unfortunate class should be shut out from the same advantages?—Certainly not.

19,901. Then, to sum up: Suppose this Commission were to recommend that there should be the means of training and educating blind and deaf and dumb children in Scotland, and that the powers of detaining such children till they were educated should be compulsory, a short Act conferring those powers upon the School Boards of Scotland would accomplish all we aim at in that respect?—I understand what would be required to carry out what you wish would be to give to the school boards the power and duty of contributing which the parochial boards at present possess.

19,902. I do not mean the optional powers which the parochial boards possess; they may or may not, and very often do not exercise them; but I mean the duty of seeing that those children are educated, and contributing as far as necessary for their education?—I do not think that an Act of Parliament would be required to make that power compulsory, for this reason, at present I take it that the Education Act, if it were pressed to the extreme point, lays upon a school board the duty or providing a school for all the children of the parish. On the one hand, it would be absurd to ask each school board to provide a school for a few blind or deaf and dumb in its own parish, and on the other hand, they have no power to provide for their education in any other way. They have no power to contribute to one central school, and it would be absurd to ask them to establish a separate school; but if the school board, having this power of contribution, were to say, "we shall not contribute," then the department would very fairly come down upon them, and say, "if you choose not to contribute,

Mr. H. Craik, C.B.

16 Feb. 1888.

"then we will make you build a school of your "own."

19,903. I believe there is no restriction on the age to which children may continue at school in Scotland?—Under the Code we do not give grants beyond 18 years of age; there is no limit to the time when they can stay at school if they do not claim a grant.

19,904. If they get grants elsewhere there is no limit at all to the time they can stay at school, is there?—When I speak of grants, I mean only our grants. They might stay in rate-supported schools as long as the school board allowed them.

19,905. And they do stay practically in your schools till they have passed such a standard as admits a considerable number of the youths of Scotland into the universities?—We would pay them grants till they were 18 in day schools and till they were 21 in the night schools.

19,906. (*Mr. St. John Ackers.*) There are no exceptions, are there, to the general law that every child in Scotland must be educated, other than that contained in the 73rd section of the 35th and 36th Victoria?—The only exceptions are attaining the limit of age, or obtaining a certificate of ability to read and write, and of a knowledge of elementary arithmetic. If there is not a school within three miles, that may be pleaded as a reasonable excuse for non-attendance.

19,907. If there is not a school within three miles, that would make it all the more necessary that there should be power given in certain cases to pay for maintenance and travelling expenses, because, for instance, take a blind child, a blind child could not walk three miles to school without a guide?—It would be an additional argument for giving that power.

19,908. To go back to the question of training colleges, could certificated students from English training colleges, recognized by the Government, obtain schools in Scotland?—Certainly.

19,909. It is interchangeable, in fact?—Yes.

19,910. The present Code necessary to be passed in order to obtain a certificate in a Scotch training college or an English one, makes it absolutely impossible, does it not, for a blind person to obtain such certificate; he cannot pass the drawing class, for instance?—That is so, unless we make a special exemption.

19,911. Has the Department power to make an exemption, or would that require to be embodied in a new Act of Parliament?—We should have the power without a new Act of Parliament to make such an exemption.

19,912. Have you had applications from Scotland to allow blind persons to go through your training colleges and obtain certificates?—I think, myself, that the training college would be disinclined to take in such persons, unless you give it special encouragement. We only pass the candidates through the examination, and say to them, now you are qualified to enter a training college if you can find a place. We leave it to the authorities of the training college to admit them.

19,913. Would not it be desirable that the Education Department should so modify the Code as to enable a trained blind teacher to obtain a certificate?—I certainly think we should do that. I should have thought that there were certificated blind teachers.

19,914. As a matter of fact, it was frequently brought before our notice that they could not obtain a certificate?—I do not think they could pass through all the course of the training college, but we must, of course, assume in such cases a slight discretionary power. In the case of schools that we inspect, it is impossible that blind children should obtain our grant exactly on the same conditions as the seeing children, and yet our inspector has a certain discretion, and he passes the children, and they do earn the grant.

19,915. You have already stated that in your opinion there ought to be equally good teachers for the blind and deaf and dumb children as for the seeing and hearing children?—Certainly.

19,916. It would then be necessary, would it not, not only that they should be specially trained in special institutions, but that they should also have sufficient general knowledge and attainments to be able to teach, because they might only in those special institutions get that special knowledge which is necessary for their special department?—Yes.

19,917. Then it would follow that the time which would be required to train a perfect teacher for the deaf and dumb, we will say, would take longer than for those going to teach ordinary children?—Yes.

19,918. Then your opinion is, I take it, that under those circumstances it follows that a grant should be made, we will say, for the sake of argument, for three years to them instead of two years, which, you say, is now granted to ordinary students?—Yes.

19,919. I will follow up a question of Mr. Mundella's in order that there may be no mistake about it. You were asked whether special institutions for the training of teachers might not receive grants for teachers who were being trained for the deaf and dumb or for the blind; I think your reply was that there would be great difficulty if they were not all of them students; but many of them were practically only the ordinary teachers, and those who had to look after the pupils?—No, I did not intend to use the words "great difficulty," I only pointed out that it did not follow from the analogy of the grants we paid to institutions devoted entirely to the training of our teachers, that therefore we could grant the same aid to institutions which did not devote themselves entirely to that work. I do not think there would be any great difficulty in establishing a new principle of grant.

19,920. If you found an institution in which at the present time the whole of the students were being trained to become teachers, that would be, practically, on all fours with your existing training colleges?—Yes.

19,921. You would have no difficulty there in recommending a grant under those circumstances?—No, in that case the institution would follow exactly the analogy of our own training colleges; and at this moment, if it were proved to our satisfaction that an additional number of teachers was required every year, and that therefore a new training college was necessary, we would recognise voluntary action for that purpose, and if that special voluntary action applied to persons who were going to become teachers of the blind and the deaf and dumb, grant might be given to them.

19,922. If the department found that there were training colleges for teachers of the deaf and dumb and the blind in England, while there are not any at the present time in Scotland, and if students after they have been certificated are interchangeable, would there be an inclination on the part of the Scotch Department to pay something towards the training of teachers for those classes in Scotland though educated at an English institution, rather than go to the expense of having to found fresh institutions in Scotland?—That would rather be a matter of arrangement between the two Education Departments and the Treasury; the money would all come out of the Treasury purse, and whether the Treasury should pay it all through one department or partly through us and partly through the English Department, would be only a matter of arrangement.

19,923. You see no difficulty in its being arranged? No.

19,924. To pass on to another point, with regard to the Code for the blind and the deaf, it would be absolutely necessary, in your opinion, that the present Code should be modified so as to meet the requirements of the blind and the deaf and dumb?—The case of the blind is different from that of the deaf and dumb; in the case of the blind our inspectors are already, by a very slight straining of their discretion, able to give grants to blind children in special schools, and we also find that blind children claim grants in the ordinary schools; but I am not aware of any deaf and dumb child getting such a grant; and it is quite clear that the Code would be quite inapplicable to the deaf and dumb.

Mr. H. Craik, C.B.

16 Feb. 1888.

19,925. If it were proved to the satisfaction of the Department not only that the compulsory age to which deaf and dumb children, for instance, should be kept at school should be increased, but also that it is not advisable to admit them at quite so early an age as the seeing and hearing children, would the Department so far relax their rules as to admit of such children being dealt with between the periods best fitted for their education?—The Department has no power of that sort, that would be a matter of legislation; the period of compulsory education is laid down by the Education Acts.

19,926. Under the present Act it is necessary that the children should be in school when they arrive at the age of five years. Suppose it was proved to the satisfaction of the Education Department that it was better that they should not come in till they were seven, would your Department, do you think, be inclined to put in force the compulsory powers which you say now exist, and force them to attend school at that age?—The enforcement of the compulsory clauses does not rest with the Department, it rests with the school boards, and, as a fact, the school boards in Scotland do not often enforce those compulsory clauses at five years of age.

19,927. You say it rests with the school boards; but is not it the same as it is with the school authorities in England, that while it rests with them they may or may not do it according as they are compelled by the Education Department?—We have not the same compulsory powers in Scotland as you have in England.

19,928. (*Chairman.*) Is not there a power of taking a case before the sheriff?—He can adjudicate in a case that is brought before him; but he cannot tell the school board, you must bring this case up before me.

19,929. Then how are the compulsory powers exercised in Scotland; who sees that they are exercised?—The school boards.

19,930. But nobody over the school boards?—We cannot deal with a school board in default; we may apply a good deal of encouragement which may indirectly have the desired effect; we offer for regular attendance certain grants in the Highland counties where there is the greatest difficulty about the compulsory clauses; and in other places we may sometimes remonstrate with the school board, and we may point out to them the loss that they incur, but we have no power of forcing them to prosecute.

19,931. (*Mr. St. John Ackers.*) Then no change of the law, such as that which Mr. Mundella suggested just now would meet the case of a school board which declined to educate a blind or deaf and dumb child?—It would meet the case I understood Mr. Mundella wished to call attention to; that is, where a school board failed to provide the means of education; we can only force a school board to provide the means of education by taking them to the Court of Session.

19,932. You can force them to supply the means of education, but you cannot force them to fill the school when the means have been provided?—No.

19,933. If there is to be any fresh legislation with regard to children who are not being educated in Scotland, would it not be advisable that that additional power should be given to the Education Department for Scotland?—That is a very burning question, whether we should have that further power of interfering with the local bodies. I should rather not give an opinion upon that.

19,934. (*Chairman.*) It is quite clear that Parliamentary powers would be necessary for the transfer of the powers now exercised by the parochial boards to the school boards with regard to payment to institutions?—Certainly.

19,935. (*Mr. St. John Ackers.*) Can you tell me if there is any over-ruling power which would compel a parochial board for instance to pay fees at the present time?—Such power of interfering with the decision of a parochial board as is possessed is possessed under section 22 of the Act of 1878, which provides that if a parent is refused his fees by the parochial board it shall be the duty of the school board to apply to the sheriff to grant an order against the parochial board for the payment of the fees. We have supposed that that section meant simply to give a second court of appeal to the parent; that if he said he could not pay his fees and the parochial board thought he could, then he should be allowed to go to the sheriff. Certain school boards do not accept that interpretation. They say, no, we must exercise our discretion after the parochial boards; if we think the parochial boards are right in their decision we will not take them to the sheriff, if we think them wrong in their decision we will.

19,936. It comes to this, that the school boards are practically supreme?—Practically supreme, except in certain cases if they choose to appeal they may go to the sheriff. The strongest clause interfering with the school board's power of compulsion is the 12th section of the Act of 1883, which is as follows: "Where the school boards are informed by any "person of any child in their district who is stated "by that person not to be in course of receiving "elementary education by regular attendance at "some public or inspected school or otherwise, it "shall be the duty of the school board to take "proceedings under sections nine and ten of this "Act, unless the school board, for reasons to be set "forth in their minutes, think that it is inexpedient "to take such proceedings"; but there is no body to enforce that.

19,937. (*Chairman.*) Is there not generally a very much stronger feeling in Scotland in favour of compulsory education than there is in England; is not there a general feeling in favour of education being extended to all in Scotland?—Yes.

19,938. Is not the reason why the deaf and dumb have not been educated that there has been in many districts no very convenient school where they could be sent?—Yes.

19,939. (*Mr. St. John Ackers.*) I wish to ask you whether to your knowledge there are not a very large number of poor deaf and dumb children at the present time uneducated who might be educated, even under the present condition of the law?—The only information I can give upon that point is this: Of the blind between the ages of 5 and 15, there are 341, and of the deaf and dumb 781.

19,940. And how many in school?—I can only give you the number of those who are paid for. The number of blind who are paid for in institutions according to a return we have received is only 32; that would be very much under the proportion in the case of ordinary children, I think.

19,941. (*Sir Tindal Robertson.*) Paid for by whom?—By the parochial boards.

19,942. (*Mr. St. John Ackers.*) That shows that there is apparently a great remissness on the part of the school authorities of Scotland in regard to the education of these afflicted classes?—On the part of the parochial boards.

19,943. On the part of the two bodies together who have the power at the present time of sending these children to school?—Yes. Of the 781 mutes I find that only about 70 are in special institutions paid for by the parochial boards.

19,944. (*Admiral Sir E. Sotheby.*) Is it in the power of the Education Board to make any special inquiry as to how many of the deaf and dumb and the blind children are being educated?—It would be very difficult for us to get such a return.

19,945. Is it in the power of any other board in Scotland to obtain that return?—I think it would be difficult to get such a return. I have not in my possession just now any information of that sort.

19,946. Such information would be useful?—It would be useful, no doubt.

Mr. H. Craik, C.B.

16 Feb. 1888.

19,947. You would be able to spot those who were not educated?—Yes.

19,948. You have stated that there is a much smaller proportion of the deaf and dumb and the blind educated than there is of the sighted and the hearing? — I think there is a small proportion educated by the parochial boards. You must remember that, except in the case of very well-to-do parents, they must all get assistance from the parochial boards if they are to send their children to outside institutions. One would expect that a much larger proportion of those afflicted children would be educated at the expense of the parochial boards than of ordinary children, but it is not so.

19,949. Because they do not like to pay the extra expense, I suppose?—I believe the parents are very often unwilling to part with their children.

19,950. A great many of those who are unaccounted for, for all you know, may be brought up in asylums and institutions for the deaf and dumb and the blind as in England?—Yes.

19,951. You say it is most necessary to have thorough teachers for the deaf and dumb and the blind; where do the present teachers get their training?—I believe at some of the institutions, such as Donaldson's Hospital; and I understand that the Glasgow School Board just now is giving instruction in methods of teaching the blind to ordinary teachers. The Glasgow School Board is going to try to provide for blind children in the ordinary schools.

19,952. That is merely an experiment?—Yes.

19,953. Are you satisfied with the amount of knowledge and aptitude for teaching that teachers for the blind and the deaf and dumb have at the present moment?—I have no means of coming to a conclusion. The reports from Dr. Kerr have spoken well of the schools, and the efforts of the teachers; that is all I can say.

19,954. Do you think that teachers for the deaf and dumb and the blind might be given a certificate on passing an examination to test their special fitness for teaching the deaf and dumb or the blind?—I think such an examination would certainly be very useful.

19,955. There is no examination of that sort at present?—No.

19,956. If those who were intended to become teachers of the deaf and dumb or the blind, were sent to any training college where it is known that the education was thorough, it would be a great advantage?—Certainly.

19,957. Do you know any training college at present where you consider the teaching is thorough either for the blind or the deaf and dumb?—Dr. Campbell trains teachers, I understand, but I have no special knowledge as to that. I know of none in Scotland, and I have no official knowledge of any in England. I understand there are better schools in England for the training of teachers. I know that as a matter of general knowledge.

19,958. Are you satisfied that the teachers you now have in Scotland are good enough, is not there room for better teachers?—We have no means of judging that; we have no means of comparing them with the teachers in other countries.

19,959. Do you know whether any of the ministers of the Church of Scotland are blind?—I know of one who is blind; there may be more; I know one of eminence who is blind.

19,960. Are the blind ever sent to the universities in Scotland?—Yes, I have seen them at the universities.

19,961. (*Mr. Van Oven.*) If the Education Department in Scotland at the present moment do not take any notice of the blind and the deaf and dumb, as I understand you to say they do not, would it not be necessary that special provision should be made in their Codes, and in the mode of organizing the education under them to suit those two classes?—I think it would be very desirable, if we could obtain the necessary funds from the Treasury.

19,962. For that purpose it would be necessary to make a special Code suited to the conditions of the deaf and dumb and the blind, and to have certain inspectors to test the quality of the education, and the manner in which it was being given in the different schools or classes? — Yes, some articles would have to be introduced into the Code, and we would either require to have an inspector permanently on the staff, who was acquainted with this sort of education, or else we could employ from time to time as was required some specialist.

19,963. Then as regards your teachers, it would be necessary to have your teachers specially trained, either for teaching the deaf and dumb or for teaching the blind? — I have no doubt that such special training would make them more fit for their work; but at present we have two blind schools in receipt of a grant, the teachers in which have not had any special training so far as I am aware.

19,964. As regards the deaf and dumb, are there any schools where the state of things is the same?—We have none in receipt of a grant.

19,965. There is a class at Dundee, which is provided by the school board; does not the school board receive a grant for that class at Dundee?—I do not like to say there is no grant, but I think it would have come to my notice if there had been a grant for that class, probably they did not apply for a grant at all.

19,966. Then it is provided for by the rates without a grant?—I presume so.

19,967. Provided that the education of the deaf and dumb and the blind were made obligatory in Scotland, and enforced as far as possible by the law at present existing, or as it may exist in the future, would it not be advisable for the Education Department to take notice of the teachers employed for teaching specially the deaf and dumb, and to grant them special certificates for that purpose, under the examination of their inspector?—It would be very advisable, certainly. I should be very glad to see power in the Education Department for doing so.

19,968. Then for that purpose it would be necessary to make some grant for the teaching of those teachers in that special branch?—It might be found necessary, but there are many teachers of course, both in England and in Scotland, for whose training we have not paid in any way.

19,969. Do you think it would be an advisable and practicable plan, that the school boards from time to time, for the purpose of obtaining teachers suitable to teach the deaf and dumb and the blind should take certain of the certificated teachers in ordinary elementary schools, and send them to special institutions to learn the special system of training necessary to teach the deaf and dumb or the blind?—I think that would be a very desirable thing, but that raises a question of general difficulty; we find that boards are unwilling to do anything in the way of training a teacher; they say, "Train yourself," or "Get your "training as you like, and come to us and we will "employ you." It is a doubtful policy for a school board to spend the rates in the training of a teacher, who the next day may go and accept office under another board.

19,970. Do you think it advisable that the Department should pay for the training of a teacher, who had first been trained as a teacher in an ordinary elementary school, and then went to a special institution to receive that extra training which would be necessary for that teacher to become a teacher of the deaf and dumb or of the blind?—I would rather go back to what I said before, that I think, if we are to continue to pay grants for the training of teachers, —against which a good deal may be said, although I would rather not give my own opinion—if we are to go on with that principle, I think that teachers of the deaf and dumb and the blind have a very strong claim to get a share of those grants for their own training.

Mr. H. Craik, C.B.

16 Feb. 1888.

19,971. There is a system in Germany under which the best teachers in the public elementary schools are induced to go to the school for the deaf and dumb, in order to be trained as teachers of the deaf and dumb, and practise as teachers of the deaf and dumb, because such teachers are paid higher salaries than are paid to teachers in the ordinary elementary schools. Seeing that the difficulty of obtaining good teachers for the deaf and dumb is very great, it seemed to me that something of the same system might be carried out in this country and in Scotland; that is to say, that some inducement should be held out to the best teachers certificated in the public elementary schools, to enter upon that special training and become teachers for the deaf and dumb by means of higher payments or emoluments in the shape of grants given by the Education Department?—It would be very desirable indeed if something of that sort could be done; but I am afraid the system in Germany lends itself to such a thing, and ours does not. The Department might help in the training of those teachers, but it is not the Department that pays the salary of such teachers, and even if we increased the grant, we should not thereby secure a better salary to the teacher. The grant is paid to the school managers, be they a school board or anything else, and it is for them to arrange, on the principle of supply and demand, what they shall pay for their teachers. If a man is a very able man, and does his work very well, and it is important to secure him, they will naturally pay him a larger salary than they would pay a man who was not so efficient a teacher, but we cannot tell them, you must pay your teacher a large salary.

19,972. But, if the grant be given to the school authority, and their object is to work their school well, will not that enable them to offer to a special teacher special advantages?—We never make any bargain as to the salary they are to pay to their teachers. If a school authority gets a large grant, no doubt they would have all the more to give to their teacher; but a school might earn a specially large grant, and yet not pay a specially high salary to the teacher.

19,973. You might induce school boards and school managing committees to endeavour to get, for the teaching of the deaf and dumb and the blind the best teachers they could, and you might stimulate them to do so by giving grants towards the training of those teachers?—We might say, in other words, provision is made for the special training of teachers of the deaf and dumb or the blind, and if you employ one of those teachers who has had that special training, we will give you a better grant.

19,974. Suppose clauses were established in schools for the deaf and dumb and the blind, I presume you would provide inspectors who would examine those children under a special Code, and you would give the schools grants for children who had passed under such special examination, according to a special Code which you might make, in the same way as grants are given in respect of special classes of children. such as infants?—I am quite sure that the Department would very favourably consider any such proposal, but we would need to obtain the consent of the Treasury.

19,975. Such a thing would be feasible?—Such a thing would be feasible if the means were given us of doing it.

19,976. (*Rev. Mr. Owen.*) I think I gathered just now that you are of opinion that either a special staff of inspectors would have to be appointed, or, for the time being, specialists would have to be engaged to assist the ordinary Government inspectors?—I think that would be useful. The ordinary inspectors might very soon acquire the necessary experience, but the employment of experts would be very useful.

19,977. You think it would be necessary to devise a special standard, taking into consideration the difficulties of teaching this afflicted class, the standard upon which the grant would be based would have to be very much lower than the standard in the case of ordinary education?—In certain respects, it would have to be lower. I do not know that it would have to be in all. I think the general intelligence of the child for which we pay a special grant might be quite as high as in the case of an ordinary child.

19,978. Would it be fair, as a rule, to fix almost the same standard for the deaf and dumb and the blind in elementary education as you would for an ordinary child?—The ordinary subjects of reading, writing, and arithmetic you would require to make easier, but I think I have seen in the reports evidence of a considerable standard of intelligence among these children. Of course, they are called on to exercise a very considerable amount of brain power which other children have not to use.

19,979. Taking into consideration the extra cost of educating the blind and the deaf and dumb, would you be in favour of a larger grant in proportion being given?—It would be a difficult thing for me, as secretary of the Department, to say I am in favour of a larger grant; but I may say that I think a fair case might be made out for a more liberal grant.

19,980. You think it most probable that the cost of educating the blind and the deaf and dumb would be considerably more than the cost of the education of ordinary children in the same class of life?—I think that is inevitable.

19,981. Suppose an extra grant were not given, how would you suggest that the extra expense should be met; would you say it should come out of the local rates?—I think you can look to a considerable amount of voluntary contributions in these cases.

19,982. Because the children are specially afflicted?—Yes; it is not to stop the stream of subscriptions that I would recommend that the power of contributing to such institutions should be given instead of the power of establishing them. Nobody would subscribe to an institution established by a school board and kept up and managed by a school board, but people would go on subscribing, even though the school board gave a subsidy, to a voluntary institution.

19,983. The subscriptions would probably be considerably less, would they not?—I do not know that they would. If you have a large blind asylum under voluntary management, and supported by voluntary contributions, those voluntary contributions will not fall off, because a school board may make a subsidy to such a voluntary institution.

19,984. (*Sir Tindal Robertson.*) There is a friction between the parochial boards and the school boards with regard to some of these points?—There occasionally is.

19,985. But suppose that the plan that has been suggested by the Chairman was adopted, namely, that the school boards should take the whole of the direction of the matter into their hands with regard to the education of these children, would there not be a chance of still greater friction if the parochial boards had no control over the matter, but were obliged to meet the expenses?—But I should not suppose that if the matter were taken out of their hands they would meet the expenses further than that they would be obliged to meet the precept of the school board by raising a certain amount of the rate.

19,986. Then, in fact, the rate, instead of coming out of the general parish rate, as at present, would come out of the school rate?—Out of the school rate. But I should, perhaps, ask whether, in speaking of the transference to the school board of "the whole matter," you mean the payment of fees or the power of contributing to such schools?

19,987. I mean both?—Of course, if it had been merely the transference of the payment of fees to the school board, that would probably go with the payment of fees generally by all the children to the school board, and would have left the school board without any power of keeping up or contributing to an institution of this sort.

Mr. H. Craik, C.B.

16 Feb. 1888.

19,988. You are aware that, at the present time, in some of the larger school boards of this country there is what is called a higher system of education carried on, a selection of certain children coming from the lower schools to a higher grade of school where science, chemistry, physiology, and matters of that kind are taught?—Yes.

19,989. Is there anything of that kind in Scotland?—Yes.

19,990. The same system is carried on there?—Yes, in the larger towns

19,991. And with regard to the blind, the deaf, and the dumb, would it not be possible to put them on something of a similar system, only substituting handicrafts for these higher scientific subjects?—Bringing them into a single school, do you mean?

19,992. I mean instead of teaching them these higher scientific subjects, to teach them such handicrafts as would be useful to them in after life?—Yes, I think it would be possible now, and under the Technical Schools Act still more so.

19,993. Then, would you think it advisable that that should be carried on under the present school board administration, or under some new administrative body?—I think so long as it is not a boarding school that the school board may quite well overtake it; but the school board will be unwilling, I fancy, to take charge of any institution where the children are to be boarded and lodged as well as taught; and I think that to meet that difficulty I would give them the power of contributing to such institutions.

19,994. With regard to the grant to the universities, I think that is 47,000*l.*?—Under the Bill my impression is that the figure is 47,000*l.*

19,995. Is it not your impression that that is not so much distributed for the transference of certain lower scholars to the universities, but (as you yourself stated) in order that there might be a deficiency made up in consequence of certain endowments which were left in the olden time having been taken away?—Yes, and that is the reason that I guarded myself. The universities would not like it by any means to be said in Scotland that this grant was entirely an eleemosynary grant; they had estates, and, rightly or wrongly (I cannot decide the legal point or the historical point), they assert that they had a claim in justice upon the grant.

19,996. Then practically this grant is given more for the general extension and keeping up and maintenance of the universities than for stimulating any particular scholars, or taking up and maintaining any particular scholars from the lower schools of the country into the universities?—Undoubtedly. No part of the bursaries that are paid to students in our universities comes from the State; the bursaries are all private endowments.

19,997. Then, in the event of any blind, or deaf, or dumb boys being taken from these schools or special institutions into the universities that would not be available; it would be necessary to have some bursaries or funds found from some other source?—Undoubtedly. No student gets any bursary out of public funds for the university.

19,998. (*Chairman.*) There was a question whether the three miles limit with regard to the deaf and dumb and blind children should be enforced, or else travelling allowance given. Take the case of a child at a board school in a large town, who lives between three and four miles away from the central school; do you think that the three miles radius should be relaxed in order not to set up two blind schools or two deaf and dumb schools in a town, say, of 40,000 inhabitants, or that travelling allowance should be allowed, say, for tramcars, or railway, or other means of travelling?—In such a case I think it would be a great pity to establish two schools; I think it would be much better to keep up the one.

19,999. How would you meet that point; we had a case the other day where a child was walking more than eight miles a day in order to get to school?—No one would say, of course, that it is not much better to have some means of paying the tram fare or the railway fare, as the case may be; but, at the same time, I have great doubts, as a matter of administration, about adding to the powers of the school board that of paying for travelling.

20,000. I am only asking the question with regard to deaf and dumb and blind children. Their case stands on quite different grounds from that of children not so afflicted, does it not?—Of course it is open to question whether, for that very limited number of children, special powers might not be given; they undoubtedly would be, in many cases, of great advantage.

20,001. Could that be done by an alteration in the Education Code?—No, it would need an Act of Parliament. We hold that there is no power in the board at present to defray travelling expenses.

The witness withdrew.

Maj.-Gen. F. D. Donnelly, C.B., R.E., examined.

Major-Gen. F.D. Donnelly, C.B., R.E.

20,002. (*Chairman.*) You are secretary, I think, to the Science and Art Department, South Kensington?—That is so.

20,003. And all science and art classes over both England and Scotland and Ireland, are under your charge, so far as any grant is made to them by the Department, I suppose?—Yes.

20,004. How are those grants given; after inspection, or on what principle?—The grants are regulated by the rules in the Directory for Science and Art Schools. The principal payments are made on the results of examination. There are other subsidiary grants for buildings and aiding in the purchase of apparatus, and so on, but the main grant is made on the result of instruction as tested by examination. I should say that there are also grants in aid of scholarships, and matters of that kind.

20,005. We do not want to go into the general subject, but to know how far the deaf and dumb schools come under you in England and Scotland and Ireland, and what, at present, have been the grants which they have earned?—With regard to art instruction, I furnished the Commission with a tabular statement, I think at the beginning of last year, giving the result of the examination of schools in elementary drawing, and also in second grade drawing, and comparisons between them and other schools.

20,006. With regard to these schools on that list, do they compare favourably with the ordinary class of schools in drawing?—Yes. Perhaps I may be allowed to say that, having only received information late yesterday evening, I have really had very little time to look up this matter, but I have endeavoured this morning to get the papers together, and see what I could of the matter; and from my rather hurried inspection of this table, with which I furnished the Commission, it seems to me that there is one rather remarkable result; that the deaf and dumb schools do better, as far as reaching the standard for "passing," and not quite so well in reaching the standard for prizes. If you take any of the years given in this list, you will see, "schools for the deaf and dumb," and "public elementary schools." The percentage of success in the deaf and dumb schools was 54·43, and in public elementary schools 51·06; whereas the percentage who obtained prizes was, in deaf and dumb schools, 11·53, and in public elementary schools 20·15. I am taking the first year; I fancy it is a fair average year. Then, if you take the second grade examination, you find that the passes in the deaf and dumb schools are 34·02 per cent., and in public elementary schools 28·03: whereas the per-centage who obtained prizes in the deaf and dumb schools is 4·12, and in the other schools 6·07. And then, taking both grades combined in the schools for the deaf and dumb, and the public elementary schools, you find that the percentage of success is 51·21 in the deaf and dumb schools, as against 47·11 in the other schools; whereas the prize percentage is 10·37, as against 17·73. It is rather curious. I have no theory to account for it.

20,007. Would that be at all accounted for by the teaching not being so good in the deaf and dumb schools; that is to say, that natural ability enabled them to get a greater number of passes, but that the want of good teaching prevented them getting prizes?—I really do not know. As a matter of fact, I only looked at this table with a view to getting anything out of it, this morning.

20,008. Have you no reports from your inspectors that bear upon that point?—No. Of course, on the face of it, the return rather indicates that the deaf and dumb are better up to a certain average, and that you do not get among them, to the same extent, the higher excellence which is necessary to obtain prizes that you do amongst the masses who are not so afflicted. But perhaps drawing may have been more generally taught throughout the deaf and dumb schools, while some selection of pupils was made in the others. I have no means of knowing this.

20,009. Do these statistics apply to the three countries?—Yes, throughout the United Kingdom.

20,010. (*Mr. Woodall.*) Were the figures you quoted second grade and third grade?—Not third grade. This return deals with the case of schools which we know are deaf and dumb schools as compared with ordinary schools. In the third grade, that is to say, in the schools of art, and the art training school, we have a number of deaf and dumb students, but they have never been taken out as a separate class to be compared. We are dealing with specific schools.

20,011. (*Chairman.*) This return before us does not appear to include the Irish schools at all, because it is described as a return showing the results of examinations in drawing held in the institutions for the deaf and dumb in the years 1882 to 1886, inclusive; and the places named do not include Ireland at all; they are Exeter, Margate, Liverpool, Manchester, London, Newcastle, Birmingham, Doncaster, Edinburgh, and Glasgow?—The return deals with all the classes that we are aware of in the United Kingdom, but I am not aware whether there are any in Ireland that have come under the examination of the Science and Art Department.

20,012. Have you any reports from the inspectors specially recording the results in drawing in the deaf and dumb schools?—No. I asked for all the papers in the Department that could be found this morning that bore on the subject, and I have no special report, except with regard to another point, and that is the examination in science in the case of the blind; but I thought your Lordship wished to keep to art first. I have mentioned, I think, before, the simple question of the art instruction of the deaf and dumb. With regard to the blind, of course the question does not arise.

20,013. You do not make for the deaf and dumb any further grant, except for drawing; there is no other art trade taught; for instance, is there any carving or modelling?—The Science and Art Department have no power to make grants *quâ* carving; but modelling, which forms part of the general instruction in art, comes under the purview of the grants of the Science and Art Department. In the returns that I dealt with just now I was only speaking of the instruction in elementary schools, and the instruction, as far as it went, in those schools up to what is called the Second Grade Art Instruction. Of course there are a large number of students both in schools of art in the country, and in the National Art Training School who are deaf and dumb, but of whom we keep no separate record. They just work as other students, and the same grants are paid upon them as upon students who are not so afflicted. We have at the present moment, I may mention, in the National Art Training School, a student who is totally deaf, but who can speak; he only lost his hearing a few years ago; he gets his instruction by writing and by signs in the deaf and dumb alphabet, and they find that he is very easily taught, and the instructor in modelling says that he is one of the best modelling students in the school.

Major-Gen. F.D. Donnelly, C.B., R.E.

16 Feb. 1888.

20,014. What age is he?—About 24 or 25, I think, and M. Lantéri, who is the instructor in modelling, says that he has had experience of other deaf and dumb mutes in France, and that he has found them very apt at modelling, and quick to take in instruction.

20,015. Do you know whether the principal deaf and dumb modeller at Sir Henry Doulton's was trained under your schools; I think he was?—Yes, probably at Lambeth. Then Mr. Sparkes, the Principal of the National Art Training School, says, that they have had many deaf and dumb mutes in the National Art Training School; he finds them somewhat slower than ordinary students; one who is now in the school cannot use the deaf and dumb alphabet, but they make him understand by writing.

20,016. I suppose that is probably from not being well taught at school?—Yes. I think I have given you all the information I can with regard to what happens in the art schools. In those art schools they do carry on instruction in wood carving rather as a form of modelling; that is to say, the work is sent up to the Science and Art Department as designing and modelling, but we do not give grants to wood carving specifically as such. But I may say that I have had to do with the School of Wood Carving of the Committee of which I am the Chairman, which is mainly supported by a grant from the City and Guilds of London, and furnished with rooms in their institution in the Exhibition Road, their central institute; we have had several deaf and dumb pupils there. There is one now who is 23 years of age, and has been four years in the school; he is now one of the best carvers that we have; Mr. Grimwood, who is the instructor in wood-carving, uses his fingers to talk with him, but Miss Rowe, who manages the school, says that she has no difficulty in making him understand by signs. Then we have another, about 24 years of age, now in the school, who has been there about nine months; he is rather a weakly lad, and has had softening of the brain. Then there was another in the early days, aged 22, who was formerly in the school for six months; he had been taught to articulate; he made very good progress as a carver, but afterwards went to Nottingham, where he did well as a designer for lace, and he came to see Miss Rowe, the manager of the wood-carving school, some time ago, and said he was going to Australia, though doing very well as a designer at Nottingham; I do not know why he was going out there, but he seemed to be doing very well at Nottingham. And in the early days of the school we had another deaf and dumb boy, and I think there have been two or three others in the school; but these are the only ones I could get a specific record of, and they have done fairly well, one of them exceedingly well, and the others very fairly well; and in that school, which is not a Government school, they are being taught a specific industry by which they can earn their living if they succeed in it.

20,017. Do you know whether any of those deaf and dumb had learnt any of the rudiments of artistic or technical training in the schools where they had been taught, or did they all come to you for that?—I think they had all learnt to draw. We have a condition in the school that we do not take them in as free students, unless they have passed through a certain amount of drawing; I do not know whether it was relaxed in these cases, but I fancy not.

20,018. Now with regard to science, I suppose that is what principally applies to the blind; how far do the blind come under your Department; they have no technical training at all at present under you?—Of course not under the Art division.

Major-Gen. F.D.Donnelly, C.B., R.E.

16 Feb. 1888.

20,019. They might have modelling to a certain extent; in Germany we have seen the blind modelling?—I am not aware of any case of a blind student doing modelling; but, as far as science instruction is concerned, of course if they were only deaf and dumb, they could come up in the same way as other students to the examination, and payment on results would be made on account of their instruction, just as it would be for any other students.

20,020. Are there many cases?—I am not aware about the deaf and dumb. There is nothing that has been specifically under the notice of the Department; but we have had one or two cases with regard to the examination of the blind. Application has been made that we should examine the blind by allowing them an amanuensis, and that could not be permitted, because, as the Government grant is made on the result of the instruction, we could not tell how much was due to the student and how much to the amanuensis. But we have never refused to allow the examination when it was carried out by means of writing on a frame. An application was made some years ago for the examination of a candidate in Gorbal's School, in Glasgow; it was used rather as an experiment. The candidate came up in mathematics, and one of our inspectors watched the examination. I do not know whether the Commission would care to have the details. He made a very careful report of the examination, showing the difficulties of the case.

20,021. It would be interesting to the Commission to hear that?—I will read it: "As requested in the "accompanying minute, I visited the examination at "Gorbal's Public School yesterday, 10th May, from "7 to 8, with the following result. The whole of "the questions in Section A, 1st Stage Mathematics "were read to the blind candidate *twice*; he then "selected questions 1, 4, and 6. The first of these "was read once again, and taken down by him with "fair rapidity. He then read it over once to the "Superintendent (a precaution in an arithmetic or "algebra sum quite necessary). The writing occu-"pied 25 minutes, and the result $\frac{3}{4} \div \frac{3}{4} = 1$, was "taken down at his dictation by one superintendent "in the presence of another. As the different steps "in the sum occupied much more space than the "metal frame afforded, it was necessary for the "candidate when he reached the bottom to remove "the type and begin again at the top. It would "therefore be impossible for the superintendent to "write down all the steps in a moderate sized sum, "unless he did so each time the frame was filled, "which would be very tedious, and occupy his whole "time. I, however, caused all the steps in some of "the other questions to be dictated by the candidate "and copied. The frame used is $7\frac{1}{2}'' \times 9\frac{1}{2}''$, con-"taining $24 \times 18 = 432$ type holes, and the candi-"date believed that no larger frames are made. I "again visited the school from 9 to 10, and saw the "candidate work question 7, Section B, Geometry. "This he took down and worked on white paper "mounted on a small board, and as there was sufficient "room on the paper, the dictation to and by the "candidate involved no difficulty. As, however, the "difficulty to the candidate of working any but the "simplest problem in the absence of a figure must be "very great, I asked him whether he had any means "of making one, but he replied in the negative. A "book with raised figures is of course used in learn-"ing geometrical problems, but this, if its use were "even allowed, could be of no service in working "examination questions, unless they corresponded "with the problems in the book. From the above "description of the apparatus used it will be seen "that while geometrical problems can be worked on "separate sheets of paper, and read by the candidate "at the close of the examination, questions in arith-"metic and algebra must be read and copied as each "is worked out. Half-an-hour extra was allowed to "the candidate on account of all the dictation, &c. "involved, and this is not at all too much. If these "examinations of the blind are continued, I advise "the Department to re-consider its rule of employing "two superintendents to conduct them. The dicta-"tion requires much time and attention, and "(especially if only two superintendents are present "in the room), these cannot be given without detri-"ment to their general supervision. While the "superintendents are writing and listening to the "blind candidate's answers, irregularity might occur "in other parts of the room. My own impression is "that the admission of the blind to these examinations "at all is too great a burthen on the superintendents, "but, if persisted in, improvements will no doubt be "suggested by further experience. The candidate in "this case appeared to be quite master of his imple-"ments." The paper was sent up, but I do not think it came to very much; I do not know if he passed. It was all written out by one of the superintendents. Of course the great difficulty in carrying on anything of that kind would be that you would have to have each candidate in a separate room; otherwise one candidate would hear what the others said. And as respects the blind student, therefore, there are very few branches of science which he could take up with any kind of use to himself, and the examination by our Department would be almost impossible.

20,022. But we have seen the blind receiving technical instruction in the various institutions which we have visited, and the question which I rather, in looking forward to the future, is, whether it would be possible to bring these schools, as possibly recipients of grants, under a Technical School Act for England like the Scotch Act, but with such variations as are suitable to England. Do you think it would be possible to carry out grants under your Department to schools for performing certain acts in regard to the teaching of the blind in technical instruction; for instance, basket-making, mat-making, brush-making, or any other trade suitable to the blind. I am asking you with regard to the blind generally, and I am asking you with a view of obtaining your opinion with regard to England; but, perhaps, if you have done anything in regard to Scotland, which would enable you to answer that question, you would state that first?—I understand you to refer to technical instruction in the strict and, perhaps, rather limited sense: that is to say, the absolute teaching a trade or industry.

20,023. Or teaching the elements of a trade in an institution?—And not the preliminary scientific instruction which may be useful in a trade. In using the term "technical" instruction, I understand you to mean a handicraft.

20,024. (*Mr. Woodall.*) Will you distinguish between that theoretical instruction, which has hitherto been the work of the Science and Art Department, and technical instruction in the sense of the Act of last session?—As I will do so in my answer——

20,025. (*Chairman.*) As far as Scotland is concerned, that has not been brought into operation?—No.

20,026. I should have asked you on that point, if it had been brought into operation; I am assuming that you have not had time to bring it into full operation. I was asking what you thought it possible to do in regard to England. Perhaps, as a preliminary, you would answer Mr. Woodall's question?—Perhaps I could make it clearer by making my answer rather full—I hope not pedantic. The term technical instruction, as used generally, is supposed to include three things: first of all, the general scientific instruction, which may be applicable in various trades and industries; secondly, the special applied sciences—those branches of science which are specially applied to specific industries; and, thirdly, the instruction in the trade itself—in the absolute work of the trade. In the first two classes, if I may so say, we are only dealing with instruction in how things are done.

20,027. Theoretical instruction?—Yes. And in the third case, we are teaching the student how to do it. One broad distinction, it seems to me, comes in there between teaching a student how a thing is done, and teaching him absolutely how to do it. As far as the first two classes of instruction are concerned, the Science and Art Department has hitherto given grants in various branches of science, both pure and applied, which may be useful in industrial instruction. The Science and Art Department has not been authorised to give any grants hitherto in teaching the trade or industry itself. With regard to the Scotch Education Bill, to which your Lordship has referred, all that that does is to give a locality power to apply rates for technical instruction, and the definition of what shall be technical instruction, rests with the Science and Art Department.

20,028. Approved of by the Education Department?—After having been approved by the Scotch Education Department.

20,029. It means instruction in subjects approved by the Scotch Education Department?—No question has yet arisen on that subject.

20,030. We know, of course, that there is a Bill pending for England, and I feel a difficulty in asking you these questions; but what we want to know is, in what way, with your knowledge of this subject, you think that technical instruction, which means the instruction in some handicraft suitable to the deaf and dumb and blind (which is generally of such a simple nature that it is more a question of practice than of theory) can be best carried out under any ideal system or any possible system that would be likely to be introduced?—I ought to distinguish between Government grants and what the Scotch Bill, or any other Bill which may be framed on the same lines, does in this way: The Scotch Bill only provides for the local machinery; the question to what subjects grants shall be given, is a matter which is decided by the Science and Art Department with the sanction of Treasury; and, therefore, though a subject might be considered technical instruction under the Scotch Bill, that would in no way necessarily carry with it a grant from the Science and Art Department.

20,031. I am not asking you what might be determined to be technical instruction by the future Department in England, but I want to know whether you could give us any suggestion from your knowledge of the subject as to any way in which your Department could encourage this technical instruction in the existing deaf and dumb institutions, supposing it should be recommended by this Commission that grants should be given for such instruction after a certain age, say from 12 to 15, or from 12 to 18?—I think it would be very difficult for the Department to aid that strictly technical instruction unless it was under very special and exceptional arrangements made with regard to the instruction of the deaf and dumb. For a Government Department to enter into the general field of technical instruction (and I am speaking now of technical instruction in the sense in which you have used the term) would be impossible, so many conflicting interests would come into play that it would be impossible to deal with the direct teaching of trades or industries. But, taking the deaf and dumb as an exceptional class, if the Government thought that they had a right to be treated so exceptionally, I do not see that there would be any great difficulty in making payments to aid in their instruction, that is to say, in the shape of grants in aid of institutions which were supported locally either by rates or by voluntary contributions. If it was considered right, and good policy, to do so, there could be no difficulty in seeing by means of inspection, that fair and proper instruction was being given, and then giving a grant in aid which, it might be arranged, should not exceed some proportion of what was raised by rates or by voluntary contributions.

20,032. What is the principle on which the grant is distributed now; is it to individuals or to schools?—The grants are all paid to the committees of schools, but the grant depends primarily on the examination passed by each individual student.

Major-Gen. F.D. Donnelly, C.B., R.E.

16 Feb. 1888.

20,033. Not the general excellence of the school?—No, not the general excellence, it is on the individual passes.

20,034. Of course, with regard to the afflicted classes, special arrangements probably would have to be made with regard to them?—I do not think an arrangement for payment by results would be applicable, because you want the most aid to those who are least capable of earning it. In schools for deaf and dumb and blind you are starting upon an entirely different basis, and it would be absurd to try and treat them on the same principle as ordinary schools.

20,035. (*Sir Tindal Robertson.*) At present, in some of the board schools, there are higher classes, are there not, which have special grants from your Department in order to aid them in teaching the sciences of chemistry and physiology, and so on?—Yes, in several towns they have established higher board schools, which get grants from the Science and Art Department on the results of instruction in the various branches of science and art to which we give aid.

20,036. Would there be any difficulty in taking the blind children and the deaf and dumb children from the board schools, or from the institutions in the different towns, and putting them on the same footing with regard to technical education in these higher schools?—There is no difficulty in putting them on the same footing as the other children, and no difficulty has ever been made in that way; but the difficulty is in their being able to take advantage of the grants which are administered in that form. May I ask if you are using the word "technical" in the strict and limited sense in which the Chairman used it?

20,037. No, I was rather using it in the general and comprehensive sense?—I asked that question because we give no grants to the technical instruction, in the limited sense. But if you take it in the general sense, of course, a deaf and dumb child comes in and may, no doubt, earn grants for drawing without out ever knowing that he is deaf and dumb.

20,038. Supposing that an application was made to you from such an institution as the Royal Normal College for the Blind with regard to the modelling they do there, would there be any difficulty in giving grants for excellence in that work to blind children?—At the present moment I see no kind of difficulty; perhaps there might be a little technical difficulty as to whether the master came within the qualifications, but I have no doubt that might be overcome; but if the institution to which you refer were prepared to submit work on exactly the same footing as an ordinary school, I see no reason why it should not get the grants under exactly the same conditions.

20,039. As a matter of fact, has any such application been made to you by any institution for the blind?—Never *quâ* modelling that I know of. I have had so short a time to look the matter up, that I cannot be quite certain, but I never heard of any case with respect to modelling. I have already stated that we have a number of schools to which we make payments on account of drawing.

20,040. That is in the case of the deaf and dumb; I am speaking more of the blind now?—No, I do not remember ever hearing of a case.

20,041. With regard to the examination of blind people, are you aware that in the universities many blind men have been examined, and have passed successfully, taking degrees both in classics and mathematics, and that there has never been any difficulty whatever in examining them?—I was not aware of that, but I can quite imagine that it is so, and yet that it would really have very little bearing upon the case of the Science and Art Department. In a university, which is dealing with comparatively few students, you have your own staff of examiners, and so on, and they will no doubt always make arrangements for the examination of a person who happens to be in a position in which he cannot go through the examination in the ordinary way. But we have to deal with an enormous number at the May

Major-Gen. F.D.Donnelly, C.B., R.E.

16 Feb. 1888.

examination; for instance, in science, at the last May examination, there were upwards of 100,000 candidates, all over the country. Those examinations were conducted by local committees, the papers being sent down, and the committee being responsible for the papers being worked out properly. If the committee at any place undertook to examine a candidate in the way that I have just described to the Commission, the Department would make no objection; but you see that could not be carried on to any great extent, because you have not got the local people to do it. You would want one person to attend upon each candidate during the whole of the examination, and you must have him in a separate room. If the locality provided for that, the Science and Art Department would make no kind of objection.

20,042. You said that there was some objection to an amanuensis being employed; are you aware that in the examination for a barrister, an amanuensis is employed by the Council of Legal Education; that he meets the blind student for the first time in the room where the examination is to be conducted, and that as a matter of fact, the examination is conducted in that manner by means of the interpreter or amanuensis reading the questions, and then writing from the dictation of the blind candidate?—I was not aware that it was done in that way.

20,043. So that, practically, there is no difficulty in having an amanuensis?—Supposing it was arranged that some entirely outside person should take down the answers for each candidate under the Science and Art Department, I dare say some arrangement could be made; but I think you will see that if you are dealing with people on the spot, of whom you know nothing, and who may be more or less interested, you could not really pay away Government money on a matter arranged in that way.

20,044. Would there be any difficulty in arranging that certain large centres in the country, (not the small centres for the sub-divisions in which your examination is conducted), should be named at which people might be employed, and to which these candidates might be sent?—Yes, I think an arrangement could be made.

20,045. It is a matter of the greatest importance to the blind, and I am very anxious to have the thing thoroughly clear?—I think it could be arranged, but I do not think that really the question can practically arise. Almost all the scientific instruction in which we examine is experimental science, and when you are dealing with experimental science, for the blind it is unfortunately of no use, they are only learning it as a literary effort, an effort of memory, they can form no judgment from experiments which they do not see.

20,046. I should almost join issue with you on that point, but as a practical matter, would it not be a matter easy to arrange, that in certain large centres reliable people should be employed by the committees who might be able to take these persons one after the other, say two hours at a time, and if they chose to present themselves, to give them the opportunity, at any rate, of passing through such an examination as your Department would conduct?—If they can do it simultaneously. You must have the thing done simultaneously; you must have enough people to conduct the examination of each individual candidate at the same time.

20,047. So that, in fact, if the smaller points of detail could be arranged, you would see no difficulty with regard to the practical part?—No, I think no difficulty has ever been made, except, as I said, the difficulty of allowing for an amanuensis.

20,048. (*Mr. Woodall.*) Confining our attention for a moment to the deaf and dumb, you gave us just now some very interesting figures with regard to the relative success of pupils of deaf and dumb institutions in drawing; are any of those pupils, so far as you are aware, presented in any of the other subjects enumerated in the Art Directory?—In the Third Grade subjects, do you mean?

20,049. No; in any other subject than drawing?—Do you mean art subjects?

20,050. For instance, in geometry or model drawing?—Yes, in deaf and dumb institutions they come up in model drawing just as much. When we had the drawing in elementary schools under the old system, before we began the present classification, a memorial was sent to the Department with regard to deaf and dumb children, stating that there was a difficulty in getting them to pass the geometrical drawing in the elementary stage, and asking whether they might go on to the second grade without first passing in elementary geometry; and that was allowed in the deaf and dumb schools. That was from the Yorkshire Institution for the Deaf and Dumb; it was in 1884, and this was the statement made to us: "During the early years of instruction, "it would be impossible for deaf and dumb children "to draw certain figures to scale as required, intelligently, on account of their want of a knowledge of "language sufficient to understand the instructions. "For the same reason the children here have very "rarely taken the geometry paper. May I ask you if a "special exception could be made in the case of deaf "and dumb so as to defer the drawing to scale to a "period when they may reasonably be required to "take it, and if such postponement would prevent "the children in the meantime from taking freehand "or model drawing, or from earning a grant in these "two latter subjects." We said in reply, that in the case of deaf and dumb children instruction and examination in drawing to scale may be deferred to the period of their training at which, in the opinion of the authorities of the institution these children may reasonably be required to take it, and without their being prevented in the meantime from taking free-hand or model drawing of the second grade or from earning a grant in these two latter subjects.

20,051. Now, coming to a further question, so far as you are aware, are any of the children, inmates of the institutions for the deaf and dumb, presented in any of the numerous science subjects?—I do not remember any deaf and dumb institutions specifically as such applying for an examination, though I have no doubt that many deaf and dumb boys have come up for examination.

20,052. (*Chairman.*) As individuals, after leaving school, you mean?—Yes; but I will look up the question, and see as to any deaf and dumb institutions.

20,053. (*Mr. Woodall.*) Now, coming to technical instruction as understood by the framers of the Act of last session, you have already told us that in the Scotch Act the term "technical instruction" is defined to mean instruction in subjects approved by the Scotch Education Department?—Yes.

20,054. Am I right in assuming that local authorities in Scotland are empowered to give instruction in any subject which the Scotch Education Department approve as technical, and to apply the local rates to that purpose?—Yes.

20,055. But they can only obtain Government grants in aid of such subjects approved by the Science and Art Department?—Under technical instruction is included any subject approved by the Scotch Education Department as such, and any subject in respect of which the Science and Art Department makes grants at the time.

20,056. Do you understand that the consent of the Science and Art Department as well as of the Scotch Education Department is necessary to constitute a subject technical?—No. Any subject in which the Science and Art Department makes a grant is a subject of technical instruction, whether the Scotch Education Department thinks it right or not; but over and above that, any other subject may be brought in as a subject of technical instruction, such that rates may be raised for it if the Scotch Education Department approves of it as a subject of technical instruction.

20,057. It was contemplated in that Act that the Science and Art Department would extend their curriculum beyond the subjects hitherto regarded as such that they gave grants towards them?—I cannot say that it was contemplated by the Act.

20,058. Take the use of tools, for instance; was it not distinctly stated that the use of tools was to be made a subject?—But the Act had nothing to do with the question of the Department making grants.

20,059. May I ask whether anything has been done under the Scotch Act in the direction of extending the list of subjects upon which Government grants may be earned?—No, nothing.

20,060. Up to the present time there is no undertaking to give grants for instruction in the use of tools or in wood carving?—That is so.

20,061. And, therefore not in any of these special subjects, which might be supposed to be applicable to to the deaf and dumb and blind as such?—Nothing has been done in that way.

20,062. (*Admiral Sir. E. Sotheby.*) Are the deaf and dumb and blind as freely admitted into the School of Art for wood carving as other students?—The deaf and dumb are admitted as freely; not the blind, because it would be useless for them.

20,063. (*Mr. St. John Achers.*) Are not the first and second grade these in schools?—The first grade is for the instruction of pupils in elementary schools, and the second grade is what they go on to after they have passed that stage.

20,064. So that they are in either day schools or night schools?—In day schools or in night classes for adults after they have left the elementary school. Some are receiving instruction in second grade art in elementary schools, but it is taught principally in night classes.

20,065. May it not be, in the first grade, at any rate, that the reason why the deaf and dumb do not go on and do as well in the prize stage as in the first or pass stage, is that which you have already read from the Yorkshire institution, namely, that really they do not have command of language until towards the end of the time for which they are at school, and, therefore, they have comparatively a much shorter time than the ordinary children?—I do not think that explanation will meet the case, or at all events, not all the case, because they might just as well be earning prizes in freehand drawing as in the other stages, and they would count in that table as prize winners; and the fact of their being allowed to defer the geometrical drawing to a later stage is rather in their favour. What you suggest may have something to do with it, but I should say that, probably, is has not much to do with it.

Major-Gen. F.D.Donnelly, C.B., R.E.

16 Feb. 1888.

20,066. Can you tell the Commission any reason why the Irish schools have, none of them, apparently, been examined?—No; if it is so. There is no Departmental rule against their coming in, and as far as I am aware, there is nothing in the rules of the Department, which presses harder against the Irish schools than against the English schools. With regard to the Institution at Cabra, I believe they have done a little lace making; and it was suggested to them, I believe by Mr. Allen Cole, that they should establish a class for drawing, but I do not think it ever came to anything.

20,067. Is there the same desire on the part of the ordinary schools in Ireland to take part in these examinations that there is in England?—I think so.

20,068. Then there is no objection to the department, or anything of that sort, which would cause the deaf to stand out?—No.

The witness withdrew.

Adjourned.

No. 6, Old Palace Yard, S.W.

Thursday, 8th March 1888.

PRESENT:

THE RIGHT HON. THE LORD EGERTON OF TATTON IN THE CHAIR.

THE LORD BISHOP OF LONDON.
ADMIRAL SIR E. SOTHEBY, K.C.B.
B. ST. JOHN ACKERS, ESQ.
L. VAN OVEN, ESQ.

CHARLES E. D. BLACK, ESQ., *Secretary.*

Mr. HERBERT EDWIN CROFTS examined.*

Mr. H. E. Crofts.

8 Mar. 1888.

20,069. (*Chairman.*) You are one of the teachers of the Sumner Institution in New Zealand?—Yes.

20,070. How long have you been in that position?—I took my position there in July 1884.

20,071. What was your previous training?—Ordinary scholastic work in England.

20,072. Was Mr. Van Asch the principal of the institution when you went out to New Zealand?—Yes.

20,073. And therefore you have been under his direct training?—I have been trained entirely by him.

20,074. Was Mr. Van Asch trained in a German or in a Dutch school?—He was trained, I think, in the institution at Rotterdam.

20,075. How long has the Sumner Institution been founded?—It was founded in 1880.

20,076. Is there any institution for the deaf and dumb in New Zealand besides this?—There is no other institution in New Zealand.

20,077. And are the blind provided for in the same way?—There is nothing done for the blind at all. I am speaking from a government point of view; I do not know of anything being done for the blind.

20,078. Have you any statistics as to the number of the deaf and dumb in New Zealand?—We have no such statistics further than we can get from the number of children we have in the institution, and from general observations in the Colony. We have now 43 deaf children in the institution.

20,079. And what is the present population of New Zealand?—Over 600,000 white people.

20,080. Could you describe what is done by the State for the deaf and dumb in New Zealand?—The parents of children sent to the institution are supposed to pay a sum of 40*l.* a year for their board and education, where they can do it; if they cannot, they are allowed to pay what they can afford. In a great many cases where the parents are too poor to pay anything towards their children's education, it is entirely free.

20,081. Is there free education in the Colony in regard to ordinary education?—Yes.

* The foot-notes signed (G. V. A.) are by Mr. Van Asch, the Principal of the Institution, to whom Mr. Crofts's evidence was submitted for comment.

Mr. H. E. Crofts.

8 Mar. 1888.

20,082. In the elementary schools, that is to say?—Yes, in the elementary schools, there is free education.

20,083. For everyone?—Yes.

20,084. Those are not boarding schools?—No. This 40*l.* a year which I have mentioned, is simply paid for their board.

20,085. But in the case of poor parents, this is free education with board, is it not?—Yes, for the deaf; of course that does not include clothing; the clothing is provided by the parents.

20,086. How many children are there in the institution who get their board and education entirely free?—During the year 1887, 23 out of 42 entirely free, four pay 40*l.* per annum, one 30*l.*, one 25*l.*, one 20*l.*, two 15*l.*, two 13*l.*, seven 10*l.*, one and 5*l.*

20,087. Can you tell us how many pay entirely for their children, and how many partly?—There are, I believe, about six people who pay the full fee. If you notice the expenses quoted in the reports of the institution you will see what the parents have been paying during the last five years, and from those statistics you will be able to form some idea of what number of children get their education free.

Year.	No. of Children.	Payments by Parents.	Average Payments by Parents per Head.
		£ s. d.	£ s. d.
1883 -	31	322 5 10	10 7 11
1884 -	32	457 3 4	14 5 9
1885 -	36	265 12 6	7 7 6
1886 -	37	344 7 6	9 6 2
1887 -	41	385 15 10	9 8 2

20,088. What is the salary of the head master?—The salary of the director is 600*l.*, I believe.

20,089. And a house found?—And a house found.

20,090. Are you the only master?—I am the head assistant; there are two other male teachers and one female teacher.

20,091. That comes to about one teacher for every 10 pupils, does it not?—Yes, but the director, Mr. Van Asch, teaches one-half or two-thirds of the time, with a view, first, to improve the pupils, specially the weaker ones; secondly, to train the assistants.

20,092. Does not the director take the pupils when they first come in?—Not necessarily; he does if there is any peculiar point that he wishes to point out to his subordinates.

20,093. Have you any statistics as to what proportion have partial hearing?—No; I believe we have now about 14 children partially deaf.

20,094. Is there a medical examination?—Yes.

20,095. You teach the oral system, I understand, exclusively?—Yes.

20,096. It is rather important that we should know what proportion of them are totally deaf, and what proportion have remains of speech or hearing, in order to enable us to judge as to the value of the remarks you make in regard to their progress afterwards?—It will take a little time to work out.

20,097. Would you tell us whether you are or have been yourself accustomed to give the first instruction to pupils?—Yes.

20,098. Would you tell us whether the method followed is that which is followed by Mr. Van Praagh?—I believe it is very similar.

20,099. Do you confine the teaching of the first year to a mere repetition of consonants and vowels without attaching any words to them, or do you attach definite words and objects to them as early as possible?—We attach words to them as early as possible, and by the end of the first year the child would be able to give you an idea of some simple action. The child would be able to understand and use simple verbs—"I run," "I jump," &c. Such a child would also be able to give a short description of any ordinary object pointed out to it, as—"the horse," "that is a horse," "the horse is brown," "the horse has four legs," "the horse can run."

20,100. And you teach them grammar, I suppose, as they go on?—Yes.

20,101. And writing as they go on?—Writing is taught from the very beginning, but composition as they go on.

20,102. How soon are you able to teach them the Lord's Prayer?—That is a thing we have not attempted, because it is not allowed.

20,103. You mean that you give no religious instruction?—No religious instruction whatever.

20,104. It is purely unsectarian?—Yes.

20,105. And these children are boarded there for how long; how many years do you keep them generally?—The institution has only been started now eight years.

20,106. What is your curriculum of education?—From eight to ten.

20,107. During the whole of that time is no religious instruction given?—No.

20,108. None, even of an unsectarian character?—None whatever.

20,109. The Bible is never read?—No.

20,110. No moral instruction of any kind; not even the Ten Commandments taught?—There is nothing whatever done in the way of religious instruction.

20,111. Do they go home for the holidays?—Yes, they go home for Christmas only (which is our summer). The children of parents quite close to us also go home for a fortnight during the winter.

20,112. Is it the idea of the school that the parents are responsible for the religious instruction of the children?—It is entirely a Government institution, and religious instruction is not given in any elementary school.

20,113. But the ordinary elementary schools are day schools?—Yes.

20,114. And your institution is a boarding school?—Yes.

20,115. Can you give the hours of the instruction day by day followed in the school in a tabular form afterwards?—Yes.

——	Morning.	Afternoon.
Monday -	9 a.m.–12 a.m.	2.15–4.15.
Tuesday -	Do.	Do.
Wednesday -	Do.	Boys engaged in gardening and out-door work, and the girls in sewing.
Thursday -	Do.	2.15–4.15.
Friday - -	Do.	Do.
Saturday -	The boys are engaged in outside work during the day, and the girls in the domestic work of the institution.	

The hours shown above are occupied in ordinary school work, excepting the Wednesday afternoon and the Saturday, as pointed out. It would be impossible for me to give a tabular form of the work done during those hours in the various classes without reference to our time-table.

20,116. Will you give us, roughly speaking, what would be the first, second, third, and fourth years' instruction, and so on?—Yes.

1st year.—The elementary sounds, with names of common things around us; short sentences, using simple verbs, adjectives, &c., as—"table," "chair," "horse," &c., "I walk," "I jump," "that is a bag," "the bag is black," &c., &c.

Mr. H. E. Crofts.

8 Mar. 1888.

2nd year.—Advance on first year, with use of adverbs and prepositions, to giving a simple description of common objects around us, and reading simple sentences; arithmetic (addition and subtraction) and the geography of the local district.

3rd year.—Advance in reading and composition, in grammar, letter writing, geography, and arithmetic.

4th year.—Reading simple tales and newspaper reports; advance in grammar, composition, geography, and arithmetic, with use of money.

5th year.—Same subjects as previous year, with little history and elementary science.

6th year.—Same subjects as previous year, though of a higher standard.

20,117. Is the education of the deaf and dumb compulsory in New Zealand? First of all, will you state whether education is compulsory for all?—In the ordinary way it is.

20,118. Then the same thing applies to the deaf and dumb, I suppose?—It is the law, I believe, but the law is not enforced, at any rate, not in the case of the deaf and dumb. It is a deplorable fact that several parents of deaf children keep them at home to do the work.

20,119. Do you get children from both the Islands?—Yes, from all parts of New Zealand, and we have one child from Adelaide, in Australia.

20,120. You are, I suppose, aware that they have an institution at Adelaide?—Yes, they have a deaf and dumb institution at Adelaide. I visited it.

20,121. Has Mr. Laishley's report been considered by the Government; has any action been taken upon it?—No action has been taken upon it at present.

20,122. Is there any probability of day schools being established instead of boarding schools, except in cases where the parents live at a distance?—I believe that the Government is trying to do something in that way.

20,123. That is to say, that where parents live at a distance the pupils should be boarded out?—Yes.

20,124. Is your school inspected by anyone for the Minister of Education?—It is visited by the Inspector-General.

20,125. And how do you obtain teachers: are they entirely trained on the spot?—They are trained on the spot entirely. I am the only one that has been trained at the present time. There are two other male assistants being trained, and one female assistant.

20,126. You said that you would give us your curriculum year by year?—The ordinary working time is in the beginning of the year from about the 6th of February (we generally begin at that time) up to about the 17th of July, then we take about a fortnight's holiday; and from that time again we work on to about the 18th of December. Our daily work is from nine in the morning till 12, and from a quarter past two to a quarter past four. Wednesday afternoon is employed by the boys in garden work and by the girls in sewing.

20,127. One day a week is devoted to that?—Yes, Wednesday afternoon. Saturday morning is occupied entirely by the boys doing some outside work, and the girls doing some work in the institution. The afternoon is spent in recreation.

20,128. Are drill and gymnastics and the Kindergarten exercise included?—No, there is nothing done in that way; not systematically.

20,129. Are any trades taught, or is anything, beyond gardening, taught outside the institution?—No, there is nothing taught. Mr. Van Asch has often called the Government's attention to this matter. The distance from Christ Church to Sumner being 8 miles, and there being no railway communication, the difficulties are of course great.

20,130. Have you any land connected with the institution?—We have 10 acres of land connected with the institution.

20,131. Is that cultivated by the pupils?—Yes, part of it is cultivated by the boys.

20,132. And part is in grass?—Yes.

20,133. Is there any difficulty in getting places and situations for the boys after they leave?—Of course we have had very few cases of boys leaving up to the present time; but the boys who have left us, just happen to be the sons of farmers, excepting one case, and that boy was the son of a blacksmith; they are all working at home now with their parents. A boy left us at the close of 1887, and he was immediately engaged on a farm, near his home, at 8*s.* or 10*s.* a week.

20,134. When they leave the institution what amount of language have they?—They are quite capable of going out into the world and carrying on an ordinary conversation, asking simple questions, and being able to talk on the ordinary topics of the day.

20,135. Asking for what they want and understanding what is said to them?—Yes.

20,136. What proportion of boys and of girls have you?—21 girls and 22 boys.

20,137. What situations do the girls get; what are they trained for?—They are not trained for anything in particular.

20,138. For work in the household?—For household work. One girl is apprenticed to a dressmaker now, and another is at home with her father who is in the shoemaking trade.

20,139. You have told us about the first year, but I want to know with regard to the other years also, what is your course of instruction; I want to know what standard you expect them to get up to year by year and what change of treatment you make; in fact, what progress they make from year to year. You have told us the results; I want to know the gradual steps that lead up to those results. You have told us as to the first 12 months; will you go on with the other years?—Then in the second year a child would get into the way of reading short sentences from a book, and being able to give us short accounts and descriptions of pictures and of things that are going on around him.*

20,140. There are no signs used?—There are no artificial signs used. Of course there must be a certain amount of natural signs used in teaching the deaf, but we do away with those signs as quickly as we possibly can.

20,141. Do the children among themselves use signs?—They use natural signs to a certain extent, but we endeavour to stop that as quickly as we can. As they advance and begin to learn the advantage they get by communicating by speech, they will leave that sort of thing off to a very great extent. Of course they will never leave off signing entirely. It is a very difficult matter to draw the line as to what is signing, and what is not signing.

20,142. I understand you to say that they use certain natural signs?—Just natural signs; there are no artificial signs used.

20,143. What happens in the third year?—In the third year they will be able to read and to understand very simple stories, as simple as it is possible to get, and very short ones.

20,144. And in the fourth year?—They will then be able to get on to describe ordinary objects which they see about them, and, of course, to advance again in their reading. I should have said that in the second and third years of course they have started with their arithmetic. A child in the second year would be able to count up to 100, perhaps, but not with mere figures, and do a few simple addition sums. In the third year he would go on with addition and also do subtraction and simple multiplication. In the fourth year we begin to teach them the use of money.

* The backbone of the course of studies, consists in a series of lessons, which I compiled for my pupils while in England, between the years 1859 and 1879. These I have slightly altered, so as to make them applicable to the somewhat different requirements of New Zealand children. (G. V. A.

Mr. H. E. Crofts.

8 Mar. 1888.

Then in the fifth year we teach them geography, and parts of the newspaper.

20,145. Do you teach them Euclid?—In three cases; geography and history are taught.

20,146. You do not go beyond the ordinary rules of arithmetic?—No. Of course the Government in general simply give the children a sound education, because as a rule they are the children of poor parents, and they will have to earn their living in the future in some ordinary line of life, and their education is carried on with a view to that.

20,147. Are the parents satisfied with the results of the schooling?—Yes, the parents are well satisfied.

20,148. Have you any testimony to that effect?—I have one of the reports. In his report of the 10th of June 1885, the director says: "The North "Island pupils were last Christmas accompanied to "their homes by the director and his wife, who were "thus enabled to confer with the parents on matters "affecting their children's education and general "welfare. It was pleasing to find how much spirit "of industry and helpfulness in the home circle was "exhibited by many of them, and how much use all "of them made of their power of speech as far as "their knowledge of language would permit." There are some remarks in some of these reports which may be interesting, referring to those children who have been in the institution and have left it.

20,149. Can you give us any extracts?—Yes; I can give you extracts from these reports.

20,150. Year by year?—Yes, since 1883. The first case was that of a girl who left us in 1883.

20,151. (*Mr. St. John Ackers.*) This girl had been only two years in the institution, because you have told us that it was founded in 1880?—Yes; this was the case of a girl who had not lost the power of speech.

20,152. (*Chairman.*) Will you read the extract relating to her?—"The young lady referred to came "to us not as a dumb person, but as a totally deaf "person, defective in utterance. After two years' "training she returned to her friends greatly changed, "and in a most cheerful and happy frame of mind. "She felt conscious that, through having accom-"plished the object for which she entered, viz., that "of learning the valuable art of lip-reading, and of "improving her articulation, &c., she did not only "return home better fitted for the domestic circle, "but that she could now also enter into, and in a "great measure participate in, the cheerful society of "others."

20,153. Have you any independent reports of the Government inspector? What you have been quoting are remarks of your own director, if I rightly understand?—Yes.

20,154. We should like the report of someone who visits the institution, not merely the head of the institution?—Here is a report by Mr. J. H. Pope to the Secretary for Education in 1883. He says, "I "visited the Sumner Institution for Deaf Mutes on "the first of the present month. At the time of my "visit no work was going on; it was Saturday after-"noon and nearly all the children were at play. I "had, therefore, an opportunity of seeing them when "not engaged with the ordinary school routine, of "talking with them when they were free from the "restraint of being in school, and of judging how far "their training has fitted them for holding com-"munication with outside people. For the casual "visitor to an institution of this kind, the most strik-"ing feature, and the one by which the amount of "good done is generally estimated, is the ability of "the children to talk, and to understand what is "said to them. I found that nearly all the children "could make out what I said to them, and could give "fairly intelligible answers. The pupils that have "been but a short time at Sumner, say, a year or two, "understand very much better than they speak; those "that have been there for a longer time, say, for "three or four years, do both nearly equally well. "Seeing, however, that the number of children that "have been at Sumner for a long period is small as "yet, the impression made on a visitor is that the "comprehension is very much better than the speak-"ing. I am convinced that in two or three years' "time there will be an alteration in this respect. I "had quite a long conversation with one of the boys; "this lad is stone deaf, and four years ago he could "do no more than make a few signs; anyone who "had seen us talking together on Saturday last would "have noticed only that the lad repeated what I said "to him, that, so to speak, he *looked at* what I said "instead of listening to it, and that his own sentences "were delivered in a monotone; otherwise there was "nothing to give anyone an indication of the nature "of his affliction, or to cause a person unacquainted "with the kind of work done here to imagine that it "was a deaf mute that was holding a conversation "with me. A little girl, who two years ago was just "beginning the course, was able to understand and "answer questions about her home, and to inform me "that she wished the holidays to come so that she "might visit her friends. I noticed too that the "children *spoke* to one another while they were play-"ing. It would be futile to expect that these children "could ever be placed on anything like an equal "footing with those who can hear, but it is very plain "that all the children here are in a fair way to be "able to hold conversations with their friends on any "ordinary subject, and to have the disabilities depend-"ing on their want of the sense of hearing diminshed "indefinitely. This is, in my opinion, a very great "deal to have accomplished in the short time that the "institution has been at work. But the mere speak-"ing and understanding, though of course of cardinal "importance, are by no means the only acquirements "of the inmates of the Sumner Institution. It is the "awakening of the intelligence, and the developing "and putting into working order of minds disabled "by the blocking up of two of the most important "avenues of thought and its expression, that are, in "reality, the greatest benefits conferred on the "children here. It is impossible to see these children "after an interval without recognizing that in the "meantime their reasoning powers have been greatly "improved, and that their minds are able to perform "operations that had previously been quite beyond "their range. There is nothing connected with this "institution calling for unfavourable remark; so far "as I can see, everything is going on very satis-"factorily." And here is another report by Mr. Habens, the Inspector-General, in 1885.

20,155. Was his report favourable or not?—Yes, entirely satisfactory, but it refers to details with which I need not trouble you. After that we have no other report in these papers by anyone visiting the institution. The Inspector-General visits the institution every year, but no report is sent up by the inspector; the reports here are only the reports of the director and the medical officer.

20,156. Then have you any report of the medical officer showing whether the condition of the deaf and dumb children improves or not?—I have nothing here by the medical man showing the condition of the children.

20,157. I suppose you do not take in any weak-minded children; is there any provision made for weak-minded children in the Colony?—No, except, of course, the lunatic asylum. We have dull children but we have no imbeciles.

20,158. Are the children of a low physical type generally?—No; of course they improve greatly after a year's work in the institution. Our pupils are much the same as the average of English deaf mutes.

20,159. Are there any cases of consanguinity in marriage on the part of parents that you know of?—There is one case, I think.

20,160. Any case of two in a family being deaf and dumb?—Yes; we have four cases now in the institution of two in a family.

20,161. (*Mr. Van Oven.*) Do you mean eight children?—Yes; and with regard to one child who left us about a year ago now, in that family there are six children deaf out of seven children.

Mr. H. E. Crofts.

8 Mar. 1888.

20,162. Are the parents deaf and dumb?—No.

20,163. (*Chairman.*) Did Mr. Van Asch come to the Colony on his own responsibility, or was he sent for by the Education Department?—He was sent for by the Education Department.

20,164. You told us that you visited the Australian Colonies: what deaf schools did you visit there?—I visited the institution for the deaf and dumb in Sydney, and another in Melbourne, and another in Adelaide. Of course all three institutions are institutions for the blind, the deaf and dumb all together. I have here a report of the institution in Sydney, and also one of the institution in Adelaide, but I have not a report of the Melbourne institution.

20,165. Are they, in those Australian institutions, teaching the deaf and dumb on the same system as yours?—No. In Sydney they are trying to start a class on the oral system, but the other children are taught on the old manual system.

20,166. Was the standard of education good or moderate?—Fairly good.

20,167. Would they compare favourably or unfavourably with those taught on the oral system, as far as their general education is concerned?—From what I saw, I should say they would not compare favourably with those taught on the oral method.

20,168. They are both on the same system, on the manual system?—Yes. In the institution in Adelaide they are now trying to introduce the oral system entirely. I do not know what they will do in that way; they have great difficulties to contend with in trying to introduce it.

20,169. Is the education in those Australian institutions provided by the State?—No, I believe they are all benevolent institutions. I am not able to speak from actual knowledge of the fact, but I believe they are all benevolent institutions there. I believe there is a small grant given from the Government to the institutions, but the institutions are principally supported by subscriptions.

20,170. (*Mr. Van Oven.*) Mr. Van Asch's school is the only school for the deaf in New Zealand?—Yes.

20,171. Consequently, a large number of the pupils come from different districts?—Yes.

20,172. How are the funds found to make up the payments necessary; are they found by the funds of the district, the parochial funds or local funds, or are they all found out of the Imperial Fund?—They are all found out of the Imperial Fund.

20,173. There is no compulsion as regards teaching the deaf, I understand you, in New Zealand?—There is no compulsion.

20,174. They are not looked after; a deaf child might be left uneducated?—He might be left uneducated.

20,175. Then these pupils come there voluntarily?—Yes.

20,176. Who assesses the amount that they are to pay; how is that determined?—That is determined by the resident magistrate.

20,177. At what age do you receive the children?—From six years of age.

20,178. Do many come in after that age?—Yes; we have several cases of children coming up after that age.

20,179. What is the highest limit of age at which you receive a child?—The fixed rule is, that no deaf mutes over 12 need be admitted, and a few years hence the highest limit should be 11, or even 10. Of course, we take in young men and young women, if they have lost their powers of hearing, simply to teach them lip-reading.

20,180. But I mean with regard to the congenital cases?—The rule is as above stated.

20,181. And have you any rule about retaining them for the full term of eight years?—No, we have no rule about that.

20,182. Do many leave before the full term of eight years; during the time that you have been established, have many left—I mean of the purely deaf mutes?—Sometimes pupils leave after two or three years training, because the parents want to make them work. In other instances they are kept away, because the plain speech of the deaf children leads the parents to the false conclusion that the children understand language very well, or parents are deluded into the belief that their children will henceforth pick up speech in the ordinary way.

20,183. Are there many other deaf and dumb in New Zealand?—Well, I suppose there are for the number of the population.

20,184. And they have been taught by the finger alphabet?—I have only come across one case taught on the finger system, and that was a gentleman who had been taught in England.

20,185. What proportion of the population in New Zealand are deaf and dumb?—That I could not say; we have no way of getting at that.

20,186. (*Chairman.*) I did not ask you if there had been lately a general census?—The last census was taken in 1885.

20,187. (*Mr. Van Oven.*) Then these children who are in your school, and those of your pupils who have left, have no knowledge whatever of the finger alphabet?—They have no knowledge whatever of the finger alphabet.

20,188. They are not taught the finger alphabet, I know, but has a knowledge of it crept into the school?—There is no knowledge of it in the school at the present time.

20,189. That is to say, when the children are by themselves, they do not make any use of the finger alphabet?—No, not so far as the school is concerned.

20,190. I mean while they are at the school?—No, while they are there, they do not.

20,191. Have you any cases of defective sight in the institution?—Two cases of shortsightedness.

20,192. But not of sufficiently defective sight to prevent their acquiring lip-reading?—No.

20,193. If you had such a case, how would you treat it?—I suppose the sight could be helped by the use of glasses.

20,194. But suppose it were impossible for them to acquire lip-reading?—If the sight is so bad that the child would never be able to read the lips, the child would be practically blind.

20,195. You would consider that a case for a blind asylum, not a deaf one?—That I cannot say.

20,196. Therefore, a blind child, who was deaf, you consider, should be taught in a blind asylum, not in a deaf institution?—That I do not know; my experience of work does not enable me to give an opinion on that question. If I had a case before me, I should have to form my own ideas.

20,197. Who undertakes the management of the house, and all the domestic arrangements of the institution; is that under Mr. Van Asch's special care?—Yes.

20,198. Then, as regards the question of religious instruction, there may be no religious instruction or training given, but is there no prayer of any kind that the children make use of night and morning; is there no grace before or after meals?—No, every child says a prayer at the bedside.

20,199. And are the parents satisfied with that?—Well, I suppose so; I have not heard of any complaint being made.

20,200. Are there any district visitors that come round like missionaries, or people of that kind?—No.

20,201. You said that there were difficulties in Adelaide as regarded the oral school; what are the difficulties?—I mean in doing away with the old system. Of course in the Adelaide Institution the children they have had for some years past have been taught on the old manual system, and now they find a difficulty in introducing the oral; unless they can keep the children taught under the one system apart from the children taught under the other, they can do no real good with the oral method.

20,202. Then, to a certain extent, the Adelaide Institution is a combined institution?—To a certain extent.

Mr. H. E. Crofts.

8 Mar. 1888.

20,203. And you consider that it is impossible to give good oral teaching in a combined institution?—Yes, I think that perfectly impossible.

20,204. Therefore, supposing, for instance, you had a separate house for the children to be taught on the oral system, and they mixed with those taught on the manual system in the playground and in their drill exercises, and that they were accustomed on those occasions, and at religious services to attend to signs, or the manual alphabet, you think that would be destructive of the effect of oral teaching?—I believe it would.

20,205. Did you see, practically, in Adelaide that such an effect was produced by the mixture of the two systems; did you yourself consider from what you saw that that effect was produced?—I did not see that institution in full working order.

20,206. (*Admiral Sir E. Sotheby.*) Is the institution confined to the English population, or is there anything done for the natives who are deaf and dumb?—We have only at present come across one case of deafness amongst the Maories, a child in the extreme north of the island, a son of a Maori Chief in the Thames district, and the father did not like the idea of the child leaving him; he could not be induced to allow the child to come to the institution.

20,207. The native children go to the elementary schools?—Yes, they have separate Maori schools for their ordinary education.

20,208. What part of New Zealand is Sumner in?—It is about eight miles from Christchurch; Christchurch is in the Canterbury district.

20,209. Is it a matter of any difficulty for children to come from Wellington, Auckland, the Thames, and that part of New Zealand?—They come by boat.

20,210. But I suppose the children come more from the neighbourhood than from the north part?—No. I have the statistics here giving the number of children each year from the different districts. In 1883 we had from Auckland 7; from Hawke's Bay 1; from the Wellington district 2; from the Otago district 10; and from the Canterbury district we had 10.

20,211. Nelson?—We had none from the Nelson district. The next year from Auckland 7; Taranaki 1; Hawke's Bay 1; Wellington 1; Canterbury 10; and Otago 11.

20,212. Have you visited any deaf and dumb institutions in England since you have been here?—I visited the institution in Fitzroy Square and the Doncaster institution, and the institution in Henderson Row, Edinburgh, and one public institution in Glasgow, and also a small private institution in Glasgow.

20,213. If it is a fair question, how do you consider your institution stands in comparison with those you have visited?—I could not compare many institutions I have visited in England with ours, as in most of them, more or less, the combined system is used. I consider our institution compares very favourably with the one in Fitzroy Square and also with Miss Griffith's private school in Glasgow.

20,214. (*Mr. Van Oven.*) The latter are a better class of children, I suppose?—Yes.

20,215. (*Admiral Sir E. Sotheby.*) You said there is no religious education at all in the Sumner institution?—There is no religious education at all.

20,216. You have spoken about that, have you not, or Mr. Van Asch has spoken about it?—I have never spoken about it officially.

20,217. Would there be any objection, according to the feeling of the Colony, to introduce any religious education?—For myself, I do not think there would be.*

20,218. But I suppose it is the wish out there that no religious education should be introduced in any school?—Yes.

20,219. The pupils may seek it where they can?—Yes.

20,220. Do you know if any of these children go to any place of worship?—The assistant master in charge takes them to church occasionally—the Church of England—the girls go in charge of a lady.

20,221. And where do you place them in the church?—They generally sit near the middle of the church with me.

20,222. And are they able to understand what the minister says?—No; the children could not possibly understand from the lips of a man they had never seen before, a sermon straight off; their knowledge of the English language alone would not allow them to understand it.

20,223. Those are the children, I presume, who have been only a short time with you, but you have some children that have been eight years with you?—At the time I left we had four children who had been eight years with us.

20,224. Would those children understand what is said by the minister?—No, they would not understand what is said from the pulpit. They would understand if one went into the place with the full intention of speaking to them as deaf-mutes; but a total stranger, and at that distance from them, they would not be able to understand.

20,225. Supposing that children had been educated on the combined system, and went to a church where the preacher preached on the sign-manual system, could they understand then?—He would only be able to communicate with them in the ordinary language of the deaf, that is, the English language simplified.

20,226. And would they understand him?—Yes; they would understand him.

20,227. Then are not you in favour of anything like a combined system?—No.

20,228. Then you would deprive those children entirely of having any satisfaction out of going to church?—Not at all; those children are perfectly capable of understanding a sermon just as well as the other children if you make the language what they can understand; but you would be obliged to have a man that is working among the deaf to preach to them, in the same way that you have a man who is used to the sign-manual system to preach to the deaf in that system; they would not understand a sermon in Westminster Abbey. If they got a man who had been teaching among the deaf, and he knew what kind of a congregation he had got before him, he would be able to make them understand him. Of course, the children taught on the old manual system could not understand anything unless the man in the pulpit used his fingers.*

20,229. Have you a board over your institution?—No, it is entirely a Government institution.

20,230. Have you ever heard out there, whether there is any advocate for teaching the combined system?—No, I have never heard it mentioned.

* I think there would be, at any rate on the part of the Roman Catholics. The parents of Roman Catholics have asked me personally not to let their children attend the church, and I carry out their wishes in this respect to the letter. (G. V. A.)

* Is this the point? Is not it rather what method will give these afflicted children *the best chance* to benefit from religious services carried on either in the ordinary way, or in the extraordinary or special way? In reply, my experience in England leads me to say, that all deaf mutes *properly* educated in the oral *system*, prefer attending the Church of England services with the hearing community, and get there—*not from the preacher's lips*—but from the reading of the church service along with the hearing congregation, *at least* as much benefit as deaf mutes who attend even a special service conducted by means of dactylology. As a matter of fact, all the deaf children of christian parents, whom I educated in England, attend the parish church with their friends, and my remark applies to them. In regard to the second part of the question, I am of opinion that holding special services for the deaf and dumb *in chapels of their own* is, from a moral and social point of view, a very questionable practice. But if ever special services must needs be held, let there be separate services for women, and separate services for men. And again, if *such special* services are considered necessary in the case of the deaf, who read the lips, I further maintain that special preaching to speaking deaf mutes will, in its results, at least hold its own with that carried on by manual signs. (G.V.A.)

20,231. They stick to the oral system?—Yes, and nothing else.

20,232. Is yours the only institution in the whole of New Zealand for the deaf and dumb?—It is the only one.

20,233. And how long ago have these institutions been established at Sydney and Adelaide?—I am not able to say.

20,234. I suppose when you went there you found an old established system?—Yes.

20,235. They have been teaching on the sign manual?—Yes.

20,236. And have only lately introduced the oral?—Yes.

20,237. Just the same as in this country?—Yes, it appears to me to be just about the same; the working in Australia and the working in this country.

20,238. Are there no blind institutions in New Zealand?—None at all.

20,239. Are there in New South Wales?—Yes; there is one in Sydney, one in Melbourne, and one in Adelaide; they are all combined with the deaf and dumb.

20,240. Then they are large schools?—Yes, very large institution.

20,241. How many have they?—I am not able to say. I visited them all, but I do not remember the numbers in each institution.

20,242. Are your classes in separate rooms or merely screened?—They are in separate rooms.

20,243. And you advocate that?—Yes.

20,244. In order that they should not hear each other talk?—In order that neither teacher nor pupils may be interrupted by other work going on around them.

20,245. What is your salary?—My salary at the present time is 175*l.*

20,246. Does Mr. Van Asch do anything more than being the director of that institution?—No.

20,247. That is his sole duty?—Yes.

20,248. He gets his house and 600*l.* a year?—Yes.

20,249. (*Mr. Van Oven.*) Have you any rent to pay?—No, not now.

20,250. (*Admiral Sir E. Sotheby.*) Where were you trained?—Under Mr. Van Asch, in New Zealand.

20,251. And where did he get his experience?—In Rotterdam for rather more than four years, but he got most of his experience in England.

20,252. Do the deaf and dumb pupils perform all the domestic duties of your institution?—We keep three servants in the house.

20,253. And there are only 40 children?—Forty-three.

20,254. And it is necessary to keep three servants?—But in that house the director and all his family live as well as the deaf. The institution is split up in this way: we have three distinct buildings; in one building the director and his family live with the girls and six of the youngest boys in the institution; and with regard to the other two cottages, I have charge of one, with some five or six boys during the night, and the other assistant with a matron has charge of the other.

20,255. How would you propose that the deaf-mutes should communicate with those who are not deaf in the dark?—A deaf-mute taught on the oral system would not be able to communicate in the dark except by natural signs. I believe that two deaf children getting together, taught on the oral system, thoroughly understanding natural signs, would be able to make each other understand what they were saying.

20,256. Then you are rather an advocate of natural signs?—No, I do not advocate natural signs at all; I simply say that they would use them.

20,257. Would not it be an advantage to enable them to communicate by pressure of the hand?—I do not know; I do not see that there would be any great advantage in it.

Mr. H. E. Crofts.

8 Mar. 1888.

20,258. You often talk to people in the dark, I suppose?—I suppose I do.

20,259. Would you deprive the deaf-mutes of the possibility of being able to communicate with their friends and neighbours in the dark?—No; but if you want to carry on communication with anyone you do not generally look out for a dark place; you are not anxious to get out in the dark to talk to him.

20,260. (*Mr. St. John Ackers.*) Is it not usual at ordinary institutions to forbid talking at night amongst the pupils?—I think so.

20,261. If a deaf person were ill, is there anybody in the room who could strike a light and speak to one of the deaf taught under your system?—There is always somebody close at hand.

20,262. Who would be capable of striking a light and communicating orally?—Yes.

20,263. With reference to your pupils attending religious services, in answer to Sir Edward Sotheby you said that they could not understand a sermon in Westminster Abbey; is it not a fact that they must see the mouth of the speaker before they are able to understand?—Yes.

20,264. Is it not a fact also that in ordinary preaching the mouth is not always visible to the congregation; sometimes the head is down, and sometimes it is turned on one side and sometimes on the other?—Yes.

20,265. And that it is just the same as it would be if you took an ordinary book, and held it before a sighted person, and then every now and then turned the book the other side, or turned it down in front so that he could not see it?—Just so.

20,266. You said that the deaf on the sign-manual system could understand a sermon specially delivered in that system even at a distance; that would require somebody specially versed in that particular system, would it not, to give a particular service to the deaf?—Certainly.

20,267. The majority of those you have met with in the world are not conversant with that system?—No.

20,268. The majority that you meet with are conversant with ordinary speech?—Yes.

20,269. It is therefore more easy to imagine that a deaf person taught on the oral system would have the opportunity of attending an oral service, even if he understood it imperfectly, than that he would be able to attend a service specially for deaf-mutes on the sign-manual system?—Yes.

20,270. (*Chairman.*) I suppose in New Zealand your churches are not so large as Westminster Abbey?—No, not quite.

20,271. (*Mr. St. John Ackers.*) Is it not also a fact that those taught under the pure oral system can understand not only (as you said in answer to a question) if the speaker or if preacher is using language suited to their capacity, and looking straight at them; but is it not also quite possible for a parent or a relation of a deaf child to sit near that child, and to interpret in plain and simple language what the preacher or the lecturer is saying?—I do not know.*

20,272. Have you not done that yourself; when you go to church with these deaf children, do you not interpret what is going on?—I may tell them in a simple way the heads of what is going on at the time; I could not explain it to those children at the same time that the man is speaking, I could not keep up with him.

20,273. But you could give a short outline of what he is saying?—Not at the time; I could not keep going fast enough.

20,274. I will put it in another way: Is it because your pupils are, some of them at any rate, those who have not got sufficient language to enable you to keep up with the preacher?—It may be that, of course. I have got 20 children, and they are of different standards.

* I think the deaf and *dumb* should *worship in* the church, and *be taught out* of it. (G. V. A.)

Mr. H. E. Crofts.

8 Mar. 1888.

20,275. You have the whole of those children?—Yes. If I had got three or four or six all in the highest state of proficiency, then it would be different altogether.

20,276. Now let us come to what it would be in after life; take those who are orally taught, and have gone through their course of education; is it not possible for those deaf-mutes to get the benefit of ordinary religious services by coming with their parents or friends to church, and letting those parents or friends speak without voice to them, so that they may get the benefit of what they cannot see on account of the movement of the preacher?—I dare say it is quite possible in the case of those whose instruction has been finished.

20,277. Then, in fact, those who were taught under the oral system would have a very much better chance of getting the benefit of religious services than those taught under the sign-manual alphabet, who could only get it by going to some place where there was a special preacher in that system?—I believe so.

20,278. Have you any idea how many special services are held for the deaf-mutes in England?—I have no idea.

20,279. But at any rate a very much less number than would be held every Sunday for ordinary congregations?—Yes.

20,280. Again, take the question of religious instruction; could not any ordinary minister of religion prepare for confirmation or otherwise instruct those leaving school in a high standard, or before they have left school, on the pure oral system?—He could, undoubtedly, if they were properly taught.

20,281. That he could do in a comparatively short time?—Yes, when he has got used to the children. What I mean is this: I do not think it is possible under the pure oral system for a child to go into a lecture room or a church and sit down, and understand from the man's lips what is said to him.

20,282. (*Chairman.*) That is not so much, if I understand you, from any inability to read the lips as because those taught on the oral system in common with those taught on the manual system have not so large a vocabulary as the ordinary hearing public?—Just so.

20,283. (*Mr. St. John Ackers.*) And also because they cannot see the lips of the preacher or speaker the whole time?—Yes. Of course, I thoroughly believe in the oral system myself; it will do a very great deal, but it will not put deaf children on a level with hearing children.

20,284. In your opinion, no system can do that?—No system can put them on a level with hearing children.

20,285. But you do consider that the oral system is that which gives the deaf the greatest facility of intercommunication with their fellow creatures?—Yes, I do.

20,286. Now, to go to one or two other questions, do the ministers of religion ever make an effort to teach in your school?—No.

20,287. You are aware that Mr. Van Asch was educated at Rotterdam, where the system was for the minister of each denomination to attend during certain hours in the week, and to give instruction to those of his own persuasion?—Yes.

20,288. So far as you know, has any representation been made to the Government on behalf of your institution, that (as the Chairman said) inasmuch as this is not a day school, where the pupils can get religious instruction at home, but is a boarding school where they are the whole year, with the exception of their holidays at Christmas, there should be some relaxation of the rule, and that the ministers of religion should be allowed to come to those of their own persuasion?—I do not believe that any representation of that kind has been made.

20,289. Now, you spoke of natural signs; would you kindly describe what you mean by natural signs: just give us one ordinary natural sign?—(*The witness beckoned with the forefinger.*)

20,290. Have you seen a good many signs in schools conducted upon the sign-manual system which are called by the teachers of that system natural signs, which you yourself could not understand?—I have seen a great many signs used; I should call them natural signs, but I do not know what the teachers call them themselves.

20,291. Would you call that (*putting down the thumb*) a natural sign?—I do not know that; I do not call that a natural sign; that is an artificial sign.

20,292. Then, in your opinion, the phrase, natural sign is made to mean different things by different speakers?—It is so.

20,293. But in the profession all signs which are derived from some natural action are called natural signs?—That may be; but the teachers with us are strictly prohibited to make use of these imitations of natural actions.

20,294. However little of the original natural action it is thought necessary to preserve?—Yes.

20,295. You use these natural signs, which are practically gestures, how long in teaching?—For as short a space of time as we possibly can; we do away with them as quickly as we possibly can.

20,296. For instance, when a child knows the word "come" would you continue to use the beckoning sign?—No.

20,297. Then, in fact, as soon as you are able to give spoken language you do away with the sign?—Yes. But you will bear this in mind, that a teacher of the deaf who is teaching on the pure oral system is bound to sign,—he cannot help himself; I mean a little, not a great deal,—just as a lecturer or preacher does.

20,298. It is a certain amount of action accompanying the words, in fact?—Yes.

20,299. But you do not make any signs which ordinary hearing people would not understand?—No.

20,300. (*Mr. Van Oven.*) Nor do you make those signs intentionally?—No, involuntarily.

20,301. (*Mr. St. John Ackers.*) Is drawing taught in your school?—It has been taught since February 1888.

20,302. Are accurate tables kept in your school with regard to the causes of deafness, consanguinity of the parents, deaf relations, and so forth?—I have not seen any.

20,303. Has that been one of the suggestions made to the Government from your school?—I believe that that suggestion has been made by Mr. Laishley.

20,304. You spoke of the schools in the Australian Colonies you visited being of a charitable character; do you know whether the ordinary education of those colonies is gratuitous for the hearing children?—I do not know.

20,305. (*Chairman.*) Is there anything else you would wish to tell us?—No.

20,306. You have not visited the institutions on the Continent, have you?—I have not; I am going over next week.

Adjourned to to-morrow at 11 o'clock.

6, Old Palace Yard, S.W.

Friday, 9th March 1888.

PRESENT:

THE RIGHT HON. THE LORD EGERTON OF TATTON IN THE CHAIR.

ADMIRAL SIR E. SOTHEBY, K.C.B.
SIR TINDAL ROBERTSON, M.P.
B. ST. JOHN ACKERS, ESQ.
T. R. ARMITAGE, ESQ., M.D.
W. AUCHINCLOSS ARROL, ESQ.

EDMUND C. JOHNSON, ESQ.
THE REV. W. BLOMEFIELD SLEIGHT, M.A.
THE REV. CHARLES MANSFIELD OWEN, M.A.
L. VAN OVEN, ESQ.

CHARLES E. D. BLACK, ESQ., *Secretary.*

Rev. S. S. FORSTER, M.A., examined.

Rev. S. S. Forster, M.

9 Mar. 1888.

20,307. (*Chairman.*) You are the principal of the College for blind sons of gentlemen at Worcester?—Yes.

20,308. Do you think the objects of the institution have been carried out during the time you have been principal?—Yes, judging by the results of the public examinations to which the blind boys have access.

20,309. A list of the former pupils is contained in your annual report which you put in?—Yes.

20,310. I understand that you propose to place your college, if possible, on a permanent basis by raising a definite sum, and turning it into a public institution?—Yes.

20,311. Because it is on those conditions only that the Gardner Trust is prepared to continue its grants?—Yes. I might add that the Clothworkers' Company, who were also our benefactors, have withdrawn their annual scholarships, until our college is made a public institution.

20,312. How do you propose to make it a public institution?—Our idea was to collect a sum which we fixed at 6,000*l.*, because it was an accessible sum, a sum, the interest of which would do something, though not much; and then we proposed to have a body of trustees and of governors. Our original intention was to go on tentatively for a year or two, and then if any advantage should appear to accrue by putting ourselves under the Charity Commissioners, and if it appeared that our constitution would not be interfered with, we proposed to put ourselves under the Charity Commissioners.

20,313. Would you contemplate proposing a scheme to them for their sanction?—Yes, we should. At the time when you visited our institution in Worcester we had not got the latest and most accurate views of our possible relations to the Charity Commissioners; but we have found since, by writing to Dr. Ranger, that being intended to be a charitable trust, an educational trust, we come *ipso facto* under the control of the Charity Commissioners, and we should in fact have no choice in the matter. We found also that they would respect the constitution which we should present to them, that is to say, if we proposed a constitution on Church lines, that they would respect that, and not interfere with it.

20,314. They would be willing to accept the curriculum of studies you submitted to them, I presume?—That has not been formulated.

20,315. You would have to submit your curriculum of studies to the Charity Commissioners, and you would have to obtain their approval of it?—I think that would be so.

20,316. Do you think the higher education of the blind should be in any way aided by the State?—I do. There are three classes of blind persons with whom we have to deal. The first class is those who can pay for their education. Then there are the well born boys who are poor. There are many well born blind boys who are poor, and one does not see how they are to get their education except by the intervention of the Government, or of some large charity; and the Government appears to be the quarter to which we might look for aid in giving them that education. Then the third class are boys of proved ability and high moral character, whose committees can conscientiously certify that it would be a good thing to push them forward into higher education.

20,317. In what way would you propose the Government should give that aid; by annual grant on inspection of pupils?—Yes. I do not think any definite scheme has been formulated yet. Suppose we begin with 6,000*l.*, we might ask the Government to double that, to make things more easy.

20,318. Have you gone into the question of precedents for that?—I have tried to collect some precedents, but I should leave you to judge of the value of them. I find that not until 53 or 54 years ago did the Government do anything for education in any way. The then Privy Council used to make grants of books through the medium of the National Society, and the British and Foreign School Society. That system of granting books appears to have lasted up to the year 1852; at any rate I have a little volume with the date of 1852 in it, in which there is the stamp of the Privy Council. Then I find that one of the earliest recommendations of the Committee of Council on Education was, that normal schools for the training of schoolmasters should be greatly assisted; and to such extent has that recommendation been carried out, that I understand that of the 34 training institutions now existing only two are unassisted by the State.

20,319. Do you propose to make your college a training college for blind schoolmasters?—That would come under its scope. Then I find that the Government makes itself responsible for fees at the London University. Then I find it assists the Welsh, the Scotch, and the Irish Universities, and the Queen's Colleges. I find also it has made grants to those universities for the improvement of their buildings. In 1864 it granted 120,000*l.* to the Glasgow University to improve its buildings, and it also gave 20,000*l.* to the Edinburgh University in 1881, and 17,000*l.* to the Royal University of Ireland. These appear to be precedents for State aid in higher education.

20,320. We have had a copy of your proposed scheme laid before us; we understand that that is not a matured scheme, but merely the first draft?—That is so.

20,321. Are you satisfied that the blind teachers in your college are the best teachers you can get for the boys who are blind?—They have certain advantages, in having passed through all the trials and troubles of blind education, and they are perfectly familiar with the instruments of education; but of course they

Rev. S. S. Forster, M.A.

9 Mar. 1888.

have the great disadvantage that they cannot *see*. Where by force of character they are able to a great extent to overcome the disadvantage of their loss of sight, they are very valuable assistants.

20,322. I suppose that you would say that under seeing supervision they would be efficient teachers of the blind, if well trained?—Yes, I think so; necessarily in many things they are deficient. For example, they can only read such books as are accessible to themselves; and they cannot become your substitute in many things, on account of their loss of sight.

20,323. You could not manage an institution like yours with blind teachers only, and if you have a blind vice-principal you must have a seeing vice-principal to assist you?—I would certainly recommend that there should be a seeing vice-principal.

20,324. And in the case of a smaller college or school there also should be a seeing superintendent at the head?—Yes.

20,325. I presume one of the inducements to employ blind teachers would be that they are ready to come at a lower salary than seeing teachers; and there would also be the feeling that it is a legitimate avenue of employment for the blind?—The latter reason certainly operates powerfully with us. We have always striven to show that blind men can do those things which we claim they should have an opening for. Whether a good blind man should not be as well paid as a seeing man, if we could afford to pay him the same, is another question. I think he ought to be as well paid.

20,326. All things being equal, of course; but blind teachers would not for the reasons you have mentioned be exactly equal to sighted teachers?—No doubt that is so.

20,327. Has your committee any reason to believe that they will raise this sum of 6,000*l.*?—We have progressed so far very slowly but very steadily, and there seems no reason to believe that we shall not get it ultimately. The committee do not meet very often.

20,328. Have you got the active support of the Dean and Chapter of Worcester?—Yes, we have the active support of the Dean and of Professor Creighton, and the friendly support of the whole Chapter.

20,329. (*Dr. Armitage.*) Have the Gardner Trust, or the Clothworkers' Company defined what they mean by a public institution?—I think the Gardner Trust defined it as an institution which should be properly managed by means of trustees and governors, and also have attached to it an annual list of subscribers. That is the definition given to us in the letter which we have received from them.

20,330. Did they make it a condition of their grant that a certain sum should be raised?—In their first communication with us they made it a condition that we should first raise 5,000*l.* upon which they would give 1,000*l.*, but I begged them, as they were an influential body, to begin with a subscription, and they put down then the sum of 1,000*l.*

20,331. You said that the Clothworkers' Company had withdrawn their annual scholarships till you had made your college a public institution; have the Gardner Trust taken theirs away or expressed any intention of taking them away?—No.

20,332. Would it not be possible to become a public institution in a sense to satisfy the Gardner Trust, even before you raised a large sum of money?—I do not see how.

20,333. By having a committee and trustees?—I take it that there must be some property before you can have trustees.

20,334. A great many of our public institutions which are governed by a committee and by trustees have no property; but the trustees will take charge of property if it comes?—I do not know how they can be trustees, unless they have something committed to them as trustees.

20,335. (*Chairman.*) You have certain property already in trust for certain purposes; might you not without going any further create yourselves a trust under the Charitable Trusts Act?—We have property, but that property is not in our own name.

20,336. You could get it transferred, and you could create a trust without handing over the school, or raising the 6,000*l.*?—The scholarship fund that now exists is called "the scholarship fund for blind sons of gentlemen;" it is not primarily and specially attached to us: we have the first claim upon it, but it is not strictly speaking in our own private possession.

20,337. But could you not if you liked vest that sum of money which is now for the blind sons of gentlemen in some trust for carrying out the objects you have in view?—The fund is for a particular purpose.

20,338. Could not you, with the consent of the existing trustees, apply to the Charity Commissioners to get that purpose varied?—This 2,000*l.* is for a special object; the trustees of the scholarship fund are not the trustees we propose to have for the new trust. It might be possible to vary that trust, but it has never been proposed.

20,339. (*Dr. Armitage.*) Some years ago you published a paper in which you expressed your opinion that blind children of the poorer classes are better trained with the seeing in ordinary schools than in special institutions?—I published a paper some years ago on the Glasgow system, and I then expressed what I felt upon the subject, viz., that blind children would receive a good education in the seeing schools. I think that is as far as I went.

20,340. Do you still believe that blind children can be well educated in connexion with seeing children?—I think that blind boys can be well educated in connexion with seeing boys.

20,341. Have you ever been to Glasgow?—Yes.

20,342. Have you seen the education there of blind children?—Many years ago when Mr. Barnhill was alive.

20,343. Were you satisfied with it?—I was satisfied with it as far as it went; it was only to be preliminary.

20,344. Has it ever occurred to you in connexion with this subject that it might be well to select as a site for a college for blind sons of gentlemen, the neighbourhood of one of our public schools, where the blind boys could receive special education in special classes, such as you have at Worcester, and at the same time attend the ordinary classes of the public school?—No, it has not.

20,345. Does that idea commend itself to your judgment?—I think it might be possible, perhaps, to carry out such a plan.

20,346. You have not considered that subject?—No, we have not had it brought before us.

20,347. From the statement with regard to your college that we have before us, it would appear that the great opening for men who have gone through the training you give is the Church?—Ten of the pupils that have graduated have selected the Church.

20,348. Can you tell us how many of the bishops will ordain blind clergymen?—I cannot exactly tell you. I do not know how many of them have been asked to do so.

20,349. How many have ordained blind persons?—The Bishop of Worcester, the late Bishop of Ripon, the late Bishop of Salisbury, the late Bishop of Lincoln, the Bishop of Hereford and the Bishop of St. Albans. The Archbishop of York, I think, declined.

20,350. Can you give us an idea what those gentlemen who have gone through you college are doing; in the first place you say ten have taken orders?—Yes.

20,351. Can you give us an idea of what they are doing, whether they are curates, or what they are?—Three of them are vicars; and by referring to Crockford's Clerical Directory and the official Clergy List we are able to get at their incomes. The incomes of the three vicars appear to be over 1,000*l.* (at least 900*l.* according to one account), and one of them takes pupils. I suppose the income of the three altogether, including their houses might be put at about 1,200*l.* or 1,400*l.*, certainly the former.

Rev. S. S. Forster, M.A.

9 Mar. 1888.

20,352. Is that pretty equally divided?—The income of the vicar of Brafferton, Mr. McNeile, is put down at 357*l.*; the income of the vicar of Gillingham is put down at 438*l.*; the income of the rector of Icomb is put at 190*l.* Mr. Marston takes pupils: he has three pupils, who probably pay him 100*l.* a year, which added to 190*l.* gives him a fairly good income. As to the six curates I do not know their circumstances, but I suppose we may fairly estimate their income at about 100*l.* each.

20,353. Is Mr. Beresford one of the vicars?—No, he is a curate.

20,354. Are the pupils that Mr. Marston takes blind or seeing?—They are blind pupils.

20,355. (*Mr. St. John Ackers.*) In what trades and professions do you think the blind could get on best other than the Church?—It is very difficult to say; though there is a good deal of sympathy with blindness, for it is a very great barrier to many of the professions. I should think the law is a good opening for clever blind men.

20,356. If your college could take in say a couple of hundred, do you think there would be a reasonable chance of good good employment for them?—I do not think we can expect a couple of hundred in the first instance.

20,357. I am looking forward to the number you might expect hereafter?—Between the ages of one and 20 I think the number of blind is only something over 2,000; and though no statistics exist upon the point, we could not expect to have as many as 200 out of that number.

20,358. In what professions would you expect that persons whom you trained at your college would find employment?—I think music affords a large opening for the blind, and there is a great demand for musicians; the Church has not been closed to them, and I think a great many more might become clergymen. Some might make their way in the law; some might be employed as teachers; some might become lecturers and public reciters. So, practically, there would seem to be considerable opening for the comparatively small number of blind that would be received at our college.

20,359. You do not know what that number would be likely to be?—We have no means of ascertaining. I do not think it would at any time reach 200.

20,360. Out of the pupils you now have, how many are blind sons of gentlemen?—The great majority are persons above the class who are sent to elementary schools.

20,361. (*Mr. Arrol.*) You advocate the education of the blind with the seeing; would you recommend that the blind should be educated with the seeing up to the age of 13 in public schools?—Yes, but I think that blind boys when they arrived at the age of 13 should be given more special instruction.

20,362. Are there any special reasons that would induce you to recommend that the blind should be educated alongside of the seeing?—They derive many advantages from mixing with sighted boys; every object presented to them becomes a topic of conversation and explanation, and thus knowledge is imparted to them more fully.

20,363. Could you speak as to the result of the training in the board schools in the case of any of those young men who have come to Worcester College from such schools?—I do not know any boys that have come to us through the board schools.

20,364. (*Mr. Van Oven.*) Is it your opinion that if a system were introduced in board schools of scholarships for blind children who showed exceptional talent, and who were ultimately sent to a higher class school, they would then, after having received such higher education be able to support themselves in life as well as if they were at once sent from the elementary school to practise at a trade?—I think the best of them would.

20,365. You think a blind boy of exceptional ability should be sent to some school or college where he might receive higher education, and you think that with that higher education he could make his way better than he could by working at a trade?—I think so.

20,366. (*Rev. Mr. Owen.*) Do you know much about the Worcester Society for Providing Cheap Literature for the Blind?—I know a little about it.

20,367. Is it doing good work?—It is at present in very low water.

20,368. Is that society in any way connected with the college?—Not in any way, except through the officers; for instance, I am the treasurer of it, but that forms the only link of connexion.

20,369. Do you think if it was properly supported it would be a very valuable institution as an adjunct to your own college?—It is printing the Roman type, and the Roman type is unpopular; it is therefore engaged in an uphill work; but it prints Braille as well.

20,370. To what extent do you purchase books from that society for your own college use?—All our religious books are purchased from that society.

20,371. Have you any suggestion to make on the question of how to overcome the difficulty of providing books for the blind, which seems to be acknowledged on all hands?—I would recommend that if the Government could be induced to take the subject up, it should take the three types and work them side by side, and let experience decide by use which should fall out, and which should stand. They have amalgamated the types in America. There is a printing society in America in which they produce more than one type.

20,372. Have you yourself made up your mind as to the type question?—In a great measure I have. I have a strong opinion upon the type. I think that every English blind boy should be taught the Roman type. Of course no blind boy could be educated without the Braille type. Then I think the Moon type is very good for the aged and feeble handed.

20,373. At any rate you think that in every institution for teaching the blind the two types, the Roman and the Braille, should be taught side by side?—I think that every English blind boy should be taught the Roman type, which there is not any difficulty in learning. Any clever boy could learn two or three types, or four types or more; and any boy could learn the Roman type.

20,374. Do you consider that you have sufficient teaching power at your college now?—We have twelve blind pupils, and we have myself and three blind teachers.

20,375. You think that quite sufficient?—I think we could teach a great many more than we have.

20,376. As regards inspection, do you think that it ought to be done by a seeing inspector with the assistance of a blind man?—There are seeing persons who can read Braille with sufficient celerity to look over the papers quickly. If that were all that an inspector would be required to do, a seeing inspector would be sufficient.

20,377. Do you think a seeing person could better test the literary acquirements of the pupils than a blind person?—Not necessarily so. A blind man would find it easier to read the examination papers of the boys, because he would read them in a natural way with his fingers. It is fatiguing for a seeing person to read a great deal of Braille type, it hurts the eyes. I think the inspection would be best conducted by a seeing inspector assisted by a blind reader.

20,378. (*Mr. Johnson.*) With regard to the question of type, you are of opinion that the Roman type should be taught together with the Braille and the Moon. I see your society prints large-sized type for hard hands and smaller type for educated hands; the smaller type as I understand is the lower case?—Yes.

20,379. Which do you think is the better of the two, the ordinary size, or the lower case?—The larger sized type is very suitable for old people, and people

Rev. S. S. Forster, M.A.

9 Mar. 1888.

whose hands have become hardened; the smaller type is easily learned by young people up to the age of 20.

20,380. Do you think it is as easy to learn the small type as it is to learn the Braille type?—I think not, but I would not undertake to give a general opinion upon it, because what is easy to one boy is not easy to another boy.

20,381. Do you teach your boys both types, both the smaller Roman type and the Braille type?—Yes.

20,382. Do you find that they learn the smaller type without much difficulty?—The smaller type is not so easy to learn as the large Roman characters, and not so easy as Braille.

20,383. You think Braille and the large Roman characters equally easy?—Yes, I think they are both equally easy, especially comparing the large Roman characters with the Braille letters which are now produced, which are good sized letters. The letters produced in the British and Foreign Association books are good sized letters, as large as the big Roman letters, if not larger.

20,384. You advocate that the Roman letters should be taught to every blind boy, as well as Braille; what system of writing do you recommend for the blind?—The Braille system.

20,385. That is to say, for writing between themselves?—Yes, between themselves.

20,386. Do you advocate that they should be taught the Roman letters for writing to their friends?—The Roman letters cannot be written except with the greatest possible difficulty. I do not know any facile method of writing the Roman type with any success in embossed letters.

20,387. You are aware that they can write it with a pencil?—Yes, if they have learnt to write before they became blind.

20,388. Is not it a great advantage that the blind should be able to write in the writing of the sighted, so as to be able to communicate with the sighted?—If they have been able to write before they became blind they generally write the Roman type with the pencil; but I do not think it is the custom to teach them to write the Roman type after they have gone blind, it is so very laborious.

29,389. Are the Greek, Latin, and English works which are published in Braille by the Society for providing cheap literature for the blind extensively used by you?—We use them whenever we want them.

20,390. You have some books in the Greek characters?—We have.

20,391. Have you any Greek books in Braille?—We have a Greek New Testament in Braille, that is to say, a large portion of it, and other books.

20,392. Some books have been printed in the Greek characters?—Yes, four Epistles.

20,393. Do you use those in your college?—We are not actually using any of those Epistles at present; we should use them if we wanted them.

20,394. Where is the chief market of this society for the sale of these books?—Its total market is extremely small. I suppose we are its greatest present customers. It is applied to from time to time for books here and there, but it has no great sale for its Roman books.

20,395. To what do you attribute that; do you attribute it to the small size of the types or to the bad selection of the books?—I cannot admit that alternative. I should say, first of all, that the Roman type has no great friend to back it up; the two other types prominently before the public have powerful friends who are willing to push them, and even to give away the books in large numbers; no such advocate for the Roman type has ever appeared in my day.

20,396. Since the death of Mr. Alston there has been no one to advocate the Roman type to any great extent?—No.

20,397. How are the funds procured for the printing of these books by this society?—There is a subscription list which I think does not reach 100*l.* a year at present.

20,398. Is the stock of books very large?—Not very large; it is not the custom to print a large edition at once.

20,399. Do you stereotype the plates?—Yes.

20,400. Therefore you have all the plates ready for use when they are wanted?—Yes.

20,401. You only emboss when there is an order?—We emboss a small edition, and when that has run out we emboss another small edition.

20,402. To go back to your college, the object of your college is rather to prepare men for the university than to prepare them for a profession?—Yes, I think you may say that is our object.

20,403. Is any special education given in your college which makes it better for the blind sons of gentlemen to come to you instead of going to Harrow or Eton, for instance?—There are no facilities for teaching them at Harrow and Eton. Our college is a school for teaching blind boys.

20,404. With special appliances for the education of the blind?—Yes.

20,405. Which special things they could not get at Harrow or Eton?—No; I think not. I admit that a clever blind boy could make his way through Harrow or Eton, if he had the assistance of a tutor at home to prepare his lessons. I know that Mr. McNeile, one of our early pupils, resided several years in the house of Mr. Blair, who was a master at the Worcester Grammar School, and he went daily to the cathedral school to do his work.

20,406. You recommend that this college should be started as a public institution at Worcester; do you think that Worcester is the best locality for such an institution; why do you choose Worcester?—We choose Worcester because we have been for 20 years at Worcester, and because the Bishop, who is our great friend, earnestly desires that we should not leave Worcester in his day.

20,407. Originally your college was for the blind sons of gentlemen, and then you developed it into an ordinary school admitting seeing boys, why did you do that?—We found that in order to take the blind boys about we should require to have a number of boys liveried; we could not afford to have a number of such boys, and therefore we looked about for the most efficient substitute, and it occurred to us that if we received the sons of clergymen for a moderate sum we should do a service to the clergy and at the same time do a service to our own boys, and avoid the disagreeable necessity of liveried boys.

20,408. Of your present pupils how many are seeing boys?—We have only two seeing boys at present, we have had as many as 12.

20,409. Is it your intention still to go on taking seeing boys as well as blind boys?—Yes.

20,410. Suppose this college were established on the proposed lines, would it be an establishment to which both blind and seeing would be admitted?—It would be a college to which we should admit seeing boys, on account of the special benefits that arise from having them; but they would be admitted not as boys who would be remunerative, but as boys who would be part of the machinery of the institution; we should get as much from them as we could, but we would take them at a less price for the sake of the benefits they would bring.

20,411. You would not let any of these sighted boys participate in any scholarships that might be founded?—No, they would not receive any benefits provided for the blind.

20,412. I understand you want 6,000*l.* to start with?—We want 6,000*l.* to form a trust, so that we may enjoy the interest of it.

20,413. Do you think 400*l.* a year would be enough to start so large a scheme with?—It would be enough to draw the thoughts of the charitably inclined to the scheme, and it would be a handsome nucleus to begin with.

20,414. You contemplate that the 6,000*l.* would be collected from the public somehow, and then you would ask the Government to double that sum as a

sort of nucleus, that would be 12,000*l.*?—Yes, that is the proposal.

20,415. I gathered that you were in favour of employing blind teachers to teach the blind?—I am in favour of employing blind teachers to teach the blind when they have a strong moral force about them; but I would prefer a seeing man to a blind man who did not possess that strong moral force.

20,416. Do you think it requires any special training on the part of seeing teachers to undertake the education of the blind?—Not any special training. I think they should know how to write and read, and understand the use of instruments perfectly.

20,417. Which might be obtained in a very short time?—I think so. I have seen it stated in Dr. Armitage's well-known book, and it is a matter of common experience that the type is quite easy to learn.

20,418. Do you think that in the lower education of the blind, ordinary seeing schoolmasters might be able in a very little time to acquire all the necessary knowledge of the apparatus to teach blind children in a seeing class?—I do not think there is anything to prevent it.

20,419. You do not think it necessary in the lower grades of education to have a blind teacher to teach blind children?—Not absolutely necessary. *Rev. S. S. Forster, M.A.* 9 Mar. 1888.

20,420. You think an ordinary seeing teacher with an ordinary amount of intelligence could teach blind children any one of these types?—Yes.

20,421. (*Dr. Armitage.*) In mentioning the methods of writing for the blind you did not mention stylography; was that an unintentional omission, or do you not use it?—We do not use it.

20,422. Do you give any technical teaching in the use of the fingers, I mean in carpentering or any work of that sort, in your school?—Yes; our second master is very fond of carpentering; he is a very good carpenter himself, and he enjoys any work of that kind with the boys; in Worcester we had a workshop containing a bench and a number of tools.

20,423. Do many of the boys learn carpentering?—I think three of them like it and excel in it.

20,424. Do you think it a desirable thing for boys of the class you have that they should have that kind of training by which their hands become more useful?—Certainly.

The witness withdrew.

Mr. John James Plater examined.

20,425. (*Chairman.*) You are a basket manufacturer at Birmingham?—Yes. *Mr. J. J. Plater.*

20,426. How many blind men do you employ?—Three indoors and two out.

20,427. How many seeing men do you employ?—On an average about a dozen in the winter, and 16 to 18 in the summer.

20,428. How is it you do not employ more blind men?—The majority of blind men are unable to turn out their work so as to compete with sighted labour.

20,429. From what does that arise?—Partly from the fact that they are taught by sighted individuals, whereas they should be taught by qualified blind teachers.

20,430. If, as you say, the work of the blind is not generally so good as that of the sighted, why should the blind be the best teachers of the blind?—Because a sighted man teaches a blind person from his own standpoint, whereas a blind man teaches him to work by feeling.

20,431. You being a blind man yourself, why have not you educated more blind men to work under you as basket makers?—Had I begun business with capital, the probability is I should have been too pleased to do so; but I had to make my way, and I had to look to money making as the first principle of my business. I did at first find employment for a good many blind men after they had left the Birmingham institution, and then after a little while, after I had put them square, they would leave me and start for themselves elsewhere.

20,432. Then they can earn their livelihood elsewhere, by working at home?—Yes, some can.

20,433. How many blind have passed through your manufactory in that way?—A dozen; that is after they had left the Birmingham institution or other institutions.

20,434. You say you employ three blind persons; do you employ them in doing the same work as the seeing, or in inferior work?—I am employing them to make brown hampers. I employ sighted men to make the same class of goods, but I do not employ the blind in the higher class of work.

20,435. Because they cannot compete with the seeing?—Because they cannot compete with the seeing in quality and finish, that is speaking generally; there are exceptional cases of very clever blind workmen that have turned out some work quite equal to the sighted, but they take a much longer time in doing the work.

20,436. What institution were you brought up in?—The Birmingham Institution.

20,437. Do you think the training there fitted you for your work afterwards?—I learned to make baskets there.

20,438. Did you have to begin again, as some people have told us they had to do, after you left that institution?—I was then certainly not what I should now call a qualified workman, but I was not afraid of trying to improve myself.

20,439. Was that the fault of the institution, or of the system?—The fault of the system. There is a blind assistant teacher at the Birmingham Institution now, there was not when I was there; but the fault when I was there was this: a sighted teacher tells a blind person to do so and so, whereas a blind teacher would show him in his own way how to do it; a sighted teacher, too often, if a blind man is not quite on the right lines, instead of showing him how to do the thing with his own hand, and making him do it, does it for him, he finishes his work off too often instead of leaving it for the blind man to do it thoroughly throughout, thus giving his work a better appearance, but that is detrimental to the interests of the blind man when he leaves the institution.

20,440. Do you advocate the use of frames such as are used in Lancashire in making square or round baskets as being a useful guide to the blind in making baskets?—That is according to the style of the work; in making baskets all of one size, they help them very much, but they impede the workman in point of speed.

20,441. Is not the great fault of the work of the blind want of uniformity in character?—I should consider the best workman would be one who would be able to turn out his work with the greatest uniformity.

20,442. We have to deal not with the minority, who are good workmen, but with the majority, who are indifferent workmen?—In the majority of cases frames are absolutely necessary.

20,443. We have not found them generally used?—They are not generally used.

20,444. Do you recommend their use?—Yes, I do, certainly, for general work.

20,445. How soon do you think a blind boy should begin his technical training; that is to say, training with the figures as distinguished from learning reading, writing, and arithmetic?—I think that there should be attached to every institution in which a

Mr. J. J. Plater.

9 Mar. 1888.

blind child was being educated a workshop for him to go in for a short time each day.

20,446. At what age would you commence to give that technical training?—At the proper age for a child to begin to be educated, say, a child began to be educated at seven, that child should go into the workshop and learn to handle tools, and to model with clay, and so get ideas of shape. By handling different kinds of material, his perceptive powers would be cultivated, that should be a part of his earliest education. Then, I would teach him to make boxes and light baskets, not so much with a view of selling them as for enabling the child to gain a knowledge of how to use his hands.

20,447. With regard to the sale of work done by the blind, do you think that in each large district or centre there should be a place where work done by the blind could be sold in connexion with institutions where there were such institutions existing, or where there were no institutions existing that there should be created a centre for the sale of such work with a central workshop?—Yes, I think any districts in which there is a great demand for baskets, especially if they are of uniform size, would be the best places for the blind to be employed in, for instance, a few miles out of London, in Kent, there is a great demand for round sieve fruit and vegetable baskets, in which fruit and vegetables for the London market are packed.

20,448. And around Manchester there would be a demand for potato baskets?—Yes. I believe no institution has taken it up in London; there is no excuse why an institution should not introduce it; I think it is very simple work for the blind.

20,449. Do you think there are openings for the sale of work done by the blind which are not taken advantage of at present?—Yes, especially in the supply of baskets for the fruit and vegetable markets of London, because the quantity bought for the London market is enormous. Then I think there would be a demand for baskets in the district of Pershore or Evesham, where a very large quantity of fruit is grown which goes all over the United Kingdom. What are called pots are used there, those could be made of one size, and it would be work that a blind man could earn good wages on.

20,450. With regard to those blind persons for whom less is provided at present than any other class; namely, those who become blind after they become 20, and who are too old to enter institutions; what do you think they could best be employed at?—I lost my sight at 20 and I took to basket making.

20,451. Do you think that the best trade for a man who becomes blind at 20?—Yes; unless he has exceptional musical abilities, then to my mind there is nothing equal to music and tuning.

20,452. Those who go into music must go into it in early life; what is to be done with those who have become blind from accidents or various causes after they have grown up and who have not had any previous training?—Say they become blind from 20 to 30 years of age, they have not got too old then to learn basket making, but I have found that men who have lost their sight at the age of 30 or more seem to lose the power of learning a new trade, and the small amount that they are able to earn while they are learning seems to take the pluck out of them. Too often the loss of sight so crushes their energies that there is not much left in them, and in such cases I should recommend that they should be encouraged to do that sort of work which they could do equally well with seeing people; for instance, they might take up the selling of newspapers and periodicals, they might go on a round in the day time and solicit orders for morning and evening papers, and get a connexion that way. I know several cases in which men have got a good living in that way. The work they are so doing is of equal value to that which would be done by a seeing person, and naturally people would give a blind man the preference under the circumstances. I have one man in my mind who lost his sight at the age of 25; he was receiving 5*s.* a week from a sick club, and not rousing himself to do anything. I recommended him to sell newspapers; he was shocked at the idea; I told him if he would go to a part of Birmingham, away from my own home I would go with him and shout for him the first night—that had the desired effect, and he began selling newspapers, this would be ten years ago, and he told me a year ago, that by the sale of newspapers and hawking brushes and small things used in houses in the middle of the day, he was getting 25*s.* or 30*s.* a week. I think a man with fair energy that loses his sight when he is too old to pick up a trade might get a living in numberless ways, if he has energy, and if he has no business ability he could sell newspapers, and do many kinds of work. When I first began basket making, for instance, I had no capital, at least I started with one solitary sovereign, and I had a lot of sighted competition to contend against, and how to do it I was at a loss to know, but I got on gradually by getting orders for baskets in the day time and working at nights to execute the orders. I thought I might sell some nail bagging, and I got a list of addresses of bagging manufacturers in Scotland and Ireland, and I wrote and offered my services to sell on commission to manufacturers in the district. I represented a firm in Belfast for some years, and sold their bagging for them, and that helped to bridge over the competition I was contending with. Then I went to a coal merchant and asked him to give me a commission on orders I could get for coals. If I called on a manufacturer that used coal, nail bagging and baskets, I could generally pull an order off him for one of the three. I think that a man that may not have much mechanical skill, if he has a fair amount of intelligence and a fair amount of energy could do work of that kind, which is so simple that any one could do it. He does not want eyesight to sell coal, nail bags, or many other kinds of goods and material.

20,453. Do you know anything about the condition of the blind in workhouses?—No.

20,454. (*Mr. Johnson.*) How long were you at the Birmingham school?—Three-and-a half years.

20,455. For how long a period did you get instruction after you left that institution before you became a master basket-maker?—I married and got into business in a few weeks after I left. I perhaps made a mistake, but I rectified all that if I did. I knew my responsibilities, and I worked from 6 in the morning to 12 at night to pull right the first year.

20,456. You did not think you had quite completed your education as a basket-maker in three-and-a-half years at Birmingham; did you get any more instruction after you left?—I got no more instruction after I left; but if I had to make a basket I got one as a pattern, and made up the order equal to pattern.

20,457. But you got all your preliminary education at the Birmingham school?—Yes.

20,458. And you were taught there entirely by a sighted basket-maker?—Yes, with the exception of the aid of the blind who were there.

20,459. (*Chairman.*) Did you marry a seeing person?—Yes.

20,460. (*Mr. Johnson.*) Do you approve of the blind marrying the blind?—Certainly not.

20,461. Have you any experience of the disadvantages of the blind marrying the blind?—I have come across two or three such cases, and there is a sadness about them which is much to be deplored. I think one pair of eyes at least are necessary for two people, so that the one with eyes may read to the other and do various things which a person with eyes is more capable of doing than one who is blind.

20,462. (*Chairman.*) It is an immense advantage for a blind person to marry a sighted person?—Yes.

20,463. (*Mr. Johnson.*) You have employed about 12 persons who have passed through the Birmingham institution?—Yes.

20,464. What was the amount of intelligence that they showed at basket-making; were they likely to be able to earn their own living?—Some of them are earning their living now.

20,465. But they were not sufficiently good workmen for you to keep them on?—I could only pay the ordinary wages of the district; they were anxious to improve their condition, which they thought they could do by starting on their own account, and I helped them to start on their own account, and one or two that worked for me formerly I supply material to and take work from.

20,466. Then what was your scale of wages?—The ordinary trade list of the sighted.

20,467. Do you think there is any objection on the part of sighted basket-makers to the employment of the blind as a rule?—Yes, there is a prejudice against the employment of the blind by sighted employers, because they feel that blind institutions where work is done by the blind are prejudicial to their interests, consequently they are prejudiced against blind people apart from the question whether they are good or bad workmen.

20,468. Because they think the blind are competing with them?—Yes, that is why I think it is so necessary to give further facilities for the sale of the work of the blind.

20,469. Have you any experience of blind workers in other institutions except Birmingham? — Not except Leicester.

20,470. Did I rightly understand you to say that the blind make brown hampers best?—The men in my shop make brown hampers, because brown hampers are in demand for packing goods in that district; but there is no reason why a blind person in Lancashire for instance should not make white skips as well as a man with his eyesight, by the use of frames.

20,471. You think education and trade should go on together in the case of the very young blind?—Yes, I believe in technical education as being the best thing for the blind.

20,472. Have you any experience about music; have you come across blind persons who have devoted themselves exclusively to music?—Yes.

20,473. Do you find they make a good living?—I find some do, according to their ability and energy.

20,474. Where do they get employment?—I know several that are organists at different churches, they teach music and singing, and some are pianoforte tuners.

20,475. Do you know any blind organists in Birmingham?—Yes.

20,476. Do you know any who play in public houses?—No; there may be some, but I do not know one. I know there are some playing about the streets.

20,477. Where abouts do you get your rods?—All over England, and also from Belgium, Holland and Germany.

20,478. Do you prefer rods from any particular district more than another?—English are the best.

20,479. From what part of England do you get your rods principally?—All parts of England, wherever I can buy the best for the least money. I went through my last year's trade yesterday, and I find I got through 145 tons of willows last year; three tons 10 of cane, and one ton of chair cane. I could give the relative value of each; 35 tons of white willows, varying from 12*l.* to 18*l.* a ton. 15 tons of buff willows, varying from 18*l.* to 32*l.* a ton; 95 tons of brown willows, varying from 4*l.* to 7*l.* a ton. The basket cane averaged 20*l.* a ton, one ton of chair cane averaged 1*s.* 6*d.* a pound. Plaited rush has been recently introduced into basket making. I set some women on to do that, I sold 60,000 yards of that last year. I sell the women the rushes outside and they bring the work in.

20,480. (*Chairman.*) What would those women earn?—About 10*s.* a week, but they are not blind.

20,481. (*Rev. W. Sleight.*) What other trades besides basket making do you consider best for the blind to work at?—Brush making is considered by some people to be a good trade for them, but I never met with a brush maker who got a living outside an institution. I do not see why a blind man should not make packing boxes.

20,482. What can a blind man earn at basket making?—As a rule an average man would earn 12*s.* a week.

Mr. J. J. Plater.

9 Mar. 1888.

20,483. Then the blind man could never earn as much at basket making as a sighted one?—No, without the sighted man was very slow. You may say that a blind man would earn half what a sighted man would earn, or less.

20,484. Do you think that the teachers in workshops for the blind should be blind or sighted?—I think in blind shops the teachers, collectors of accounts, and the managers, those who have to keep the institution in touch with the public, should be all blind; blind institutions now are too much institutions for the benefit of the sighted, who get good salaries, while the blind people are allowed to work at very low wages. I should like to see that order of things reversed. While I was waiting to come in here my son was reading to me a book by Dr. Armitage, in which reference is made to Birmingham, and to the number of teachers there. I should very much like the Commission to ask for a return of the salaries paid to blind teachers in the Birmingham institution, and in other institutions, and the salaries paid to sighted teachers, because I believe that blind teachers in institutions are underpaid and kept back compared with the sighted teachers. The blind should get good wages where it is possible, where they are of proved ability. For instance, the woman who teaches cane work at the Birmingham institution only gets 7*s.* 6*d.* a week, and she has to walk two miles to and from her work each way, they would not get a sighted woman to teach at anything like those wages, she ought to get 10*s.* or 12*s.*

20,485. (*Chairman.*) Why should she be paid 10*s.* or 12*s.* if she is willing to come for 7*s.* 6*d.*?—Because it is that or nothing.

20,486. (*Mr. Johnson.*) You would supplement her wages by giving her 2*s.* 6*d.* as a gift?—Yes; I contend that institutions for the benefit of the blind cannot fairly be compared with purely trading firms, because where is the necessity of charitable people giving their money to blind institutions if the workers in those institutions are only to be paid for their labour at the same rate as they would get anywhere else? Funds are given to an institution to benefit the blind, and if a blind man earns in that institution so much a week I contend that the institution should supplement his small wages out of the funds of the institution, out of the moneys given to the institution for the benefit of the blind or profits on trade I should prefer to see the small wages of the blind workmen supplemented with the profits on the trade of such institution and the subscriptions given by the public should bear the general expenses of the institution.

20,487. (*Rev. W. Sleight.*) In your opinion could the blind make the baskets for the Parcels Post?—Certainly they could, good fair workmen, especially if the work were divided.

20,488. As well as sighted workmen?—So well that a good many who were or were not basket makers could not tell the difference between a basket made by a blind person and a basket made by a sighted person.

20,489. Have you taken out any patent in basket making?—I have brought out several designs in basket making and basket fittings. I brought out what is known as "Plater's Registered Basket Fastener," the one that was adopted by the Parcels Post, and a patent bar which we have in use for fitting baskets up.

29,490. Have you registered those?—Yes, and there are a lot of things I have brought out, that I did not patent or register.

20,491. Have you taken any contracts for the Parcels Post yourself?—Not for baskets, when the orders were first given out, I was written to, and I sold 20 tons of willows for making the first lot of Parcels Post baskets that were made. I did not care to make the baskets, I had not room without interfering with my general trade.

20,492. In your opinion might the Post Office officials be asked to give preference to the blind, when

Mr. J. J. Plater.

9 Mar. 1888.

they want baskets for the Parcels Post?—Certainly, and it would be very kind of them if you could get them to do it.

20,493. (*Mr. St. John Ackers.*) For what number of years have sighted basket-makers to serve their apprenticeship?—Five, six and seven, as a rule.

20,494. Is the time that is given to teaching basket-making in institutions as a rule as long a time as that?—I think so.

20,495. You were only 3½ years at Birmingham?—That was all.

20,496. Then do I understand that at Birmingham, at any rate, the majority of the basketmakers serve an apprenticeship at their trade for five or seven years?—Yes; the reason I left after being there only 3½ years was this, I was 20 when I went in, and I wanted to get away quick.

20,497. You consider that the reason why those who have been taught basket making in the Birmingham Institution do not succeed so well as might be expected is not so much the shortnes of the time that they are in the institution as the character of the instruction they get there?—Their prospects are now very much improved with blind teaching and sighted supervision.

20,498. (*Mr. Van Oven*). I understand you prefer blind teachers for the blind, because they can better grapple the difficulty that a blind person has to deal with than a sighted person?—Just so, from experience.

20,499. Then as regards the blind themselves, is a person who has been born blind able to learn a trade such as basket making with greater or less facility than a person who has became blind in after life?—If a person loses his sight after he has arrived at the age of 20 he has to contend with the shock to the system and the lowering of energy which the loss of sight causes, at the same time the possession of eyesight for the first 17, 18 or 20 years must be a great advantage to any one as compared with a person born blind; because while he has had eye-sight he has acquired a knowledge of the shape of things, and so on which becomes of great value to him in carrying on his work after he has become blind.

20,500. Therefore a person who has had eye-sight has considerable advantages over a person who has never seen, so far as regards working at his trade?—I have one or two good basket makers in my mind that never remember seeing, that were brought into basket making when they were young. In the great majority of cases where blind men take to it after they have arrived at the age of 20, they lack energy and there is too much gone out of them to begin learning.

20,501. (*Dr. Armitage.*) Do you know a good many of the men who learnt the trade of basket making in the Birmingham Institution and who are now basket makers?—Yes; I think I know them nearly all.

20,502. Are there many who are able to support themselves?—I do not think there are more than a dozen that are able to support themselves unaided. I mean by that, they live at home with their father and mother and they get some other support; but a dozen would cover the number that are able to earn a living by basket making.

20,503. About how many men in all have passed out of the Birmingham Institution who were taught basket making in that institution?—I could not give you the number. You might get the number from the reports of the Birmingham Institution.

20,504. You said you knew pretty nearly all who had passed through as basket makers?—I meant all who were getting a living—hundreds must have passed through, about 10 or a dozen are getting a living at basket making.

20,505. Are those getting a living in workshops or at home?—I mean they are working on their own account or employed as journeymen outside institutions.

20,506. There are a dozen working on their own account making a living?—Yes, and employed as journeymen.

20,507. Do many of those who are not making a full living at the trade of basket making live at home being partially supported by their friends?—Yes; but very few of the whole number who have passed out of the institution having learnt basket making, follow the trade of basket making fully.

20,508. You think that the great majority of those who have learnt basket making in the institution do something else when they leave, that they do not carry on the trade of basket making?—Compared with the number that go through, I think very few continue the trade. I think the teaching of basket-making in the Birmingham Institution is not a success.

20,509. With regard to other trades do you know of any brush makers who are earning their living?—Not one of those who were in the institution.

20,510. Do you know any mat-makers who are earning a living?—Not outside the institution.

20,511. Do you consider basket-making a better trade to teach than matmaking in an institution?—Yes; you have prison labour to compete with in mat-making. I do not think mat-making is any good for blind men. I think it is time thrown away to teach them mat making.

20,512. You were saying that there was a great opening for blind workshops in certain districts of England; do you think that in certain districts where baskets were wanted you might plant small colonies of basket makers, 10 or 12 perhaps, with a blind foreman, so as to avoid all the paraphernalia of an institution? Take Kent for instance: suppose two or three sheds and a dwelling house were taken just in the centre of the fruit district and suppose you began with three or four blind men and gradually increased perhaps up to 10 or 12, with a clever blind man as the foreman, do you think that such isolated colonies would be likely to do pretty well?—I think if you took premises or had a place built that would at once admit of 50 blind basket makers working in it, there being room for enlargement to admit 200 or so, and if they got a living there I do not know that it would be necessary for the promoters of such an institution to look after them and see how they lived outside the institution; but I believe 100 or 200 might be employed in Kent within 10 miles of London, and 100 or 200 could be employed in the vale of Eversham, and the same number in Lancashire, taking one or two places as centres in the heart of the manufacturing district, if premises were taken in which blind workmen could work. There would be funds required to assist them but I think employment could be found for some hundreds of blind men in that way.

20,513. (*Chairman.*) Do you mean that you would have a sort of central workshop in the districts you have spoken of, where a number of blind persons would be employed who would live outside?—Yes.

20,514. (*Dr. Armitage.*) How far do you think such a workshop would be self-supporting?—It all depends on its management it ought to be self-supporting if well floated.

20,515. How much do you think that a blind man could earn upon the average working at this sort of rough hampers?—10*s.* or 12*s.* in those country districts would be about as much as they would earn; some might earn more by being on one uniform kind of work, they would get more than they would by changing about.

20,516. Do you know the plan followed in Germany, of letting the blind work in their own homes, selling them material from the institution at wholesale price and assisting them at critical times?—No. The best way of helping the blind when they leave institutions is to establish workshops in different parts of the country where baskets were in large demand which workshops should be connected with each other; while they would be separate institutions they should be in communication with each other for the giving of information and helping one another to execute orders, one might get orders that the others could supply and so they might assist each other all round. To

carry out such a scheme practically you would require good experienced management and there should be a centre which should be as near the centre of England as possible for the sake of railway communication. Suppose you had such a workshop in Kent, the great bulk of the material that would be used there could be bought in Holland and Belgium and would come by water; them if you take Evesham, willows grow all round there for 20 or 30 miles, hundreds of tons grow there; then if you take Lancashire, there is a good deal of material growing in Cheshire and different parts of Lancashire; and it is so handy to the East Coast that you could send stuff across with a very short land carriage. Workshops for the employment of the blind started on those lines if once fairly floated with a moderate amount of capital I believe would be self-supporting, and I would rather see such a system carried out than the system of institutions subscribed to annually by charitable people; the amount of success attending on which institutions is not what it ought to be, they have too much money and they depend on the public rather than on themselves, they depend on the subscriptions that come in to keep them going, whereas if they were properly managed and were thrown more upon their energies they would achieve a greater amount of success.

20,517. Do you think it would be possible to induce seeing manufacturers to employ blind people by giving such manufacturers a little consideration, say 2*s.* or 3*s.* per man or something of that sort?—That looks very well, but it does not seem to me in practice as if it would answer.

20,518. Do you know that it has been done?—No. I do not think it would answer in practice, for this reason, that many men for the sake of the 2*s.* or 3*s.* would employ blind men in a dilatory sort of manner, whereas, if such blind men were working in a manufactory among other blind people with blind supervision and where the management was interested in getting good work out of the blind there would be a great stimulus for the men to call their energies into play.

20,519. Do you think that a blind man working with the seeing will become more energetic in consequence of finding what better men than himself are capable of doing?—Not so much as where the blind man was brought in contact with clever blind men, for this reason, the tendency among blind men working with sighted people is to attribute all the success of the sighted to the fact that they have their eyesight; but if a blind man of moderate ability is mixed up with blind men of more ability and greater energy, it is likely to make him more energetic and make him try to equal the men placed unfortunately, in the same position, that is to say, a clever blind man would create ambition and cultivate energy in another blind man to do as much as the clever blind man did, but that would not be the case where they were working in a shop with sighted people because they attribute their superior ability to their having their eye-sight.

Mr. J. J. Plater.

9 Mar. 1888.

20,520. (*Admiral Sir E. Sotheby.*) You advocate the employment of blind people in making market baskets and fruit baskets: are you aware that in some parts of England, and especially in London by the river side, they are made by children at 5*s.* or 6*s.* a week?—I know they are not, that is to say, not the baskets I am speaking of.

20,521. When I say children, I mean boys and girls of 11 and 12; are not a large quantity of such baskets made by them by the river side?—No, the round fruit sieves used in Covent Garden, are made by men only, the making of such baskets is too heavy work for children, the baskets that you are speaking of are probably what are called punnets, I am speaking of the round seives, that men carry on their shoulders, they use them for packing currants and general fruit.

20,522. You employ three or four blind people?—Yes.

20,523. What wages do you give them?—They earn, according to the trade list, about 11*s.* to 13*s.* on the average.

20,524. What are the hours of work?—Twelve hours a day.

20,525. Do those blind people that work at home get any help in their work from their sighted friends?—Yes, some do.

20,526. They have wives, and their children and they help them at their work?—Yes.

20,527. You mentioned something about blind teachers being very inadequately paid; what do you consider fair wages for a blind teacher of basket making or brush making?—It all depends on his ability.

20,528. A man of good ability, he would not be a teacher unless he was of good ability?—He ought to be worth in the country 1*l.* 1*s.* or 1*l.* 2*s.* to 1*l.* 5*s.*; in London 1*l.* 5*s.* at least.

20,529. You think that ample?—If you take a man of only moderate or fair ability, but he should be paid higher, in proportion to experience and ability.

20,530. Do you think they are paid under that?—Yes.

20,531. Do you know what the blind teachers are paid at Birmingham?—It was through my suggestion that a blind teacher was first employed at Birmingham to teach basket making; he was a good workman, but to start with he had 18*s.* a week.

20,532. Has that gone on increasing?—Yes.

20,533. What has it got to now?—I do not know.

The witness withdrew.

Adjourned.

6, Old Palace Yard, S.W.

Wednesday, 25th April 1888.

PRESENT:

THE RIGHT HON. THE LORD EGERTON OF TATTON IN THE CHAIR.

ADMIRAL SIR E. SOTHEBY, K.C.B.
SIR TINDAL ROBERTSON, M.P.
T. R. ARMITAGE, ESQ., M.D.
F. J. CAMPBELL, ESQ., LL.D.
E. C. JOHNSON, ESQ.
WILLIAM WOODALL, ESQ., M.P.
THE REV. BLOMEFIELD SLEIGHT, M.A.
THE REV. CHARLES MANSFIELD OWEN, M.A.
L. VAN OVEN, ESQ.
CHARLES E. D. BLACK, ESQ., *Secretary.*

The Right Hon. JOSEPH CHAMBERLAIN, M.P., examined.

Right Hon. J. Chamberlain, M.P.

25 April 1888.

20,534. (*Chairman.*) While you were on your special mission to America I believe you visited the Deaf Mute College at Washington?—Yes, I was conducted over it by Professor Gallaudet, the principal, on the 23rd of January.

20,535. From the evidence he gave us we understand that the college is divided into two branches, the primary school and the college?—Yes.

20,536. Did you visit both?—Yes.

Right Hon. J. Chamberlain, M.P.

25 April 1888.

20,537. Will you tell us in the first instance what impression you formed of the primary school?—I was accompanied by the professor and by one of the senators who is one of the official governors of the institution (which is principally supported by federal funds), and I found a really admirable institution, beautifully situated, the buildings being surrounded by grounds the extent of which would be about 100 acres. In the first instance I went to the primary school and was introduced into a class room where a number of children, boys and girls, were being taught by the schoolmistress to articulate.

20,538. Was that the lowest class?—That was the lowest class. They were all young children, all of them however seemed to have made some progress. Some of them spoke well in that peculiar voice which seems to be universal amongst deaf mutes taught in this way. They were before a black board upon which were words and sentences, and the teacher pointed to those words and sentences and then the children articulated them. The teacher conversed with them and was teaching them to read both by the movement of the vocal organs and by placing their hands upon the throat and other parts of the face. The teacher told me that she found very great difference in the facility with which the children learned, some apparently being quite incapable of articulating. She compared it to what teachers of music find where they have to deal with a child absolutely without ear; they find that such a child can make no progress at all, and some of these deaf and dumb children appear to be without the faculty of articulation. I was particularly struck with the brightness and intelligent look of the children. I was told that it was probably in part due to the use of the eyes which gives a brightness and keenness to them which I do not think you see generally amongst children who have all their faculties. They seemed to understand all that was said to them. As I was leaving, one of the children made a sign to the mistress, and she said that the girl wanted to speak to me if I did not mind, so I went up to her and she said, "Have you been in Switzerland?" I said "Yes," and then she said, "I was born there; I was born in Geneva," and I had a little conversation with her about Geneva which seemed to please her very much, but she had been in the school two years.

20,539. Was that a congenital case?—Yes, she had been born deaf.

20,540. What age was she?—I should think she would be about 13.

20,541. We have been told by Professor Gallaudet that the system adopted in that school is what is called the combined system, and therefore one would like particularly to know how the pupils were being taught in that class. You describe their being taught by articulation; were they also taught contemporaneously by signs during the first period of instruction?—They were being taught orally at the time I was there, but the teacher communicated with them by signs; she communicated with them both orally and by the manual language.

20,542. That is to say first of all she gave them a word by finger language and then pronounced it orally?—While I was there the communication was oral, but when a difficulty supervened the teacher communicated by the manual method. Then from this class I went into the other classes and saw all kinds of teaching going on, that is to say, primary teaching, and in every case the teacher was teaching by the manual method, and not orally. I was told that it was impossible to teach a class simultaneously by the oral method, but that the teachers communicated orally with the children as well.

20,543. The reason for teaching them by the manual method probably being that they could teach a larger number in a class by that method?—Yes, they said it was impossible to teach a considerable class orally, because the children could not follow the instruction; they said that oral teaching could only be followed when the children were in full view of the teacher, and conveniently only when one child was being addressed at the time. I spoke to the children in those classes, to one or more of them in each class, and I found that they could understand me if I spoke plainly and slowly.

20,544. Taking those pupils who could speak and understand speech best, what age would they be; would they have had four, five, or six years' instruction?—In this first class some of the children who were speaking had only had a few months' instruction—six months' instruction.

20,545. Then they most probably had been taught elsewhere?—Not orally. Of course their speech was imperfect, and in speaking to them the sentences had sometimes to be repeated to them; they could understand the mistress when they could not understand me; still, there was a certain amount of proficiency even after instruction of a few months. I was told that the proficiency of the child varied very much, independently of the time that it had been under instruction, according to the capacity of the child.

20,546. We have been told that you require at least eight years to teach speech on the oral system thoroughly; did you inquire how long in the highest class they had been under tuition—I mean in the primary school?—No, I do not know the number of years they had been under instruction.

20,547. Did pupils generally speak with facility?—I am not able to speak by comparison, because I have never seen any other school; they spoke with facility, but not rapidly; it could not be said that they approached to ordinary conversation. At the same time, it appeared to me that those children could undoubtedly make themselves understood in the street; if they wanted to ask their way, or anything of that kind, they could make themselves understood, and they could understand what was said to them.

20,548. Did their general education appear to be fair, considering their age?—Yes, their replies were exceedingly intelligent.

20,549. Those were written, I presume?—Yes.

20,550. The teacher, I understand you, put questions to the children by the finger alphabet; did the pupils answer by the finger alphabet or in writing?—I think most of them answered in writing; they had their slates and they were writing their lesson. One class, I remember, was an arithmetic class, and sums were given to them; they took them down as in an ordinary school, and they were working them out very well. Really the proficiency of the children in ordinary education seemed to me about equivalent to what it would have been in an ordinary primary school in this country.

20,551. Did they strike you as being remarkably intelligent?—There were some negroes and one or two Indians, as well as Americans and English; but, speaking generally, the intelligence seemed to me above the average; undoubtedly, the children looked to me much better than the corresponding class of children in one of our English primary schools.

20,552. A good deal would depend upon whether in taking in the pupils any selection is made?—I think they take anyone. I think they are obliged to; it is a national school.

20,553. The primary school, as well as the college, is for the whole of the States?—Yes, so I understood. I asked in some of the classes where the children came from, and I was told that they came from all parts; some of them came from very distant States.

20,554. (*Sir Tindal Robertson.*) There were others than Americans?—Yes, but of course they were resident in America, though born in other countries.

20,555. (*Chairman.*) After visiting the primary school did you then go to the college?—Yes; there, of course, I found the proficiency in speaking much greater; some of the pupils spoke extremely well. One spoke so well that I made special inquiries about him, and found that he had not been born deaf, which accounted for it. With regard to the others, there was this peculiarity of intonation—which we always find in the speech of deaf mutes—at the same time there was considerable freedom in conversation, and I found the pupils engaged in higher mathematics, chemistry, geology, and French and Latin. As regards French there was an incident which particularly struck me. They were writing on boards answers in French to French questions. I asked the teacher if they could pronounce French, and he said, "No, they had not been taught French orally." I said, "I wish "you would ask them to read a French passage, and "see what they make of it," and so he asked two of them to do so—they both deprecated it—one of them, in fact, refused, and said he could not possibly do it, but the other read, and read with what I should call a cockney French accent. Then I asked him how he had learnt this accent, and he said he had learnt it phonetically. "Parley vou frongsay," for instance, he would write on the slate for "Parlez vous Français," and in that way taught himself the French pronunciation, showing of course a very considerable facility in oral language. He not only was able to speak English, but he was able to speak French. Those youths were also extremely intelligent, and I heard a good deal of their success in after life. Two of the professors had been educated in the college. Then after going through the college I visited the dormitories and studies, which were exceedingly nicely arranged, very cleanly and airy, and all the arrangements were extremely good. Then Professor Gallaudet asked me if I would come to the large room, where the whole of the children and their teachers were gathered, and on reaching that room, to my surprise, one of the pupils got up and presented an address which he had drawn up himself. This address was read to me by Professor Gallaudet, while the pupil stood up and translated it with one hand to the whole of the meeting. I suppose there must have been at least 150 people there—children and their teachers. Then I asked Professor Gallaudet whether he would like me to say something in reply, and I made a little speech to them, which he, standing by my side, translated as I spoke. I spoke as I should have done at an ordinary public meeting, and the applause showed that there was a perfect appreciation of everything that was said; it came in at the right moment, and I could not distinguish that I was addressing deaf and dumb people, it was exactly the same thing as if I had been addressing an audience of hearing people. It was really a most interesting and touching sight. In going to this big hall I passed through a corridor where I was shown some tablets, which were in memory of some pupils who had died either there or after leaving, and I was told that the words inscribed on one of them were almost the last words spoken by a pupil on his death-bed; those words were, "It has taken away half the bitterness of death "to have been permitted to learn something."

Right Hon. J. Chamberlain, M.P.

25 April 1888.

20,556. Those pupils in the college come as the others do from various parts of America?—Yes.

20,557. Having gone through a course of instruction in schools where either the oral system or the combined system had been taught?—Yes.

20,558. Did you get any information with regard to the previous instruction of those who spoke best; for instance, did you find out whether they had been taught on the oral system?—No, I attributed their proficiency to the greater length of time they had been there, as compared with the others.

20,559. I should like to know how they practised their speech in the college. According to the evidence we have received, they give instruction by the finger language, that is to say, lectures are given by the one-handed alphabet; in order to keep up their speech, what systematic instruction have they in language?—The teachers told me that they conversed orally with their pupils.

20,560. In ordinary conversation?—Yes, and in the classes too; I was told that the two things went on together. In every case in which I spoke to the pupil I found that he understood me. It did not strike me that any of them were unable to speak or to understand me when I spoke, except those exceptional cases where I was told that the faculty did not exist. I remember there was one youth in the college pointed out to me as being unable to speak.

20,561. We understand that among themselves they converse by the fingers?—Yes.

20,562. They do not speak much amongst themselves?—No, I do not think they do speak among themselves orally, and I do not see why they should, because it is perfectly certain that under any circumstances the oral method must be an imperfect method. It appears to me that the whole object of teaching them orally is to enable them to communicate with the outside world; but as between themselves the manual method is by far the best.

20,563. Of course the college recognises the importance of enabling them to mix with the world as far as possible?—Yes.

20,564. Though signs are more easy to them than language?—Yes.

20,565. And proceeding on those grounds, did it appear to you that the teaching at the college was successful?—Yes.

20,566. That is to say, the pupils, by the instruction that is given them, are able to speak sufficiently well to be able to communicate with the outside world, and at the same time instruction is given them in general subjects by the most convenient medium, the manual method?—Yes.

20,567. That was the impression produced on your mind?—Yes.

20,568. You would wish to say, with regard to the organisation of the college, or with regard to the higher education of the deaf and dumb, from what you saw on your visit to that college?—No; I may say that I was struck with the results. They seemed to me to be extremely satisfactory; those young men would be quite able to hold their own with young men outside.

20,569 I believe many of them go afterwards into public offices?—Yes, there were some very remarkable cases mentioned to me of distinguished success afterwards. One man, who was educated at this institution, is one of the greatest patent lawyers in the States.

20,570. (*Sir Tindal Robertson.*) Did you visit any other institution in America than the one at Washington?—No.

20,571. Have you visited any in this country?—None.

20,572. Was the impression that you formed from visiting that institution that the combined system was a good one for the deaf and dumb, and that it could be carried on with facility?—At the time my attention was not specially directed to the question which I think has been occupying you very much, but I have thought of it a good deal since. I was quite satisfied with the results I saw, and thinking over it since, I confess I cannot bring myself to believe that the oral system could possibly be satisfactory by itself. I am strongly in favour of the combined system.

20,573. Was it your impression from what you saw at the Washington College that if the pupils had been taught by the pure oral system, they in their intercourse with each other and with many of the outside world also, would still have recourse to signs?—I think it would be absolutely necessary for them to do so if they are to have any real enjoyment of life.

20,574. The Washington College is aided by the State?—Yes, it is supported chiefly by a direct grant from the Federal Congress.

20,575. Have you formed any opinion from your visit to that institution as to whether it would be advisable that the State should take any action with regard to this particular class in England?—Yes, a very strong one. I think it is a national duty.

20,576. May I ask you to state in what way you think that would best be done?—My impression is that the principle adopted in America will have to be followed here; that is to say, that it will be impossible to teach those children locally; the utmost you can do is to establish one or two centres to which such chil-

Right Hon. J. Chamberlain, M.P.

25 April 1888.

dren must be brought; they cannot be taught with other children; and as their number is not very large they would be most conveniently dealt with in central institutions, to which I think the State should make an adequate grant.

20,577. You are probably aware that many of the board schools in this country have classes for the education of the deaf and dumb?—Yes.

20,578. Do you think that advisable or do you prefer the plan of having them in a separate institution?—I should prefer to have them in a separate institution; or at all events I would make it a separate branch of board school education. In great centres like Birmingham and Manchester deaf and dumb children from scattered places might be brought into the board schools, but I think it is impossible that every child should be taught in the locality to which it belongs.

20,579. In your opinion would there be any difficulty in having them taught in board schools in special classes, and having them boarded and maintained in some institution where their moral and general training would be carefully looked after?—I do not think there would be any difficulty in that at all.

20,580. We have been told by some of the witnesses who have given evidence before us that there is a great objection on the part of parents of deaf and dumb children to receiving money from the guardians in order to put those children into institutions. To meet that objection do you think that the power might be transferred to the school board to provide the means for the education of those children at those institutions instead of leaving it as at present to the board of guardians?—Yes, certainly, I strongly deprecate its being left to the board of guardians; whether the power ought to be given to the school board or to new county councils may be a question. I should prefer the county councils.

20,581. Do you mean that they should deal with cases arising in the whole of the county or that the district councils should deal with cases in their districts?—Probably there would not need to be more than one institution in a county.

20,582. (*Mr. Johnson.*) I suppose you are aware that in the board schools of London the system employed in teaching the deaf and dumb is the oral system?—So I am told.

20,583. Do you think, from your observation, it would be desirable to adopt the combined system in those board schools instead of the present system?—Yes, I do. At the same time if I were dealing with the matter by legislation I should not make a stereotyped rule, I should allow the different centres to find out experimentally which was the better system, and let them adopt that. My own opinion is very strong that the combined system is the one most calculated to be beneficial to the children.

20,584. We have been told by those who teach the oral system that it is an undesirable thing that the children who are being taught on that system should be taught signs or be permitted to use them. In the one system, viz., the oral system, isolation is recommended, and in the other system, the combined system, communications with one another, and with the outside world by means of signs is recommended; do you think it a desirable thing to isolate the children?—I do not think so.

20,585. (*Chairman.*) The isolation is in the institution itself?—I understand that, but as I understand the object is to drive children into the oral method by not allowing them to use the manual method.

20,586. (*Mr. Johnson.*) That is the view that the school board have taken?—I feel quite sure that it is a wrong view to take. The children will find it absolutely necessary for their own comfort and convenience to learn the manual method afterwards, and I do not see why they should be deprived of it during school life.

20,587. During your visit to America did you observe any deaf and dumb children speaking to one another?—No. I met one rather remarkable instance of a deaf mute in society.

20,588. I am speaking of the primary school and the college?—I did not observe any of them speaking to one another.

20,589. You had no opportunity of seeing whether they conversed with one another orally or by signs?—No. As far as I saw it was by signs. I should assume it would always be so as between two deaf mutes; the manual method is so much more convenient and so much more perfect that I cannot conceive why they should talk orally.

20,590. (*Mr. Woodall.*) You were going to mention a remarkable instance of a deaf mute whom you had met in society?—I met in society, at Washington, a person who was a deaf mute from birth, but who had been taught to speak, and who was mixing in society, and conversing with strangers with considerable facility.

20,591. But was there no embarrassment in holding a conversation with that person?—I would not say there was no embarrassment. It was possible to make oneself understood, but I should think it would have been impossible to have conducted, for instance, an argument upon some perfectly new and especially some complex subject.

20,592. We rather gather from what you have said, that the sole value of the oral system to any one is to enable them to communicate with people in the outer world rather better than they would by the use of the slate?—Yes.

20,593. That would be about the total value of the teaching?—In my opinion the sole advantage of it is to enable them to communicate with strangers who do not know the manual alphabet.

20,594. Then do you think that the accomplishment is worth the great cost that it entails?—I think so. It is almost impossible that a deaf and dumb person should be carrying a slate about perpetually; and practically, as we know, the deaf and dumb are isolated from all who have not learned to communicate with them by means of signs.

20,595. (*Rev. Mr. Owen.*) Did you consider from what you saw that the teaching of the sign and manual system *pari passu* with the oral system was any detriment to progress in the oral system?—No.

20,596. One question as regards State aid. Did I rightly understand you to say you would recommend State aid being given to institutions, and that the State should not dictate the method, but give a grant on the results produced by whatever method the individual committee should adopt?—Certainly.

20,597. (*Rev. Mr. Sleight.*) What number of children were being taught in a class?—They varied very much indeed; the largest number I should think would be under 20. In some of the classes there were only half a dozen.

20,598. When there were only half a dozen in a class was the instruction given orally?—No, in no case was the instruction given orally.

20,599. Were they classed according to their capabilities?—Yes; and according to subject no doubt. I think the total number of children in the lower school is only 60.

20,600. I think you said that boys and girls were being taught together?—Yes.

20,601. Were any of the teachers deaf mutes?—Yes.

20,602. Had they all received their instruction in the college?—I believe so. I think they had.

20,603. The instruction throughout the school was really given manually, but the oral instruction being additional to the manual instruction?—Yes, very much in the same way in which languages are taught in our schools. French for instance is taught as an additional subject, the ordinary work of the school being conducted in English.

20,604. From what you saw of the way in which the pupils communicated with one another, did you form the idea that the sign and manual method was virtually their language?—Yes, as between themselves; the oral system is their mode of communication with the outer world, but as between themselves they use the sign and manual language.

Right Hon J. Chamberlain M.P.

25 April 1888.

20,605. Then I assume under no circumstances would you think it advisable to debar them from the use of signs?—No.

20,606. Do you think it at all likely that the children could have read that speech you delivered to them from the lip?—I think it would have been impossible; it was a very large room. I had to raise my voice as one does naturally on the assumption that people are listening to you, and from the distance they were off me it would be impossible for them to see the motion of my lips sufficiently to understand what I was saying.

20,607. Will you tell us a little more as to the manner in which the instruction at the college was given, were lectures ever given orally?—No; I asked the question and I was told not.

20,608. Was a lecture given to any of the young men whilst you were there?—No, there was a class being taught geology; the teacher had a book before him and he was reading the book to them and commenting upon it by the finger alphabet.

20,609. In communicating with the children orally did it strike you at all that they rather guessed at what you say?—No, I think not.

20,610. You think there was a decided attempt to read your lips?—Yes.

20,611. (*Dr. Campbell.*) You said that the Washington Institution is chiefly supported by funds provided by the Federal Government; are you aware that as regards the primary school the Federal Government only pays for children that come from the district of Columbia, and that if they come from elsewhere the money must be provided by their friends or it must come from other sources?—I was not aware of that.

20,612. Was your attention called in any way to the result of intermarriages between pupils in this school?—No.

20,612*a*. (*Mr. Van Oven*) You say that there are only 60 children in this lower school; how are they selected?—I do not think they are selected at all. I think they take in any children as far as the accommodation provides.

20,613. There must be a great many more than 60 deaf and dumb children to be educated; do they pass any examination?—I think not. I do not think they reject any except those they consider to be of weak intellect; those who they consider to be of weak intellect they do not take in; those are relegated to other institutions.

20,614. You say some of the young children who had been at school but a short period spoke words distinctly?—Yes.

20,615. Did you make any inquiry as to whether they had been born deaf or whether they had any partial hearing?—Yes, some of them certainly were born deaf; the majority of them were born deaf, but in one case in particular, where a youth spoke so well that I was particularly struck by it, I found that he had not been born deaf.

20,616. Did you get any statistics as to the number of those who failed to articulate?—No.

20,617. You say that in your opinion the oral system could not be so successfully taught as the combined system?—Not as a system for the general education of the deaf and dumb.

20,618. Why do you think so?—Because I think it is necessarily an extremely imperfect method; communication between the teacher and the pupil cannot be as perfect by that means as by the manual method, and that consequently the results will be proportionately imperfect.

20,619. Why should not communication between the teacher and the pupil be as perfect by the oral method as by the manual method?—My experience is of course extremely limited, but from what I saw I should have thought that it was impossible ever so to perfect the oral system as to make communication by that mode as free between the deaf and dumb as between persons who have not that defect.

20,620. The manual method can only be used by means of spelling, and communication by writing would be the same whether the deaf and dumb person knew the manual alphabet or not?—Communication by writing is a slow method of communication as contrasted with speech and signs.

20,621. You have never seen any good teaching on the oral system such as exists in Germany and Italy?—No, this is the only institution I have visited.

20,622. You say instruction is never given orally in the Washington Institution?—Not as far as I know, except when the teacher is addressing a single pupil, the class instruction is not given orally.

20,623. Do you not think that the power of reading the lips of others, which of course is what is aimed at by the oral system, must in a measure be weakened if another mode of communication is given to the children?—Yes, I think so to some extent. If the sole object is to teach the children this oral method, if everything is to give way to that, I have no doubt the object would be attained more rapidly and more completely by absolutely confining the instruction to that system.

20,624. Do you think it would be possible for you to acquire the power of lip reading?—Yes, I think so after what I saw. Just as I learnt French in an English school, it is the same thing. I have known parents send their children to a French school where they heard nothing but French with the view of teaching them French, and the result has generally been that their general education has suffered.

20,625. But do you not think that a deaf person who has no other means of communication than the oral method has his faculty of sight and observation in watching the movement of the mouth and the organs of speech so sharpened that he is able to acquire the power of lip reading and consequently the power of imitating the speech of others much better than a person who has some other channel of communication?—I have no doubt that in teaching a person by the pure oral system you give him a certain advantage, but then I think the corresponding loss would be more than sufficient to compensate for the advantage.

20,626. But you have no means of testing by your experience of oral schools of a high character whether there is a loss in that respect; it is merely imaginary on your part?—It is theoretical.

20,627. You are only giving your own opinion not based on any actual observation?—This is the only institution I have seen, and I have no means of comparing it with other institutions in which the oral system is alone employed.

20,628. (*Dr. Armitage.*) You said that the children came from all parts of the States; did you ascertain how they were selected, because of course 60 is a very small number?—I do not know that there is any selection.

20,629. Do you know whether the children pass from the primary school into the college as a regular thing?—They do not all pass in.

20,630. Do the best pass in?—I cannot answer positively, but my impression is that there is a matriculation examination.

20,631. Which they have to pass before they enter the college?—Yes.

20,632. About how many children were there in each class?—The number varied from six to something less than 20.

20,633. Did Professor Gallaudet say that a class could not be taught orally?—That a class of a considerable number of children could not be taught orally, and the teachers said the same thing.

20,634. (*Admiral Sotheby.*) Do you consider that the principal object at the college is to teach the oral system?—No, the principal object is to give a general education on the combined system, and the oral system is merely one branch of the general curriculum.

Right Hon. J. Chamberain, M.Pl

25 April 1888.

20,635. With regard to the person whom you met in society, that talked very fluently with you, was that considered a remarkable case?—I do not think it was considered remarkable, because other deaf mutes speak as well—some of those children that I saw undoubtedly spoke better—with much better pronunciation.

20,636. And were they able to carry on as rapid a conversation?—Yes.

20,637. You mentioned that there was a lawyer of great eminence in America who was a deaf mute; do you know how he conducts an argument in court?—He does not go into court, he is a consulting lawyer.

20,638. Suppose there were two deaf mutes, one who could speak orally only, and the other who only carried on conversation by signs and the finger alphabet; which do you think would get on best in the world?—I would sooner be the one who could speak by signs.

20,639. (*Mr. Woodall.*) That is supposing you lived in a community of sign-speaking people?—No; what I should say is, that the one who spoke by signs would have a perfect communication with his intimate friends and relations, and that that was worth more than his imperfect communication with the outer world.

Mr. William Joseph Day examined.

Mr. W. J. Day.

20,640. (*Chairman.*) I believe you lost your sight when you were 29 years of age?—When I was 29 years of age, about 10 years ago.

20,641. What was your profession at the time when you lost you sight?—I was a shorthand writer and journalist.

20,642. How long have you been visitor to the Worcestershire Blind Visiting Society?—Eight years.

20,643. In what district have you been employed by the Worcestershire Blind Visiting Society?—Principally in the county of Worcester. I may say that the society was formed principally through the exertions of Mr. Forster and myself. I was seeking for employment, having become blind, and I came in connexion with Mr. Forster. It was felt that such a society would be an advantage for the blind poor of Worcestershire, and the society was started, and has been carried on ever since.

20,644. Have you any salary?—I have a salary which depends on the contributions which are obtained; my wife is the honorary collector of the society, and if sufficient subscriptions are obtained and the expenses are paid I receive a salary; it is an unguaranteed salary altogether, it depends on the thing being a success.

20,645. When you became blind I believe you learnt the various blind types?—Yes; I learnt the Moon, the Roman, and the Braille. I may say I learned the Moon in Australia, that was the first I learned, and it is the one I use the least now.

20,646. Which do you use most?—I prefer the Roman, but I am compelled, owing to the short supply of books in the Roman type, to make use of Braille. I find Braille very useful.

20,647. Over what area do your operations extend?—I make Worcester the centre, and I go as far as Moreton-in-the-Marsh towards the south, Gloucester in the west, and I go as far as Tipton in Staffordshire northwards, and as far as Redditch on the east, a radius of 30 miles.

20,648. Do you know every blind person in that area?—Yes, I think I can safely say I know every blind person in that area.

20,649. What number does that amount to?—There are at present 296 on the list.*

---

* Note.—The following statistics relate to the blind visited by Mr. Day:—

1. *Abodes.*

Dwelling-houses	263
Almshouses	8
Workhouses	25

2. *Periods of Life at which Blindness occurred.*

Teachable, under 15	96
Industrial, between 15 and	36
Unteachable, over 40	164

3. *Previous occupations of those going Blind after 15 years of age.*

Agricultural labourers	21
Bargemen	1
Boiler makers	2
Bricklayers	3
Brickmakers	1
Butchers	1
Button-makers	1
Carpenters	1
Carpet weavers	2
Cellarmen	1
Chain makers	1
Carwomen	1
Coachmen	1
Coal miners	6
Domestic servants	2
Drapers	1
Dressmakers	1
Fish hawkers	1
Forgemen	1
Furnace builders	1
Game keepers	1
Gardeners	2
Gasfitters	1
Gipsies	1
Glovers	2
Grocers	2
Heraldic artists	1
Ironworkers	5
Leather dressers	1
Limestone workers	15
Malsters	1
Man servants	1
Marine store dealers	2
Married women	44
Milkmen	1
Nailers	4
Navvies	1
Needle finishers	3
Ostlers	1
Pit labourers	2
Plasterers	2
Prison warders	1
Publicans	1
Puddlers	4
Salt makers	1
Sawyers	1
Scuttlemakers	1
Scythe makers	1
Shoemakers	1
Smiths	1
Soldiers	3
Spinsters	1
Tailors	1
Tanners	1
Tarpaulin makers	1
Watchmakers	1
Wiredrawers	1
Without occupations	9
Information unobtained	37

4. *Causes of Blindness.*

Accident	42
Birth	33
Blight	3
Brain fever	1
Cataract	40
Decay	74
Epileptic fits	1
Inflammation	45
Lead poisoning	1
Measles	4
Paralysis	1
Scarlet fever	1
Small-pox	7
Sunstroke	1
Typhus fever	3
Water on the brain	3
Information unobtained	37

5. *Present Ages of the Blind.*

Under 15	20
Between 15 and 21	20
Between 21 and 40	54
Between 40 and 60	64
Over 60	104
Information unobtained	34

6. *Present Circumstances of the Blind.*

Independent	20
Self-supporting workers	16
Partially self-supporting workers	50
Dependent either on relatives, poor-law relief, or clubs	210

W. J. Day

Mr. W. J. Day.

25 April 1888.

20,650. How many males and how many females?—190 males and 106 females.

20,651. How many of that number are under 15 years of age?—20 under 15 years of age.

20,652. How many of these are there under five years of age?—Three.

20,653. How many between five and 10 years of age?—Five, and the remaining 12 are between 10 and 15 years of age.

20,654. Of the 17 children within school age how many are at school?—Only six, five at a blind school, and one at an ordinary elementary day school.

20,655. Where are the remaining 11?—At home.

20,656. And they receive no instruction except what you give them?—They receive no instruction except what I or what their parents or anybody about them may give them, but it is very difficult to get them to school at the present time, and unless there is some radical alteration it will always remain so.

20,657. You think compulsory power should be obtained?—Yes, I think so; the parents are very reluctant to send their children to school, and if they are kept at home their parents do not treat them properly. I do not mean to say they treat them unkindly, but it is false kindness altogether; instead of making them more helpful they coddle them up and make them worse than they otherwise would be.

20,658. Do you think the feeling of the parents is in favour of their children going to ordinary elementary schools, in which case they would live at home, or to institutions?—I should think the feeling of the parents is about equal in that respect, some are very reluctant to let their children leave their homes. I can give you several instances in which the parents have been most reluctant, and where the careers of the children have been altogether spoiled by the parents not allowing them to go to school.

20,659. Do you attach importance to technical instruction being begun early?—No; I think that the blind should be educated just in the same way that seeing people are educated. The mental education of seeing children, as a rule, is finished before any technical education is given them, and it should be the same with the blind. Their mental education should be practically finished first of all before technical education is imparted to them.

20,660. Seeing that the blind must depend more upon the sense of touch than ordinary children, should not their sense of touch be educated earlier than seeing children?—I do not see any reason why the blind should be put upon a different footing to the seeing

20,661. As touch is more essential to the blind than it is to the seeing, do not you think the sense of touch should be developed in the blind rather earlier than in the seeing?—The sense of touch would be developed by their mental training.

20,662. How can their sense of touch be developed by their mental training?—If they are constantly being taught reading and writing, which writing they have to read afterwards with their fingers, their sense of touch must of necessity be developed.

20,663. That will not enable them to learn any trade, ?—They are not physically capable of learning a trade till they arrive at a certain age; it would be only wasting time.

20,664. With regard to your mission, you found nobody covering the field you are now covering?—No. There had been two societies previously, one which dealt with the southern part of the county and another founded in connexion with the Home Teaching Society in London, which had covered Dudley and one or two places round. Both of those had collapsed, and nothing had been at work for four or five years previous to my going there.

20,665. (*Mr. Johnson.*) What was the name of the other society?—The other society was founded and carried on by a lady now dead, a Miss Breay. She was the foundress of the school that exists at Kilburn.

20,666. It was known as Miss Breay's Society, was it?—I do not know that there was any name given to it. She employed a visitor to go and visit.

20,667. (*Chairman.*) Taking the whole of England, to what extent is the ground covered by missions similar to yours?—I should think there was a large amount of ground uncovered. I was looking the other day at the list of societies published in Mr. Wilson's pamphlet, and I should say from what I found there that a very large portion of the United Kingdom is uncovered by any blind visitation society.

20,668. From your knowledge, would you say that Mr. Wilson's pamphlet contained an accurate representation of the facts?—It is accurate as far as I have any means of knowing. I know there is a society in Birmingham, which I believe is carried on in connexion with the school; it depends on funds that come from Edgbaston School. There is another visiting society at Bristol, and there are some workshops at Cheltenham, and they profess to visit. Those are the only societies that do any visiting near Worcester.

20,669. Do you go to Cheltenham?—No, I go to Gloucester. I do not go to Cheltenham, because I do not wish to interfere with the work of the existing society there.

20,670. Have you any funds to distribute literature or to do anything beyond visiting?—I lend books to people in whatever type they are able to read.

20,671. What proportion of the blind that you visit are able to read?—About one fourth are able to read.

20,672. Do you teach any children to read; those that are not attending school?—Yes, I have taught several children to read. The difficulty with my work is having to cover so large an area of ground, so that the people outside Worcester are not seen as often as they ought to be really, but still I have been able to teach several of the children to read myself.

20,673. What type have you taught them to read?—The Roman type, for various reasons; first of all because I think blind people should be taught the Roman type, because it places them on a level with the seeing, and secondly, because it enables their parents and relatives to take a share in the thing. To show the reluctance of parents to send their children to school, I may refer to a case where I had taught a child to read the Roman type and then it was sent to an elementary school; after remaining there some short time it was taken away, and I have been urging the parents some time to send it again to school; they raised difficulties about the funds, and when I told them how to get the funds they still objected to send the child to school.

20,674. You say that the child had been to an elementary school, you having previously taught it to read the Roman type?—Yes, and they carried that on at the school. There were great difficulties in getting it into an elementary school, the board school refused to receive it, and the Roman Catholic school at last took the child in.

20,675. Did the teacher know any blind type or only teach the child the Roman type?—The teacher only carried on the reading I had taught.

20,676. Of course if a child is to go into an elementary school and to be able to read when it gets there either the teacher ought to be acquainted with the type for the blind, or the child should have been taught somehow or other before going to the elementary school?—One or the other. There would be many blind children at the elementary schools if it were not for this difficulty. Managers and masters of elementary schools have objected to take in blind children, saying that it would cast a great burden upon them, which I do not agree with at all.

20,677. Would not it take more trouble to teach a blind child than to teach a seeing child?—No, not with the assistance of the Roman type. The masters cast a great amount of the elementary work on to the pupil teachers, and it would be just as easy for a

Mr. W. J. Day.

25 April 1888.

child in the same standard to explain the letters of the alphabet to a child who could not see as it would be for the master to do it. It would cast no extra burden upon the masters.

20,678. It would cast an extra burden upon someone?—The blind children would go into a separate department; they would come to the school not knowing the alphabet, and someone would have to teach them the alphabet. If the Education Act was in force with regard to blind children all over the country they would come into the school at the age of five years, and would go into the infant department, and it would be just as easy to teach a blind infant the alphabet by the raised letters as it is to teach an ordinary child the ordinary letters. The managers and the teachers of elementary schools objected to take in these blind children. I brought the matter before the local association of church managers and teachers and gave them an address upon the subject, and one or two seemed to take my view of the matter, but difficulties were raised and the matter was referred to the Education Department. I had a certain amount of correspondence with the Education Department, and the result of that correspondence was that while they were very anxious that the managers and teachers should take my view of the matter, and that they should take the children in, they could not compel them to do it, and the matter has been dropped. All you can do is to teach children to read and to leave it to Providence almost, at present, whether they go to school or not.

20,679. Is there much blindness caused by accidents in your district?—A large amount in the northern part, but that will decrease from various causes. The amount of minerals got and the amount of limestone obtained is not so great and the means of getting the minerals and the stone are improved and much better precautions are taken.

20,680. Did you receive a circular from this Commission?—Yes.

20,681. Did you fill it up?—Yes, but I have come across a large number of blind people who have not received any such paper. At the same time I may say that there is a difficulty in getting the blind to fill up these returns; they will not fill them up unless they think they are going to get something by it. They have asked me what they were going to get by filling them up. They were very disappointed that it was not going to lead to any pecuniary result. I may mention that I have a case book in which I enter the name of everybody I visit, the age at which he or she became blind, the cause of blindness, previous occupation and present circumstances. I could tabulate those cases and send it to the Commissioners.

20,682. Do you go over the whole of your district without a guide?—Yes, I have done so from the very first; of course it involves a certain amount of risk; there have never been sufficient funds to enable me to have a guide in the first place even if I cared about having one. I have come up with my wife to-day simply to humour my relatives in London. I work without a guide, and have from the very first. A blind man is not worth much unless he is prepared to prove that he has courage equal, in fact superior to his work. Of course it involves risk and inconvenience, but I have not met with a single accident.

20,683. Do you travel mostly by rail or do you walk a good deal. You must walk in certain parts of your district?—I have to walk in certain parts where there is no railway; in certain parts of my district the blind would be passed over if walking was not done. Last week I travelled about half-way by railway and half-way on foot. I went from Worcester as far as Moreton-in-the-Marsh.

20,684. Is there anything else you wish to say to the Commission bearing on your mission work?—I think it would be a very great thing for the blind if they were visited all over the country, but as long as the thing depends on private subscriptions that cannot be expected. It is only with the greatest difficulty that we keep our society going in Worcester, and I am certain that it would be the same in other parts of the country.

20,685. You would not advocate State-aided missions to the blind, would you?—I would to a certain class of blind people, to those who I think ought to be aided by the State, those who are at work.

20,686. In what way would you give State aid?—I would say that all those people who had been to a blind school and have learned a trade, and who settled in a particular locality, should receive some assistance from the State in proportion to their character and to their earnings. The most critical time for the blind man is the first two or three years after he has left school; his relations as a rule are poor and he is poor himself, and it is then when assistance ought to be given, and I think if somebody were authorised by the State to visit those working blind and to report upon their condition that a great deal of good might be done. I think it is in the interests of the State that people should be made independent even if the State has to pay a portion of their earnings; it is better that the State should do that than that those blind persons should gradually drift into becoming paupers.

20,687. There are a great many societies in England which have got funds at their disposal. If the State were to relieve them to a certain extent of the work which they now undertake, would not they have more funds at their disposal to help their pupils after they left the institution?—Then I am afraid that the immediate wants of blind persons would not be adequately met. Take a school like St. George's—their past pupils scattered all over the country—if the thing was worked from London I am afraid some of their past pupils would be overlooked.

20,688. Why should not there be a travelling inspector from the great institutions in London to visit the blind if they knew where they were?—They ought to know where their past pupils are.

20,689. Do not you think an institution would do that much better than the Government?—I doubt it, because if the assistance had to come from the school, the school would feel itself bound to assist a man whether he deserved it or not, for the credit of the school. If a man leaves a blind school and goes home and he starts in work, it is to the credit of that school that he should be a success; and if the schools had the administration of the assistance, very often they would give the assistance simply for the credit of their own school, so that the man should not be said to be a failure, whether he deserved it or not.

20,690. You would say that they are not to be trusted with the administration of this assistance; who would you entrust it to? You ask that State aid should be given to the blind after they leave school; who is to see that it is properly administered?—The plan I would suggest would be this, that the State should appoint as inspector a man who knows something about the blind, their wants and necessities; that the names of the past pupils in the various schools should be supplied by all the schools; that it should be compulsory upon the schools to supply that list; that those people should be visited by this Government inspector on whose report the money should be sent through some authorised channel to the person who had been visited.

20,691. Through the guardians?—No, if it was sent through to the guardians it would be the first step in making the man lose his self-respect; I would suggest that an account should be opened in the man's name in the Post Office Savings' Bank, and he should never be allowed to draw it all out. I think the greatest good that could be done for the adult working blind would be to give them State aid, and that it is to the interest of the State to do so. If a person becomes afflicted an obligation is cast upon the State to help him to a certain extent as long as he is not unreasonable in his demands, and he should be helped on. In some cases within my own knowledge where such help has been given the man has become thoroughly independent and has not wanted any further assistance. It is to the interest of the State that

Mr. W. J. Day.

25 April 1888.

there should be no festering canker amongst the community men who are afflicted and disappointed into the bargain are liable to become such. A man goes to school, and leaves it with high hopes that he is going to succeed; he soon tumbles down from that castle, and anything that would keep up the self-respect of a blind man, I think, would be in the interests of the State; that is my conviction.

20,692. You have spoken of the adult working blind; how would you deal with those who, from various causes, are incapable of earning their own livelihood; would you deal with them by pensions?—If there was this State aid to the adult working blind the funds of societies which now aid by pensions would be greatly relieved, and they would be able to help those people.

20,693. From your knowledge, do you think that pensions are well administered at the present time?—I had better be frank; I hardly like to answer that question, because I am in receipt of a pension myself from one of those funds—the Gardner bequest. The great difficulty as regards all these funds is that there is not enough money.

20,694. We want to know whether the money now available is properly administered?—I think it is, as far as the money goes.

20,695. Do you think there ought to be any alteration as to the limits of age which at present govern the distribution of certain pensions?—I think it would be undesirable to make any such alteration, unless there were a great increase in the amount of funds to be distributed. Even now, with the great restriction which is placed upon the administration of those pensions by the limits of age, there are not enough funds. Men and women have to wait a long number of years to get assistance, and during that time very many become disqualified who were not disqualified when they first applied. There is what they call the Blind Man's Friend Fund; you have to wait 12 months before your name is even registered, and then you get a printed statement that there are over 2,000 applicants. I am told by people who have received assistance from that fund that they have had to wait 15 or 16 years before they have received anything—it comes when they are worn out. I can give you cases where tremendous hardships have been submitted to. I know one case where a woman struggled hard to keep herself off the parish till she arrived at the age of 60; for 16 years she struggled at making guano bags, she would have been better off if she had gone into the workhouse, but she held on with the hope that she would get this pension, and fortunately she has got it. I think that pensions are a great help. I think that a pension that covers, as it does in a great many cases, the rent of a person's house, is a great assistance. I am afraid that there is great overlapping in the distribution of pensions in some cases.

20,696. (*Admiral Sotheby.*) You said that only one quarter of the people you visit can read, and that three-quarters of them cannot read?—I said one-fourth can read. I should be sorry to say that the other three-fourths were incapable of reading. There are a great many who might learn to read, if they took the trouble to learn.

20,697. There is one-fourth who are able to read?—Yes, there are 74 on the list who can read. Then there remain 222 who cannot read. About half of those are not capable of being taught to read.

20,698. (*Chairman.*) What age are those who cannot be taught to read, are they old people?—Yes, they would be over 60 years of age; all those who are incapable of learning to read would be that age.

20,699. I believe 130 of those you visit are above 60 years of age?—I made a return of the present ages of all the blind which was sent in to the Commission.

20,700. Do you mean that they do not read, or that they are incapable of reading at the present moment?—

20,701. (*Admiral Sotheby.*) You spoke of one child that no elementary school would take, until it was taken in by a Roman Catholic institution?—Yes.

20,702. Was that child a Roman Catholic?—No.

20,703. Do you know if that child has become a Roman Catholic?—No, I do not; it is not at school now; the parents have taken it away from school from some difference with the teacher. Now it is old enough to go to a blind school—it is 11 years old, but the parents do not seem to care about parting with it.

20,704. It is the fault of the parents that the child is not at school?—It is the fault of the parents in that case.

20,705. (*Dr. Armitage.*) You say that you teach the Roman system by preference?—By preference.

20,706. How do you begin teaching an adult blind man?—I teach whatever type I think he is capable of learning to read; if I think it is most likely that he will learn Moon I teach Moon, if Roman I teach Roman, if Braille I teach Braille type.

20,707. What induces you to suppose that one person before trying him will learn Roman, and another Moon, and another Braille?—I am guided by their previous occupation.

20,708. Take a person with soft hands, a clerk for instance, what system would you begin with?—The Roman.

20,709. Supposing they succeed in Roman would you teach them any other type?—Yes, I would if they wished to.

20,710. Would you suggest it?—Yes. In the case you put a man who was a clerk or an educated man I should suggest that he should learn Braille. I do not think a man's education is complete without.

20,711. In the case of such a person you would begin with the Roman, and then you suggest that he should learn Braille?—Yes.

20,712. Suppose he failed in the Roman type what would you do?—Then I should try to teach him some other type; if he failed in the Roman type I should say the only chance for him was the Moon. My idea would be always to try and keep a blind man on a level with a seeing man, and if I thought a man was capable of learning the Roman type I would teach him the Roman type. If a man was not able to learn the Roman type he would not be able to learn any smaller type, he would have to go to a bigger type.

20,713. Do you say that from actual experience or is it only a theory of yours?—I say that from actual experience; I have tried to teach several people the Roman type, and they got on very well so long as they only had the capital letters to master; then when they came to the small case letters they seemed to fail.

20,714. Then your experience is this, if I understand you rightly, that if a person's touch is not acute enough to learn the Roman type he is not likely to learn the Braille?—Yes.

20,715. Are you aware that that is entirely different from the ordinary opinion amongst the blind?—I have not heard such an opinion expressed. I think so far as the blind people with whom I have come in contact are concerned my opinion is the same as theirs.

20,716. (*Chairman.*) You are speaking of a class lower than the educated class?—Yes.

20,717. (*Dr. Armitage.*) Are there among the people you visit any men of tolerable intelligence?—Yes, there are some certainly who are very intelligent indeed.

20,718. Can they read the Roman type?—Yes, there are several who can read the Roman type.

20,719. Can they read the Braille type too?—A few can

20,720. But not all?—No, not all.

20,721. Can the few who can read the Roman type write it?—I should suppose they could, but I have never received any communications from them.

20,722. You do not teach them to write?—Yes, you must teach people to write Braille to enable them to read it.

20,723. Do you teach it?—Yes, I teach it whenever a person is willing to learn it. I may say I think that different types are necessary for different classes of people.

Mr. W. J. Day.

25 April 1888.

20,724. How many of the pupils that you visit possess a Braille writing frame?—I only know of one at the present moment who possesses one. I may say several have parted with their Braille frame.

20,725. What do you mean by saying that you would try to keep a blind man on a level with the seeing by teaching him the Roman type?—If a blind man is reading a book in the Roman type a person who has his sight can look over his shoulder and read at the same time; the blind and the seeing are on a level in that respect, whereas if you have the Moon type or the Braille type there is only the blind man who can read it.

20,726. You do not think in fact that a blind man as a rule can read Braille or Moon much more fluently than the Roman?—It depends on the person's age; if the person is old and his occupation has been laborious so that his fingers have become hard then the Moon type is the best; the Roman type is the type for children, and Braille is the type for people who wish to follow a particular line of study.

20,727. How long were you learning Braille?—I learnt it very quickly; I think learnt it in one lesson from you.

20,728. How long was that lesson?—I think we were there together about an hour. I must say this; I should not have learnt it so quickly if I had not been a shorthand writer. My previous avocation helped me to master it quickly.

20,729. In teaching children what type do you begin with?—The Roman type.

20,730. Do you then go on to teach them Braille?—I do not get the opportunity. I do not consider that the children that I have to deal with are old enough to learn Braille with any advantage.

20,731. Do you not think that children who are able to write as well as to read have a better chance of getting on in ordinary day schools. If they are on an equality with the seeing with regard to writing as well as reading, are they likely to get on better?—The Braille type does not put them on an equality with the seeing with regard to writing; the only type that does that is what they call the Alston.

20,732. You expressed an opinion that the technical teaching of the blind should begin after they left school, or at any rate that it should begin at about the same age as special technical training generally does for the seeing?—I said that the mental education should be completed first.

20,733. Do you mean by that to say that you disapprove of kindergarten work, and carpentering, and all kinds of hand-training for blind children?—No; what I mean is this, that the length of time at which children remain at school should be greatly increased; that they should go school at seven and remain there until they were 21, that from 7 to 12 they should have simply mental instruction, that from 12 to 16 the education should be of a mixed character, technical and mental, and that from 16 to 21 it should be solely technical, and then I believe that a blind man would come out fairly perfect.

20,734. (*Mr. Johnson.*) With regard to types, do you think it is a desirable thing that all the types should be taught if the opportunity were afforded for teaching them?—Most decidedly.

20,735. Beginning with Roman, then going on to Moon, for those whose hands have become hardened, and then Braille for the purpose of communicating with one another?—Yes. I think all the three types are necessary. I do not come here to advocate any one particular type.

20,736. Do you think it is a desirable thing also to encourage blind people to acquire a knowledge of the letters used by the sighted?—Yes.

20,737. And to write with the pencil?—Yes, most decidedly. I can write in pencil well enough for anybody to read what I write.

20,738. The reason you like the Roman type, as I understand, is that it is the characters of the sighted?—Yes.

20,739. And the other characters are shorthand characters, as you may call them, requiring a key to enable them to be deciphered?—Yes.

20,740. The Roman type is character of the sighted as well as the blind, and the Braille is for the blind themselves?—Yes.

20,741. You say that you lend books; do you lend them in all the different types?—Yes, in Roman, Moon, and Braille.

20,742. Do you get Roman type books from Worcester?—Yes.

20,743. Do you get Braille books from the British and Foreign Society?—The Braille books that I have lent have been made up by myself.

20,744. With regard to the Moon books, does the Moon Society give you any books?—No, we have had to buy all our books hitherto in the Moon type.

20,745. I believe the funds for providing books for your lending library are supplied by subscription?—Yes.

20,746. Do you think it would be an advisable thing if the Government were to make grants to lending libraries for the purchase of books in all the types?—It would increase the number of books that you could lend.

20,747. You have told us that a large proportion of the cases of blindness in a certain part of your county were from accidents; what class of accidents?—They have principally arisen from explosions in blasting, the men being coal miners and limestone workers.

20,748. You also told us you would suggest that information should be got from the different blind schools as regards their past pupils?—Yes.

20,749. Have you any experience of the difficulties which schools have in getting information?—I know one or two schools which are communicating with their past pupils in my district, therefore I should not think there would be much difficulty.

20,750. You think there would be no difficulty in Worcestershire?—I should think not, if a proper register was kept in a school of the address of the pupil on leaving school.

20,751. You are not aware of the fact that there is such difficulty experienced in many schools?—No, I am not aware of it; I do not see why it should exist. I think the difficulty must arise from the fact that the schools do not look up the past pupils periodically. Certain schools do not look them up at all, unless the pupils communicate with them.

20,752. I suppose you are aware that there are a very large number of applicants for the pensions given by the different pension societies, and that there are very few pensions to give away?—I am quite aware of that.

20,753. And you are aware that in the City Companies, and other pension societies, the information is obtained as regards each case, and verified, before the pension is given?—Yes, I believe an attempt is made to verify the information.

20,754. And the reason so many are left in the cold is that the societies have not money to give them?—I suppose that must be the sole reason.

20,755. (*Sir Tindal Robertson.*) With regard to your opinion about State aid, which you thought should be given through the medium of the savings' banks. When we were at Hull, the opinion was expressed by some blind people not connected with the institution there, that such State aid might be administered by committees to be established in large centres, such committees to be constituted of some of the principal persons in the district, combined with gentlemen representing blind institutions and also people representing the blind people themselves; do you think that would be a means of meeting the difficulty?—It would only partly meet the difficulty, because they would only give aid to people who applied to them; it should be the duty of someone to look the people out.

20,756. Supposing there were an inspector appointed by such a committee, to look out the whole of the blind people in the district, would not that meet the case; would not such a committee, with the aid of their inspector, be more likely to find out those cases, and be better able to understand whether they were deserving or not, than a person who was simply appointed by the State, and who had to travel a large portion of the country?—They might be better able to deal with the particular circumstances of the people, but the assistance that would be given would not be of an uniform character.

Mr. J. W. Day.

25 April 1888.

20,757. Why not?—Because people in one part of the country would take a different view of what aid should be to those in another part.

20,758. Suppose lines were laid down that there should be a certain amount given in each case?—I am afraid it would be impossible to lay down any hard and fast lines.

20,759. I mean elastic lines; still, with a certain maximum and minimum, your idea would involve a perfectly new condition of things; it would involve that a separate department should be created by the State for this particular purpose; do not you think the object could be accomplished by the means I have suggested?—I am afraid there would be a disparity in the assistance. I think if a body such as you suggest was constituted, that seeing people should not have much voice upon the matter, not because I think that seeing people have not sympathy with the blind, but because it is impossible for a man who has not had the misfortune of losing his sight to understand what are the difficulties, wants, and necessities of the blind.

20,760. If that principle were to hold good all institutions in the country managed by sighted people would have to be managed by blind people?—As a rule the people who are taught by blind people succeed the best.

20,761. There is one other question I would like to ask you. Do not you think if this sort of State aid were given in manner you speak of, that is to say, administered by the State itself, a great many of the voluntary contributions which are given at present for the blind in different parts of the country would be withheld?—No; because the aid I suggest would only affect about one-third of the blind; it would only affect the adult working portion of the blind. In the district I visit, which I think is a representative district, because agriculture, mining, and manufactures are carried on it, out of the 296 that I visit there are 66 blind people who are at work in some shape or form, and only 16 of those are self supporting, and therefore I think there is a very strong case made out for aid to the working blind.

20,762. I quite agree with you, but what I wanted to put to you is this, do not you think if that aid were to be administered by the State, and the working blind had a right to claim it, the blind institutions would lose a great amount of the voluntary contributions which they now receive? Do not you think that it would be better to have a committee such as I have indicated which would enable the working blind to get a certain amount from the State which might be supplemented very much by private contributions?—The best answer to that is, I think, that very little of the sort has been done in the country.

20,763. (*Dr. Campbell.*) Can you tell us the number of volumes that you have in your library in different types?—I could not say offhand; the Moon type is much in preponderance owing to the fact that the previous societies taught nothing else but Moon; the Roman is very much restricted owing to want of funds on the part of the Printing Society.

20,764. (*Dr. Armitage.*) I understand you have no printed Braille books. No, none that I lend; they have all been made up by myself; at present there are only a very few people in the district, and those who have just come back from school, that are readers of Braille.

20,765. Do you varnish your written Braille books?—Yes.

20,766. (*Chairman.*) Is the feeling among the blind one of satisfaction or dissatisfaction with regard to the institutions?—It is of a very mixed character.

20,767. What is the fault that they find with the institutions?—The two principal faults they find are that in the first place proper means are not taken to develop the pupils physically, and secondly that they have not the sort of instruction that they ought to have. There are a great many blind people who go to a blind school who are perfectly able to get about before they go there, and they come back having lost that physical power altogether. They almost unanimously complain as to the way they are fed in a great many schools; if the statements that the parents make as to the way the children are fed are to be believed, it is a wonder some of them come out alive.

20,768. Do they come back in an emaciated state?—Some come back in a weakly state. The majority are not allowed that amount of freedom and exercise which they got before they went to the school, and the result is that while they have gained a great deal by going to the school, they have lost that physical strength which they ought to have and which would help them to get a living.

20,769. We have had evidence as to the imperfect training of the blind in trades or technical pursuits in institutions; what is the feeling among the blind with regard to that?—The feeling among the blind as regards that, more especially amongst handicrafts, is that what they are taught at schools is for the benefit of the school more than for the benefit of themselves. Take a basket maker for instance; he is taught fancy and light work, the sale of which adds to the funds of the school, but when he comes away from the school he finds that sort of training has not been of very much use to him.

20,770. (*Mr. Johnson.*) Are you aware that it is not worth any blind basket-maker's while to do that fine work, and that it has therefore been discontinued in almost every institution that we visited?—I am simply stating what the blind have told me.

20,771. Is it your opinion that institutions where children and adults are collected together should be superseded by any other description of institution?—I think it is a great mistake to congregate together blind persons of different ages; and I think if there was a greater classification of scholars it would be much more to their permanent advantage.

20,772. (*Chairman.*) Are you in favour of establishing workshops for those who have become blind after the age of 20, when they are too old to go to school?—As to workshops, while they provide work for blind people, they destroy their self-reliance altogether. If a blind man has his work at home the anxiety of getting work is on his own shoulders, whereas if he goes to a workshop the anxiety is cast upon the people who keep that workshop going. I think if a blind man has the means of starting a shop of his own he should do so, and employ blind people.

20,773. Does a blind man, generally speaking, employ blind people?—I know several such cases. I know one case of a blind man at Malvern who employs two blind and one sighted person to carry on his work as a basket maker.

20,774. Do you know of many cases of blind persons who have left institutions or who have become blind after the age of 20, being able to earn their own livelihood entirely without any support, unless they have been persons of exceptional energy and ability?—I have just referred to one case. I think if there was a greater number of industrial schools the number of workers would be doubled.

20,775. What distinction do you draw between an industrial school and a workshop?—The distinction I should draw between an industrial school and a workshop is this: an industrial school would be a place where a man might be taught a trade without regard being had to what receipts the work might bring in; whereas a workshop is a place where a man who knows a trade already may bring in something for himself and something for the institution. What I mean by an industrial school is a place where a man who became blind between 20 and 40 might go and be taught a trade.

Mr. J. W. Day.

25 April 1888.

20,776. A workshop, if it takes in those who have become blind by accident, necessarily becomes an industrial school, does it not?—The essential point of a workshop is that it should be made to pay.

20,777. You said that one of the faults that the blind find with the institutions is that they do not give the instruction which they ought to give?—I think a great many things are taught at a blind school which are never likely to be profitable. In the present state of things, the only two things profitable to the blind are music and basket making; and I think girls ought to be taught domestic work at the blind schools more than they are at present. I visit a woman who can do all sorts of domestic work, but she had not been taught it at a blind school.

20,778. (*Mr. Johnson.*) You think the only trades they should be taught are music and basket making?—Yes.

The witness withdrew.

Rev. WILLIAM STAINER further examined.

Rev. W. Stainer.

20,779. (*Chairman.*) When you gave us evidence before you did not go fully into the question of your homes, and, as I understood at the time, on the ground that they had nothing whatever to do with the school board of which you are an officer?—They are totally independent of the school board, the children of the homes attend school board classes, that is the only connexion.

20,780. Are those homes under any official inspection?—They are certified and are under Government inspection.

20,781. How often are they inspected, and by whom?—Mr. Hedley inspected them previously to the certificate being granted, and I think he has visited them twice since.

20,782. What was the date of his last inspection?—In July last year.

20,783. Are your homes the only homes in connexion with the school board?—There are no similar means of residence afforded to children attending board schools except that which I have provided.

20,784. Are the homes visited in any way by members of the school board in order to see whether the homes of the children who attend the board schools are well kept?—The school board has nothing whatever to do with the management. I do not remember any member of the school board visiting the homes.

20,785. Does any officer of the school board visit the homes from time to time?—The school board visitor visits the homes, the visitor of the school board has to ascertain the number and names of the children at their homes so as to verify their attendance at school, and he visits my homes in the same way and at the same time that he visits the homes of children whose names are on the school board books. The school board visitor's duty is to visit the homes of all the children to verify his lists with the attendance lists of the respective schools, and in doing that if he discovers any deaf and dumb children he reports them to me.

20,786. The school board undertake no responsibility with regard to these homes?—They have stated so—they were referred to, previous to the granting of a certificate to one of my homes, and the substance of the reply was that they had nothing to do with the homes.

20,787. I understand that children are sent to your homes from all parts of England?—I should not refuse a child that was sent to me from any part of the country.

20,788. What is the difference between the amount that guardians would have to pay if they sent a deaf and dumb child to an institution, and what they would have to pay if they sent a child to your homes?—The payments made to institutions throughout the country for what are commonly called intermediate pupils, whether they are sent by guardians or anybody else, varies from 12*l.* 10*s.* to double that amount. The institutions receive children free in many cases, but where charges are made, whether to guardians or others, the institution charges them, I believe in most cases, a sum equivalent to what the education and maintenance of the child costs the institution. I have one institution in my mind that takes them as low as 12*l.* 10*s.*, and I know another institution that charges 25*l.* to guardians and others.

20,789. You told us when you gave evidence before that 16*l.* a year is what you charged guardians; is that so now?—No; at that time it was so, but it is not so now; since that evidence was given the charge has been fixed by the Local Government Board at 18*l.* 5*s.* 0*d.*; though 18*l.* 5*s.* 0*d.* would appear to be an increase from 16*l.* it is not really so for this reason: The 16*l.* a year which I formerly charged did not include clothing, and I had to send in clothing bills which were found to be objectionable, not being uniform, and the 7*s.* a week which is fixed by the Local Government Board includes clothing.

20,790. Therefore there is not much difference between what guardians would have to pay if they sent a child to your homes, and what they would have to pay if they sent a child to one of the institutions in the country?—My charges are somewhat less, taking the average.

20,791. You are not at any cost for the education of the children?—I send the children to the school board classes, and they pay the ordinary fee.

20,792. How much is that?—The fee for all cases of deaf and dumb children is 2*d.* per week; that requires some explanation; it is to be borne in mind that I have not founded these homes for the purpose of getting these children educated by the School Board for London at 2*d.* a week, but these homes have grown out of the necessity of providing homes for the deaf and dumb children in the metropolis; it is not that the board schools are supplementary to the homes, the homes are supplementary to the board schools.

20,793. I want to compare your homes with other institutions in the country, and I want you to tell us whether you do not get practically a bonus over other institutions of the country by getting your school appliances, your teachers and your school buildings, found practically at the rate of 10*s.* a year for each child?—If the homes were established for the purpose of taking advantage of the school board education I think I might acknowledge that to be so.

20,794. You ought therefore to be able to provide as good board and lodging for these children as other institutions provide, because you have not to provide the education. You say that the cost in most institutions of the country varies between 16*l.* and 25*l.*, and those institutions have to find teachers, school buildings, and school appliances as well as food. You receive 18*l.* a year and have only to find food and clothing?—Yes.

20,795. Therefore with the money you receive from the guardians you ought to be able to feed and clothe the children as well as they do in those institutions?—Yes, certainly.

20,796. The object of my asking you these questions is this: the Commission have visited the homes at the request of the Home Secretary, and have inquired into the nature of the food given to the children; they have also seen the children in the board schools, and they would like to know from you how it is that the children in several cases were apparently imperfectly fed, and that in many cases they were prevented from going to school because they were suffering from

chilblains and skin eruptions?—As regards not being sufficiently fed the principal meal of the day which they have is an abundant one.

20,797. Last year we saw the children at their dinner, this year we had an opportunity of seeing them at lunch, and we certainly did not think the meals abundant?—They have nothing but bread and butter at lunch; that is objectionable I admit.

20,798. We should like to compare what the children get at your homes with what they get at other institutions. Will you be so good as to furnish us with your dietary?—I will do so.*

20,799. It appears that some of the children do not get anything to eat between 4 o'clock in the afternoon and eight o'clock the next morning?—That is so in some cases, and it has arisen in this way, notwithstanding my directions that the children should have food before they go to bed if they wish for it, I understand the matron has not given some of the younger children food on going to bed because they eat very much at the 4 o'clock meal and some of the children go to bed early, and if they are given food on going to bed it is found to disagree with them.

20,800. Instead of giving definite instructions to the matron that the children should have food between 4 o'clock in the afternoon and 8 o'clock the next morning you appear to have left it to the discretion of the matron to give it them or not?—I told the matron that they were to have food before going to bed if they required it.

20,801. That means nothing?—The prescribed meals are three in number, viz., breakfast, lunch, and dinner; they have not an additional meal after their dinner which sometimes lasts till half-past 4 and sometimes to 5 o'clock, but there is no stint of food.

20,802. When we visited the homes we found that there were a large number of children who were prevented from going to school; were they under medical treatment in any way or was any extra diet prescribed for them in consequence of the poor state of their blood as evidenced by the chilblains and skin eruptions that we found on them?—The children were under the medical treatment of Mr. May who lives next door to the home, and whose instructions were fully carried out, and as regards their diet they had additional milk whenever they required it during the day.

20,803. That does not correspond with what we were told on the spot?—You could refer to Mr. May. Perhaps now that the homes have been extended, and I have a larger number of children than I had formerly, I ought to have a regular medical attendant connected with the homes. When I had a small house with about 20 children it was a very different thing to what it is now with about 100 children in adjoining houses.

20,804. We understand from inquiries we have made that a boy named Richard Jones was not visited by a medical man recently before he was sent home?—I believe that is true.

Rev. W. Stainer.

25 April 1888.

20,805. You said just now that all the children who had anything the matter with them were under medical treatment; this child had something the matter with it and was not visited?—He was subjected to the same treatment as the others suffering from the same complaint.

20,806. He was not visited?—Mr. May had been in the home very recently before that boy left.

20,807. How recently?—I could tell by referring to my diary.

20,808. We were informed on the spot that Jones had not been under the care of the surgeon since the beginning of the year?—I will refer to my diary and ascertain. The matron has full power to bring forward any child for medical treatment.

20,809. The matron is not the person responsible; you are responsible for the conduct of the home?—Yes.

20,810. You do not throw the responsibility on the matron?—No, I do not.

20,811. Comparing these deaf and dumb children with ordinary children, are they more liable to skin affections?—My experience is that they are much more liable to them.

20,812. They ought therefore to be medically treated more frequently than other children?—Yes.

20,813. There has been no systematic inspection of those children by a medical attendant?—There has been no systematic medical inspection because the medical man to whom I have referred resides near and has always been sent for if required.

20,814. As I understand you, you wish to carry on the homes exactly in the same way as a well-managed institution, and no question of cost enters into the matter, either as regards food or medical attendance?—Certainly not.

20,815. You wrote this morning saying that you had closed the class in Southampton Street, Pentonville?—Yes, yesterday.

20,816. And you say you found it necessary to do so in order to put the children under special medical treatment?—Yes.

20,817. We found 20 out of 43 were away from school when we visited it last week; why had not they been under proper medical treatment?—There are not 43 children in the home. The numbers given at the school apply to other children who were absent from other causes. The home children had been under proper medical treatment, but it has come to my knowledge that there is a contagious skin disease amongst the children which renders it necessary that they should be kept at home till it is cured,

* DIETARY SCALE.

CHILDREN AT AND ABOVE 9 YEARS.

Breakfast at 8.

Bread, 6 to 8 ozs., according to age, with butter or dripping. ½ pint of boiled milk, alternately with oatmeal, porridge, or cocoa.

Dinner at 1.

Sunday - 6 ozs. uncooked beef, 8 ozs. potatoes, 2 ozs. bread. In summer, the meat cold, with lettuce.
Monday - 6 ozs. uncooked mutton, 8 ozs. potatoes, 2 ozs. bread.
Tuesday - Soup made with fresh meat and vegetables. 4 ozs. bread.
Wednesday 6 ozs. uncooked mutton, 8 ozs. potatoes and other seasonable vegetables, 2 ozs. bread.
Thursday - 6 ozs. boiled beef, 8 ozs. potatoes, 2 ozs. bread.
Friday - Suet or other pudding, with jam or treacle.
Saturday - Irish stew, meat pies or puddings, 2 ozs. bread.

Tea at 5.30.

Bread, 6 ozs., butter, ½ oz., milk, ½ pint.

Supper at 8.

Bread, 3 ozs., with cheese, butter, or jam.

CHILDREN UNDER 9 YEARS.

Breakfast at 8.

Bread and milk; 4 ozs. of the former, and ½ pint of the latter, mixed and sweetened.
Lunch at 11. 2 ozs. seed bread, or bread and butter.

Dinner at 1.

Sunday - 4 ozs. meat minced, 6 ozs. potatoes, 2 ozs. bread. In summer, the meat cold, with lettuce.
Monday - Boiled rice, with sugar, and 6 ozs. potatoes, with broth.
Tuesday - 4 ozs. meat minced, 6 ozs. potatoes, and other seasonable vegetables, 2 ozs. bread.
Wednesday Boiled rice, with jam or sago pudding, and in summer stewed fruit; 2 ozs. bread.
Thursday - Same as Tuesday.
Friday - Suet pudding, with jam or treacle.
Saturday - Soup, made with fresh meat and vegetables; 3 ozs. bread.

Tea at 6.

Bread 4 ozs., butter ½ oz., milk ½ pint.

Rev. W. Stainer.

25 April 1888.

which will take a few days, and as superintendent of the deaf and dumb instruction in board schools, I took upon myself to close the class and send the children home till they were in a proper state to attend school.

20,818. Those children had been in that state some time; why were not they medically examined before?—I think it is only very recently that they required medical treatment.

20,819. From inquiries we made upon the spot we found that those children were suffering from skin disease, from which they had been suffering for some time?—I understand from the medical attendant that he does not consider the cases very bad ones.

20,820. Does your medical attendant report to you the cases of those children who are unable to go to school?—Yes.

20,821. Will you show us any report of your medical attendant of the cases of those children who have been kept from school from time to time from chilblains?—I have special reports, not regular reports, from the medical attendant.

20,822. These children that I refer to were not attending school; have you any official report from the medical attendant giving the reasons why they were not fit to attend school?—The matron would call attention to the cases and a note of the cases would be made in the diary.

20,823. Upon receiving a statement from the matron that very nearly half of the children were unable to attend school, did you direct a medical report to be made upon those children?—Yes.

20,824. How soon?—Immediately.

20,825. At what date?—Mr. May's last report to me is the 9th of April. Immediateiy I was informed there was something requiring attention I gave notice to Mr. May to examine every child.

20,826. But these chilblains were not of recent standing and therefore either you were misinformed as to the state of the health of the children in the home, or you did not visit it yourself?—I visit the home regularly; I knew that two or three of the children had chilblains.

20,827. Will you tell us what number of your children are in the Children's Hospital at Paddington Green; how long have they been there, and with what diseases?—There is one in the hospital at Paddington Green now suffering from enlarged elbow joint arising from scrofula from which the child had been suffering previously to coming to the home. There is a girl who has now been received at King's Cross Hospital suffering from an affection of the bone of the leg. Occasionally I have sent children requiring special treatment from Pentonville to the Paddington Green Home so that they might receive proper attention at the Children's Hospital to which I subscribe. That hospital is a few doors off and the medical staff are very kind in giving every attention to the children in the home.

20,828. Have you any medical reports from them?—Not written reports.

20,829. With regard to the case of Richard Jones, you have seen the report of the surgeon when the boy was visited at Brighton?—Yes, it was a difficult case to deal with. I was rather perplexed to know why the child should have been sent to me from Brighton. When the first application came I was rather disinclined to take the child. When he was received in the home he was found to be a very delicate child. The child wanted a great deal more than ordinary attention. He was not removed from the home because any fault was found with the way in which he had been treated, but the father was unable to keep up the payments. He became a bankrupt, and left the quarterly payments in arrear; and in the end I let him off by paying half the last quarter. That was the reason of the child's removal. It was not on account of any complaints that had been made. Two days after the child arrived home I found that he was examined by a medical man, and then a complaint was made. If the child had been left in the home and treated there, I do not think that he could have been in the state in which he was reported to be in when he was examined at Brighton, but these things will happen after a day or two if neglected.

20,830. This is the statement that was made to us by the nurse and the matron in the presence of each other: "The boy Jones had not been under the care "of the surgeon since the beginning of the year, and "Jones had a sore in his head about as big as half-a-"crown when the nurse first came on the 22nd "February." Are you prepared to contradict that statement?—I will refer to my diary and see whether or not that statement is correct.

20,831. What is the whole number of children in your homes?—170.

20,832. How many are paid for by their parents or friends?—About 50.

20,833. Who pay for the rest?—The poor law guardians.

20,834. None are admitted free then?—No.

20,835. Are all the children treated alike, or is there any difference either in the diet or clothing?—They are all treated alike, the only difference is in the clothing. In the cases in which 16*l.* is paid the parents or friends provide the clothing.

20,836. Have you no cases where the friends pay at a higher rate than 16*l.* or 18*l.* 5*s.*?—There is one little boy at Paddington whose parents wish that extra attention should be given him; he is a very delicate boy, and his mother pays 5*l.*; that is an additional 1*l.* a quarter. There are no children the parents of whom pay more than the others with the exception of that one and another who is a big boy. I should like to explain that these 50 cases, which are sent to me by their parents or friends, are nearly all charitable cases. I have not half-a-dozen that are paid for actually by their parents.

20,837. Do you consider them to be an unusually weakly class of children?—Particularly so.

20,838. Exceptionally so?—Yes. It is a mistake to think that children who are deaf are simply deaf.

20,839. Ought they not to have a more generous diet than other children?—I endeavour to give them as generous a diet as they require. I have no wish to stint them. It is not a matter of money with me. Those I have taken to visit the homes when the children have been at dinner have said that they are given more meat than they ought to have.

20,840. (*Sir Tindal Robertson.*) In answer to a question by the Chairman, you said that you should not object to take children from any part of the country. Out of the whole number of 170, how many come from places outside London?—Thirty-eight.

20,841. The children in your home get the advantage of education from the London School Board?—They get that advantage by residing in the school board district; they claim education under the Act.

20,842. With regard to your dietary, when your homes were first established, did you take the advice of anyone upon it, or did you draw up the dietary yourself?—I have not taken any special advice on the subject further than consulting the medical man who attends the homes from time to time. I have had considerable experience myself in connexion with institutions, and I have acted on my own experience.

20,843. You drew up the dietary yourself?—Yes.

20,844. Has the medical man who has attended this particular home approved of this particular dietary given in the home?—Yes.

20,845. Is he aware of the fact that has been mentioned, that from 4 in the afternoon to 8 next morning many of the children get no food?—He has been made acquainted with that fact, and he has spoken to me on the subject, and I agree with him and with anyone else who says that the children ought to have their principal meal in the middle of the day, and a third meal after that. The difficulty in this case arises from children having to go a considerable distance to their school, and having to keep the school board hours as near as they can.

Rev. W. Stainer.

25 April 1888.

20,846. My question is this, did this medical officer know, as a matter of fact, that these children of tender years and of this particularly feeble temperament were unable to get food between 4 o'clock in the afternoon and 8 next morning?—He is acquainted with the fact.

20,847. And did he sanction it?—He has not ordered any change.

20,848. Have you made any substantial gain or suffered any substantial loss by these homes?—At the present time my loss is considerably over 300*l.* a year. The whole loss on these homes since I established them 13 years ago is nearly 2,000*l.*

20,849. Has that been made up to you in any way by voluntary subscriptions or has the whole of that loss fallen upon yourself?—That is the deficiency; the whole loss has fallen entirely upon myself.

20,850. (*Mr. Johnson.*) As I understand, your homes are carried on at your own risk?—Entirely at my own risk.

20,851. Have you any list of subscribers to these homes?—I publish a list of the contributions I receive.

20,852. You are assisted by contributions?—To a very limited extent.

20,853. Have you any committee?—No.

20,854. You are sole dictator and manager of the establishment?—Yes.

20,855. Do you visit these homes yourself, and how often?—I visit the principal home twice and three times a week, and sometimes more frequently. I have been in daily attendance at the Pentonville homes since they have increased in size.

20,856. Then, as I understand you, you not only attend at the home but you go through the establishment and inspect the bedrooms and see to the cleanliness of the place?—I have done that from time time, but the last year or two I engaged a superintendent specially for that purpose, though I have not a superintendent at the present moment. The matron now finds she has so much to do in this enlarged home that she cannot visit the smaller homes, namely, that at Camberwell and that at Paddington, but those homes are under efficient management, and my visits occasionally I have deemed it a fair supervision.

20,857. Is it the fact, as were told, that the children only have meat three times a week?—That is in the case of the infants—that is according to my directions.

20,858. What do you give them on the days on which they do not have meat?—They have good puddings and soup and bread, the soup being made from good meat.

20,859. At any time when you made your inspections did you remark that there was a great prevalence of skin disease about the head?—I have always remarked it; all the cases are pointed out to me on each visit.

20,860. Are you aware that from your home at Pentonville some very suspicious looking cases went into the board school in Southampton Street?—I am quite aware of that.

20,861. Do you think it was an advisable thing to let those children go to the board school with their heads in that condition; did your doctor sanction it?—The doctor said he did not think it necessary for those children to be kept at home—those were his words.

20,862. Did he give a certificate to that effect in writing, or did he merely say that to you or to the superintendent?—He said that to the superintendent.

20,863. Is there any medical register kept in your homes?—No medical register is kept in the homes.

20,864. No book is kept in which the medical officer makes a note?—There is only a general diary kept.

20,865. You have no book in which the medical officer makes remarks with respect to anything which might strike him on his visit?—I have no regular medical attendant.

20,866. Do not you think it would be advisable to have one?—I think it most important, now that this Pentonville home receives the large number of children which it does, and which home I hope to be able very shortly to be put on an equal footing with any institution in the country. Hitherto we have had small houses in certain centres conducted by matrons, but the thing has increased so rapidly lately that it has almost grown beyond present control.

20,867. I think in justice to yourself you ought to know that some of the Commissioners were very much pleased with the laundry, and also with the workshop which have been started; and those departments being so perfect it seemed a pity that the medical supervision was so imperfect?—I hope to have more perfect arrangements hereafter.

20,868. (*Admiral Sotheby.*) You say that these children who on certain days of the week do not get meat at dinner have soup instead?—Soup made from good meat, or suet pudding made with beef suet, with which they have jam or sometimes golden syrup.

20,869. What time is your dinner over?—Four o'clock is the nominal hour for dinner.

20,870. They get nothing after that?—No.

20,871. What time is the dinner over?—It is often past 5 before it is over.

20,872. What time do the children go to bed?—The children begin to prepare to go to bed at half-past six; some of the young children who have to be washed.

20,873. Then there is no time for an extra meal between the four o'clock dinner and the time for going to bed?—No.

20,874. If they had an extra meal it would lie heavy on their stomachs?—Yes; it is considered undesirable that they should have anything after having had a full meal at the dinner hour. The deaf and dumb scarcely have any limit to their appetites; you put food before them, and they eat more than is good for them.

20,875. At what time do they have breakfast?—Before they go to school between 8 and half-past 8.

20,876. In the middle of the day have they bread and butter?—In the middle of the day they have bread and butter, which is objectionable.

20,877. Do they have as much as they like?—Yes.

20,878. How often does the medical attendant go round and examine the children?—As I have explained already, I have no regular medical attendant.

20,879. (*Rev. Mr. Owen.*) You said that since the homes were certified, Mr. Hedley, the inspector, had visited them twice?—Yes.

20,880. How long ago was it when he made his last visit?—Nearly 12 months.

20,881. In addition to the payments that you get in respect of each child from the parents or the guardians, you get subscriptions?—Yes, to a small extent.

20,882. In addition to that, the school board provides the education?—The school board provides the education; the children are sent to the school board classes.

20,883. After all, unfortunately, you are out of pocket; you have not enough to meet expenses?—That is so.

20,884. I imagine you started these homes because you found that the day-school system required to be supplemented?—Yes; the instruction of the deaf and dumb in board schools could hardly be carried on without supplementing it by homes.

20,885. By your own acknowledgment, the combination of the day-school system and your homes, which is practically the institution system, is more expensive than the ordinary institution system?—It ought not to be; I do not see that I acknowledge that.

20,886. Take first the expense of your homes, and then the expense of the day-schools, where rooms and teachers are provided, the combination of those two is practically the institution system; then I ask you, is not that a much more expensive system than what we call the ordinary institution system?—To answer your question it would be necessary for me to make myself acquainted with the average cost of children at all the

Rev. W. Stainer.

25 April 1888.

institutions in the country, which I have not done. I know that the cost per child in the institutions in the country is certainly not less than 20*l.*, and it rises to 40*l.* in some institutions.

20,887. You say that the cost in institutions is not less than 20*l.* ?—I believe that the cost in no institution is less than 20*l.*, and I might say further that those institutions are in many cases endowed, and in the majority of cases well supported by contributions; they have their buildings, so that they have not 500*l.* or 600*l.* a year to pay for rent, amounting to a third or a fourth part of their income, which I have to pay for my houses in London.

20,888. Is not it your opinion that the institution system, as we generally understand the word, is on the whole a better system than the combination of your homes and the day school system?—I think it is.

20,889. I think I understood you to say that you hoped to put your homes on a footing with any in the country?—I wish to do so; if spared to accomplish what I desire, I should like to hand the whole thing over into the hands of the Government and forego any claim I may have for expenses incurred out of my own pocket.

20,890. May we say that the day school system of instruction of the deaf and dumb, as started by the London School Board 10 or 12 years ago, has practically broken down?—It would have done without my homes. I could not have expected that the classes for the instruction of the deaf and dumb in the board schools would be sufficiently attended to justify the expenditure required for buildings, apparatus, and teachers, unless I had taken the matter into my own hands personally and supplemented the school board work by establishing homes by my own voluntary efforts.

20,891. You are quite of opinion that the best interests of the deaf and dumb would be served by the domestic arrangements and the education arrangements practically being all under one roof?—Yes.

20,892. You said as far as you know your medical man has never taken any exception to your dietary; did you ever send him a copy of the dietary?—No.

20,893. So far as you know your dietary has never been submitted to your medical attendant?—I have taken it for granted that from my own experience in connexion with institutions I could prescribe a dietary without laying it before a medical officer. At present I have no medical officer, but when I have one the dietary as a matter of course will be submitted to him.

20,894. From your knowledge of the institution system you know perfectly well that the dietary is submitted to the medical attendant of the institution and signed by him, yet you never carried out that principle in your case?—I never had a medical officer attached to the institution.

20,895. You said you closed one school board class the other day?—Yes.

20,896. Should you have done that if it had not been for the visit of the Commissioners?—Yes.

20,897. On information received?—On information received from the medical attendant who visited the home in which the children having skin disease resided.

20,898. We were told by the teachers that when they saw children suffering from skin disease which they considered made them unfit to come to school they always reported the cases to you personally or in writing?—That is so.

20,899. And yet some of the children continued to attend the school?—Yes, as I found on inquiry, because Mr. May, the medical attendant, said he could see no reason why they should be kept at home.

20,900. You said you visited the homes as often as you could?—Yes.

20,901. The reason for your not visiting them more often being that they are a long distance apart?—Distance makes no difference to me.

20,902. You consider that you visit them enough?—That is another question. I visit them as often as I can, and special visits are always made in cases of emergency.

20,903. You have already said that you consider deaf and dumb children to be decidedly more delicate than ordinary hearing and speaking children, and yet from what you have stated it does not appear that you visit these homes as frequently as you ought as superintendent of the homes?—That may be your opinion.

20,904. You think you do?—Yes.

20,905. Would not some of these evils have been averted had you paid more frequent visits to the homes?—I think I may answer that question in this way. The homes being scattered, perhaps I may not visit them so frequently as I might if they were congregated together, although the distance does not make much difference in time in London, with the facility of communication, still it may be that if they were all together I could visit them more frequently as a whole and give more attention to them. That is one reason why, amongst others of a more important nature I have endeavoured to bring a number of the children together in one centre, that centre being in Pentonville.

20,906. That is an argument in favour of the institution system, because in institutions you have the children more easily under the supervision of the superintendent?—Yes.

20,907. (*Rev. Mr. Sleight.*) Why do the Local Government Board fix 18*l.* 5*s.* 0*d.* as the yearly payment for children sent by the guardians?—I have no means of knowing, I made no application that the amount should be fixed at 18*l.* 5*s.* Previous to that intimation being sent to me from the Local Government Board that the amount would be fixed at 18*l.* 5*s.*, my charge was 16*l.* (but that did not include clothing). On receiving that intimation from them that they considered 18*l.* 5*s.* a reasonable sum I made the charge, which I considered I was justified in doing, raising it from 16*l.* to 18*l.* 5*s.*, because that 18*l.* 5*s.* included clothing, which I understand in some cases barely covers what is paid for it.

20,908. What holidays have the children; do they leave from Friday to Monday?—Very few do. My first idea in establishing these homes was to meet the difficulty that arose in consequence of deaf and dumb children being but a small proportion of the population and being scattered over a large district, so that some of them would have long distances to come to the school. My idea was having homes in the vicinity of the school in which they could reside from Monday to Friday. The idea was taken up at first by a number of parents of deaf and dumb children who were delighted at the prospect of being able to send their children to school, and they willingly paid the amount I charged, which was 2*s.* from Monday to Friday, they having to pay the school fee, 2*d.*, in addition. The reason that that system of keeping the children in homes from Monday to Friday did not succeed was, that times got hard with many of those people, and the first expense they could save was by keeping of the children at home. Then bad weather would affect the children, and sometimes they would not come on Monday morning. Sickness was a very common excuse. The parents also found that they could have their children provided for entirely, which would be a great relief to them and an advantage to the children. Many inquiries were made of me by parents of deaf and dumb children as to what assistance they could get from boards of guardians so as to enable them to send their children into the home without having to pay for them themselves. I was acquainted with the fact that the guardians had the power of paying for deaf and dumb children under certain Acts, and I gave information to the parents that they could get such assistance. I never myself actually sent a case to the guardians with a recommendation, but I gave them information that they could gain such assistance by application to the boards of guardians. Such applications were made by numerous parents, and in most cases were refused. I

Rev. W. Stainer.

25 April 1888.

can only account for that by the fact that I know in many cases the guardians and their advisers, their clerks and solicitors, were ignorant of the law on the subject; they refused on the ground that they could only pay for children in homes or institutions, where the children were paupers. The action of the guardians in this respect is not uniform; it is very irregular.

20,909. Can you mention any cases in which the application of the parents to the guardians to pay for the maintenance of their deaf and dumb children in your homes has been refused?—Perhaps I might have a difficulty in proving whether the application had been made in the proper form; but the Boards of Guardians of Shoreditch and Islington have refused to pay for such children, and those children are in consequence not receiving instruction.

20,910. Do you publish a yearly statement of the expenditure on your homes?—I have a yearly statement of the entire receipts and expenditure, for the accuracy of which I can personally vouch, from the commencement, an abstract of which you will find here (*handing in a book*). That gives the receipts and expenditure, and the deficiency in each year from 1875 to the end of 1886.

20,911. (*Dr. Campbell.*) Do you have your accounts audited and certified by an auditor?—Yes.

20,912. You said you were hoping to hand over these homes to the Government, but it may be a long time before the Government are prepared to take them over; would not it be more satisfactory to the public, and a great relief to you, to have a committee to control them?—I should be perfectly willing to have a committee. I took action in that direction some few years ago. I asked several friends if they would act as a committee, one of whom said: "Well, if you put "me on your committee, I shall not allow you to "spend your own money." I said: "In that case the "homes cannot go on developing," and therefore I did not pursue the idea.

20,913. If that gentleman had chosen to provide a part of the money and so saved your pocket, I suppose you would not have had any objection?—It is very difficult to find people willing to bear any proportion of the deficiency.

20,914. I understand that you are going to furnish us with your dietary, but I should like to ask you this question: Do you give the children any fish?—I have tried the plan of giving fish dinners in more than one of the homes, but they did not give satisfaction; the children did not seem to like fish as well as meat.

20,915. (*Mr. Van Oven.*) As regards medical supervision I understand that Mr. May has given some kind of medical advice from time to time, but he is not in any way, as far as I gather from you, the appointed medical inspector or medical attendant of your homes?—His name is on the reports as visitor; he is not the appointed medical officer.

20,916. Does he give his services gratuitously?—No, not gratuitously; he is paid for every visit.

20,917. Therefore, unless it is an important case, he is not sent for?—He is sent for if the case is considered sufficiently important.

20,918. Do you not think it would be advisable for the future to have some special medical attendant whose duty it would be to inspect the children in these homes, and to inspect the general arrangement of the homes, so that such mischief as has occurred may not occur again?—I do think so.

20,919. Do not you also think it would be advisable, in the absence of a committee, that you should endeavour to get a number of benevolent ladies to undertake to visit the home and inspect the domestic arrangements from time to time?—I have tried that. I got ladies to visit the homes and to make entries in a book kept for the purpose, and the entries that they made from time to time were, "Nothing to report, all satisfactory." I had a regular list of lady visitors. Three years ago the attendance fell off, and it amounted in the end to only a casual visit from one or two personal friends.

20,920. With regard to the case of Richard Jones, he had been some time at the home?—He had been there 12 months.

20,921. Had he visited his parents during that time?—No.

20,922. Had his parents visited him?—No.

20,923. Therefore there had been no communication except by letter between him and his friends?—There had been some friends to visit the child.

20,924. (*Chairman.*) Did you ever ask any medical man if he would inspect these homes from time to time, voluntarily?—I suggested it to Mr. May; he said he could not give up his time to do it. I got a reduction in his ordinary expenses.

29,925. Is there anyone in the children's hospital at Paddington Green who would be able to give a general supervision over your children?—Yes, one of the medical men attached to that hospital would do it, no doubt.

20,926. (*Dr. Campbell.*) How often do the children take baths?—The whole of the children in the homes are regularly bathed once a week, and the younger ones more frequently. For want of means I have not been able as yet to fit up such bathing appliances as I hope to do hereafter, but the Boys' Home I have furnished with two excellent baths with hot-water apparatus at a cost of 50*l.* recently, and I hope by means of funds which I expect to be able to raise to fit the other home in a similar manner, and then I think the regularity and efficacy of the bathing will not leave any room for remark.

Adjourned.

6, Old Palace Yard, S.W.

Tuesday, 12th June 1888.

PRESENT:

THE RIGHT HON. THE LORD EGERTON OF TATTON IN THE CHAIR.

SIR TINDAL ROBERTSON, M.P.
B. STJOHN ACKERS, ESQ.
T. R. ARMITAGE, ESQ., M.D.
F. J. CAMPBELL, ESQ., LL.D.
EDMUND C. JOHNSON, ESQ.
ROBERT MCDONNELL, ESQ., M.D., F.R.S.
THE REV. W. BLOMEFIELD SLEIGHT, M.A.
THE REV. CHARLES MANSFIELD OWEN, M.A.

CHARLES E. D. BLACK, ESQ., *Secretary.*

The Right Hon. Sir PATRICK J. KEENAN, P.C., K.C.M.G., C.B., examined.

Rt. Hon. Sir P. J. Keenan, P.C., K.C.M.G., C.B.
12 June 1888.

20,927. (*Chairman.*) You are Resident Commissioner of National Education in Ireland?—I am.

20,928. (*Dr. McDonnell.*) As this Commission may have to consider some important questions as to the Irish national system of education in its possible relations to the education of the blind and the deaf and dumb, &c., would you kindly give some general idea of the system?—From the year 1733 to 1831 Parliamentary grants, which in the aggregate during that period amounted to upwards of 3,000,000*l.*, were made to various educational societies in Ireland. These societies were privately constituted and unrestricted and unchecked in their administration of the grants. Most of them were professedly proselytising in their character, but they proved to be all failures, failures in not attracting the masses of the people to their schools, and in not satisfying the popular demand for impartial education. Convinced at last that no private society deriving a part however small of their income from private sources, and only made the channel of the munificence of the Legislature without being subject to any direct responsibility, could adequately and satisfactorily administer a great national system of education, the Government, in the year 1831, in the Chief Secretaryship of the late Lord Derby, then Mr. Stanley, resolved to appoint an independent and responsible board of commissioners. To these commissioners, who were persons of distinguished position, was given absolute control over the funds annually voted by Parliament for the support of national education. They were to grant aid towards the erection of schools, to appoint inspectors and an administrative staff, to award payments to teachers, to establish a model and training school, and to edit and publish suitable school books. In point of fact, the Commissioners were to constitute the official, the Governmental Department of Irish national education. The board at present consists of 20 members,—10 Roman Catholics, and 10 Protestants. One member who is called the resident commissioner, receives a salary for his services. The Parliamentary grant dispensed by the board is moving fast upon 900,000*l.* this year. There are about 8,000 schools in active operation, and the daily average attendance of scholars is nearly 520,000. There are about 8,000 principal teachers and 3,200 assistants—all certificated; besides, there is a staff of about 6,000 paid monitors. Four-fifths of the income of the teachers come from the Parliamentary grant, awarded to them on a composite principle, about two-thirds in fixed class salaries, and the remaining third in results fees, determined by the ascertained proficiency of the pupils. Not to weary the Commission with a mass of details, I may briefly state that the national system embraces in its operations: (*a.*) The great central office in Dublin, in which the administrative work is carried on, including the quarterly payment of the salaries of the teachers and monitors and the making of grants for the erection of new schools, &c. (*b.*) A thoroughly efficient system of inspection. (*c.*) Colleges for the training of teachers, one of which is non-sectarian, and three of which are denominational. (*d.*) A set of model schools in different parts of the country, attended daily by about 8,000 children. (*e.*) A great depôt for the sale of books and school requisites at cost price and carriage free to the national schools. (*f.*) An agricultural department for the training of agricultural teachers and agriculturists and dairy-maids, and for the diffusion of agricultural knowledge generally. (*g.*) The industrial training of girls in needlework, &c. I suppose I need hardly add that the fundamental principle of the system is that a national school is open to children of all creeds and classes, and that its conscience clause is so rigid that a Catholic teacher cannot permit a Protestant child or a Protestant teacher permit a Catholic child to remain in the school at the time of religious instruction, unless by the express direction of the parents in writing, properly attested, and even investigated and countersigned by the inspector.

20,929. Are there any schools under the Board of National Education besides the ordinary national schools?—Yes, the workhouse schools are nearly all under the Board. We have also provided in our rules for the affiliation of schools attached to lunatic asylums. To these schools we simply give the advantages of inspection and cheap books. Formerly we gave the same advantages to schools attached to jails, but the prison authorities decided to discontinue the arrangement.

20,930. Are the certified industrial schools and the reformatory schools under the Board?—No; but as more than half of the certified industrial schools are held in buildings adjoining national schools, we permit the pupils of those industrial schools to receive their literary education in the national schools. Inasmuch, however, as payment for the education of the industrial pupils is made directly by the Industrial Schools Department, we do not grant salaries to their teachers. The pupils themselves are, however, eligible for the prizes of the national school, including the great prize of the paid monitorship.

20,931. Have the Commissioners of National Education in Ireland ever contemplated the admission of the blind and the deaf and dumb as pupils of national schools?—No.

20,932. (*Chairman.*) Nor imbeciles?—No; they have not made any provision in their rules in respect to those suffering classes. They have, however, never deliberately decreed their exclusion. So long as the managers and teachers are satisfied that a deaf mute or a blind child will not disturb the discipline or mar the instruction of a school, the Commissioners are not likely to forbid his attendance. From time to time accordingly, a stray blind or deaf and dumb child is met with in a national school. I caused a

Rt. Hon. Sir P. J. Keenan, P.C., K.C.M.G., C.B.
12 June 1888.

return to be recently made of the number of those afflicted children who were found in the national schools during the whole of last year. This return shows only seven deaf and dumb, five deaf but not dumb, and one blind—13 in all. A curious feature in the return is that in 11 cases the afflicted were poor solitaries in the schools. In each of 11 schools there was only one such child, and in a twelfth there were two.

20,933. (*Dr. McDonnell.*) Have you elicited the opinion of your inspectors as to the advisability or feasibility of engrafting the education of the blind and the deaf and dumb upon the national schools?—I have. Since it was intimated to me that I should have the honour of appearing before this Commission, I sent a circular letter to the inspectors, inviting their opinion upon the subject and asking for information. I made no inquiry of them with respect to imbeciles. With your permission I shall now read some extracts from their replies. Mr. E. Downing, district inspector, Galway, says: "During my 10 years' "experience of this district (that is the whole county "of Galway, including Connemara) only one case of "the kind occurred, that of a deaf and dumb boy. "Under my guidance the schoolmistress taught this "lad to write a splendid hand and to understand "writing. He was then sent to the Cabra Insti- "tution. The teacher used to say that the first flash "of intelligence that illumined his face when the "purpose of writing dawned upon him, was sufficient "to repay for the labour of a year." Mr. A. Purser, district inspector at Dublin, says: "I am under the "impression that teachers would consider the educa- "tion of such children as outside their sphere, and "believe themselves justified in not admitting them "as enrolled pupils." Mr. S. E. Strong, district "inspector at Waterford, says: "Parents do not "send such children to the national schools. I do "not think the teachers have time to pay attention "to such pupils. Much labour would be required "in the case of any one of them, and the hope of "earning a results fee would be infinitesimal." Mr. H. M. Beatty, district inspector at Bantry, says: "I believe that the teachers would not be at all "favourable to the admission of children of these "classes. With regard to their education I do not "know that the teachers have formed any views; but "I think they would be very unwilling to undertake "it." The superintendents of the Marlborough Street Training College and Model Schools say, "We have "conferred with the teachers on this matter. They "are not favourable to the admission of such children; "they believe that any attempt to teach them would "most seriously impede the general work of the "schools." Mr. D. J. Roantree, district inspector at Sligo, says: "I have consulted some of the best "teachers as to the admission of such pupils; they "think it would be useless to admit them, as the "carrying out of any special scheme for their educa- "tion would be incompatible with the working of "ordinary national schools." Mr. E. P. Dewar, district inspector at Dungannon, says: "The "teachers think it would be prejudicial to the "interests of their schools to admit the blind and the "deaf and dumb on the following grounds:—(*a.*) "Mode of communicating information to them and "to ordinary pupils so essentially different. (*b.*) "Time spent on these pupils would be taken from "ordinary pupils, so that latter class would suffer, "and proficiency of schools would deteriorate. (*c.*) "These pupils naturally slower than ordinary pupils, "hence time of latter would be wasted. (*d.*) They "are irritable and envious; these passions might be "inflamed by constant intercourse with brighter, "quicker children. (*e.*) They would materially "interfere with the discipline of the school. (*f.*) "The small progress which could be made would "be out of all proportion to the time and trouble "spent." Mr. W. Healy, district inspector at Down- patrick, says: "There was one deaf and dumb child. "The teacher had taught the child to spell and "articulate words, gutturally, of three letters, and "also to make a fair attempt at elementary writing "on slates. The child has since been sent to a "deaf and dumb institution. The teacher looked "upon what she had done in the light of an "interesting experiment, and believes, and I think "justly so, that the child benefitted by the in- "struction. It was by means of imitation of the "teacher's vocalisation that the child was taught "to spell and read." Mr. E. MacCreanor, district inspector at Newry, says: "I believe national teachers "generally do not consider deaf, dumb, or blind "pupils suitable for admission to or instruction in "ordinary national schools." Mr. J. O. O'Connell, district inspector at Ballina, says: "I believe I am "correct in stating that the teachers consider that "the admission of blind or of dumb children to "national schools would not be productive of much "benefit to the children themselves, and that it "would entail on the teachers duties which, from "want of experience and other causes, they would be "unable to discharge with success. Such children "must be rare in any master's experience, and he "could scarcely be expected to teach them as "effectively as persons in large institutions for the "blind and dumb, who have got special training and "a large acquaintance with such cases." Mr. A. J. McElwaine, district inspector at Roscommon, says: "There is one pupil deaf, but not dumb. I believe "the teacher approved of the admission of this pupil. "Considering the physical defect under which she "labours, she has made very satisfactory progress in "most of the subjects of the programme, and is now "a pupil in one of the senior classes." Mr. M. Sullivan, district inspector at Limerick, says: "I "believe the efforts made by the partially blind to "read, write, and work arithmetic prove seriously "injurious to their eyes, and I fear that in several "instances they ultimately become totally blind; but "before this happens they cease to attend school. "The partially blind pupils whom I met had not, as "a rule, consulted an oculist; nor did they use "spectacles. I believe that a great deal could be "done for the partially blind, and that much total "blindness could be prevented if the partially blind "were judiciously dealt with." Mr. J. W. Rodgers, district inspector at Armagh, says: "Whilst at the "national school the deaf and dumb boy included in "the return was taught chiefly by some of the pupils, "who had learnt the deaf and dumb alphabet from a "deaf mute who lived in the neighbourhood of the "school. The teacher says he had become expert "in transcribing from printed matter." Since I received the replies which I have just read I held a conference of the six head inspectors to discuss the subject carefully and minutely, especially as to the policy of permitting the deaf, dumb, and blind to attend the national schools in ones and twos (the most to be anywhere expected in country districts). I found the head inspectors, on the whole, not at all so hostile to such attendances as the district inspectors. They presumed that these waifs and strays were children who could not obtain admission to institutions, and who, even if they should fail to profit by the general teaching of the national school, might learn many useful things involuntarily,—the blind by hearing, and the deaf and dumb by seeing maps, charts, pictures, and models. Above all, such children, they felt, would gain the immense advantage of becoming subject to the influences of discipline.

20,934. What is your own opinion, and what are your conclusions, upon the subject submitted by you to the inspectors?—It is only as a *dernier ressort* that I would favour the engrafting of the education of the deaf, dumb, and blind upon the national school education. If driven to such a *dernier ressort*, I would have a few suggestions to offer. But if you permit me I will first describe the course I like best. I know something about the interesting system of "centres" for extern pupils which prevails in London. This system, however, would not be feasible in Ire-

Rt. Hon. Sir P. J. Keenan, P.C., K.C.M.G., C.B.

12 June 1888.

land. I have caused very careful inquiries to be made in the three largest cities, Dublin, Belfast, and Cork, and have ascertained that the elements to constitute a "centre" in any one of them are not found to exist. You have therefore nothing for it in Ireland, at all events, but to perpetuate the present utterly inadequate and defective system, even with a little modification, to which I shall refer, or to extend the resources and the numbers of the "institutions." The latter is the course I warmly advocate. The "institutions" at present existing, though nominally private, are yet largely aided by contributions from the poor law guardians. I have, however, heard from most reliable authority that sometimes the guardians are stingy in making these contributions. Whatever the system of the future may be, the requirement of some local contribution will not, I presume, be abandoned. I would, however, make the local contribution compulsory, or in other words I would require each board of guardians to send every deaf, dumb, and blind child, within certain limits of age, and whose parents belong to the poorer classes, to an institution. To minimise the tendency to stinginess I am inclined to think that the best course would be to levy the poor law contribution, as was done in the case of the cattle plague contributions, by a "national rate." This would, probably, be only a farthing or a halfpenny in the pound. Whilst I feel so strongly as to the duty of the guardians I feel quite as strongly as to the duty of the State. I think that as in Ireland, the State awards four-fifths of the cost of the primary schools and gives, as in England, Scotland, and Wales, three-fourths of the cost of the denominational colleges for the training of school-masters and school-mistresses, at least the latter proportion, three-fourths of the cost of each deaf and dumb or blind pupil at an institution should be derived from the Imperial Treasury. If the cost per child were, say 20*l.*, then 15*l.* of it should come from the parliamentary vote, and the other 5*l.* from the rates. To contribute to the maintenance of pauper lunatics is now an acknowledged obligation of the State. In the estimates of this year 104,460*l.* for this purpose is provided for Ireland. But to speak of education alone, every phase of Irish education but this of the education of the deaf, dumb, and blind, commands a share of the parliamentary funds. The pauper children in the workhouse are taught by teachers whose salaries come from Imperial funds; the orphan and the outcast in an industrial or reformatory school is supported and educated largely by the votes of Parliament; the 400 and odd children of soldiers who are pupils at the Royal Hibernian Military School are supported and educated entirely by Imperial funds; the half million of children in daily attendance at the national schools get four-fifths of the cost of their education from Parliament; the intermediate schools get the interest of a million of the Irish Church fund, practically a public grant; the students of art and science in Irish schools get parliamentary aid through South Kensington; students in archeology and Celtic literature are aided by the Imperial vote to the Royal Irish Academy; and, then, not to speak of the Queen's Colleges or the Royal University, or of any of the incidents of "professional" education, I think it may reasonably be asked why it is that the deaf, the dumb, and the blind, are apparently alone left out in the cold. I shall not venture to dwell upon the generous practice of foreign governments in relation to the class of institutions under consideration. If, as I think ought to be the case, at least three-fourths of the cost be borne by the State, it then becomes necessary to arrange for efficient inspection. As the Commissioners of National Education already inspect, as I have shown, many different classes of schools, I do not apprehend any unwillingness on their part were the Government to desire them to undertake the inspection and administration of the institutions. In the event of not carrying a complete system, under the auspices of the institutions, it has occurred to me that at the institutions there might be short courses of instruction to enable the blind, say, to learn the embossed type, so that their education in a common national school might, in elementary matters at all events, proceed *pari passu* with that of the seeing children; and, again, the deaf and dumb might be enabled to acquire a knowledge of the signs of the alphabet, so that any intelligent teacher mastering so much of the sign language might be of some service in working up the intelligence of such children. A special results fee for the instruction of such children might be an inducement to teachers to undertake, as an extra branch, this diversion from their ordinary duties. This plan, however, I appreciate only, as I have said, as a *dernier ressort*.

20,935. At Question 19,569 Mr. Patrick Cumin says: "Unless the Government are prepared to supply "education to the children of all deaf and dumb or "blind people who chose to apply, I think there "would be very great difficulty." Do you think that answer would equally apply to Ireland?—It would equally apply to Ireland, and I would impose, as I have said, the duty upon the guardians of sending deaf and dumb and blind children to institutions whether those children were previously inmates of workhouses or not.

20,936. With regard to compulsory education of deaf and dumb and blind children, in your opinion is Ireland a country in which that compulsory principle could very well be applied?—So far as relates to the question of compulsory attendance of deaf and dumb and blind children in schools and in institutions I think I have already practically given an answer to the question; but I must add that I have never heard any opinion expressed upon it except by officers of my own board who have been in consultation with me.

20,937. (*Chairman.*) You say that the guardians should be compelled to send deaf and dumb and blind children to institutions, I presume you mean that they should be compelled to send those children to such institutions whose parents applied to have the children educated. Would you go a step further, that is to say, supposing it were thought desirable to recommend that the guardians should be required to make such inquiries as to satisfy themselves that these unfortunate children were not left without any education, would you propose that, on its being found that the parents had not the means to send them to institutions for such education, the guardians should have the power to send them whether the parents liked or not?—Perhaps it would be better for me, in the first instance, to say a word about compulsory attendance in its bearings upon the subject of elementary education; that is a vexed question in Ireland. A few years ago the Government made every effort to ascertain the opinion of educationists upon it, and on the whole they thought they were justified in bringing a measure into the House of Commons requiring the compulsory attendance, of a limited character, of every child in the country. The regulation as to the limit of attendance was that a child should attend at least 150 days in the year. There were other little details which it is not necessary to trouble you with.

20,983. Was that measure carried?—No; the Government went out and it was dropped. That measure was very well received at the time, as we were given to understand by Cardinal McCabe, and the Catholic bishops generally; but very shortly after it was introduced into the House of Commons, there happened to be a meeting of the Irish Catholic bishops in Rome, who sent home from Rome to the Government a set of resolutions criticising the Bill which had been presented to the House of Commons, and amongst other points of their criticism decidedly condemning the principle of compulsory attendance. However, from my personal knowledge of individual bishops, and of clerics of all denominations, and of course I have an opportunity of meeting many of them, I would say that, on the whole, their feeling is in favour of compulsory attendance. Then, as regards the question of compulsory attendance of the deaf and dumb and the blind, that is a branch of the question which very likely has never entered into general consideration; but last week I happened to have an interview with the Roman Catholic Primate of all Ireland and the Bishop of Clogher, and when I told them that I was preparing to undertake a journey here to give evidence before the Commission on the Blind and the Deaf and Dumb, they said, "Oh, Sir "Patrick, above all things suggest that the guardians "may be required to send every deaf and dumb and "blind child to an institution."

Rt. Hon. Sir P. J. Keenan, P.C., K.C.M.G., C.B.

12 June 1888.

20,939. Do you think Ireland is a country where compulsory education for the deaf and dumb and the blind would not be required because the parents naturally would apply to the guardians to send their children to such institutions?—I would prefer to have it compulsory.

20,940. You would not leave the discretion to the parents?—I would not; I am of opinion that every poor deaf and dumb or blind child ought to be looked to by the State, and not left to the haphazard fortunes of an illiterate home. I have heard from a Roman Catholic authority of great eminence that these poor deaf and dumb children are often hid in corners of houses in the country like lepers.

20,941. (*Rev. Mr. Owen.*) If the State required that every deaf and dumb child should be educated, do you think the State ought either to dictate, or recommend the method of instruction, or would you leave it to the individual institutions to adopt the particular method they thought best?—I think it ought to be left to the individual institutions. I think systems of education are likely to be all the better if left to free trade.

20,942. Have you had any opportunity yourself of investigating the advantages of one system over the other?—I would not venture to say that I ever deliberately undertook any such investigation; one could not help, however, seeing that one system prevailed here and another prevailed there; but I cannot profess to give any opinion as to the comparative merits of them. If I were to add another word, I would say I like both.

20,943. I notice that in this return, which was asked for in the House of Commons, there are about six deaf and dumb children taught in workhouse schools; have you any idea how they are taught?—No; I apprehend they are not taught; I fancy they are simply present.

20,944. The instruction would be very elementary if any at all?—Yes; it would be practically no instruction at all. As an instrument of education, it would, I suppose, be confined to the involuntary learning which the children could not help compassing.

20,945. In England some of the school boards seem to be willing to send deaf and dumb children to institutions; but then comes in the difficulty that the school board has no right to pay for maintenance which would be part of the regime at the institution?—In one of my previous answers I suggested that the poor law guardians ought to contribute a portion of the cost of the maintenance and education of a child at an institution, the State, however, contributing the larger proportion.

20,946. (*Rev. Mr. Sleight.*) Would parents be likely to be unwilling to apply to the guardians for the payment of the education of their children from the feeling, whether well founded or not, that they would become pauperised thereby?—I do not know anything on the matter as a question of fact, but as a matter of opinion, I would say that there would be parents no doubt so proud that they would rather keep their children at home and hide them in corners than openly declare them to be subject to the aid or protection of the guardians. What I suggest, however, is that it should be compulsory upon the guardians to find out every blind and deaf and dumb child of school age and then to send it to an institution.

20,947. (*Mr. Johnson.*) You said that, taking the cost per child to be 20*l.*, you would suggest that 15*l.* of it should come from the State and 5*l.* from the poor rates, may I take it that you think that 20*l.* would be sufficient to provide education for these classes?—I only gave 20*l.* as a hypothetical figure, not meaning it to be inferred that 20*l.* had ever been, by me or anybody else, determined as the measure of the cost per child: perhaps instead of saying 20*l.* I ought to have said 40*l.*, or, as I know to be the case in America 50*l.* I merely gave 20*l.* as a hypothetical figure for an easy division into the proportions to be borne by the State and by the guardians.

20,948. Whatever figure you take you propose that three-fourths should be contributed by the State and one-fourth by the guardians?—Yes.

20,949. Supposing any system of compulsory education were introduced in Ireland, do you think it would be desirable to send deaf and dumb and blind children to district schools or to institutions?—I think it would be desirable to send them to institutions.

20,950. To institutions where they would not be educated with any other class?—From all that I have personally observed and all that I have heard they are infinitely better educated in institutions with children of their own class than they would be at home even under the best private tutors.

20,951. Then supposing such a system of compulsory education for the deaf and dumb and the blind in force, do you think there would be any difficulty with regard to the religious question?—There would be an enormous difficulty if you did not at once recognise the principle of denominationalism. The Catholics would only go to a Catholic institution and the Protestants would only go to a Protestant one.

20,952. There would have to be two sets of institutions established?—Yes.

20,953. If the State and the guardians were to contribute the necessary funds, you think both the Catholics and the Protestants would be glad to undertake the education of the Protestant and Catholic children so subsidised?—I am perfectly sure they would.

20,954. And they would carry out their system of education in any way the managers of the institution thought best?—Yes.

20,955. I understood you to say you were not of opinion that there should be any definite system of education prescribed by the Government either for the deaf and dumb or for the blind?—I should object very much to it. I think stereotyped systems are not salutary in education.

20,956. I understood you to say that from a return which you had made to you of the number of deaf and dumb and blind children in the national schools you found that there were 13 in all; seven of those being deaf and dumb, five deaf but not dumb, and one blind; are those all the blind and deaf and dumb cases that have come within the knowledge of the whole of your inspectors?—Yes; they were all the cases met with, in the 8,000 schools of the country in the year 1887.

20,957. That would be an infinitesimally small proportion of the whole of the deaf and dumb and blind children in Ireland, would it not?—An infinitesimally small proportion.

20,958. You read us the replies you had received from your sub-inspectors, and you also gave us the opinions of your six head inspectors; do you attach greater importance to the opinion of the head inspectors or to the opinion of the sub-inspectors?—I attach greater importance to the opinion of the six head inspectors; they are the crême de la crême of the inspection staff; they are men of great distinction and experience as educationists, and they are the chief advisers of the Commissioners of National Education upon all practical matters connected with educational administration.

20,959. I think you said that one advantage which the head inspectors looked to as likely to result from the education of deaf and dumb and blind children in ordinary schools would be that they would become subject to the influence of discipline?—That would be one of the advantages that they recognised if that

Rt. Hon. Sir P. J. Keenan, P.C., K.C.M.G., C.B.

12 June 1888.

mode of educating the deaf and dumb and the blind had to be resorted to.

20,960. But, as I understand, as far as you can judge, deaf and dumb and blind children do not get anything like education in the national schools, where they are in national schools?—As far as I could judge, none of the inspectors could tell a story of any genuine education except in one case; but I can myself testify to a case of genuine education of a blind child. I happened 33 years ago to have official relations with the county of Donegal. I was at that time head inspector of schools, and I had under my direction the schools of the province of Ulster. In an ordinary national school in a remote part of the county Donegal I found a little blind boy about 14 years of age, and except that he could not read a book or a newspaper, he was the best educated national school boy of his age I had ever met; yet he had never been in any school in his life but that national school in that wild part of Donegal. He could calculate a sum in his mind just as well as other children could on their slates. As to his singing, one could not help being quite enchanted with it; he had a thorough knowledge of geography and grammar, and everything that a child in a national school might be expected to know; and he was unquestionably the brightest and most intelligent of all the children in the school.

20,961. Am I right in supposing that you would be of opinion, from the result in that case, that it would be possible to educate blind children with the sighted in ordinary schools?—Certainly, if I were to make that boy my standard, I think an ordinary national school would be a very excellent refuge for a blind child. But he was an exception; he was a child of genius.

20,962. (*Mr. St. John Ackers.*) In answer to one of the previous questions, you stated that you were of opinion that it would be necessary to have denominational schools for the blind and the deaf and dumb; you would require to have Protestant and Catholic schools?—Yes. I said so on the hypothesis that it was to institutions that the children were to be sent; and in my opinion, and I believe the general opinion is in accordance with it, an institution must necessarily, like a home, recognise an identity of religious belief amongst its inmates.

20,963. The national schools in Ireland are at present open to the children of every denomination?—Yes.

20,964. Supposing it were found advisable or possible to establish day schools for deaf and dumb and blind children in Ireland, would you then consider it necessary that they should be denominational schools, or would you follow the present national system?—I think that unless you made these special schools to which deaf and dumb and blind children were sent denominational schools, you would not get those to whom you might naturally look to be concerned in the work of educating these afflicted children,—the clergy and the monks and nuns, and so on,—to take an interest in the thing. They should be established on the denominational principle.

20,965. Knowing as you do the wants and feelings of Ireland thoroughly upon this matter, you are of opinion that whether the education of these children is given in institutions or in schools, the institutions or schools must be denominational?—Yes, if they are exclusively for the deaf and dumb or the blind.

20,966. You stated in an early part of your evidence that there are no centres, even in the three large cities, where day classes could be formed?—Yes, I took the greatest pains about that, and I got our inspectors to inquire of the clergy of all denominations, and I went myself to some convents, to see if there existed any number of children of those classes in the three large cities not in institutions, and I found that, except a stray one here and there, there was nothing of the kind. If I had anticipated that I was to be examined upon this point, I could have brought an immense number of letters to show that there are hardly any such children in those large towns that are not in institutions. In country districts, of course, you will meet them, occasionally, in ones and twos.

20,967. In one of your previous answers you said that in your opinion the institution should be denominational, perhaps you will give your reasons?—Well, I think that I have, a few minutes ago, given a sufficient reason for my opinion, but in sustainment of it I may, perhaps, add that there is at present sitting in Ireland a commission under Parliamentary authority to prepare schemes for the future management of endowed schools, and that amongst the endowed schools that presented petitions to the Commissioners for a scheme was the Ulster Deaf and Dumb Institution. A great deal of the attention of the Commissioners was given to the question as to whether this institution was to be, for the future, strictly denominational or not, and finally the case came before the Judicial Committee of the Privy Council, which was unanimous in determining that into the Belfast Institution, that is the Ulster Institution, none but Protestants were to be admitted; and it will now be illegal on the part of the authorities of the institution to admit a Catholic. That is a forcible illustration of the tendency at all events in Ireland towards making such institutions denominational institutions.

20,968. Going back again to the question whether there are a sufficient number, or might be a sufficient number of these afflicted children in large centres, that is to say, in the large cities and towns, I understand that the reason why there are so few at present in those large towns is because they are all in institutions?—I think the answer that has been given to our inspectors almost universally is that the deaf and dumb and the blind in those large towns are already in institutions, and that those not in institutions are scattered in ones and twos and threes through the country. An eminent Roman Catholic priest, the very Rev. Dr. Macnamara, who is President of the Irish College in Paris, and who takes an enormous interest in this question, wrote me a letter last year, without reference to this Commission or my possible appearance before it, in which he said that he had the names of nearly 400 deaf and dumb children in rural districts who ought to be at institutions and who are not, and who are scattered about in ones and twos. His object in opening up a correspondence with me upon the subject was to induce me to get the Commissioners of National Education in Ireland to look to the matter.

20,969. (*Chairman.*) Has that figure been tested in any way?—I think not.

20,970. But you believe it to be correct?—I believe it to be correct, because Dr. Macnamara is a very reliable person.

20,971. (*Mr. St. John Ackers.*) Have you the number of blind and deaf and dumb children in Ireland between the ages of 5 and 15?—That I cannot give you.

20,972. Going back again to this question of centres; supposing public elementary day schools on the national system were to be started for the blind and deaf and dumb in the large centres of population, do you believe that the children would be sent to those schools, or is it your opinion if it were optional the parents would still prefer to send them to institutions?—They would infinitely rather send them to institutions. In one of the letters I received from an inspector who is intimately acquainted with Belfast, was enclosed a letter from a priest who knew only of one Catholic child in Belfast that was not either at school or at an institution, and who said he was making every effort to get him into an institution.

20,973. You spoke of 400 deaf and dumb children that were wholly uneducated, are any of those at the present time supported so far as you know either wholly or partially by the guardians?—I could not say.

20,974. You stated that in your opinion it should be compulsory on the guardians to send all deaf and dumb and blind children in their districts, whether pauper children or not, to some recognised institution for the deaf and dumb or the blind. I should like to know whether you would impose that duty on the guardians under the present condition of the law as to payment, or whether you would first make it compulsory upon the State to pay the three-fourths which you suggest they should pay?—I should certainly wait till the arrangement was made that the State should pay the three-fourths.

Rt. Hon. Sir P. J. Keenan, P.C., K.C.M.G., C.B.

12 June 1888.

20,975. That is to say, you would not make it obligatory upon the guardians to pay the whole of the cost?—I would not.

20,976. Therefore you would wait till the law was altered in the direction you desire, that is to say, till the State was required to contribute three-fourths, while the guardians contributed one-fourth, and then you would make it compulsory upon the guardians to send all deaf and dumb and blind children in their district to an institution?—Yes, I think there would be comparatively little difficulty in getting the guardians to contribute one-fourth, but there would be enormous difficulty in making it compulsory upon them to pay the whole cost.

20,977. None of those 13 of whom you spoke, who are in ordinary schools, are paid for by the guardians?—None.

20,978. You spoke of certificated teachers in all the ordinary schools throughout Ireland, is there anything to make it compulsory to have certificated teachers at the present time for the blind and the deaf and dumb?—No, they are not under Government inspection.

20,979. One question with regard to the means taken to prevent total blindness in the cases of children who have imperfect sight; we have been informed that directions have been prepared for the treatment for the prevention of blindness in such cases, are those directions hung up in ordinary elementary schools?—No, certainly not in the national schools.

20,980. (*Dr. Armitage.*) Was your opinion of the unsuitability of the ordinary national schools for the education of two or three blind children founded on any knowledge that you had of the present special system of educating the blind?—Only on the knowledge of an ordinary amateur visiting such institutions, no better knowledge.

20,981. Would your opinion be at all modified if you were told that children now can be very readily taught to read and write at home in the hours during which they are not in attendance at school?—Of the two alternative schemes I infinitely prefer, as I have repeatedly said, the institution system. At the same time, the more that blind children or deaf and dumb children can be taught, as you describe, the less objection there could possibly be entertained to the casual attendance of such children at ordinary national schools.

20,982. Do you think that if a blind child could attend the national school of its village for some three or four years, so as to learn reading, writing, and arithmetic, and the elements of geography, and so on, it would be in a better position to go to an institution than if it had not had the advantage of that training along with seeing children?—I think that such a child would go to an institution infinitely better prepared to derive the higher advantages of the institution than if he had not had the advantage of that training. I think if such preliminary education as you are pointing at could possibly be given to a blind child in an ordinary national school for a certain number of years, that child, when it went to an institution, would very likely master all that the institution would teach him in a much shorter time than if he had not had that preliminary training.

20,983. You say, from what you know, that the contact of a blind child with seeing children would be an advantage to it?—I do think it would; it would be a great advantage. But its general education, as I have already ventured to surmise, would proceed more satisfactorily in an institution with children of its own class.

20,984. (*Chairman.*) As I understand, to carry out your views the law would have to be altered in several important particulars?—I daresay.

20,985. And you think there would be no difficulty in getting the law altered in the direction you mention?—Your lordship would be a much better judge as to that than I can possibly be.

20,986. This is a question outside political questions, as I understand, and you think in dealing with the question no religious difficulty would be raised at all?—I think there would be no religious difficulty at all. On the contrary, I am quite sure that the Catholics would support the policy which I have suggested, and I know from a visit that I paid a few days ago to the Protestant institution for the deaf and dumb in my own village, Glasnevin, that the Protestants are most eager that the State should come to their help.

20,987. You have these private institutions now existing requiring the assistance of the State, and, as I understand, they would welcome any alteration of the law which would do two things, first, which would make it compulsory upon the guardians to send to institutions these afflicted children with or without the consent of the parents, and, secondly, which made the charge for such children not a union charge but a national charge?—I put that last proposition, the national rate, as an alternative for easing the burthen upon the guardians.

20,988. The other alternative being three-fourths national and one-fourth local?—Three-fourths Imperial and one-fourth local, and as I have just observed, I thought that the local contribution might be made a national rate, so as to minimise any difficulties that might have to be encountered owing to the stinginess of guardians in sending pupils forward to institutions; and I said that I thought that that national rate, as in the case of the cattle plague, might be very easily collected.

20,989. When we were in Ireland we were told that the existing rate was so high in some of these unions that they were unwilling to add to it by such a charge as this?—The remedy for that would be to make the rate a national rate, as was the case, as I have just said, at the time of the cattle plague.

20,990. Are these private institutions now inspected by your inspectors?—No.

20,991. Then the next step would be that these institutions receiving national aid would require to be inspected by national inspectors?—They should be under some Government authority, and I venture to suggest that they might possibly be placed under our board.

20,992. Then what power would you give to these inspectors, would you give them power to make certain requirements either as to the cost of education or as to the proper appliances to be used or as to carrying out proper sanitary arrangements?—I would give them plenary power as inspectors.

20,993. Of reporting and suggesting alterations?—Yes, of requiring, by representations in their reports to the board of National Education, everything necessary to be attended to, as is done in the case of all the schools which we have under our control.

20,994. When you were speaking of three-fourths being contributed by a national rate and one-fourth by the poor rate, were you speaking of the whole cost of maintenance or were you speaking of the proportion usually paid by the guardians to supplement what is given by voluntary subscriptions?—I was speaking of the total cost, precisely as is done in the case of a training college in England, Ireland, or Scotland. I would propose that three-fourths of the total cost of maintenance, education, housing, and everything should be borne by the Imperial Exchequer and one-fourth by the guardians. Then, of course, if any such legislation were attempted it would be very proper, as is the case in the training colleges, to fix a limit to the possible maximum to be spent.

Rt. Hon. Sir P. J. Keenan, P.C., K.C.M.G., C.B.

12 June 1888.

20,995. That leads me to this; you say you would have free trade in systems and you would give grants according to the expense of the maintenance and the education. The expense of education and maintenance on the oral system would probably be half as much again as on the sign and manual system; of course you would recommend that the grant should be half as much again on the one system as on the other?—I was not aware of that, but I would say that if a certain system commanded a large measure of undoubted public recognition its expensiveness ought not to bar its operation. As I observed before, a limit, however, should be placed on the expense; there should be some maximum of expense. In the case of the training colleges the three-fourths which the Education Department in England and the Commissioners of National Education in Ireland give to the training colleges for the year is not to exceed 50*l.* for a master and 35*l.* for a mistress.

20,996. I think you stated that there are a large number of these uneducated deaf and dumb children scattered over Ireland. We find that the institutions in Ireland are grouped in two centres, the Protestant in Belfast and the Roman Catholic, with some trifling exceptions in Dublin and Cork leaving a very large portion of Ireland a considerable distance from those institutions. Do you think that is a weak point in the institutions in Ireland?—I think not; railway communication is now universal, and the one trip that a child would have to make to go to the school, and then the trip going back, would not cost much. I do not think it any hindrance to the success of the system of institutions that they should be chiefly in Belfast, Cork, and Dublin; on the contrary, I think they are all the better for being placed in those towns inasmuch, as they can command better teachers, and better appliances, and better markets, and all that.

20,997. Do the guardians themselves inspect the pupils in the institutions for whom they pay?—I could not answer that question. I apprehend that they do not, for, as a rule, they do not inspect the schools within their own workhouses.

20,998. It has been contended in England that the institutions to which deaf and dumb and blind children might be sent by guardians should not be all in London; that they should be in different parts of England, because it is a long distance for the guardians to come up and inspect the children?—I do not think there would be any difficulty, because there is railway communication to all parts. The four training colleges of Ireland are all in Dublin.

20,999. (*Mr. Johnson.*) Are they under the same inspection as training colleges in England?—They are under the inspection of a head inspector and a district inspector.

21,000. (*Chairman.*) You said you were familiar with the education given in Ireland to imbeciles, though you were not prepared to make any special statement about it; there is only one institution for imbeciles, the one at Dublin?—There is only one that I know of. I am sorry to say I have never visited it, and I cannot give you any information about it.

21,001. In so far as imbeciles were capable of instruction you would apply the same principle as to compulsion to them that you would apply in the case of the other classes we have been talking about?—Certainly.

21,002. Are they under the same law as deaf and dumb and blind children; can the guardians send imbecile children in the same way to institutions?—I cannot say whether they can, supposing them not to be deaf and dumb or blind.

21,003. You would apply the same principle to them as you would in the case of the deaf and dumb and the blind?—Clearly so.

21,004. (*Sir Tindal Robertson.*) In the scheme which I understand you to advocate, you contemplate that three-fourths of the cost of the maintenance and education of the child should come from the Imperial revenue, and the other one-fourth from the guardians; would you exclude private contributions or contributions by the parents in your scheme?—I think I should exclude them. If the child is the child of a gentleman that gentleman can provide for it; if the child is the child of a person of the poor class, I think it a matter of national importance that for numerous cogent reasons, the State should take care of it and educate it, and I should therefore propose that three-fourths of the cost of its education and maintenance in an institution should come from the State, and one-fourth from the rates.

21,005. With regard to another point you said you thought it would be necessary to have denominational institutions, I did not catch what reason you gave for that?—I have already said that inasmuch as an institution is necessarily like a home where people live, eat, and drink, and mix together from morning to night, identity of religious belief must be recognised as a natural basis in the organisation of such an institution.

21,006. Would not the providing of separate institutions for Protestants and Catholics tend to accentuate religious differences?—I can only repeat that it seems to me a matter of necessity that where you have a domestic establishment you must have an identity of religion amongst its inmates.

The witness withdrew.

Dr. Francis Xavier Frederick MacCabe examined.

Dr. F. X. F. MacCabe.

21,007. (*Chairman.*) You are Medical Commissioner of the Local Government Board for Ireland?—I am.

21,008. And you were an inspector under the Irish Local Government Board for a considerable number of years, were you not?—For nine years.

21,009. You have also visited the imbeciles in Ireland under the Lunacy Acts?—I have not visited any of the institutions.

21,010. The only imbecile asylum is at Dublin, is it not?—There is only one that I am aware of in Ireland, and I have never seen that. My experience is of lunacy administration, and that asylum is not under the Lunacy Acts.

21,011. Under what administration is that institution?—It is not under the Local Government Board. It is a twofold institution. As to a small number of lunatics it is a private asylum, and is under the inspectors of lunatic asylums. As to the idiotic children I do not think it is subject to any inspection; it certainly is not under the Local Government Board.

21,012. So far as these imbecile children are capable of education and are educated there, you state that they are under no Government inspection whatever?—None.

21,013. Is it in your opinion a right state of things that the imbecile children should be under no inspection whatever?—I think it a very deplorable thing, so far as regards the immense number of imbecile children all through Ireland; but as regards that particular institution the number is very small, the average being about 70. It certainly is desirable that it should be inspected by some competent authority.

21,014. Have you, as the medical commissioner, visited the workhouses and the imbecile institutions, or inspected imbecile children, either in workhouses or elsewhere, officially?—I should explain that the medical commissioner of the Local Government Board does not visit institutions; but in my past experience as an inspector under that Board I did visit a very large number of the workhouses in Ireland; in fact I may say most of the principal workhouses; and there it

was part of my duty to see any imbecile children that happened to be contained in them.

21,015. What was their condition generally when you visited them?—There was no particular provision made for their training.

21,016. I presume that you are aware that imbecile children are trained in other countries, and in England?—Yes, I am aware of that.

21,017. But with the exception of the Stewart Asylum we found no provision for them in Ireland?—There is no other provision; there is no special training.

21,018. As an inspector under the Irish Local Government Board, did you ever bring that which you admit to be the want of such educational inspection to the notice of the Board?—It is a subject which has been spoken of, but I have not officially brought it under the notice of the Board, because the feeling of the Board and of the inspectors was pretty well known. The imbecile children are scattered through the 161 workhouses of Ireland. In each workhouse they are in such small numbers that the Board never felt warranted in calling upon the guardians to make any special provision for them in any one workhouse.

21,019. Would not that rather point to the advantage of assembling those children in some well-managed institution where they could be cared for and, if possible, improved?—That would be very desirable.

21,020. Of course, the imbeciles are closely connected with the blind, deaf, and dumb; as you are aware several of the blind, and deaf and dumb are imbeciles?—Yes.

21,021. Can you tell us what are the provisions of the Irish Poor Law bearing upon those two classes, the blind and the deaf and dumb?—The legal enactments bearing upon the subject of the deaf and dumb and the blind are in the first place the 14th section of the 6 and 7 Vict. c. 92, an Act entitled the Irish Poor Law Amendment Act, 1843. That Act provides that the guardians of any union may send any destitute poor deaf and dumb or blind child under the age of 18 to any institution for the maintenance of the deaf and dumb or blind, which may be approved of by the commissioners with the consent of the parents or guardians of such child, and may pay for the expense of its maintenance there out of the rates raised under the authority of the 1 and 2 Vict. c. 56. Next to that there is an enactment of the 39 and 40 Vict. c. 50, which is called the Poor Law Rating (Ireland) Act, 1876; and that Act by its 4th section provides that the expenses incurred in the relief of the deaf and dumb and blind, whether relieved in the workhouse or in an asylum shall be borne by and charged against the whole union. Next to that there is the 41 and 42 Vict. c. 60, which is entitled the Poor Afflicted Persons Relief (Ireland) Act, 1878. The 3rd section of that Act removes the restriction as to age prescribed in the first recited Act as regards the blind and the deaf and dumb, provided for by the guardians in any special institutions, and while giving the guardians power to pay for such persons it provides that the weekly payment in each case shall not exceed 5*s.* That Act makes a further provision which has been availed of to a very small extent. The 4th section of it provides, that the guardians of any union may, with the consent of the Local Government Board for Ireland, send any idiotic or imbecile pauper to the workhouse of any other union with the consent of the guardians of such last-mentioned union, or may with the consent of the Board contract for the reception, maintenance, and support of any idiotic or imbecile pauper in any public or licensed asylum or establishment for the reception and relief of idiots or imbeciles, and pay out of the rates the cost of maintenance, clothing, and lodging of such pauper, in such workhouse, asylum or establishment, as well as the cost of his conveyance thereto, or his removal therefrom, and the expenses of his burial when necessary, provided that the amount to be paid by the guardians of such union for the maintenance of every such idiotic or imbecile pauper shall not exceed the sum of 5*s.* weekly.' That provision practically gives power to guardians, either to arrange that some one workhouse shall receive the idotic and imbecile children of a county, or several counties, or of a province, or that they shall send them to a special establishment. But with regard to the sending of them to a special establishment the proviso that the cost shall not exceed 5*s.* weekly practically makes it impossible to get any institution to take them. The Commission I am sure are aware that imbecile children constitute a class that require a great deal of care and trouble, and attention; it involves an expensive staff and a great deal of outlay if they are to be properly looked after, and if they are to be educated in such ordinary matters as personal cleanliness, tidy habits and neatness; and it could not be undertaken at a cost of 5*s.* per head weekly. The one institution that we have in Ireland for those children is the Stewart Institution for imbecile children, to which your Lordship has just referred. In a return up to the 31st of March which I obtained from the secretary, he states, that although their average number is about 70, on the day that I happened to ask for the return, the 31st of March, they only had 59 inmates; and of those 59 inmates there were only nine imbecile children from the whole of the workhouses in Ireland.

Dr. F. X. F. MacCabe.

12 June 1888.

21,022. Therefore, practically, that provision is almost a dead letter?—Quite. The restriction of the payment to 5*s.* per head, which is 13*l.* a year, puts it quite out of the question for any institution to be established for the reception of those children.

21,023. With regard first of all to the deaf and dumb and blind, do you think that there should be any alteration of the law which would alter the word "may" into "shall"?—The alteration of the word "may" into "shall" would really be a very important change. It would do away with all the option on the part of the guardians. It would render the exercise of the powers vested in them by the first Act which I quoted compulsory, as I understand it.

21,024. It would make it compulsory, but it would not be compulsory in the sense in which it is compulsory in England unless the words were further altered "with" or without the consent of the parents?—I think that is one of the three questions that the Royal Commissioner addressed to the Local Government Board.

21,025. We wish to know what their opinion is; first of all whether the word "shall" should be substituted for the word "may," and also whether the consent of the parents and guardians should not be required which would make it as compulsory as the law for general education in England?—In answering that question I should wish it to be understood that I am not speaking for the Board of which I am a member, because the Board as a Board has not considered the question. The Local Government Board for Ireland consists of five members. The Chief Secretary for the time being is the President; next to him is the Vice-President, Sir Henry Robinson; next in official rank is the Under-Secretary to the Lord Lieutenant for the time being. There is further a Commissioner in Dublin, Mr. Morris; and there is the Medical Commissioner.

21,026. Since the appointment of this Commission two years ago the Board has never taken the matter into consideration?—The Board has not considered it as a board; but I am prepared to give my own view, and I think I may venture to add that it is concurred in by those members of the Board whom I have had an opportunity of consulting. The view is this: I am of opinion that to render compulsory the payment by guardians for the maintenance of children in special institutions is not necessary or advisable. I do not consider it necessary, because boards of guardians as a rule have not shown any disinclination to take advantage of the provisions of the existing enactments upon the subject.

21,027. Is that so; because we have had evidence to the contrary?—That certainly is borne out in the

Dr. F. X. F. MacCabe.

12 June 1888.

strongest possible manner by my own personal experience. I have acted as inspector in some of the largest unions, and I have found the guardians not only willing, but anxious to strain the law so as to admit cases to the workhouse with a view of transferring them to special institutions, which if they had been actuated by an illiberal feeling they certainly need not have taken in. To continue my answer, there are at present about 750 blind and deaf mutes supported in special institutions at the cost of the poor rates. You will find that number in these returns.

21,028. What is the whole number of deaf and dumb and blind of educable age, that is from 5 to 15 years of age?—I am dealing with the deaf and dumb and blind from the Poor Law Ireland administration point of view. I think I can give you the number according to the census, but I can only answer for my own number. What I have stated to the Commission is that there are at present about 750 blind and deaf mutes supported in special institutions at the cost of the poor rate; and although a considerable number of persons so afflicted remain in workhouses the majority do not appear to be fit subjects for special institutions, either by reason of some additional mental or bodily defects, or from being apparently incapable of deriving any benefit from the special instruction or treatment afforded in such institutions. If special asylums existed for the reception and treatment of imbecile children it is probable that a large proportion of the children coming under the description of blind and deaf mutes, not considered fit for blind or deaf and dumb institutions, would be found proper subjects for idiot asylums.

21,029. But there are no such institutions in Ireland?—There are not.

21,030. That is a want, is it not?—That is a very grievous want, which I shall be prepared to give further evidence upon presently.

21,031. You say that you look upon the deaf and dumb and blind entirely from the Local Government point of view; that is to say, so far as they would come under the view of the guardians from applications made by the parents for assistance to them as paupers or as poor?—Yes, I am giving the facts precisely on those points, but I give my opinion upon others.

21,032. Is it the case as was stated by the last witness, that there is a large number of deaf and and dumb children of whom the board of guardians take no notice whatever and who receive no education whatever?—There undoubtedly must be a very large number of deaf and dumb persons who are at large as it were.

21,033. I mean of educable age and not being educated?—So far as I am aware, according to the census returns of 1881, there are in Ireland, 3,845 deaf mutes, and of those 771 are between the ages of 5 and 15.

21,034. (*The Rev. Mr. Owen.*) Is it not 1,200?—I think that is a mistake; I think that in taking the figures you take those who are mute, but not deaf. They are bracketed, but I think those would come under the head of imbeciles. Under the census returns you will find that the number of true deaf mutes from 5 to 15 years of age is 771. Out of that number I can account, under the Poor Law administration, for 613; that is to say, if you would like the precise figures, there are relieved in workhouses 169, in special institutions 401, and at their own houses receiving outdoor relief 43. I will put in, for the use of the Commissioners, these figures when I have dealt with some other points connected with them.

21,035. (*Chairman.*) Then do you think that there is only a limited number of deaf and dumb of whatever class who are not educated in Ireland?—There are I am afraid a very large number.

21,036. Then there must be more than 771 altogether?—Yes, that is only between the ages of 5 and 15. That is what you might consider an age when they would be susceptible of some training. But beyond that age there must be over 3,000 of them. It is right that the Commission should understand that into some of the large institutions in Ireland, like Cabra, where they receive deaf and dumb children from the guardians, there is a constant inflowing stream of untrained children sent by the guardians, and every year there is an outflowing stream of those who have been trained by them, and who go back to their families. In the census returns the enumerators count the trained and the untrained, and they do not give us any distinction under the head of deaf and dumb as between the educated and the uneducated, although I do find that distinction made under the head of blind. I know from my own personal experience, occasionally meeting with young women deaf mutes, of adult age, and asking why they have not been sent to an institution and regretting that they had not, that the number must be large.

21,037. I do not quite see how there can be a very large number uneducated, if you count these 613 out of 771; and besides that, of course there must be a certain number in institutions whom you cannot count as being assisted by the Poor Law, and therefore of course they would be in addition to the 613 under Poor Law administration?—When I give the number in workhouses and institutions, and assisted by outdoor relief, of course those are received through the Poor Law.

21,038. But you cannot tell us the number between those ages who are not in an institution, and who are not receiving any instruction?—I cannot; I have not got the data for that.

21,039. Of course, if anybody ought to have it the Local Government Board in Ireland ought to have it. It is desirable, is it not, that the Local Government Board should be in possession of those facts?—That is a question for the enumerators under the census.

21,040. But who conducts the census?—That is under the Registrar General for Ireland; we have nothing to say to that; we only take cognizance of statistics so far as they affect the poor rate.

21,041. But has there been no communication between the Local Government Board and the Registrar General for Ireland, as to the desirability of ascertaining these facts, because this has been going on for decade after decade?—It does not come within our province.

21,042. You say that, in your opinion, and in the opinion of your Board, there is no necessity for making it compulsory upon the guardians to send those deaf and dumb or blind children to institutions, and pay for their maintenance. We have had evidence at the institutions themselves, that many of these guardians do not pay anything, and that in cases where they did pay, they have of late years withdrawn their support from the institutions, as the guardians said they could not afford to go on paying; has that never been brought to your notice?—No, that has never come officially before me.

21,043. And the ground was to a very great extent that the rates were so high that they could not afford to continue paying for the children at the institutions?—I think that return that we made to the Commissioners shows after all that the guardians have not been wanting in their duty with regard to either blind or deaf mutes at an educable age. We can account for almost every one of these children that are returned as either deaf mutes or blind between the ages of 5 and 15; and I think that if the numbers are looked at, it will be found that the guardians do send a large proportion of them to special institutions.

21,044. It was stated before us at Merrion that two girls sent by the Castleblaney Union were withdrawn by the union from this very institution, as the guardians could not afford to go on paying. The Scariff Union for five years never paid anything for four cases sent by them. Those are two specimen cases, and we have several other cases in which the guardians have paid for a time and have then refused to pay?—Those returns with which we furnished the Commission were made up to the 13th of November last. In the Castleblaney Union I find that there were one male and two female deaf mutes between the ages of 5 and 15, and that all three of those were in special institutions.

Dr. F. X. F. MacCabe.

12 June 1888.

21,045. But those that I have mentioned to you at Scariff and at Castleblaney were blind children?—In Castleblaney there were one male and two female blind children between the ages of 5 and 15, all three supported in special schools, by the guardians. Scariff I know is a very poor union; it has been in very great financial difficulties.

21,046. This statement is for five years, and it does not say in what year it was, but that is the statement that was made to us. It is quite possible that if the Scariff Union sent these cases to an institution they would put them down as having sent them there, whether they paid for them or not?—Yes, they have returned them to us at all events as being in special institutions, and it is to be presumed that they paid for them, they ought to have paid for them, but that I cannot answer for. That is a matter that the managers of Merrion would be competent to speak about. That only points to what I was mentioning to the Commission as the result of my own experience; that certainly I find no unwillingness on the part of the guardians to send either deaf and dumb or blind children to the special institutions. It has been quite the opposite; I have known them strain a point in order to get them in for the purpose of transferring them.

21,047. Supposing that from the pressure of the rates they have been unable of late years to send them to such special institutions, do you think it would be desirable that the grant from the State should be larger, and that a larger proportion should be paid by the State than by the local authority, or that there should be any revision of the terms?—I should very cordially go with the Commission in that. I think the deaf and dumb, the blind and the imbecile, possess the strongest possible claim to some State aid, and there I should go the whole way. The only thing is that I think it would be right and an immense advantage that any State aid that is given should be given, not to the special institutions, but to the guardians.

21,048. How would that work?—It would work just the same. The deaf and dumb, the blind and the imbecile, are set apart by nature, and exceptionally handicapped in the race of life, and I think it would be quite fair to extend to them a principle which has already been recognised and acted upon in respect of the lunatic poor, and the sick poor, and I do not see why those who suffer from a permanent disability should not also be assisted. The reason why I would rather have it done through the guardians is this: that deaf-mutism, blindness, imbecility, and epilepsy, are all very frequently congenitally associated, and it is very difficult to say with regard to a deaf and dumb child whether it is suitable for an institution until it is sent there. If you give the grant to the guardians and the child is sent back as being unteachable, or as being subject to epileptic seizures, and unfit to be kept at the institution, if the rate were given into the guardians' hands, I think the Local Government Board then might take some steps to move guardians to set apart some one institution among the workhouses of Ireland where a good training staff might be established, and to which all these little children might be drafted, and even if you do not do that, by giving the grant to the guardians, you would enable the guardians to make better provision in their own workhouses for this class, if they found that they were returned on their hands from institutions. But if you give it to the managers the managers will pick the most teachable and improvable, and those are not the most to be pitied: it is often the least improvable that are the most to be pitied and taken care of. If you give the grant to the guardians it will be better spent, and I think that it would be a great blessing to those classes, and that the guardians, so far as I know them, would be worthy of the trust and would do their best.

21,049. But over and above that, do you not want something more to enable the guardians to seek out those cases of the deaf and dumb and blind who are not receiving any education, from the neglect of their parents?—I think so. If the State made a grant towards the education, the training, or the better treatment as circumstances might require of those children, then the relieving officers in the different unions would make a return to the guardians of all the cases. That is a matter that could be very easily arranged.

21,050. But unless there were some definite power or understanding that the money should be devoted to the improvement of the condition of those classes, supposing that they were not able to get into institutions, the object aimed at would not be attained, would it, and that could only be done by a proper system of inspection?—Certainly.

21,051. It is your opinion that the guardians, supposing that they get a grant, must be moved to do that which is right and proper for these classes under Government inspection?—Certainly, and we have the machinery for that inspection.

21,052. And that would be under the Local Government Board?—It would be under the Local Government Board, unquestionably.

21,053. Do you think it desirable that these classes, both the deaf and dumb and blind, should be kept longer at school than the ordinary school age, for the purpose of giving them such industrial or technical training as may enable them to be better prepared to earn their own livelihood in after-life?—That is my opinion; and you will have observed that the restriction as to age has been removed, and that the age has been raised to 18.

21,054. Has that relaxation been acted upon to any extent?—It has, but the restriction as to the payment ought to be removed from that Act, 5*s.* is the maximum; it is most important that that restriction should be removed, because practically, at the present time, I hope the Commission quite clearly understand that as regards Ireland up to the age of 18 the guardians can pay anything they like; it is only when a child comes to the age of 18 that they cannot exceed 5*s.* So that it appears to have been an oversight to have removed the restriction as to age, and to have left the restriction as to payment. The restriction as to payment ought to be swept away, because the payment ought to be proportioned to whatever is the amount that the Government will allow per head. If the Government allow so much per head let the guardians allow something more.

21,055. Would you say that there should be any rule that the guardians should find one proportion, and that the State by grant, or in any other way, should find the other proportion in the case of these poor children?—I am not prepared to say what is the best proportion. I think that is a detail which might be left till afterwards for consideration and consultation with the Local Government Board, because it is a difficult matter, and there are a good many considerations involved. I could only say as a sort of guide that in Ireland a capitation allowance is made by the State of 4*s.* per head per week for every pauper lunatic.

21,056. That would not go far, would it, towards the maintenance and education of this class?—No, for this special class who require training that would not, I think, be enough.

21,057. At present the Local Government Board does not inspect these private institutions?—No.

21,058. But does it license them?—The Local Government Board in Ireland have nothing at all to say to lunatic asylums.

21,059. I am talking of those institutions for the deaf and dumb and the blind?—We have nothing to say to them. They are not supported out of the poor rate, although children are sent in by the guardians and paid for out of the rates; and they are not inspected by any public officer.

Dr. F. X. F. MacCabe.

12 June 1888.

21,060. Are the houses certified?—No, they are not certified or inspected in any way.

21,061. There are a considerable number of adult deaf and dumb and blind in workhouses; can you tell us how they are treated; are they treated any better in consideration of their affliction than an ordinary pauper, or relatively worse, because they require more and are given less?—They are placed on exactly the same footing as to dietary, clothing, and lodging as any ordinary pauper. In practice I know there are some little indulgences that they are allowed, but it is contrary to the regulations.

21,062. Do they get better fare?—They do not. With regard to the food, if they are able-bodied they are on exactly the same footing as the other paupers. The only thing is that in the wards which there are for the blind they are allowed a little tobacco, or a little snuff, or something of that kind; the medical officer generally sanctions some little thing of that kind. Of course, if the medical officer thought that their infirmity required any improvement in the dietary, he has absolute power to order anything he likes; but, in practice, I find that they are treated exactly the same as the ordinary able-bodied inmates.

21,063. Do you think that the blind, especially who after a certain time of life are not able to do much for themselves, should be treated in a more liberal way by the poor law than they are at present?—I have always thought that the blind should be treated with very great liberality, on account of the terrible misfortune under which they suffer; and I think it is a deplorable thing that when young they are not trained in some industrial pursuit, because nothing would add so much to their happiness as giving them an occupation.

21,064. Then the blind in workhouses are not at all classified, but are just put into the ordinary wards with the other inmates?—That is so, except that they are always classed with the infirm. Our classification is able-bodied, infirm, sick, and then under a certain age. I understand you to speak now of the adult blind. They are always put in with the infirm, and not classed with the able-bodied, amongst whom they might be knocked about or badly treated.

21,065. The deaf and dumb, if they are infirm, of course are treated in the same way?—The deaf and dumb are generally treated with rather more indulgence, I find, because my experience is that in all the workhouses where I have met with a few adult deaf and dumb they were generally employed in the sick wards as nurses. They make very good nurses; they are very quiet, and they can see what they are doing, and they get the extra allowance, what is called a ward allowance, so that they are slightly better off.

21,066. They would be employed also, I suppose, for house work?—Always; they are employed principally in cleaning the wards and in looking after the sick wards.

21,067. Is the out-door relief of the blind and of the deaf and dumb liberal in Ireland?—It is liberal, because although we have no law of settlement at all in Ireland, we have a law of electoral division chargeability; and, inasmuch as the blind are made a union-at-large charge, no guardian ever objects to them getting liberal out-door relief, because it is a charge upon the whole union. Therefore, no guardian of an electoral division feels that he has any personal reason for opposing it.

24,068. Do you think that that system works well?—I think it is a very good system, and it is a recognition of the fact that, although they are a charge, they are an unavoidable charge.

21,068. What is the usual out-door relief that is given to the blind?—It varies very much in different parts of the country and according to the circumstances of the recipient; but it is anything between 1*s.* (confining myself to classes such as the blind) and 3*s.* per week per head. Of course, the guardians often allow more in the way of out-door relief in cases of acute illness or accident; but I am speaking now of what they would treat as a permanent charge.

21,070. Have you now much granular ophthalmia in workhouses in Ireland?—During the nine years that I was an inspector I never saw any ophthalmia amongst the children in workhouses.

21,071. I am speaking of adults?—Very little; that belonged to a past condition altogether.

21,072. We heard a good deal about it at Cork, and saw it to a certain extent?—I was going to mention that I had charge of the Cork district for some years, and the only case that I know of an outbreak of ophthalmia in an Irish workhouse is the very case which has just been referred to at Cork within the last two years. That was manifestly due to overcrowding in the wards, and to some other conditions that were of a temporary character. Dr. O'Farrell wrote a very able report upon that.

21,073. We were told, and I suppose you are able to confirm it, that it rises very much from a low state of health and unsanitary conditions in the house?—Certainly; principally from over crowding and want of care about the lavatory arrangements. Dr. O'Farrell points out that the contagious form of ophthalmia was brought into the workhouse by the children coming in. His report is altogether upon an outbreak amongst the children; it was confined to children in that case.

21,074. It was not so at Cork when we were there; there were some grown up people who had it?—I have seen no ophthalmia in the workhouses, although I have visited a great number of public institutions in Ireland. The workhouses are not now crowded as they were soon after the famine year when all the wards were overcrowded, and the conditions do not exist in the workhouses that would be favourable to the extension of that contagious form of ophthalmia. I should look upon it as so serious a matter that if there was an outbreak of contagious ophthalmia in a workhouse the Local Government Board would at once send an inspector down to make a special report upon the subject.

21,075. Have they had any special report with regard to Cork?—Yes, in consequence of the instructions of the Local Government Board a report was made by Dr. O'Farrell, who was the medical inspector in charge of that province. The Local Government Board for Ireland have certainly taken a great deal of trouble with regard to all kinds of infectious disease, such as ophthalmia. The Commission are no doubt well aware that a great number of infants are placed in conditions at all events which lead to the loss of their sight owing to the want of care at birth.

21,076. You are speaking now of the purulent ophthalmia of infants?—Yes, upon that subject I was asked a question, and I can assure the Commission that we issue circulars to every medical officer in Ireland, and to every midwife in Ireland.

21,077. Are the midwives certified in Ireland?—We have midwives, but they are not necessarily certified, though as a rule they are. It is quite an exception for us to have midwives who do not hold a certificate from a lying-in institution; but in a few cases where they are not certified, they are specially examined by a medical officer, and he has to certify to us in writing that he considers the woman fit to discharge the duties. I should like to put in the circulars which are issued to the medical officers.

21,078. Have those instructions been in practice for some time so as to have had an effect in Ireland already?—I think that circular is dated 1884, and I do not think there was any formal printed circular issued to midwives before that time.

21,079. I suppose it has hardly been long enough in operation to have had a sensible effect in diminishing blindness?—So far as my general knowledge goes, I do not myself think that much of the blindness amongst our poor is to be attributed to that cause. I do not think the ophthalmia is often of so grave a character as to cause blindness. There must be a specific discharge of a peculiar character to bring about the destruction of vision in these cases of new-born children, and these forms of disease are not at all common amongst our poor people.

Dr. F. X. F. MacCabe.

12 June 1888.

21,080. Is there a tendency in Ireland for the blind to prefer to receive outdoor relief, and to object to going into the workhouse, as a rule?—They always prefer outdoor relief.

21,081. Are the blind in any way forced into the workhouses by the action of the guardians, or is outdoor relief always given to them where they wish it?—Where the blind have got any decent home, and are well conducted, the guardians are willing to give them outdoor relief; but (I think very properly) they do not give outdoor relief if the blind people are doing what is a very common thing in Ireland, going about the country begging; then the guardians try to force them into the workhouse, and I think quite rightly.

21,082. There is no power to several unions to combine together to establish anything like a home for the blind?—That has never been done, and it is rather doubtful whether the present state of the law would admit of it.

21,083. Is there no power for unions to combine together for any purpose?—They can combine for educational purposes, for instance.

21,084. Can they not combine for lunacy purposes?—They cannot; at least they have not done so. But one of the recent Lunacy Acts gave power to the guardians of a union to come to an arrangement with the governors of a county asylum to take from them harmless and incurable lunatics, with a view of saving the counties from increasing the size of the district asylums for the mere retention of incurables. There is such a power as that between guardians and governors of asylums, and it has been exercised in two cases; but there is no power that I am aware of to combine for the other purposes, although it is very questionable whether under the 7th section of the Irish Poor Relief Further Amendment Act of 1862, it might not be done. That is the section that gives power to guardians to send any inmates for special treatment to extern hospitals. I think it might be possible under that section for the guardians of a particular workhouse to make special arrangements, for instance, for the training and treatment of blind and imbecile children, or for the matter of that even of deaf mutes, and that then the guardians of other unions might send their cases of that kind to that particular workhouse as to a special institution. The only doubt that one has is whether the guardians of the institution so chosen would have a legal power to receive those cases; but I do not think that is a difficulty that need be insurmountable. The key to the whole position with regard to that would be to give those classes some State aid. That would be a great encouragement to the guardians to combine, in order to make arrangements for them. Both with regard to the deaf mutes and the blind, and particularly with regard to the unfortunate imbecile children, they are scattered all through these unions in such small numbers that it would not pay to make arrangements for them. If they were collected in one house it would pay; you could provide a staff then, and the staff could devote itself to all of them.

21,085. Of course, as long as the institutions could take the children in there would be no difficulty; but I am contemplating the possibility of certain children from various parts of Ireland not being able to be admitted owing to the institutions being full; ought there not to be some alternative power on the part of the guardians to set up for themselves what private institutions do not do for them?—I think that would be most important, because if all the institutions for the blind for instance in Ireland were filled they could only take 900, and there are over 6,000 blind in Ireland, and of those 6,000, 2,894 are uneducated, so that we have only special institution accommodation for 900, and it would be absolutely necessary, if justice were to be done to the blind, to have some special institutions for them that would be supported in that way by capitation grants, and by the contributions of the various unions who would send blind subjects to them.

21,086. We found that everything in Ireland centred round Dublin, Belfast and, to a limited degree, Cork; do you think that if the guardians had that power they would still build their new institutions in the large towns, or would it be likely that they would bring the institutions more to the people, say in the west of Ireland?—I think that the west of Ireland is the place where the greatest advantage would be felt from having a workhouse set apart for this class. Of course, in the large centres of population, they will always give the preference to nicely equipped institutions like those which the Commission have seen in Dublin and Belfast; but in the west of Ireland I think if there was a workhouse set apart and there were proper appliances for industrial training and for technical teaching it would be an advantage.

21,087. You think there is a want for some institutions for training those classes, say in the west of Ireland?—I think there is a very great want.

21,088. But you say that the law is not quite clear as to the power of the guardians on that point?—It is not perfectly clear, and I think it would require to be made quite clear that the guardians could set apart one workhouse, and that the other guardians could send to it and pay. It would be very simple, because it would only require a clause to be inserted in any Bill for dealing with this subject, saying that, for the purpose of technically training and educating the deaf-mutes and the blind, any workhouse provided with such staff and appliances as the Local Government Board may approve shall be deemed to be a special institution within the meaning of the 7th section of that Act. You could provide for it in that way.

21,089. (*Mr. St. John Ackers.*) Are there any other points in which you would desire the law altered other than those which you have already mentioned to Lord Egerton?—Yes, there is one matter that I should be very anxious to see an alteration in, and that is with regard to the imbecile children. Some of them may be deaf; some of them may be dumb, or deaf and dumb; some of them may be blind. But the principal characteristic of their congenital infirmity is deficient intellectual development; and I think that with regard to those children it is very important that they should be treated as *non compos mentis*, and that they should be looked after. I think that the provision that was contained in a Bill that was drafted some years ago called the Lunatic Poor (Ireland) Bill, and was read a first time in the House of Lords, ought to be embodied in any enactment with regard to these helpless classes.

21,090. Would you read the special provision to which you refer?—This was a Bill to amend the law affecting lunacy in Ireland. I am under the impression that in Scotland imbecile children are registered as lunatics, and that they are looked after, inspected and classified, and that those that are found to be teachable are sent to institutions for their training, and that those that are found not to be susceptible of education are looked after periodically by the overseers of the poor in Scotland. This Bill contemplated something of the same kind with regard to Ireland. It placed upon relieving officers in their districts the duties of looking after any imbecile, or reputed idiots, and reporting to the guardians whether they were well treated at home, and where they were not well treated it gave the guardians the power to take them into the workhouse. I think that is a very important matter; it would lead to all the imbeciles being registered, and I think they ought to be periodically visited and classified.

21,091. Would you extend that same power of the relieving officer to the blind and the deaf, who are wholly uneducated at the present time?—Yes, I should be disposed to do so.

Dr. F. X. F. MacCabe.

12 June 1888.

21,092. By that means you think you would be able to get an accurate return of all the defective classes?—Quite so.

21,093. Is there any other point that you would desire to press upon the Commission with regard to the alteration of the law?—I am particularly anxious that the restriction as to the sum to be paid by the guardians should be removed. That I have already mentioned.

21,094. Are you in favour of the amount which would, either under present law, or under any alterations of the law, such as you have proposed be paid by the guardians, being paid out of a union rate, or out of a national rate, over the whole of Ireland for the defective classes?—I think that a union rate would be better.

21,095. Why would you prefer the union rate to the general rate?—At one time I was rather disposed to be in favour of a national rate; but those who had much longer experience than I are very averse to seeing that principle ever again introduced. They tell me that it was very much abused when rates in aid, which were really national rates, were in use, and they think it better to retain the union as the area for rating purposes.

21,096. With regard to the causes and the prevention of infantile ophthalmia, what steps does the Local Government Board take to bring to the notice of those who are responsible for the management, those different circulars which are sent out?—The circular giving instructions as to the simple steps to be taken to prevent ophthalmia is sent to every midwife and to every medical officer practising in Ireland under the Poor Law.

21,097. And you think that is sufficient; would you desire that it should be circulated in schools, or in any other way made public for the parents to see?—I think the more that information could be diffused the better for all concerned.

21,098. In fact, if the Local Government Board for Ireland and the Board of National Education would work together in the matter, you would advise that these circulars should be made a wider use of?—Certainly.

21,099. What power has the Local Government Board over midwives and Poor Law doctors who neglect these instructions?—The Local Government Board for Ireland has the power for sufficient reason under the Medical Charities to remove any medical officer. Of course, with regard to a thing of that kind, it is an almost impossible supposition, because every medical officer would cordially co-operate in carrying it out.

21,100. The evidence that was given to us in Ireland was, that not only in the centres of population, but in out-of the-way country places, both the doctors and the midwives did very greatly neglect the regulations laid down by the Local Government Board, and that a very considerable amount of infantile ophthalmia was the consequence?—I should accept that with great hesitation; it is quite opposed to my experience, and I think I can speak with more than usual authority upon that point, because I have been a dispensary medical officer myself, and I know the feeling of the profession in that grade.

21,101. Perhaps you are able to tell the Commission what is the proportionate decrease in infantile ophthalmia in the four years since these circulars were sent out; is there a perceptible decrease?—We have no returns of infantile ophthalmia.

21,102. Then there is nothing to prove at present that these circulars have been operative at all?—The statement has been made that infantile ophthalmia has contributed towards blindness, and therefore we have taken every means to prevent such a factor as that coming into operation; but we have no evidence, and we have no returns upon the matter.

21,103. (*Dr. M'Donnell.*) Could you find out about it?—That would be an impossible thing to do, because the Commission may not be aware of it, but there is a very great practical difference in Ireland in that branch of professional practice. In England it is a common thing for a medical officer under the Poor Law to have to attend women of the humbler class in their confinements. In Ireland, unless there is some difficulty, unless the circumstances are not of a perfectly natural character, the medical officer is never called in; it is the midwife, practically. So that I should hesitate very much to accept the statement that any of our medical officers had ever neglected a case. They are very rarely called in in rural practice to women in their confinements, unless operative interference is necessary, or deemed to be necessary by the midwife. It is the midwife who practically has it in her hands, and it is more important to instruct the midwife than anybody else in Ireland. It is not so in England.

21,104. (*Mr. St. John Ackers.*) What control has the Local Government Board over the midwife?—We remove her from the office by sealed order, if her conduct is unsatisfactory.

21,105. Who is to determine whether her conduct has been satisfactory or not?—If there is a complaint against her, the Local Government Board would direct one of their own inspectors to go down and hold an inquiry (upon oath) into her conduct.

21,106. But who makes the complaint in the first instance?—The medical officer, or perhaps more likely one of the clergymen of the district would complain to the Local Government Board; and then as the officer would be directly responsible, in the first instance, to the Dispensary Committee, we should send down a communication to the Dispensary Committee requesting their observations. They probably would return it to us saying that they had a bad opinion of the woman, or that they believed the charge to be well founded, and requesting us to hold an inquiry. If not they would say that they had great confidence in that particular officer. If the circumstances appeared *primâ facie* to demand it, we should send down an inspector who would hold an inquiry on oath; and, if he reported unfavourably, the report would come before the medical commissioner of the Local Government Board, and he would make a minute upon the papers directing an order to issue under seal to remove the woman from her office. Of course no order under seal is issued without consultation with his colleagues, because it would prevent that person from holding office again under the Poor Law.

21,107. (*Dr. M'Donnell.*) In order that the Commission may understand one or two points of some difference between England and Ireland, I wish to ask a few questions first of all. At present in Ireland the Lunacy Department, as I may call it, is not under your Board?—It is not in any way connected with it.

21,108. There are two inspectors of lunacy who are in fact free agents as regards the management of their own department, and who are not connected in any way directly with your Board?—That is so.

21,109. They are both no longer young?—That is so.

21,110. And it was contemplated, I believe, in this report which we have been alluding to, which is known as Major Trench's Report, and which was published in the year 1879, a very elaborate and full report, that in course of time the Lunacy Department and your Local Government Department should in fact be merged in one, and that the Lunacy Department should be made a branch of Local Government management in Ireland?—Yes, that was so.

21,111. I suppose there is no reasonable doubt that if a vacancy occurred now in the office of Inspector of Lunacy, any Government would probably undertake something of that kind?—It is desirable; I cannot say whether it is probable. We have the anomaly of two different authorities dealing with the same classes of people, and therefore it is very desirable that the two authorities should be merged in one.

21,112. However, it is probable and it is desirable, that if the opportunity occurred in the way I speak of, a change would be made merging the Lunacy Department in the Local Government Board of Ireland?—I think it very desirable.

Dr. F. X. F. MacCabe.

12 June 1888.

21,113. Arising out of this Report there was a Bill actually introduced in the year 1883, to which you have already alluded; and the machinery which this Bill proposed to use for discovering the lunatics and imbeciles throughout Ireland, was the Royal Irish Constabulary, or the Dublin Metropolitan Police Force, or the relieving officers throughout Ireland?—Yes.

21,114. It was recommended in this report that there should be in Ireland a modification; in fact I may say an amalgamation of the asylums of different kinds; and in general terms what they thought of having was district hospitals for the insane, intended for the more curable class of insane cases; lunatic asylums for the less curable or chronic class of cases; and auxiliaries to be attached to workhouses in certain parts of Ireland for the treatment of what we may call harmless lunatics, imbeciles, and so on?—That was the scheme.

21,115. Are you familiar with this report?—Perfectly familiar.

21,116. Do you think on the whole that the recommendations embodied in this Bill were well considered and favourably received by the people interested in the subject in Ireland?—I think that they were well considered, and that they would have supplied a very manifest want.

21,117. We have nothing to say directly to the lunatics, but I find that in this Bill the explanation of the word "lunatic" in Ireland was intended, in the same way as it does in Scotland, to include idiots and persons of unsound mind?—Yes.

21,118. Therefore, the educable class of idiots would have come under that Bill if it had passed?—Yes.

21,119. You are acquainted with the general contents of this report?—Yes, I know them.

21,120. If the recommendations of this Commission were adopted as regards the part that we have something to say to, some arrangement might be made for the better provision for educable imbecile children in some one or several of these institutions set apart for that purpose?—Yes.

21,121. Do you think that if a recommendation were made, simply adding to this report that a certain number of institutions should be set apart for the educable class of idiots, that would meet the requirements of the case?—It would meet the requirements of the case, and I think that one institution would meet the requirements.

21,122. Have you any idea of the number in Ireland of educable idiots for such an institution as I am now speaking of?—I think the term "idiots" in the census is intended to include lunatics also. I can give you some information upon that point, because we have been preparing a return upon the subject of idiots in workhouses that we send out every year to the inspectors of lunatic asylums for their information, and these are the figures simply in the case of idiots under 14 years of age. These are probably idiots who are capable of education, because I am keeping them strictly apart from the epileptics. In Ulster there are 24; in Munster 26; in Leinster 12; and in Connaught 4, making a total of 66.

21,123. Have you any means whatever, or could you suggest to us any means of getting information with regard to these unfortunate idiots who are often living at home and are very badly taken care of?—I think I can tell the Commission something on that subject. In 1883 at the time when that Bill to which you have just alluded was introduced, or was about to be introduced, the Lord Lieutenant was very anxious to ascertain what was the condition in Ireland of the unregistered lunatics at large; that includes lunatics and idiot children. In Ireland nobody looks after them. So little are they looked after that no Department has even taken the trouble to have them enumerated since the census of 1881, and the latest specific Returns that we have about them were made for that very Commission. It was found that there were then 6,700 of these persons all over the country, a large proportion of them being children. The Lord Lieutenant was anxious to know what was their condition, and I was asked whether I would undertake to visit them at their own homes. I said that to undertake to visit them all would be impossible unless I were to lay aside my own duties; but that if he would permit me to take two unions as typical of their condition, one an urban union and the other a rural union, I would visit all in those two unions. I accordingly took the South Dublin Union as a type of an urban population, and the Carlow Union, which includes the whole county of Carlow, as a type of a rural population; and I visited all the unregistered lunatics at large. Nothing could be more deplorable than the state of the idiot children. I should like very much to put in—with a request to the Commission, that if they publish it, they will substitute initials for full names, because it might hurt the feelings of these people—a short Report upon the condition of these unhappy persons, and I think that nothing could more eloquently show the necessity for the little idiotic children being looked after than the appendix attached to my Report. Here is an educable child, J. D. I found that little boy, 14 years of age, an idiot, and he was perfectly naked, lying in a filthy bed, wretchedly neglected, unable from confinement to bear the light, and who ought to have been in an institution. That was a child that was lapsing into blindness from neglect. The next on the list is J. B., aged 16, another pitiable case—a congenital epileptic idiot lying on straw in a wretched room. He was whining and sobbing when I went in to see him. He was alone in the house, and the neighbours all stated that he ought to be looked after. He was lying naked, his limbs were contracted, his body filthy, and chilblains on his feet. That gives an idea of the condition of these unregistered idiots at large. I think it would strengthen the hands of the Commission if they would allow me to put this paper in with regard to these imbecile children and the Report which accompanied it. The Report is already a public document, but the Appendix is not published.

21,124. You think that, so far as Ireland is concerned, the carrying out of this Report, and adding to it a provision for this unhappy class which you describe, would make upon the whole a great improvement and a good working system in Ireland?—I think it would be an immense improvement.

21,125. The ordinary idiot who is not educable might be provided for in what are called here the auxiliaries, and the educable idiots might judiciously be provided for in a certain number of educational institutions?—Exactly, and in the first instance all these little idiots should be sent there.

21,126. Could you give us any idea of how many such educational institutions for the idiot class would be sufficient for Ireland, bearing in mind that probably there must be one for the Roman Catholic imbeciles, and one for the Protestant imbeciles?—I think that one each for the north and one each for the south would be sufficient.

21,127. You think that that would meet the requirements of the case?—Yes.

21,128. From the evidence which you have already given, you seem to think that there is not sufficient accommodation in Ireland for the education of the deaf, dumb, and blind, probably through the Local Government Board a corresponding arrangement might be made for those classes?—That is what I hope.

21,129. That there might be for the poor classes of the blind something similar to what we are now speaking of for the idiots?—Quite so.

21,130. You do not appear to have any very strong opinion yourself as to the desirability of the union rather than the sea being made the limit of the area for the local part of the State aid; do you think that it is a matter of much importance?—From what I

Dr. F. X. F. MacCabe.

12 June 1888.

hear, I think it is very important not again to introduce the larger area.

21,131. You think that there are advantages in the local area?—Yes.

21,132. At all events you think that some of the provision for this class should come from Imperial, and some from Irish sources?—Quite so.

21,133. Although you think that the part coming from Irish sources might be advantageously taken from the unions?—From the unions.

21,134. With regard to the outdoor relief for the blind, let us suppose that recommendations were made as to having certain institutions for the pauper blind (who from my own inspections of workhouses I am bound to say seem to be in a very wretched condition, though in some of the workhouses better than in others), do you think that if something similar were done with regard to the blind to what I now suggest with regard to educable idiots, that is to say, if there were one or two workhouses made into blind asylums for the poor, they might be given their choice of going there or of having a certain amount of outdoor relief given to them if they chose to remain in their own homes? Would you make it optional, or would you only allow it to be done, as at present, under the guidance of the guardians?—Your question involves very important considerations, and I hesitate to reply to it at once. The answer would very much depend upon the circumstances of each individual blind person, as to personal character, and as to the members of the family that they might have about them to take care of them,—in other words upon local circumstances,—that I would prefer leaving it to the guardians to exercise a certain discretion; because there is no use in disguising the fact, that a great number of the blind in Ireland are people of anything but good character; they go about, and some of them are a very bad lot; and therefore I would rather leave it to the guardians. Some of these wandering blind people do a good deal of harm, and it is very desirable to get them into the institutions, whereas others who are well and kindly attended to by their own family and properly looked after, one would not like to take away from their homes and associations if they were of a desirable kind, because they have so little in life to console them. I should like to leave a good deal of discretion to the guardians.

21,135. At the present moment what becomes of the bulk of the children of the poorer classes who happen to be imbeciles?—There is absolutely nothing done for them. I have found cases in my visitations in those two places where parents when they were obliged to go out to do their day's work, simply locked the imbecile children in. I have found them sometimes in a cabin in company with a pig, or a cat, or sitting over a fireplace without a fire in it in the middle of winter. And if they are able to go outside they are only too often made the object of ridicule by others, by the children about. The result is, that the worst parts of their characters are developed and brought into prominence, and all their gentler attributes are kept in abeyance. Then when you come to girls, who have just passed the age of puberty, even worse results sometimes follow. Imbeciles are not in a position to protect themselves, and instances are known where they have come into the workhouse when they were about to become mothers; and very often the mental defect is hereditary, and the offspring is imbecile also. So that imbeciles more than any other class, I think, want to be looked after.

21,136. You need not answer this question if you have any private reason for not answering it, but I should like to ask you this: In the year 1879, a most admirable report was made upon the subject that we are now speaking of, containing a great deal of evidence and going into the subject with the very greatest care. Not many years afterwards a Bill is drawn embodying very simply and pointedly the principal advantages which would arise from carrying out this report. There is nothing in it of a political kind that I can see; there is nothing that rouses the hostility of any particular section of persons in Ireland against it. What may be the reason that a simple Act of this kind doing an enormous amount of good upon a subject, upon which most people are perfectly unanimous, was obstructed and not allowed to pass?—I really cannot tell you. I have always thought that it was a result very much to be deplored, that that Bill which was brought in in 1883 did not become an Act.

21,137. The report was made in 1879, and the Bill was brought in in 1883?—Yes, I think there was an erroneous impression at the time when that Bill was brought in, that it would lead to expense, the fact being that it would have been a source of the greatest economy.

21,138. Was there, to your knowledge, any opposition to it upon the part of the local people in the unions throughout Ireland?—I never heard of any opposition. I think that nothing could be better than the lines of that Bill.

21,139. (*Rev. Mr. Owen.*) You are in favour, you said, of the attendance of deaf and dumb children at school being made compulsory; have you any suggestions to make as to the time they ought to remain; do you think that as they are specially handicapped they ought to be compelled to remain longer?—I was not in favour of depriving the guardians of the discretion which in Ireland I think they have exercised very well.

21,140. Have you gone into the matter, as to the time deaf and dumb children should be kept at school?—I have always thought that that should be left to the conductors of the institution to advise the guardians upon; I think the guardians should be enabled to pay without any restriction as to age, at all events up to the age of 21.

21,141. So as to allow for them a longer period at school in consideration of their infirmities?—Precisely so.

21,142. (*Chairman.*) As I understand, in your opinion the probability would be that if a larger share came direct from the State rather than from the local funds, the guardians would be more likely to keep the children on longer than if they had to pay the whole of the expense themselves?—Certainly.

21,143. Therefore the direction that you are going in would be to offer every inducement to the guardians, by giving larger Government aid passing through their hands to keep the children in the institution for a proper time rather than to clothe the guardians with compulsory powers to keep the children there, the State paying them when they are at school?—Yes, I would rather that the State would assist the guardians, and I feel confident that the guardians would not be found wanting.

21,144. (*Rev. Mr. Sleight.*) You stated that there were 169 cases of deaf and dumb alone in workhouses; what is being done for their education?—There are some workhouses where it appeared to us that they had an undue number of deaf and dumb returned as being in the workhouses. We asked an inspector in each case to go and visit these workhouses, and to find out from the medical officer what proportion of those who were retained were capable of deriving improvement from being sent to institutions, and what proportion were not; and I find that a very small number indeed were returned as being fit cases for asylums. Out of the total number of deaf and dumb in the workhouses, amounting to 336, there were only 32 who would be improved by being sent to asylums, and in that case the inspectors would press the guardians to send them, but the remaining 304 were, in the opinion of the medical officers of the workhouses, unfit to be sent to asylums, or some of them had actually been sent and returned upon the hands of the guardians as not being capable of improvement. I will put in that return, and then the Commission will have an opportunity of seeing the grounds alleged in each workhouse for having them there. The grounds are set forth, for example thus: at Cork there were seven deaf and dumb in the workhouse and 17 in institutions. We asked with regard to these seven

Dr. F. X. F. MacCabe.

12 June 1888.

in the workhouse: "Why are those seven in the workhouse?" and the report is: "Two might, in the "opinion of the medical officer, be benefited by "removal to an asylum, though mentally afflicted. "Two others were sent to an asylum, but were "returned as unfit. The others they retained in the "workhouse partly because they have no desire to "leave it, and partly because the cost of their "maintenance would be greater in an asylum than in "a workhouse. Most of them have for many years "been in the workhouse, and are aged and incapable "of improvement." That gives you all the different cases that are in the workhouses, and an explanation with regard to them, and I think it would be a useful addition to the other papers that are put in. That has also attached to it a list of blind and deaf and dumb institutions approved of by the Local Government Board. The Commission may have noticed that the words of the Act are: "Such institutions as may be "approved by the Poor Law Commisssoners." The Local Government Board succeeded the Poor Law Commissioners in their statutory powers and obligations.

21,145. What is the average cost per child in the workhouses?—It varies a little in the different provinces. In Ulster it is 2*s.* 3*d.* per head per week: in Munster 2*s.* 7¾*d.* per head per week; in Leinster 2*s.* 10¾*d.* per head per week; and in Connaught 2*s.* 6½*d.* per head per week. That is exclusive of the clothing.

21,146. I see from the return that has been put in that as a general rule 15*l.* is the sum given for a child who is either blind or deaf and dumb, in special schools; how has this amount been fixed?—That is by agreement with the managers; we have nothing to say to that.

21,147. Does the 15*l.* practically include the whole of the cost of the child in the institution, clothing and all?—Yes, the whole cost; and if you would like to have it by the week, in the case of the deaf and dumb it is for adults 5*s.* 7*d.* per week in institutions, and for children 5*s.* 8*d.*

21,148. That is about double the cost in the workhouse?—Yes, very nearly; so that you can see why it is that the guardians do not care to pay a large sum towards their maintenance when the children are not improvable, and no good is derived from it.

21,149. (*Chairman.*) Who is the judge as to whether they would be improved or not?—In the cases that I have referred to, it has been in every instance the responsible authorities of the particular asylum, who, in point of fact, have sent the children back upon the guardian's hands, and have said, "We will not keep so and so; that is not an improvable case." That is why I am so anxious that the capitation grant, if any, that is made towards these unfortunate classes should be made to the guardians. Very often the authorities of public institutions decline to keep the children in the institutions because their habits are filthy; that is one of the great difficulties that one has to contend with, and it is in that respect that a special training is required, even in the workhouses. There is no doubt that with a little pains, in most cases that can be improved considerably.

21,150. That would rather lead you to desire to have a special building where those cases which are rejected by the institutions should be specially cared for, such place being supported jointly by the different localities in a combined centre?—Quite so.

21,151. (*Dr. M'Donnell.*) That is exactly what is proposed in this report to which I have referred, is it not?—Yes.

21,152. (*Rev. Mr. Sleight.*) Are any of the children in the institutions paid for partly by the guardians and partly by the parents?—The guardians sometimes enter into a voluntary arrangement with the parents that they shall contribute something towards the sum paid out of poor rate.

21,153. But do the guardians make any part of the cost chargeable upon the parents?—They have no power to do that, except under such a mutual arrangement as has just been referred to.

21,154. Do you find any reluctance on the part of parents to apply to the guardians for assistance?—On the contrary, so far as my experience goes, the parents who might be considered on the border land between independence and very small means indeed have always applied to the guardians through the relieving officer to get their children into these special institutions; and the guardians, in order to make it as little painful to their feelings as possible, admit the child in the morning and send it forward to the institution on the same day, so that it is only a colourable admission to the workhouse. With regard to deaf mutes, speaking from recollection of the terms of the Act, I believe that they have not to be admitted to the workhouse. With regard to the blind who are to be sent for treatment to a hospital, they must be admitted to the workhouse; but with regard to the blind to be sent to special institutions, my recollection is that they need not be sent to the workhouse.

21,155. (*Chairman.*) Have you any other information that you wish to lay before us?—No, nothing else.

The witness withdrew.

Adjourned to to-morrow at 12 o'clock.

6, Old Palace Yard, Westminster.

Wednesday, 13th June 1888.

PRESENT:

THE RIGHT HON. THE LORD EGERTON OF TATTON IN THE CHAIR.

T. J. CAMPBELL, ESQ., LL.D.
E. C. JOHNSON, ESQ.
ROBERT MCDONNELL, ESQ., M.D., F.R.S.
THE REV. W. BLOMEFIELD SLEIGHT, M.A.
THE REV. CHARLES MANSFIELD OWEN, M.A.
L. VAN OVEN, ESQ.

CHARLES E. D. BLACK, ESQ., *Secretary.*

Mr. E. H. WODEHOUSE examined.

Mr. E. H. Wodehouse.

13 June 1888.

21,156. (*Chairman.*) You are the Local Government Board's chief general inspector?—Yes, and assistant secretary.

21,157. You have had as part of your duties to inspect workhouses all over the country?—Workhouses in the two districts I have had charge of at different times.

21,158. And do you also inspect the workhouses in London?—No.

21,159. Who inspects them?—The workhouses in London are inspected by one lay inspector, one medical inspector, and an assistant inspector. Their names are Mr. Hedley, Dr. Bridges, and Major Jordan.

Mr. E. H. Wodehouse.

13 June 1888.

21,160. Do they send in reports as the result of their inspection?—They send in reports as the result of their inspection.

21,161–9. Are the whole of those reports published and laid before Parliament?—No; the ordinary reports, I should say, are made by the assistant inspector, but those reports go before the general inspector and the medical inspector for any observations they have to make.

21,170. Do they not come up to you?—Yes, they come up to me.

21,171. Have you any confidential reports as to the condition of the blind in the workhouses in London or the country?—No reports specially dealing with the condition of the blind.

21,172. Do the Board, or do you, consider that the condition of the blind in workhouses is entirely satisfactory?—I am afraid I could not say what their opinion is on the subject.

21,173. What is your opinion?—I have never inspected workhouses in London.

21,174. Then I will say in workhouses in the country?—I think it is not altogether satisfactory.

21,175. You have never had any confidential reports respecting the condition, first of the aged blind, and secondly of those adults who have become blind as adults, and who are sent to the workhouse because they are unable to follow any trade and unable to earn their living. Do you consider their condition satisfactory?—We have had no generalreports dealing with that subject as a whole; but from time to time if an inspector visiting the workhouse found a blind person there who, he thought, should be sent to an institution, he would note it in his report.

21,176–7. We have had complaints made to us as to the state of the blind in the workhouses. You say you do not consider it entirely satisfactory, and yet you have had no reports from your inspectors about it?—I do not consider it more unsatisfactory than that of people disabled in other ways, such as persons who have lost a leg.

21,178. Is it not the opinion of the Board that the blind deserve some greater consideration than those who, perhaps by their own fault, have brought themselves into a state of pauperism?—Certainly greater than those who have brought themselves by their own fault into pauperism.

21,179. There are necessarily a great number of those in the workhouses. people who have brought themselves in a state of pauperism by their own fault?—Yes.

21,180. But the general rule of the workhouse, with reference to the blind, is founded on their general treatment, the treatment they ought to have, without taking into consideration the special condition of the blind and the special claims they have to a better treatment?—I should say that the guardians have ample power to allow exceptional treatment.

21,181. But do they?—I should think that in many cases they do, but I think it would be difficult to give a general answer to that question.

21,182. You have no reports at all in the office with regard to the general condition of the blind?—No, none whatever.

21,183. Have you seen the evidence of the Rev. Charles Henry Andras, contained in the notes after question 19,135?—I have seen that; it was sent to me by the secretary of this Commission for confidential use, and was marked "Confidential."

21,184. On seeing it, did you make any inquiry as to the state of the blind in the workhouse at Woolwich, to which that evidence refers?—It had never been before me officially, only confidentially.

21,185. We sent for you to give evidence in order that you might state the opinion of the Local Government Board upon the facts which we laid before them in the evidence which we have received?—That was never placed before the Local Government Board. I was absent from England at the time, and it was sent to me when I returned. On any complaint being made, what we should naturally do would be to instruct our inspector to go down and make inquiries. If the intention of the Commission had been known to the Local Government Board, Mr. Hedley would have been sent to inquire into the facts and to give evidence, not I.

21,186. We have had evidence that the workhouse at Greenwich is radically unfitted for the reception of the blind, that accidents to the blind happen from their running against the iron gates, that they are constantly running against them, and tumbling down the stone steps, and that there have been a variety of accidents in the last four years. These are points we have called your attention to?—My attention was called to them confidentially, and I did not know that special inquiry was intended to be made into the statements contained in that evidence. We could only do that by sending the inspector to the workhouse to ascertain whether it is true.

21,187. But I thought you would be prepared to tell the Commission the opinion of the Board on the subject?—I can undertake that Mr. Hedley shall go there in a very few days, and ascertain those facts.

21,188. The statement has been made to us that, as a rule, or certainly very often, the blind are a better class of paupers than the ordinary paupers, and that they should be treated with greater consideration, and greater comforts allowed them, is that the view of the Local Government Board?—I do not think that they have any evidence before them that they are a better class.

21,189. Are they worse. They are not so well treated, because there are many things that the blind require that they do not get there, for instance, prevention from accidents and so forth. Does not the treatment of the blind demand special notice?—Whenever it was brought to our notice that an accident had occurred to a blind person in a workhouse, we should make a searching inquiry.

21,190. This gentlemen, Mr. Andras, who is chaplain of the Woolwich workhouse, made certain statements which we sent to you that you might be able after inquiry, to state the opinion of the Board upon the subject?—If the Commission wish that inquiry to be made I will endertake that it shall be made now.

21,191. Most distinctly; and we should like reports from your inspector as to the way in which the blind are treated all over England?—I think I can answer the questions, speaking generally for the counties where I have inspected the workhouses, and that there is no special treatment of the blind as apart from other persons who are in an unfortunate condition, such as epileptic persons, persons who have lost a limb, or are a subject of some bodily infirmity, except this, that I think that the guardians and the officers and the inmates are all more kind to persons of that character than they would be to persons not in that unfortunate condition.

21,192. I suppose they are all placed on the infirm list?—Not always. If a blind man is able bodied, I think he is happier with his own companions.

21,193. But it has also been told us that there are a great number of young men in the workhouses, who are blind and who are unable to get teaching there. I will take a case in the evidence of the clerk of the guardians of St. George's-in-the-East. This is a case of a young man, who in consequence of an accident has been deprived of sight. He comes into the workhouse, he has no means of earning his livelihood outside, because he cannot carry on the trade that the blind require to be taught to carry on, basket making, and the result is that he of course goes into the workhouse. Has it ever occurred to the Local Government Board that that was an unsatisfactory state of things, that these men, who might perfectly well be taught some trade, are kept in the workhouse doing nothing, spending their lives in the most unprofitable and useless way, because the guardians have no power, or do not exercise their power, of getting those men into an institution?—

Mr. E. H. Wodehouse.

13 June 1888.

The guardians have full power to send a person into an institution for the blind.

21,194. There are no institutions of that kind for them, the guardians could only do it by combining together and having some institution suitable to that class?—I think the Local Government Board would consider it desirable that further facilities should be afforded for the instruction of blind persons who are capable of being taught something which will enable them, wholly or in part, to maintain themselves.

21,195. The Local Government Board have never had any report, then, from their inspectors as to this unsatisfactory state of things?—No.

21,196. Nor have the Local Government Board taken any steps to remedy this state of things?—No. We get numberless letters throughout the year complaining of the conduct of the guardians in various respects, and we certainly have had very few letters complaining with regard to the condition of the blind or the deaf and dumb in workhouses.

21,197. But the blind are not quite in the same position as the others; because they cannot write for themselves?—I am speaking not so much of inmates, but of persons outside who are interested in them.

21,198. We have had evidence of complaints before us here, and we have not gone very fully into the subject because we thought we should be able to go to the Local Government Board and get the information from them. We find we are mistaken in that expectation?—It is a great pity that I was not informed precisely what was the nature of the information which the Commission wished to be given.

21,199. As long back as April or May you were communicated with?—But not as distinctly as that. With regard to those specific allegations of the chaplain and the clerk, we have received no written communication whatever, except that those were forwarded by the secretary to me. I did not know that I was at liberty to send an inspector down and tell the guardians that these allegations had been made. We should have had to tell the guardians and their officers there that they would, to some extent, be put upon their trial.

21,200. It would not have been communicated to you if you had not been intended to act upon it?—Would it be the desire of the Commission that the Board's inspector, Mr. Hedley, should be instructed to visit and make inquiry as to the allegations at the Greenwich workhouse?

21,201. Yes, and as there has been no inquiry made, a similar inquiry all over England; we should be glad to get reports from certain districts to know how the aged blind are treated, and how many there are of the adult blind who might work, but cannot work because they are not taught any trade, and the guardians do not send them to an institution; we should like to know how many there are of that class between 21 and 45, that is, the class that might be fairly expected to do some work; and again between 15 and 21, who are those who may have just left an institution and failed to get work, and are thus brought into the house?—With regard to the children, it strikes me that the return is extremely favourable. Out of a total of 336 children, rate-supported blind children, no less than 286 are at special schools for the blind.

21,202. As far as the institutions for the young blind go, they are fairly well provided for; but what we have found is that there is no provision made for the adult blind. We want to find out whether the Local Government Board can tell us how many there are of this class, and whether in their opinion that is a desirable state of things?—Perhaps you would let me call attention to this, that it is entirely optional with the guardians whether or not they will send these blind children to special institutions, and the Local Government Board have no power to compel them to do so; and when it is found that out of 336 rate-supported blind children under 15 years of age no less than 286 have, by the spontaneous action of the guardians, been provided with instruction in special schools, I think it is very strong evidence that the guardians are fully alive to their duties and fully ready to assist these poor persons in the way that is desired.

21,203. The evidence that we have had has not been entirely so favourable to the guardians. What you have just said only shows that they are sent to school; but we have had very great complaints made that the guardians give very insufficient support to these children in the institutions; we have had great complaints from institutions, and from the parents. We should like to know why they are not all sent, and whether it is not desirable that all should be sent, who are capable of instruction, that is to say, who are not prevented by epileptic fits or any other infirmity which would prevent their being sent into institutions?—I think it would be impossible to answer that question without knowing the circumstances of the individual case.

21,204. Has the department ever considered that question with regard to the desirability of making the action of the guardians compulsory, in all cases where there is no physical or medical reason for the children not being sent into an institution?—I think I could only answer that question in this way. With regard to these blind and deaf and dumb children, their claim to being assisted out of the rates arises not out of the fact that they are blind or deaf and dumb, but out of the fact that they are destitute; and by destitute I mean, not only that they cannot support themselves, which is obvious in this case, but that they have no relations liable by law to maintain them, or no relations such as a brother or a sister who, though not legally liable to maintain them, ought, if they are in fairly good circumstances, to take the charge of these children upon themselves rather than allow them to be a burden upon the ratepayers.

21,205. But would it not, from an economical point of view, be right that every child who has no friends to educate it, should be educated by the guardians compulsorily; supposing he was blind or deaf and dumb, would not that make an additional claim?—I think it would not be desirable that they should be educated at the expense of the State if they have relations in affluent circumstances.

21,206. I am not putting my question on that hypothesis, that they have relations in affluent circumstances?—I think these figures to which I have referred, show that there is no reason, with regard to the children, for thinking that the guardians are not willing to avail themselves of their power.

21,207. We have had evidence that in the case of many of them they are not willing to send them, that the sums they grant are very often insufficient. We have been making this inquiry; the Local Government Board appear to make no inquiry as to the condition of the blind in the workhouse, and therefore they do not appear to be in possession of the facts. Although the Local Government Board have brought these facts out with regard to a certain number of the children being sent to institutions, they seem to have taken no steps to find out why the remainder are not?—We had nothing before us except the evidence of the clerk of a board of guardians in London and a chaplain to a workhouse, which evidence was marked confidential, and which I should not consider myself at liberty to institute an inquiry upon.

21,208. We are asking how it was that the Local Government Board, knowing that this state of things existed, took no steps to remedy it?—What state of things?

21,209. That these children are not sent to school?—But we have no evidence of that kind before us.

21,210–11. We have a great many cases; we waited till we got this return, before we examined you, with these facts before us, hoping that the Local Government Board would be able to tell us something about them. They know absolutely nothing,

Mr. E. H. Wodehouse.

13 June 1888.

it seems?—I should be very glad if these cases were sent to us for investigation.

21,212. We did not visit many workhouses, but we visited, for instance, Wolverhampton workhouse. We found that the women there were doing nothing at all; we were told that they were not allowed to earn anything by any work they do, consequently they will not do it; there was not the slightest encouragement given to them to do anything. Now we think that a very unsatisfactory state of things; we think it a point which any inspector who had gone over that workhouse ought to have called attention to; and in other cases we found that there were young men doing nothing at all, and no steps taken to teach them any trade?—I think it would be extremely difficult to make provision for anything being earned in a workhouse. It is part of the regulations of a workhouse that no pauper should receive any remuneration for his labour.

21,213. Do you consider the state of the blind satisfactory; you say not?—No.

21,214. Are they in their proper place at all in the workhouse?—I think it would be very desirable that more of them should be removed from the workhouse into separate institutions. I think I have stated that as my opinion already.

21,215. Has that been ever recommended by your inspectors?—I should think that in the course of the reports, some remarks in that direction could be found; but I cannot produce any special report that has been made with the recommendation.

21,216. No steps have been taken by the Local Government Board to remedy what you admit is a defect in the treatment of the blind?—A defect which the Local Government Board could not remedy without legislation; it would require legislation.

21,217. Would it require legislation for the guardians to teach these blind persons any trade in the workhouse?—There are so few workhouses in which the number would be sufficient.

21,218. Is there no power of combining to send them to any central place?—No, practically no power. We have certified these institutions for the reception of the blind and do all we can to encourage the guardians to send them there.

21,219. Will you tell me how many of these institutions meet the wants of the particular class of adult blind who become blind between 20 and 40, and who, if they are not taught a trade, have no means of earning their livelihood?—There is a considerable difficulty in regard to that class of cases, which I thought I stated at the outset. I thought your Lordship was asking me questions as to alleged ill-treatment of the blind.

21,220. No; I am asking you upon the question of the unsatisfactory condition of the blind in the workhouses?—That I quite admit.

21,221. Have you had any representations made from the boards of guardians in London with regard to the treatment of the blind in workhouses?—Not since I have been assistant secretary.

21,222. Do you know the rules, with regard to blind inmates, of the workhouse of St. George's-in-the-East; if so, I should like to ask you whether there is any reason why the others should not do as the St. George's-in-the-East guardians have done, namely, give a more liberal treatment to them than to the ordinary paupers?—There is no reason whatever why that should not be done; the guardians have it within their power, and the medical officer can prescribe what diet he thinks fit for the blind.

21,223. In that workhouse, permission is given for them to be visited by visitors from the Indigent Blind Visiting Society and the Home Teaching Society, who may teach them to read and lend books to them; and they are also allowed to attend classes outside the house, which would enable them to get instruction; and also entertainments at all reasonable times, on application to the board, and also mission room services; dinners are provided for the men on their return from the classes, and guides for the above purposes are provided by the master. In fact various rules are laid down for the more generous treatment of the blind, which seem to us to be only reasonable, and an example to be followed by others?—I should like to have the whole of the rules before me, before I gave any opinion. (*A copy of the rules was handed to the witness.*)

21,224. We want to know whether you think it desirable that all the other London guardians should follow that example, and whether the Local Government Board would take any steps to bring it to the notice of the other guardians. Are those rules passed by the Local Government Board?—No; the management of the workhouse is a matter for the discretion of the guardians.

21,225. Has the Local Government Board inspector any discretion at all as to what he recommends?—Certainly; our inspector is constantly attending meetings.

21,226. Would it not be possible for the inspector to suggest a more generous treatment of the blind in all cases, and to enable them to visit classes outside, and to get some sort of instruction, either as an amusement for them or to enable them after a time to earn their livelihood outside?—Certainly, if it is not done already; but we have had no evidence of that.

21,227. We have had evidence that it is an exceptional case?—If that evidence is sent to us we will make inquiries into the circumstances; we should like to investigate, through our inspector at the workhouse, whether this really is so.

21,228. We thought that your inspector would have made the remark. "In this workhouse I find a much "more generous treatment than in others." I do not see the object of the inspector if he does not make a report of that kind?—But have the Commission any report before them of the way in which the blind are treated in other metropolitan workhouses?

21,229. We have?—If that were sent to us we would make inquiry. I think Mr. Browne cannot have much knowledge of what is done in other workhouses in London than that of St. George's-in-the-East, in which he is clerk to the guardians.

21,230. It seems to me rather extraordinary that the Local Government Board should not know what has been done with regard to the blind in the workhouses. If they do not know, what public body should know?—My answer is that no exceptional treatment is given to the blind any more than to other unfortunate persons.

21,231. I say we have had evidence before us of exceptional treatment in St. George's-in-the-East, you are not aware of that?—I am quite sure that many boards of guardians (I am speaking not of London) would treat the blind as liberally as the guardians of St. George's-in-the-East.

21,232. Where do you think that is the case?—That could only be ascertained by a report upon every individual workhouse for this purpose.

21,233–34. We want to know all the points which we thought that the Local Government Board would naturally have known with regard to the treatment of the blind at the present time in the workhouses?—All I can say is, that we have not had officially before us complaints as to the neglect of the blind or of the deaf and dumb in workhouses.

21,235. I am speaking now, not of the deaf and dumb, but of the blind?—Yes, I understand, of the blind in workhouses. Nothing could be more various than the treatment of the blind in the various unions I have been acquainted with. In some places, where there are sufficient of them, they have a ward to themselves, in other places, where there are few of them, they mix with other inmates. In some places they are with the sick, in other places the doctor thinks that when they are free from disease they are more happy with their own natural companions. The result is that there is great variety of treatment.

21,236. The Commission would like to know something more than you are able to tell us about it, we did not go into the subject at all, because we imagined that a public department having all the workhouses under it would be able to give us the information?—If your Lordship asks me for any facts inquiry will be made on those points.

21,237. We want to know in each workhouse how the blind are treated, whether in the same way as others, or whether any indulgencies are allowed to them, whether the blind are left without any one to care for them, or any amusements or any means of recreation, which others have who are able to read and to take exercise. They cannot take exercise without assistance, they cannot read unless some one reads to them, or teaches them to read in many cases. Surely the condition of the blind in workhouses is worthy the attention of the Board?—I think there are many other cases of persons suffering from some affliction.

21,238. We have nothing to do with the cases of persons suffering from other afflictions, but we have to do with the blind?—The Local Government Board, I think, would say: We strongly advocate the formation of separate institutions for that purpose, but there is great difficulty in affording exceptional treatment to a few inmates in a workhouse because it makes the others discontented.

21,239. But in order to have something on which to found some paragraph in our report embodying that view, we must know exactly what the present state of things is. We cannot visit all the workhouses. We consider that the Local Government Board have inspectors whose duty it is to visit the workhouses, and we ask them to give us a special report with regard to each workhouse, or each group of workhouses, as to what is the treatment of the blind?—I can only say that we have no special information of that sort. We get reports upon every workhouse in the kingdom every year, but no special report upon the treatment of the blind.

21,240. However, we shall be glad if you can give to the Commission some information on that point?—If the secretary of the Commission will state precisely what the information required is, I will see that it is furnished. May I ask that that may be put as specifically as possible? And with regard to any specific complaints that have been made before the Commission, perhaps the secretary will be good enough to transmit those, so that wherever a specific allegation is made, we may at once institute an inquiry. And I may say that our attention was called to a home for the deaf and dumb children under the management of Mr. Stainer, and we had an inquiry instituted by our inspector, Dr. Bridges, who has made an exhaustive report on the subject, and we have communicated with Mr. Stainer with regard to it.

21,241. You have not sent us that report?—It is sent to the Home Office.

21,242. It is desirable that we should have that; we have had Mr. Stainer before us, and we should like to have a copy of the report, not necessarily for publication, but to see how far the Commission are supported by the inspector?—If I had had the smallest notion that the Commission desired it, I would have had these inquiries made. With regard to Wolverhampton, I strongly suspected what took place at Wolverhampton, and I was anxious to send down our inspector to inquire into it; but I did not like to send an inspector down to make an inquiry when the complaint had only been communicated to me confidentially.

21,243. You see "the guardians there have refused "to make sufficient allowance for workers to main-"tain themselves while learning a trade at the institu-"tion," the result of which would be that they would be able to earn to a great extent their own livelihood and be independent of the rates; whereas they would be more or less dependent on the rates if they cannot earn their livelihood. "There are five men and "three women in the union; two of these women can "knit, but the Commissioners were informed that they "are not allowed to do so or to come to the institution "for that purpose;" that is the institution of the Wolverhampton Home Teaching Society and Workshops for the Blind; that is to say a relaxation of the ordinary rules would enable these wretched people to come and learn something outside?—Yes; but as far as I understand the allegation, they are not allowed to knit in the workhouse. I very much wish that statement to be investigated. I have inspected a vast number of workhouses and have never known that happen. The result was, you see, that these women would not knit because they were not allowed to make use of their knitting; but still this was an allegation against a responsible body, the board of guardians, as to the management of their workhouse.

21,245. It substantially comes to that; if the guardians prescribe such rules as will prevent those who are willing to knit from earning anything, that will practically put a stop to it?—I should like the guardians to tell their story; that is all.

21,246. (*Mr. Johnson.*) If the people have to find the materials, where are they to get the materials to knit with?—I see no reason why the guardians should not find the materials.

21,247. I fancy that is really at the bottom of the objection, that they will not find the materials for these people to work, and that they do not allow them to dispose of what they do?—I thought on that statement which was sent to us that it required further investigation before we could form any conclusion upon it.

21,248. (*Chairman.*) It is quite right that that should be inquired into, and it is quite possible that if the Local Government Board had recommended the guardians to make any relaxation of their rules so as to enable or induce women to knit, they would have been willing to relax their rules. Surely that is desirable?—If a blind person is allowed to earn something, and an epileptic person, for instance, is not, and all are mixed together within the same ward, it raises the great difficulty of exceptional treatment.

21,249. In the view of the Local Government Board, are not the blind in a different position from others in the workhouse who are sent there from causes which it is in their power to prevent?—They are in a different position from those persons, but not from other persons suffering from other misfortunes.

21,250. Not from people suffering from epileptic fits, perhaps, but they are in a worse position in this respect that they cannot see?—In my idea, the true policy is to take them out of the workhouse, and not to give them an exceptional position in it.

21,251. (*Mr. Johnson.*) In your idea, the true policy is to take them out of the workhouse and to put them in special institutions?—Yes.

21,252. (*Chairman.*) It would be difficult, no doubt, to disturb the economy of the workhouse; but would there be any difficulty in having, without any alteration in the law, a central institution for the blind in London, under the Metropolitan Asylums Board?—I am unable to say, without reference to the statute, whether any amendment would be necessary, but it would be a very simple one at all events.

21,253. (*Mr. Johnson.*) The persons would be paid for by the guardians, of course?—Paid for by the guardians of the respective districts.

21,254. (*Dr. Campbell.*) And I suppose they would have the power of taking them out of London, so that they might have the advantage of country air and surroundings?—Yes.

21,255. (*Chairman.*) Then I gather that it is quite your opinion that the example of Darenth should be followed with regard to the blind, and that has been done with regard to the imbeciles, they should have a separate institution outside London for the pauper blind in London?—Yes.

21,256. How often are the workhouses inspected by your inspectors?—We only get a report now once a year; we used to have a report once in six months; but I should say that the inspectors practically visit the workhouses oftener than that; those are visits paid

Mr. E. H. Wodehouse.

13 June 1888.

Mr. E. H. Wodehouse.

13 June 1888.

unexpectedly and on a day other than that on which they meet the guardians.

21,257. Are they instructed to make any recommendations to the guardians on any points they think deficient?—Certainly; the Board's inspectors have a statutory authority to attend the meetings of the boards of guardians; they are ex officio members except that they cannot vote; they have the right to attend every meeting and speak and take part in their proceedings, but not to vote.

21,258. Would it be possible for a circular to be issued by the Local Government Board calling the attention of their inspectors to the position of the blind in the workhouses, and urging them to recommend to the guardians to treat the blind in as favourable a way as possible, could they order such a circular as that to be issued?—I see no objection whatever to that, but the natural preliminary would be that we should get from your report when it is published (unless it is communicated to us beforehand) what the Commission would consider to have been established by evidence before them as to the condition of the blind in workhouses. I think it would be probable then that we should ask our inspectors to investigate for themselves some of these statements that have been made before you, and if we found that the statements were borne out by the evidence it would be the proper course, no doubt, to issue a circular to the inspectors directing them to call the attention of the guardians to the subject.

21,259. I think probably what this Commission would like to be done would be to get the Local Government Board to let us have the reports from the inspectors. Now would it be possible within the next six months to have reports from the inspectors as to the present condition of the blind. We have tested it in certain places sufficiently to make us wish for more information: we could not possibly visit every workhouse in the kingdom?—In the course of the next six months it would be perfectly possible to do this, if the Commission would state in some little detail the points relating to the treatment of the blind in workhouses upon which they wish for information, we would instruct our inspector to make a report to us on those points. They would in the course of the next six months probably not be able themselves to visit every workhouse, but they would obtain from the clerks of the guardians such information as, coupled with visits to workhouses where there were any large number of blind, would enable them to give good information on the subject.

21,260. We should like to have information of that kind?—Certainly, that would be practicable within six months.

21,261. There have been several points raised by witnesses we have had before us, and by the notes of our visits, the power of going out, learning trades outside, reading, and visits of visitors, and so forth?—Perhaps I may instance this as a difficulty the inspectors would have, that I think you will find in many country workhouses there are no blind at all, and it would be no use their going to those workhouses; we have no return of that.

21,262. We have this return now before us?—That only relates to a particular day.

21,263. We should be quite satisfied if we got a certain number of typical workhouses, particularly in large towns?—Yes, that could be done. If you would specify any workhouse in particular which you would desire a report of, I would direct a special report to be made of that workhouse.

21,264. On page 10 of the notes of our visits under the head of the Catholic Blind Asylum, Liverpool, we find that a girl was sent there by the Newcastle guardians at 19 years of age, who had been nine years in the workhouse school, "but was taught nothing "there, she knitted while the others did their lessons." She was eventually sent to this institution in consequence of a kind lady who visited her once a month, and taught her the Braille type. That is a case we think ought not to have occurred, that a child should be left in the workhouse school for nine years, and there are many cases of that kind?—Supposing the facts are perfectly true, there is this additional matter to be considered, whether this girl had a brother or sister who was really in affluent circumstances, but was perfectly willing that that child should be a burden on the rates at a central institution at a distance, but the guardians thought they would not be willing to have the child in the workhouse near. I think that the guardians in such a case would be perfectly justified in leaving that child in the workhouse. The Commission must remember that the claim of these persons by the law of England arises solely out of their destitution. However much we may pity them for being blind or deaf and dumb there is only one consideration which gives them an absolute legal right. If they show themselves to be destitute, they can come and claim as of right to be relieved.

21,265. But being in the workhouse, from whatever cause, we consider that these children have as much right to receive an education there as any other child outside?—But what I understood in this case was that in the opinion of the Commission the guardians ought to have sent those children to an institution. I will give you a reason why it may not be right to send them to an institution.

21,266. (*Mr. Johnson.*) It is not a question of sending them to an institution, but of a child remaining there nine years uninstructed and uncared for except in regard to food and clothing?—I do not defend that, but I think you have not the whole facts of the case before you, the guardians are absolutely bound to investigate to the bottom the means of all the relations of these persons before they admit them.

21,267. (*Mr. McDonnell.*) Naturally we look on blindness as the thing which gives the claim, you look at it that destitution gives the claim, that is the view taken by the law at present, and you are correctly stating that view, but you must remember that we think that the mere fact of blindness constitutes in itself a claim?—But I wish to guard myself as not simply stating my view; it is not for me to criticise the law; I am merely stating what the law is.

21,268. (*Chairman.*) Our point is that the child being in the workhouse the blindness ought not to have been a bar to her education. If she had not been blind she would have been educated. I only mention that as an illustration; there is no use in discussing it?—Certainly they ought to have educated the child in the workhouse; but it was first suggested that it was their duty to send her to an institution.

21,269. I hope the department will not justify the conduct of the guardians in that case?—What I was asked was whether they were justified in not sending her to an institution.

21,270. No; I said, were they justified in allowing the child to remain uneducated?—I think that was only put to me afterwards.

21,271. That was my point; then another point is whether you think it desirable that the guardians should be compelled to send such a case to an institution?—I have never said that I thought they were justified leaving the child uneducated in the workhouse. A very important point arises as regards sending children to institutions.

21,272. Now we find that there is a great variety of sums allowed by the Local Government Board for the maintenance; can you tell us at all what are the principles of the Local Government Board in allowing sums for maintenance in institutions?—When an application is made to us to certify a home for the reception of pauper children, whether deaf and dumb or otherwise, we instruct our inspector to visit and report, and he makes a report and among other things he recommends what sum shall be allowed; and in that he is guided by various considerations, but sometimes by the application of the persons themselves who manage the institutions. I myself, when I was an inspector, have certified homes, but purposely placed the sum low because the managers (this was in the case of an orphanage) thought the guardians would be more likely to send children if he did not claim the total amount.

Mr. E. H. Wodehouse.

13 June 1888.

21,273. I want to know this: whereas Dr. Stainer was previously charging 16*l.* the Local Government Board allowed him to charge 18*l.* 5*s.*, to which he immediately raised his charge; he quite justified the rise; but I want to know upon what grounds the Board allowed that particular charge?—It is not 18*l.* 5*s.* it is 18*l.* 4*s.*, and that is 7*s.* a week exactly; that is probably the reason.

21,274. As soon as he got this permission to charge 18*l.* 5*s.* he charged 18*l.* 5*s.*, having previously charged 16*l.*, but he put the 2*l.* 5*s.* as against the clothing; I only want to know on what grounds that particular sum was selected?—I think it was selected as it is 7*s.* shillings a week, which is the common sum that we allow.

21,275. (*Mr. Johnson.*) Did it come to 7*s.* a week including or excluding the clothes?—Including the clothes.

21,276. (*Chairman.*) From the returns we have got from various institutions for the deaf and dumb, in 20 institutions the guardians paid for a total of 912 sums varying from 5*l.* to 25*l.*?—All that we have to do with it is to fix the maximum they may pay; and with regard to the deaf and dumb we have only certified four institutions, and have fixed 20*l.* in the case of three of them, and I have no information as to the fourth. It frequently happens that they do not pay the maximum that we certify they may pay; that is a matter of arrangement between themselves and the managers; if they are willing to take children from a particular workhouse for less than the maximum, the guardians of course will not pay the maximum. If it would be any assistance to the Commission that statement would give you information as to the actual sums we certify (*handing a statement to the Chairman. See Appendix* 40).

21,277. I see at Norwood you certify for 30*l.*?—Yes; that is a very exceptional case.

21,278. I thought the maximum was 25*l.* by law?—No; it is entirely optional.

21,279. It is a self-imposed limit of 25*l.*?—No.

21,280. Why is Norwood the only one that is 30*l.*?—I think very likely the others did not ask for more than 20*l.*

21,281. How many cases get 30*l.* at Norwood?—I am unable to say; all that we have to do is to say what is the maximum sum that the guardians may pay, and within that maximum the guardians may make such arrangements as they are able to with the management.

21,282. Then, I suppose, if it be shown that the deaf and dumb schools on the oral system are more expensive than the others they will get a larger grant. As you have allowed 30*l.* as the maximum in Norwood I presume that is on account of education there being more expensive. If it was shown that the expense of the education is greater (as no doubt it is) that would be a ground for raising the amount allowed?—Yes, if the Commission recommended that form of instruction.

21,283. Applying the same principle to the deaf and dumb as to the blind?—Yes.

21,284. If it costs half as much again to teach on the oral system that would be a ground for raising the amount allowed?—If the Commission considered it was a good system of instruction, and considered that it was more expensive, we should not hesitate to increase the maximum; but it would rest with the guardians whether they would pay it or not; and with regard to orphanages, I always think managers exercise a wise discretion if they fix a low sum, because they thereby get the guardians to send more children.

21,285. Do you see any practical objection to transferring the power of sending children to institutions from the poor law guardians to the school authority, whatever it may be, whether it is the county authority or the school board authority?—Yes; upon my view of the law of course there would be great objection to that.

21,286. Would there be any objection to the law being altered to enable that to be done?—Yes; in my view there would be.

21,287. Would you state the objection which the Local Government Board might be supposed to have to the power of sending these children to special institutions being transferred from the guardians to the school authority.

21,288. As the law stands at present, the claim of these children arises, as I have stated, from their destitution; and boards of guardians have had long training in judging whether a particular case is or is not one of destitution; and also they have a staff of officers by means of which they may test the applications that they receive and ascertain the facts of each individual case. The school board has no such machinery and no such experience.

21,289. But is there not a natural reluctance on the part of many parents to apply to guardians, to apply to the poor law authorities that is to say, for the admission of their children into these institutions, parents, I mean, who themselves may not be actually paupers but who are not able to bear the expense themselves of sending a child to an expensive school like that?—I think there is a reluctance on the part of parents to apply for relief of that description, and I think that reluctance is proper.

21,290. But in the case of those parents, who are not of the pauper class but yet are too poor to send a child to such an expensive school, would it not be likely to be more acceptable to them to apply to the school authority?—I think it would be more acceptable to them, but I should not myself approve of it.

21,291. We have had some evidence before us that purulent ophthalmia may be easily prevented if proper medical precautions are taken after the birth of the child, and it has been suggested to us that the Local Government Board might issue circulars of instructions as matters of precaution in some way or other?—To whom?

21,292. To the guardians, or in any other way, through the medical officers?—The secretary of this Commission forwarded to me a copy of circulars issued by the Irish Local Government Board. Those were addressed to the medical officers and midwives. That would be quite contrary to our practice; if we issued that circular, we should address it to the guardians suggesting that they should call the attention of medical officers to it. The position of the Irish Local Government Board is quite different from that of the English Board.

21,293. But now your attention is called to it, you admit, do you not, that something should be done in that direction?—I think we should probably first make further inquiry whether the facts of the case in England justify it. May I ask if the Commission have had any evidence with regard to the number of children who are born blind, or who become blind immediately after birth, in London workhouses? I am told that it is extremely small.

21,294. We have not had such evidence as regards the London workhouses, but the medical evidence we have had is to the effect that a considerable number of the cases coming to the hospitals have been caused by that?—I may state that just before I came here I spoke to our medical inspector, Dr. Bridges, upon this very point of purulent ophthalmia arising from negligence at the time of child-birth, and he was aware of the report of the Ophthalmological Society alluded to, and I asked him with regard to London workhouses (which he is very familiar with), and he stated to me that so far as his knowledge went the number of the children who became blind from that cause in London workhouses was extremely small.

21,295. It would be only reasonable to suppose that in the workhouses they would take those precautions which are necessary, whereas in the great mass of cases outside the workhouses they would not?—Yes;

Mr. E. H. Wodehouse.

13 June 1888.

that is a matter we should consider before we issued any circular.

21,296. The test of the necessity must not be taken by the state of things in the workhouses, but by the state of things outside. We are asking you with regard to outside the workhouses?—That would only mean, so far as we are concerned, out-door paupers; we have nothing to do with the other matter.

21,297. Still the information so circulated would permeate through many of the lower orders?—If it were thought that such a circular would be likely to be productive of good, I can see no objection to its being issued.

21,298. (*Mr. Johnson.*) Are the outside paupers attended by the midwives of the parish?—In some cases, but more often by the doctors, I am speaking generally of England, except in a few towns midwives attend very little.

21,299. (*Chairman.*) We have had evidence that very nearly one-third of the blindness in asylums is caused by purulent ophthalmia?—But I understand that the circulars issued by the Local Government Board in Ireland referred to purulent ophthalmia arising from a particular cause, namely, from injury to the child within a short time after birth.

21,300. (*Mr. Johnson.*) Do you think that your Board is aware that a Bill was before Parliament with this provision in it—"that from and after the passing "of this Act it shall be lawful for the commissioners "for administering the laws for relief of the poor to "establish an asylum or asylums for the maintenance "and instruction of such blind inmates of workhouses "as the boards of guardians of the unions may think "proper." This was in 1860?—No doubt it would be recorded in the legal department of our office.

21,301. But from what I understood from your observations you are quite in favour of such asylums being established?—I am quite in favour of such asylums being established, provided that the admission to them is not taken out of the hands of the guardians, the individual boards of guardians.

21,302. That is to say the individual boards of guardians would have the power of sending the cases to your own asylum just as they would send imbecile cases now to Darenth?—I think that would be very desirable, and I think it still more desirable in the case of idiot children, which is a great want in the country.

21,303. I am speaking of the blind, do you not think that an infirmary for the treatment of the diseases of the eye, in connexion with that, would be very advantageous. You see they get no treatment now, a blind person comes into the workhouse and remains there. We have done with the question of education and we know that he is not educated, but is he thoroughly supervised, ophthalmically I would say?—I am not aware of any objection to that, but it is strictly a medical question.

21,304. I mean an infirmary where they are inspected opthalmologically. I will tell you why I ask the question. A man came into an institution which I am connected with, blind, an operation was performed upon him and he became a sighted man, and he is now porter of an institution?—We should consider that the medical officer of any workhouse would be guilty of great neglect if he did not give any blind person in the workhouse the full advantage of his medical skill.

21,305. He would be merely an ordinary medical man in any workhouse?—He would be a fully qualified medical practitioner.

21,306. Do you not think that a school in connexion with such an asylum, for the training and educating of children, would be a good thing; do you not think that if such an asylum, a Local Government Board asylum I will call it, was established, it would be a very good thing to have a school in connexion with it for the young people, a school for the teaching and instruction of the blind?—Yes, I think so.

21,307. And also a means of teaching them a trade?—Yes; certainly.

21,308. And do you not think you might use profitably the labour of blind people, when instructed, to pay a portion of their maintenance?—Certainly.

21,309. Of course an infirmary already exists in every workhouse?—Yes; not a separate infirmary in the very small workhouses.

21,310. I made use of the term "ophthalmically," as covering the question whether they were specially looked after?—In some cases they have a special ward for themselves. I remember a workhouse in Kent, which was under my inspection formerly, where they were grouped separately.

21,311. That is to say, they were only grouped together for the sake of being together?—Yes.

21,312. Not with regard to any educational or medical treatment?—No; the doctor, for instance, found all the blind people together.

21,313. You do not think that a desirable thing, do you?—No; I think they are happier for mixing with the sighted.

21,314. I think it was shadowed forth in that Bill, which was lost, that the board of management should consist of the chairman, the vice-chairman, and deputy vice-chairman of the union in which such asylum should be situated, together with the chairman, vice-chairman, and deputy vice-chairman of the unions immediately adjoining; that is to say, it would be entirely under the administration of the boards of guardians, and that would forward the view which my Lord enunciated just now of the possibility of having one larger pauper asylum, as it were, for the blind in London?—Quite so.

21,315. (*Rev. W. Blomefield Sleight.*) Would you state to the Commission why you would disapprove of parents applying to the school board instead of the guardians for payment with regard to the education of their afflicted children?—Because I think that the school boards are not so competent by experience, or by machinery ready to their hands, for sifting the actual destitution in each case.

21,316. Are parents legally pauperised if guardians give them relief for the education of their children?—Certainly, if they give them relief for the education of their children, except in the case of the payment of school fees of children attending a public elementary school under section 10 of the Education Act of 1876, and in the case of the deaf and dumb and the blind, which is specially provided for in section 56 of the Poor Law Amendment Act of 1834.

21,317. I mean in the case of blind children?—In the case of the deaf and dumb and the blind there is a special provision, which the Board have called the attention of the Commission to. If it was for the medical treatment of the child there would not be a disqualification, in consequence of the recent Act of Parliament; but there are two things to be considered, what is a pauper, and what results from being a pauper? Any person is a pauper who is supported wholly or partly at the cost of the rates; but it does not follow that they become civilly disabled.

21,318. If children are admitted into workhouses cannot you surcharge relations for the payment of their costs?—You can obtain an order from the magistrates directing them to contribute if they have sufficient means; but that only applies to certain relations; it does not apply to a brother or a sister.

21,319. (*Mr. Van Oven*). As regards the transference of the aid for the education of the deaf and dumb or the blind from the guardians to the school board, at the present time by the agency of the school board the rates are charged for the education of ordinary children, and the parent receiving that benefit is not thereby pauperised?—No.

21,320. And then again I believe it is the law that the school board officers can demand from the guardians the payment of the school fees in cases where the parents declare themselves incapable of paying?—It is for the guardians to determine whether they are incapable of paying or not.

Mr. E. H. Wodehouse.

13 June 1888.

21,321. Therefore in that point there is a kind of joint action between the school board authorities and the guardians as regards the payment for those children?—Yes; to this extent, that school boards can remit fees in a board school under their management, and that boards of guardians can pay school fees at any public elementary school.

21,322. Now in the same way could not a sort of joint action be taken to prevent the abuse of this transference of the maintenance of children in asylums, or sending them to special schools for the deaf and dumb, by the guardians and the school board; thereby preventing parents who are in a decent position, but still are unable to pay for the special education of these afflicted children, from coming under the stigma, or the imagined stigma, of their being pauperised by applying to the guardians?—But in the present case the guardians have to be applied to; the school board cannot pay the fees, but can only remit them in their own schools.

21,323. That is true, but I mean there is a joint action there between the school board and the board of guardians in the investigation of the condition of the parents; could not something of the nature of that arrangement be made as regards the payment of the special fees for the education of the afflicted classes?—I do not understand that there is any joint action now between the school board and the guardians; the parent or the person having the custody of the child must apply to the guardians for the payment of the school fees.

21,324. (*Chairman.*) I have not asked you about the imbecile children, but we have found that to a certain extent there is a difficulty in getting them sent to institutions. Does that come under your Board?—In the country there is great difficulty. It comes under the knowledge of our inspector.

21,325. Does your Board inspect the imbecile asylums like Darenth and the others?—Yes.

21,326. And also those in the country, such as the Lancaster one?—Those that are certified.

21,327. That is to say, certified as places where the guardians can send children?—Yes. The Lancaster one is not certified, I think.

21,328. They do get some from the guardians?—Yes, but the Act under which the certificate can be given is the 25th and 26th Victoria.

21,329. Is Lancaster not certified?—I think not, but the guardians sent a good many there.

21,330. I do not understand why it is not certified; is it because the certificate has not been applied for?—Probably there has been no application.

21,331. Of course it is to a considerable extent a paying hospital; not like that of Darenth, which is one wholly for pauper cases?—That one at Lancaster is, I understand, confined to the six northern counties. London is tolerably well provided for by the Metropolitan Asylums Board, but for the rest of the country there is nothing.

21,332. Would you think it desirable that some alteration in the law should be made, if the law is not quite clear (as we have had evidence), as to the possibility under the present law of counties joining together to form an institution similar to that of Darenth for pauper cases?—There is a power by which unions could join together, but it is practically a dead letter.

21,333. And you advocate an alteration of the law as regards that point?—Yes.

21,334. And do you also advocate the guardians being compelled to send children to these institutions under a medical certificate?—Certainly not by legislation. I think it might be possible that the Local Government Board should have power to issue an order, where they were satisfied that the person in question was a fit and proper person to be sent to such an asylum and the guardians refused to send him.

21,335. But I mean whether you would go so far as to say that they might compel the parents to send the child so afflicted to some institution instead of keeping it at home, uncared for and getting worse and worse?—I should be very reluctant to be driven to the conclusion that it is desirable to do that.

21,336. But the ordinary law is that they are compelled to send their children to school unless there is a valid reason to the contrary, do you think that imbecility is a valid reason?—I thought the question of expense came in.

21,337. No: that of course could be met by the guardians in all cases where the persons could not afford the expense of an education at a special institution?—That would amount to compelling a person to apply to the guardians to send his or her child to a rate-supported institution.

21,338. Yes?—I should be very reluctant to impose that as an obligation upon any parent.

21,339. What is the alternative? The alternative is that many of these children who might certainly be improved are left, according to the evidence we have had, in a neglected state, an unimproved state, in consequence—Because they have bad parents?

21,340. Because their parents are too fond of them in many cases; not because they have bad parents?—Because they have unwise parents. I think it is a very serious thing to interfere with parental responsibility and I should require very strong evidence to induce me to support a proposition which amounts practically to compelling a person to send his child to a pauper institution.

21,341. Could there be no way of meeting those cases where parents neglect to send a child to school?—If it could be shown that a parent was neglecting a child I see no reason why proceedings might not be taken before a magistrate.

21,342. But that would not meet the cases where the child is not neglected by his parent; cases where it is cared for at home but is not properly treated; because it cannot be properly treated in a private home in the same way as in an institution as far as curative treatment is concerned; is not that so?—That is so. I only say that any such provision should be fenced round with the most serious provisions for magisterial investigation into the circumstances of the case before such an order is issued; but the real difficulty, I may say, which has been always brought to my notice when I was an inspector, was the extreme difficulty that the guardians have in providing for these idiot children. It is not, I venture to say, that the guardians neglect, or are unwilling to perform, their duties, but that they really have no means of doing it.

21,343. Do you think that if these asylums were made more numerous in England, and situated at more convenient centres, there would be less objection to sending the children to a neighbouring place than there would be to sending them to one of two or three large asylums at a considerable distance from the parents' home; would not that be so?—I think so; but with regard to pauper children who are idiots, I know no institution except the Royal Albert Institution at Lancaster (which is confined to the six northern counties), and the Starcross Asylum in Devonshire, not at all a large institution. I am not aware myself of any other which takes in pauper children.

21,344. Then you think that is a very inadequate provision for the imbecile class?—Very inadequate.

21,345. Have you any reports from your inspectors, of those two asylums?—We have of the Starcross Asylum.

21,346. No official report of the Lancaster one?—No, because it is not under our inspection. We are not entitled to inspect it; it is not certified.

21,347. Do you not think it is desirable that any institution to which the guardians have power to send children, should be liable to public inspection?—That would require legislation.

21,348. Do you think is undesirable that it should remain uninspected?—I am not prepared to state precisely what the law is with regard to the power of the Commissioners of Lunacy over such an institution as that.

Mr. E. H. Wodehouse.
13 June 1888.

21,349. They visit it?—I am not sure that such an institution against its wish should be subjected to double inspection. Inspectors are not very popular, and if they have a commissioner of lunacy one day, and a Local Government Board inspector the next, they say that there are more inspectors in England than there are people to be inspected.

21,350. (*Dr. McDonnell.*) A very large number of the persons suffering from such calamities as blindness and imbecility belong to the humbler and poorer classes; but yet they are not technically paupers; would you allow such persons as that to be received into such asylums as we have now been speaking of; blind persons or imbeciles who do not belong to the absolutely pauper class, but to the poorer and humbler classes not technically paupers?—I think every case of that sort must be decided on its own merits, and that a person should not be relieved at the cost of the State unless he is destitute; and that he has prior claims upon his relations to those that he has upon the rate-payers.

21,351. Then a very large number of persons belonging to the humbler class of the people in this country are to be left to the precarious chances of what their own relatives in affluent circumstances can do for them?—I can hardly answer that without having explained to me what is meant by saying that they are "left." They have a full right to be maintained, and if their relations do not maintain them the guardians are bound to step in and do it, taking such proceedings against the relations as they may be able to do.

21,352. Do you not think that the State might do something for them without carrying them at once into the pauper class, an idea from which they shrink?—They only shrink from it from an insufficient consideration of what the shame of it really consists in. My view is that every person who is destitute has a legal right to have that destitution relieved; that there may or may not be a cause of shame in being so relieved; if it is from some unadvoidable misfortune there is no shame whatever in it, and the law gives it to him as an absolutely legal right and not as a matter of charity; but if he is brought to destitution from his own fault, from not having made provision for himself which he might have made, then the shame is precisely the same whether he is brought up in a workhouse, whether he is given outdoor relief, or whether he is brought up in an institution in the middle of the county entirely disassociated from all idea of pauperism, or in whatever other form the relief is given. Whereas in the minds of people there is great reluctance to receive relief in a workhouse close to their own friends, there is very little to receive it in a large institution in the county which has been carefully protected from all outward show of being connected with the poor law; and yet the cause of shame, if there be cause of shame at all, is precisely the same in the one case as in the other.

21,353. Do you think that it would be possible with regard to institutions of this kind to draw the line between the two classes that you have very well described, those who are pauperised by their own vices and follies and those who are pauperised by unavoidable calamities coming upon them without their personal fault?—I am quite unable to suggest any way in which that can be done.

21,354. Do you think it would be desirable if it could be done; in other words would you draw a line between a person who had been pauperised by vice and a person who had been pauperised by adversity?—I should draw the line in the shape of giving the person pauperised by adversity greater comfort, treating him with greater humanity, doing everything I could to alleviate his lot, but not by pretending that he was any less a pauper in the proper sense of the word than the man who had been brought to that condition by his own fault; because I think it is an unreal distinction, and pretending to be what it is not.

The witness withdrew.

Adjourned to to-morrow at 12 o'clock.

6, Old Palace Yard, S.W., London.

Thursday, 14th June 1888.

PRESENT:

THE RIGHT HON. THE LORD EGERTON OF TATTON IN THE CHAIR.

SIR TINDAL ROBERTSON, M.P.
B. ST. JOHN ACKERS, ESQ.
T. R. ARMITAGE, ESQ., M.D.
F. J. CAMPBELL, ESQ., LL.D.
EDMUND C. JOHNSON, ESQ.
ROBERT McDONNELL, ESQ., M.D., F.R.S.
WILLIAM WOODALL, ESQ., M.P.
THE REV. W. BLOMEFIELD SLEIGHT, M.A.
THE REV. CHARLES MANSFIELD OWEN, M.A.
L. VAN OVEN, ESQ.
CHARLES E. D. BLACK, ESQ., *Secretary.*

Mr. A. GRAHAM BELL (Washington) examined.

Mr. A. G. Bell.
14 June 1888.

21,355. (*Chairman.*) You are well known to have taken a great interest in the education and general condition of the deaf. I think you have before you President Gallaudet's evidence before this Commission with regard to the education of the deaf and dumb in the United States. Is there anything in what he says with regard to the education of the deaf and dumb in America that you would like to supplement or to make any remark on?—There are a few points which I should like to enlarge upon a little, in which I think Dr. Gallaudet has been misled, in relation to the statistics of the deaf and dumb as given in the census of 1880: which is the best census we have had taken in the United States. It was well known to Dr. Gallaudet, and to the other superintendents and principals of American institutions, that many deaf mutes were reported twice, once from the institution where they were receiving instruction, and once from their homes. Then there were numerous cases of persons who were reported as deaf mutes who became deaf at 80 years of age and 40 years of age, and so a good many of the principals and superintendents may have formed an idea that the census of 1880 is unreliable, and that the numbers of deaf mutes are as much overstated in that census as they were understated in the former census; they have a right to have that belief, but I am in a position to show that they are wrong and that the census of 1880 is very reliable.

21,356. You are now referring to Dr. Gallaudet's answer to question 13,105, in which he says: "It

"may be taken that the ratio before 1880 was too "small, and it may be presumed that one in 1,800 "would represent accurately the proportion?"—Yes.

21,357. You wish to make some remarks with reference to that statement?—Yes; of course it is not improbable that there may be duplicates in the returns obtained in 1880, but to my personal knowledge very great efforts were made by the census commission to eliminate all those duplicates, and to eliminate all cases where the persons reported had become deaf in adult life; certainly there could be no such error as would change the proportion of the deaf and dumb from one in 1,480 of the population to one in 1,800. According to Dr. Gallaudet's assumption the number of deaf mutes in the country on the 1st of June 1880, would be 27,864, that is one in 1,800 of the population, instead of 33,878, as given in the last census, the difference being 6,014 duplicates—that is to say, between one-fifth and one-sixth of the whole number. The actual number given in the census is 33,878, that is one deaf mute in 1,480 of the population. Dr. Gallaudet assumes that there is one deaf mute in 1,800 of the population, and if you make the calculation on the whole population of the country, which is 50,155,783, you will find that that yields a resultant of 27,864, which is a difference of 6,014 cases that are attributed to duplicates. That is a very serious charge against our census, and on seeing this statement I immediately telegraphed to the Rev. Frederick Wines, who had charge of this department of the census, telling him that the accuracy of the United States census had been attacked before the Commission on account of duplicates, and asking from him a reply to present to the Commission. I received the reply just before starting, and it is as follows:—"Spring- "field, May 28th, 1888. My dear Sir,—I thank you "most sincerely for your kindness in informing me "by telegraph that the accuracy of the last census "relating to deaf mutes has been attacked before the "Royal Commission. It is the first that I have heard "of it, and it is rather difficult to know how to "answer an attack which one has not seen. No "census that has been taken, in any country since the "world began, can claim to be free from inaccuracy; "and no one knows this so well as the census taker. "But every census before that of 1880 has erred in "the matter of the enumeration of the deaf, on the "side of omissions rather than duplication of names. "There are two ways in which duplications may "occur. First, a deaf mute may be enumerated in "the institution of which he is a pupil and an inmate, "and he may also be enumerated at the place where "his family resides. Second, it is possible that some "physician, in reporting to me the names of lunatics "and idiots within the sphere of his personal and "professional knowledge, may have reported a deaf "mute also. But the greatest possible pains were "taken to purge the list of all duplicates; and, if any "have remained undetected, it has probably been "owing to the mis-spelling of names in cases where "two different spellings were possible. But the "number of such duplications can in no event have "been considerable. A liberal estimate would not, I "think, place it above 100 in all, which, as you know, "is scarcely worthy of notice in an investigation of "such magnitude. And the duplications, granting "that they exist (which I do not admit without proof, "of which none has been laid before me) are much "more than counterbalanced by the known omissions. "If you will look at the enumeration by age, you "will perceive that the number of deaf mutes returned "under the age of five years is much less than it "must actually have been, as is especially evident "when attention is directed to the number of con- "genital deaf mutes. I have no doubt that, whatever "may have been said to the Royal Commission by "some person unknown to me, the number of "deaf mutes in the United States exceeds rather than "falls below the number reported in the census. "If there is any subject which I should like to urge, "had I the opportunity to do so, before the Commission, "it would be the necessity of more liberal provision "for the training of the idiotic and feeble-minded, "who are less likely to be fully represented before it, "than either the deaf or the blind." I am in a position to support Mr. Wines in a remarkable manner. It so happens that I have had access to the original schedules of the census returns, and I have noticed the pains and the care with which deaf mutes have been hunted up, hundreds and thousands of letters have been written to ascertain the accuracy of the returns; and for purposes of my own I have made a card catalogue of the deaf mutes in the United States; the undertaking was enormous, and is not completed yet; but for some months I have had in my possession, arranged in alphabetical order, the names of 23,969 deaf mutes from the census—that is nearly 24,000—these have been copied on cards from the census returns, and then I have had them arranged in alphabetical order, so as to bring all the surnames together, and so as to examine cases where a large number of deaf mutes would appear of the same surname, so that if any considerable duplication existed—if between one-fifth and one-sixth of the total number were duplicates—I must have observed it. But there is a method of testing the figures by which you may judge for yourselves. I happen to have in my possession an official copy of the Returns of the deaf mutes of the six New England States, numbering 2,581. Now, if you come to look over those you will find, if Dr. Gallaudet is right, no less than 461 duplications of names. I should be happy to place this before the Commission for their examination (*handing it in*). It will, perhaps, be interesting also to you to examine the kind of material that has been collected; but I must say that my study of the census returns has given me great confidence in the accuracy of the 1880 census, and has led me to the conclusion that a great deal of pains has been taken to eliminate duplicates and ascertain the truth. Mr. Wines, as you see in his letter, is of opinion that instead of the numbers of the deaf and dumb being over estimated in the 1880 census they were under estimated.

Mr. A. G. Bell.
14 June 1888.

21,358. That would generally be likely to be the case?—Yes. He estimated that there were, in 1880, probably 35,000 deaf mutes in the United States instead of the actual number shown. Of course that is a matter of opinion.

21,359. Have you any remarks to make on any other statement of Dr. Gallaudet?—Of course there are many points on which I differ from Dr. Gallaudet, but those are chiefly differences of opinion. I should like to supplement Dr. Gallaudet's historical sketch of the schools and the organisation of schools, given in answer to questions 13,111 and 13,112. I think his statements are very accurate, but I should like to say a few words on the policy of the States in dealing with their deaf and dumb, from the time when the instruction of that class began to be taken up by the Government. In 1815, when the first school was established, the number of deaf and dumb was not known; they were supposed to be few in number and widely scattered through an enormous extent of country, and a policy was adopted, which I shall term a policy of centralisation—a policy to reach the deaf and dumb by taking them away from their homes and bringing them together into some central institution. The Federal Government made a grant of land to the American Asylum in order that this school might be a school for all the deaf and dumb of the United States, and there were many who seriously doubted whether there would be enough pupils to support a school. The plan of centralisation soon failed. The National School at Hartford could not accommodate a fraction of the number of the pupils who made their appearance. The State Governments then took action, and the plan that was then first adopted was the plan of centralisation in each State, and the attempt was made to bring into one school the deaf mutes of the State. But, as statistics regarding the deaf became more accurate, these State institutions

Mr. A. G. Bell.

4 June 1888.

were found to be insufficient to accommodate the deaf mutes, and a gradual splitting up of the larger institutions has taken place. The central institution in New York has been split up into seven or eight distinct institutions, scattered in different parts of the State We have now over 50 State institutions.

21,360. We were told that there are 67 ?—I cannot tell you the exact number without consulting my notes. I am speaking of the centralised institutions, but it was found that they were not enough to accommodate the deaf children who required instruction, and another move towards decentralisation took place in the establishment of day schools in the large cities. We have now 69 institutions, including day schools and private schools. The Census returns of the United States of 1880, show that there were 15,059 deaf children of school age (that is to say, "from five years old to twenty") and 5,393 in all the institutions put together. I find on examining the census, that the day schools are not taken into account, but the total number in the day schools is comparatively small. At all events, whatever the actual number of deaf children growing up without instruction may be, it is evident that whatever allowance we may make, certainly we have as many deaf children of school age growing up without instruction, as there are in all the schools and institutions in the United States put together. This, I think, has arisen largely from the policy adopted by the States, the policy of centralisation. Mothers will not part with their children, except upon compulsion. In a country like ours, the value of physical labour is so great as to prevent many children from being sent to school, especially in country districts. The whole plan of centralisation has failed to bring under instruction one half of the deaf children of school age. When I came to examine the statistics of each State, I found a similar condition of affairs in every State, showing that the fault is in the system, and is not remediable by any increase in the number of institutions. A certain per-centage of pupils will escape instruction. I have therefore urged the adoption of the policy of decentralisation to bring schools as near to the homes of the children as possible; to extend the day school plan, to supplement our institution plan by an enlarged development of day schools, acting upon the principle that the nearer the school can be brought to the home of the pupil, the less likelihood is there that he will escape instruction. Other reasons also urged me some years ago to advocate the policy of decentralisation, and I would supplement Dr. Gallaudet's testimony by pointing out to you how far that policy has been adopted in one particular State. It may be within the knowledge of the members of this Commission that a conference of teachers of the deaf met in the Senate Chamber at Madison, Wisconsin, to confer with the teachers of the hearing, at a meeting of the National Educational Association. At that meeting I advocated the policy of decentralisation. Great interest was excited in Wisconsin, as a Bill had been brought forward before the Wisconsin Legislature advocating the same thing. It was the first attempt to embody in a law the policy of decentralisation, whether it will be successful or not I do not know. I am not a law maker, but I can see very clearly the principle involved, and when the Committee of the Legislature invited me to visit Wisconsin and speak upon the subject of this Bill I did so, and embodied the substance of my remarks in an open letter, which was addressed to the members of the Legislature and Senate of Wisconsin, a copy of which I beg leave to present to the Commission, which will show you my views upon that subject (*handing it in*).

21,361. (*Mr. St. John Ackers.*) What was the date of that meeting at Wisconsin? — The meeting in Madison was July 16th, 1884; the date of the letter is February 1885; the Bill passed on April 15th, 1885, and it was amended on March 12th, 1887. I have printed copies of this Bill which I will hand in; the printer, however, has placed the amendments before the Bill itself.

21,362. (*Chairman.*) Is there any attendance officer in the United States to see that every child goes to school?—Yes, in some cities.

21,363. Not in the rural districts?—I cannot speak with authority; in Boston there are what are called truant officers. I have urged that there should be no law of compulsion, unless you can offer a choice between a day school and an institution. I recognise the right of the community to see that deaf children are educated, for uneducated they may be a danger to the community in which they live; but I do not recognise the right of the community to take a child away from his own parents without their consent; unless it can be clearly shown that his education necessitates removal from home; but if the State could offer to the parent of a deaf child either an institution or a day school, then I could advocate compulsory education. In this Bill, to which I have directed your attention, the object has been to facilitate the giving of State aid to day schools. Hitherto the State has recognised only the central institution, and if parents want their children educated at home, or if they start a school and provide a teacher they do it out of their own pockets, and get no State aid. This Bill is to encourage the growth of these little schools, so that if there should be one parent of one deaf and dumb child he can have State aid to get a teacher; such teacher being approved by the State superintendent of public instruction. He will get 100 dollars from the State Treasury through the machinery that has been provided. If he applies to the nearest school board and asks for a school for his deaf child the teacher will say yours is the only child, or there are only two or three, well the parent will say, if you can get this State aid of 300 dollars for these three children, I and the other parents will meet the balance required to pay the salary of a teacher. That is the idea. It is only an experiment; it is a new departure, but I think it is an important departure. Immediately on the passing of the Bill a worthy private school that had been struggling along without recognition by the State, the Phonological Institute at Milwaukee, at once received State aid, and became a public school under the public school system of Milwaukee. Two years ago another little school with six pupils started at Lacrosse in Wisconsin, under the provisions of this Bill, and I hope by degrees, as parents find the advantages that may be derived from these little schools, that the whole of the State of Wisconsin may be dotted over with little day schools around the central institution which will then be enough to accommodate all the children who cannot attend a day school.

21,364. Are these schools conducted on the oral or the combined system?—The oral system.

21,365. Those established in that State?—Those established in that State under the provisions of the Bill. The Central Institution is on the combined plan. The teachers in those new schools much prefer the teaching of articulation, but in the Bill there are no provisions with regard to the method of instruction. I do not advocate any restriction in regard to methods of instruction, nor did the promoters of the Bill. We are very much inclined to believe in America, with my friend Dr. Gallaudet, that diversity in methods is favourable to progress, but what we want is some superior power over the institutions and schools to collect statistics and test the results of instruction; we have no such machinery. In Wisconsin we have a general superintendent, but generally throughout the States there is no general system of State inspection.

21,366. That you advocate?—Yes. I would not impose my own ideas, upon any school. I would not have one method of instruction if I could. I think that honest men differ, and that the proper way to test methods is by results, and there are no statistics extant by which we can test results. I go to the conventions of teachers of the deaf in America and listen to the discussions between the sign and manual and the oral teachers, and then I study historically

what happened a hundred years ago. The same arguments and the same things are reproduced. The same arguments have been brought forward for a hundred years, and the questions raised have not been settled. The reason is we have no mechanism for testing methods of instruction by results. I would urge upon this Commission the importance of devising and bringing into operation some practical method of testing by results, and getting statistics relating to adult deaf and dumb to show the influence of methods of education on their after life. I would not have you put any restriction on methods, diversity is favourable, but I would have you avoid centralisation. We have found another evil to spring from centralisation in America, a centralised institution in a great State becomes oppressive; an established method of instruction, like an established religion, becomes intolerant, it crushes out the little schools that appear round about it. And, by-the-bye, in that connexion I would like to direct your attention to what Dr. Gallaudet says in answer to question 13,131. He says "For all practical purposes the private schools are "hardly worth considering," I say they are. There is a great lesson to be learnt from private schools. The existence of private schools in a country like ours, where the States are munificent in their benefactions to the deaf and dumb is an anomaly. Why do these private schools exist? They express the existence of grave dissatisfaction with the institutions—that is their significance —and when you come to examine the statistics of those private schools you will find that they are of two classes, one purely religious and the other purely oral.

21,367. You mean the dissatisfaction is partly on religious grounds and partly with regard to not teaching speech?—Yes, and the day schools also are expressive of dissatisfaction with the life in the institution. As you examine the statistics of these private schools another thing becomes significant, they keep changing. A little school starts up and then it will go out of the list of private schools and become a State institution. It struggles along for a short period in adversity, because it cannot get the recognition of the State; it cannot at first get State aid, and then when it gets State aid it goes out of the list of private schools, so they always seem to be small in number. There are several States in which day schools have been established in the large centres of population, supported partly by the State and partly by the cities in which they are established; but the effect of this Bill that was passed in the Wisconsin Legislature will be to push the day school system into the rural districts, and into the smaller districts of the country, where only a few children can be brought together. The expense of the education of a deaf child at an institution is so great as to render it a matter of economy to the State to send a teacher wherever you can have four or five deaf children brought together rather than take them to an institution.

21,368. (*Mr. Woodall.*) There is nothing to prevent any municipality under the public school system establishing a day school for the deaf and dumb?—Nothing except the expense, and that does prevent the establishment of such schools except in the large cities.

21,369. (*Chairman.*) In answer to question 13,115, Dr. Gallaudet says, "There are day schools in about six "or seven cities, and the next question is have they any "endowments?" To which his answer is, "Some of "them have endowments, two or three." Therefore, it is a very small number which have endowments. Practically, with the exception of Wisconsin and these two or three day schools, they are not generally recognised or subsidised by the State?—I do not know; these private schools, as I say, are significant; the policy of centralisation has rendered it necessary for the institutions to give religious instruction to their pupils. It is true this is done in a very guarded and a very proper way, but still that has led to dissatisfaction and the establishment of denominational schools, chiefly Roman Catholic, these are chiefly, I think, upon the sign system.

Mr. A. G. Bell.

14 June 1888.

21,370. In answer to question 13,128, Dr. Gallaudet says: "It is the rule to give religious instruction to "a very slight extent, hardly more than the reading "of the Bible and a prayer, and in some schools not "even that is given." Does that apply generally to schools in which the deaf and dumb are taught?—I think it does. There are some parents that object to that, and others say it is not enough.

21,371. Some parents object to any religious instruction being given at all?—Some object to any religious instruction being given at all, and others wish it to be given according to their own creed or denomination, and so we have a number of denominational schools that appear among the private schools, for those are generally not recognised by the State, excepting in the State of New York. The private schools (other than denominational) are exclusively oral, and the meaning of that is that there are certain parents and persons dissatisfied with the instruction given in the institutions, and they would rather pay for the instruction of their children by the oral method than send them free of charge where their speech is not attended to—that is the significance of it. So I do not agree with Dr. Gallaudet in thinking that these schools are hardly worth considering. In fact these private schools have effected a great reformation in the United States. They represent a germ of life, a very little thing in itself, but it keeps pushing and growing Every now and then one of the little schools will become an institution. The teachers in these oral schools, who are nearly all ladies, who hardly ever venture to express an opinion in public, have worked quietly and silently and the establishment of those schools has effected a great reformation. They have forced the institutions to give attention to speech.

21,372. From Dr. Gallaudet's evidence generally I think we should form the impression that combined schools are in the majority in America—your evidence rather tends to show that there is a wish for more instruction in speech such as is given in the pure oral schools?—Yes, that is my reasoning on the subject. I may be wrong.

21,373. There is dissatisfaction with the State schools and that shows itself by the formation of these private schools?—Yes.

21,374. Dr. Gallaudet says that the present feeling is in favour of adding the oral system to the sign system, which means the combined system. You say that the establishment of these private oral schools shows that there is an inclination to go still further, and to give more instruction in speech than is given in the combined schools?—Yes; and as these private oral schools increase in size and show successful results, the institutions become alarmed and immediately commence to teach speech to a portion of their pupils, so I look upon these private oral schools as a lever which is enforcing greater and greater attention to the teaching of speech and speech reading in our institutions, but I cannot follow Dr. Gallaudet in his classification of methods. I do not recognise any combined method or system, and I notice that the very institution that he brings forward as a typical combined institution—the Pennsylvania Institution—discards the idea; this shows the vagueness with which the term is used. In answer to question 13,141, speaking of the Pennsylvania Institution, which is undoubtedly one of the finest of our institutions, and is doing real good honest work in all branches of education, oral and otherwise, he says:—"The system "of which we speak in America as the 'combined "system,' is one which allows of the bringing to-"gether of all methods under varying conditions. "For example, the Philadelphia Institution has a "separate oral branch in which pupils who are "found to succeed well in speech are taught on what "would be termed here in England the pure oral "method. This, which was started as a manual "school, is now conducted under what is called the

Mr. A. G. Bell.

14 June 1888.

"combined system." In a note which the principal of this institution has sent to me occurs this statement: "The combined system has no place in our "school at present." I have no doubt it is a combined system in the mind of Dr. Gallaudet, but it shows the vagueness with which the term is used, that the principal of that very institution uses that language. I think it is very important that we should consider the proper classification not only of the methods of instruction, but of the deaf. I agree with Dr. Gallaudet that the Philadelphia Institution is a model institution; there is no dispute as to what is done, but one terms it an institution on the combined system and the other does not. I may as well say here that before I left America I was anxious to present before the Royal Commission a picture of the condition of the education of the deaf and dumb in America, and to give to you the views of the principals and superintendents themselves upon the questions in which you are interested. I therefore directed a circular letter to the principals and superintendents of all the institutions and day schools and private schools in America, including Canada, and I have received replies from 58, and the mass of material collected is very valuable. I was in hopes to have been able to present to you this testimony in printed form at least a day before my own examination. On account of the shortness of time I have been unable to do so, but by the kindness of Messrs. Spottiswoode I have been able to get the greater portion of it in print in the shape of proof. Messrs. Spottiswoode have set their whole establishment to work upon it, and I am able to hand to you the answers to some of the questions (*handing in the same*). This is what Principal Crouter says of his own institution: "The combined system has no "place in our school at present. Our pupils are "taught either orally or manually." And then, in answer to another question, he says: "I believe "in oral instruction (separate oral) for all deaf "children who can be successfully instructed by "that method, and in sign instruction for those who "cannot." There is one other point of fact in Dr. Gallaudet's testimony to which I should like to refer. In answer to question 13,139 he states:—"A very "large majority of the leading schools are carrying "on the combined system. That means that in a "large majority of the public schools speech is taught "to as great a number of pupils as it is found pos-"sible to teach with success; that is the policy in "these combined system schools." I know that this is not done, whatever the policy may be.

21,375. (*Dr. Campbell.*) When he says "public schools," does he refer to ordinary public schools?—I think he is referring to all the institutions and schools that are supported by the State or the city.

21,376. Probably when Dr. Gallaudet was speaking of the combined system being taught at the Philadelphia Institution he meant that the pupils there were taught by either system, not that each pupil was taught both orally and by the sign system, that may be so?—Yes, it is either one or the other that is taught at that institution, but not both combined. I have here a tabular statement showing the amount of teaching of articulation in the United States in May 1883. Out of 6,232 pupils in the United States, 1,991, or 31·9 per cent., were taught articulation, and 4,241, or 68·1 per cent., had no instruction whatever in speech.

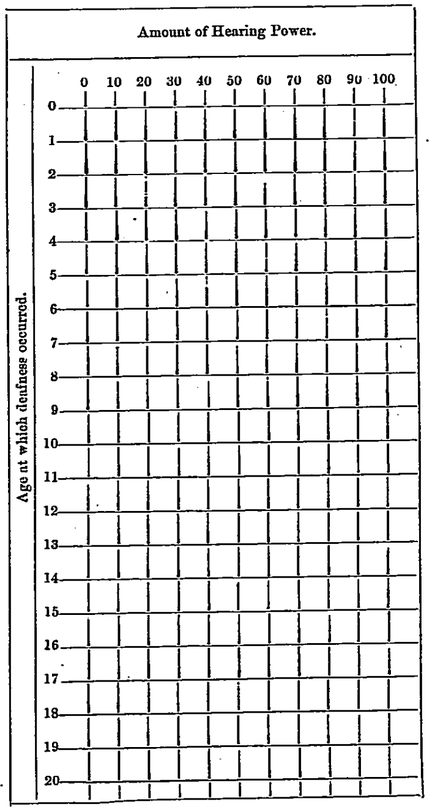
21,377. Upon that I would ask you this: Do you think that 68 per cent. of the deaf and dumb in America could not be taught articulation?—Undoubtedly not; they could all be taught articulation. I do not think they could all be taught to read from the mouth.

21,378. Are those 6,232 under instruction at the present time?—No, this refers to May 1883.

21,379. There was an increase between 1880 and 1883 from 5,393 to 6,232?—Yes; those were not all; this information was obtained through a circular letter of inquiry directed to the principals of the institutions by the principal of the Clarke Institution at Northampton. Here are the full results of that inquiry (*handing in the table.*) In looking at the totals you will find that 6,232 was the total number and 1,991 was the number taught articulation. Then discriminating those who were taught orally from those who used articulation simply as an accomplishment, who had instruction for an hour or half an hour a day, we find that the number orally taught was 886, or 14 per cent.; 1,105, or 18 per cent., were taught speech as an accomplishment, making no use of it in the schoolroom; and 4,241, or 68 per cent. received no instruction whatever in articulation; that is in 1883. The total number of pupils under instruction in 1883 was 7,169, and of these 6,232 were reported to the Clarke Institution.

21,380. Since that time have you reason to believe that the number of pupils receiving oral instruction had increased?—In 1884 out of 6,228 pupils, 2,041 or 32·8 per cent. were taught articulation, which is an increase, and 4,187 or 67·2 per cent. were not. In 1885 out of 6,780 pupils, 2,618 or 38·6 per cent. were taught articulation; that is an increase again; and 4,162 or 61·4 per cent. were not. In 1886 out of 6,596 pupils, 2,484 or 35·7 per cent. were taught articulation, that is a decrease, and 4,472 or 64·3 per cent. were not. In 1887, this is the year that Dr. Gallaudet speaks to, out of 6,862 pupils, 2,556 or 37·2 per cent. were taught articulation, and 4,306 or 62·8 per cent. were not taught speech at all.*

NATURAL CLASSIFICATION OF THE DEAF.



* For amended reply *see* queries 21,496 and 21,497.

CLASSIFICATION INTO EIGHT GROUPS.

Period of Life when Deafness occurred.	The Deaf.	
	Totally Deaf.	Semi Deaf.
From birth or infancy (*i.e.*, less than 2 years of age).	1	2
From early childhood (*i.e.*, 2 years and less than 5).	3	4
From late childhood (*i.e.*, 5 years and less than 14).	5	6
From youth (*i.e.*, 14 years and less than 21).	7	8

21,381. (*Dr. Campbell.*) In regard to that year when there was a falling off, do you know what the cause of it was?—I do not know the cause. We might analyse the statistics and discover the cause, but I have not gone sufficiently into them to do so.

21,382. (*Chairman.*) Your opinion is, that all those that could be taught to speak at all could be taught to speak orally, even if they could not be taught to lip read?—Undoubtedly. I am too familiar with the mechanical nature of speech to doubt it for a moment.

21,383. With regard to the classification of the deaf, have you any suggestions to make?—I am very much dissatisfied with all the classifications I have seen. They seem to me to be based upon an inconstant quantity, the character of the speech (which can be modified by instruction). We classify the deaf according to the amount of muteness, and that amount of muteness can be remedied by instruction. It leads to a false classification, as false as if we were to classify them by the amount of ignorance, which is also remediable. I would suggest a natural classification of the deaf. It is now universally recognised that those whom we term deaf mutes are simply persons who are deaf from childhood; that the natural defect is a single defect and not a double one, and muteness or dumbness is the result of the natural defect and not a defect in itself. I would classify pupils by the natural defect alone, and there are only two elements to be determined which would completely define, as it were by means of lines of latitude and longitude, the position of a deaf child in the whole mass of the deaf. These two elements to be determined are (1) the age or period of life at which the deafness occurred, and (2) the amount of the defect. If we say that a child became totally deaf at five it is understood what that means. We do not require to say that he is a semi-mute—that is the resultant—and if we say a child was born deaf we know that the mental condition must be entirely different. In America we measure the amount of hearing power of a child, so that we can say that a child has a hearing power of 10, 20, 30, 40, 50, or 60. Let us represent that by vertical lines, the lines of longitude of our map, and represent the age at which the deafness occurred by horizontal lines or lines of latitude upon the map, then we completely define on that map the position of any deaf person. If you do not measure precisely the amount of hearing power you may measure it roughly. You may divide the deaf into two great classes, which you may term the totally deaf and the semi-deaf—those who have not a sufficient amount of hearing to perceive the difference of vocal sounds and those who have. Then, again, if you did not know the precise age at which a child became deaf you could classify roughly by periods. For instance, you might put in one class all those who had been deaf from birth or infancy, *i.e.*, those who had become deaf under the age of two years. Then those who had become deaf between two and five might constitute the "deaf from early childhood," and those who became deaf from five to the age of puberty the "deaf from late childhood," and above that the "deaf from youth," and if you followed that classification you would divide the deaf into eight groups, each group having marked characteristics of its own. I would recommend to the serious attention of the Commissioners some natural classification of the deaf under those two heads, the amount of the defect and the age or period at which the deafness occurred. Another point is important, how is it that we fail to discover so many of the little deaf children we desire to bring under instruction? Their parents will not call them deaf mutes. For instance, a child becomes deaf from scarlet fever, at the age of 4½. The census taker comes along and says, "Are there any deaf "mutes in this house?" The parent says "No." But suppose the census taker asked if there were any persons in the house who were deaf or hard of hearing, the answer would be "Yes, my child can-"not hear since he had scarlet fever." Then if the census taker said "At what age did the deafness "occur?" The answer would be "4½ years." I would recommend that such questions as those should be asked by your census takers when they take the next census. I am now urging upon the census authorities in the United States the advisability of asking the questions, "Are there any deaf or hard of "hearing persons in this house, and if so at what age "did the deafness occur?" and if you cannot get at the age, at what period of life did it occur. The census takers might get at that as nearly as they could; then after that the census taker could ask about deaf mutes; if you get these particulars you can completely determine the case; we can get at those who belong to the class called "deaf and dumb" without hurting the feelings of the parents of those children, and it is those little children we want to reach.

Mr. A. G. Bell.

14 June 1888.

21,384. (*Sir Tindal Robertson.*) Would you recommend that the census takers should inquire into the cause of the deafness?—Certainly, all the information which could be got should be got in the census return, but the recording of the fact of the deafness and the age at which it occurred would enable us to find out the deaf children of school age in time to bring them under instruction.

21,385. (*Chairman.*) With regard to classification of methods of instruction have you any remarks to make?—It seems to me that we want to think very carefully over the methods of instruction, and find some suitable and natural classification of them. I cannot say that I have hit upon such a classification, but I have some ideas upon the subject to offer to you which perhaps you may think worthy of consideration. In this classification I cannot see any place for the combined system, it is neither one thing nor the other. When we come to consider that the possibility of instructing a deaf child is based upon the possibility of teaching it a language of communication whereby ideas may be imparted and the mind cultivated, I think in that language of communication we have a basis of classification. You cannot very well have a combination. It is difficult for a person to think in two languages. There is some one language in which a child thinks: the question is, what is that? Whatever your method of instruction may be the child thinks in some form of expression. When we think we think in words—or rather *with words*, for I presume no one really does think in words, although we have a consciousness of what we mean by "thinking in a language." We think in the English language, and when we come to learn French or German we are still English, and we translate. What is the language a deaf child thinks in? It is that language which is habitually used by the people around to impart ideas to the child. That is the basis of classification to my mind, and you may divide that broadly into two classes, one the ordinary language of the people and the other a special language. I do not care whether it is sign language, or German or French. It is a

Mr. A. G. Bell.

14 June 1888.

language special to the child if it is not the language of the people. You have those cases in which the language of communication is the ordinary language of the people, and you have those cases in which the language of communication and thought is a special language different from the language of the people.

CLASSIFICATION OF METHODS OF INSTRUCTION.

Basis of Classification.	Class to which the Method belongs.	Sub-group.	Specific Methods of Instruction.
The language employed to impart ideas.	Ordinary Language Methods.	(1.) Manual Methods.	(*a.*) The Manual Alphabet Method.
			(*b.*) The Speech-reading Method.
		(2.) Oral Methods.	(*c.*) The Auricular Method.
	Special Language Methods.	(3.) Sign Methods.	(*d.*) The Sign-language Method.

21,386. Before a deaf and dumb child has had any instruction at all his mind is the same as that of a speaking child or a hearing child; why should there be a special language for a deaf and dumb child differing from that for a speaking child?—We all start in life without a language, and we all acquire a language by instruction.

21,387. By imitation?—By imitating the language spoken by those round about us; any language that a deaf and dumb child can imitate, that is clearly perceived by his senses, that is used by the people round about him he will learn by imitation. If people round about him do not use any language that he can acquire by imitation he goes to work to invent one, and the moment a child commences to invent a language of his own he has got to the age when he should be taught a language. He wants to express ideas. It seems to me that the classification of methods of instruction should be based upon whether the language of the people is used as the language of communication, or a special language not the language of the people. Now we may divide the "ordinary language of the people" into two sub-classifications, viz.: (1) Its written (or "manual") form, and (2) its spoken (or "oral") form; and among the sub-divisions of "special language" would come (3) a language in the form of gestures (or "signs").

"Manual," "oral," and "sign" methods may be still further sub-divided according to the mode in which the language is presented to the pupil so as to designate specific methods of instruction.

1. Under "manual methods" would come (*a*) "*the "manual alphabet method*," which rejects the sign-language and relies upon writing and a finger alphabet.

2. Under "oral methods" would come (*b*) "*the "speech-reading method*" (pure oral), and (*c*) "*the "auricular method*," the spoken language of the people being presented in the one case to the eye, and in the other to the ear; and

3. Under "sign methods" would come (*d*) "*the "sign-language method*" used in America where the "combined system" is employed.

There we get a distinct basis on which to build, broad enough to include other possible methods.

21,388. Is not the old classification more simple, namely, (1) language, and (2) signs; the one appealing to the eye and the other to the ear?—I only submit this, without very much confidence, to the Commission as a basis upon which we might perhaps arrive at some reasonable classification of methods.

31,389. (*Mr. Johnson.*) What you call a special language would be sign language?—The language of signs is a special language; it is immaterial whether it is sign language, or French, or German, or Hottentot; it is not the ordinary language of the people, and when a deaf and dumb child is taught in sign language he thinks in that sign language, and he has to go through the mental process of translation when he comes to use English, and it is that difficulty which separates the deaf who are so taught from the hearing world in adult life, and leads the deaf to keep together and not mix with hearing people, and to intermarry and have deaf children.

21,390. That is on the hypothesis that he is taught signs?—On the hypothesis that he is taught a language that is not the language of the people.

21,391. What is your definition of special language?—I mean by the term any language that is special to the deaf and not used by the people among whom they live.

51,392. (*Chairman.*) Do you think much can be done in the way of improving the hearing of the deaf?—When we realise the truth of the fact that there is no other defect in those that we term deaf mutes than the simple defect of deafness, we may also realise that there may be degrees in the amount of that deafness, and we have been startled in America by the discovery that large numbers of those who are congenitally deaf are only very slightly hard of hearing; they suffer from such a slight disability of hearing that, had the defect occurred after they had learned to speak, they never would have appeared in an institution for the deaf and dumb. Now, the difficulty is to ascertain the amount of hearing possessed by an apparently deaf child. Experiments have been made with hearing tubes and various appliances for a great number of years past. The first case on record in which an attempt was made to ascertain to what extent a deaf person could be made to hear occurred before 1867, when Mr. Whipple, in Connecticut, who had a deaf mute son, tried to teach him to speak. Mr. Whipple, who was a man of little culture and education, was dissatisfied with the instruction given in the institution at Hartford, and he set his son up in front of him and shouted at him, and mouthed at him, and the boy learned to speak. Mr. Whipple thereupon formed the erroneous idea that all deaf children could be taught to speak in that way. He produced his son to the Principal of the American Asylum in Hartford, and the principal of that institution went behind the boy, about a foot behind his ear, and spoke to him, and the boy answered him. The principal unfortunately came to the conclusion that it was a case of fraud or self-delusion, and that the boy was not a deaf mute at all. He failed to see in this case the beginning of a great discovery, that the hearing power could be educated and utilised.*

21,393. We have had evidence of the fact that instruction in speech does develop a certain amount of hearing?—Then I will not trouble you by going into the history of the development of that mode of treatment of the deaf, but I will proceed to give the per-centage of those that are capable of receiving auricular instruction.

21,394. When a child first comes into school are any means taken to ascertain the amount of hearing that the child possesses and how far any of these auricular appliances would be a benefit to him?—It is very difficult to ascertain the amount of hearing a child possesses. In the first instance in the case of young children, they almost always appear to hear.

21,395. You mean they always say they hear?—Yes; it is well known that in our institutions for the deaf the pupils are summoned in from the school ground by ringing a dinner bell, that indicates that a good number of them can hear, and I suggested the experiment of counting the number of pupils who could hear the ringing of a bell, and so determine the per-centage, but Dr. Gillett of the Illinois institution replies, "I "find all my children can hear the ringing of the "dinner bell, but only five per cent. can hear the "school bell." Mr. S. T. Walker, the Superintendent of the Kansas Institution, says, that out of 161 pupils tested "88 said they could hear, but 48 of these also "said they heard when the bell was not rung." Still, some very interesting statistics have resulted from the experiments that have been made within the last month in America upon that question, and I have been able to get a per-centage of cases where there is partial hearing. I find that out of 1,475 pupils tested 304, or 20·6 per cent., can hear the ringing of a bell.

21,396. How was that tested?—Mr. Walker (Superintendent of the Kansas Institution), describes the method as follows:—"I had them turn their backs to "me each trial, and at a signal face me and tell "who heard. These trials were repeated several times "and one or two of them were false trials, when the "bell was not touched. Notwithstanding 48 of the "161 tried answered that they heard the bell *every "time*, even when it was not touched. Knowing "that to make statistics of real effect (or rather the "conclusions drawn from them) they should be as "nearly correct as possible, I was careful to have "these tests correct."

21,397. (*Dr. Campbell.*) It would make a great difference whether the children stood on a wooden floor or a stone floor; have you any information as to what sort of floor they stood on?—No. In the proof I handed to you you will find some remarkable testimony regarding auricular instruction. Those are reports from the institutions which have pursued auricular instruction as a distinct method, giving details of the instruction, and the method of instruction, and giving full statistics.

21,398. (*Chairman.*) Would the system of auricular instruction, if it were systematically and constantly pursued, tend to develop the general hearing?—The apparent hearing power is enormously developed by it.

21,399. (*Mr. Van Oven.*) In such a case as you referred to just now, do you think the continuous shouting in a boy's ear would tend to develop the power of hearing?—Yes. It is extremely doubtful whether it produces any real improvement in the hearing proper, but there is a marvellous improvement in the power of discriminating sounds, but that comes, I think (and it seems to be the prevailing impression in America), from an increased knowledge of language and increased attention, but certainly it is the case that pupils who at first exhibit very little power of imitation when you speak into a hearing tube, after being taught orally and auricularly for a few months, come to understand through that hearing tube, and to discriminate sounds, which they could not discriminate before, and it is a great problem whether there is any improvement in the hearing or not. I am inclined to think there may be some slight improvement, due to that cause, because when we perform the act of listening we use a muscle, in the action of listening there is a contraction of a muscle adjusting the tension of the membrane, and why should not that muscle grow by use, like other muscles of the body. I must say, however, that this opinion is contrary to the opinion of all the aurists to whom I have spoken. Take a congenitally deaf child, he has no language, that lack of language is an element in making his deafness appear greater than it really is. Suppose a Chinaman were to test your hearing by asking you to imitate some Chinese word or phrase, it would be rather hard on you if he attributed your inability to repeat that word or phrase to lack of hearing. A deaf child has to contend against the difficulty of the want of familiarity with the language. The English language is Chinese to that child, and as he advances in knowledge of language he also advances in power of perception. I may refer to a remarkable instance of what can be done in the way of auricular instruction: there is a young man, a teacher in the New York Institution, Mr. Jones, who was a congenital deaf mute, or became deaf very early in life. He passed through the whole curriculum of that institution as a deaf mute, he graduated from that institution and went through the course in the National College at Washington as a deaf mute; he then married a hearing lady and became a teacher in the New York Institution. Just about this time experiments, which attracted a great deal of attention in America, were being made in the Nebraska Institution, where it was shown that 16 per cent. of the pupils could be taught auricularly, and that of those the majority could be turned out of school as simply "hard of hearing speaking persons," and not as deaf mutes. The wife of this gentleman knowing he had some hearing, thought she would like to try some experiments with him, and she set to work to teach him to speak; and he has learnt to speak and learnt to hear. When I was at the New York Institution, I placed him at the end of the schoolroom, and I talked with him, and he answered me, then I went out of the room backwards into the passage a considerable distance away, and I could carry on a conversation with him by shouting to him.

21,400. Is any special instrument other than the ear trumpet used?—The tendency seems to be to discard instrumental aids, but the majority of teachers prefer to use, temporarily at least, what is known as the Currier "Conico-cylindrical conversation tubes, with duplex ear-piece. This (*producing it*) is a photograph of a class at the New York Institution for the Deaf and Dumb which will show the nature of the apparatus. Each child has a duplex tube (two speaking tubes connected to a single ear-piece). The teacher speaks into one of the speaking tubes, and the child itself into the other, the idea being that he may hear his own voice and compare the intonation of his voice with that which proceeds from the teacher. In class instruction the teacher takes a whole bunch of these speaking tubes in his hand at once, and speaks into them all at the same time. This operation is shown in the photograph. I may say that this auricular instruction is carried on as a separate method of instruction in four schools in America. The endeavour was first to test the hearing of all the pupils, and then to form an auricular class.

21,401. Are those schools oral exclusively?—No. Three of them are what Dr. Gallaudet would call combined schools. The other is a private oral school.

21,402. Are they leading schools in America?—Three of them are State institutions. Each one is a leading school in its own State, and I presume no principal would like me to discriminate between one institution and another. I have statistics from Nebraska if you would care to have them. At Nebraska they started a class to test whether the audiphone was of any value, each child placed one against the teeth, and all the children who seemed to perceive any sound were placed in a class by themselves, and attempts were made to get them to imitate the sounds uttered by the teacher; it was found that a certain proportion did so, and then it was found that the audiphone was of no use, and that they could do just as well without it. That was the origin of this auricular class, and Mr. Gillespie, the Principal, states that his belief is that 16 per cent. of all the pupils in our institutions are capable of auricular instruction. In New York experiments were made by myself in conjunction with Mr. Currier and Mr. Clarke, and in Washington by Professor Gordon. We had been appointed a committee to investigate this subject of hearing power, and we devised an apparatus which we have called an audiometer, for measuring the power of hearing, and I have brought one of these instruments with me which I shall have great pleasure in presenting to the Commission. The hearing power of several hundred deaf mutes has been tested by an apparatus like this. It consists essentially of two coils of wire and a magneto generator which generates an intermittent current of electricity in one of the coils, the other coil being connected with

* Mr. Whipple attempted to put his ideas into operation by opening a private school, "The Whipple Home School," at Mystic, Conn. He succeeded in teaching all his pupils to speak though not to hear. After his death the school was carried on by one of his sons ("Zeno," I think), who proved to be a successful and ingenious teacher, and who invented a very interesting form of alphabet (known as "Whipple's Natural Alphabet"), for the purpose of teaching articulation. The characters were pictorial of the positions of the vocal organs in uttering sounds, thus having the same basal idea as my father's system of "visible speech," but it was devised, I believe, quite independently of my father. Mr. Zeno Whipple (the inventor of the alphabet) died a few years ago, but the school still exists among the private schools.

Mr. A. G. Bell.

14 June 1888.

Mr. A. G. Bell. 14 June 1888.

a telephone, and currents are induced in the secondary coil by the action of the first, but the intensity of the induced current depends on the distance between the two coils, so that if you get the two coils in close proximity you get a tremendous noise; but as you draw one coil away from the other the sound becomes less and less till at a certain distance no sound can be perceived. Then the distance between the two coils we take as the measure of the hearing power.

21,403. (*Rev. Mr. Owen.*) Is that audiometer your invention?—Partly my invention and partly Mr. Clarke's. We got it up among us, and it has served a very useful purpose. We do not know how far it may be of value; it is of value in giving numerical estimates of hearing, but it takes a great length of time to test hearing. We tested the hearing of the pupils in the New York Institution by that instrument, and also by the ringing of a bell and also by shouting, and I came to the conclusion that if a child can hear the ringing of a bell there is some hope for him by auricular instruction. A curious point in connexion with this auricular instruction was this, that some of those who would not be termed semi deaf developed into hard of hearing persons by instruction in the institution. I think 16 or 17 per cent. of the whole number of pupils in our schools will prove fit subjects for auricular instruction. In Nebraska the principal has stated it to be 16 per cent., and in Arkansas the principal has also stated it to be 16 per cent., and in the New York Institution the auricular teacher has stated it to be 17 per cent. In the private school, "The Voice and Hearing School," the per-centage is greater. The per-centage of those known to be semi-deaf by the principals of institutions I find to be this. Of 5,060 pupils, 462, or 9·1 per cent., are known to be semi-deaf, that is the minimum per-centage, and we know now from the experiments which have been made in auricular instruction that a large number who are not known to be semi-deaf turn out to be semi-deaf. From the bell experiments the per-centage was 20·6, which I take to be the maximum per-centage, so that probably 16 or 17 per cent. would turn out to be the true average per-centage. It will be unnecessary for me to speak about methods of instruction or apparatus used, for those are fully entered into in the reports which I have placed in your hands from those who have had most experience in that class of work. I may say here that in experiments with this audiometer I tested the hearing power of over 700 children in the public schools in Washington in order to arrive at an idea of what the normal hearing was, and I found that there are children in our public schools who hear worse than the best cases of deaf mutes in our institutions, and if we could classify the deafness of the whole population we would find a complete gradation from perfect hearing down to no hearing at all.

21,404. (*Rev. Mr. Sleight.*) Has any one perfect hearing?—Probably not, for there is generally a difference between the hearing power of the two ears. There is one other apparatus I have brought here (which is an improvement, perhaps, upon that which I have just shown you) which has not been tested yet; but it tests hearing with more facility than the other instrument.

21,405. (*Chairman.*) Must you have electricity for that too?—Yes; this takes advantage of the principle of the induction balance. There are two coils here, if they are kept in this position no human ear can perceive any sound, but if this is moved a hair's breadth the normal ear will perceive a sound, so that you can at once select those who have got normal hearing from those who have not.

21,406. (*Mr. Van Oven.*) Is that your invention?—Yes.

21,407. (*Chairman.*) Would you now give us your opinion as to the causes of deafness; you have gone into that matter very fully, I believe?—I do not know that I am capable or competent to give much detailed information on the causes of deafness. I can allude to some of the principal causes in the United States.

21,408. Are there any statistics for that purpose?—Every institution report records the causes of deafness of the pupils admitted. I may say here that I have brought over a large collection of institution reports in case the members of the Commission would like to look over them. In each of these reports you will find the causes of deafness of the pupils admitted. I would, perhaps, rather speak of the causes of deafness of the whole deaf mute population.

21,409. Can you present it to us in a classified form?—Yes. I can present some light on the causes of deafness. The full returns of the census with regard to the causes of deafness has not yet been published; it is the very last thing to be published; but I have, in my "Memoir upon the formation of a deaf variety of the human race," a copy of which I would like you to consult, given on page 35 (*See* Diagram No. 1) the results of an investigation of 22,472 cases of deaf mutes reported in the census, dividing these into two classes: those who are reported deaf from birth, and those who are reported deaf from disease or accident. You will observe that the curves are very remarkable. I may say further on the point, that these cases are also classified according to the period when deafness occurred. The vertical height of the curve indicates the number of deaf mutes who became deaf at a certain period, which is indicated by the horizontal distance.

21,410. What does the dark line at the top indicate, where it gets to 3,400?—That indicates that there were about 3,400 congenital deaf mutes who became deaf in the period from 1861 to 1870, in that decade. (The actual number was 3,390.) If you refer down you will see that. The vertical height indicates the number of cases that became deaf, and the horizontal extension indicates the decade in which that deafness occurred. In the case of the congenital deaf mutes it indicates the period of birth also. In the case of non-congenital deaf mutes it does not indicate the period of birth.

21,411. Then the dotted line seems to go back to 2,000 in the decade from 1871 to 1880?—Yes; but it is to be observed that these are the younger deaf mutes, of whom probably many were not enumerated. You will find on page 36 these words, "Mr. "Wines says that in proportion to the degree of "their youth, the younger deaf mutes are not enumerated. Fewer deaf mutes who are babes in arms are "enumerated than at the age of three years, and fewer "at three years than at seven. The apparent maximum "at seven is not the actual maximum; the actual maximum is at some younger age not yet ascertained." In fact you can see from Diagram No. 1 that the census of 1880 shows a proportionately less number of deaf-mutes who lost hearing in the decade 1871–80, than in the previous decade. Owing to this apparent deficiency the line for that decade has been dotted to call attention to it. It appears as though the younger deaf-mutes were not fully returned. That led Mr. Wines to suppose that the total number of deaf-mutes in the United States, if it could be ascertained, would amount to 35,000 instead of 33,878.

21,412. What is the next line below that?—The light line is a graphical representation on the same plan of the deaf mutes who become deaf from disease.

21,413. This table begins at eight years old?—Yes, at any age; but the period there refers not to the period of birth, but to the period when deafness occurred. Now you will observe one general result that you may obtain by a glance at the tables, viz., that there has been an enormous increase in the last few years in the numbers of the non-congenitally deaf, so great as to reverse the whole relation between the two classes. You see the curves cross one another. In the case of the younger deaf mutes, the majority are non-congenitally deaf; in the case of the older deaf mutes, the majority were born deaf. It will also be seen that this result is not due to a diminution in the number of the congenitally deaf. The curve formed by the congenitally deaf is a perfectly

To face question N° 21,409.

1870–1879			1870–1879	29	129

The dark lines indicate those pupils who were born deaf, and the light lines those who became deaf from disease or accident. The pupils are arranged according to period of birth.

DANCERFIELD, LITH. 22, BEDFORD ST. COVENT GARDEN. 16579-7/88.

Mr. A. G. Bell. 14 June 1888.

symmetrical curve; there is a regular increase at a regular rate, and a mathematician could project it where it is deficient.

21,414. I do not quite know why one of these lines begins at the third line, and the other begins at the fifth line apparently; has it anything to do with the ages?—If you take the extreme left corner of the diagram at the lower point as your starting point, that is the origin for the axes of co-ordinates; that is the lower left-hand corner, where the vertical and horizontal lines cross one another. That point is on the vertical line indicating the decade 1771 to 1780, but no deaf mutes were living in 1880 who were born in that decade, so that neither of the curves extend as far as that. Now, if you go two lines to your right, where the actual curve commences, that indicates the period from 1781 to 1790. It is the dark line that commences there. This shows that some of the congenital deaf mutes who were living in 1880 were born in that decade. By reference to the figures you will find that nine were born in that period.

21,415. (*Mr. Woodall.*) I thought you expected us, in this diagram, to see the average ages of the children at which certain results were obtained?—No, except in the case of the congenitally deaf, because there the period of birth coincides with the period when deafness occurred. This enormous rise of the light line indicates a period when there was an enormous increase in the number of persons who became deaf from disease.

21,416. (*Chairman.*) Will you call attention to the general results, apart from the diagram?—The general result is this, that the numbers of the non-congenitally deaf are subject to great and sudden fluctuations on account of epidemic diseases which cause deafness; whereas the numbers of the congenitally deaf are not subject to these sudden changes. In the second diagram you will observe a comparison of the congenitally and non-congenitally deaf admitted to the American Asylum and the Illinois Institution. In the American Asylum you will see that there were two periods when there was an abnormal increase in the number of persons who became deaf from disease. In the Illinois Institution the increase in the number of persons who became deaf from disease has been so great within the last few years that I call special attention to it. I will read from my paper what I say: "In regard to the Illinois pupils (Diagram No. 2) "it will be observed that the increase in the numbers of "the non-congenitally deaf is so enormous that, of "the pupils who were born in the decade 1860–69, "there were more than three times as many non-con- "genitally deaf as there were congenitally deaf, and "of those born in 1870–79 more than four times, "whereas the census returns show that more than "half of all the deaf mutes living in this country "(1880) were born deaf." There is, therefore, evidence that, taking the deaf mutes as a whole, there has been of recent years a great epidemic; and on examining the statistics of the various institutions I find that it is due to an epidemic of cerebro-spinal meningitis, which now takes the first rank as the deafness-producing disease of America.

21,417. (*Chairman.*) Is that consequent upon some particular conditions of life?—I am not able to say.

21,418. (*Dr. McDonnell.*) "Spotted fever," I see in the note, is another name for it?—Yes, so it is stated. These cases often become deaf suddenly, in half an hour.

21,419. (*Chairman.*) Is that an inherited disease, or is it caused by some affection of the patient concerned?—I am not competent to decide that; I think it is not inherited. There are evidences of two great epidemics of cerebro-spinal meningitis in America which caused deafness, one occurring in the decade from 1810 to 1819, and that is the cause, by-the-bye, of that sudden sharp curve about that period in the American Asylum diagram (Diagram 2), and also probably the cause of the irregularity in the noncongenital curve for the deaf-mutes of the country (Diagram 1), occurring at that same period (1811–1820). If this is so, it indicates that the earlier epidemic extended over the whole country sufficiently to affect the relation between the congenital and non-congenital classes. That died away, and about 1840 scarlet fever assumed the first rank as the deafness-producing disease. Since the period of the Civil War scarlet fever has gradually taken second rank, and cerebro-spinal meningitis is now the prevailing cause. Few, if any, deaf-mutes have appeared in our institutions who became deaf from cerebro-spinal meningitis in the period from 1820 to 1860.

21,420. (*Mr. Woodall.*) Perhaps you will explain whether the epidemic was more felt in Illinois than in the other States?—I do not know; but there is evidence that it has been felt all over the country; all the institution reports show it, and it affects, as you see, the relation of the non-congenital to the congenital cases in the whole country; it has reversed the whole relation.

21,421. (*Rev. Mr. Sleight.*) Why is the line in diagram 2 (Illinois Institution) dotted from 1860 to 1869?—Because there we know the curves are incomplete; they are inaccurate because all the pupils who became deaf in that decade, who would ultimately be sent to that school, had not been admitted into the institution at the period when the report was made, from which these diagrams were made.

21,422. (*Sir Tindal Robertson.*) What is the average age at which deafness occurs?—I have no idea of that.

21,423. With regard to this particular epidemic that would be a most interesting point?—You will see these reports, and if the question is one of importance to the Commission I shall be glad to examine the point and see what we can determine. We cannot determine it from the census returns, because the ages and causes of deafness have not been fully published.

21,424. Could it be ascertained whether at the same time there was any corresponding disease with the same results with regard to adults?—Not from the institution reports.

21,425. From any other sources?—Yes; we have sources of information from which much information could be obtained. We could certainly obtain statistics relating to deaths, but I do not know whether the fact of deafness in adults could be obtained. Dr. Billings, of the Army and Navy Medical Library (Washington, D.C.), could give you information upon this point.

21,426. (*Mr. Woodall.*) You have probably explained just now what can be said with regard to the extraordinary increase of congenital deafness over this period traversed by your diagram?—I have not touched the question of the congenitally deaf yet; we are now on the non-congenitally deaf.

21,427. But I observe that the increase in non-congenital deafness shown in the diagram of Illinois is corroborated by the general increase over the States generally?—Yes.

21,428. But the relative amount of congenital deafness in the two institutions on the second diagram does not exactly correspond with the first diagram. Congenital deafness over the United States generally appears to have reached a higher figure, does it not, in the period of 1870, than it has done in the separate institution?—That is very simply explained. The report from which the American asylum diagram was made, was issued in 1877, and so it is unreliable, say, for two decades before that, because pupils are rarely admitted till they are 10 or 12 years old, and some do not appear until they are adults. It is not reliable for the decade 1850 to 1859. The reports from the American Asylum show that there was a decrease, not that there was any real decrease, there for that period, but simply that all the pupils who were born in that decade (1850–1859), (who would ultimately be sent to school) had not appeared in the institution at the date when the report was made (1877). The Illinois institution report again is a later report, 1882; and it only starts from 1846; whereas the American asylum report starts from 1815. That explains at once the difference. Put the two diagrams

Mr. A. G. Bell.

14 June 1888.

together in the mind. The American Asylum for the earlier period and the Illinois Institution for the later, and the composite approximates more closely to the curve from the census returns.

21,429. But looking at Diagram No. 1 only, it might almost have been assumed that there was neither congenital nor non-congenital deafness at all preceding the period of 1780–1790?—But we do not know that. And in the census there were very few, because they were not living in 1880. The census returns are only for deaf mutes who were alive in 1880.

21,430. That I take it must be always borne in mind, that you have been steadily decade by decade making stricter scrutiny into the existence of those causes whose existence was previously ignored?—Yes.

21,431. (*Rev. Mr. Sleight.*) That is to say that the more accurate returns you give, the higher it goes?—Yes. There is one important point of difference between the institution returns and the census returns. The institution returns give all the deaf who were admitted, their dates of birth, &c., irrespective of whether they were alive or not when the reports were made. The census returns only gave those deaf who were living on 1st June 1880. And let me direct your attention to a very important point. I may be wrong in my deductions; but I think it is an important point that we can determine from such curves as these, and throw some light upon the growth of the deaf mute population, without reference to the earlier defective censuses, and I have attempted to do so on the large diagram shown facing page 40 in my Memoir (see Diagram No. 3). I think it is very important that the Commission should form an opinion as to whether my line of reasoning is correct or not; because we cannot rely upon the earlier censuses. My idea is this: that if we compare the relative numbers of congenital deaf mutes and hearing persons *of the same age*, that should give us the relation between the whole congenital deaf population and the hearing population at the period when they were born, on the assumption that the death rates are equal, that they are cut down equally; that is the assumption on which I go. If we assume that the numerical relation that now exists between congenital deaf mutes and hearing persons *of the same age*, approximately represents the proportion of the congenitally deaf to the whole population born at the period when they were born, we have the means of comparing the growth of the congenitally deaf population with that of the population at large. The indications are that the congenital deaf mutes of the country are increasing at a greater rate than the population at large; that is evident from the curve which shows it.

21,432. (*Mr. Woodall.*) In the earlier diagrams these are gross figures, are they not; they are not relative figures to the population?—No.

21,433. In the diagram which you have presented, showing the relative proportion of congenital and non-congenital cases of deaf mutism in the United States, the ascending scale indicates the actual gross numbers and not the per-centage to the general population at all?—Yes, that is true for the first diagram presented.

21,434. Would not a table showing the general population of the United States during that period, and its wonderful increase, have something like the same appearance as this diagram presents?—I have shown that.

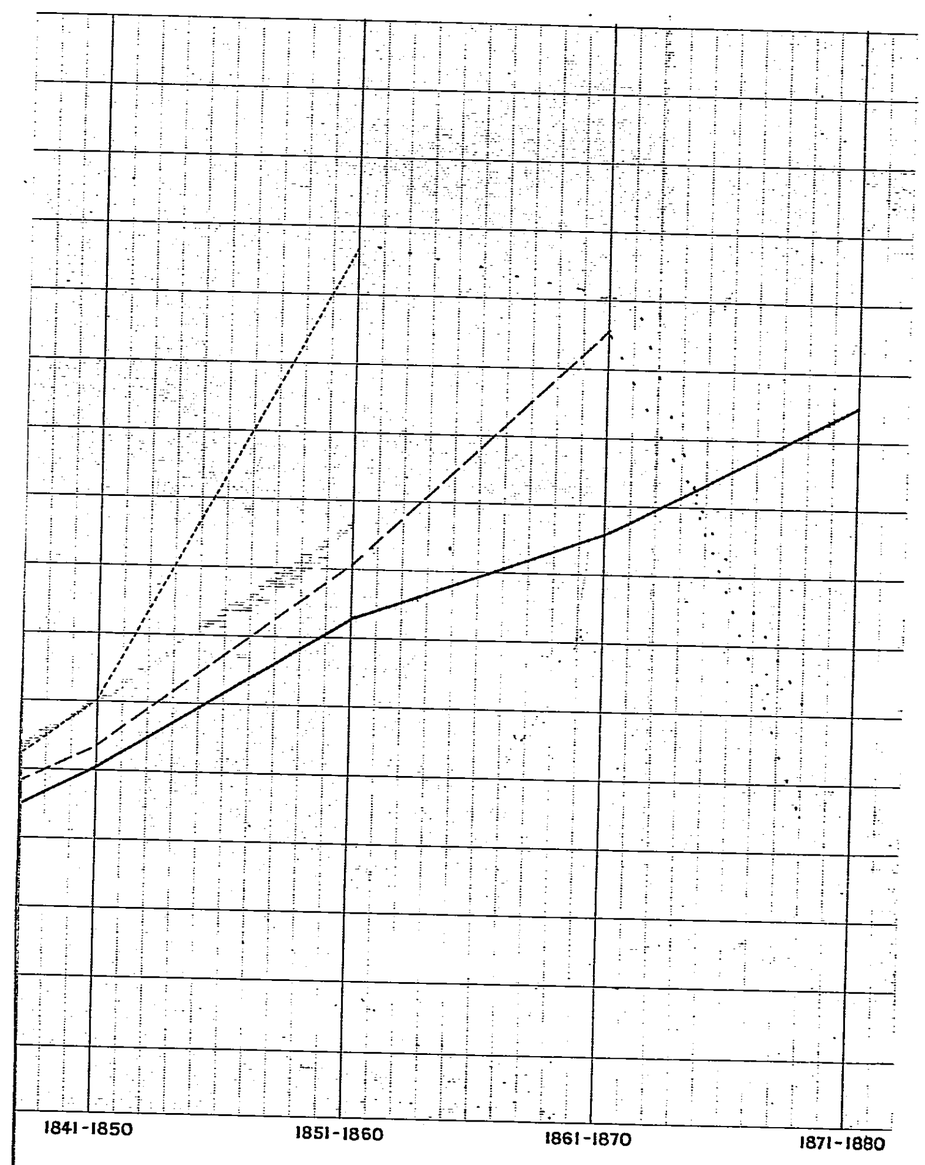
21,435. For the entire population?—Yes, for the entire population of the United States; it is shown on the diagram No. 3. But it would be difficult to represent on the same scale, the absolute number of the whole population and the absolute number of the deaf population; and I have therefore taken per-centages so as to give them on the same scale; the lower dark line indicates the distribution according to age of the whole population of 50,155,783. Then the second line indicates the distribution according to age of the congenitally deaf population; and if you look in the Appendix to my Memoir, you will find the table and all the figures given from which that table is made. I would like very much that the Commission should realise that this demonstration (because it seems to my mind to be a demonstration) that the congenitally deaf mute population is increasing at a greater rate than the population at large, is independent of the errors of the earlier census reports. All the material is taken from the 1880 census alone. The table to which I refer is Table U in the Appendix, on page 77. It is as follows:—

Deaf-mute population of the United States compared with the population at large.

Period of birth.	Population of the United States (1880), classified according to period of birth, and the number of persons born in each period reduced to a percentage of the whole.		12,154 congenital deaf-mutes living June 1, 1880, classified according to period of birth, and the number of deaf-mutes born in each period reduced to a percentage of the whole.		Deaf-mutes both of whose parents were deaf-mutes, classified according to period of birth, and the number of deaf-mutes born in each period reduced to a percentage of the whole.	
	Number of persons.	Percentage.	Congenital deaf-mutes.	Percentage.	Deaf-mutes both of whose parents were deaf and dumb.	Percentage.
1871–1880	13,394,176	26·7051	2,068	17·015	19	14·3
1861–1870	10,726,601	21·3866	3,398	27·958	41	30·8
1851–1860	9,168,393	18·2798	2,460	20·240	42	31·6
1841–1850	6,369,362	12·6992	1,614	13·280	20	15·0
1831–1840	4,558,256	9·0882	1,078	8·870	11	8·3
1821–1830	3,111,317	6·2033	751	6·179	—	—
1811–1820	1,830,095	3·6488	472	3·883	—	—
1801–1810	776,507	1·5482	241	1·983	—	—
1791–1800	196,197	0·3912	63	0·518	—	—
1781–1790	20,863	0·0416	9	0·074	—	—
—— 1780	4,016	0·0080	—	—	—	—
Total	50,155,783	100·0000	12,154	100·000	133	100·0

21,436. In effect there has been a very remarkable growth of the general population of the United States, a still greater growth of the congenitally deaf, and in a much greater ratio—especially from 1840 to 1860—of deaf mutes born of deaf mutes?—Yes.

21,437. (*Mr. Van Oven.*) But there is an immense falling off from 1871 to 1880?—These are the deaf children of deaf mutes. The apparent falling off does not necessarily mean a real falling off. These deaf children were returned to me as having been at some time pupils of institutions. Few pupils make their appearance at school before they are 10 or 12 years of age, so that many of the younger deaf children had not appeared in school at the time the returns were

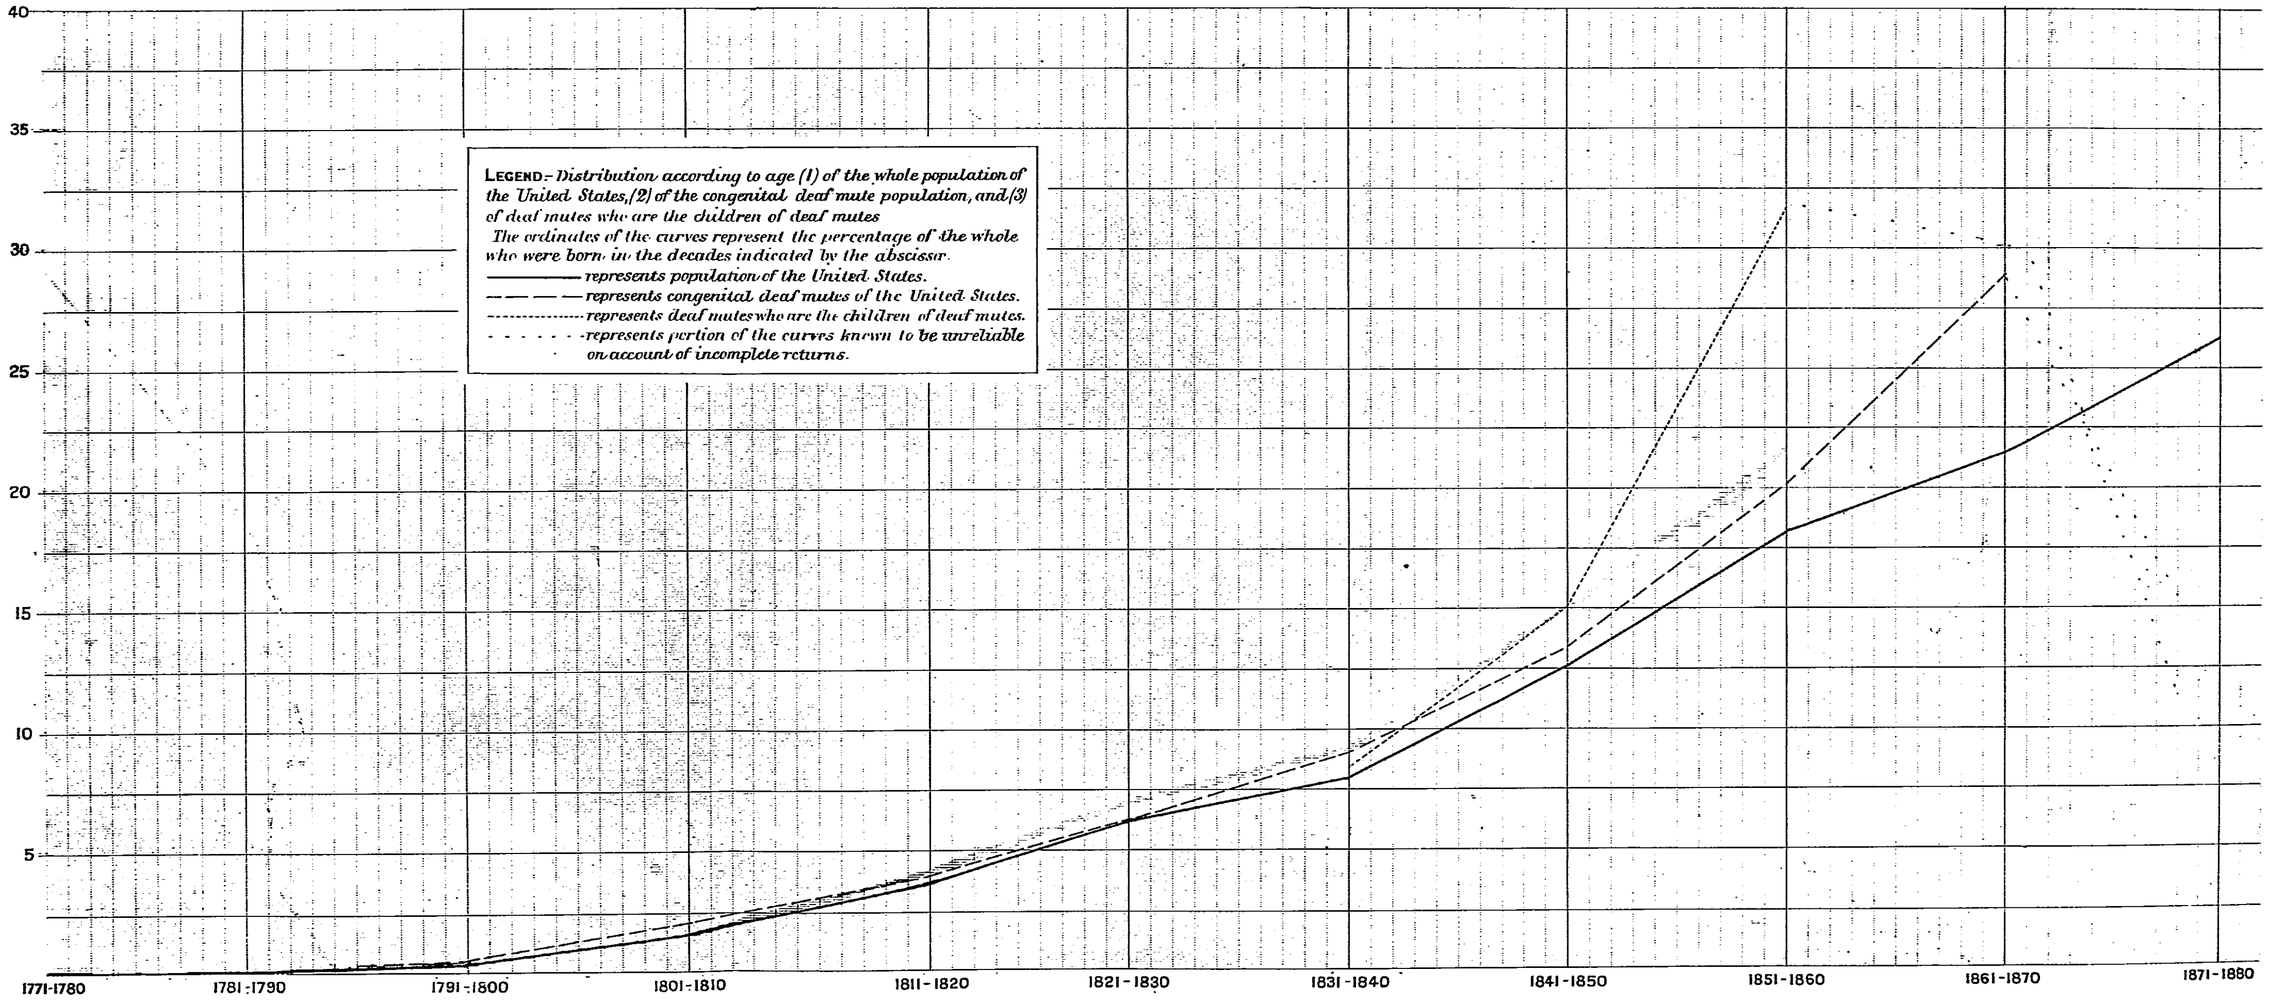


Dangerfield Lith 22. Bedford St Covent Garden 16566/6 A&J

To face question No. 21.431.

DIAGRAM No. 3.

Comparison of the congenitally deaf population with population at large, in the United States.



Dangerfield Lith 22, Bedford St Covent Garden 16566 (F. 48)

made to me. But there is another point. The line forming the line for deaf mute children born of deaf mutes commences suddenly. There are none at all before the decade 1831–1840.

21,438. (*Chairman.*) Is that an absolute fact, or is it only unrecorded?—I think it is an absolute fact, but that is simply my opinion. When I come to enter upon that subject (which I would rather not do just now) I will deal more fully with it. There are cases of deaf mutes who have one parent deaf, who were born earlier. But even with the fuller information now in my possession, the only case I have found of a deaf child with both parents deaf before that decade was a female born in 1829, but this case requires verification. Then there was no other case until 1833 that I have found; there may be others, of course. But the important point is that the line starts suddenly. It does not extend back to the beginning of the century like the others.

21,439. I think you said that you would give us a classified return of the causes of deafness, so far as you can?—If the Commission would like it, I should be glad if they would put any definite questions, and I shall be glad to see what I can do in the way of solving them between now and the next meeting.

21,440. The classification of the causes of deafness in the United States we have not got in a tabular form?—I shall be happy to do what I can to arrive at that.*

21,441. Are there any other causes of deafness to which you wish to draw particular attention on which you have made any particular remarks; you have told us of scarlet fever and cerebro spinal meningitis?—The causes of congenital deafness are very obscure. There is a very prevalent impression among the parents of congenital deaf mutes that mental impressions upon the mother during the period of pregnancy have an influence on the child. I must say that I am not inclined to believe that; but I must say that in my examination and inquiries among parents I found that belief very prevalent. It is evident that one of the chief causes of congenital deafness is a hereditary pre-disposition. That is manifested by the fact that of the 2,262 congenital deaf mutes, mentioned on page 13 of my memoir, more than one half, or 54·5 per cent., had other members of their family deaf and dumb.

21,442. Is arrested development the cause of deafness? Sir William Dalby says that in the first class of causes he would place deafness as due to arrested development before birth, which is quite unpreventable?—I am very much inclined to think that there is a great deal in that.

21,443. (*Sir Tindal Robertson.*) Can you tell us whether that idea of mental impressions is shared by experienced medical men, specialists, in America, or is only a sort of popular idea?—It is a sort of popular idea.

21,444. Have you any particular book upon the question written by a recognised medical authority which throws any light upon this particular question of causes of deafness?—I believe not. I am now engaged in a very elaborate investigation by which I hope to arrive at some light. It is based on this fact: that 54·5 per cent. have deaf mute relatives. From that fact I deduce this consequence that heredity plays a part in the production of congenital deafness. If there is no deafness in the ancestry, it is something else in the family which is not specially indicated. If it is not deafness, how are we going to find it out? I have formulated a plan of research, from which I expect to obtain important results. It is to examine the ancestry of families containing three or more deaf children. If one child in a family is born deaf, it may be accidental; if two children in a family are born deaf, it is a little less likely to be accidental; but if there are three or more children born deaf, I think we may confidently assume that there is something to be discovered in the ancestry. Therefore I have started a genealogical inquiry which has now assumed enormous proportions. I felt that one man could hope to do very little, and that it would be better to take a limited area of country and examine all the cases in that area in which three or more children had been born deaf. I have taken as the base of my operations the New England States, and I have experts, genealogists, at work who have been engaged for nearly four years in tracing the ancestry of all the families that I have any record of in the New England States, that have three or four deaf children. My plan is this: I trace the ancestry up in every branch. I do not know what it is we are going to look for except that it is probably something abnormal. Therefore we search for any peculiarities or abnormalities among the ancestors, or the brothers and sisters of the ancestors. My idea is that, where we have got a good number of cases of distinct families having no deafness in the ancestry, but where three or more deaf children have appeared, we should take and put together these genealogies, make a sort of composite photograph, and see what sort of abnormalities appear in common in the ancestry; and that will have something to do with the deafness.

21,445. (*Sir Tindal Robertson.*) Taking into consideration blood relationships?—Yes.

21,446. (*Chairman.*) We have had evidence before us that consanguinity has a very important bearing?—Without taking up the time of the Commission, I should like them to look at these papers. Those will give you an idea of the mass of material which I am collecting. This is the index to the genealogical material I am collecting with regard to the ancestry of deaf mutes in the New England States.

21,447. With us in 35 institutions, there have been 56 cases resulting from the marriages of first cousins, 11 of second cousins, of other relatives, two; and 28 cases which were children of deaf and dumb parents. Therefore the deaf and dumb marriages of first cousins appear to be double the number of those of children of deaf and dumb parents. And that is not quite a disposing cause, because a great many more first cousins have married of course than are the parents of deaf and dumb children?—I presume that the Commission is familiar with the researches of Dr. George Darwin, of Cambridge, who has investigated that very point of consanguineous marriages. If I remember rightly he examined the institutions for the deaf and dumb in this country, and found the per-centage of deaf mutes who are the children of first cousins; so, too, he took the blind and the idiotic, and so forth, but he did not stop there as others have done, he took the per-centage of children with no defects at all in the schools, and found the per-centage the same. And so far as my researches have gone, I have given considerable attention to this subject, and I can see no proof; at least we have no statistics that undeniably prove that a consanguineous marriage is a cause of deafness: but I do see abundant proof that a consanguineous marriage occurring in a family in which there is already deafness increases the deafness in the offspring; it is simply a case of selection; the family peculiarities, whatever they are, are increased. However, I must refer you to one source of information which seems to me to give the most plausible proof that consanguineous marriages may be a cause of deafness, that is the report of the Halifax Institution for 1877; it is out of print. The principal of that institution has only one copy. He had two, and he presented me with one. If the Commission have not got it at hand I have it here; and I think the statistics that are in that report are very striking with regard to consanguineous marriages. But again with regard to this subject, if the Commission desire me to search the reports of the American institutions, and make tabular statements, I shall only be too glad to do so.

21,448. (*Mr. Woodall.*) In stating Dr. Darwin's view, I understand you to concur in it?—Yes, so far as my researches go. In regard to the question of arrested development in the nervous system, I may

* *See* reply to Query 21,487.

Mr. A. G. Bell. 14 June 1888.

direct the attention of the Commission to a very curious phenomenon. White cats that have blue eyes are always deaf; it is a very curious thing. Darwin (the father) explains this peculiarity upon the hypothesis of arrested development of the nervous system. He says that all kittens when they are born are deaf. Not only are their eyes closed, but their ears are closed also, and if you avoid making a current of air, and simply make a loud noise by clanging together a poker and shovel, you cannot awake kittens if they are asleep. Now when the eyes are first opened they are always blue; they change afterwards, and Darwin says that supposing an arrest of development to occur in the nervous system at the period of closed eyelids, the eyes will be permanently blue, and the kitten permanently deaf. In proof of that I may say that there was a French doctor, whose name I forget for the moment, who observed a white kitten with blue eyes, and tested its hearing as well as he could, and studied it, and when this cat grew to be about one year of age, he found that the eyes began to change colour, and then the cat began to hear. In the case of deaf mutes, I have sought to see whether we have anything similar in the blue eyes. I counted the blue eyes in one institution, and I found a very abnormal proportion of blue eyes in the New York institution, but I do not hold that as conclusive at all, because in New York State the Roman Catholic children go to a separate school, and they belong largely to the dark eyed races. I wish, however, to direct the attention of the Commission to one very curious thing. I cannot assert it as a fact, but I think it is of importance. I have found a few cases of deaf mutes who have eyes and hair that do not match, and every one of those was partially blind.

21,449. (*Chairman.*) More or less albinos?—No, light blue eyes and black hair. And on examining a school for the idiotic in Elwin, Pennsylvania, my attention was immediately struck with the fact that about 50 per cent. of the children in the primary school there had eyes and hair that did not match. Some had very light blue eyes and black hair, and others had very dark eyes and light flaxen hair. It is a subject that should be kept in mind. Now with regard to correlation there is an undoubted correlation between blindness and deafness and idiocy. I will not take up the time of the Commission by going into details, but will refer you to an article upon that subject I published in "Science" of February the 13th, 1885, in a paper entitled "Is "there a Correlation between Defects of the "Senses?" I will just refer to a few of the general remarks. There are 14½ times as many blind persons among the deaf and dumb in proportion to the population as there are in the community at large, and 46 times as many idiotic; there are 14 times as many deaf mutes among the blind as there are in the population at large, and 19 times as many idiots.

21,450. Then you think that there would be a peculiar fitness in this Royal Commission inquiring into the education of the idiotic, so far as they can be educated together, with the education of the blind and the deaf and dumb?—No;* I bring this forward as bearing on the causes of deafness. I say that these three things probably have some common cause. I would say that there does not seem to be any great correlation between deafness and insanity, so far as the census returns show. My genealogical researches, on the other hand, indicate that while comparatively few deaf-mutes are insane, insanity has appeared not infrequently among the brothers and sisters of ancestors of deaf-mutes. I would recommend this paper to the Commission. I present them with a copy of "Science" containing it. I suggest there that it may be possible, in a certain proportion of cases of blindness, deafness, and idiocy, that they may spring from a common cause, probably from arrested development of the nervous system. I find that it is not uncommon for deaf mutes, especially where they belong to a family having a number of deaf mutes to have cousins, not brothers and sisters, who are idiots; as if the defect had struck down in one branch as deafness, and in the other as idiocy. In concluding this subject of the causes of congenital deafness, I think we must undoubtedly assume that in the majority of cases some ancestral cause operates, whatever it may be; and I am very much inclined to the belief that there is an arrest in the development of the nervous system. I find all round the points, where deaf mutes appear in large numbers, evidences of other disturbances in the nervous system, paralysis, chorea (St. Vitus's Dance), and epilepsy; and it is probable that in regard to congenital deafness in families, there is some cause in the nervous system that is inherited—it may not be deafness—but heredity plays a part. There is one other point associated with congenital deafness, and that is, variability. You will find abnormalities all round the points where you find numerous deaf mutes. I am specially struck with one point that may turn out to be nothing more than a coincidence when I come to take the per-centage, I allude to the presence of twins and sometimes triplets in the families of the ancestors of large families of deaf mutes. I do not know what the association is, but it occurs so frequently in the families that I have been investigating as to have attracted the special attention of my correspondent, Mrs. Pratt, who first pointed it out to me. In that connexion, I may say that one of the Siamese Twins had deaf and dumb children. The Siamese Twins, in America, married two sisters, and one had deaf and dumb children. And in Martha's Vineyard, in Chilmark, where one person in every 25 of the population is a deaf mute, you have evidences of variability—various sex peculiarities which cannot very well be spoken of in the Commission; and you have dwarfs, and you have six-fingered persons.

21,451. (*Dr. Campbell.*) Can you form any idea of how soon you will be able to publish the results of this investigation?—I cannot say. I have no idea. I have been at work upon it four years. I expect to publish one part of it this autumn. That is the part which refers to the deaf mutes in Martha's Vineyard. That has proved to be an interesting field, being an island where consanguineous marriages have occurred, and I have been able to trace the ancestry. As you will observe by my reports, the ancestry is traced in every branch. That has been very difficult work, but I have got the ancestry traced up through 10 or 12 generations. The rest of the work may take years.

21,452. (*Mr. Woodall.*) Where is Martha's Vineyard?—In the southern part of Massachusetts; it is one of our largest islands, between 50 and 60 miles from Boston.

21,453. (*Chairman.*) What is the population, about?—The population of this little hamlet (Chilmark), where deafness occurs is only 500, and there are 20 deaf mutes. I have a list of 72 deaf mutes born in that place, or whose ancestors came from there. But on the 1st of June 1880, there were 20 deaf mutes there to a population of 500, which is one in 25 of the population.

21,454. (*Mr. Woodall.*) Without pursuing in anything like detail, what you refer to with regard to the peculiarities of sex, were they monstrosities?—Yes, what are called hermaphrodites. And then there are other curious sex peculiarities. I will tell you one. In the Brown family of Henniker, New Hampshire, in which deafness has gone down through four generations there is a very remarkable sex peculiarity.

* I do not wish my reply to this query to go upon record in the negative. Reflection convinces me that the education of the feeble-minded should be inquired into by the British Government. I know from what I have seen in America that much can be done for the idiotic, and many that would otherwise be a burden upon the public can be taught to be self-supporting. The causes of idiocy are so inter-related to the causes of deafness and blindness that I think there would be a peculiar fitness in this Royal Commission inquiring into the condition of the idiotic.

Mr. A. G. Bell. 14 June 1888.

The first deaf mute in this family is one of nine children, and they are all girls except the deaf mute, and he is a boy. In his mother's family they are all boys except one girl, and in her mother's family they are all girls except one boy. And in all these three cases the families are large. I will show you another case with regard to twins and triplets. That is the Allen family. That is a very curious case. In this case the deafness has gone down through three generations, and the third generation is very young. In the family containing the first deaf mute there were 12 brothers and sisters, including a case of twins.

21,455. (*Sir Tindal Robertson.*) Was the deaf mute a twin?—No. Go up to the father of the family and you have among his brothers and sisters a pair of twins and a case of triplets. I am constantly struck with the appearance of twins. Whether they have any significance or not I do not know; one is apt to be misled. It may be that twins and triplets are as common in the community at large; but it is a point which is attracting my attention. In this same family you have correlation with idiocy. The first deaf mute has a brother who is insane; then he has another brother who has one child insane and one child who is all right. That child has a child who is feeble-minded. Go up on the mother's side here. The mother had a brother and one of his children was feeble-minded. You find here is insanity again. All round the point where the deafness occurs you find evidences of something generally affecting the nervous system in connexion with the brain. In such families you sometimes find consanguineous marriage taking place. There is a case I have in which seven children are deaf mutes. There was no deafness in the ancestors that was known, and no consanguineous marriage.

21,456. That does not stop pro-creation?—I do not think so. But in this case one of these seven deaf mutes married his first cousin and had a number of children who could all hear and speak, but three of them were feeble-minded. There again is something to indicate that the thing intensified might be in the brain and not in the ears at all.

21,457. (*Chairman.*) With regard to the education of the deaf and dumb in America, are there any special points on which you wish to dwell; what are the main points that influence you in regard to your being in favour of the day school system rather than the special institution system of education; what are the dangers to which you think the institution system open?—There are a number of distinct lines of reasoning that all point as a conclusion to the advisability of increasing the number of day schools and making them as small as possible.* In theory the best school for a deaf child is a school with only one in it; but of course it is impracticable, it is too expensive. I believe the best way to arrive at the solution of such a problem as the character of the best school is to formulate your ideal school, recognising that it is impracticable, but coming up as near to it as you can. In my "Memoir upon "the formation of a deaf variety of the human race," I have formulated one of the principal reasons for the advisability in my opinion of extending the day school system on page 45. I say "I think all will agree "that the evidence shows a tendency to the formation "of a deaf variety of the human race in America. "What remedial measures can be taken to lessen or "check this tendency? We shall consider the subject under two heads: (1) repressive; (2) preventive measures." Repressive measures I abandon. On page 46 I take up the question of preventive measures, and I would request the very close attention of the Commission to this point, for it really forms the central point of my idea of the day schools with regard to preventive measures (that is in regard to preventing the inter-marriages of the deaf and dumb). I say:—"The most promising method of lessening "the evil appears to lie in the adoption of preventive "measures. In our search for such measures we "should be guided by the following principle: (1) "Determine the causes that promote inter-marriages "among the deaf and dumb; and (2) remove them. "The immediate cause is undoubtedly the preference "that adult deaf mutes exhibit for the companionship "of deaf mutes rather than that of hearing persons. "Among the causes that contribute to bring about "this preference we may note: (1) segregation for "the purposes of education; and (2) the use, as a "means of communication, of a language which is "different from that of the people. These, then, are "two of the points that should be avoided in the "adoption of preventive measures. Nearly all the "other causes I have investigated are ultimately "referable to these. Segregation really lies at the "root of the whole matter; for from this the other "causes have themselves been evolved by the "operation of the natural law of adaptation to the "environment. We commence our efforts on behalf "of the deaf-mute by changing his social environ-"ment. The tendency is, then, towards accommo-"dation to the new conditions. In process of time "the adaptation becomes complete; and when, at "last, we restore him to the world as an adult, he finds "that the social conditions to which he has become "accustomed do not exist outside of his school-life. "His efforts are then directed to the restoration of "these conditions, with the result of inter-marriage "and a tendency to the formation of a deaf-mute "community."

21,458. (*Mr. Woodall.*) Is that so?—Yes. "The "grand central principle that should guide us then in "our search for preventive measures should be *the "retention of the normal environment during the "period of education.* The natural tendency to-"wards adaptation would then co-operate with in-"struction to produce accommodation to *the permanent "conditions of life.* The direction of change should, "therefore, be towards the establishment of small "schools and the extension of the day school plan. "The practicability of any great development of day "schools will depend upon the possibility of con-"ducting very small schools of this kind economically "to the State; for the scattered condition of the deaf "and dumb in the community precludes the idea of "large day schools, excepting in the great centres of "population. The principle referred to above in-"dicates that such schools should be of the minimum "size possible; for the school that would most "perfectly fulfil the condition required would contain "only one deaf child. It also points to the advis-"ability of co-education with hearing children; but "this is not practicable to any great extent. No "instruction can be given through the ear, and "complete co-education would only therefore be "possible by a change in the methods of teaching "hearing children. It is useless to expect that such "a change would be made for the benefit of the deaf "and dumb on account of their limited number. "Partial co-education is, however, possible, for some "studies are pursued in the common schools in "which information is gained through the eye. For "instance, deaf mutes could profitably enter the same "classes with hearing children for practice in "writing, drawing, map drawing, arithmetic on the "black-board, sewing, &c. For other subjects "special methods of instruction would be necessary, "and these demand the employment of special "teachers. They do not, however, necessitate special "schools or buildings, and a small room in a public "school building would accommodate as many deaf "children as one teacher could successfully instruct. "Considerations of economy render advisable the "appropriation of a room of this kind, as the "appliances of a large school might thus be obtained "without special outlay. The average *per capita* "cost of the education of a deaf child in an American "institution is $223·28 c. per annum. Very small day "schools could be maintained at no greater cost."

21,459. Is that over the whole of the States?—That is the average arrived at from the average of

* See replies to Queries 21,457; 21,464; 21,468; 21,469.

Mr. A. G. Bell.
14 June 1888.

34 institutions; they are not my figures; I quote them from the principal of the Illinois institution in 1882. Perhaps Dr. Gallaudet's testimony will be more reliable.

21,460. 250 and 260 dollars I find was paid by the States generally *per capita*?—You will find the table from which the *per capita* is calculated in the Appendix, Table X.

21,461. (*Chairman.*) I wanted to ask you this question. In Germany they have a large number of institutions, and they have a certain number of every day schools; but where the oral system is taught there is no inter-marriage practically by the deaf and dumb; and therefore while you are advocating, in order to prevent the inter-marriage of the deaf and dumb, day schools instead of institutions, would it not be far more simple to follow the example of Germany, and would you not consider that if you give them speech, you take away the great inducement to inter-marriage. Or is it practicable to do that. If it is not impracticable it is more simple, but is it practicable?—We do not find the facts in America the same as you state. The pupils of our oral schools do marry deaf mutes.

21,462. But do they do so exclusively, or do they not also after they leave school mix with those on the sign system?—A larger per-centage of the pupils on the oral system marry hearing persons than of those on the sign system.

21,463. I assume that you wish to prevent this calamity happening of the formation of a deaf variety of the human race; the question is whether you can arrive at that in the best way by your system, that is to say, by doing away with institutions, and having day schools, so as to prevent the possibility of the deaf and dumb being thrown together so much when young. Would you not attain your object better by assisting their learning speech as far as possible?—I do not advocate the abolishment of institutions. I am only on the line of researches. I propose to keep our institutions.

21,464. It is a very serious question you raised of doing away with institutions altogether?—We could not do that; that is a step backwards. It may be done by the process of natural selection. I do not propose to do that; I propose to supplement the institutions by a large development of small day schools, and leave in each state at least one institution which shall accommodate the children who cannot attend day schools; and, where it is practicable in any State, let the day schools be affiliated with the public schools so that the children shall be in the public school buildings, in a special room under a special teacher, but thrown in contact with the hearing children in every possible way. One of the lines of argument that lead to the same result is my desire that all deaf children should be taught to use their vocal organs, and to speak. The conditions in an institution are unfavourable to this, because there are few people there who can hear them speak; so that if they are placed in an institution the English language is of little use to them; and if you want a child to make a rapid advance in the English language you must make the language of use.

21,465. Do you think it would be an advantage to the deaf and dumb children to be brought in contact with speaking children in play hours?—Undoubtedly; I am very strongly of that opinion.

21,466. In London, besides our institutions, we have a certain number of school board schools, in which the deaf and dumb children are in many cases in a part of the same building where the ordinary hearing children are taught, and to a certain extent they mix with them. If that were to be carried out as it could be carried out in large towns, and is being carried out in England in large towns, it would obviate your suggestion for the deaf and dumb being kept together in a separate class?—Yes.

21,467. Do you see any objection to that system?—No; I do not believe you can carry on co-education with hearing children. I do not think that that is a practicable thing for a large number; there are individual cases where it may be done. But I think that partial co-education is not only possible but practicable; and it would be an advantage to the deaf to have a special teacher in a special room in the same building with a large number of ordinary children.

21,468. Do you think it advisable, after deaf and dumb have had a sufficient education (I am assuming that they are being educated in speech) to enable them to go out into the world, after they had had eight or ten years in a private school or with separate education, which you admit they must have, that they should if possible go to some technical school where they can be taught in common with other children the rudiments of practical mechanics and drawing, and other elements of industrial trades, say from 14 to 16 or 16 to 18. Do you think that that is a step in the right direction?—I think it is. In the day schools in Boston no industrial training is provided by the city, and the principal, through a private fund, has sent a number of her boys to the Institute of Technology, where the Russian workshop system is introduced, where the pupils are not taught a specific trade, but are taught the elements, the use of tools and the elements of a trade; and these boys have found no difficulty in getting good employment. There are two other points that occur to me with regard to day schools. A boy who is brought up in close association with a large number of hearing children will derive a great advantage in adult life from his knowledge of these hearing children, even though he never communicates with them. They will be the men and women among whom his lot in life is cast, and they will help him in getting on in life; they will remember that he was a schoolfellow and will help him.

21,469. That must be on the oral system, otherwise there would be no means of communication between them?—Let there be any means of communication that they can get, or if they do not communicate at all it will still be an advantage. Boys are not always rough. When these children grow up to be men and women they will remember the deaf children, even if they never spoke a word to them; and these deaf children will have friends in the hearing community who will help them to business and places; whereas if they are kept away from hearing persons and go out into the world without knowing any, they find it much harder to get employment. The other point is still more important; it is this, that the institution plan does not bring half the deaf children under instruction. You can get the children into day school at a younger age, and make the institutions places of higher learning. You can reach the children at an age when they cannot go from home; you can carry the school to the door of the home. The institution system of America has not brought under instruction one half the deaf children, and teachers tell me the same elsewhere. The reason is the same; that the parents will not part with their children. I should propose to supplement the institution plan therefore by these little feeders which will reach those pupils at a younger age. They will occupy a field that the institutions cannot touch and will prove of advantage to the institutions by bringing the pupils into the institutions at a much further state of advancement than if they had had no previous instruction at all.

21,470. I see that in your American schools the industrial department is introduced into most of them. I see from the evidence that out of the whole number only about 14 have no industrial departments; eight of these are day schools, so that only six have no industrial departments in connexion with them; I suppose that is so?—I believe so.

21,471. How late do the majority of your pupils remain in the institutions; how long do you keep them?—I do not think that I am competent to give an opinion as to that. But I may say in regard to the pursuits of the deaf and dumb in adult life, that it is very obvious that they do not follow the trades

which they are taught in institutions. And yet, as a class, they are self-supporting. How did they acquire the trades by which they earn their livelihood and which were not taught them in school? In ordinary shops, by simple observation and experience. That is a very important point as to how far it is advantageous to teach specific trades in institutions; because the institution is necessarily limited to the choice of very few trades. A boy, whatever his abilities may be, is obliged to become a boot maker or a cabinet maker; whereas he might prefer something else. And all these deaf children go into competition with one another where they are not wanted. I think that the tendency should be to scatter the deaf and dumb in different employments rather than to bring them all into two or three trades; and that it would be better to teach the elements of trades in institutions rather than specific trades. I would commend to the attention of the Commission on that subject a paper by the Rev. Edward Everett Hale, of Boston, as to what occupations and trades should be taught to the orphans in our orphan asylums. It should have a practical bearing on the education of the deaf. It is reprinted in the American Annals of the Deaf. I can say, in one word, that Mr. Hale advocates giving the highest training.

Mr. A. G. Bell.
14 June 1888.

21,472. Secondary training?—Yes, to orphans or public charities, because they will come into less competition with the outside world than if they are taught lower occupations, and the same thing applies to the deaf and dumb. Art training is of great importance with regard to them. I would recommend the Commission to look at that article, and I will furnish the reference to it. [See Annals for January 1887, Vol. XXXII., pp. 16 to 20. "What kind of Trades shall be taught?" By the Rev. Edward Everett Hale, D.D., of Boston, Mass.]

The witness withdrew.

Adjourned to Thursday next at 12 o'clock.

6, Old Palace Yard, S.W.

Thursday, 21st June 1888.

PRESENT:

THE RIGHT HON. THE LORD EGERTON OF TATTON IN THE CHAIR.

ADMIRAL SIR E. SOTHEBY, K.C.B.
SIR TINDAL ROBERTSON, M.P.
B. ST. JOHN ACKERS, ESQ.
T. R. ARMITAGE, ESQ., M.D.
F. J. CAMPBELL, ESQ., LL.D.
WILLIAM WOODALL, ESQ., M.P.
THE REV. W. BLOMEFIELD SLEIGHT, M.A.
THE REV. CHARLES MANSFIELD OWEN, M.A.
L. VAN OVEN, ESQ.

CHARLES E. D. BLACK, ESQ., *Secretary.*

Mr. A. GRAHAM BELL further examined.

Mr. A. G. Bell.
21 June 1888.

21,473. (*Chairman.*) I believe you desire to amplify some of the answers which you gave in the course of your examination before the Commission last week?—Referring first of all to my answer to question 21,383 in regard to the classification of the deaf, where I propose to classify the deaf by two elements only, the age at which the deafness occurred, and the degree of the defect, that classification is sufficient for all purposes of education, but it is insufficient for investigations relating to inheritance; and I would propose that you should again divide the deaf into two broad classes according as they have deaf relatives or not. That is for the purpose of studying the inheritance of deafness, and guiding our deaf pupils in their choice of partners in life. No one desires to bring misfortune upon his offspring, and if the deaf were so classified as to distinguish those who would be likely to transmit their defect, from those who would not, many of the more intelligent of our pupils might avoid forming unions that would increase the chances of their having deaf-children. (*See* foot-note.)

21,474. That of course is merely a special view of it for a special purpose?—Yes. The other classification is sufficient for educational purposes.

21,475. Would you have any objection to our putting a copy of your diagram into our report?—I shall be only too delighted for the Committee to make any use they may desire of my material. Proceeding with what I was saying I would propose to divide the deaf into two great classes, the sporadic and the non-sporadic. That is better than the distinction of congenital and non-congenital. We cannot decide who were and who were not born deaf; it is very indefinite.

21,476. Not absolutely definitely?—No, it is not possible.

21,477. Do you mean to say that a surgeon cannot tell that?—I cannot presume to say that.

21,478. I want to know from what point of view it is impossible; do you mean that it is impossible to do

CLASSIFICATION of the DEAF into FOUR GROUPS as a GUIDE to MARRIAGE.

Period of Life when the Deafness Occurred.	Character of the Deafness.	
	Sporadic Deafness.	Family Deafness.*
Before birth (congenital)	2	4
After birth (non-congenital)	1	3

* For want of a better term I characterise non-sporadic deafness as "Family Deafness"—that is deafness that seems to run in families—deafness that affects more than one member of the family. The hereditary tendency is most marked in persons who belong to familes containing more than one deaf-mute. The greater the number of deaf relatives a child has, the greater is the danger of his handing down his defect to his offspring.

Persons belonging to Class 1 do not manifest a tendency to transmit the defect to their children.

Persons belonging to Class 2 do manifest such a tendency, but not so strongly as persons belonging to Classes 3 and 4.

Persons belonging to Classes 3 and 4 (especially Class 4) manifest a very decided tendency to propagate the defect.

Persons belonging to Classes 2, 3, and 4 (and their hearing brothers and sisters) increase their liability to produce deaf offspring by marrying persons belonging to Classes 2, 3, and 4 (or their hearing brothers and sisters); and diminish it by marrying persons belonging to Class 1 (or their hearing brothers and sisters), or by marrying hearing persons who have no deaf relatives. Persons belonging to Classes 2, 3, and 4, increase their liability to produce deaf offspring by marrying blood relations—especially if these relatives are on the deaf side of the family.

Mr. A. G. Bell.

21 June 1888.

so with any degree of certainty, or that it is impossible from a medical point of view, by a medical man?—Medical men would be better able to answer that question than I am. But the difficulty here is that we cannot test the hearing of an infant; we cannot ascertain that a child is deaf for a long time after its birth, therefore in studying the inheritance of deafness, the proper classification would be that of sporadic and non-sporadic. As a general rule sporadic cases do not tend to have the deafness inherited; that is to say, cases in which a single member of the family is deaf, whether reported congenitally deaf or not, have a much less tendency to transmit the defect than cases where three or four members of a family are deaf and dumb, even where the latter were not born deaf.

21,479. There is another question bearing upon that point which I should like to ask you, and which is alluded to in your paper in "Science," that is to say with regard to a large number of deaf mutes who have been classed as idiots; and you say that that fact rather disturbs some of the returns; does the fact of their being classified as idiots, instead of being classified as deaf mutes, to any extent disturb the classification?—I think not to any great extent; but that subject has been very fully investigated by the officers of the census. At the same time I think that a large number of deaf mutes are returned as idiotic who are not idiotic. On the other hand, it is probable that many idiots are reported as deaf who are not deaf. The number of doubly afflicted persons may therefore be decidedly less than it appears in the census. We cannot safely assume that the returns of any isolated fact are complete.

21,480. That leads me to ask the question whether there are not many children who are simply deaf sent to idiot schools?—No doubt.

21,481. Are there not more than several?—I am inclined to think so.

21,482. And then again, on the other hand, idiotic children are sometimes sent to deaf and dumb institutions?—Yes, but they are generally rejected. The difficulty of ascertaining the correctness of the returns relating to the idiotic deaf and dumb, is the difficulty of ascertaining whether the observers are competent or not to decide upon the mental condition of a deaf and dumb child. There is very considerable doubt as to the number; but the number is so enormous as compared with the whole of the deaf and dumb population, as to show that the feeble-minded must be very much more common among the deaf and dumb than among the hearing.

21,483. You spoke of the correlation between the deaf mutes, the blind, and the idiotic; and you think that those defects may possibly all arise from a common cause?—That is my feeling. I feel that by a study of the causes of these forms of defects we shall find some common cause involving the production of congenital deafness. Then there is one further point which I wish to refer to in my answer to question 21,402, which is a question I rather avoided answering. It has reference to the schools where auricular instruction is practised as a separate department. I am asked whether they are leading schools in America, and I say that I do not like to discriminate between one institution and another.

21,484. That was not my object in asking the question; I merely wanted to know whether they were schools of great calibre, size, and so forth?—I had a feeling that this answer of mine rather cast reflections upon these schools by implication, and as I think the members of this Commission are entitled to have my honest views upon all questions, I should like to speak for one moment of those four schools which adopt auricular instruction. (1.) The Nebraska Institution is one of our leading institutions, and that is where auricular instruction was first introduced as a distinct method.

21,485. That is the view I meant to convey in speaking of the leading schools, in the sense in which you are using the term now, that is to say, one of the principal schools?—The principal of that school is a man whose opinions are always treated with respect by all members of the profession. He is a man who states his views in moderate terms, and he is very careful and guarded in his utterances, so that whatever he says regarding auricular instruction you may believe.

21,486. Has he said anything in his pamphlet bearing upon this point?—Yes, all these four schools have made reports which are printed here. (2.) Miss McCowen, who was one of the teachers in the first auricular class in the Nebraska Institution became dissatisfied with the results of the auricular system in a combined institution, and thought that the system would be more successful in an oral school. She therefore started in Chicago a voice and hearing school, a private school. She makes a report also upon auricular teaching. In regard to Miss McCowen, I may say that she is an enthusiast. Her heart is full to overflowing with her work, and this should be borne in mind in weighing accurately whatever she may have to say. Her report seems to be very carefully worded, and I am sure it may be thoroughly relied upon.

21,487. What is the name of the principal of the Nebraska Institution?—Mr. Gillespie. I may state that a committee was appointed by the last conference of articulation teachers to investigate the whole of the grounds of this method of teaching.* I was chairman of that committee, and upon it were also Professor Gordon, of the National College for Deaf-Mutes, and Mr. Clarke, of the New York Institution. (3.) Experiments were made in the New York Institution by Mr. Clarke and Mr. Currier, the special teacher of articulation in that institution, and those experiments resulted in the formation of an auricular department in the New York Institution. Mr. Currier sends a report. I do not know much about Mr. Currier; he seems to be a good teacher of articulation. I do not know anything about his public writings, but I think from personal conversation with him, that his statements may be fully relied upon. (4.) Then Mr. Clarke, who was on the committee, and who was one of the teachers of the New York Institution, has recently become the principal of the Arkansas Institution, and an auricular department has been conducted in that school, and Mr. Clarke sends us a report. Before Mr. Clarke went to the Arkansas Institution it was in an unsatisfactory condition. It has yet a reputation to make. Mr. Clarke has made an honourable record as a teacher, and from my personal knowledge of him I can fully commend his report to the Commission. Referring now to what appears at question 21,439, I am happy to be able to present the Commission with a very full classification of the causes of deafness. In fact I have here a short analysis of the chief points relating to the deaf and dumb, which, if the Commission desire it, I will incorporate in my evidence. This is an analysis of the tenth census of the United States relating to the deaf and dumb results, compiled from published statements of Rev. Fred. H. Wines, expert and special agent of the tenth census for the defective, dependent, and delinquent classes:—

DEAF and DUMB of the UNITED STATES (1880).

Where found.

At home or in private families	27,867
In schools (excluding day schools)	5,393
In almshouses	511
In benevolent institutions	79
In hospitals or asylums for the insane	24
In prisons	4
	33,878

* For Report of this Committee, written by Professor Gordon, see Annals, Vol. xxx. p. 59.

Mr. A. G. Bell.

21 June 1888.

Sexes.	
Males	18,567
Females	15,311
	33,878
Ages.	
Under 6 years of age	1,437
6 to 16 years of age	10,046
Over 16 and under 21	5,013
21 years of age and over	17,382
Total	33,878
Age when deafness occurred:—	
Born deaf	12,155
Under 5 years of age	7,289
5 to 9 years of age	2,235
10 to 14 years of age	694
15 years of age	100
Unknown	11,405
Total	33,878
Causes of deafness:—	
Congenital	12,155
Adventitious	10,318
Not stated	11,405
Total	33,878
Causes of adventitious deafness:—	
Causes assigned accepted and tabulated	9,209
Causes assigned, rejected as too vague or improbable to be counted or classified	978
No cause assigned	131
Total	10,318

Causes of adventitious deafness assigned with more or less definitiveness and probability in the following cases:—

Accident	593
Diseases of ear	366
Other diseases	8,250
Total	9,209

21,488. What would be the other diseases that would generally be reckoned as causes?—I have here an analysis of all the causes of adventitious deafness that have been accepted in the United States, which have been accepted and tallied by the officers of the 1880 census. They are as follows:—

Meningitis	2,856
Scarlet fever	2,695
Malaria and typhoid fevers	571
Measles	448
Fevers (non-malarial)	381
Catarrh and catarrhal fevers	324
Other inflammations of air-passages	142
Falls	323
Abscesses	281
Whooping-cough	195
Nervous affections	170
Scrofula	131
Quinine	78
Blows and contusions	74
Inflammations of the ear	72
Diphtheria	70
Hydrocephalus	63
Teething	54
Mumps	51
Small-pox and variola	47
Erysipelas	36
Fright	32
Water in the ear	25
Sunstroke	21
Noises and concussions	21
Tumours	11
Chicken-pox	10
Struck by lightning	10
Foreign bodies in the ear	9
Salt rheum	3
Malformation of the ear	2
Syphilis	2
Consumption	1
Total	9,209

21,489. You spoke of making one of your divisions as between those who are deaf at certain ages as giving you a clue to those who would be able to use speech to begin with. As I gather all those after five would be those who have remains of speech to begin with?—Yes.

21,490. It is important to know the number of those who have remains of speech left, in order to know the number of those who would be suitable for oral schools; I suppose you may say that all those above three years of age would be suitable?—In my opinion those who become deaf in early childhood (two and less than five years) constitute a doubtful class. They have all spoken, but the habit of speech has not been fully formed, so that they readily forget how to articulate unless constantly encouraged to speak at home. Many of them easily regain the power of speech by instruction in school. Whether or not, however, they retain remnants of speech when admitted to school, their minds are in a much more mature condition than those who became deaf in infancy (under two years) and they should not therefore be classed with them. Those who become deaf in late childhood (five or more years of age) certainly retain some recollection of speech, even though they may have been neglected at home. Their speech is very readily preserved and improved, and they speedily acquire the power of speech-reading by eye.

21,491. What you have given us now will be sufficiently near for our purposes; you have got those at five years old?—Yes.

21,492. You have already told us that it is difficult to say whether they are actually congenitally deaf, or whether they have become deaf before they speak?—You have simply to accept the returns. It may be that a large number of those who became deaf in infancy were congenitally deaf; but we cannot ascertain it certainly. I think that members of the Commission may rely upon this analysis of causes of adventitious deafness, these causes having been analysed by experts. As a general rule the causes assigned cannot be relied upon in all our institution reports. The causes are very vague and improbable in a large proportion of cases, and as you see even in the census returns, there are a very large number, nearly a thousand, rejected as improbable. The others were submitted to competent medical inspection and classified in this way. I have here another table which I have prepared, and which I think the Commission might like to have. It is a table of comparison showing the growth of American schools for the deaf from 1857 to 1887—statistics compiled from the American annals of the deaf, and it is as follows:—

Date.	Total Number of Schools.	Total Number of Pupils.	Number of Pupils taught Articulation.	Total Number of Teachers.	Number of Deaf Teachers.	Number of Articulation Teachers.
1857	20	1,721	—	95	—	—
1863	22	2,012	—	—	—	—
1866	24	2,469	—	119	—	—
1867	24	2,576	—	120	—	—
1868	27	2,898	—	170	71	—
1869	30	3,246	—	187	77	—
1870	34	3,784	—	222	94	—
1871	38	4,068	—	260	110	—
1872	36	4,253	—	271	107	—
1873	38	4,252	—	274	104	—
1874	44	4,892	—	290	98	—
1875	48	5,309	—	321	111	—
1876	49	5,010	—	304	104	—
1877	49	5,711	—	356	111	—
1878	49	6,166	—	375	126	—
1879	51	6,431	—	388	113	—
1880	55	6,798	—	425	132	—
1881	55	7,019	—	444	147	—
1882	55	7,155	—	481	154	—
1883	58	7,169	—	497	151	—
1884	61	7,485	2,041	508	155	—
1885	64	7,801	2,618	540	156	—
1886	65	8,050	2,484	566	158	134
1887	69	7,978	2,556	577	155	171

Mr. A. G. Bell.

21 June 1888.

21,493. Are you at all aware how far the tables in the American annals of the deaf and dumb in deaf and dumb institutions throughout the world are accurate; have you ever made it your business to test in any way the accuracy of those tables?—Yes, they are considered by the profession to be thoroughly reliable for America. The American annals of the deaf is the official organ of communication, and is supported by the institutions. Its information is collected every year by a circular letter of inquiry addressed to the institutions, and the institutions recognise the importance of correct statements; and I think that these statistics may be considered as being thoroughly reliable for America.

21,494. I see that the number of articulation teachers increases in a much larger ratio than the number of sign teachers; do you draw any deductions from that; is there any proportionate increase in the number of articulation pupils, or has it been found necessary to have a larger number of teachers so as to have smaller classes?—I have not analysed these returns, but I think it is undoubtedly the case that articulation teachers have a smaller number of pupils.

21,495. There is a proportionately larger increase in the number of articulation teachers as compared with the number of articulation pupils. I want to know whether it was for the causes that I asked you about you do not draw any deduction from that?—No; I do not draw any deduction, because the number of articulation teachers has only been noted in the Annals for two years past. Of course, articulation teachers were employed before, but we do not know their number. We cannot safely generalise from only two observations. The institutions have devoted a great deal more attention to speech recently, but where you find one articulation teacher for 60 or more pupils, the articulation cannot be very perfect. In such cases the pupils come to the articulation teacher for only a short period of time every day.

21,496. (*Dr. Campbell.*) As a rule, how many do they have at once?—In the oral schools I think the number ten is supposed to be about the limit that can be satisfactorily handled. I should like here to refer to my answer 21,380 in regard to the growth of articulation teaching in the United States. I find that the totals from which I calculated the percentages are the total number of pupils who were present on the 1st of December in the year, instead of the total number present during the year, which is a larger number and affects the percentage. The number taught articulation is correct, but the effect of the error is to increase the percentage of those who are taught articulation, and to reduce the percentage of those who are not taught articulation.

21,497. (*Chairman.*) Have you any table to put in with regard to this point?—I have a table showing the growth of articulation teaching in the United States, which is as follows:—

Year.	Total.	Taught Articulation.	Not taught Articulation.	Percentage taught Articulation.	Percentage not taught.
1883*	6,232	1,991	4,241	31·9	68·1
1884	7,482	2,041	5,444	27·3	72·7
1885	7,801	2,618	5,183	33·5	66·5
1886	8,050	2,484	5,566	30·8	69·2
1887	7,978	2,556	5,422	32·0	68·0
1888*	4,944	2,213	2,731	44·8	55·2

* The totals for 1883 and 1888 are not complete, but the number of cases is so large as probably to yield a correct per-centage. It may be possible, however, that the institutions which failed to make returns were those which paid least attention to articulation, in which case the per-centage taught articulation may be excessive.

I have corrected the totals. I give you now the total for 1888 from my returns. You will find the full returns for articulation teaching in the pamphlet that I have handed to you commencing on page 176, and going on to page 177; but as many of the returns were imperfect, it was impossible to arrive at a sum total. I have therefore added together only those that made returns from which we could have the total number of pupils, and the total number taught articulation. The total number of pupils that I have included in my table is 4,944, and of these 2,213 were taught speech. I have here the percentage; it is over 44.

21,498. (*Dr. Campbell.*) They are taught speech; but not the pure oral system?—It includes all who are represented as having been taught articulation. I have not been able, on account of the labour involved in analysing the returns, to find out any further detail than that it is 44·8 per cent. The percentages returned for 1883 and 1888 are very much larger than they are in the intervening period. These two periods were ascertained by circular letters of inquiry from private parties. The 1883 percentage was deduced from the replies to a circular letter from the principal of the Clarke Institution. My 1888 percentage was deduced from the answers to my circular letter of inquiry, the intervening numbers come from the totals shown in the annals.

21,499. (*Mr. St. John Ackers.*) Does not that show that the returns in the annals are under the mark?—Or that the others are over the mark.

21,500. Which is it, in your opinion?—I am inclined to think that if any are incorrect the others are over the mark.

21,501. (*Mr. Woodall.*) Can you express an opinion as to whether at any time there has been a sudden growth in the matter of oral teaching, and at another time a diminution; have there been anything like waves of popularity up and down?—It may be possible. My opinion is that the increase in oral teaching in our sign institutions (the combined institutions), has been due very largely to outward pressure, to the pressure of public opinion applied from without, and there have been periods when there has been a greater amount of popular attention directed to the subject of oral teaching, than at others; and it may possibly be that the number has fluctuated in the way shown.

21,502. (*Chairman.*) With regard to the results of intermarriage with the deaf, I gather from these returns which you have handed to us, that there is a considerable variety of opinion as to the results of such marriages, and in the case of some of the scientific witnesses while admitting the perfect possibility of such a result, do they not contend that it would be only after a succession of marriages of that character through a great number of generations, and under circumstances which would hardly be likely to recur in every generation? I want you to say with regard to those points how far you agree and how far you disagree with the views expressed in some of these answers not as to the possibility, but as to the practical probability of such a thing occurring; because that is what as practical men we have to see, whether it is practically likely to happen, not so much whether it is theoretically possible. I am with you on that point, but I want rather to test your view as to the practical probability of it?—Upon this question of the intermarriages of the deaf, and the production of deaf offspring, I would like to deal with facts and not with opinions. I have in this little pamphlet presented to the attention of the Commission the evidence of scientific experts on the subject of heredity for you to ascertain the conditions that will certainly result in the production of a deaf race if they are carried out; and then I want to direct your attention to the facts to ascertain whether they are carried out or not. There are certain conditions which all these scientific experts unite in declaring will certainly establish a deaf race,—it being only a question of time.

21,503. But time is an important element?—Yes, time is an important element. It requires a number of generations. The conditions are these; that large numbers of the congenitally deaf shall marry one another, and that their congenitally deaf children if they have any, shall again marry congenitally deaf; and that their congenitally deaf children, if they have any, shall again marry congenitally deaf and so on; that that alone will result in an increasing proportion of deaf offspring in each succeeding generation, and

Mr. A. G. Bell.

21 June 1888.

ultimately after a certain length of time which we cannot calculate at the present time, a true breed or race will be formed. It is a very important question to find out whether that condition is being fulfilled and it is being fulfilled.

21,504. But does not that suppose that in each generation in order to come to an absolute variety of the human race, the deaf mutes must intermarry?—Yes, or marry hearing persons belonging to families in which deafness is hereditary.

21,505. Because directly the line is broken you start afresh again, and the chances are by so much more diminished of the eventual creation of a deaf variety of the human race; you admit that I suppose?—Yes, no doubt, the chances are diminished, but you do not have to start entirely afresh again. You have simply diminished the hereditary tendency which may still exist in a much stronger degree than in normal families.

21,506. Is not that a disturbing element in the calculation. The chances are of their marrying a person who is not deaf and dumb?—Yes, if that element entered largely into the calculation. But I would like to call your attention to the facts.

21,507. What we want to know is what has happened; to what extent that constant intermarriage from one generation to another of the deaf and dumb has occurred and how far the results have issued from those marriages?—The percentage of the deaf and dumb who marry hearing persons is entirely insignificant now; they nearly all marry deaf mutes.

21,508. Is that so?—It is so. I deal with facts and not with theory. I have taken a great deal of trouble to investigate the subject, and if you will allow me I will bring forward my facts. That is the point. The deaf children of deaf mutes are not marrying hearing persons, they are marrying deaf mutes.

21,509. Shall we be able to understand this part of your evidence without tables?—Entirely, and it will not take up much of your time.

21,510. We want the conclusions founded upon facts?—I want to give you facts exclusively, and nothing else. In my memoir on page 16 I give an analysis in Table XX. of 1,089 deaf mutes who have married. These deaf mutes are taken from the New England States, from New York State, from Ohio State, from Indiana State, and from Illinois State. Of these 1,089 deaf-mutes, 856, or 78·6 per cent., were recorded to have married deaf-mutes, and 233, or 21·4 per cent., married hearing persons. Then in Table XXI. I range them according to the period of birth. Of those who were born before 1810, 129 are recorded to have married. Of these 72 married deaf mutes, that is 55·8 per cent. Of those born between 1810 and 1839, 80·7 per cent. married deaf mutes. Of those born between 1840 and 1859, 84·1 per cent. married deaf mutes. Of those born after 1860 (and that does not bring it down to very recent times) 91·7 per cent. married deaf mutes. In my memoir I queried that percentage because it was based upon only 12 cases. But now let us examine the volume of evidence from America of the Illinois Institution, which gives us a larger number of cases of intermarriages of the deaf. The paragraph that I refer to is on page 57, and it is in these words: "Of "the deaf mutes who have been connected with the "institution as pupils and have left it, 272 have "married deaf mutes, and 21 have married hearing "persons." That is about 93 per cent. married deaf mutes.

21,511. (*Chairman.*) Further down I see it says: "It is interesting to know that among all these only "16 have deaf mute children"?—I should like you to calculate the percentage. The absolute number is not so important as the relative number. Supposing that you take an equal number of marriages of hearing persons, how many deaf children should there be? There should not be one.

21,512. (*Dr. Campbell.*) Does the percentage which you have just given, 93 per cent. or whatever it is, mean so many persons, or so many marriages; is it man and wife inclusive?—It is the percentage of the pupils who have married, that is to say, of all the pupils who have married, about 93 per cent. married deaf mutes. If they married pupils in the same institution it would reduce the number of families; and if they married deaf mutes in other institutions the number of persons coincides with the number of families.

21,513. If they married each other there would only be about 136 marriages?—Yes; I cannot ascertain that there.

21,514. (*Mr. Van Oven.*) It is an important point, is it not?—Perhaps so. For, as I understand the report, there are 16 families in which there are deaf-mute children. Now, if there are only 136 families, instead of 272, the proportionate number of deaf children will be still larger than at first sight appears.

21,515. (*Chairman.*) How many are married in the institution he does not say?—No.

21,516. (*Mr. Van Oven.*) One thing is very certain, that if 272 married deaf mutes, a large number must remain in the institution, because the institution is in the State; and they would not have married from other States?—They chiefly marry in the same institution.

21,517. Therefore that would be 136, and the 21 would be those who married outside entirely?—Yes; I have for more than a year past been gathering statistics relating to this subject; it is very difficult to obtain them; I have found one means of doing so which I should very much like to bring to your attention. The deaf mutes of America have newspapers of their own, gossipy papers, speaking of their marriages, their families, and their children. I have succeeded in making complete files of some of the earlier of these deaf-mute journals for preservation; I then took these deaf-mute journals and had copied out on cards, which I submit for the inspection of the Commission, all the records of marriages, giving the names of both parties who were married. Generally the journals did not state whether the deaf mutes were born deaf or not, but I have taken these cards and as far as I have been able I have hunted up the deaf mutes that have been married in the institution reports; and now I have a collection of marriages from which we can deduce a percentage.

21,518. (*Mr. Woodall.*) When you speak of the deaf mute journals, are they published for general circulation, or are they merely printed in the institutions?—Most of them are printed in the institutions with the object of giving the pupils practice in the art of printing; they are also circulated by the institution among the former pupils. I have brought with me, in order that you may see the nature of them, a journal published in the New York Institution, and this is a volume of it (*producing the same*); and I would direct your attention very specially to one feature which is a very important element in promoting clanship in the deaf and dumb; there is a column entitled The Itemizer. I will read the heading of this column and you will see its importance and significance. "Facts relating to deaf mutes "from all parts of the world, news from every State "in the Union. The idea is to gather into this "column items that relate to deaf mutes personally "or to associations of deaf mutes or to institutions "for the benefit of deaf mutes. We hope our friends "and readers will keep us supplied with items for "this column. Mark items to be sent 'The Itemizer.'" You can imagine the fascination which such papers as that have for deaf mutes; they can hunt up and find the movements of their deaf friends recorded; if a deaf mute cuts his finger it is here. These papers are very valuable from a genealogical point of view, and I have been making great efforts to preserve complete files.

21,519. There is a similar paper published at Philadelphia is there not, called "The Silent World"?—Yes, there are quite a number of such papers.

Mr. A. G. Bell.

21 June 1888.

21,520. (*Chairman.*) You think these papers are objectionable because they tend to bring the deaf and dumb more together and tend to their intermarriages?—Undoubtedly. The institutions should not publish papers of that kind. Of course you cannot prevent the deaf and dumb publishing independent papers.

21,521. (*Mr. Woodall.*) But would you not say that they served certain other very useful purposes?—Yes.

21,522. (*Chairman.*) There may be other reasons why the deaf and dumb should have their own journals?—Perhaps so. The object is a very worthy one, namely, the teaching of the art of printing, but I do not think the public money should be expended in promoting clanship among the deaf and dumb. Papers of that character should, I think, if printed at all, be printed at the expense of the adult deaf mutes themselves. The institutions should encourage their pupils to read ordinary newspapers, and if printing is taught by the publication of a periodical, the aim should be, in my opinion, to give the pupils of the institution (not the adults) information, in simple language, of what is going on in the great world outside, the items of news that interest hearing persons. I have somewhere in my book a table giving the results of the examination of 757 marriages reported in deaf-mute news papers, which I have been able to use for the purposes of statistics, and the percentage of those who marry deaf mutes which comes out of this examination is 95 per cent.; that is to say, 95 per cent. of those who have married have married deaf mutes,* so that it is absolutely certain—it is no question for argument or opinion—that of the deaf who have married there has been a constantly increasing number who marry deaf mutes, until now they nearly all marry deaf mutes, and of those who marry hearing persons, in the majority of cases the hearing persons are the brothers and sisters of deaf mute friends. I beg to present the Commission with the facts referred to in Queries 21,510 to 21,522 arranged in tabular form.† (*See* "Statistics of Intermarriage.")

21,523. (*Mr. Woodall.*) May we not take it that the perfecting of education has made them far more independent of a hearing and speaking mate than was the case before. I take it that formerly where they were taught the means of communication by signs only it was a great advantage to a man or woman to have a hearing and speaking husband or wife to be a medium of communication with the outer world; but as we have perfected a system by which they can themselves directly communicate with the ordinary population, there is less necessity for them to have an interpreter associated with them. Is that at all likely do you think to be one of the influences at work that tend to their intermarrying?—It may be one of the influences at work; and it certainly is a curious fact that there are no intermarriages of deaf mutes on record in the United States before the establishment of institutions. There are very few cases of marriage of deaf mutes at all before the establishment of institutions and those were exclusively with hearing persons; I have examined a few of these early cases and there are indications that even in these cases there were difficulties in the way of permission being granted to marry. For instance, I find a delay of two years between the record of an intention to marry and the actual marriage (which seems to have been solemnised to legitimatize a birth).

21,524. (*Chairman.*) Were there any State prohibitions or restrictions as to marriage?—No, not that I know of, and you will find in the appendix at the end of the small pamphlet a letter from the librarian of the Law Library of Congress which fully investigates the subject of the marriage laws in relation to the deaf and dumb from which it seems that there could not have been any restriction.

21,525. (*Mr. Woodall.*) Does it not follow that when these young people of both sexes are taught together in the same institution as they commonly are, that in itself would naturally lead to amorous relationships, and ultimately to marriage?—Undoubtedly that is the prime cause of the whole thing, namely segregation. Sign language is undoubtedly a most powerful element operating in adult life, but that again has been evolved from segregation.

21,526. (*Chairman.*) I do not quite see how the fact of institutions in themselves can be said to produce intermarriage of the deaf and dumb, if it is not so in Germany where they have a larger number of the deaf brought up in institutions, I believe, as far as we gather by the enquiries that we have made, certainly in large towns, and where they are all taught on the oral system. As the result of the enquiries which we have made in Germany, we have satisfied ourselves that there was no great intermarriage of the deaf and dumb?—The oral schools in America have been too recently established to enable us to get reliable and accurate returns; but still we find that the pupils of these schools do to a large extent marry deaf mutes, but the proportion who marry hearing persons seems to be much greater than in the case of sign-pupils. For instance, in the Clarke Institution, there are 17 pupils married, of whom 12 have married deaf mutes educated in other schools, and five have married hearing persons. Then there is a very curious point which is worthy of investigation. When you look at the 12 who have married deaf mutes, 10 of them are girls; it is the sought that are married more than the seekers. I see also that in the Horace Mann School, which is an oral school, (only it is a day school, and the teachers have no control over the pupils after the school hours), there are three cases of intermarriage of pupils.

21,527. But supposing that these institutions were day institutions, the pupils would be thrown together just as much as if they lived in the same house, or very nearly so, would they not?—Yes, while they were in school.

21,528. Would your objection be equally strong to large day institutions?—Equally, if the pupils were brought exclusively together. We want to mingle the deaf with hearing children in every possible way. We want to have the deaf mutes brought together in as small numbers as possible, and we want them to be in close proximity with hearing children in as large numbers as possible. I wish now to speak

* For analysis, *see* answer to Query 21,848.

† STATISTICS of INTERMARRIAGE.

1. Analysis of 1,089 cases of marriage of deaf-mutes from the following States:—Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, Ohio, Indiana, and Illinois. For sources of information *see* Memoir "Upon the Formation of a deaf variety of the Human Race," foot-note to Table XII. *See also* Tables XX. and XXI. In the following Table the married deaf-mutes are classified according to period of birth.‡

Period of Birth.	Total recorded to have Married.	Total recorded to have married Deaf-Mutes.	Per-centage.
Before 1810 -	129	72	55·8
1810 to 1839 -	715	577	80·7
1840 to 1859 -	223	196	84·1
1860 and after -	12	11	91·7

2. Analysis of 293 cases of marriage of pupils of the Illinois Institution. *See* "Facts and Opinions," page 57.

Total recorded to have married before 1888.	Total recorded to have married Deaf-Mutes.	Per-centage.
293	272	92·8

3. Analysis of 1,443 cases of marriage of deaf mutes from all parts of the United States—collated from records in deaf-mute newspapers. 71 of these married hearing persons, and the remainder married among themselves, the whole constituting 757 families. For full analysis, *see* reply to Query 21,848.

Total Deaf-Mutes reported to have married.	Total recorded to have married Deaf-Mutes.	Per-centage.
1,443	1,372	95·03

Mr. A. G. Bell.

21 June 1888.

of the deaf offspring, that is to say, of the results of intermarriage, because that is a most important point; and I want you to examine this question not from the point of view which interests me so much, which is the scientific point of view, namely, the formation of a deaf variety of the human race, that is not the practical point for you; the practical point for you to consider is how far you are increasing the burden on the people by the education of the deaf offspring of deaf people; and looking at it from a merely money point of view (which I hold to be a lower point of view than the scientific one which interests me) it is a very serious and important question. The most accurate statistics on this question are those that are given by the Rev. W. W. Turner, and published on page 20 of my memoir. The general result is simply this, that with one parent who is a congenital deaf mute one tenth of the children are deaf, and with both parents congenital deaf mutes, about one third are born deaf.

21,529. Out of a smaller number of families?—Yes, about one third of the children are born deaf. Now, the only principal who has given me complete statistics of the marriages from his institution is the principal of the Georgia Institution; and I would recommend your attention specially to his table on pages 60 and 61 of the pamphlet, in which he finds that 16 marriages of congenital deaf mutes produced 59 children, 19 of whom, or 32¼ per cent. were deaf mutes; that is nearly a third. While that percentage is important from a scientific point of view, you are more interested, of course, in the absolute numbers. I refer you to my memoir, pages, 78. 79, 80, and 81 which contains a list of deaf mutes introduced to our institutions who have one or both parents deaf. These names were returned to me by the principals and superintendents of our institutions in reply to a circular letter of enquiry. There are 207 of them. It is only an imperfect list. If you turn to pages 28 and 29 and onwards of my memoir, where I allude to families of deaf mutes, you will see a number of large families of deaf mutes, and I find that these are not included in the table at the end. In my researches I have incidentally come across altogether 124 cases, which are not included in the table at the end.

21,530. Are you speaking of the table of the Brown family?—Yes, look at the Hoagland family on page 30 where there is a Hoagland with seven deaf and dumb children. On page 32 you have another case of Sayles Works, who married a female deaf mute who had six brothers and sisters deaf and dumb, and they have six children deaf and dumb. There again these children are not included in the table at the end. Adding all these we obtain a list of 331 deaf mutes who are children of deaf mutes, but that still is very incomplete. My conclusions have been criticised by the principals and superintendents as you will observe, on account of the incompleteness of the returns. But will you consider for one moment what that incompleteness means? It means that the results are worse than those that I have given—that there are more deaf children of deaf-mutes than those I have specified. One month before I left America, a new method of ascertaining the number of deaf children occurred to me independent of the principals. I thought I would see what could be done by reference to the census returns. Suppose, for instance, we find a number of deaf-mutes of the same surname living in the same house. Now look at their ages: May you not then be able to find out whether they are the children of deaf mutes? I will show you the sort of information I get from the census return. Here is a case. Here is a family all of the surname of Runck, all living in the same house, here is Daniel, aged 40; Annie, aged 38; Elias, aged 17; Eddy, aged 12; and Mary, aged 3, all deaf mutes living in the same house with the same surname. Here is another case: a family of the name of Holtman. There is Richard, aged 40; Ruth, aged 30; George, aged 4; and Levy, aged 2. Now in such cases it is surely reasonable to assume that we have deaf-mute parents with deaf-mute children. I have gone over the United States Return of the Deaf and Dumb, and picked out all such cases as that. I am astonished, I am alarmed at the number that I found. These are capable of complete verification because in the population returns, the relationships are given to the head of the family, so that all we have to do is to take the numbers and hunt them up in the population returns, and find out exactly the relationship of those deaf mutes to one another. Unfortunately I have not been able to verify the list here for the Commission, for this reason, that the manuscript returns of the population are now in the hands of the binder, and are not accessible; it would take some time to bind them, but in the autumn I hope to verify everyone of these cases. I have put into the shape of a card catalogue all the cases which appear to me conclusively to be children of deaf mute parents. The indications are that we have at least 607 deaf mute children of deaf mutes in the United States living before 1880.

21,531. (*Mr Woodall.*) One or both parents being deaf mutes?—Yes. As I say these are all capable of verification, and I shall make it my duty to verify them the moment I can get at the population returns. In the meantime in order that you may examine them and see whether my judgment is reliable or not, I have had a duplicate made of my card catalogue, which I present to the Commission (*handing in the same*). It contains the names of 607 deaf mutes who are believed to be the children of deaf mutes. In every case the authority is given. Where the authority is given as A. G. B.'s memoir, the result is reliable, because I have ascertained it directly from the superintendents and principals. Where the authority is given as the census it is a matter of judgment, and your judgment is of course as good as mine. I desire to say here that quite independently of the scientific aspect of the case I should like you to take and calculate upon the basis of the average *per capita* cost what it must cost the United States to educate those children, and then I would like you to see my analyses of these children according to their ages; and to see the rate at which they are increasing; it is something tremendous. If you will allow me I will just read the figures according to the ages of birth, so that you can see quite independently of the formation of a deaf variety of the human race that we are paying in dollars and cents, an increasing and increasing amount for the education of such children. That alone makes it a very serious question for statesmen to examine. Here is the analysis by ages. I have four tables which I will submit to the Commission; but I will read these by ages as it shows the increase. Of these 607 cases, 3 were born in the decade 1800 to 1809 (I take each decade). In the next decade 3 were born; in the next decade 13; in the next decade 36; in the next decade 57; in the next decade 102; in the next decade 128; in the next decade 178; that is all that I have ascertained, making a total of 520. Of those not ascertained there were 87. Dividing these according to whether the deafness was congenital or not, the following are the figures. There are 239 with regard to whom we cannot determine whether the deafness was congenital or not. That leaves 368 cases which we can divide into congenital and adventitious. Of these 368 cases, 328, or 89·1 per cent., were born deaf, and only 40, or 10·9 per cent., were not born deaf; from which we may deduce that 89 per cent. of these 607 cases are congenital deaf mutes; and if you examine whether they constitute any considerable percentage of the whole congenitally deaf mute population, you will be startled by the result. If these figures are to be relied upon (and I ask the judgment of the Commission upon that point), *one deaf mute in every 34 among the congenital deaf mutes is the child of deaf mute persons.*

21,532. (*Mr. Woodall.*) Is that a larger proportion than you would have expected to find?—Yes. My figures have hitherto been based upon 207 cases, and all the scientific testimony that I have read from my book is based on only 207 cases. I knew that my

Mr. A. G. Bell.

21 June 1888.

returns were imperfect, but I had no conception of that number, which shows that the matter is one of very much greater immediate importance than I had any idea of, and I do not know what scientific gentlemen would say as to the length of time which would be required to form a deaf race with so many. The number materially alters the question.

21,533. (*Chairman.*) I presume from some of the answers to the questions which you have received, that it does not always follow that the marriage of deaf mutes produces deaf mute children in the first generation; but it often skips a generation?—That is the popular idea; I do not know of any cases to justify it; I mean that I do not know of any considerable number of cases. It is a very common idea, but I have not found any proof of it.

21,534. Certainly some of the answers to the questions distinctly state the opposite view?—Yes, but if you examine the institution reports that contain deaf relatives, you will find that a remarkably small proportion of the children have grandparents who are deaf, or great uncles or aunts who are deaf, which would be the case if the peculiarity skipped a generation.

21,535. In the Halifax Institution, out of 30 marriages 20 have been to deaf mutes and 10 to hearing persons, and the principal says:—"So far there are "probably between 30 and 40 children in these "families, and only in one case do the offspring of "these unions share the infirmity of the parents; but "that case is sadly noteworthy, all the children, five "in number, being deaf mutes. In this instance, "however, the children were, so to speak, doubly "stamped, there being several deaf mutes in the "family on both sides, as well as deafness in one of "them three generations back." There is a case certainly, in which all the children were deaf mutes in consequence of that double stamp; but on the other hand there were a great number who were not so affected?—The majority of children of deaf mutes can hear, but the proportion of deaf offspring of deaf mutes is enormously greater than the proportion of deaf offspring in the community at large, and that is the point. Now these deaf children are going to have a larger proportion of deaf offspring than their parents had if they marry deaf mutes, and 95 per cent. of all those who marry are going to marry deaf mutes. That is again the point; it is the continuous selection from generation to generation.

21,536. Is it the fact that deaf mutes in the United States have less instruction than the ordinary children. It is stated, I see, in the pamphlet that the common law undertakes the education of all children from 6 to 21, but in the mute State schools the pupils formerly only got five years' education; is that so?—It is the case that they get a very much less number of years instruction than the hearing children, the reason I suppose is the expense that the State is put to to board them.

21,537. They are in boarding schools are they?—Yes; I believe it would be better for the State and more economical for the State, as well as better for the children, to let their parents board them wherever it is possible, and to lengthen their time of instruction.

21,538. (*Dr. Campbell.*) Is not that state of things partly brought about because they are often drafted off to practical employment; is it not the theory that as soon as they are prepared so that they can enter into ordinary society, it is better for them to do so. A great many people have a theory, have they not, that if these children are going into practical life in some employment, they ought not to remain in one of these boarding schools too long. Many of them have eight years have they not?—Yes; but hearing children have from the age of 6 to 21.

21,539. I know that, and I agree with you that it would be better if these children were partially prepared before they went there, so that they would not begin so early; but I think that most educators of the deaf and dumb would themselves hold that they should not stay too many years in a boarding school for the deaf and dumb, but that it is better for them to get out into the world; I should like to get your opinion upon this point, I think that previously to the time of education the religious opinion of the community had something to do with the prevention of marriages between the deaf and dumb in the same way which it had amongst the blind. But what I want to ask you is this; do you not believe that the great preponderance of this evil might be removed if the State would have entirely separate institutions for girls and boys; and that if one State could not afford to have more than one institution, different States should combine, so as to have separate institutions for boys and girls; that is my theory with respect to the blind, and I want to know whether you share the same opinion with respect to the deaf and dumb?—I do not think that that would make much difference, so long as the language that is used by deaf mutes is different from the language of the community.

21,540. Do you not think that where girls and boys are seeing each other every day, and come into contact through meeting in class and society, they form the very feeling which leads to after marriage with a great majority of them?—Undoubtedly the collection of the two sexes into one institution does of itself promote intimacies and affections among the pupils. But quite independently of that, the fact of the possession of a language different from that of the community, would bring the deaf together in large cities, just as the English-speaking people come together in the cities of Europe, because they have a common language. So far as I can find historically (and I have examined the subject) the first case of intermarriage of deaf mutes seems to have been the marriage (in 1819) of Laurent Clere, the teacher whom the elder Gallaudet brought from France to America; and as I look through the literature of the subject, I see evidences that the results of that marriage were watched with very great interest and eagerness by the deaf mutes of the country. There undoubtedly was a feeling before that time that it was wrong for a deaf mute to marry a deaf mute.

21,541. (*Chairman.*) They had a feeling that it aggravated the evil?—Yes, and some of the earlier teachers of the deaf and dumb had an idea that intermarriage would lead to a deaf mute race. I was not the first to start that idea. Dr. Turner, of Hartford, was the first who produced that theory; and it was founded upon facts within his knowledge. I have simply amplified his facts.

21,542. You stated that the result of that marriage was looked upon with great interest by all the deaf and dumb at the time; what was the result?—The children all heard.

21,543. If they had not heard, the old system would have prevailed?—That is my opinion.

21,544. (*Mr. Van Oven.*) Is there any record as to whether the husband and wife,—this lady who was imported from France, and the person whom she married,—were congenital deaf mutes or became deaf in after life?—In regard to the husband we do not know. He came from France and was supposed to be congenitally deaf but we do not know it for certain. There is one thing which may indicate that he was not. It seems that his sign-name in Paris, translated, meant the false deaf mute; so it may be that he was not born deaf. His wife, who was one of the early pupils of the American asylum, was not born deaf, but Laurent Clerc himself was thought to be congenitally deaf, and that was what gave special interest to the case.

21,545. (*Admiral Sir E. Sotheby.*) Do you know what is the result of their children marrying?—All their children were hearing and speaking children, and all the descendants can hear.

21,546. (*Mr. Van Oven.*) But there is no proof that either of them were congenitally deaf.—No. After that time the deaf and dumb commenced to intermarry.

21,547. (*Chairman.*) Assuming then that you have proved the case (which certainly is a very strong case from the statistics) that the present system is leading to a serious increase of deaf mutes in America which should be prevented, what is your remedy for it in the way of suggesting other methods of instruction; would you formulate any distinct plan for avoiding that which would be applicable to this country as well as America. I want you to sum up generally what you said before into any plans which you have had before your mind?—I think that I can give the Commission some general principles which will be valuable in forming a conclusion. My plan for preventing the intermarriages of deaf mutes is to examine carefully the artificial causes, whatever they may be, which have led to intermarriage and to eliminate them from our methods. If I may sum it up in my own way I would say this: I want you carefully to formulate from the scientific testimony in this little pamphlet, the breeders way to produce a deaf variety, and then to look at the methods which have been adopted by philanthropists, and to see whether you agree with me in the conclusion that these are the ways in which the breeder would go to work. How would the breeder go to work, supposing that he wanted to make a deaf race? The first thing that he would do would be to collect all the deaf mute children at as young an age as possible, take them away from their homes and hearing people, bring them all together and make them live together from early childhood up to adult life. Is not that just what we do?

21,548. (*Admiral Sir E. Sotheby.*) How long would you keep them there?—As long as possible if you want to make a deaf race. That makes them more likely to marry one another than to marry hearing people. That is just what philanthropists have done. But that is not enough. You have certainly promoted acquaintances among the deaf; you have certainly prevented them from making acquaintances among the hearing. But still you send them out into the world, equipped, it is supposed, to mingle with the world and to take their place in society; and inasmuch as there is only one deaf mute for 1,480 of the population, it would seem rather difficult to formulate a plan that would make a deaf mute in adult life go and marry only a deaf mute. But supposing that we were to get a very ingenious breeder, supposing that we were to find a man who could formulate a plan which should compel the deaf to marry the deaf, to choose the one out of the 1,480, what plan would he adopt? Now I conceive that about the only practicable plan, but it would be efficacious, would be this: *do not let your deaf mutes think in English language;* make them think in a different language from the language of the people, and then you have got the conditions. Now then, send them out into the world, and they not only know one another and do not know hearing persons, but they think in a language of their own distinct from the language of the people. That will compel them to keep together. And is not that what we do in America? These are the two chief elements that produce deaf children in America. First segregation which itself evolved the sign language; and secondly, the sign language which prevents the acquisition of English as the vernacular which brings the deaf children together in adult life, and forces them to marry one another. The hopeful feature about the whole case is that these are artificial conditions. You want to eliminate these conditions. The first error made by philanthropists was to take the deaf from their homes and from hearing children. We want to reverse the whole policy of centralisation. We want to adopt the policy of decentralisation to the greatest possible practicable extent. We want to bring the deaf together in as small numbers as possible, and we want to separate the deaf from hearing children as little as possible. We want them to be among their friends and in their own homes; we want to strengthen, not to weaken, the ties that unite them to home. Institution life severs the home ties of the children.

21,549. (*Chairman.*) Do you think that the principals of these institutions, knowing these facts which you have brought before us, make any attempt to discourage or prevent the marriage of deaf and dumb; because given those facts a great deal might be done if they were brought together under these circumstances; is anything done by those who have control of them when young to instil into their minds the dangers and disadvantages which they are entailing upon their offspring and those to succeed them by intermarriage?—My best answer to that is to quote the words of the principal of the Illinois Institution, who is a representative man among our teachers. At page 53 of the pamphlet, Dr. P. G. Gillett says: "I "do not discourage the intermarriage of the deaf as "they are usually more happily mated thus than "where one of the parties only is deaf. The deaf "need the companionship of married life more than "those who hear, and it is a gross wrong to dis-"courage it."

Mr. A. G. Bell.

21 June 1888.

21,550. It is not surprising when a man of so much influence as that in America advocates their intermarriage that his advice is followed by other teachers?—Certainly not.

21,551. (*Dr. Campbell.*) Is it not quite evident also that the majority of the principals of the deaf and dumb institutions throughout the States hold the same opinions?—I think so.

21,552. (*Chairman.*) Supposing that you had another system of teaching the deaf and dumb, as long as you have got a language which separates them from the rest of the world, even if they are brought up in their own homes, will not those who have been brought up under the separate system gravitate together when they are grown up, and again just at the time when marriage would take place be brought into contact with each other after they left their own homes?—Yes, if there is a separate language that result must follow.

21,553. So that it is not enough to do away with institutions?—No, but it is not practicable to do away with institutions.

21,554. But even if you could do away with institutions, that of itself would not be enough?—No; in fact the chief cause of the intermarriage I hold to be that special language, but then that language was evolved from segregation which was the first cause; it never would have been evolved but for that.

21,555. (*Mr. Woodall.*) Among the deaf mutes themselves is there not a preference for those who are similarly circumstanced, rather than for marriage with a hearing and speaking person?—That is the immediate cause of the marriages; but then they do not know other people; they have been brought up together and have had no chance of forming acquaintances among other people.

21,556. Do you think that there is any general prejudice on the part of those who possess their faculties to the disadvantage of those who are deprived of the one or the other?—When they have not the opportunity of seeing deaf children, there is a prejudice; but when they have the opportunity there is no prejudice at all.

21,557. You have had so happy an experience as we know that I hardly know in what way to put my question; but do you think that marriages generally between those who are so similarly circumstanced and those who are differently placed in this respect, are happier in the one case than in the other?—The opinions of the principals seem to be that they are happier when both are deaf mutes. But I know of no data myself from which we can form conclusions.

21,558. (*Mr. St. John Ackers.*) Is it not a fact that a very fair number of hearing teachers in institutions in America have married deaf and dumb ex-pupils?—I am not prepared to generalise; but I know a good many who have done so.

21,559. (*Chairman.*) Following your remarks upon the questions which affect the increase of the deaf and dumb, will you now tell us what your views are with regard to the methods of instruction, first of all in

Mr. A. G. Bell.

21 June 1888.

relation to what we call the special language which we have been in the habit of calling the sign language, and next with regard to the teaching of language which is known in this country as the oral system; will you give us your views as to how far the education of the deaf and dumb is affected and governed by those two systems?—In trying to educate the deaf child the first thing that we have to decide is through the medium of what language shall we educate him? Now I think the important principle that should guide us should be that we must teach our child to think in the language of the people among whom he lives; that is to say, that whatever method of instruction we adopt in this country, English in some form should be the language of communication and thought. The moment you use a special language that is not the language of the people, it comes between the deaf child's mind and the English language which he then acquires as a foreign language, and then certainly in adult life he will seek those who use that special language. The whole question of the education o the deaf is the question of language teaching.

21,560. How far is that special language necessary, or is it necessary at all?—That special language is not necessary at all; it is in the way because it interferes with the acquisition of the vernacular. For that purpose I should like to give you my views of the special language that we use in America, and which is known as the sign language. The same results I hold would follow if we used German or any language which is not the language of the people. I think that half the misunderstandings that arise between the teachers of the various systems of instruction arise from mutual misunderstandings of the meaning of the word "signs." There are signs and signs; and I think that it would be a matter of great importance to this Commission to classify the signs in order to have a proper and suitable classification by which we might see what class of signs are harmful and what class of signs are not. I would divide signs into four broad classes: (1) Signs of the emotions, facial expressions, and so forth; (2) Dramatic signs, signs used by orators and others to emphasize the meanings of their words; (3) Imitative signs, natural pantomime by which people imitate; and (4) Symbolic signs or conventional signs; these are generally imitative in their nature but are symbolical of something else.* As an illustration of what I mean by a conventional sign, if you attach the idea of "good" to holding up the thumb, that is conventional. Or again, suppose you adopt the sign for a cap string, drawing the thumb down the cheek, for a woman; that is a conventional sign. In America the sign for the cap string now means "female." It would be applied to an animal as well as to a human being. Or if you use a shirt front with the meaning, not of a shirt front, but "white," that is a symbolical sign. The first three classes constitute natural signs. That is—signs that are naturally used and naturally understood by all mankind. The use of a symbolical or conventional sign constitutes the basis of a real sign language. I may say in regard to that sign language that when I first became interested in the subject of the education of the deaf, I came to the conclusion that it was the duty of any man who desired to benefit the deaf to study all the methods of communication that were known. I, therefore, in 1872 or 1873 began to make a study of the sign language and took lessons in it for one year. I mingled with the adult deaf mutes of Boston to get familiarity with the language and I know the language as you know French or German, or Russian, or some language that you do not think in but translate. I may not care to use it, but I know enough about it to admire it and be fascinated by it as a scientific study, and as a philological study. To see the way in which this language has arisen by a process of evolution from natural pantomime has fascinated me; and in 1878 I brought forward the subject before the Philological Society of England in London, when I advocated the study of this language by men of science. I say this in order that you may know that I do not approach this language with the bias of an oral teacher. I admire it as much as any teacher of signs can do; I think it worthy of study, and worthy of preservation; and yet I think it a mistake to use it in the education of the deaf. Now, in order that you may get clearly the distinction between the third and fourth classification, natural pantomime and sign language, (that is symbolical signs) I would draw your attention to an exactly similar parallel between pictures (which correspond to pantomime) and a picture language like the Egyptian hieroglyphics (which corresponds to the sign language). In the one case you have natural signs and symbolical signs just as in the other case you have natural pictures and symbolical pictures. I think the whole difficulty with our teachers, and probably with yours, in knowing what to do with signs arises from not clearly formulating the radical differences between these kinds of signs. There is no teacher who does not use signs of the nature of Class 1 and 2, they all use expressions of face and they all use dramatic gestures. There is no teacher that objects to Class 3 in moderation being used as pictures are used; there is no teacher that would not allow his children to illustrate the meaning of a sentence or story by acting it out. Natural pantomime is a great thing to interest a child in language, but it should be used as pictures are used, as mere illustrations. *The proper use of signs is to illustrate language, not to take its place.* It is the conventional language corresponding to hieroglyphics to which objection is made. It is an arbitrary language, a conventional language, a symbolical language, exactly analogous to the Egyptian hieroglyphics, and it takes the place in the mind of the deaf child that the English language should take. I think it important that we should teach our children to think in the language of the people. Now how does that language appear? It appears under two forms, the spoken and the written form. Where the spoken and written forms coincide, as in Germany and Italy, there is really one language to be learnt, and I would advocate there as in all countries similarly circumstanced the pure oral method alone. But I do not think that that plan is quite suitable for all deaf children in our country because the spoken and written languages are different.

21,561. Why are the spoken and written languages different in England, and not in Germany and Italy?—I suppose we are more conservative, I do not know; but since the introduction of printing, the written form of the language has remained comparatively fixed, whereas the spoken form of the language has shifted, so that now the pronunciation and spelling do not coincide.

21,562. That renders it more difficult of course than Italian or German?—Yes, that renders the introduction of the oral system more difficult.

21,563. I did not know to what you were alluding, I quite understand it?—We want to teach our children the English language. Now how are we going to teach any children a language? I think there is only one royal road to the learning of a language, and that is to use it for the communication of thought without translating it into any other language. The moment you teach one language through another the pupil thinks in the one language and translates into the other. You must use the language without translation, and I hold that any language that is used in the presence of deaf children will be acquired by them by imitation if the language is clearly presented to their senses. And in regard to teaching language, if you have not had the evidence of one man, a fellow countryman of your own, I recommend you to bring him before this Commission; a Scotchman (a good old Scotchman) a Scotch tutor in Oxford, who wrote upon the education

* Classification of Signs.

Signs	Natural signs	1. Emotional signs.
		2. Dramatic signs.
		3. Imitative signs.
	Conventional signs	4. Symbolic signs.

Mr. A. G. Bell.

21 June 1888.

of the deaf and dumb an admirable treatise, and who died and was buried and was forgotten. A hundred and fifty years afterwards his remains were discovered by Dugald Stewart on the dusty shelves of an old library, and the works of George Dalgarno were reprinted by the Maitland Club of Glasgow; and if this Commission has not looked at that little work of Dalgarno's entitled "Didascalocophus" you will find that is a work containing many of the ideas of the nineteenth century. This was a man of gigantic intellect in his day, and when you consider that this was written about the year 1680 before the deaf were educated at all, you will be surprised at the clear ideas that he has. If I have any ideas of value about language teaching I give the credit to Dalgarno. You will find a reprint of his work in the Annals for January 1857, Vol. IX., pp. 14–64.

21,564. At that time they were taught language and not sign, I suppose? They were taught nothing; the deaf were not taught at all; there was nothing in the year 1680 for the education of the deaf. His ruling principle in the way of teaching a language is, use it, and use it, and use it; he says that it is the frequency with which words come that impresses them upon the memory so that the more frequently you can present words to the eyes of the deaf child the better; all that you have to do is to present words to the eyes of the deaf child as we present words to the ears of the hearing child.

21,565. Written words?—Yes; then the child will come to understand them, and afterwards will come to use them.

21,566. But then as you have to present it only to the eyes in the first instance, how do you first begin to teach language; would your system be to write down a word and then speak it orally?—My plan would be simply to write or spell to a deaf child what I would say to a hearing child. After a time he would come to understand it—then he would imitate it and use it.

21,567. In each case you would write down a word and then speak it orally or *vice versâ*; which would you begin with?—It depends entirely upon the class of the deaf I am dealing with. Take those who are born deaf, those who have no knowledge of language; I hold that the basis of their education should be written language, the written language of the people. The spoken language presented by word of mouth, what we term speech reading in America, reading from the mouth, every child who has a knowledge of language can acquire; but I think that with the congenitally deaf to commence their education by speech reading, to commence to have the child read words from the mouth, *before he knows the language*, interferes with his mental development, retards progress in the acquisition of language, and thus defeats its own end, and retards the acquisition of speech-reading itself. I will illustrate in a moment what I mean. When you come to look at the mouth of a person so as to read from the mouth, you find that the elementary signs or positions are not clearly differentiated to the eye.

21,568. In English it is so, certainly?—Yes. For instance, take the difference between P and B and M. Here the lips are closed and accordingly the differences must be interior. All those three letters involve the closing of the lips, and the differences, whatever they may be, are interior. Whatever differences of adjustment differentiate to the ear the three sounds P, B, and M, there is nothing that can be seen by the eye, because the lips are shut, so that to a deaf child the letters P, B, and M are alike. So with T, D, and N; so with K, G, and NG; so with F and V, and so with S and Z. In fact when you come to consider the visibility of the elementary sounds of the language they are very ambiguous. Take the case of P, B, and M again. A child cannot tell whether you say P, B, or M, but what he can tell is this—that the sound you utter is one of those three letters; he can differentiate groups, but not individual letters. He can know that whenever he sees the lips shut, it must be one of those three letters, for there are no other elements in the English language that involve the closing of the lips. So again if he sees the under lip against the upper teeth he knows that it must be either F or V, but he cannot tell which; so that so far as the elementary positions are concerned all that a deaf child can do is to determine groups of sounds. It follows from that ambiguity to the eye when you deal with words that there are many words that have the same appearance to the eye. Take such a word as "man"; there are no less than 13 words that look just alike to the eye of a deaf child; so that if you were to say the word "man" to a deaf child, he could not tell from sight alone which one of those 13 words is the word you intend. They are all homophenous with one another. Let me take the case of the words which look like the word "man"; there are, for instance, pat, bat, mat, pad, bad, mad, pan, ban, man, pant, panned, band, and manned; those are all alike to the eye of the deaf child. If you say the words singly he cannot tell one from the other. But supposing you put them into a sentence; supposing that the child knows that the word is one of the group that I have given and I say "I met a (?) in the street" it could not be pat or mat, and it could not be bad or mad; it is *man*. Then, again, supposing that I say "I wiped my feet upon the (?)"; it must be one of those words, and it can only be *mat*. *Context differentiates the ambiguous words one from the other.* It follows from this that those who have a sufficient knowledge of the English language to be able to judge by context become good speech-readers, but those who have not do not, and speech-reading alone will not give them the knowledge. Those who could speak before they became deaf have that knowledge naturally. The congenitally deaf must first be given it artificially. If you were to take a pair of scissors and cut a line of writing right in half, so that you could only see the upper half or the lower half, it is evident if you show it to a man who knows the language perfectly he can read. It is ambiguous, but the context tells the meaning. But if he does *not* know the language will such a presentation of it teach it to him? I think not. So I think that if we present the English language in its spoken form to the eyes of those deaf children who know the language, we get good speech reading; but if we present it to those who do not it will not teach the language, and we only retard mental development by presenting a language to them prematurely in an ambiguous form. In order to teach the language it should be presented in a clear and unambiguous form. Writing and a manual alphabet will do that. I do not think that there is any difference of opinion among practical teachers, either here or elsewhere, that in the case of children who have natural speech, and who therefore know the language, the pure oral system should certainly be adopted with them. But in regard to the congenitally deaf where they do not know language, there diversity of opinion occurs. I am inclined to think that those children should be taught the English language in a written form before being required to rely upon the mouth alone.

21,569. With signs?—All the natural signs you like.

21,570. Would you use the finger language then; where would that come in; that maintains the language, does it not?—That maintains the English language, and I see no objection to it from a mental point of view. The objection is that it interferes with speech reading; that is the true objection. But its use in the school-room, in the oral department, is a matter entirely within the control of the teacher. Do not mix the manual alphabet and speech-reading together, for then one will interfere with the other. Writing also interferes with speech-reading, if it is used to explain ambiguities of speech. Would you therefore deny a child a knowledge of written language? Certainly not. But how does a manual alphabet differ from writing? It is simply another form of alphabet—it is not a language by itself, only

Mr. A. G. Bell.

21 June 1888.

another kind of character or letter that can be made when writing materials are not at hand—and that has the advantage of writing in being more expeditious. But when we come to consider the deaf, I think we have more to look at than speech reading. Take the case of a congenitally deaf child; there are three misfortunes that result from his deafness; it is quite a different case altogether from a child who speaks naturally. In the first place he knows no words, so that his thoughts are carried on without words; there is a mental condition that is extraordinary, an ignorance that we cannot realise. Secondly, resulting from that, he knows no speech; he does not know spoken words, because they are addressed to his ear. And thirdly, although he has perfect eyesight and the printed page appeals to him as it does to us, he derives no ideas from written language. So we have these three necessities which are very obvious in the case of congenitally deaf children: lack of speech; lack of knowledge of written language; and lack of mental development which comes from intercourse with other minds. Now the three broad varieties of methods of instruction, the oral, the manual, and the sign methods, aim for one of those three things, *but not for them all.* A sign language teacher says, it is the mental development that is most important and we will reach the mind any way, no matter about language; so he develops the mind through that language which it is easiest for the deaf child to learn, irrespective of written language and irrespective of speech. The oral teacher says the child does not speak; let us remedy that; and it is speech that is made the one object. and written language is secondary, mental development is secondary, and everything must go through speech. The manual teacher, on the other hand, thinks that written language is the only thing of value and neglects speech. So that each method aims at one of these three defects instead of all of them. I think that undoubtedly there is a great deal of truth in all the points that are made by all the teachers of all the schools. I think that if we have the mental condition of the child alone in view without reference to language, no language will reach the mind like the language of signs; it is the quickest method of reaching the mind of a deaf child. If you want a child to learn written language there is no method like using written language and spelling it and writing it on the board and on paper, and spelling it with the fingers. Use the written language all the time. Then in the case of speech, there is nothing that will develop speech like using the mouth. But if you try to send a billiard ball in three different directions at the same time, the billiard ball takes a resultant path, and I believe that the broad-minded man who looks at the whole condition of the deaf will not aim at one of these things; he will not adopt that method which is best calculated to attain one of these results at the expense of the others; *he will take the resultant path.* My own ideas upon that subject as regards the congenitally deaf are these: that those signs which are natural are really, or should be really, common to all the languages that you teach a deaf child, whether speech or otherwise. It is only the fourth class of signs that is objectionable. While I admit that the use of a sign language might *start* the mind of a deaf child more quickly than the other methods—the mental improvement is not continued but retarded as time goes on; for the printed literature, through which alone much advancement can be gained, is in another language (the English language), and he cannot profit fully by this until he has *unlearned the language he first acquired,* so as to be able to think in English. The sign language is in the way of his learning the English language, so that though his initial velocity may be very great, he soon runs against an obstacle which checks his further advance. I believe that for the congenitally deaf written language should form the basis, because it is clearly differential to the eyes; it is perfectly distinct and perfectly clear, and I think that it should be supplemented by the use of the manual alphabet, for we want that method, whatever it is, that will give us the readiest and quickest means of bringing English words to the eyes of the deaf, and I know of no more expeditious means than a manual alphabet. Then I think that every deaf child should be taught to use his vocal organs. For those little deaf children who are taught by writing and the manual alphabet, I should advocate also the teaching of speech.

21,571. Simultaneously, not as an accomplishment?—Not as an accomplishment. but simultaneously. I would have a deaf child speak in the schoolroom all the time, and have the teacher write or spell to him. Of course I speak still of the congenital deaf. Their difficulty is a one-sided difficulty; deafness interferes with their comprehension of language *addressed to them.* There is no defect of the vocal organs to prevent them from using speech in addressing their teacher.

21,572. What would you have the teacher do, write or use speech?—I would have him write or spell so as to present the language in a clear form, and when the child has arrived at familiarity with the English language then is the time when he may profit by speech reading. Then is the time, and not till then, that he is thoroughly competent to decide upon the ambiguities of speech. I think that the oral teachers retard the acquisition of speech reading by their congenitally deaf pupils by not relying more on written language. I advise that they should be taught both written language and speech, and that while the pupil should be encouraged to use speech all the time, the teacher should rely upon written language in the earlier stages, and that as they grow up in their knowledge of language speech-reading should be substituted for writing and spelling.

21,573. That is, I suppose, what is meant by the combined system in some cases. You have told us that it is very difficult to know what the combined system is, that it may be one thing or it may be another. Is that the view that is taken in America with many who say that their schools are on the combined system?—I do not know. The greatest diversity of opinion prevails about the word "combined."

21,574. What are the institutions in the United States which adopt your method; are they institutions which describe themselves as combined schools?—There are not any. The teachers in America are all extremists; they are either pure oralists, or they are sign teachers, or manual teachers. The best results I have seen in the teaching of English to little children on a large scale have been in the Western New York Institution, where sign language is abolished, and all communication is carried on by the manual alphaphet, but they neglect speech. In all the schools with which I am acquainted "speech" and "speech-reading" go together. It is not fully recognised that they are two distinct arts, and that a pupil may succeed in one and fail in the other.

21,575. (*Mr. Woodall.*) When you speak of the Western New York Institution, do you mean the one at Western, New York?—No, I mean the one at Rochester, New York. I think it important to make a very great distinction between articulation and speech reading. All the difficulties in the way of the application of the oral method, which all men must admit is the best if it is practicable, lie in speech reading.

21,576. You think then that everybody can learn to speak?—Everybody can learn to speak, and everybody who knows the English language can learn to understand it from the mouth. If we are to teach our children to speak we have, practically, in English-speaking countries to teach them *two languages*, or rather two dialects of the same language, for the spelling and the pronunciation are very different from one another. They must learn the written form. Then keep it separate by itself, like a distinct language. During one portion of the day have all communication by writing and a manual alphabet;

Mr. A. G. Bell.

21 June 1888.

at another portion have it all by speech and speech-reading (and if writing must be used to explain ambiguities let it be phonetical writing). In the earlier stages I would use writing and a manual alphabet almost exclusively; simply teaching articulation and speech-reading for an hour or so a day. The pupils will be able to pronounce words long before speech-reading can be relied upon as the means of communication. I would then in this stage have them use their speech (instead of writing and spelling) when they communicate with their teacher *all the time*, but have the teacher continue during the greater portion of the day to address them by means of writing and a manual alphabet, but for an hour or so a day let him use speech without the manual alphabet. As the pupils become familiar with English phrases many will be found whose education could be carried on in an oral department, exclusively by oral methods. Others will not be able to understand speech from the mouth readily and easily, while they may be able themselves to speak intelligibly. In such cases they should remain under manual instruction, but speak themselves in the school-room, oral instruction being given for a limited period each day.

21,577. Then you look upon lip-reading as a subsequent part of the instruction which ought not to be begun at first?—It should be begun from the very earliest stage, but should not be relied upon as the means of communication.

21,578. I suppose you admit that unless speech is taught when young, the results of speech to the deaf are never satisfactory?—Yes, but I do not wish to assert this too positively.

21,579. That is the evidence which we have had, and we have observed ourselves that a great deal of the voice depends upon practising speech early; is that your opinion?—Undoubtedly, but I must say one word as to the method of measuring the results of speech in oral schools. I think that the method which is adopted of ascertaining the relative value of speech and signs is entirely wrong. Let us now see of all the accomplishments, and all means of communication, that are taught to a deaf child, what are those means that are of use to the child in communicating with the hearing world. (1.) First of all look at a sign institution. They use the sign language. That language is not known by the hearing world; it is of no use to them in communication there. They use the manual alphabet; that is not known to the hearing world; that is of no use in communication. There is only one thing which they have that is of use in communicating, and that is writing. That is the only bond of union between a deaf child taught by the sign method and the hearing world. (2.) So if you look at the manual method in which the sign language is excluded, and writing and the manual alphabet is used again we find only one means of communication, viz., writing. (3.) Now you come to the oral school, and here is the point which we do not realise as a general rule,—that they have writing too. The children are taught to read and write, and they have that means of communication with the hearing world, so that whatever articulation they have, let it be of the most abominable character possible, it is something in addition to that which they have by all the other methods. We are generally apt to gauge the value of the oral method by the perfection of the speech. That has nothing to do with it at all. Whatever speech a child has, is something in addition to what a child has who has no speech; and the way in which you should compare the oral schools, the manual schools, and the sign schools is to take what they have in common and compare the results then; compare their knowledge of written language, and their use of it in oral schools, manual schools, and sign-language schools; and supposing that they simply are all equal, then the oral system is better. If they are not equal, then the defect should be remedied. The claim has been made, and I am inclined to think with some justice, that in some cases they are not equal. I am inclined to think that in some cases in oral schools the knowledge of language of the congenitally deaf is not equal to that of those who are taught in manual schools, certainly not in Mr. Westervelt's schools; but that can be remedied; there is no reason in the world why written language should not be used more freely. The manual system relies on writing and neglects speech. The oral schools rely upon speech and neglect writing. But there is the means of comparing them. If you are to value speech, how are you to value it? Not by its perfection but by its intelligibility.

21,580. As a means of communication?—Yes, that is the value of speech. But if you value the oral *method*, you have to base your value on the knowledge of written language possessed by the children. If their knowledge of written language is the same as the knowledge of written language possessed by those taught on other systems, then they have something in addition in whatever power of speech they have.

21,581. Do you think that that knowledge of speech, which is very often found to a limited degree in the deaf and dumb, is valued by them as a means of intercourse as much as it ought to be valued?—It is valued in the place where it should be valued; it is valued in the homes of the children. The teachers of the deaf do not value it; they think that, because speech is imperfect or perhaps painful to the ear, it is of no use. There never was a greater mistake. All those who have had anything to do with the deaf, and who may have had deaf persons in their own family, know that an imperfect articulation may be very sweet to those who love the child; and the point of value is the intelligibility of the speech. If it is intelligible that is its value. Of course the greater perfection we can get the better. But do not discard articulation because it is difficult to get it in perfection.

21,582. But where articulation is only taught as an accomplishment, as it is in some schools, there appears to be, from what we have seen and heard, a great shyness on the part of children who are deaf and dumb in an institution to exercise that speech; there does not seem any great willingness on their part to exercise speech; that is so, is it not?—Undoubtedly; the conditions in institutions are unfavourable to the practice of speech. Indeed I have known speaking children who became deaf at 12 years of age, who have gone to a sign institution, and been placed under a deaf teacher, and have come out deaf mutes—those were children who had been in our ordinary public schools. That is to say, they were deaf mutes in this sense, that they did not use their speech, that they were shy in using it; they had the ability of course, but they come out deaf mutes, and were mingling with deaf mutes in adult life.

21,583. Therefore you think it very important that everybody should have an opportunity of being taught speech?—I think it is a crime not to try to teach the deaf to speak. In our institutions, as you will find from the statistics which I have presented to you, the majority of the children have no opportunity of acquiring the art of speech; they are not dropped from articulation classes. If you look at the statistics that are collected at the end of this little volume, "Facts and Opinions relating to the Deaf," you will find that the majority of the pupils have not been dropped from articulation classes; they have not had a course of training for a year or so in speech, and then been dropped on account of their inability to acquire it; they have never had the opportunity of learning, and I hope the moral sentiment of society in future will be such that it will be considered a crime to deprive a human being of the power of articulate speech by neglecting to instruct him in the use of his vocal organs. Therefore I have urged that in all the institutions of the country, whatever method of instruction is employed, articulation should be raised at least to the level of geography and history. It should be a study that should be taught as a matter of course to every deaf child, not only on account of the benefit that it is to his health and his lungs, but as a matter of duty and conscientiousness.

Mr. A. G. Bell.

21 June 1888

21,584. In an institution where you have some who are congenitally deaf, and others who have the remains of speech, in the one case you say that the congenitally deaf must be taught by the finger alphabet in the first instance, and that those who have some remains of speech must be taught orally. Have you any strong views as to the necessity of keeping those two classes absolutely distinct in such an institution, and not allowed to communicate with one another?—I have no strong views as to the separation of those two classes out of school hours. I think that their knowledge of written English will be increased by communication with one another by the manual alphabet. I would not, however, have the manual alphabet used in the schoolroom in the oral department.

21,585. Passing them up from that department to the oral school, and making the oral school an upper school?—Yes, putting all those who have a knowledge of speech in the oral school to start with; and in the case of those who have no knowledge of speech, I would give it them; but speech reading should not be used as the sole means of communication until they are familiar with the English language. Just as fast as they become familiar with the idiomatic phrases of the language, then they have the faculty of reading from the mouth, and they can be graduated into the oral classes. One point with regard to speech reading is very important. When you come to realise that context is the key to speech reading, you can see a very curious result that ordinary speech at its ordinary rate of utterance is more clearly intelligible than slow and laboured articulation. I have studied this matter very closely, and have been informed by a lady, who relies exclusively upon speech-reading, that she understands strangers more readily when they do not know that she is deaf, because they speak naturally and at the ordinary rate; but the moment they are told that she cannot hear, they commence to mouthe and make exaggerated motions, and then she finds more difficulty in understanding them. You can easily see that if context is the key to speech reading, if you speak single words to a deaf child, word by word, he does not get enough to make the context. You want to present the whole sentence to a child. But you cannot do that with a congenitally deaf child, although you can with one who knows the language. So that I hold that relying upon speech reading in the earlier stages of the congenitally deaf, defeats its own end. We do not get such good speech reading as we would if the children were taught familiarity with the English language first. As already stated the conditions in an institution are not favourable to articulation and speech reading. There are few people who can hear him talk, for his companions are all deaf, and if he is put under a deaf teacher his speech is of no use. I believe that in day schools, especially in little schools where children have frequent intercourse and association with hearing children, you will get one thing that is wanting in institution life, viz., a stimulus to the acquisition of speech. There are people all round the child who can hear, the people at home and at school, the people who go to the same building can hear, so that every word that a deaf child learns to speak is a bond of union between him and his hearing companions; every word that he learns to understand from the mouth is a bond of union between them and him; and as his education advances and he becomes more able to communicate by word of mouth or by writing with those who can hear, those bonds of union will become more and more numerous until ultimately he will be absorbed into the population; whereas if we keep him away from hearing persons speech is of no use, the English language itself is of no use. Segregation and sign language tend to separate the deaf from the hearing world. They are not restored to society. You must have small day schools and plentiful instruction in articulation and speech reading, for that alone is the means by which children can come into communication when they are too young to communicate by writing. There is one point with regard to the general matter of instruction which I should like to mention here. It is very important that in examining methods of instruction you should ask the age at which the child became deaf. The cases that are shown in America as cases in which great results have been obtained with deaf mutes, have very often been cases of children who became deaf after they had learned to speak. I have thought of one method by which we can gauge the general success of our American institutions. It is rather a curious method, and Dr. Gallaudet has promised me his assistance in applying it. We have in America a national college for the higher education of the deaf, which is open to all the deaf graduates of our institutions. These persons who apply for admittance are examined; there is a matriculation examination, when certain of them are thrown out and others continue in the college; and finally, they go through the whole curriculum of the institution and some graduate. Now we know what is the proportion of the congenitally deaf to the whole deaf mute population. It is more than one-half, but of the graduates of the National College only 10 per cent. were born deaf. That to my mind indicates that as regards the congenitally deaf who form the majority of our pupils the methods of education have not been so successful as to place them on a level intellectually and mentally with those who started with speech.

21,586. I want to know with regard to this college of Dr. E. M. Gallaudet what proportion of the students come from oral schools, because he stated to us that those who had been in the oral schools mixed freely with the others, and he thought there was no objection to that; but I do not think he told us what the proportion was; can you do so?—I am unable to say what is the proportion; but Dr. E. M. Gallaudet promised to give me every facility to examine it; and I think the statistics of the National College can be used to gauge the general success of the education all over the United States.

21,587. You say in your memoir that at Dr. E. M. Gallaudet's school and college, that is the primary school and college, there is not one single pupil using articulation as a means of instruction?—No, not one. But you will observe in the evidence from the Kendall school, which you will find in this little volume, that speech is used as a means of instruction in that school, but not as the sole means of instruction.

21,588. (*Mr. Van Oven.*) Do you not think it is possible that the reason why the percentage of congenitally deaf mutes is comparatively speaking so small in their college for the higher education of the deaf, may arise from the fact that their intelligence is not so good to begin with, that the same cause which made them be born deaf in all probability may have produced less brain power; do you think that you should put it entirely upon the training?—I do not know what the cause is; but it is simply suggestive to my mind as a means of testing the methods of education.

21,589. Let me suggest that to you, because your opinion is so valuable that I should like you to say whether it is a hard and fast opinion or not?—It is not a hard and fast opinion at all. I may say, however, that so far as my observation has gone, there are many bright intelligent minds among the congenitally deaf, and some of the brightest of our pupils have themselves been children of deaf mutes.

21,590. (*Mr. St. John Ackers.*) You are, I understand here, not specially deputed by any one school of any one system in America?—I come as the representative of no system; I express merely my own opinions and my own ideas. I have invited the principals and superintendents to express their ideas for themselves in the pamphlet that I have handed to the Commission ("Facts and Opinions relating to the Deaf").

21,591. Referring to Dr. E. M. Gallaudet's evidence before this Commission in answer to question 13,140, he there mentions a convention which was held, I think, in California; do you know of that?—Yes.

Mr. A. G. Bell.

21 June 1888.

21,592. He says there, in effect at any rate, that there was an entire consensus of opinion as to the best way of teaching in America, and he says, "I speak "of that as a matter of very great importance, "because it was really a burying of the hatchet." Are we to understand that in your opinion there is a general agreement in America between teachers as to the best method to be pursued, or do you consider that there is still great diversity as to what should be the system?—I know that there is the very greatest diversity of opinion among teachers; but there is a burying the hatchet. Our teachers meet together in friendly conventions, and we discuss all these disputed questions in a friendly spririt, each having respect for the opinions of others; so that in that sense there is a burying of the hatchet. We have in our country representatives of all the methods of instruction that are used elsewhere, but instead of there being the animosities that prevent progress there is free discussion in such conventions, as the convention which was held in California. I was not present at that convention and therefore I cannot speak as to its results.

21,593. Then when these words are used in the report of that convention: "The war between the "two prominent systems of instruction, the 'manual' "and the 'oral,' which has been carried on so "vigourously for many years may said to be prac-"tically ended." That does not mean that persons have come to one mind in the matter?—By no means.

21,594. But simply that each is inclined to follow his own line?—I think it means that the acrimonious war is ended. There were very bitter feuds between the upholders of the different systems; those are dead. In that respect I think that Dr. Gallaudet is right in saying that the war is ended though the diversities remain.

21,595. The diversities are in fact as strongly marked as ever?—Yes.

21,596. Now referring to the articulation tables at the end of your memoir, to which I have already partially referred, the statistics go there, do they not, to prove conclusively that a very large proportion of the non-congenitally deaf are still debarred from articulation?—Undoubtedly the majority of them.

21,597. It is not therefore confined to be congenitally deaf: but the majority even of the others are debarred from articulation under the present prevailing system in America?—I believe that is true.

21,598. You spoke on the last occasion when you were under examination of the proper classification in the census returns; do you not consider that it would be of very great importance if a similar classification could be obtained in the census returns of all States?—Undoubtedly.

21,599. And would you not consider further that there should be uniform statistics in each school and institution?—Undoubtedly so, and in that connexion I would refer the Commission to the action of the recent conference of principals that was held in Jackson, Mississipi, very shortly before I came from America, in which the forms for the collection of statistics that Dr. Gallaudet referred to were formally accepted by the principals of all the institutions so as to produce uniformity in the collection of statistics. You will find a description of these forms in the Annals for 1885, Vol. XXX., pp. 52–58.

21,600. Would it not enormously help to a right conclusion as to the causes of deafness, and therefore to a great extent as to their prevention, if these statistics were kept in an uniform way in each institution; not only in each country but in all countries?—Undoubtedly.

21,601. And those who like yourself have spent so very large an amount of time in research in this matter, would welcome such a change as being extremely beneficial?—Undoubtedly.

21,602. Then as I understand you, it is desirable to classify so as to thoroughly understand the causes of deafness and other particulars in the census return in each individual institution, and also to classify what is meant by the different terms used in deaf mute education?—I think it is necessary.

21,603. I want to go back to what seems to me, if I may say so, the most important part of your extremely important evidence; that is, with regard to deaf children being the offspring of deaf parents. Is it not a common error even amongst those who have most to do with the deaf and dumb, that congenitally deaf persons marrying are not more or not much more likely to have deaf children than other persons?—That is a very common error.

21,604. And is not this on account of the number of such persons having hearing children?—Yes.

21,605. They conclude because a very much larger number of these children are hearing children than are deaf, that really there is not a very much larger proportion?—That is the reason undoubtedly. Nearly all of the objections that have come to my theories are based upon the fact that the majority of the children of congenitally deaf mutes can hear.

21,606. If the average of the children of the congenitally deaf were taken, the total number of their children hearing and deaf, and then the number of their deaf children, and compared with those born of hearing parents, the difference would be seen at once, would it not?—Undoubtedly.

21,607. Let us now turn for a moment to page 20 of your memoir, and I am now going for the sake of convenience to deal with round figures rather than in the actual figures which appear here; for instance, instead of saying one in every 1,486 I should say one in every 1,500. I would ask you in the first instance how many children you reckon should be taken as the average number of every family; do you reckon three or five or what number?—I cannot venture to say.

21,608. It does not signify much; I will take three. For the sake of argument, allowing three children to every family and allowing (this is all for the sake of argument please to understand) half the total number of deaf to have been born so, and also allowing for the sake of argument that as many deaf are born to hearing as to deaf and dumb parents (which of course you do not agree to), would you not expect to find one child who is deaf and dumb born to every 3,000 of the population?—Undoubtedly, speaking in round numbers.

21,609. Allowing one in every 1,500 to be deaf and dumb, and allowing one half of those to be congenitally deaf and dumb, you must double the number of the population to get one congenital case, therefore it would be one in every 3,000?—Yes.

21,610. Now can you tell us what is the minimum number that you find as the average in your researches where one or both parents are deaf, taking 50 or 60 cases?—I cannot answer the question in that form.

21,611. Will you put in your own way?—I can answer that by taking totals. Taking the whole deaf mute population at 34,000 in round numbers, if congenital deafness was no more common among their offspring than among the offspring of hearing persons, we should expect that one in 3,000 of the deaf mute population would himself be a congenitally deaf child of deaf mute parents. We can calculate that. Upon that basis we should, by dividing 34,000 by 3,000, arrive at the total number of congenitally deaf children in the country who should themselves be the children of deaf mute parents, say 12. There should not be more than 12 congenitally deaf mute children of deaf mute parents in the country, if the children of deaf mute parents were no more liable to congenital deafness than those of others. But we have here a list 607 deaf mute children of deaf mutes, and of these 89 per cent., that is about 540 were born deaf. So that while I cannot answer the question in detail with families, we can form some general idea looking at the whole deaf population.

21,612. Is it not a common thing for those who hold (as I see that some of the heads and other teachers of institutions in America still hold) that there is not a greater number of deaf children the off-

Mr. A. G. Bell.
21 June 1888.

spring of deaf parents, to produce statistics to show that such is the case; and when those statistics are analysed, taking their own figures, you find that a very much larger proportion are really the children of congenitally deaf parents, or where one parent is congenitally deaf, than when that is not the case?—Yes; the very figures that are brought to prove the converse of the fact show that.

21,613. You have spoken of the causes of the deaf marrying together, and you have stated, I think, that the chief causes are, in the first place, the language not being the language of the country; and secondly, their being brought together in large numbers in institutions. You have stated that, when they go out from those institutions they cannot mix with the ordinary world, and are therefore brought together again. May I ask whether there are not in America and elsewhere adult societies, philanthropic societies, missionary societies, and social societies which very much increase the congregating of large numbers together?—Undoubtedly so; not only do we have such societies in nearly all of our large cities, but the Church missionary system extends over the whole country, and there are itinerant missionaries who travel from city to city, and bring the deaf together.

21,614. Have you had much opportunity of talking with those missionaries, and with other officials of the adult deaf and dumb societies, as to what value they place upon articulation?—I have not had much opportunity of talking upon that subject with missionaries.

21,615. You cannot therefore tell us, from your own knowledge, what line they take with regard to this subject?—No.

21,616. Is it within your knowledge that they very frequently try, and succeed, to join with the totally deaf and dumb those who have been orally taught?—It is within my knowledge that efforts are made to bring into the societies the pupils of oral schools.

21,617. I will take, for instance, the case which I personally know of Boston, where you have a large day school, and where there is every effort made to prevent the pupils being together except in schools, and where they are living in their own families. Is it not the case that when they leave school, and even sometimes in the evenings before they have left school, there is a great effort made, and a successful effort, to get them to join the deaf and dumb adult society?—Yes.

21,618. And that in your opinion conduces very considerably to an extra number of marriages of the congenitally deaf and dumb?—Yes.

21,619. And therefore they increase?—Yes.

21,620. At the majority of your institutions are the pupils of the different sexes mixed?—I think in the majority of them, so far as my observation goes, they have the different sexes in the same schools.

21,621. With regard to the adult deaf and dumb societies are the majority of their meetings, whether for social or religious purposes, confined as a rule to one sex at a time or do they mingle together in these evening meetings?—Both sexes mingle together.

21,622. As a rule they are both together at the same time?—Yes.

21,623. I see that the view you take that the intermarriage of these congenitally deaf mute persons dates very much from the system of sign teaching and institution life, is not held, at any rate, by certain of the professors and teachers in America. I see that there is one person mentioned in this pamphlet page 83 from the Cathedral School in Cincinatti, who argues in this way (and I do not know that I should take much notice of this if it had not been that unfortunately we get the same argument from other places): "The world is six thousand years old, and "during all these years deaf mutes have been born; "they have intermarried and died, leaving children "after children, yet nowhere on the face of the earth "is a hereditary race of deaf mutes found." I take it that you would at once say that this is incorrect as to their having intermarried, in the sense in which you now speak of intermarriage, with regard to deaf mutes in America; inasmuch as we know perfectly well that the institution life and system did not exist, say, 150 years ago from the present time?—Yes.

21,624. May I ask you whether in your large experience in America of these different gatherings, and outside, you do not find ideas very similar practically to this which is here stated. Perhaps this is an extreme case; but is it not the case that there is a very large amount of ignorance upon this matter which, if once dispelled, and the real facts thoroughly grasped, would, in your belief, lead to a very different state of things with regard to the way in which the present institution life and sign system is regarded in America?—Undoubtedly so. Light and information are what is wanted.

21,625. You have referred to the scientific evidence which is given in your pamphlet from persons with apparently a very large knowledge on the subject; and I see that on page 95 Mr. Brewer says:—"It is "conceded that the same biological laws apply to "man and brute alike. I am not aware that any "eminent biologist, naturalist, or breeder denies this." I think we shall all agree to that. Then he goes on to say that a different race, if we may say so, is generally considered to have been thoroughly produced after four or five generations; he says: "Five genera-"tions of sires and four of dams is the common rule." I would ask you whether, in examining these matters with regard to the intermarriages of the congenitally deaf, you would not be of opinion that in all probability it would require considerably longer than is here stated, for this reason, from my own experience at any rate, and I have had considerable experience in these matters of breeding, as our chairman knows, of certain classes of animals, it is only usual to attempt to classify them as this gentleman speaks of herd-books after several generations of similar breeding have taken place; and that when he speaks of four or five generations going back, those four or five generations really mean recorded cases after long years of similar conditions existing, not perhaps so strict; and therefore perhaps it might take a considerably longer time than the four or five generations before you could get what you might call a complete variety of the human race; do you follow me?—I do not know. I would rather in such questions trust to the scientific man; and here is what Prof. Brewer says in answer to that very point. He says: "Five generations of sires "and four of dams is the common rule," and here is the answer to your question: "And I imagine that "the chances of a child being born with hearing "would be small if all its ancestors for a like number "of generations had been congenitally deaf."

21,626. You think that even with four or five generations the chances would be small?—I think so.

21,627. (*Chairman.*) It is not absolutely so; but the chances would be small?—Yes. Of course I know nothing of that question myself. I have to rely upon the statements of such men as Professor Brewer.

21,628. I pass from that, which seems to me the most important of all the subjects which you have brought forward, and touch very shortly upon one or two others. I do not think that this examination would be complete without one word as to one of your family discoveries, if I may use such an expression—that of visible speech. It is a fact, is it not, that you and your father and grandfather have all worked out one after another and perfected that universal alphabet, or whatever you may prefer to call it, which is generally known by the name of visible speech?—My grandfather, my father, and myself have devoted our attention almost exclusively to the study of the mechanism of speech, articulation; and to my father is due the invention of the system of symbols known as visible speech.

21,629. That system has been in use, has it not, in the oral institutions, or some of them, in America for some years?—Yes.

21,630. Have you a chart of that system just to show to the Commission?—I have (*producing the same*).

Mr. A. G. Bell.
21 June 1888.

21,631. By that system you are able, are you not, to give to a person who understands it, although perfectly deaf, a means by which he can reproduce certain sounds which he has never heard before?—Yes.

21,632. It is a fact, is it not, that amongst other instances of this a very remarkable one took place (I remember one that took place when I was in America, but there are, of course, hundreds of others) whereby you are able to get a deaf mute to pronounce a particular word of the Hottentot language (the Hottentot click, or whatever it may it may be termed) which the hearing persons in the room were not able at the first attempt to produce as well?—Yes.

21,633. I should like to ask you this as a practical point now, how far, in your opinion (and it is a most valuable one), this system should have a place in the education of the deaf?—I have the feeling that the adoption of some such system as this is essential and necessary in the instruction of the congenitally deaf in obtaining perfect speech. The result will necessarily, I think, be imperfect without some such system as this.

21,634. May I ask whether in working out this system of visible speech, and in working also for the mechanism of speech, you have not been led to other important discoveries?—Undoubtedly so.

21,635. Was it not through these investigations that you were led to the great and world-wide discovery of the telephone?—Undoubtedly so; that originated from investigations relating to the teaching of articulation to the deaf.

21,636. With regard to the American institutions, do they take all the deaf that are offered to them, or is there any selection?—I have never known of there being selection. The charge has been made that certain pupils are selected; but I have not known personally of any such cases.

21,637. I judge from the evidence which you have already given that no institution in America will take weak-minded pupils, that is to say, below a certain point, never mind whether on the sign or speech system?—I referred there simply to children who were simply weak-minded and not deaf. As a matter of fact, some of our institutions do receive deaf mutes who are weak minded. As a general rule the institutions decline to receive pupils who are weak-minded.

21,638. And that would apply to all the institutions upon whatever system?—Yes.

21,639. (*Dr. Campbell.*) Are all State institutions either for the deaf and dumb or for the blind compelled to receive all pupils unless they can be proved to be feeble-minded within certain limits, provided that their characters are satisfactory?—I do not know exactly what the legislation is upon that point.

The witness withdrew.

Adjourned to to-morrow at 11 o'clock.

SIXTY-SEVENTH DAY.

6, Old Palace Yard, S.W.

Friday, 22nd June 1888.

PRESENT:

THE RIGHT HON. THE LORD EGERTON OF TATTON IN THE CHAIR.

SIR TINDAL ROBERTSON, M.P.
B. ST. JOHN ACKERS, ESQ.
EDMUND C. JOHNSON, ESQ.

THE REV. CHARLES MANSFIELD OWEN, M.A.
L. VAN OVEN, ESQ.

CHARLES E. D. BLACK, ESQ., *Secretary.*

Mr. ALEXANDER GRAHAM BELL further examined.

Mr. A. G. Bell.
22 June 1888.

21,640. (*Mr. Van Oven.*) From the evidence which you have already given us it seems to be your opinion that frequent intermarriage between the deaf, especially between those who are congenitally deaf, or those who are deaf from inheritance, is likely to produce in time a race of deaf people?—That is my opinion.

21,641. You consider, therefore, that it is exceedingly important that, so far as possible, the deaf should be induced to mix with the hearing world?—Decidedly.

21,642. So as to prevent the constant association one with another?—Yes.

21,643. Therefore, without going any further into that question, you consider that on that point, however desirable they may be upon other points, all these societies which exist for the benefit of the adult deaf are to a certain extent harmful, because they collect the adult deaf together and cause them to associate with each other, and consequently in all probability would lead to intermarriage?—To a certain extent, certainly, just as I consider institutions harmful, but I do not think that we can do away with these adult associations entirely, for there will always remain a certain number of pupils who are not fitted to mingle with the world, and I do not know how else we are going to reach them and benefit them without some such association, so that while theoretically I do consider them harmful, I think that in certain respects they are necessary, but we want to give great thought and great care to the subject of the association of the adult deaf.

21,644. I do not propose for a moment to consider or to ask you or anybody to consider the idea of suppressing such societies altogether, but I want to elicit from you your opinion, which I gather to be this, that so far as possible we should place the deaf in such a position as to render the great portion of them independent of such societies, and to a great extent not desirous of joining such societies; I conclude that that can only be done by their general admixture in the world, and that for that purpose the use of speech and lip-reading is of very great importance beyond the importance which of course attaches to the fact of the deaf-mute being able to mix with all people who are not familiar with any special mode of communication?—I agree with you entirely in your statement there.

Mr. A. G. Bell.

22 June 1888.

21,645. In following this up it follows as a corollorary that you consider it highly important that all the deaf should be taught to articulate with fair distinctness, and should, if possible, be able to read from the lips of others, therefore the system which is called here the oral system of instruction is in your opinion highly desirable?—Very much so.

21,646. Then again, I take it from the evidence you have given us that you think, even in school life, it is exceedingly desirable that, if possible, the sexes should be kept separate, so that school boy and girl friendships should not be encouraged, which may lead in after life to the continuation of that friendship and ultimately to marriage?—I do not wish to express too decided an opinion upon that point

21,647. You have no decided opinion as to whether the sexes should be kept separate in school or not?—I have no decided opinion.

21,648. And even when boys and girls have got beyond childhood, and are 14 or 15 years old, do you think that they should be kept at separate schools and taught in separate establishments, or should they be taught together and play together?—I cannot say that I have formed any decided opinion upon the subject; I have devoted my attention more to the condition of the very young, where the question of the separation of the sexes does not assume importance. In regard to older pupils, I recognise that there are evils that result from the co-education of the sexes; but I also recognise that evils result from keeping persons of one sex together, without opportunities for forming acquaintances with suitable persons of the opposite sex. I would, therefore, rather not express myself positively upon that subject.

21,649. Now, as regards the question as between day schools and residential schools, I gathered from your remarks that you consider the day school decidedly preferable if circumstances will admit of that system being carried out?—Undoubtedly so.

21,650. And I believe your reason for so holding is that you think in day schools the children are mixing in home life and in the world generally, whereas in residential schools they are only mixing among the deaf or among those so accustomed to the deaf that they become as it were a special class of the community?—Yes; and I recognise distinct classes of day schools. The day school that forms a school for the deaf apart and distinct by itself I do not think so advantageous as the day school that is in a public school where hearing children are, so that opportunities might occur for mixing the deaf children in with the hearing children in the same classes for subjects where they might profitably go together, the principle being to mingle the deaf in every way possible with the hearing.

21,651. You have just answered the question I was coming to. Consequently I may take it you are of opinion that this mixing with their hearing schoolfellows in play hours, or in drill, or in other exercises, such as writing, or things of that sort, where the deaf can be taught with hearing children, is exceedingly desirable?—Exceedingly desirable and important.

21,652. Therefore, if other circumstances admit of it, you think that the plan, or rather a modification of the plan, which is at present being adopted by the London School Board, of having deaf-mute classes in the ordinary schools, is a desirable plan?—I am not familiar with the details of your London School Board plan. The principle of it is undoubtedly sound.

21,653. I am not talking of the details, but of the principle?—The principle is undoubtedly sound if those deaf classes are taught by special teachers. I do not believe that complete co-education with hearing children is a practicable thing; but if those deaf classes in your London board schools have special scholars and special teachers I consider it an admirable plan.

21,654. That is exactly the point I want your opinion upon. Now in America the system of instruction generally followed is what is called the combined system, I believe?—Yes; in my opinion that is the sign language system in disguise.

21,655. Now, as to this combined system, is it the same in all schools, or does a combined school mean a school where they do not confine themselves to one special form of instruction, but combine various forms of instruction together. For instance, a school which endeavours to teach by means of the ear as well as the mouth would be to a certain extent a combined school, although no finger language were used; would that be a called a combined school in America?—I do not know. The idea underlying the term "combined" is undoubtedly a good one. The idea is to adopt an eclectic system, but the definition attached to "combined" is vague and indefinite, and you have schools that are actually classified in the annals as "manual, oral, and combined." If "combined" includes the manual and oral, I do not see the necessity for the distinction.

21,656. Taking, for instance, the Deaf and Dumb Institution at Margate under Dr. Elliott, which is one of the largest in this country, and almost the oldest (indeed I think it is the oldest), there is a large building and a certain number of pupils are taught by the sign language and the manual alphabet, and a certain number, a great many of whom are in a separate building, are taught on what is called the pure oral system; but all the children mix together for the purposes of recreation, for dining, for drill, and for other purposes, on which occasions all the children oral or not oral are communicated with by means of the sign-and-finger language. Do you think the people of America generally would call that a "combined school"?—I think that is what is meant by a "combined school" generally in America if the sign-language is employed as well as a manual alphabet.

21,657. That is to say, that they have different departments where they are using different systems, but the children who are taught orally mix with the children who use the sign-and-finger alphabet, and from time to time are educated by that means themselves?—It is my impression that that is what is usually spoken of as the "combined system" in America. But Dr. Gallaudet does not seem to define it in that way. What you have just said with regard to this English school exactly defines what appears to me to be the usual meaning of the word in America, that is, if the sign-language is used as well as the manual alphabet; but you must form your own judgment upon that question, for as I say, I am not an authority upon the "combined system," and I do not believe that the term is correct. I do not think that a system using the finger alphabet—but excluding the sign-language—would be called a combined system in America.

21,658. I dwell rather at length upon this point, because it is desirable that when we talk of a certain system we should know what we are talking about; and if you talk of a school as a combined school in America, we should know what a combined school means?—Yes, as a matter of fact, in very many of the schools which are stated to be under the "combined system," that plan is adopted, in fact in most of them; that is to say, that all the children who are taught speech mingle freely with those who are not taught speech out of school hours, and use the sign language for purposes of inter-communication.

21,659. (*Mr. Woodall.*) The directors of the Pennsylvania Institution have a detached school in which the pupils are taught upon the pure oral method?—Yes.

21,660. But in the general institution a certain proportion of the pupils are taught the oral method. Am I to understand from you that those children are allowed or are not allowed to mingle with the other pupils in the ordinary exercises of the playground and in the industrial classes, for instance?—The principal of the Pennsylvania Institution attempted by an experiment to decide which plan was best for the oral pupils, exclusion from the sign pupils or mingling with the sign pupils after their school

instruction was over; therefore for a number of years they have had two oral systems in use in the Pennsylvania Institution, one a separate and distinct school, known as the oral branch of the Pennsylvania Institution, in which all children taught orally were separated entirely from the other pupils and had no admixture; and secondly, in the main body of the Pennsylvania Institution they had an oral class, or oral classes, in which the pupils mingled afterwards in play hours with the others. They have had the two systems in that same institution, and as a general result Mr. Crouter expressed his opinion as it is quoted at the bottom of page 107 of the pamphlet "Facts and Opinions relating to the Deaf."

21,661. (*Chairman.*) After this experiment has been carried out he gives that as his deliberate opinion?—Yes, as his deliberate verdict. He says: "I believe in oral instruction (separate oral) for all "deaf children who can be successfully instructed by "that method," and so forth.

21,662. That is that there is separate instruction, although Dr. Gallaudet calls it a combined school?—Yes.

21,663. Dr. Gallaudet may have had the other branch of the school in his mind at the time?—Yes.

21,664. (*Mr. Van Oven.*) I gather Mr. Crouter's opinion, as expressed in what you have read, to be this: that in order successfully to carry out the system of oral instruction it is necessary to restrain as far as possible the chances, or at any rate to put no encouragement in the way of the pupils so taught, for using any other mode of communication; is that what you understand Mr. Crouter's opinion to be?—That is the impression that I draw from what Mr. Crouter says, but of course the Commission can decide for themselves.

21,665. Do you share in that opinion; it is your opinion which I wish to elicit?—My opinion is that any other mode of communication than that by word of mouth and by speech-reading interferes with the art of speech-reading; but it is my opinion also that in spite of that it is advisable for other reasons—mental reasons—with the congenitally deaf to use the English language in the written form very constantly.

21,666. Consequently the system as carried out at Margate, which appears to me to be very much the system carried out in many of the combined schools in America—that is to say, a separate class-room and a separate building for the children taught on the pure oral system, those children being allowed at meal times to mix with the other children, who use the sign-and-finger alphabet, and being instructed by means of the sign-and-finger alphabet at drill and in other portions of their curriculum, is to a great extent detrimental to the full development of the oral system. I take it from what you have said that your opinion is that if these children were not only kept in a separate class but kept entirely to themselves as they are in many continental schools, the oral system would have a far better chance of producing excellent results?—As I have tried to express to this Committee, I look upon institutions or separate schools as evils, and of course, if institutions are necessary, we have got to make the best of an evil. I do not believe in separating deaf children from hearing children, but if you have got to do it then I think that the admixture of pupils who are taught speech and the admixture of pupils who are taught the sign-language out of the schoolroom is harmful to the articulation and the speech-reading of the pupils. That is the main point. Then you included in your question the manual alphabet. I would not express the same view for a school where the manual alphabet was used to the exclusion of the sign language, because then the intercourse of the pupils with one another, though to a certain extent it would interfere with the speech-reading, yet would be a constant practice in the use of the English language in one of the forms in which people have it ordinarily. It would be the same as the practice of written language. My point is that speech-reading is not all that we have to consider in the education of the deaf; the mind has to be considered as well, and my objection to the mingling of the two together where the sign language is used is that the practice outside is in the special language. If that communication outside were in the English language, I should hold that while it might not be good for speech-reading it might be good for the child on the whole.

Mr. A. G. Bell.

22 June 1888.

21,667. Then I would ask why the finger alphabet is considered by you desirable in a large school in preference to the children writing down anything that they may not be able to communicate by word of mouth?—Because of the speed with which it can be used. The speed of writing, even if one scribbles, is only about 30 words a minute, whereas the speed of a manual alphabet may be as much as 100 words a minute; and we want to have the most ready and quick means of communicating English words to the pupil that we can get. Speech-reading is better still, because the speed of that comes up to 150 words or more a minute, but this speed is only practicable where the pupil has already familiarity with the language.

21,668. But admitting, as you do admit, that the power of speech-reading and the power of articulation are greatly interfered with by the use of any other method of communication, do you not think that giving the finger alphabet a mode of communication which is so easy and ready and speedy, will greatly retard the acquisition of the power of lip-reading and the clearness and precision of articulation; have you considered whether that loss is not, perhaps, greater than the loss of time involved by prohibiting the use of the finger alphabet, and forcing the communication to take place either by speech or writing, remembering, of course, that writing exercises give even a greater amount of instruction in language than spelling on the fingers?—If you have followed my ideas so far you will see that speech-reading is only easy to those who are vernacularly acquainted with the language. Therefore, in the case of those who know the language in either its written or spoken form, I would not have the remotest hesitation in saying that we should not use the finger alphabet, but should rely exclusively, as far as possible, on speech and speech-reading; but in the case of those who do not know the language speech reading does not by itself teach it. A knowledge of language will teach speech-reading, but speech-reading will not teach a knowledge of language, so that, I think, that every means we can employ to make the English language familiar to the pupil should be adopted before we cause him to rely exclusively upon the mouth. In separate institutions the manual alphabet will retard speech-reading, undoubtedly, if used when the pupil has arrived at an age when he might rely upon the mouth but the use of the manual alphabet in the schoolroom is entirely within the control of the teacher, and outside, it is important that inter-communication among pupils should be in the English language. The pupils will communicate with one another in that mode that is easiest to them. If speech-reading is easy to them they will prefer it; if it is not they will use signs, unless a manual alphabet is permitted. In schools where the deaf children have plenty of communication with hearing children. I do not see any disadvantage in having the manual alphabet in such schools. It is only in separate schools where the manual alphabet would be likely to take the place of communication by word of mouth that it is disadvantageous. If the child has opportunities of frequent admixture with hearing children, we may trust to the laziness of human nature that they will use the means of communication which is to them most easy, and it is more easy for a hearing child to talk with his deaf companion, if the deaf companion can understand him, than it is for him to spell upon his fingers, and if he cannot understand his speech, it is better that the manual alphabet should be used than that communication should be stopped. I would not put any restrictions upon the methods of communication between deaf and hearing children. Let us use every means to give a knowledge of the English language,

Mr. A. G. Bell.

22 June 1888.

and when that is got, reliance may be had upon speech-reading. Those who know the language first may rely upon speech-reading at once.

21,669. I have followed what you say, and I know very clearly the truth of your remark; but I must confess that I am a little dubious as to how you would advise the education to be carried on, having in view the fact that the education under the oral system must of necessity be interfered with if a finger alphabet is taught or allowed. However much I may appreciate your idea as regards a separate class being taught in a central school where the general admixture in the playground, and otherwise, is with hearing children, I cannot see that it has the same force as regards a separate school for the deaf, and I apprehend that our school board classes as they exist now, and as I feel confident they always must exist, will be to a great extent separate schools; consequently, if the finger alphabet be there taught the finger alphabet will be the general mode of communication between one pupil and another, and will be generally used by them, however much they may know of the language, and be able to read from the lips?—Of course, the views I have been expressing on the manual alphabet are simply my own individual views. The principle that underlies my ideas in the case of the manual alphabet is the absolute necessity of using with the congenitally deaf in the earlier stages of education the written form of the language. So long as you use writing in place of the manual alphabet that meets the same end. My only advocacy of the use of manual alphabet is based upon its rapidity, and instead of its interfering with oral methods, it is necessary that the pupil should be largely taught by the written form in the earlier stages. I mean that with the congenitally deaf reliance should be had upon writing as the means of communication in the earlier stages until the pupil has become familiar with the language. In respect to speech itself I do not hold that view. I think that all children should have instruction in articulation from the very first, and that they should be caused to use their vocal organs in the schoolroom on all occasions. As I look upon it the defect in the deaf children is a one-sided defect. It interferes with the communication of other people with the child, and not the communication of the child with other people. The vocal organs are perfect, and I would have the child taught to speak and speak all the time in the schoolroom. Hence I should not put him under a deaf teacher; you must have a hearing teacher. My only point of difference with my oral friends is as to the mode in which the communication is carried on with the child. In many of our oral schools the principle is adopted that no word shall be presented in writing until after the child can read it from the mouth. That is what is meant by the pure oral in our country.

21,670. That is not the case in Germany, is it?—I cannot say, that plan I do not advocate. The plan that I would advocate is where the written word is always presented in the earlier stages with speech. Of course, with those who have a knowledge of the language, that is, those who are usually termed semi-mutes, there is no difference of opinion. We do not want the manual alphabet, we want reliance upon speech and speech-reading alone.

21,671. I take it that your idea of the mode of instructing the deaf child should be commencing by teaching articulation and by teaching language from writing?—That is it exactly.

21,672. That if it be found a child's appreciation is not sufficient to enable that child to read words easily from the lips, or that the child being a congenitally deaf mute, and never having had any language at all, the teaching of that child is greatly retarded for want of a quicker method, then that child might be placed in a separate class, and be given, in addition to the other modes of communication, the use of the finger alphabet?—Yes.

21,673. I do not understand it to be your opinion that in a school for the deaf generally, the finger alphabet should be used for all alike, whether congenitally deaf or not congenitally deaf,—whether quick of apprehension or slow of apprehension?—I may say that, to the best of my judgment, the knowledge of a manual alphabet is of no harm to any deaf child, because it is practise in the English language. I admit that if it is used in conjunction with speech to explain words that are ambiguous to the child when he does not understand them from the mouth, it interferes with the acquisition of the art of speech-reading; but that is a matter in the control of the teacher. I would not have the manual alphabet used in the schoolroom, where in your oral department explanations must be by the mouth itself or a pupil will come to rely upon the hand instead of the mouth. In communications with hearing children I do not think that the use of the manual alphabet interferes with speech-reading, because it is so much easier for a hearing child to speak to a deaf child, if he can understand, that he will always prefer it to the manual alphabet. In schools where the deaf children have the power of mingling with hearing children, I would not restrict their methods of inter-communication with the hearing children, I would let them have the manual alphabet, I would let them have signs, or any way in which you can bring them into communication with the hearing children in the full confidence that the hearing children will adopt speech as the means of communication wherever it is possible, because it is easier to the hearing child to speak than to use the other methods. Therefore I would not exclude the manual alphabet or any crude signs that the pupils could invent which would bring the deaf children into communication with the hearing children.

21,674. (*Chairman.*) You mean to say that you have no objection that the hearing children should learn signs, or the finger alphabet, because there is no temptation to them to make that the principal means of communication?—Exactly.

21,675. But, of course, where the contrary system exists you would not say the same?—In the institution life it is different, because they are all deaf, and the sign language that would grow up there would take the place of the English language, and they would never learn it. I would like my idea to be perfectly clear in regard to the matter of articulation. I come here not to advocate any system or any method; I come to express only my own views as to what is good, not for the oral method, but what is good for the child; and, in regard to articulation, I would have articulation used in all schools for the deaf. I would have the pupil use his mouth, for that is perfectly practicable; every child can be taught to speak, and the only difficulty is the mode of communicating with him on account of his deafness. I agree thoroughly with all that my oral friends would advise, that speech shall be used, and that the pupil shall speak under whatever system of instruction he is taught; that he shall communicate with his teacher by speech however defective it may be, whether you use the oral or any other method. The only difference between me and my oral friends is as to the means by which we should communicate with the deaf child. With all those who have a knowledge of the language sufficient to enable them to judge by context of the ambiguities of speech-reading, speech-reading should be used. With all those who have not that knowledge the language in its written form, or some clear form, should be used, and I see no harm there but only good in the use of the manual alphabet. After the language has been acquired I would drop the manual alphabet in the school. Let the children use it outside as much as they like, but let them communicate in the schoolroom by speech-reading. If you can have the deaf child brought into constant communication with the hearing child the manual alphabet will do him no harm.

21,676. (*Mr. Van Oven.*) I understand you to say that in America something over 44 per cent., I think you said it was 44·8 per cent., were taught articulation in one way or another; is not that a very small proportion?—It is according to the returns sent to me in answer to my circular letter of inquiry.

Mr. A. G. Bell.

22 June 1888.

21,677. Can you suggest any reason why so few are taught articulation in America?—One reason is obvious; we cannot get teachers who are familiar with the mechanism of speech. Hearing persons grow up from early childhood to adult life and never study the mechanism of speech. You may take hundreds and thousands of our best teachers in the public schools and hardly find one who can give an intelligible description of the movements of his vocal organs in uttering the simplest sentence. Quite independently, therefore, of the difficulty of introducing speech into an institution the difficulty exists of getting teachers who know anything of the mechanism of speech. I must say on behalf of our American institutions that the principals and superintendents of all our American institutions express, so far as words can express, the desire to give every child an opportunity of acquiring speech, and only dropping a child from the articulation class when it is shown that he cannot profitably acquire it. They all express that desire, and in our last convention of teachers in California it was specially recommended that they should do it. The fact is, however, that they do not do it, and that the majority of the pupils in America do not have the opportunity of trying whether they can be taught speech or not. My researches show that 44·8 per cent. are taught speech, leaving 55·2 per cent. who are not taught speech. Now I have asked the principals to distinguish, as regards that 55·2 per cent., between those who have been dropped from articulation classes and those who have never received any instruction in articulation. Looking down this table of statistics, it is obvious that the vast majority have never had an opportunity of learning. I must, however, give the principals credit for the expressed desire to do more than they do, and I think that there is really a difficulty in the way of getting competent teachers.

21,678. (*Chairman.*) You have no system of Government inspection of schools in America, and therefore, I presume, that has never been brought prominently before the States?—That is the great difficulty.

21,679. If you had a Government inspection of schools, would not that want have been prominently brought before the States?—Yes; the great want in the whole subject of the education of the deaf is the want of competent teachers. It is not fine buildings and schools that we want, but it is teachers who first have a knowledge of the art of teaching, who have been trained to be teachers of ordinary children and who have superposed upon that any special knowledge that is required in regard to the deaf. We are fortunate in America, in giving salaries liberal enough, to bring into our schools men and women of education. We have that advantage, but there are very few of them who have been trained as teachers. I would urge upon the British Government the advisability of providing that one of the requisites for State or Government aid should be a teacher who has been trained as a teacher, who has as the basis of knowledge the knowledge how to teach ordinary children. This question of teachers is the most important point I think you can consider. The methods of instruction and the character of the schools and buildings are all secondary to the matter of teachers. One of the first things to consider is the competency of the teachers. The next thing is to see that you pay them such salaries as shall induce well educated men and women to enter upon the work. I would recommend to your special attention in this matter the recommendations of the principal of the Halifax Institution, and who understands more of your British needs than those at the American institutions do. His recommendations are quoted at page 168 of this pamphlet: "Facts and opinions relating to the deaf."

21,680. (*Mr. Van Oven.*) Have you ever visited any of the German institutions?—No.

21,681. Are you acquainted with the mode at the Schleswig Institution, which is very much that which you point to, namely, that the best teachers from the public elementary schools are selected to become the teachers of the deaf, and are paid higher salaries in order to induce them to so enter themselves. Do you think that the proper plan for us to pursue here?—I think that is a very excellent plan; I think your articulation teachers should all have studied the mechanism of speech.

21,682. In special training schools for the training of teachers for the deaf?—Not necessarily in special training schools for the deaf. The knowledge of the mechanism of speech is the essential thing, and not the place where they acquire it.

21,683. Therefore your idea, if I gather it rightly, is that the teachers for the deaf should be selected from the general teachers of the country; that as good a one as possible should be selected, and should then be specially trained for the teaching of the deaf, and for that purpose should, of course, receive a higher salary?—Yes.

21,684. Now we were speaking the other day about the aural method of teaching by means of hearing; you say that you consider that 16 per cent. could be orally taught?—That seems to be about the percentage—16 to 17.

21,685. You do not mean 16 per cent. of the congenitally deaf?—No, of the whole mass of the deaf.

21,686. How would you proceed to investigate those cases which you would treat aurally?—I would proceed first to make experiments to ascertain those pupils who seemed to have any perception of sound. One of the simplest means of doing that is to take a large dinner bell, and ring this bell behind the pupil's head, and see whether he can hear it. Another method is to shout behind the pupil's back when he is not expecting it, and see whether he turns round. I fully expect from the statistics gathered that you will find that about 20·6 per cent. of the pupils will manifest a sufficient amount of hearing to hear the ringing of a dinner bell or to turn round at a shout. All those pupils I would put in a separate class for separate auricular instruction, to ascertain those who might profit by such instruction. I would give all those pupils the opportunity of improving their hearing. The statistics seem to indicate that a number of those cases will have to be dropped from the auricular class, and that the true per-centage will be somewhere about 16 or 17 per cent. of the whole.

21,687. When you say auricularly taught, do you mean that the whole instruction should be given by means of the ear, or should any signs be given; should they be taught at all on the oral method, or should the instruction be entirely by means of the ear trumpet?—In the Nebraska Institution, which is at present our model, the pupils are taught on the oral system, with the addition that the voice of the teacher is raised sufficiently to reach their organs of hearing. The distance of the pupil from the teacher is arranged with regard to the amount of hearing. Their general education is carried on by speech and speech reading, with what hearing they can gain from the teacher's shouting; and then they are specially exercised in the use of their ears without their eyes by conversation carried on behind their backs. I am not sure at the present moment whether those pupils are allowed to mix with the sign pupils of the institution in which they are taught or not, and whether they are not also taught by signs. My impression is that they are kept distinct; but Mr. Gillespie has given some details; I have not yet had time to investigate the details myself.

21,688. By the exercise of the hearing faculty, is the hearing much improved, as a rule?—The apparent hearing is enormously improved; whether there is any real improvement in the hearing proper is another question; that is to say, the pupils who cannot imitate sounds through the hearing tube come to understand speech—come to be merely what you may call hard of hearing; that is all we know; that is the fact. When you start their education they seem to perceive only noises. If you try to get them to imitate words, you fail. These pupils by education come to be only hard-of-hearing people, and you can carry on a con-

Mr. A. G. Bell.
22 June 1888.

versation with them behind their heads, so that the apparent amount of hearing is entirely changed. Of course it is a very great problem what the change is. There is no doubt at all about the fact. Whether it is due to the improvement in the hearing apparatus itself by use, or whether it is simply due to the increased knowledge of language and familiarity with the sounds that are represented, we do not know absolutely, but the opinion of teachers generally is that it is due to the greater familiarity with the language and greater attention, and not to the improvement in the hearing power. I would not reject the other hypothesis entirely; I think it is possible that there may be some improvement in the hearing power, too, although the aurists do not agree with me.

21,689. Consequently, in your opinion, all pupils in a school for the deaf should, if possible, be taught auricularly?—Undoubtedly all who are capable of it. There is one point in auricular instruction that I have not touched upon. There are some cases where the pupils appear to be totally deaf by every test that you make, with the hearing tube or by the bell being rung or by shouting; and yet who can hear and imitate sound by the audiphone. Such cases are very rare, but there are some cases. In those cases the conducting mechanism has been destroyed, and yet the internal ear exists and vibrations communicated through the bony structure of the head through the teeth are perfectly perceived. I shall never forget my surprise in the discovery of one case of that sort in New York, for, as a general rule, the audiphone is utterly worthless, and pupils who can hear with the hearing tube do not seem to hear well with the audiphone. We made a series of tests in the New York Institution. We first used the audiometer which you have here, then the hearing tube, and then the bell, and then we tried to see if they could imitate vowel sounds, and then at last we took the audiphone and tried that. I can mention one case in which they tried the audiometer without any sensation of hearing; then they tried the hearing tube, but the person did not seem to hear. Then they tried shouting but without the person hearing, nor was he able to imitate the vowel sounds. Then we came to the audiphone test, and at first we thought "it is hardly worth while to try that." However, in order to make our test complete, we tried it, and the boy could imitate speech with the audiphone. It was the greatest surprise I ever experienced. That example teaches us, that though the audiphone is useless in the vast majority of cases, we should not discard it entirely. I know a few cases in adult life where it has answered. I know a lady in Washington who derives a great deal of benefit from the audiphone in society, and I presume there must be cases (I do not know how to reach them) in our institutions in which the middle ear has been destroyed, and the internal ear remains perfect, and might be reached by the audiphone; experiment should be made with it, and it should not be discarded entirely. The audiphone is a fan-shaped instrument, and any ordinary card-board fan answers the same purpose, and does just as well.

21,690. (*Rev. C. M. Owen.*) I believe you had formerly a private school at Washington for the deaf?—I had for about two years a private school.

21,691. How many pupils had you?—I limited it to four pupils.

21,692. And you only had it two years, I think?—I think that was the time.

21,693. So that you really had not time to complete the education of your pupils?—I had not.

21,694. What practical experience have you had in the teaching of the deaf and dumb?—I was for some years before the telephone took my attention from the subject, a teacher of articulation, or rather a teacher of teachers of articulation. I taught in the Horace Mann School for the Deaf in Boston; I instructed the teachers in the Clark Institution at Northampton I instructed the teachers at the American Asylum in Hartford in the use of my father's symbols for visible speech, and then I opened in Boston a normal training class for articulation teachers of the deaf. I had about 60 teachers under instruction altogether. In our experiments in teaching articulation we were met with the difficulty of providing pupils to give the teachers training in the art of teaching. To remedy that difficulty we opened a free class for adult deaf mutes in Boston, and quite a number of adult deaf mutes came forward and formed the experimental subjects for the teachers to work upon. At that time I was simply engaged in articulation work; I did not enter into the general subject of the education of the deaf, in fact, I kept clear of it. In my introductory article on the use of visible speech which is published in the American Annals for January 1872, you will see the position that I took then, which I have consistently kept throughout since. What I said was this: "Visible speech takes no part in the contest between articulation on the one hand and signs and "manual alphabets on the other. In presenting his "system for adoption all that the inventor means to "say is this: here is a means by which you can "obtain perfect articulation from deaf mutes; make "what use of it you choose. He places the tool in "the hands of teachers with general directions how to "use it." That has been my position from that day to this. I have advocated teaching articulation to all the deaf, but not necessarily teaching *by* articulation. You see that there is a very great distinction there; so that while I have appeared as a consistent advocate for oral training I have not always appeared as a consistent advocate of what is known as the oral method of instruction. Now as to my experience of the modes of teaching, I could not enter into this work without being interested in the more general questions of education. I did not obtrude my views upon my teachers, and my teachers went into sign institutions or into articulation schools, and all over the country to institutions of all kinds. I longed to have some little pupil upon whom I could test ideas of my own, and such a case presented itself. The father and mother of a deaf child, a little boy five years of age, thought that I had good ideas upon the subject, and came to me and said, "Take our deaf child and do "what you like with him—we trust you." I said, "I "do not propose to follow any method that is in use "anywhere else." But they said, "We will trust "you; we believe in your ideas." Accordingly they sent the child to me when he was five years of age with a nurse to look after him. I employed a lady to look after him and to relieve me of a good deal of the work of instruction, and I carried on that boy's instruction till the telephone took my attention away from the subject. That boy is now a young man; he appeared in Washington desirous of entering the National College, and I had a note from the Principal of the Kendall School saying, There is a young man at our school who has an unusual knowledge of the English language for a congenital deaf mute; he does not articulate particularly well, but his general familiarity with the English language is something remarkable, and we have crossed questioned him to find out how he was taught, and he says that you taught him, and we would like to know how you did it. I therefore wrote an account of the method of educating this child, which was published in the Annals, and a copy of which I beg to present to the members of this Commission (*handing in the same*). The article will be found in the Annals for April 1883, Vol. XXVIII., pp. 124–139, under the title, "A method of teaching language "to a very young congenitally deaf child." Now the ideas here are derived from George Dalgarno, as you will see from reading the paper. I will not go into it now at any length, but there is one point to which I would wish to direct your attention and that is how I got over the difficulty which our teachers experience with regard to the use of the manual alphabet and how I was able to use a manual alphabet that would not interfere with speech reading. I came to the conclusion that you could use an alphabet read by the sense of touch instead of by the sense of sight (of course there was

Mr. A. G. Bell.
22 June 1888.

no difficulty in doing that where you had only a single pupil to deal with). I made a slight modification of George Dalgarno's manual alphabet, which is shown on page 10 of the pamphlet which I have just handed in; that also formed a means of communication with hearing persons. Dalgarno's plan is that the pupil should wear a white glove and that the letters of the alphabet should be written upon the fingers of the glove. Of course when this boy was with me he did not require to wear a glove because I knew the position of the letters and would touch the place on his hand, but, when he was with his friends in society and they wanted to talk to him they would see the letters on the glove and touch them when they could not use the ordinary manual alphabet. But to deal with the question of communicating with the boy, my belief is that the whole difficulty in teaching language is how we are to communicate with the deaf person. My mode of education was to make school life as life-like as possible; and this boy had no regular instruction in the sense in which we use the term in general, but I would take him to the window and talk to him on his hand about what he could see going on outside. I have somewhat modified my ideas and I would certainly advocate that the parent should speak to the deaf child at the same time that he touches his hand and let the child look at his mouth so that he would get the definite communication through the hand accompanied by the movement of the mouth, when the parent is close to the child and when he is a little way off he would have the mouth alone; so that you have an education for speech reading through the use of a manual alphabet of this kind. However, I do not desire to enlarge upon that point. The members of the Commission will be able to read this pamphlet if they wish, and I would simply say now that it is of great importance that we should consider the methods of teaching very young congenitally deaf children at home before they are old enough to go to school. This child could write a letter, and was writing letters to his friends all day long, before he was six years old. Indeed, the floor of his nursery was littered with scraps of paper on which he had been writing. I made the experiment fairly which George Dalgarno spoke of. He suggested, as I say, on page 3 of this pamphlet, "that a deaf person should be taught "to read and write in as nearly as possible the same "way that young ones are taught to speak and "understand their mother tongue." His idea was that we should talk to the deaf child just as we do to the hearing child, with the exception that our words are to be addressed to his eye instead of to his ear. Indeed, George Dalgarno carried his theory so far as to assert that the deaf infant would as soon come to understand written language as a hearing child does speech, "had the mother or nurse but as nimble a "hand as commonly they have a tongue." That idea has been ridiculed by teachers, and I accordingly wanted to test it. To test it I determined to carry the thing out fully in the education of this child. The first education of that child commenced by my writing on the board before the child whole sentences. I did not commence with letters, or even with words, but I wrote whole sentences on the board just as I would speak to a hearing child. Whatever words came into my mind that I would want to say to the little fellow if he could hear I wrote down on the board. Persons who came and saw the boy said, "How wonderful! Does that child understand what you have written there?" I said, "Oh, no." They said, "Then why do you write it?" I said, "He can never "come to understand it until he has first seen it. If "you speak to a baby by word of mouth does the "baby understand what you say? Of course not; he "has to hear it and hear it and hear it again before "he can understand the words which you speak." I commenced, as I say, with sentences, and then I wrote down on separate pieces of card the names of the toys, or of the things that he had to eat, and indeed, of everything that he wanted, and I taught him to go and ask for them by picking out the card that corresponded to the thing he wanted, and I made a game of it so as to make it as easy as possible for him. My idea was to make him use written words as much as possible in place of his own little baby signs. I studied his signs for my own purpose, but I never used them; I tried to give him words in place of his signs. The moment he could recognise a written word I pretended not to understand his sign, and then he would run to the board and pick out the card for the word corresponding to the thing he wanted; he could do that before he knew a letter of the alphabet, or could use Dalgarno's alphabet. He could write whole sentences by imitation before he knew a letter.

21,695. Just in the same way, I suppose, as a child can speak before he can write?—Exactly. That was the experiment which I tried, and it was successful; and it is, I believe, the only case that has been tried according to George Dalgarno's method. It contains perfectly true methods of teaching the language. I believe from the experience I have had it is a true principle—that there is a time to teach a child a thing, and that you may teach a child a thing prematurely. Now the indication of what is the right time to teach a child a thing is when the child indicates the want or need of it. When a child begins to invent a sign for everything he wants that is a proof that he wants words. I began by expressing all ideas to him in writing; that was my sole means at first of communicating, and I kept on writing and writing things that the child did not understand. Now you may ask me how he expressed his desire to write. It was in this way: He went to the blackboard, and he wanted to be the teacher, and to make me his pupil, and took the chalk in his hand and scribbled all over the board and then made signs to me to act, because I used to make him act in his play what I had written. That was an indication that he wanted to write, but he did not know the letters. I tried to find out what he wanted me to do, and I discovered that it was to give his doll a drink of water. Thereupon I wrote upon the blackboard, "Please "give dolly a drink of water;" and then I erased the sentence so as just to leave the slightest possible trace of it on the board, and then I gave the chalk to the child, and he traced it over and pointed to me to do what he had written.

21,696. (*Mr. Woodall.*) How old was he when that occurred?—He came to me when he was about 5, and all that happened within a month or two.

21,697. Doubtless you have seen remarkable instances of a child as young as 6 being able to write with great proficiency what is pointed out to him?—Yes, you will see letters in that pamphlet written by this child without any assistance before he was 6 years of age, in which expressions occur so remarkable as to show that he thought in English, and I can give you an illustration of that.

21,698. (*Rev. W. B. Sleight.*) Was the child born deaf?—Yes, he was born deaf.

21,699. Was he a particularly intelligent child?—He has not turned out to be particularly intelligent, though he was thought to be rather a prodigy in those days.

21,700. You had good material to work upon in that case?—Yes, I had good material to work upon.

12,701. (*Mr. Woodall.*) You do not cite that particular case as the case of an abnormal child?—Not by any means.

21,702. (*Mr. Johnson.*) But it was an exceptional case, was it not? You have no more like it; you have only tried this one case I believe?—Yes; the telephone took my attention away from the subject. Now just let me read to you from this pamphlet some remarkable expressions which he has used, and which he never saw used before. He came to me on October 1st, 1872, and on page 14 of this pamphlet you will find a letter written on November 14, 1873, which is a little over a year after his first coming to me; he was then six years old, and this is a conversation which actually took place, I may say that I used

Mr. A. G. Bell.

22 June 1888.

writing as much as possible, and when he had not writing materials at hand he used Dalgarno's touch alphabet. The following conversation was all written on two scraps of paper:—"*Mr. Bell.* I think you are "tired and *hot* now, so we will be *quiet* and *rest* now. "What does 'rest' mean? *George.* Rest means stop. "*Mr. Bell.* Yes, dear; it means 'stop' or 'still.' "*George.* Or wait? *Mr. Bell.* Yes. *George.* "Please may I put a your handkerchief, and be like "an old woman." Note in my record book. After playing for a while he remembered that his grandmamma had made fun of him for pretending to be a woman, so he wrote: "I am not put on my towel "on my head and be like an old woman, and grandma "said not now, grandma will be so very sorry now." That you will remember is the case of a six-year-old child. Now I will just refer you to a few remarkable expressions that show that he thought in English words. In a letter here you will find: "I matched the lamp on fire." That is perfectly expressive though he had never seen such an expression. Then he says, "The rain is not well but rain is sick but "the snow is well." However, I will not take up your time any further with these illustrations, you will be able to read the pamphlet if you wish to do so. I will only say that, in George Dalgarno's opinion, the only point of art in teaching language to a deaf child is to use no art at all—but diligence. "Let the same words be seen and written as often by "the deaf man," he says, "as they have been heard "and spoken by the blind; if their faculties of "memory and understanding be equal, the measure "of knowledge also will be equal." In the teaching of language, he says, that only diligence and patience are needed on the part of the teacher, and not great abilities. "An acute man will be impatient, and not "able to stoop so much as the other. And to clear "this further," he says, "I think it will be readily "assented to, that a prattling nurse is a better tutrix "to a foster child than the most profoundly learned "doctor of the university."

21,703. (*Rev. Mr. Owen.*) I think that answers the question I was putting to you?—I have not completely answered your question yet. The telephone took away my attention from the practical work of teaching, but my interest has always been in the general work of the education of the deaf; and having obtained new ideas relating to the education of very young deaf children I at last determined to start the private school limited to four children in Washington, to which reference has been made, in connexion with a kindergarten school for hearing children. I will not take up your time by going into the matter any further, but will simply state that I found difficulty in getting teachers. My first teacher remained with me for a year and then married and left me. My second teacher remained with me for a year, and then her mother died and she had to go home and keep house, and then the difficulty of getting teachers seemed to me to render it advisable not to carry on the school again (it was an experimental school) until I could get either a married lady, or a man who could devote his whole attention to the work, for I could not do more than spend a very little time in the school myself. The great questions connected with the telephone law-suit so occupied my thoughts at that time that I was unable to attend properly to the school, and I have therefore given it up, but I hope only temporarily, and the children are now being educated on the same methods by their parents, who went through the parents' class in connexion with the school.

21,704. Then, as a matter of fact, you have had no practical personal experience in the American institutions, the greater number of which are carried on under what is called the "combined system"?—I have no personal experience except by observation. It is my custom to visit the institutions, and I go among the little pupils, and sit down and write to them, and try to find out what knowledge of written English they possess. I have visited quite a large number of institutions in that way as a sort of outside impartial critic; so that while I have no practical experience I have a general knowledge of some of the institutions.

21,705. You have told us that you are a warm advocate of the pure oral method, and you have quoted Principal Crouter's opinion; are you aware that Principal Crouter in a paper read before the Convention of American instructors of the deaf said this, and I will ask you whether you agree with it: "It is "believed that a large per-centage of our pupils, "namely, semi-mutes and semi-deaf, and such of the "congenitally deaf (few in number probably) as are "capable of receiving oral instruction, can and should "be orally taught, and that all others (forming to be "sure the majority of the pupils) should be taught "by manual methods." Do you agree with that?—I think I have fully expressed my ideas upon that subject. There is a great deal of confusion as to what is meant by oral method. I think it means generally the "speech-reading method." I believe that all children should be taught articulation, and taught to use articulation; but I do not think that all children should be taught by articulation, that is to say, speech reading. All who can be successfully and readily taught by speech-reading should be so taught, and those who cannot should be taught manually—by which I mean that written language should be used by the teacher. In all cases, however, the mouth should be used by the pupil as *his* means of communication. In this sense I would use an oral system for all. "Speech" for all; "speech-reading" for as many as can readily profit by it. That is my opinion.

21,706. Do you find that orally-taught pupils really use speech and lip reading in after life?—Undoubtedly, those who read with facility, and I speak from personal experience; my own wife has been orally taught, and for every word of communication she relies upon communication by word of mouth. In fact, it is my knowledge of the fact that it is perfectly practicable for a person without hearing to rely for every word of information upon the mouth of others, that has led me to come forward as I have done prominently in America. I desire that all deaf children should be placed in the condition that my wife is.

21,707. You told us your wife became deaf at the age of five, I think?—Four and a half.

21,708. Undoubtedly the oral system has answered in her case?—Yes, admirably in her case.

21,709. Do you think it would have been equally successful, if she had been congenitally deaf?—I think if she had acquired a knowledge of the English language before being allowed to depend upon the mouth for information, the result would have been the same. So far as my observation has gone, if a pupil is taught to rely upon the mouth for communication before the language is acquired, it interferes with the acquisition of language; but if he is taught the language before he relies upon the mouth, then that knowledge of the language enables him to acquire the art of speech reading.

21,710. Then you have no objection to the manual alphabet being used for the purpose of giving the child its knowledge?—I have none whatever personally.

21,711. You do not consider that the use of the manual alphabet in the earlier stages of education is a hindrance to articulation?—I do not. I think it is a great advantage to the pupil.

21,712. You were present, I believe, at the Conference of American Principals and Superintendents in America at Faribault?—Yes.

21,713. You are reported as having said at that meeting, "I would advocate the use of a manual "alphabet," and then later on you said, "If oral "schools would only adopt the manual alphabet." Are you still of that opinion?—Undoubtedly.

21,714. Is not that what we call the "combined system"?—That is for you to define. I do not think that is what is meant by the term in America. In all the combined schools the "sign-language" is used,

and I do not think that any method would be spoken of as "combined" which rejected the sign-language.

21,715. What I think most of us Commissioners understand by the "combined method" is that both systems, the manual system and the speech system, are used as channels and means of education to the same identical child?—Yes, but it is a very indefinite term, and in America always, I think, includes more. Sign-language as well as manual and oral instruction.

21,716. You told us that you did not object to the manual alphabet being used as a subsidiary means of education in oral schools?—I do not, undoubtedly.

21,717. That is not the pure oral system, is it?—It is not.

21,718. From your knowledge of the institutions in America do you agree with what Dr. Gallaudet says, "that they adopt the combined or American method, "that is to say, the method in which the best "features of both systems are incorporated?—As I have said, I do not believe there is any "combined system" in America. What is known as the "combined system" is simply the sign language system in disguise. The sign language is the language of communication; I would divide the methods according to the language of communication that is used. There are two radical varieties. Special language (which in our country is the sign language) and the ordinary language of the people. Now, I discard entirely a special language as being nothing but harmful, and I would advocate the ordinary language of the people which appears in two forms—written language and spoken language. Spoken language I would have used by the pupil from the commencement of his education to the end of it, but spoken language I would not have used as a means of communication with the pupils in the earlier stages of the education of the congenitally deaf, because it is not clear to the eye, and requires a knowledge of the language to unravel the ambiguities. In that case I would have the teacher use written language, and I do not think that the manual alphabet differs from written language, excepting in this, that it is better and more expeditious.

21,719. Are you aware that the advocates of the pure oral method in England are totally opposed to the use of the manual alphabet?—I am; and so they are in America.

21,720. Then you do not agree with them on that point?—Certainly not. I would permit the pupils in every school to know and use a manual alphabet. I would not permit the use of the sign language.

21,721. You have said you scarcely approve of missions amongst the adult deaf and dumb as bringing the deaf and dumb together?—They have bad features and they have good features, and I do not wish to express a decided opinion on the subject. I can recognise that there must be many in our schools who grow up to adult life without the ability to communicate with hearing persons; they are isolated from the community and the question is, what are you to do for them. I do not mean to express any decided opinion as to that. You have got to reach them some way or other. It would be better to reach them in some other way than by bringing them together, but I do not know how to do it. It might, perhaps, be possible to bring together adults of only one sex at a time.

21,722. Do you not believe that the association of the deaf and dumb among themselves is a very great element in their happiness?—Not necessarily so. I think that the association with persons with whom they can talk and converse is an element in their happiness. If they cannot talk or converse with hearing persons then, of course, association amongst themselves is an element in their happiness, and you cannot keep them apart. We want to make every effort to help them to make friends among hearing persons of their own age.

21,723. Have you given the matter consideration as to how far religious missions to the deaf and dumb are to be carried on; would you exclude them all and, if so, how would you reach the spiritual needs of the deaf and dumb?—That is a matter that I have not given much thought to, and it is a very important matter. My thoughts have been chiefly directed to the young and to the means of reaching them and educating them and preventing this association in adult life that we have. I have not given much thought to the means of reaching the adults and benefiting them. I am not competent therefore to give an opinion upon that.

Mr. A. G. Bell.

22 June 1888.

21,724. Now, as regards the day schools and institution system, I want to ask you one or two questions; do you not think that in many cases the teaching is much checked by the children going home to illiterate parents under the day school system?—It depends entirely upon the character of the home; I think in the majority of cases that the teaching is helped. But there is more than that to consider. Many parents desire to benefit and assist their children at home, but do not know what to do. In the day schools they come into personal relations with the teachers, and an exchange of ideas occurs. The teacher tells the mother what to do at home, and she does it. In an institution pupils are taken away so far from their parents; the parents never communicate with the teacher, or very rarely; and when the children go home in the holidays they do not know how to communicate with them. The children get tired of home and long for the school playground and the deaf children with whom they can communicate so freely; the ties of blood relationship are weakened and the institution becomes their home. The day school strengthens those ties of relationship. The communication between the teacher and the parent enables the parent to help the child at home; and I have seen in the Horace Mann School many instances of wonderful results achieved quite as much, I think, by the parent as by the teacher, by the co-operation of the two.

21,725. You told us that institutions do not seem to get the children at sufficiently early age; do you not get them quite early enough for their minds to be capable of receiving instruction?—Yes, but they are too old to start easily the study of language and speech, especially speech. It is in very early childhood that a language is most readily acquired. I believe with Dalgarno that it should be acquired in infancy or very early childhood. When the child comes to be 10 years of age you have to adopt methodical and grammatical ways of teaching, whereas the language should be acquired naturally in very earliest childhood by imitation if the language is constantly used by those around the child in a clearly visible form.

21,726. Do not you think that in institutions the children get the advantage of discipline, training, and moral tone which they could not get in any day schools?—I doubt whether it is an advantage to a very young child to be placed under that discipline. Kindergarten methods are more suitable. In regard to morality, I should say certainly, no. There is no person who can look after the morals of a young child like its own mother.

21,727. It seems to be generally admitted that physical training is most important for the deaf and dumb; is not that a great feature in institution life that could not be obtained in a day school?—I do not see why it could not be obtained in day schools. I think everything that can develop the lungs is of importance. Speech is of importance in that light, and I think the experience that Dr. Gallaudet enunciated in his testimony, shows the enormous development in that respect in the case of his pupils at the National College by physical gymnastics; but I do not see why that means of development should be confined to institutions. In the Horace Mann School, which is a day school, there is a gymnasium, and the pupils have daily exercise with dumb-bells to develop the chest.

21,728. Have you visited the Stainer Home for teaching deaf children in connexion with the board

Mr. A. G. Bell. 22 June 1888.

schools in London?—Not yet; but I hope to do so very soon.

21,729. Then you are not prepared to answer any question with regard to that system, because you have not been there?—No.

21,730. (*Mr. Woodall.*) I want to ask you a few questions bearing upon the general system of public aid to schools in America; I suppose that each State in the Union has its own method of dealing with the deaf mutes much as it determines its own process with regard to the education of all other classes?—Yes.

21,731. And consequently there is nothing like uniformity in the general policy of the States, although there may be substantial agreement, perhaps?—There is substantial agreement in adopting the policy of the central institution for all the deaf mutes of the State, but each State has its own laws in reference to the education of the deaf.

21,732. Does every State charge itself with the responsibility of providing the means of education for the deaf mutes?—I think it does. You see in America it is very generally recognised that the safety of the Republic depends upon the education of the masses. Hence, education is a matter of State concern, and in some of our States (as in the State of Wisconsin, as you will see if you will refer to my open letter), there is actually a provision in the constitution of the State that every child should have the opportunity of education at the public expense from a certain age to a certain age.

21,733. That also appears in the constitution of some of the New England States, does it not?—I am not prepared to answer that question; but I may say that you will find, as a general rule, in each institution report the laws of the State where the institution is found relating to the deaf and dumb.

21,734. In effect may we take it that the institutions have been established on private foundations and arranged by independent boards?—I am not competent to speak upon these questions. I observe that Dr. Gallaudet has already given testimony in the matter, and he is much more competent than I am to say what the actual organisation of the schools may be.

21,735. The States recognise the obligation of contributing to the institutions an amount which they regard as sufficient to bear the whole cost of the education and maintenance of the pupils sent by the State?—I think they all recognise the obligation of the State to educate the deaf and dumb.

21,736. Then, perhaps, you will state the amount usually contributed to those institutions?—I cannot do so with accuracy.

21,737. May we take it that it is as much as 250 dollars, equal to 50*l.* of our money, a year for each child?—Dr. Gillett stated the average *per capita* cost at 223 dollars 28 cents per annum. I wrote a letter to the editor of the "American Annals of the Deaf," asking him what the average *per capita* cost at the present time is. If you like I would read the letter in response, if that is the information which you desire.

21,738. May we take it that 223 dollars is the average arrived at by including States where the cost of living is much cheaper than it is in New York, for example?—Undoubtedly, and I do not think that that average *per capita* cost truly expresses the average *per capita* cost. I have not calculated it myself because I cannot trust myself upon such a matter, but I will read the letter of the editor of the "Annals" giving me the information how to calculate truly the average *per capita* cost in America, and that information will guide you just as well as it will guide me. This is his letter: "Dear Professor Bell, I do not "know that any calculation of the *per capita* "expense has been made since Dr. Gillett's, "with which you are familiar. The materials "for one may be found in the last January num- "ber of the 'Annals' in the tabular statement of "the schools of the United States, which gives the "number of pupils and expenditure for support "during the year 1887 for most of the schools. "Schools having a department for the blind should "be omitted, as the number of deaf mute pupils only "is given, while the expenses of both the deaf and "the blind departments are included in the state- "ment of expenditures. Such schools are marked "(on the page giving expenditure) with an asterisk. "Perhaps it would be fair also to omit the Columbia "Institution as the collegiate department is included "in the table of expenditures, and the expenses of "this department in proportion to the number of "students is much greater than in any of the schools. "I do not think (but am not sure) Dr. Gillett made "either of those eliminations. Very sincerely yours, "E. A. Fay."*

21,739. Are you aware of the fact that in addition to the amounts contributed by the State for maintenance and education a sum which is sometimes 30 dollars a year is given by the county for the supply of clothing to those who need that assistance?—I am not aware of the details.

21,740. I only ask these questions because I am anxious to know whether, in your opinion, this comparatively generous aid given from the public purse has had the effect of checking or diverting private benevolence from the institutions?—There is no doubt at all in my mind that private benevolence has been diverted by the very generous State aid, but we must remember that the attitude of the American mind towards questions of education is peculiar. Education at public expense is claimed as a right pertaining to American citizenship, and is not looked upon as a matter of charity. Parents often complain bitterly at the injustice of considering the education of their deaf children as a matter of "charity," when no one would dream of viewing the education of their hearing children from such a standpoint, though the hearing, as well as the deaf, are educated at public expense. It is chiefly, I think, the schools that have opposed the institutions that have received private aid—the articulation schools, for example, the Clarke Institution; that is my belief; but I may be wrong; I am not an authority upon these subjects, and, perhaps, I should not express an opinion at all.

21,741. But surely all the institutions you have named, particularly those in New York and Philadelphia, founded by private benevolence, and managed by voluntary boards under charters, are substantially kept going by the capitation grant given on the pupils sent by the State, are they not?—I should say in that whole department of the subject I am not a competent authority to speak. I have crude ideas, but I may be wrong or I may be right.

21,742. But you have said you attached a great deal of importance to the necessity of effective government inspection; can you tell the Commission what kind of investigation is now made by the State authorities in the cases where they have given money aid?—So far as I am able to judge a formal inspection of the institution is made; but, as a rule, I do not think that the persons who inspect the institutions are competent to judge of the results of the education of the deaf. For example, the members of the legislatures sometimes inspect the State institutions in a body. An exhibition of the school is given. But members of the legislature would, as a rule, accept a child who became deaf at five years of age, as a fair specimen of the average "deaf-mute," and attribute his mental condition to the instruction he received in school.

21,743. But each State maintains a Superintendent of Public Instruction, does it not?—It does.

* In connexion with this subject, Rev. Fred. Wines says: "The *per capita* expense cannot be accurately calculated, "because (1) the reports do not state the *average* number of "pupils, and (2) the average number, in institutions which are "closed for a part of the year, may be either the average for "365 days, a full year, or for the number of days included in "the actual school term. I have little faith in any of the "statements made by the officers of institutions for the deaf on "this subject. They do not use words in the same sense. "The *per capita* cost could only be approximated from the "table in the Annals."

Mr. A. G. Bell. 22 June 1888.

21,744. Is it not the duty of that superintendent periodically to visit institutions that are aided by public money?—I do not know, because in many cases the institutions for the deaf and dumb occupy an anomalous position among the schools. They are very often placed under the boards of State charities instead of the boards of education. They may be, and sometimes are, under both. It may be possibly that in all cases the superintendent of public instruction inspects them, but that I do not know. It should be done.

21,745. But you are aware that the reports generally are addressed to the senate and House of Representatives of the particular State in which the institutions are placed?—Yes.

21,746. And that the institutions have to make a return to the Government controller of the finances of the institutions?—Yes.

21,747. But all this is something quite different, I presume, from what you contemplate when you suggest that there should be an efficient and skilful system of Government inspection?—Undoubtedly; and I should say in connexion with that point that the difficulty of inspection in a State lies in the fact that as a general rule there is only one school in the State. I think that the true way to promote improvements in our methods of instruction is to have very numerous small schools. I would direct your attention to the letter of Professor Fay, the editor of the "Annals," which is the last letter on the subject of instruction of the deaf at page 175 of the pamphlet "Facts "and Opinions relating to the Deaf," which I have handed in. Professor Fay says, "I will only "express the hope that you will urge the British "Government to afford liberal support to existing "schools of all kinds, and to establish new ones, "without hampering them by close restrictions "of any kind as to the methods to be pursued, "trusting rather to 'the survival of the fittest,' which "will be the inevitable result of the free discussion "which has been going on for some time, and is not "yet ended." There is just one point there upon which I differ from Professor Fay. I do not think that "the survival of the fittest" will operate unless there is "a struggle for existence." The different methods of instruction have been in existence for a hundred years, and the "survival of the fittest" has not brought one of them out in place of the others yet. The reason is that we have not any means of testing the results. In order to have the survival of the fittest there must be the struggle for existence. If you have got a State institution, without any competition or opposition, there is no tendency to improve.

21,748. The unfittest in that case may survive as steadily as the fittest?—Yes; what you want is this: numerous small schools *dependent for life upon the results obtained*. And in testing these results I would have the British Government keep one point in view as the primary thing to test by, and it is this: to compare the results in those schools as regards their acquisition of written English; their familiarity with the written language of the people, for that is the one point in which all the methods agree; that is one of their objects; they are all trying to teach the written language of the people. I should eliminate everything else in the first test. Then supposing that all succeed equally well upon that test, the one that in addition to that teaches speech is worthy of encouragement. Next, supposing you have a number of schools under different methods that do equally well as regards the knowledge of written language and their power to articulate; then comes the still higher point, namely, the ability to read from the mouth. The thing that is common to all is the written language; therefore I say test that first, do not throw out the articulation school because the articulation is bad or painful or disagreeable, provided that the knowledge of written language acquired by those pupils is equal to the knowledge of written language acquired in some other school where speech is not taught, because that bad speech is something in addition that the pupil has got. However bad it may be it is something more than a pupil has who has no speech. Do not compare speech with a knowledge of the sign language, because the sign language is of no use in the hearing world, whereas the speech, even if imperfect, is of use if it can be understood.

21,749. You are aware that we have in this country a system in our primary schools of Government inspection and payment by results which is unique, and you are probably also aware that that has often been charged with the evil of having stereotyped the methods of instruction?—The whole subject is new to me, and I should like very much to investigate the matter, because it is a problem with me how to evolve some method applicable to America, by which we could have a supervision over our institutions as you have in this country and test by results.

21,750. While you are in this country you will give attention to that matter, I presume?—Yes.

21,751. I gather from answers that you have already given that it would be possible for the State in the most eclectic spirit to institute a system of inspection and payment to the several schools on the results attained in achieving the end which you have thus indicated while leaving each institution to pursue its own methods?—Yes, that is just the point I would keep in view, I would leave these schools free to pursue any method they like, but I would have the British Government give their aid by results.

21,752. But in order to get those results in teaching you insist that great efforts should be made to ensure the competency of the teachers employed?—It is very necessary. The great mistake in America has been to recognise what I may term as bricks and mortar as the thing to which State aid should be given. The competency of the teachers is not an element. I do not mean to say by this that we do not have good teachers, for we have. Indeed, I believe that the average of intelligence and culture among our teachers is at least equal, if not superior to that of those employed in Europe. I would have you to recognise the importance of competent teachers, who should receive payment for each pupil in accordance with the pupil's attainments, wherever the teacher may be, whether in one particular school or another, and not confine your aid to some centralised institution.

21,753. In England in our primary schools Government grants are only given when certificated teachers are employed; do you think that a good plan?—Undoubtedly.

21,754. Now with regard to the training of teachers for particular work of instructing the deaf and dumb; do I gather rightly that you think those teachers might be best obtained from the ordinary normal schools of the country rather than that they should be specially trained from the first for teaching the deaf and dumb?—That is my impression; but I do not think we want to be very strict about that, because there may be admirable teachers of the deaf who have not obtained a normal school education. But I should insist that every teacher of the deaf should have a competent knowledge of the general art and science of teaching. If they are not trained in a normal college they should be tested and examined on that point before they are allowed to teach the deaf.

21,755. Is it not the fact that the great bulk of the most competent teachers employed in the institutions at present have been trained for the ordinary public schools of the country?—I have no statistics to determine that. My own personal experience, from my knowledge of a number of teachers, is that the bulk have not been trained, but only a very small percentage have been trained, but they are as a rule persons of good general education; but very few of them, I think, have been specially trained as teachers or have passed through the normal course.

21,756. I gather that you do not advocate the establishment of a special training institution for teachers of the deaf and dumb?—I would not advocate the establishment, by the Government, of a special training school for teachers of the deaf, for

Mr. A. G. Bell.

22 June 1888.

this reason, that it will tend to the perpetuation of some one method of instruction. I believe that diversity in methods of instruction will be advantageous to progress, if there is competent supervision and examination of results and payment by results; and that it would be better to draw our teachers from all the normal schools of the country, and let them acquire their special training in schools and institutions for the deaf. It would be a very proper thing for special training schools to be established by private enterprise—to propagate some special method—and such teachers might be accepted and recognised by the Government, if their general qualifications come up the Government standard.

21,757. You are familiar with the methods of training in some of the normal schools, are you not?—I am not sufficiently familiar with them for you to be able to rely upon my testimony.

21,758. May I take it that it is a rule throughout the United States that no teacher is allowed to be employed in a public school until he has completed his apprenticeship in the normal schools?—I believe that a certificate is required as a rule from the teachers of the hearing, but not from the teachers of the deaf.

21,759. I believe you have nothing in the public schools of America analogous to our pupil-teacher system, by which apprentices are employed in the actual work of teaching in the primary schools?—I am not competent to say.

21,760. Given that you have secured a properly trained teacher, you prefer day schools to institutions for the reasons you have stated?—Undoubtedly. I recognise that you cannot do away with the institutions, but I prefer the day schools wherever they can be adopted.

21,761. I think you told us that very little more than one third of the children of school age who are known to be deaf are at present under public education?—I did not mean to convey that idea. What I meant to state was that on the 1st of June 1880 there were 5,393 pupils in all the state institutions, excluding the day schools, whereas there were 15,059 children of school age in the country. The number in the institutions upon that particular day was, therefore, about one third of the total I have given; but of that total, many had already received partial education in the institutions. I think, however, upon the evidence that exists we may be able to say (though this is only matter of opinion) that there are probably as many deaf children of school age growing up without instruction in America, as there are in all our institutions and schools put together. That is, as I say, matter of opinion and not proved as fact.

21,762. Whatever the proportion may be, is it not a little surprising in view of the very generous aid given from the public funds towards the maintenance as well as the education of the deaf in America?—It is very surprising, and indicates to my mind a defect in the methods of reaching the deaf and dumb. It indicates to me that the policy of centralisation, however generously supported (and it is generously supported in the United States), fails to reach a large number of the deaf and dumb; because their parents will not send them away from home. No increase in the number of institutions will remedy that evil. I would say, do not increase the number of institutions to accommodate those children who have not come in, but push out little day schools as near the homes of the children as you can, that is to say, supplement the institution system by the day school system.

21,763. I gather that you do not look to any system of compulsory attendance as the remedy?—No, I think not.

21,764. At all events, you would not advocate compulsion where the only available means of instruction is at a distant institution?—I would not advocate it.

21,765. But do you think if there were provided within a certain walking distance from the home such day schools as those you have indicated, compulsion might then be properly applied?—I think the community would then have the right to apply compulsion.

21,766. To the same extent as it is applied to the ordinary hearing child?—Yes; on one condition, that the wishes of the parents are consulted in regard to the methods of instruction.

21,767. You cited the action of the State of Wisconsin in having specially legislated for the establishment of day schools upon the models which you approve; and you told us that the State had agreed to make a grant of 100 dollars a year for each child so taught. I am not quite sure whether you told us by what particular county authority these day schools would be managed; would they be part of the Public School system?—They would be part of the Public School system under the Local School Boards in the places where the schools are established. They would be supervised by those Local School Boards, and would also come under the supervision of the State Superintendent of Public Instruction, and State aid would only be given to those local schools on the condition of their having a teacher whose competency is certified to by the State Superintendent of Public Instruction.

21,768. Supposing the actual cost of instruction of each child to be more than 100 dollars a year, would you say from what other funds the balance would come?—From the local school funds and from the parents and friends of the pupils; but I would not advise that day schools should be discriminated against by the State; that is, I would not advise that the pupils in day schools should have less aid from the State than the institutions receive.

21,769. But, presumably, the cost of giving instruction in a day school where the children go home to their parents would be very much less than in an institution?—Undoubtedly. Hence the State might afford to give a longer term of instruction at the day school.

21,770. Supposing it be not possible to establish these day schools within walking distance of the child's home, do you contemplate the establishment of local homes to which children might be sent, say from Sunday to Sunday?—I do not contemplate the establishment of local homes, excepting as an alternative to the greater evil of institutions. They are better than an institution, but not so good as a school where the children return to their own parents after the school hours are over. The cost to the State where the parents assume the cost of board is, of course, very much less than where the State assumes the cost of maintenance and board as well as education; and I would advocate in cases where the parents bear the cost of board, the State should not discriminate against the day school by making a less total appropriation for the education of a day scholar than it gives to an institution scholar. I should, therefore, advocate that the terms of instruction at the State expense in the day school should be increased, so that the same amount of money that is expended on the child at the State institution may be expended on the education of the child at the day school in the form of giving him a longer period of instruction. Now, hearing children have at the public expense an education from the age of 4 to 20 years in Wisconsin, whereas the deaf who need education so much more than the hearing, are limited to a very few years in the institution on account of the expense. I hold, therefore, that if the State can be saved any expense by sending the deaf child to a day school, the term of his instruction should be lengthened until it approximates to or equals that afforded to the hearing child. In regard to homes for deaf children, I look upon the homes as an intermediate step between the day school proper, which I advocate, and the institution which is very objectionable. The objectionable feature in a system of day schools supplemented by homes, is the bringing of children together into those homes for so many days exclusively without the supervision of their parents; but still it is a step in advance of the institution plan in my view: it is better than to take them from their parents for several months in the year.

Mr. A. G. Bell.

22 June 1888.

21,771. Under the English law of compulsory attendance a limit is fixed within which there must be a suitable school available; is there anything of that kind in the laws or byelaws of the American system?—There is in relation to the hearing children.

21,772. Do you imagine that the same regulation as to distance would apply to the deaf and dumb as to the hearing children; or is their case materially different?—I think that the distance might be increased in the case of deaf children; because parents very often recognise the very great necessity of the children going to school, and would prefer to send their children, as they do in America, 18 miles by railway to attend a day school rather than send them to an institution. So I therefore think the limit of distance could be very considerably enlarged.

21,773. I have been asking you these questions because I was anxious to know whether this grant of 100 dollars per annum for each child (equal to 20*l.* a year with us) contemplates the cost of maintenance as well as the cost of education to any extent at all?—It does not contemplate maintenance at all.

21,774. Are there any facilities afforded in America in the nature of free passes by railway or tramway systems for pupils under any circumstances?—Very generally some arrangement has been made. There has recently been a law passed interfering with the granting of passes for any purpose. I do not know how far that has affected the day schools; but I know that in Boston, in the Horace Mann School, private parties very often leave money for the purpose of horse-car fares, and things of that sort for the pupils; so that there is no necessity for any parent paying for the transportation of the child, if he is not able to afford it. I may say also that in my opinion day schools promote charitable enterprises much more than institutions do. In day schools at Boston, for instance, people come forward and leave money in the hands of the principal of the school for the boot and shoe fund, so that if a child comes from a home where it cannot be properly dressed she has her school dress provided. If you were to go into the school you would see nothing in the nature of a ragged school. All the children are well dressed, with clean faces and good boots and shoes. These day schools promote enterprises of that description more than the institutions do. I forgot to allude to a very important movement just established in Boston which has touched me very much, namely, the establishment of the first infant school for the deaf in America, which has just been opened this last month. I have given the whole history of it, so far as I know it, at page 165 of my pamphlet, "Facts "and Opinions relating to the Deaf." *See* "The "Sarah Fuller Home for little Children who cannot "hear." It takes little children at three or four years of age.

21,775. We may assume that in such infant schools, even to a greater extent than is common in ordinary schools, great attention would be given to the kindergarten?—Undoubtedly; that would be essential.

21,776. I do not want to go into details as to the methods of instruction; but, putting the question broadly, would you regard the general kindergarten principle as applicable to every stage of the instruction of the deaf and dumb?—In the earlier stages, I think, it is essential for the very young.

21,777. That leads me up to a concluding question I would like to ask, as to the extent and character of the industrial instruction for which you would provide in conjunction with the ordinary literary work of the school?—I have a feeling that we want to interfere as little as possible with the literary work, and that the industrial education during the period of school life should be as much as possible confined to the elements of trades and the use of tools, rather than extended to the teaching of special trades or special pursuits, and that after the pupil has finished his education there should be some aid from the Government to apprentice the child to the trade or pursuit for which he evinces the best aptitude. I think they should be scattered as much as possible in different pursuits, whereas the teaching of special trades at school brings them all into one or two trades, in which they cannot all obtain employment. As regards most trades and businesses which deaf persons enter into, the deaf are able to acquire, without instruction through language, by simple observation and imitation the details of the trade, and they have no difficulty I am sure in acquiring them where they start with a competent knowledge of the use of tools and the elements of the trades. I should therefore recommend that in schools for the deaf only those elements should be taught that are common to a number of special trades, and that after the school life is finished some aid should be given by the Government to apprentice the children in different pursuits and different specific trades, scattering them as much as possible through the community.

21,778. Do you look upon the industrial training given on those principles as likely to be useful to the physical development of the pupil?—I see no reason why it should be unfavourable.

21,779. It might be directed to that as its special aim?—It might be so directed.

21,780. And you have told us already that you see no reason why physical exercises should not be as thoroughly well given in a day school as in an institution?—I see no reason. In the Horace Mann School in Boston they have regular gymnastic exercises. They have a little gymnasium in the first place where the pupils can exercise at their own desire, and, furthermore, they have regular class instruction with the dumb-bells; all the children in the school are drilled like a set of soldiers; they all make the same motions with the dumb-bells for a certain length of time each day.

21,781. Very much the same exercises, I suppose, as those that are given in the best public schools of America?—The aim is to make them the same. By-the-by, there is one feature in the Horace Mann School in Boston which I have not mentioned, which is unique. It has arisen from an accident, but as it is so very important I will direct your attention to it. The school became too small to accommodate the children, and, pending the erection of a special school building, the principal sent two of her classes, the most advanced classes, into an ordinary public school building; she picked out the two classes where the progress in speech and speech-reading was most advanced, the children of which could talk well. That acts, I think, as a stimulus to the articulation of the younger children, because they want to go into the public school. It also brings the best class of pupils into contact with the public. The teachers and children of the public school converse with these selected deaf children and do not see the worst cases. It acts as a stimulus, as I say, because the children know that if they make sufficient advancement in speech-reading and articulation they will be drafted into the public school, and go into what is looked upon as a sort of upper class in the school. I think it very important that we bring the pupils of our schools—especially the older pupils—into contact with hearing persons in a greater and greater degree as their education advances, as a preparation to entering the world. The object of their education is to fit them to live in a world of hearing people, and as their education advances they become better able to communicate with hearing persons, and should have opportunities of becoming accustomed to the conditions in which they will live in the future, instead of being left to plunge in at the conclusion of their school course, without any experience of the difficulties with which they will have to contend. The Institution plan of preparing them to enter the world reminds me of the remark of the ancient monarch who

Mr. A. G. Bell.

22 June 1888.

was nearly drowned, and who vowed he would never again go into the water *until he had learned to swim!* The Institutions try to teach them to swim without putting them into the water.

21,782. In American schools for the hearing and speaking children I believe a very large portion of the teachers are females; do you think that women are as well adapted for the teaching of the deaf and dumb?—I think that they are better adapted; they are more patient and understand the condition of little children a great deal better than a man does. They are able to bring themselves down to the level of the children very much better.

21,783. (*Sir Tindal Robertson.*) I know that your evidence relates more to the deaf and dumb than to the blind; but I put this question to you because you have exceptional acquaintance with telephone work and work of that kind. I would ask you whether you think that blind people, especially blind girls and blind women, might be advantageously employed in telephone work considering that they would not be required to write?—I think that a very important suggestion; it never occurred to my mind before it was suggested to me here; but there is no reason at all why the blind should not be employed in our central offices where hearing alone is required, and the telephone business certainly opens up a great avenue for the employment of the blind.

21,784. Then with regard to the question of heredity amongst the deaf and dumb, I understand you to say that you would avoid, as much as possible, the congregation together of the deaf and dumb either for educational purposes or for social intercourse in order to avoid the possibility of inter-marriage?—I should adopt the principle of decentralisation in education and separate the deaf from one another as much as possible and strive to encourage bonds of union between the deaf population and the hearing population. No doubt we cannot avoid bringing the deaf together to a certain extent, but we should do it as little as possible, and we should recognise that it is an evil to be avoided if possible.

21,785. Considering that we must, as you say, bring them together to a certain extent, would you advise that in all institutions for the deaf and dumb there should be a separate school for each sex?—I must say I have not formed any decisive judgment upon the question of separating the sexes in schools; it is an unnatural thing to separate them. I have not formed any decided opinion upon that subject. What we want to do is to avoid the association of the two sexes in adult life.

21,786. Is not that much more likely to happen when they have been associated in their school life?—I think it depends a good deal upon the method of instruction and upon the character of the school. Institution life certainly tends to association in adult life, but if you have a very small day school for the deaf in the same building with a large school for the hearing, and if those deaf children associate freely with the hearing children and their own parents and friends, I think the deaf boys will see and know many more hearing girls than deaf girls. I am very undecided as to the propriety of separating the sexes, especially during the earlier period of education.

21,787. In the question I just put to you I was referring to an institution which was for the education of deaf and dumb children exclusively, would it be advisable in your opinion that in such an institution there should be separate schools for the sexes in order to avoid the great evil which your theory manifestly suggests?—I would rather not express too decided an opinion upon that. In Montreal we had a school for males and a school for females, at the first blush it seems a good thing, but I can see many objections to a separation of the sexes, especially in the case of very young children, and I would rather not express too decided an opinion upon the question. It is a matter upon which we should think carefully and come to a careful decision. I would rather not announce my views upon that subject in too rigid terms at the present time. I may say that I am inclined to think that separate schools for the two sexes, especially for the older pupils might be advantageous, but I do not wish that to go on record as my firm conviction.

21,788. (*Mr. Johnson.*) I understand you to say that you have not a very decided opinion as to the desirability of separating the sexes in institutions for the deaf and dumb; but I assume you would not see any objection to their being brought together in an ordinary public day school?—No, I would not separate them there.

21,789. In an institution you think it might probably be desirable to separate them?—I am inclined to think it might be desirable in the case of older pupils, in the case of young pupils I do not think it so desirable.

21,790. Your experience has not been so much with old pupils as with the young?—My experience has been more with the younger pupils.

21,791. With regard to masters and mistresses for the deaf and dumb, where do you get your masters and mistresses from now?—That is a mystery; but I must say this for American institutions, that we do get men and women of ability, both as principals and teachers, but not, so far as my observation goes, specially trained as teachers.

21,792. Have you anything corresponding with our pupil-teachers system?—No. I cannot speak with authority upon this question, but my impression is that a teacher is selected by the principal, and the principal is the judge of the competency of that teacher. When a teacher once goes into the work, and has been in the work for two or three years, he or she is likely to continue, and it is very much the custom of institutions when they want new teachers to take their teachers from other institutions. This is specially the case in sign-institutions, for teachers who know the sign-language have practically a monopoly of the work; it takes so long a time for a raw teacher to acquire the language.

21,793. In some instances they take persons who know very little as regards the treatment of the deaf and dumb, and they train them in the institutions?—That is so.

21,794. But there is no training college in the States for teachers for the deaf and dumb?—No.

21,795. Do not you think it would be a desirable thing to establish such a college?—No. I think it would be advantageous perhaps to have a training school on each method, which could send out advocates of its own system, but I would not have a training college supported by the State. I think the Government should take from the training colleges for hearing persons those who would be likely to make good teachers of the deaf and send them to schools for the deaf and let them gain experience in those schools for the deaf. Special training colleges might very properly be established by private enterprise, but I do not think it would be well for the Government to do so. Government action would be apt to interfere with healthy competition between methods of instruction, by encouraging some one system at the expense of the others. I would have the Government take no part in the contest between systems of instruction otherwise than as an impartial judge of the results.

21,796. With regard to homes I do not know whether I understood you rightly that there are no such things as homes for the deaf and dumb in America in connexion with day schools?—There are such homes.

21,797. Are they very numerous or not?—I think not, but there is a day school in the city of Portland in the State of Maine, to which there were so many applications for admission that the principal was obliged to find homes for the children among private families in the city. Then some one family became a sort of head centre and received 10 or a dozen children, while there were a number of scattered homes in the city receiving in each case a smaller

number. A very small per-centage of the children who attend that school come from Portland itself; they come from other parts of the State. I am afraid that the result will be the establishment of an institution; that is to say, that the day school will become an institution. If an institution is established in that State, what I would recommend would be that it should not be in the city of Portland, but somewhere else, and that the day school should be kept in the city for the children of the city and surrounding district.

21,798. You would prefer the separate boarding-out system to the associated system?—Yes. I should prefer that, but the plan that I would prefer to all others would be that the children should be at their own homes; next to that, if that is impossible, I should prefer to have them boarded separately in families, with people who would look after them; next to that, if that is impossible, I would have a home the inmates of which should be as few as possible; after that, if that was impracticable or expensive, I should have a boarding school; but in every case I would keep my number as small as possible, and the boarding school should be constructed and operated on the cottage plan, rather than upon the dormitory system.

21,799. In those day schools where deaf and dumb children are admitted, is there any medical supervision or examination at all to determine the causes of deafness, or to ascertain whether any steps might be taken to ameliorate their condition medically and surgically?—I am not competent to speak upon that. I am acquainted with what is done in the Boston School, but not with what is done in other schools. I think in that school the teachers simply advise the parents of anything they ascertain themselves, and in some cases an examination of the children is made by a competent aurist, who, as a general rule, charges nothing for the examination; but I do not think that sort of examination by an aurist a general feature of a day school. Generally in institutions there are medical men whose names at all events appear upon the reports as doctors to the institutions, who look generally to the health of the pupils, and you will find in the reports of the institutions a report upon the health of the inmates from the medical superintendents. In some cases those are outside physicians who attend at the institutions as they go to a hospital, in other cases they are associated intimately and closely with the institution.

21,800. Do not you think, supposing there was anything like compulsory education of the deaf and dumb, that it would be a desirable thing to have a special medical supervision of the schools into which deaf and dumb children were admitted, with a view to ameliorating the deafness from which the children were suffering, where practicable?—I think it would be a very good plan.

21,801. I ask you the question because in some of the institutions we have visited in England we have found that deafness depends very much upon an enlargement of the throat and an enlargement of the glands of the ear, a condition which might be very much modified by medical treatment?—I think it is very important that the British Government should collect correct statistics relating to causes of deafness. The teachers, the principals, and the parents of the children are incompetent to decide as to the causes of deafness. The most ridiculous causes are sometimes assigned. The true causes of the deafness in particular cases in my opinion can only be arrived at by some competent system of medical supervision. Some competent medical authorities should examine the children and give a report upon the causes of deafness from a medical point of view. The results of medical treatment of diseases of the ear in America do not seem to be very encouraging.

21,802. Have you arrived at anything like a conclusion as to what is the most frequent cause of deafness among children?—The most frequent cause of congenital deafness is hereditary predisposition, as is shown by the fact that more than 54 per cent. of those who are returned as congenitally deaf have other members of their families deaf and dumb. That is the most frequent cause amongst the congenitally deaf.

Mr. A. G. Bell.

22 June 1888.

21,803. What has caused the deafness in the parents of those congenitally deaf and dumb? Is syphilis a cause?—I do not find syphilis to be a cause in any large number of cases. I have examined very carefully the history of a family in which deafness has gone down through five successive generations. I had competent medical assistants to assist me in the examination. I made a special study of that family, and I specially inquired as to syphilis, because members of the family in the lower generations had fallen very much in social status, and it might be supposed that syphilitic symptoms might have had something to do with it, but I found from the doctors who had attended upon those deaf and dumb persons that in some cases an amputation had been performed—an amputation of a finger, for instance—and the person recovered perfectly from the operation; the wound healed in a way it would not have done had there been syphilis in the family. Then I have not observed Hutchinson's notched teeth in the family. I do not think syphilis is the cause of congenital deafness to any very great extent; it does cause it in some cases, undoubtedly.

21,804. In those cases it would be in the secondary or tertiary form?—I do not know. This chart shows the pedigree of the family I have referred to—the Lovejoy family, of Maine. The black dots indicate those who are deaf mutes. In the Sydney branch of the family deaf mutes have appeared for five successive generations, and this chart gives a complete account of all the descendants, deaf and hearing, so far as known, of the first deaf mute.

21,805. To go to another subject, has there been any great trial in America of the pure oral system; that is to say, a system in which signs and the manual alphabet are rigidly excluded?—That system was introduced into America about the year 1867. The schools on that system are increasing in number. I am sorry that the Commission have not had testimony before them from some one who is a pure oralist. As I have explained to the Commission, I cannot undertake to present the views of the advocates of any particular system.

21,806. Taking the education of the deaf and dumb as 100, have you any idea what would be the per-centage of the purely orally taught children as far as you know, would it be a third, or a fourth, or a fifth?—In the pamphlet "Facts and Opinions relating to the Deaf" (Part V., pages 176–181) you have the materials from which you can determine that for yourselves. I have not added up the figures because the records are imperfect; some of the institutions have not made full returns. You will see that in those statistics of articulation teaching I have discriminated between those pupils to whom articulation was taught as a means of instruction and those to whom articulation was taught but not used as a means of instruction. In 1883 a similar letter of inquiry was addressed to the principals of American institutions by Miss Rogers, who was the principal of the Clarke Institution and the result showed that at that time out of 6,232 cases 886, or 14 per cent., were under oral instruction, while 1,105, or 18 per cent., were taught articulation as an accomplishment, and 4,241, or 68 per cent., received no instruction whatever in speech. From the tables presented to you you can get the same facts for 1888. Then there is this fact in addition. Among those who are not taught articulation are a number of cases who have been dropped from articulation classes as not being suitable subjects for such instruction. I have attempted to separate those from the others, and you can get at the result for yourselves.

21,807. (*Rev. Mr. Sleight.*) Upon the question of statistics upon which you dwelt a great deal, at what period did the American census begin to take any

Mr. A. G. Bell.

22 June 1888.

note of deaf mutes?—I think the census of 1830 was the first that took note of them.

21,808. Then the earlier records of the congenitally deaf are not reliable?—Not at all reliable. I do not think any census is reliable except the 1880 census.

21,809. You said that a number of idiots were deaf mutes, what means have you of ascertaining that absolute idiots are deaf mutes?—You can find out whether an idiot can hear or not by his taking notice of sound. If an idiot is deaf he is, of course, set down as a deaf mute idiot, the deafness carrying the muteness with it; but I hope and believe that the census relating to idiotic deaf mutes is incorrect, because an ordinary observer, I think, could hardly be competent to decide upon the mental condition of deaf mutes. I know of some deaf mutes who were thought to be idiots, but who turned out to be perfectly bright and intelligent. While, of course, we have to accept the figures of the census, and while we must admit that the proportion of idiots among deaf mutes is abnormally large, yet I hardly think we can trust to the judgment of the census-taker and assume that all that are reported as idiots are idiots. In any British census I would recommend that the British Government should take care to formulate some system by which the statements of the census-takers should be checked and verified by competent observers. A great deal has been done in the United States census to eliminate errors in that respect by correspondence with physicians in the neighbourhood and by getting opinions from them.

21,810. At what age is a child capable of receiving auricular instruction?—We do not know yet at what age, the whole subject is too new and there are very great difficulties in the way of ascertaining how far a very little child can hear and so many of them pretend to hear who do not.

21,811. Sound having once reached a child's mind do you not consider that that child is more capable of being orally taught than a congenitally deaf mute?—Certainly. If the voice can reach the child through the ear I think we have got something instinctive to work on; we have the instinctive feeling in the child to help us. A child whose ancestors for generations back have made use of the vocal organs in expressing thought, must have acquired some hereditary aptitude for that means of expression, a child whose ancestors for generations have received ideas through the medium of the ear, must in my opinion if it has any hearing, however slight, have some hereditary aptitude for receiving language through that means. Of course I may be entirely wrong in that idea, but it is one that I give to the Commission for what it is worth.

21,812. Are not there many who consider the sign language the mother tongue of the congenitally deaf?—There are very many who do so consider it, mistakenly as I conceive. I have discussed that question very fully in public with my friend Dr. Edward Gallaudet. We always seem to be opposed to one another upon that particular question and when I give a lecture upon that subject I invite him to come and oppose me, and I publish the results of the discussion on both sides, and I have great pleasure in presenting the Commission with the result of our last friendly contest on the matter, which is contained in this pamphlet (*handing it in*). This discussion with Dr. Gallaudet is printed in the annals for January 1884, Vol. XXIX., pp. 32–69, under the title "Fallacies Concerning the Deaf." In the same volume, pp. 312 to 325, will be found my discussion with Dr. Philip G. Gillett, in Chicago, concerning "Deaf Classes in the Public Schools."

21,813. Language is what we want to give to deaf mutes, but given that a child can only be five years at school (the average is not five years in our own schools) by which system could you best impart a knowledge of language to a congenitally deaf mute?—By the system, whichever it is, by which you could bring the greatest repetition of English words to the senses of the child; and in that connexion I may allude to what I consider to be an important suggestion that I brought before the recent Convention of Principals held in Jackson, Mississippi, just before I came away from America, which was very favourably received by the principals, upon that very point. The method I would advocate for teaching a congenitally deaf mute would be that method by which you could produce the greatest number of repetitions of words to the eye, distinctly and clearly, in a given time. The difficulty in presenting English words to the eye of a deaf child is the difficulty in the speed of writing, or in the speed of spelling with the hand, you cannot write more than about 30 words a minute; with the manual alphabet it is possible to approximate to 100 words, but very few teachers can do it. 80 words would be the outside, with an average expert teacher. Now I suggest that you should have recourse to a method by which you can get a greater speed. Before speaking of this method let me call your attention to the rate at which words are presented to the ears of hearing children. The average rate of speech to a child, using the simple words which children employ, would be about 200 a minute. A stenographer would say 150 words a minute was a very good rate of speech, but that is for language in which long words are of frequent occurrence. Nurses and mothers gabble at a tremendous rate to little children, and from experiments I have made in reading children's books aloud and counting the number of words I found that 200 words a minute is not a fast rate at which we present words to the ear of a hearing child. Now make a calculation and see what would be the number of words presented to the ear of a hearing child before he acquires our language. Suppose that all the talking that goes on in the presence of hearing children in the course of the day were to be concentrated into one long continuous gabble, and suppose we put that at three hours, the number of words that that child would have presented to his ears in the course of those three hours at 200 words a minute would be 36,000 (and as the whole vocabulary that we use with a child hardly exceeds 300 words, this means a very great repetition). We do that 365 days in the year; we do not stop on Sundays; and we do it continuously for two years before the child turns round and speaks to us. Now, what we want to get at is, how can we present English words as rapidly and clearly to the eyes of a deaf child as we do to the ears of a hearing child. If we can do it with the same rate of rapidity we know perfectly well that he will learn the English language as easily as the hearing child, the difficulty is how to do it, I suggested at the recent conference a mode by which I think that result can be arrived at. I have been testing the rate at which we can take in words by the eye, though the rate at which we write is only 30 words a minute at the outside the rate at which we read words once they are written is over 350 words a minute. The first time that the importance of this fact struck me was when I noticed the enormous amount of reading that is done by what are termed semi-mute pupils, and the little amount of reading that goes on among the congenitally deaf. I thought I would test the speed of that reading. I gave a deaf friend an interesting novel (she did not know the object I had), a novel which I knew would fascinate her. I made note of the time when she commenced to read. She read it through at one sitting, and when she finished it I noted the time; then I took the book and estimated the number of words in the book and found that, on an average, she had read nearly 400 words a minute; *she had read more words in an hour and a half than a hearing child hears in the course of a day.* I say there is great hope for the deaf in giving them a knowledge of language by putting books before them and accustoming them to form the habit of reading. There is a great attempt made in our institutions to adopt what is termed the natural method of teaching, but they fail in one particular, they do not realise this, that in the natural process of learning a language comprehension of the language precedes expression of

ideas in that language. A child understands a language before he uses it, whereas the attempt is made in our schools for the deaf to make a child use the language before he understands it; for instance, in the sign institutions the process would generally be to tell a story in signs and make the pupils express the ideas in the English language before they know the English language. Very rarely do you find the converse; where they give the story in English words and get the pupils to express the meaning in signs. I would advocate as a very important thing the cultivation of the habit of reading. I would make it a regular part of our school exercise that interesting stories should be put before the children, and that they should read them whether they understand them or not. Teachers say, Why put books before deaf children and require them to read that which they do not understand? But a deaf child never can learn language till he has seen it any more than a hearing child can learn it till he has heard it, he must hear it without understanding it at first; he comes to understand it by hearing it, and a deaf child will come to understand it by seeing it. I may say that I made an experiment upon myself which has a very important bearing upon this whole subject. I obtained a Spanish book on the education of deaf mutes. I did not know anything of the Spanish language, and I determined to try how far I could understand this book by forcing myself to read it. I read about 20 or 30 pages of it, and I found I could make very little of it; the Latin roots helped me a little, and I understood a few technical terms, but that was all. I refused a dictionary altogether; a dictionary stops the current of thought; I read about 30 pages of it, and then I stopped. Now a number of words had occurred so often that they impressed themselves upon my memory; a number of other words had occurred pretty frequently, but not often enough to impress themselves on my memory; those which had occurred so frequently as to make me remember them without explaining themselves by the context I hunted up in the dictionary. Then I read a few more pages, and I found that those words, the meaning of which I had obtained from the dictionary, formed the key for the next 30 pages, and the meaning of many sentences, which otherwise would have been obscure, became apparent. New words explained themselves by the context, and after I had turned over 30 or 40 more pages I turned to the dictionary again and found the meaning of some more words that I could remember. Having done so, I turned back and read the book a second time, and a very great portion of the meaning of that book revealed itself to me, and I felt convinced that if I wanted to learn the Spanish language I had nothing to do but to read and to read and I would learn it. The application to deaf mutes at once flashed across me. It is a most unfortunate thing that our deaf mutes do not read books; that is to say, our congenitally deaf mutes,—our semi-mutes do read,—and I think that half the credit that teachers get for the knowledge of language possessed by those who are termed semi-mutes is not due to the teaching at all, but is due to the books they read. I am strengthened in that view by what I have observed in the case of deaf friends. There are many expressions they use that are never used by persons with whom they come in contact; exceptional forms of speech common in society novels, but not usually employed in conversation. I have come to the conclusion that novels and plays that are usually banished from the libraries of our deaf and dumb institutions, might prove a great means of giving language to the deaf and dumb, especially those society novels in which you have conversations in questions and answers. Ordinary books like books of history, Stanley's Travels, and so on, do not give the language of the people, it is book language; but novels and plays are the books that will facilitate the acquisition of language and stimulate the pupil to read. If you make a deaf child perforce every day, as a regular school exercise, read over, not a few paragraphs of a book, but hundreds of pages, he will gradually learn language; he gets the repetition of words to the eye that the hearing child gets to the ear. I strongly recommend this plan of introducing reading as a part of the school exercise, the reading of interesting stories that hearing children love to read, introducing it as a school exercise without any explanation of the meaning, getting them to read, whether they understand what they read or not. I would recommend that some reward should be given to a child for this process of reading a book that he does not understand; that is to say, after reading an interesting story I would recommend acting it out. I would act it out in natural pantomime with him, or I would show him a picture—pictures are as tangible as signs. I would not show him the picture till after he had read in the book what was represented by the picture. Then let us trace what goes on in his mind. He obtains the idea that this language which he is reading expresses a pantomime or expresses a picture, and all the time he is reading his mind is being exercised and he is wondering what sort of pantomime it is going to be, or what sort of picture it is going to be. That is the sort of mental exercise that the child needs. If his idea was incorrect the pantomime or the picture would correct it, and if, on the other hand, the pantomime or the picture corresponded with the imaginary picture he formed in his mind, he would be doubly delighted. That, I think, is a process which should be followed in all schools for the deaf. It is the reverse of the process usually adopted. For example, in our sign schools a story will be told in signs, and pupils who know little or nothing of the English language are asked to go through the drudgery of writing it out in words. This makes of the English language a school task. Even in schools which do not use the sign language, "action writing" is resorted to before the pupils are able to read. For example, a teacher may take a book from a boy, open it, place a slip of paper in it as a mark, close it, and lay the book upon her desk. She then asks her class to express in writing what she has done. This kind of exercise is known as "action writing," and it is used in nearly every school. It is an admirable exercise in composition for older pupils, but out of place with pupils who cannot understandingly read an ordinary book. It reverses the process of nature, which demands that a child shall understand a language before he uses it. A hearing child has constant repetition of words to his ear for two years before you expect him to express himself in words. A deaf child should have constant repetition of words to his eye before you call upon him for any very great exercises in English composition. I would, therefore, have a child read books in order to learn the language, instead of studying the language in order to read books.

Mr. A. G. Bell.

22 June 1888.

21,814. I know that in sign schools the children are generally taught columns and columns of nouns and adjectives to commit to memory?—That is just as useless as if you got them to learn the whole of Webster's Unabridged Dictionary. It is not words that a deaf and dumb child wants, it is how to use them. Phrases and varied forms of sentences are what he needs. Sentence forms that remain constant though the constituent words may be infinitely varied. Mere names are of little value until he has occasion to use them. The vocabulary that serves the varied wants of a hearing child rarely exceeds 300 words. Why, then, burden the memory of the deaf child with multitudinous words for which he has no need?

21,815. (*Mr. Johnson.*) You say you would give the child an interesting story to read; before you did that would you give the child any preliminary teaching of any sort?—What I did recently in the case of a little child four years of age whose father I was visiting was this: The child did not know a thing, I took up a book containing the story of the "Three Bears," and I made the child put the forefinger of her right hand on the line of words and travel along the line of words with that hand, while I took her left hand in mine and spelt the words upon that left hand (using Dalgarno's Touch-alphabet)

Mr. A. G. Bell.

22 June 1888.

as the child put her finger upon each printed word. My object was to be sure that the little girl had her eye fixed upon the proper word, I spelt it upon her hand, and I put emphasis and expression to it, then after a little while I took the child down and we had a little pantomime. I was the bear and the child had the idea that that was expressed some how or other by those printed words. Every time I went to the house that child brought a book and wanted me to read to her. She had obtained the idea that the words in the book expressed a pantomine. She would, by herself, take up the book from which I had read, and, looking at the words, recall the pantomime she had seen. She would point to the words, and try to explain to her deaf brother the pantomime that had been employed.

21,816. (*Rev. Mr. Sleight.*) The first word the child learnt was the word "bear"?—I do not think she learnt that either. I did not attempt any methodical instruction with the child, it was only to show the parents how I would deal with the child. The child is under methodical instruction now. I only say that is the way I would have commenced the education of the child, and carried it on if it had been in my power to do it. What I did in that case was simply to test whether a child who had not any knowledge of language or letters would get the idea that the pantomime was expressed in the book by the printed letters, and that child had that idea. Telephone matters have occupied my attention very much during the last year especially, so that I have not been able to devote much time to following up my experiments in that direction.

21,817. Did that child express her first ideas in natural signs?—In natural pantomime, helped out by crude conventional signs it had devised for itself. A congenitally deaf child always at first uses signs to express ideas for which it lacks words.

21,818. With regard to the children admitted into the infant school of which you have spoken, do the teachers begin by teaching those children articulation, or do they use signs?—I know from the lady who is the general superintendent that they will commence on the pure oral system, believing that the vocal organs of a deaf child should be exercised when very young, and believing that the power of imitation in a deaf child is very much greater in infancy than when advanced in life. The idea is that if you commence at as young an age as practicable with a deaf child on the pure oral method he will learn to read from the mouth and to speak better than if you commence later. That is the idea on which that school is carried on.

21,819. Do you think it a good system to debar these infants from the use of signs?—They do not debar them from the use of signs, they debar them from the use of conventional signs or sign language; they do not debar them from natural pantomime. Sign teachers quibble a great deal about the word "signs." There is no objection in any method of instruction to the use of natural signs so long as they do not supersede language. Oral teachers object to the use of "sign language"; then the sign teachers turn round and say that the oral teachers object to the use of "signs"; they do not, they use natural signs in every school. It is impossible to reach the mind of a child without the use of natural signs. Hearing children use natural signs in the same way—the only objection is to this conventional *language* of signs. The advocates of sign language muddle the minds of people who have not studied the question by confusing the subject of sign language with the more general subject of signs. I have read a little of what the German teachers have said on the subject of signs. They do not object to natural signs, and there is no such thing as a school in existence where natural signs are not employed, natural signs being understood to mean the signs that ordinary people employ.

21,820. (*Mr. Johnson.*) They give up natural signs when the pupils are sufficiently advanced in oral teaching?—I do not think so. I do not think anyone ever gives up natural signs; but they do not use natural signs in place of words. They are used simply to illustrate and render more interesting the word as you might smile pleasantly when saying something pleasant to a child, or as you might point to the door when you told him to go to the door. Sign teachers have ridiculed the oral method very unjustly, and they have said when an oral teacher says to a child go to the door, he at the same time points to the door, and they say that is a sign. Of course that is a sign; but that is not sign language. That is a thing done to illustrate the meaning of the English expression that the teacher had used to the child, just as is done in the case of a hearing child. We are always using natural signs. Life would be uninteresting without them. Some sign teachers seem to have the idea that a proper teacher of the oral system is a person who will tie his hands behind his back rather than use a gesture of any sort.

21,821. (*Rev. Mr. Sleight.*) Is not it a rule in oral schools that there must be no signing?—They use the word in the sense of conventional signs; they do not mean to prohibit the use of natural signs. I would recommend this Commission to endeavour to get at what is meant by some of the words used by the advocates of different methods. Half the controversy between teachers would be gone if we had distinct definitions.

21,822. Could you explain to me what is the difference in these American schools between a combined, a manual, and an oral school?—I would have to refer you to the principals of those schools. I see No. 24, Le Couteulx, St. Mary's Institution, in Buffalo, is "manual, oral, and combined."

21,823. What does that mean?—It simply means that the sign language is used; that is what is meant by the word "combined," and it is a very hopeful sign that the sign teachers seem a little disinclined to state definitely that they use the sign language; they come before the public as using an eclectic system, but they do not follow it, so I translate this "manual, oral, and combined" as meaning that it is manual, oral, and sign language.

21,824. (*Mr. Van-Oven.*) How do you read No. 30, the Nebraska Institute, "combined and aural"?—That is sign language and auricular; they have a special auricular department there.

21,825. How do you read No. 32, St. Joseph's Institute at Fordham, "combined and oral"?—I look upon that as sign language and oral; they have an oral department there. Of course you may combine other languages in your curriculum of studies just as you may teach French and German to your English-speaking children. Though you teach hearing children French or German they are English all the time; they think in English, and the other language is a subject of study. Now in schools where they claim to have the combined method, as a general rule they have sign language as the language of communication with the mind, and the pupils study written language and spoken language, as our hearing children study French and German in the public schools, and with similar results; the sign language is their language when they come out of school, and the other is a foreign tongue. It is very difficult to combine in the mind of a child two languages, so that he shall think equally well in both; as a general rule he thinks only in one, and the other will be a foreign language to him. In these combined schools the pupils think in the sign language, and the English language both in its written and in its spoken form is a foreign tongue to them. In the manual schools it is the written language that is the language of thought, thought being probably accompanied by motions of the fingers, and they dream on their fingers when they are asleep.

21,825*a*. (*Rev. Mr. Sleight.*) And if they are wandering in time of sickness they will wander on the hand?—Yes. Now the pupils taught on the oral method think in motions of the mouth, and there is a very important metaphysical question involved as

to what goes on in the mind of a child when it is denied articulation, even of a crude kind. I think in the majority of our institutions children are wilfully deprived of the power of articulation by neglecting to give them the chance to learn speech.

21,826. Not wilfully deprived in the sense of doing them a wrong?—They are wilfully deprived in the sense of not giving them a chance to learn. There is an unfortunate opposition between advocates of the oral method and the advocates of the sign method, and articulation in those schools which are not pure oral schools is not put on the level of geography, or history, or arithmetic, and the pupils are not taught how to use their vocal organs, because of the prejudice against the oral system. I am not a pure oralist, but I advocate that every deaf child should be taught articulation, whatever may be the method of instruction employed. It is my opinion that in the lower stages of instruction of the congenital deaf it would be better to adopt the plan I have spoken of; but in the higher stages I would have the speech-reading method, for all that would succeed with it. If there were any that did not succeed I would continue the manual alphabet plan, not the sign language plan, for the way by which a person acquires language is by the repetition of words, so that the duller a child is the more necessary is that repetition, and the more harmful is the sign language. A dull child needs to have a greater repetition of words than a brighter child. If a child has no speech, it is a curious problem what goes on in his mind. I do not mean to settle it, but he does not think exactly as we do. I remember in the case of that little child that I experimented with before the telephone took my attention from the subject. I came down stairs one day and found him sitting at the bottom of the stairs, and his fingers were moving; he was thinking to himself upon his hands, and I read his thoughts. He was sitting with one boot on and the other off, and he was spelling to himself, "Grandmamma says I must not go out to the stable."

21,827. (*Mr. Johnson.*) Has any evidence been obtained in the case of any educated deaf and dumb person to show what was the previous condition of mind of that person before he was educated?—The late Dr. H. L. Peet attempted to solve that question, and there is printed in one of the earlier numbers of the Annals (Vol. VIII., p. 1) a very interesting paper by him upon "The Notions of the Deaf and Dumb before Instruction." Rebian's theory (Annals, Vol. VIII., p. 105) is, "that the deaf and dumb do "not think either in signs or words, but only in "images and ideas." My feeling is that they must think in pictures. A succession of pictures probably passes before the mind. I am not sure that we do not all think in pictures, but our pictures come labelled with language attached to them.

21,828. But often in ordinary dreaming a conversation goes on; there can be no conversation in the dreams of the deaf and dumb when they have no knowledge of language?—Excepting pantomimic conversations.

21,829. (*Rev. Mr. Sleight.*) Referring to this school for infants which you have spoken of, is not that beginning the institution system much earlier in the child's life than the institutions at present do?—Yes.

12,830. One of your strong points is that you object to children being taken from their mothers; but in that school for infants they are doing so?—I do not say that I advocate that system. I was simply directing attention to the fact that it is the first infant school in America; I consider it a great misfortune to take children away from a good home; but in cases where children have not good homes, and in cases where no attempts are made to instruct them at home, it is a problem what is best to be done. I do not think such a school as that is the best kind of infant school. I would rather have a kindergarten where the children could live at home. I was only directing attention to the manner in which this school came into existence without intending to express any opinion, favourable or otherwise, to the plan itself. But I certainly think that a child should be brought under instruction in language in infancy.

Mr. A. G. Bell.

22 June 1888.

21,831. You would approve of institutions for children whose homes are not what homes should be?—I do not approve of institutions at all, except so far as they are absolutely necessary. I consider them as evils to be avoided as much as possible. I do not approve of taking a child out of the condition in which nature has placed him. I would not take a child away from its home unless it was absolutely necessary. It would be better to find another home for a child in a hearing family than to place it in an institution.

21,832. Have you ever tested the amount of knowledge of written language possessed by pupils in the American institutions on the combined system?—I have.

21,833. What have you found?—Of course, the experience of any one man cannot be taken as a gauge of the whole of the pupils under instruction in all the schools, but I have found as a general rule with little pupils who have been under instruction less than two years, that it is difficult to carry on any sort of conversation in writing without the use of signs or some pantomime. I am alluding only to little pupils. I do not examine the elder pupils much when I make visits to any of these institutions. I try to get hold of the congenitally deaf. I do not care much about the semi-mutes; their method of education is settled, namely, pure oral. Those that I am more interested in are those who are congenitally deaf, and those who were deaf before the age when speech was acquired, so that when I go into a school I ask for those children who are congenitally deaf, or who have not had any knowledge of language, and who have been there less than two years. A child should learn a language in two years, and, as a general rule, in the combined schools I have visited I find that I cannot carry on a conversation in writing with children who have been under instruction less than two years. In the Rochester school I was able to do this.

21,834. You would never put a deaf mute on the same footing as a hearing child, a hearing child would always have the advantage?—A deaf child has an advantage over a hearing child in this respect, that he is shut up with books, and he ought to be ahead of a hearing child in mental attainments, it is only the difficulty of teaching them the language. The semi-mutes, that is, those who are deaf from late childhood, are often equal, if not superior in intelligence to hearing children of their age, and that results from their being forced into the companionship of books, so that they rise higher and higher mentally, but the congenitally deaf as a class do not read books, and they lose ground mentally after leaving school, that is not because they are congenitally deaf, it is because they do not know language, and cannot therefore read with profit and enjoyment.

21,835. Do you consider it possible that the higher education of the deaf could be carried on wholly by lip reading, could a lecture ever be delivered to the deaf by the lip?—If the classes were small it could, in large numbers it could not.

21,836. Without having recourse to the manual alphabet?—Undoubtedly. I do not mean to say that you could deliver a lecture to a large number in the hope of its being understood by all the class, but if you had a dozen intelligent young men who were earnest in their studies, and who had acquired the power of reading from the mouth, they would follow the lecture, and if any one of the dozen did not understand a point here and there he could ask for an explanation. I do not see any impossibility in it where you have a small number in the class.

21,837. (*Mr. Johnson.*) It would require acute eyesight, would it not?—No; my impression is that the congenitally deaf as a class have better eyesight than the non-congenitally deaf, but they do not come up to those who are termed semi-mutes in the power of reading from the mouth. The difficulty is the language difficulty. It is a mental problem that the

Mr. A. G. Bell.
22 June 1888.

pupil has to solve not merely a visual problem. He sees merely a portion of speech and has to make out the rest by his knowledge of language; he sees enough to fill up what he loses by the context, just as if I gave you a piece of printed matter and left out a word here and there, or mutilated a word; if you had a good knowledge of language you would read it all perfectly clearly. It is not a question of eyesight, it is not even a question of intelligence, it is a question of knowledge and familiarity with the English language. All those who have familiarity with the English language have the key to speech reading, those who have not have not.

21,838. Do you not think that amongst the deaf and dumb there are a great number of persons who have feeble sight?—It is not a general characteristic, but the proportion is greater than in the normal population.

21,839. (*Rev. Mr. Sleight.*) Are you aware that Dr. Ed. Gallaudet, the President of the College says, "We know it would be useless to attempt to give "lectures *vivâ voce* even to those who read well by the "lips"?—My answer to that is it is difficult to believe that he could ever have attempted it.

21,840. To what age do you keep your pupils in the American Institutions?—Very many are kept up to the commencement of adult life, but some do not enter till the commencement of adult life.

21,841. Do the orally taught inter-marry as much as those who are taught by the combined method or by the manual method?—There are too few cases of marriage among the orally taught as yet for us to base reliable conclusions on, but, judging from the few cases that have occurred, I should say that a larger proportion of the orally taught marry hearing persons than of those taught on what is called the combined method. I would here refer to a practice which promotes inter-marriage in our institutions; it is a common habit in many of our institutions to call together periodically the former pupils of the institutions; the boys and girls of former years meet together as men and women to have a nice time in honour of their *alma mater*. The Clarke Institution in Northampton was the first to adopt the plan of having no periodical reunions of this kind, and there have been no inter-marriages of pupils of that institution. All the pupils have either married hearing persons or have married deaf mutes belonging to other institutions.

21,842. Have you known any cases of pupils who have received auricular instruction being drafted off into the elementary schools?—Yes, the auricular teachers lament that process very greatly, they say they lose their best pupils. The principal of the institution in Arkansas says that this auricular work is very discouraging work because when visitors come to see his school and he shows what he has been doing to develop the hearing of the pupils, and they find the pupils hearing what the teacher says to them they say, That is not a deaf mute at all, and they turn away and take no further interest in the work. In Nebraska pupils have left and gone into ordinary schools for the hearing and carried on their education there.

21,843. (*Chairman.*) I will just ask you a question or two bearing upon what you have said to-day. You spoke of the advisability of giving technical instruction, not of a distinctive, but of a general character in schools for the deaf; that plan has not been adopted in England for the reason that the teachers think it undesirable to diminish the short time that many pupils have for the study of language; at what age do you think that pupils might fairly begin to receive such general technical instruction?—I do not know that my opinion is entitled to any weight upon that subject, but I should think that a year before their graduation would be sufficient.

21,844. It has been suggested that if technical schools were started for the general population, pupils who have been educated in deaf and dumb institutions and who have received there a certain amount of technical education might after the age of 16 or so enter those technical schools to finish the technical education which they had begun in their special schools, do you think that would be a desirable thing?—I think it would be a very desirable thing. I see no reason why a deaf person could not attend one of those technical schools just as well as a hearing person.

21,845. Who appoints the principals of these deaf and dumb institutions in the United States?—I think they are appointed by the governors of the States.*

21,846. They are political appointments?—I think so. In one or two cases those political appointments have given very great dissatisfaction. I must say I condemn that system.

21,847. Then I will ask you a question on another point; would you be in favour of the appointment of a certain number of deaf mutes on the governing body of the institutions for the deaf and dumb?—I think it might, perhaps, be advantageous to have a minority representation of such persons, not a majority representation. I have not given that question much thought. The feeling in America is against it, I think.

* The governor appoints trustees, and the trustees appoint the principal. The principal appoints the teachers and employés.

Adjourned to Tuesday next at 11 o'clock.

SIXTY-EIGHTH DAY.

6, Old Palace Yard, S.W.

Tuesday, 26th June 1888.

PRESENT:

THE RIGHT HON. THE LORD EGERTON OF TATTON IN THE CHAIR.

The RIGHT HON. SIR LYON PLAYFAIR, K.C.B., M.P.	EDMUND C. JOHNSON, ESQ.
SIR TINDAL ROBERTSON, M.P.	The REV. W. BLOMEFIELD SLEIGHT, M.A.
B. ST. JOHN ACKERS, ESQ.	The REV. CHARLES MANSFIELD OWEN, M.A.
F. J. CAMPBELL, ESQ., LL.D.	L. VAN OVEN, ESQ.
	CHARLES E. D. BLACK, ESQ., *Secretary*.

Mr. ALEXANDER GRAHAM BELL further examined.

Mr. A. G. Bell.
26 June 1888.

21,848. (*Chairman.*) Before asking you any questions with regard to visible speech, have you anything further to add with regard to intermarriage of deaf mutes?—I have some tabulated statements relating to the intermarriage of deaf mutes (*see Q.* 21,522). I have here a table showing an analysis of 757 cases of intermarriage between deaf mutes (*handing in the following Table*).

Mr. A. G. Bell.
26 June 1888.

MARRIAGE OF DEAF MUTES.

Analysis of 757 cases.

		Females.				
		Deaf Mutes.				
		Cause of Deafness.				
		Congenital.	Non-congenital.	Not stated.	Hearing persons.	Total Males.
Males. Deaf Mutes. Cause of Deafness.	Congenital	86	93	48	13	240
	Non-congenital.	108	115	53	26	302
	Not stated	27	35	121	10	193
	Hearing persons	8	6	8	—	22
Total Females		229	249	230	49	757

Of 757 males, 22 were hearing persons, and 735 were deaf mutes.

Of 757 females, 49 were hearing persons, and 708 were deaf mutes.

Hence of 1,514 persons, 71 were hearing persons, and 1,443 were deaf mutes.

The general result that that table shows is, that of the 1,514 persons who intermarried in those 757 cases, 1,443 were deaf mutes, and 71 were hearing persons, and of the 1,443 deaf mutes, 71 or 5 per cent. married hearing persons, and 1,372 or 95 per cent. married among themselves.

Then there is another point which I did not touch on on Friday, which is very important on the question of heredity. We have hitherto had absolutely no statistics relating to the proportion of the congenitally deaf who marry partners who are themselves congenitally deaf. I have here a table (*handing it in*) showing an analysis of 402 cases of intermarriage of deaf mutes out of the 757 cases in the table I have just handed in.

INTERMARRIAGE OF DEAF MUTES.

Analysis of 402 cases.

		Females.		Total Males.
		Congenital.	Non-congenital.	
Males.	Congenital	86	93	179
	Non-Congenital	108	115	223
Total Females		194	208	402

Of 179 congenital deaf males, 86 married congenitally deaf, and 93 non-congenitally deaf females.

Of 194 congenitally deaf females, 86 married congenitally deaf, and 108 non-congenitally deaf males.

Hence of 373 congenitally deaf persons, 172, or 46·11 per cent. married congenitally deaf persons and 201, or 53·89 per cent. married non-congenitally deaf persons.

Of 223 non-congenitally deaf males, 108 married congenitally deaf, and 115 married non-congenitally deaf females. Of 208 non-congenitally deaf females, 93 married congenitally deaf, and 115 married non-congenitally deaf males. Hence of 431 non-congenitally deaf persons 201 or 46·64 per cent. married congenitally deaf persons, and 230 or 53·36 per cent. married non-congenitally deaf persons.

I would also present the Commission with an analysis of the 607 cases of deaf children of deaf mute parents referred to in Queries 21,530 and 21,531.

The witness handed in the following table.

DEAF-MUTE CHILDREN OF DEAF-MUTE PARENTS.

Analysis of 607 Cases.

Sex.		Cause of deafness.	
Males	271	Congenital	328
Females	275	Non-congenital	40
Not stated	61	Not stated	239
	607		607

Of 368 deaf-mute children of deaf-mute parents, 328 or 89·1 per cent. were congenitally deaf, and 40 or 10·9 per cent. were non-congenitally deaf.

Period of Birth.	Father deaf, Mother unknown.	Mother deaf, Father unknown.	Both Parents deaf.	Total.
1800-9	3	—	—	3
1810-9	1	2	—	3
1820-9	6	6	1	13
1830-9	14	11	11	36
1840-9	23	14	20	57
1850-9	31	30	41	102
1860-9	32	35	61	128
1870-9	21	37	120	178
Ascertained	131	135	254	520
Not ascertained	35	8	44	87
Total	166	143	298	607

21,849. (*Dr. Campbell.*) Before admitting a deaf mute child into an institution in America, are specialists employed to diagnose the causes of the deafness, or is the statement of any practitioner practising in the locality taken?—Neither the one nor the other, the institutions simply take what the parents say.

21,850. (*Chairman.*) Then how do you ascertain that out of those 607 cases, 328 were congenitally deaf?—From the census and from the records of the institutions.

21,851. Founded upon the statements of the deaf children?—Yes.

21,852. The parents would be able to say pretty accurately whether the children were congenitally deaf, unless they were cases which were from infantine diseases?—Yes, the statement of the parents is all you have to guide you.

21,853. Practically the congenitally deaf cases in your table would be cases where the child had never been known to speak?—Yes, cases reported in the census as congenitally deaf, or cases in which the parents had stated that the child had been born deaf, whatever that means.

21,854. (*Chairman.*) You say you are not able to ascertain whether those children were actually born deaf or whether their deafness was owing to some infantine disease?—No.

21,855. There is that element of uncertainty about the statistics?—Yes. That the majority of those who are reported to be congenitally deaf were congenitally deaf I think will appear from the fact that 54 per cent. of them have other members of the family deaf and dumb. That is strong evidence that we must not reject entirely the classification of congenital

Mr. A. G. Bell

26 June 1888.

deafness and non-congenital deafness. When you come to analyse these cases according to the reported causes of deafness you find that of 368 deaf-mute children of deaf-mute parents 328, or 89·1 per cent. were congenitally deaf, and 40, or 10·9 per cent. were non-congenitally deaf, which is enormously different from the proportion of those two classes in the deaf-mute population as a whole, and in the lower part of the table you will see the period of birth given. I have arranged these cases by their period of birth. You will observe that before the decade 1820–9 there is no case in which both the parents were deaf. In those cases where I say "Father deaf" it may be that the mother was deaf also; and in those cases where I say "Mother deaf" it may be that the father was deaf also, but in nearly all the cases born in the first three decades, I have ascertained that only one parent was deaf.

21,856. The records I suppose are very imperfect before 1820?—These cases are all taken from the census of 1880 or from the cases mentioned in my memoir upon "The Formation of a Deaf Variety of the Human Race."

21,857. When was the first census taken in America?—In 1790, but there was no record of deaf mutes in that census. The first census in which deaf mutes were taken note of was 1830. I was enabled to investigate in detail the history of deaf mute cases by the discovery of an immense mass of genealogical information in Washington. The original sheets of paper containing the names of all the persons in the United States from which the census returns were made had not been destroyed. I found them piled away in a dark vault in the basement of the Patent Office, and the Secretary of the Interior had them bound and arranged so as form a special Library which contains many thousands of volumes, and there one can hunt back deaf mute families from one census to the other without any trouble. It is sometimes difficult in examining the ancestry of deaf mutes to get your starting point; you cannot get information concerning the families themselves directly at first. From these census returns you can work the family back as far as 1830, and the heads of the families back to the census of 1790. In the New England States we have such a mass of genealogical material printed in the shape of town histories and separate genealogies, that in many cases the census returns give us information that can be continued in detail backwards through genealogical publications. It is chiefly in this way that I have collected my material relating to the ancestry of the deaf of the New England States.

21,858. Perhaps as we are on the question of heredity you will explain any of the most typical genealogies which you have hung upon the wall?—I have already directed attention to the fact that in the island of Martha's Vineyard, a map of which I have here, there is a township called Chilmark, a very isolated place containing a total population of only about 500. In 1880 there were 20 deaf mutes in this township, which is a proportion of one to 25 of the population. In examining the history of the appearance of deafness in that township, I found there had been deaf mutes in that part of the island for 200 years. I found from records that two deaf mutes were born somewhere about the year 1680, and that deaf mutes had appeared at different times ever since then, and the appearance of deafness is confined to that particular part of the island. The geological character of that part of the island is different from the rest of the island. The surface is undulating and hilly, whereas the rest of the island is flat. It has a subsoil of very curious variegated clays that crop out, in the form of a bold headland that is so beautifully coloured by these clays as to have acquired the name of Gay Head. Whether that has anything to do with the deafness I do not know, but it is a very curious fact that it is in that part of the island alone where the deafness occurs although the bulk of the population lies outside. I have a list of no less than 72 deaf mutes who have either been born in this place or whose ancestors have come from the place. I have traced the ancestry of those deaf mutes in every branch, and I found a great deal of intermarrying and a great many consanguineous marriages in the ancestry. So my theory of the origin of the deafness here is that a deaf-mute stock was very early introduced into the island, and that the defect had been perpetuated among the descendants by consanguineous marriages. I have here a manuscript volume which I will submit to the inspection of the Commission, showing all the lines of ancestry of those deaf mutes. In determining the important strains of blood in those deaf mutes, it seemed to me that one ought to look for focal points in the ancestry, to find out how many of those deaf mutes had common ancestors, and to find out in that way the important blood in the deaf mutes. I have examined every surname that appears in their ancestry, and they group themselves into three important strains of blood. (1.) One is the Tilton blood. All these black dots which you see here are deaf mutes, and they run up to the same ancestor, but on account of consanguineous marriages the same deaf mute may trace up by more than one line to an ancestor. There are 32 deaf mutes that trace up to Samuel Tilton out of the 72, so there are 40 which do not. That is the first strain of blood.

21,859. Are members of these families still living now?—Yes. (2.) Then comes the Mayhew blood. This chart shows the deaf mute descendants of Governor Mayhew, the Governor of the island. The island originally belonged to the Indians; then a charter was given to Thomas Mayhew who became the first Governor of the island; his son became a missionary to the Indians and people were brought over to cultivate the soil. So we had three very strongly differentiated classes of people on the island. First, the Indians; second, the common working people who came over to cultivate the land for Governor Mayhew; and third, the few families who constituted the aristocracy, that was Governor Mayhew's family, the Skiff family, and one or two others. The aristocratic families for a number of generations married among themselves.

21,860. Is there any evidence that any of Governor Mayhew's family married Indians?—No, I think it is pretty certain that there is no Indian blood in the descendants. Governor Mayhew's grandson had a manorial estate in the Island; he was Lord of the manor. Martha's Vineyard being one of the few places where a manorial estate was set up. Of the total number of deaf mutes I find that 41 trace up to Governor Mayhew and 31 do not, out of the 72. (3.) Now on this large chart we have the third important blood—the one that I think to be the really important blood—viz., the Skiff blood. This shows the descent of the Martha's Vineyard deaf mutes from James Skiff, and I find that 63 deaf mutes trace up to James Skiff, and only nine do not; those nine are cases in which I have very little information concerning the ancestry, and they might possibly turn out to trace up to James Skiff, but at all events 63 of the 72 do trace up to him.

21,861. When did James Skiff live?—In the 17th century. Now the important lesson to be learnt I think from such a diagram as that is that there may be handed down from generation to generation what you may term latent deafness. There can be no manner of doubt that these ancestors were not deaf mutes, that there has been something handed down that has come out as deaf mutism in the children. The proof to my mind that the skiff blood is the important blood is that groups of deaf mutes who have never been near Martha's Vineyard trace up to that Skiff blood; that is the important point.

21,862. Those were not born on the island?—No; there is an important group here.

21,863. (*Dr. Campbell.*) Those 72 are in the island, are not they?—No, the 72 are not all in the island; but in all those cases ancestors came from the island. This group (the Newcomb group) is not in the island. This woman had children who could all hear and speak; she had grandchildren who could all hear and speak, and of her great grandchildren 19 were deaf mutes.

21,864. There was an introduction of fresh blood in the case of the parents of the grandchildren?—Yes, fresh blood was introduced. Yet there are 19 deaf mutes among her great grandchildren.

21,865. Is that the same blood as the 63?—Yes.

21,866. Do any of those 19 intermarry with any of the 31 or the 41?—No.

21,867. (*Chairman.*) Are there present representatives of that branch?—Yes, some of them are dead. This is the Newcomb family of Sandwich, Massachussetts, in which there are seven children deaf and dumb, they are now old men. In these charts I have shown the ancestry of the deaf mutes; it would be impossible to include the hearing members on such a scale as this, so I have only shown the connections of the deaf mutes themselves. In this lower chart which shows the genealogy of the Lovejoy family I have given you all the hearing members as well as the deaf members. If there are any differences between the large diagram and the lower diagram, the lower one is the more reliable; and if the Commission would desire I should be very glad to present this diagram to them, and to write a brief account of the family to accompany the diagram without troubling you with any description of it at the present time. If you look at the large diagram* you will see that in the Sidney Branch deafness has been handed down in this Lovejoy family through five generations, we actually have five successive generations of deaf mutes, and these down here are quite young children. Then as I mentioned the other day we have the defect of hereditary blindness in the same family as a collateral defect. I could give you full details of that if desired. I have not included those cases here, because this simply refers to deaf mutes.

21,868. Will you kindly explain to the Commission the principles upon which visible speech is founded, and the reasons which led you to the adoption of it as a means of teaching the deaf and dumb?—Visible speech is the name of a phonetic alphabet devised by my father (Prof. A. Melville Bell) a number of years ago. It differs from all other phonetic alphabets in this respect, that the elementary characters do not represent sounds. When you examine the shapes of the letters of any other alphabet you will find that the little curves and straight lines of which the letters are composed have no significance, but in the visible speech alphabet, the curves and straight lines of which the characters are composed, denote the vocal organs that are used in uttering sounds, and they are built together into a compound form or character just as the parts of the mouth are put together in forming the sounds. The alphabet was devised as a universal alphabet for scientific purposes with no thought of the deaf and dumb, but my father suggested its use in this connexion in the inaugural edition of his work, entitled "Visible Speech: The Science of Universal Alphabitics" (1864). The appearance of this work marked the commencement of a new era in the science of phonetics comparable to the era that was inaugurated in chemistry by the adoption of chemical symbols. Before the adoption of chemical symbols, chemists were in the habit of giving a distinct name to every different substance on the face of the earth, and chemistry was burdened by the very multitude of names that had to be learned. The moment it was determined to abandon this method, and give to the elements of which substances are composed distinct symbols, simplicity at once resulted. Supposing you did not know what water was; if you had its symbol, H_2O, you would know that it was composed of two parts of hydrogen, and one of oxygen, and all you had to do was to put the substances together, and you would produce the substance water. Now in a similar manner, before the appearance of my father's work, philologists and linguists, and men of science, sought to give to every sound a distinct character, and when it was sought to put in one alphabet the sounds of all languages, it was found that this was impracticable; it was found that the sounds that could be produced by the vocal organs were practically infinite in number. Now, my father, like those who devised the system of symbols in chemistry, set to work to symbolise elements. However many sounds it may be possible to produce with the vocal organs, they are all produced by the adjustment of a very small number of organs. We have only one tongue, and only two lips, and he thought if he could represent the organs themselves by symbols, he would represent sound in a much more accurate way than could be done by simply giving an arbitrary character for every sound. So if you were to take one of his symbols, and analyse it, it would mean, "Put your tongue in this position," or "put your lips in this position," or "make a certain attempt to expel breath," and such and such a sound will be the result; just as in the case of chemical symbols, we take the elements and produce the compound. Thus, my father has been able to form a universal alphabet that is capable of expressing in a scientific manner, the sounds of any, and all languages. There are only 10 characters in my father's alphabet, but those can be compounded to make compound characters to an indefinite extent. This is a diagram by means of which we teach the system to the deaf (*exhibiting it*). This alphabet was produced in 1864 as a method of writing all sounds, all languages in one alphabet, and in the experiments my father made, it was shown that the actual pronunciation of words in foreign languages could be deduced from the symbols. I was one of the young men who assisted my father in demonstrating his system, and one day, during my absence from the room, a distinguished Hindustani scholar pronounced to my father some words in Hindustani containing some very curious sounds. Instead of relying on his ear, my father studied the mouth of this gentleman, and he saw that in uttering the words, the tongue was in a particular position, and the lips were in a particular position, and the positions of the tongue and the mouth in forming the particular sounds were registered by my father by certain of these symbols. By-and-bye I was called into the room, and I examined these mysterious symbols, and I obtained from them a direction, "Put your tongue in this position, and your lips in this position." I did so, and to my surprise the gentleman clapped his hands and said, "That is splendid." I did not know what it was, it was a Hindustani word, and he said he had laboured with students for years to get them to pronounce that sound, and he could not do it, and here I had pronounced it without having heard it. Now, looking to the fact that deaf mutes do not speak, simply because they have never heard language, it at once dawned upon my father, that this was a means by which they could deduce a language unknown to them, the English language, without having heard it. That was the origin of the application to the deaf.

Mr. A. G. Bell.

26 June 1888.

21,869. (*Mr. Johnson.*) Are there any symbols for the action of any other organs besides the tongue and the lips?—Yes, the vocal chords and the soft palate.

21,870. (*Chairman.*) A knowledge of these symbols implies a thorough knowledge of the action of all the vocal organs?—Yes.

21,871. And for that reason the acquisition of such knowledge would be of very great use to teachers of the dumb?—Undoubtedly. If you examine the answers to the queries that have been handed in from the various institutions you will find that whatever difference of opinion there may be as to the use of the symbols with pupils, there is no difference of opinion as to the great value of a knowledge of this method of symbolising speech to teachers. Many say it is essential to a teacher to get a knowledge of the

* *See* diagram and explanatory note of the Lovejoy family in Appendix 33.

Mr. A. G. Bell.

25 June 1888.

mechanism of speech, which he gets by the study of speech expressed symbolically in this way. I wish to make it clear to you that my idea is that some such system as this (and I know of nothing to take its place) is essential in teaching the congenitally deaf. We can get intelligible speech from the congenitally deaf without any such system, but we can get perfect speech with such a tool as this in the hands of a trained teacher, it will not do anything itself, it wants a specially skilled teacher, but with a specially skilled teacher it is possible to give perfect speech to the congenitally deaf, without it you can get intelligible speech, but I do not think you will get much more.

21,872. (*Dr. Campbell.*) When you used the words "perfect speech," did you mean natural speech, or distinct speech?—As perfect as our own.

21,873. That which would sound natural to us?—Yes, perfect enunciation I would say. These characters are the elementary characters of visible speech, and you will see that they are the outlines of the organs that they represent, hence the name "Visible Speech." This is the character that means lip, and it is the outline of the lip; this is the character that means the point of the tongue; this is the character that means the top part of the tongue, and this is the outline that means the back part of the tongue. This is an outline of what scientifically is the soft palate, but in teaching deaf mutes we call it the nose, as the effect of depressing the soft palate is to direct the breath through the nose. This is a narrow chink between the vocal chords; that means that the vocal chords are placed parallel to one another with a very fine line between them; that is the vocalising condition of the glottis. Then when we present these symbols to a deaf child this would mean back part of the tongue; this would mean top part of the tongue; this would mean point of the tongue; this would mean the lip; this would mean the nose; that would mean expulsion of air. Now there are two other characters here which do not mean organs; they mean passages. This indicates a narrow passage through which air may pass. In this case the passage is stopped up at one end and the air cannot get out. Now these may be built into compound characters or letters *ad infinitum*. You see a few of them here. (*Dr. Bell then described the compound characters, and showed how a person using his vocal organs in the way indicated by the symbols, could enunciate not only words in the English language, but words in other languages difficult of pronunciation by an English speaking person.*) I have endeavoured to give you the underlying idea in this mode of teaching visible speech, and those who desire to read further upon the subject will find an article of mine in the American Annals of the Deaf and Dumb for January 1872 (Vol. XVII. pp. 1–21), describing the mode of teaching the deaf and dumb by this system.

21,874. You think it very advisable that all teachers of the deaf should make themselves acquainted with this system as an aid in their work of teaching the deaf?—I think so undoubtedly.

21,875. I see in answer to your query whether visible speech has been employed in the institution, the Principal of the Illinois Institution says, "Used "to a very limited extent. It is of advantage to "teachers, as it enables them to comprehend "physiological facts involved in speech; but for "pupils while it is thus helpful it requires an amount "of time and labour to acquire that can be better "improved with the use of diacritical marks"?—Those are the dictionary marks.

21,876. Do you agree with that?—Not at all.

21,877. You think it is adapted for pupils as well for teachers?—I think when we come to teach speech to deaf children it is absolutely essential that we should present books and writing to them in a phonetic form; they must see the pronunciation of words as others hear. It is not enough to teach pronunciation of the words used by means of diacritical marks. The ordinary spelling does not show the pronunciation.

21,878. Except in a language like Italian?—Except in a language like Italian; but written English is unphonetical; the spelling does not represent the pronunciation, and the pupil cannot see the pronunciation distinctly from the mouth: he sees enough to enable him to understand what is said when he is familiar with the language, but he does not get at the details of pronunciation. To those who are taught pronunciation by diacritical marks and who do not see the word phonetically written, the idea of pronunciation becomes vague, and to that fact I attribute what we very commonly find in all oral schools, that the pronunciation of the older pupils is more defective than the pronunciation of the younger ones: they have forgotten the pronunciation.

21,879. (*Sir Lyon Playfair.*) Teaching them in the way you propose would, I presume, increase their general intelligence and so enable them to get on quicker?—I do not know that: I think that teaching them the ordinary written language of the people would develop their minds and make them intelligent and able to read books, but I think it is necessary to use a phonetic alphabet to develop their pronunciation. For this purpose I do not know that one form of alphabet has any special advantage over others—any form of alphabet will do—but what is necessary is that they should be accustomed to read books in which the words are spelt as they are pronounced; that is for their mouths, apart from their minds. If you are to get good speakers, especially among the congenitally deaf, they must see the pronunciation; it must not be taught simply as a school exercise; the words that are spoken by the mouth must come clearly differentiated to the eye again and again until the eye becomes familiar with them. Now I have found that the speech in our oral schools is somewhat defective, and I have tried to find out the cause of that defect. For example, Mrs. Bell's speech is very defective.

21,880. I do not think I should so characterise it; I have spoken for 20 minutes with her without knowing that she was deaf?—Mrs. Bell lost her hearing at 4½ years of age. I consider that her speech is very defective, not because she cannot pronounce the elementary sounds of language, she knows them all, but because her idea of pronunciation is vague: she relies more on the recollection of childhood. The moment she is asked to write phonetically what she thinks the pronunciation should be the trouble is revealed. She does not know how the words should be pronounced. When a word is written phonetically she says, "Is the word pronounced that way? I did not know it before," or, "I had forgotten that." Speech-reading had not recalled the precise pronunciation.

21,881. (*Mr. Johnson.*) Does she usually write phonetically?—No; her speech is partially the result of recollection of early childhood, partially the result of the instruction of her mother, and partly the result of instruction in oral schools in Germany, for when she became deaf there was no school in the whole of America where a child who had become deaf at 4½ years of age could be taught speech, and she was sent to Germany, where she was taught to speak German; and I am told by German scholars that she pronounces that language better than English. Her deafness had one good effect—it led to the establishment of the Clarke Institution in Northampton, for her father, the Honourable Gardner G. Hubbard, stung by the fact that there was no school in the United States where his daughter's speech could be preserved and improved, determined that there should be such a school, and, shoulder to shoulder with Dr. Howe and Mr. F. B. Sanborn, Mr. Hubbard fought the American Asylum in the legislature of Massachussetts for years, and at last there was established the Clarke Institution. That was the first, or one of the first, oral schools established in our country, and Mr. Hubbard was for a number of years

the president of it; and here I may say that I hope you may be able to examine some one on the oral side in America. I am generally looked on by teachers of the sign system as an oralist, but I think I have shown you that I am not a pure oralist, and I would suggest that the Commission should examine an advocate of the pure oral system as taught in some of the institutions in America. I would direct your attention to the fact that you have two gentlemen on this side of the Atlantic who could give you much information concerning the deaf of America. Mr. Hubbard (a pure oralist) is in France; and Rev. Thomas Gallaudet (an advocate of the sign method) is in England. Dr. Thomas Gallaudet is a brother of President Gallaudet, who testified before the Royal Commission last year. He is the head of the Church Mission to adult deaf mutes, and could undoubtedly give you much information concerning the adult deaf mutes of America.

21,882. (*Chairman.*) I see in the answer from the Maryland School this statement: "Visible speech has "not been employed directly in the instruction of "pupils. They have not been taught to read and "write its forms. Our principal teacher of articula-"tion was taught visible speech and used it for a "year at Northampton. Her knowledge of the "organs of speech and their use obtained by this "study I consider of great value. Visible speech "has not been used because in my judgment the "learning of the symbols by pupils lengthens rather "than shortens the process of instruction"?—I have said that I consider that a phonetic representation of speech is absolutely necessary, but it does not follow that it should be visible speech (although I think it advisable)—any phonetic alphabet will serve the purpose, and I would call attention to the fact that you have in this country a library of works printed in phonetic type, in the Pitman and Ellis type (a supply of which I think of taking home as reading matter for the pupils in the oral schools). Now, in regard to visible speech, it fulfils a function that no other alphabet can do, in teaching the pronunciation of speech, and there I differ entirely with the principals who have dissented from that view. There is no alphabet that we have on the face of the earth that will do what this will.

21,883. When would you teach this symbolical alphabet? Would you teach it, in the case of the deaf, at the very commencement of their education?—At the very commencement; I would teach it with the ordinary symbols of writing. My idea of teaching the deaf and dumb is to carry on their general education by ordinary writing in the outset, and at the same time you should train their mouths by the use of visible speech.

21,884. I see the Principal of the New Jersey School says, "Not used in the instruction of pupils. "I have used the system as a guide for my teachers "in their study of the production of sound by the "human organs of speech. My reason for not "extending its use to my pupils is, that while I "think it an aid to the forming of a correct habit "of vocalisation, I have observed in pupils trained on "this system a difficulty in passing from the use of "symbols to that of alphabetic characters." You say the two ought go on side by side?—Yes.

21,885. Do you think children of ordinary intelligence who were being instructed by competent teachers could learn two modes of speech side by side?—There would be no trouble about it.

21,886. Are there any cases that you actually know of where that has been tried?—Yes.

21,887. And where it has been successful?—Yes. A number of institutions have abandoned the use of symbols for the little pupils, retaining it only for the teachers. The invention of the telephone took my personal attention away from the work, and there has been therefore no one in America to push the system and supply teachers: the best teachers, who are chiefly ladies, leave the work.

Mr. A. G. Bell.

26 June 1888.

21,888. Have they gone to telephone work?—No, they marry and leave the profession. I think the difficulty is the lack of trained teachers, for this system is only a tool, it will not do anything by itself; it is a powerful instrument in the hands of trained teachers. I will give you my idea how I would teach speech to a congenital deaf child. I go with the oral teachers in this:—I would teach every child to speak; I would teach every child to read from the mouth, but I differ from oral teachers in the means I would take, and I think the object would be best attained by the plan I propose. I would propose to keep to the natural method of learning to speak as closely as possible. What do we do in the case of hearing children? In the first place we present sounds to the ears of hearing children; they do not at first imitate them at all, not for two years, but they perceive them, and they also instinctively produce sounds themselves: for example, they cry and laugh. The ear becomes a means of comparison between the sounds the child makes himself and the sounds that other people make. By and by as his organs and faculties improve he is struck by the resemblance between some of the sounds he makes and some of the sounds other people make, and then commences the process of imitation: the child consciously attempts to imitate sounds. Does he imitate them correctly? No, very far from it. The speech of a hearing child is imperfect, he imitates crudely, but his ear tells him how far off from the correct sound his own is, and by constant practice he approximates more and more closely to the correct enunciation. The natural process may be compared to the process by which we learn to shoot. You aim at the bull's eye, but do not hit it; at least, at the first attempt. You observe the point struck by your bullet, and its distance from the centre, and the next shot probably goes on the other side. Now you strike too high, now too low, now too much to the right, and now again to the left. Your eye tells you at a glance how far off from the bull's eye your shot has struck, and you get a practical direction that guides you in your next attempt. By constant practice your approximations become more exact, and finally you become a good marksman. Now you will observe that it is not enough that you should see the bull's eye; it is not enough that you should know you have missed. That knowledge alone would never lead to perfect shooting. You must know *where you struck*. You must see the relation of the point struck to the bull's eye. That is the knowledge that determines your progress. So in learning to speak, it is not enough that the deaf pupil should observe the teacher's mouth; it is not enough that he should know he failed to imitate correctly. He must know what he did when *he failed*. It is just here that visible speech is of assistance. The teacher presents the symbol for the English sound, and then the symbol for the incorrect position. The pupil sees at a glance the relation of one to the other, and obtains a practical direction that guides him in his next attempt. "Why! My tongue was too far forward, or too high, or too low, or too far back," &c. At the next effort he fails again, but whatever he may do he produces a sound of some kind, and whatever it may be, whether a cough! or a sneeze! or a Hottentot click! it can be written in visible speech. That is: The position of the vocal organs can be symbollically expressed, so as to show the relation of the position to that which he intended to assume. That is the kind of knowledge that is essential to progress in speech. Without it we can get rude approximations, but not perfect speech. I do not know of any other means of imparting this knowledge excepting visible speech. But visible speech is only the tool: it will do nothing by itself. It is only of such value for this purpose in the hands of a trained teacher. I would refer the Commission to another paper of mine upon this subject, which was read before the Eighth Convention of American Instructors of the deaf in Belleville, Ontario, 1874. *See* Proceedings of that Convention published in 1876 by the Belleville Institution, pp. 103–109.

Mr. A. G. Bell.

26 June 1888.

21,889. As you say, this is a system for the teaching of which you require thoroughly qualified teachers. Speaking from your own knowledge, do you know how long it would take any teacher to become so thoroughly imbued with the system as to be able to teach it to others?—You have persons in this country who could teach it to others, but there is at present hardly any one in America who could do so except myself and my father; that is the reason why it has not progressed as it otherwise would no doubt have done.

21,890. How many persons are there in this country who could teach it to others?—A large number.

21,891. Have they learned it entirely from your books?—From my father's books.

21,892. (*Mr. Johnson.*) Are they connected with institutions?—No. Mr. Sweet is one, Dr. Murray another, and Mr. Ellis another.

21,893. (*Chairman.*) I am not speaking of scientists. Do you know a single person engaged in practical teaching either in this country or in America, who has sufficiently mastered this system of visible speech to be able to communicate it to others?—I think Miss Hull, of Bexley, in Kent, and Mr. Kinsey,* Principal of the Training College at Ealing, have a good knowledge of the basis of the system, but not a sufficient knowledge of it to use it in the way I have described. There are certain persons, and you find them here and there, who have a wonderful faculty for imitating sound and analysing the mechanism of speech; a person who has not that faculty cannot be taught to use the system in the way described. Anyone may learn in a few days to use the system so as to represent English sounds; but it requires very special abilities to analyse and present to the pupil in symbolical form *the incorrect* sounds that deaf children make. It is the latter process that I consider to be essential in the instruction of the deaf.

21,894. Would not that rather lead to the conclusion that it is a system which it would be difficult to introduce into general use in this country?—I admit that it does require very special abilities, and the question is how to get teachers with those special abilities.

21,895. You say this system has been used a certain number of years in America, and the teachers of schools have taken it up more or less; but you say owing to the absence of your personal supervision to press the thing on it has not progressed very much? I find a large number carrying it on.

21,896. But it has gradually been discontinued?—In some Institutions. In quite a number of others it is still used, although it is 12 years since I left the work.

21,897. Would not it be very difficult to introduce in this country an entirely new system without some such preceding influence as your own would be in America, supposing you had time to take up the question again?—My opinion is this: if the British Government will make the acquisition of speech by deaf children a matter of attention, and if they will afford pecuniary aid to teachers in proportion to results obtained, then they will have teachers adopting the best methods, whatever they are. If speech were taught to all the deaf, a great many articulation teachers would be employed, and out of those articulation teachers some would appear who were specially competent, and who might be capable of teaching the deaf and dumb in the way described. The first thing is to create a demand for articulation teachers; that demand would lead to a supply, and then a demand would be created for improved methods of teaching.

21,898. Supposing it were possible to get a certain number of teachers to teach speech by means of visible speech, the class of teachers who would take it up and master it would have to be more highly paid; how would that greater expense be met; would you propose that the Government should give a larger amount of grant to teachers who taught on that system, or who taught speech in the best way?—I would propose that the Government should give a larger amount to those teachers who produced the best results. I would not have the Government say, You shall teach by this or that system. I would have all systems free, but I would have the Government throw the different systems into competition with one another. I would create by artificial means a struggle for existence, and then the survival of the fittest would do the rest.

21,899. (*Dr. Campbell.*) Supposing you found a dozen persons who really had the necessary aptitude for acquiring a knowledge of this system, and for teaching the deaf and dumb by it, how long would it take you to teach them?—A very short time if they had natural abilities: never if they had not. If they had not natural abilities they might be able to use the system, but they would not be able to use it in the way that I think right, that is to depict the strange sounds that deaf children make when you are teaching them. In respect to this matter of teachers, I would say it is not only of importance to the deaf, but of importance to the hearing that the mechanism of speech should be studied by teachers; it should be a subject of study in your normal schools: in all your public schools you have children with defective speech, and in the vast majority of such cases the defects are associated with perfect vocal organs—there are very few cases in which defects of speech arise from malformations of the organs. Now if you were to include in the curriculum of your normal schools all over the country the study of the mechanism of speech then articulation teachers could be selected from among the most competent to go into this special work of teaching the deaf by this method; and not only would the deaf benefit, but the hearing would benefit; many of these little defects that arise could very readily be corrected by the teacher.

21,900. (*Mr. Johnson.*) Is the mechanism of speech studied in all your normal schools in America?—No. I am urging upon the Government of America that attention should be devoted to the study of the mechanism of speech in the schools, because we have a large foreign population in Wisconsin, Illinois, and other States; and if we want to preserve the purity of the English tongue in America, we must teach speech to the pupils in the public schools, and that means that we must teach the mechanism of speech to teachers. If we do that there will be no difficulty in getting trained teachers of articulation for the deaf.

21,901. (*Dr. Campbell.*) Have you ever tried to teach singing by means of visible speech?—No; but there is no doubt that the quality of the voice can be very much benefited, for the quality of the voice depends in a very minor degree upon the vocal chords; it depends more upon the positions of organs further forward than the vocal chords. My attention was directed to the applicability of this system in this direction by endeavouring to correct the disagreeable tone of voice of some deaf children in the American Asylum at Hartford. Some pupils when they first try to speak make sounds more like the cry of a peacock than anything else, and in such cases the teacher would often suppose that the disease which caused deafness had also affected the vocal chords, and that such pupils should be dropped from articulation work. I ventured to express the opinion that the quality of the voice very little depends up on the throat, but more depends on the position of organs further forward than the throat; and I took a number of these cases and endeavoured to deal with them, and I discovered that there were certain parts of the mouth that had not hitherto been included among the vocal organs, viz., the posterior pillars of the soft palate, that have a power of approximation towards one another in the pharynx, and the more closely they approximate the more disagreeable is the character of the voice. I took these same pupils and gave them a looking-glass apiece, and taught them to depress the tongue and to control these muscles so that

* Since deceased.

Mr. A. G. Bell.

26 June 1888.

they could approximate the posterior pillars of the soft palate or separate them at will. Their voices became more natural and pleasant in quality the moment the pharyngeal cavity was expanded.

21,902. (*Mr. Johnson.*) Altering the arch of the palate?—Yes. The more the pharynx is contracted the more disagreeable is the quality of the voice, and the more it is expanded the more agreeable is the voice, and we converted those voices into agreeable voices. That same principle applied to singers would improve the quality of the voice.

21,903. (*Chairman.*) As we know, the voices of the deaf and dumb are generally harsh, do not you think that that harshness could be avoided if instruction in speech were given them very early in life?—That is my opinion.

21,904. The voice when it once gets set cannot be improved I presume?—I think it can.

21,905. Even in mature years?—Yes.

21,906. By proper teaching?—Yes, but we want properly qualified teachers.

21,907. You think it of the utmost importance in teaching speech to the deaf, that the teacher should be thoroughly acquainted with the physiology of the throat and other vocal organs?—Yes, it is the blind leading the blind without that knowledge, and it is the absence of that knowledge on the part of the teacher that is the cause of the bad speech we get from our pupils. If you ask these teachers of articulation what they do with their mouths in uttering sounds they do not know; the instruction to the pupil is, look at my mouth when I am uttering sounds and find out what I do, the teacher himself knowing very little of the physiology of the vocal organs which are brought into play in uttering those sounds, and yet with all that ignorance on the part of the teachers it is the case that they succeed in giving intelligible speech; speech may be very imperfect and yet intelligible. If we encourage the teaching of speech, if we create a demand for teaching articulation, then will come the supply and then will come the improvements in the methods.

21,908. (*Mr. Johnson.*) Do you find much tonsilar defect among deaf and dumb children?—Not so much as I should have anticipated; there are some cases of enlarged tonsils. From my observation I do not think the proportion of children in institutions who have enlarged tonsils is larger than in the community at large.

21,909. (*Chairman.*) Have you anything further to say with regard to visible speech?—I would like to supplement what I have said about visible speech by a few remarks on my father's system of "line writing." I would have the Commission realise the fact that speaking and reading speech by the eye are two different arts; in either one of which a pupil may excel while he may not excel in the other. My own individual opinion is that all deaf children can be taught to speak, but that there is a difficulty in teaching them to read speech, especially in the case of the congenital deaf. That has led to a new departure in the art of teaching articulation which I would like to explain to you.

21,910. You mean with the view of facilitating speech reading?—Yes, and with the view of facilitating articulation teaching also. I have found that there is a difficulty in the use of visible speech in a school-room on account of the slowness with which you make the characters. My father in bringing forward his system gave us several different forms, one was a printed form, another was a current handwriting form, and the other was a stenographic form for shorthand reporting in all languages. If you were to take ordinary print and to do all your writing with capital letters there would be a great loss of time, and that is what is done with visible speech in the institutions. They use the capital letters of the printed font exclusively. The writing is so slow that I wonder so many institution still use the system. To my mind that continued use is conclusive evidence of the great value of the system. An attempt has been made to employ the stenographic alphabet of visible speech; and my father has specially adapted it for the use of the deaf under the name of "Line writing." I present to the members of the Commission a pamphlet by my father describing his system of "Line writing" (*handing it in*). I may say that the little experimental school which I carried on at Washington for a couple of years was specially established to test the applicability of this line writing to the teaching of the deaf. The stenographic characters of visible speech have been taken and slightly modified so as to form distinct characters and to make them still more distinct they are written separately instead of being united together as in shorthand. The result is that the word makes a very compact picture to the eye of a deaf child. If you take any English word composed of the ordinary letter and compare the number of lines of which the word picture is composed in the English print, with the number of lines of which it is composed in the line writing you will see at once that the line writing picture is simpler and more definite to the eye than the word picture and in my little school the pupils were taught one half the day by the line writing and the other half of the day by the ordinary letters in the same subjects. I wanted to have a phonetic writing that we could use rapidly and speedily. This is capable of being written much faster than ordinary writing, but not so fast as ordinary shorthand, and I found that these little congenital deaf children always learnt the line writing form before the Roman letter form, though they had an equal opportunity of learning each. This line writing is phonetic and identical with visible speech. It is the shorthand form of visible speech. In visible speech print the vowels are brought out more prominently to the eye than the consonants. In line writing it is the reverse, it is the consonants that stand out prominently to the eye and the vowels that are subordinate; the little ticks are the vowels and the more prominent characters all consonants. Now there is a great advantage in this. In speech-reading it is the consonants which are ambiguous to the eye, the vowels are all more or less clearly differentiated to the eye, so that a child finds a difficulty in arriving at a perception of the distinction between the different consonants, the eye being directed too prominently to the vowels. Speech is perfectly intelligible without any definite vowels; you can easily supply the vowels by context. I will read a passage to you without any definite vowels, and I think I shall make myself perfectly intelligible. [*Dr. Bell read a passage leaving out the vowels.*] Speech depends for its intelligibility upon the consonants; the vowels are liable to great variations in the mouths of individual speakers. Thus it is that pupils understand very readily the pronunciation of their teachers and friends, whereas they experience difficulty in understanding strangers. This is largely due to too great reliance upon vowels. These are clear to the eye, but they vary in the mouths of different speakers. Now we get in "line writing" a comparatively clear picture of what the pupil sees in the mouth of a speaker. In reading this line writing the pupil goes through a useful mental exercise, for in the same way as the consonants are ambiguous to the eye when the pupil reads from the mouth, they are to a certain extent ambiguous in line writing. In printed line writing they are perfectly clear, but in pencil writing you cannot distinguish very well between a thick line and a thin line, the thick line means voice and the thin line means no voice. The general slope of the characters shows the part of the mouth that is used, but the absence or presence of voice is indicated simply by the different thickness of the line. The absence or presence of voice the pupil cannot see in reading from the lips, he cannot see the distinction between P and B. So when a pupil writes this line writing in pencil you get a writing that presents to the eye the very same ambiguity that the mouth presents, and there is a mental exercise of exactly the same character as the mental exercise when you read from the mouth. The pupils learn to group words that have the same general outline, that is to say homophenous words, words having the same

Mr. A. G. Bell.

26 June 1888.

appearance to the eye when they are spoken. So this method of line writing has the advantage of giving the child what he sees in the mouth when he tries to understand a speaker; but it is on paper permanently he can study it out.

21,911. There is no difference between P and B, or T and D, or K and G, except the thickness of the line?—That is so. The difference between P and B or T and D is not distinguished to the eye of the speech reader when he comes to look at your mouth in uttering those sounds. P is the same to the eye of the speech reader as B; the only difference is the presence or absence of voice; in the "line writing" the only difference is in thickness of the line, and when a pupil writes in pencil it is difficult to distinguish between P and B or T and D.

21,912. You create a difficulty in "line writing" in order to make it more like the difficulty with which the pupil has to contend in reading speech from the lips?—Yes, and there is this advantage in the line writing over speech reading. When you speak by word of mouth the positions vary successively, and the pupil has to rely on his memory, in order to accumulate a sufficient number of words to enable him to decide by the context what the meaning of the sentence is; but in line writing he gets the sentence as a whole at once. So I hold that in the teaching of articulation the printed characters of visible speech are of great value, for there the differences of pronunciation are clearly differentiated to the eye; in the printed line-writing the pronunciation is also clear; but in the written line-writing (especially where pencil is used). we have a great advantage resulting from the fact that the ambiguities in the line writing correspond with those which exercise the mind of the student in reading from the mouth. It is training in speech reading. Another great advantage is that it can be much more rapidly written than ordinary writing.

21,913. (*Mr. St. John Ackers.*) When you use the expression "voice," you mean the vibration of the vocal chords?—Yes.

21,914. (*Sir Lyon Playfair.*) One of your recommendations, as I understand, is that in our normal schools the teachers should acquire a scientific, as well as a mere technical, knowledge of what they are doing?—Undoubtedly.

21,915. You think that knowledge would be a great value to him in his future occupation as a teacher?—That is my idea.

21,916. And you think also a better result would be attained in the case of the pupil if he was taught the science as well as the practice of speech?—Certainly. I may amplify that somewhat. A pupil who is taught the science of speech can acquire the pronunciation of a foreign tongue as perfectly as his own.

21,917. In our normal schools for teaching teachers the certificates are of different classes, and the amount paid to the teacher is determined by the knowledge which he possesses. Do you think it would be advisable that the Government should make articulation a specific subject, and induce not only ordinary teachers, but teachers for the deaf, to acquire a higher certificate and a higher payment by showing proficiency in that subject?—I think that would be a very important thing. I think that such certificates would be of enormous use in this country. A great number of people are preying upon the public—quacks, trying to cure defects of speech as if they were diseases instead of bad habits—certificated teachers of articulation would do an enormous good among the hearing as well as among the deaf, by taking hold of such cases and giving proper and suitable instruction how to use the vocal organs.

21,918. In large towns where special rooms could be provided in board schools in different parts of the town, do you think certificated teachers of articulation might be advantageously employed in the teaching of the deaf?—Undoubtedly. I think we should aim to get such little schools established, not simply in the large centres of population, but in small centres of population wherever a sufficient number of pupils could be brought together to warrant the appointment of a teacher. I would advocate pushing that system of classes in affiliation with public day schools as far as practicable into rural districts.

21,919. I gather from what you said in an earlier part of your evidence that you see considerable advantages in bringing the deaf and dumb in contact with hearing children in school life?—Yes, undoubtedly. I see advantages in that association, and that quite apart from other benefits which may arise from associations formed in school being continued.

21,920. (*Mr. Johnson.*) Are you acquainted with the three great institutions that profess to teach the oral system in London, Mr. Van Praagh's, Mr. Schöntheil, and the college at Ealing?—No, I am not conversant with them from personal knowledge; I have not visited them yet. I have devoted all my time in preparing my evidence for this Commission. I hope to visit those institutions before my return to America.

21,921. Do you think that it would be possible to graft your system on to the present system of oral teaching?—I think it could be grafted on to any system.

21,922. You could graft it on to what we call the combined, or on to the oral, or on to any of the existing methods which are used in England now?—Certainly. I think that teaching a child articulation need not be the same thing as teaching it *by* articulation. It is ridiculous that in our schools in America arithmetic, geography, and history should be preferred to articulation. Articulation should be a compulsory subject of study in all schools, whatever method of instruction was employed. As the pupils advanced, it could then be seen what number were best fitted to be taught on what you call the pure oral, but which I think, would be better called the speech reading mehod.

21,923. Then you think signs might be used together with your system in a sign school?—Undoubtedly; I do not advise that, but in my opinion the two would go on together.

21,924. You do not think the teaching by the one system would interfere with the teaching by the other?—No, they might run together as much as ordinary writing and signs go together now. I have already expressed my own opinion against using sign language, but this system could be combined with sign language.

21,925. I gather that it would take a very long time to teach your system to teachers, and it would take an equally long time for pupils to learn your system. Supposing a child to be educated entirely by your method, how long would it take to educate that child so as to perfect him fairly in your system?—Speaking from my own experience, for I am an expert in the use of the system, I have found in the case of the pupils I have had under instruction, that in two or three months I have such a control over the mouth that I can make the deaf pupil pronounce foreign sounds.

21,926. How long would it take to produce something like a useful result?—I should say at the outside one year. I would advocate that no child should be dropped from the articulation class who has not had one year's instruction. In that time you can certainly find out those who can be usefully taught and those that cannot.

21,927. Amongst the institutions in America is there a very large number that follow your plan?—Fifteen institutions. My attention has been taken away from this subject for no less than 12 years, and it really is this Commission that is bringing my mind back to it, so I am not familiar with what is being done now with my father's system in the institutions, except from the statistics I have collected. My impression had been that it had been very largely abandoned, but to my delight I find it is not. Twenty-four schools have failed to reply to my query about

Mr. A. G. Bell.

26 June 1888.

visible speech. Of the remaining 55, 32 have used visible speech and 23 have not. Of the 32 schools 15 continue to use it with their pupils; 9 make a limited use of it; 1 uses the line-writing form; and 7 have abandoned it altogether.

21,928. Do they use the phonetic system in developing the mouths of the pupils in any of those institutions?—Not that I am aware of.

21,929. You advocate that?—Yes, they simply use the symbols to teach the elementary sounds of the language, but they have no practice in reading from phonetic type: that I advocate. I do not insist that it should be visible speech specially (although I think that advisable); it may be any phonetic type so long as the language is printed as it is spoken.

21,930. Do you know whether Dr. Murray, or Mr. Sweet, or Miss Hull have practised this system in this country to any extent?—Dr. Murray has made it the basis of the phonetic notation in the Oxford dictionary, and Mr. Sweet has made it the basis of his studies in Icelandic; Mr. Ellis has also employed it as the basis of his method of noting early English pronunciation. In fact in England you have a number of scientific men who are thoroughly acquainted with the system in its scientific aspect, and I should strongly recommend if anything was done in this country in the way of applying it to the education of the deaf and dumb, that they should be got to take an interest in it; and I would say further that I think it would be very beneficial if some of your philologists could be interested in the work of teaching speech to the deaf. A great many philologists have new theories relating to the mechanism of sounds; those ideas they can test in a novel way by trying to teach those sounds to deaf children. A great deal of light would be obtained by them in that process. No doubt some of your philologists might be got to take an interest in the work of articulation teaching, and it would be a very great advantage if they could.

21,931. None of those people to whom you have referred have turned their attention to the education of deaf and dumb children on your father's system?—Except Miss Hull, and it was due to Miss Hull that the system was adopted for the deaf at all. She was the first practical teacher to see that it had any advantages for the deaf, and it was here in London that my interest was first aroused in the deaf by witnessing the effect of some instruction given by her to her pupils.

21,932. (*Rev. Mr. Sleight.*) In schools in which this system is now used, how have the teachers acquired their knowledge of it?—Some of them acquired their knowledge of it at the time when I had a Normal Training College in Boston. The telephone took my attention away from the subject, and I do not know where the later teachers acquired their knowledge. Professor Butterfield, of Boston, has trained some teachers.

21,933. What number of teachers would you have attending your school at that time?—If I remember rightly I had about 60 altogether. I do not know how many graduated. I gave certificates of competency and comparatively a small number graduated, but nearly all those 60 entered into the work.

21,934. And all found employment?—Nearly all found employment, and a large number of them are still at work in the various institutions in the country.

21,935. Would those teachers require higher salaries than ordinary teachers?—I think that those who obtained diplomas of competency did. In some of our oral schools while all the teachers are articulation teachers some one teacher is employed who is a specialist in the work, and then the difficult cases are handed over to her; when there is any special difficulty it is taken to the special teacher. In the Clarke Institution Miss Worcester is the special teacher of articulation. That is a good plan, I think, in a school.

21,936. I observe that in the answer from the Clarke institution it is stated that Miss Worcester's method was substituted for visible speech; can you explain what Miss Worcester's method is?—I am sorry I cannot very fully; I would refer the Commission to a paper by Miss Worcester, read at the last meeting of the Convention of Articulation Teachers. I wrote to Miss Worcester asking from her a full description of her method to present to the Commission, and Miss Yale, the Principal, informed me that Miss Worcester was very ill, and in fact that her life was despaired of, so that I am unable to give the latest details of her method. All I can do is to refer you to the report of the proceedings at the Convention of Articulation Teachers, and in that Miss Worcester gives her plan, and it seems that of late years Miss Worcester's method has been very largely introduced into other institutions.

21,937. (*Rev. Mr. Owen.*) You said that whilst you would not suggest that the Government should dictate the method, you would advise that they should so act as to create a struggle for existence among the systems in the country, will you explain that a little more fully?—I think the Governmental aid should be largely given in accordance with the results of instruction, and that the Government should leave the different schools free to adopt their own methods; and I think that the basis on which they should go should be the ability of the children to use the English language in its written form, for that is an end that all the methods have in view. I would recommend that payment should be made according to a certain scale, having regard to the results obtained in written English, due consideration being had to the natural condition of the pupil, that is to say the age at which the deafness occurred should be known, so that the teacher should not be paid for producing results that were due to natural causes, as in the case of knowledge of the English language possessed by those who became deaf at the age of five or six. The practical test is to find out how far they are able to communicate by writing with hearing persons unfamiliar with the deaf. And then in addition to that we should have as a higher branch articulation and speech reading. The common basis would be a knowledge of written language, and in the higher branch a knowledge of articulation and speech reading.

21,938. When you spoke of the struggle for existence, you would not suggest that a higher grant should be given for one method as compared with another?—No. I should suggest that the highest grant should be given for the best results, irrespective of methods and then teachers would strive to produce the best results.

21,939. (*Dr. Campbell.*) Has any modification of your father's system been tried at all as a means of giving musical instruction to the blind?—My father has proposed a modification of it for the instruction of the blind, but no one has appeared yet to make experiments with it in the case of the blind. My own attention was chiefly devoted to the deaf. My father has proposed a special form of visible speech consisting of raised letters for the blind that are specially legible to the sense of touch, his idea being that the blind want an alphabet that will render them independent of the seeing, and that therefore that alphabet should be phonetical. I showed this system of raised letters at the South Boston Blind Institution a number of years ago, but, as I have said, I have not directed my attention to that department of instruction.

21,940. In teaching singing to the blind, we find a great difficulty in getting out the natural voice, and I wish to know from you whether your system, which appears to be calculated to bring out all the inflexions of the voice in speaking, was capable of being used in the teaching of the blind so as to bring out the natural voice in singing?—It has not been used in the musical education of the blind, but I have no doubt it might be advantageously.

21,941. (*Mr. Johnson.*) Are you aware that a system of phonetic characters for the blind was

Mr. A. G. Bell.

26 June 1888.

adopted some years ago in England, and that it has been really virtually abandoned?—I am not aware of that fact.

21,942. Mr. Frere published a great number of books in phonetic characters, but those are not now in use?—My father holds that the blind very readily acquire the pronunciation of foreign languages, and that they would very readily read foreign books in raised letters if the spelling corresponded to the pronunciation. Thus English works in phonetical type might obtain a circulation in foreign countries which would be impossible if the ordinary unphonetical spelling were adopted, and the cost of production would be thereby diminished. So too French works in raised letters would be of use to our blind if spelled phonetically, whereas they would be practically illegible to the English-speaking blind if the ordinary French spelling were adopted. The raised letters of visible speech are eminently adapted for international use, as the sounds of all languages could be written by the same alphabet.

21,943. He would use a phonetic system to carry out that object?—Yes.

21,944. Have you any experience at all of the knowledge which blind people have of foreign languages, or the way in which they acquire that knowledge?—None whatever.

21,945. You are not aware of the fact that they learn a great deal by the ear?—No. I have not devoted my attention to that subject.

21,946. (*Mr. Van-Oven.*) From the limited extent to which this system of visible speech has been adopted in the schools in America, and from what I see of the system myself, I gather that it is rather difficult to acquire a knowledge of it, but do you consider that it is desirable that all teachers of the deaf should learn this system of visible speech, so as to be furnished with a means of correcting the speech of the children they are teaching?—I think that the knowledge of the mechanism of speech which is acquired in the study of visible speech is important for teachers, and I also think it is important for the children.

21,947. But supposing it was found that to teach the children by means of visible speech was troublesome, or it was considered by the managers of the school unadvisable, you think it exceedingly important that the teachers in the school should be acquainted with it?—That is my opinion.

21,948. Consequently you would recommend that under all circumstances a knowledge of this system of visible speech should be acquired by teachers of the deaf and dumb?—That is my opinion; but I do not wish to force my own opinion on anybody.

21,949. As a means of correcting the speech of deaf children you consider that a knowledge of this system is exceedingly desirable?—Yes.

21,950. (*Mr. St. John Ackers.*) You have already stated that in your opinion it is absolutely necessary that the teachers of the deaf should understand the mechanism of speech; do you consider that it is possible to acquire that knowledge equally well by any other method than that which you have been putting before us, for instance the German method by which teachers are instructed in the anatomy and physiology of the vocal organs, and if, in your opinion "visible speech" is superior to that, will you explain to the Commission why you think so?—I think it is perfectly possible for a person to obtain a thoroughly competent knowledge of the mechanism of speech without going through a course of instruction in "visible speech"; but I think it is of very great assistance in acquiring such a knowledge; it affords the same kind of assistance that chemical symbols afford in acquiring a competent knowledge of chemistry: in fact these symbols bear precisely the same relation to phonetics that chemical symbols bear to chemistry.

21,951. Then all you insist on is, that it is essential that teachers should have that knowledge, and in your opinion if it is not got in one way it should be got in another?—Yes.

21,952. Do you think that those children who are taught by visible speech dream in visible speech?—It has not been used sufficiently to bring about any such result; they dream I think in movements of the mouth. The symbols have not been used to such an extent in any school as to make them so familiar to the eyes of the children as the ordinary print of a book. The process of forming the capital letters is so slow, that it has not yet been used so thoroughly as I should like to see it used. That has led to the idea of the line writing form which is a more rapid form.

21,953. (*Sir Lyon Playfair.*) Do deaf persons speak when they dream?—Yes, they speak audibly.

21,954. (*Mr. St. John Ackers.*) We know that orally taught pupils talk in their sleep?—Yes.

21,955. You probably know that it has been stated by those opposed to visible speech that those who are taught by it do think in visible speech and therefore practically it is a sort of a second language to them which they have to translate?—It is the first time I have ever heard that idea brought forward.

21,956. I have often heard it myself. Perhaps you will give us your reasons why you think that is a false view of your system?—We have no experience to guide us, but in my opinion it is false, and for this reason: that visible speech is never used directly to express ideas. The characters recall, not ideas, but positions of the mouth; they recall the speech, and the speech recalls the ideas. It is the speech that is connected directly with the ideas, and the visible speech-writing simply recalls the speech; it recalls the positions of the mouth. You see the distinction. So that between visible speech and the mind of the child is spoken language in its ordinary form. It is this spoken language that is most closely connected with the mind, but supposing it were the case that people thought in visible speech, then we should have the same condition of affairs that we have with ordinary writing. You can analyse that, and see how far you think in ordinary writing; we do it to a very limited extent. As a general rule, ordinary writing recalls the speech, and partially illiterate people have a difficulty in gathering ideas from a printed page unless they read the words aloud. Well-educated persons do to a certain extent recall the ordinary spelling of words. When we forget how a word is spelt, how often we have to write it to see how it looks! That shows that we have its form associated in the mind independently of the sound. But in the use of a character which more closely corresponds with speech than the ordinary written form, it would be more closely connected with speech in the mind than the ordinary form.

21,957. Do you find that it in any way affects ordinary writing; do the pupils first of all begin to write as it were in their minds in visible speech, and then write in their ordinary practice?—There is one of the chief advantages to my mind of the use of a phonetical alphabet that is not based on Roman letters. Where you use a phonetical system which is based upon Roman letters, there is a confusion of spelling, the same letters being used in two different ways. But, so far as I have observed, there is not that difficulty where the phonetical alphabet is entirely distinct from the other. The words are translated as wholes, and it does not interfere with spelling. That is my experience.

21,958. You have already stated to the Commission that in your opinion the methods of teaching the congenitally deaf should be different from the methods adopted in teaching those who have lost hearing after they have obtained speech; would you teach all by visible speech, both those who had already speech as well as those who were congenitally deaf; or would you simply teach the congenitally deaf by visible speech?—My personal opinion is that it would be an advantage to all.

21,959. (*Chairman.*) One of the reasons why you said that in your opinion visible speech was so useful to the deaf and dumb was that it prevented them from

falling into the error of mistaking one word for another, which is so easily done in English, where there are so many similar words with different significations, what you called "homophenes," whereas in German and Italian, where every word is pronounced as nearly as possible as it is written, there is not the same liability to error in lip reading. I understood you to say that English in that respect was at a disadvantage as compared with German or Italian?—Yes, in German and Italian the written form of the words conform very closely to the spoken forms, so that every lesson in articulation given by a teacher is supplemented by the written language in a book and by the printed notices and shop-signs in the streets. Every shop sign is a lesson in articulation. A boy goes into a street, and he sees the name of the street phonetically spelt, so that the pronunciation of the words is all the time kept clearly before his eyes. In English it is not so. In English the written form differs in a very remarkable and absurd degree from the spoken form, so that in teaching articulation to the deaf in our country, they are left to acquire their knowledge of the spoken form from what they can find out from the mouth of the teacher, or from what specific instruction they receive when words are first taught.

21,960. In Germany, by the pure oral system, the language can be taught more easily, can it not, than English can be taught in England?—Yes, on the oral method.

21,961. Therefore, in teaching the oral method in England, the language being different from German or Italian, you want something to supplement and facilitate that instruction in lip reading which you say is essential to the understanding of speech by the deaf?—Yes. The English language is easier than the German language as a language; the difficulty is entirely artificial. It is easier to teach a child to speak English than to speak German. I know that, because I know that in English the consonants are the parts of speech upon which intelligibility depends, and of the consonants more than 75 per cent. in English are formed by the point of the tongue. The elements that are difficult to teach, the guttural sounds, which are very prevalent in German, are formed by the back of the tongue and the top part of the tongue; but in English these guttural sounds occur so comparatively rarely that a child may pronounce them very imperfectly and yet be perfectly intelligible. What I think is necessary in teaching speech to English children is that they should have a phonetical representation of the speech, for the purpose of simply letting them see what our pronunciation is; but as to the nature of the alphabet that is used, for this special purpose I think it is entirely immaterial. Any system will do, so long as they are accustomed to read from a phonetical representation of speech. That will impress upon the memory of a child what the correct pronunciation should be, which an ordinary book would not do.

21,962. (*Mr. Johnson.*) And which an ordinary symbol would not do?—The symbols of visible speech would do as well for this purpose as any other phonetical character; I think better. But books and reading matter would have to be printed in the symbols in order to afford reading exercises. For such a purpose any phonetical alphabet would do; but visible speech has a special field of usefulness that no other alphabet can touch. Its special advantage lies, not so much in representing English sounds, as *in representing the sounds that the child makes itself*, because the principle is to go from the known to the unknown, and the known sound to the deaf child is the sound that he makes himself spontaneously, whatever it may be. It may not be an English sound.

21,963. (*Chairman.*) Do you wish to say anything further with regard to visible speech and line writing?—I should like to supplement with one word what I have said about visible speech and line writing. You see what institutions are now using visible speech. One institution, the Florida Institution, is using line-writing. That institution was actually using visible speech without knowing it.

Mr. A. G. Bell.

26 June 1888.

21,964. Although the Principal of that institution says: "We do not use visible speech, and have never done so," he has been doing it without knowing it?—Yes. My father is still active in this work; and he has produced a still further development this year, which should be known, at all events by title to the Commission. He has produced a phonetical system, the object of which is to make the English language the universal language. He has been interested in Volapük, and attempts of that sort, and he has just published a work entitled "World English," in which he proposes a modified scheme of Roman letters. I mention that for this reason; that the Principal of the Western New York Institution, Mr. Westervelt, is going to introduce "World English," as a means of teaching articulation in his school. Now that is a school where articulation has been neglected; it is a school where the manual alphabet method is used. Great advance has been made in a knowledge of written English, but speech has been neglected, and the Principal of that school is going to make an independent experiment this autumn with "World English," and has set his teachers at work to study it.

21,965. Is that "World English" to be carried out in line writing?—No, it is a new system based upon Roman letters, the idea being to enable foreigners to acquire English more readily. That book is just published.

21,966. Is it phonetic?—It is phonetic, the idea being that the difficulty of making English an universal language is entirely its unphonetical alphabet. The book is published in London by Trübner and Company, and it is entitled "World English, the Universal Language," by Alexander Melville Bell. I mention that because it is going to be used in an institution for the deaf and dumb.

21,967. Are the teachers in deaf and dumb schools in America more highly paid than the teachers in the ordinary schools?—I do not think I am competent to answer the question. I have the impression that they have salaries that compare favourably with the salaries of teachers in ordinary schools.

21,968. (*Dr. Campbell.*) Of course in addition to their salary they have their board and lodging; consequently although they get a small sum in actual money it means more than ordinary teachers get?—Yes, it means more in such cases.

21,969. (*Mr. St. John Ackers.*) When I was in America a considerable number of those teaching in the institutions were not boarded in the institutions. They are not all boarded in the institutions, are they? I think not.

21,970. (*Dr. Campbell.*) But those are usually termed Professors. When you speak of teachers in America, we understand by that, resident teachers?—I did not intend to use the word in that restricted sense. I used the term generally without reference to residence or non-residence

21,971. (*Chairman.*) I think you said that there were some other points upon which you wished to supplement your previous evidence?—I was asked a question relating to the separation of the sexes. I think that one evil very often leads to another. I should look upon the whole Institution plan as in itself an evil to be avoided as much as possible, and on the Institution plan as the pupils grow up it would be advisable to have the elder boys in a separate school, but I would not debar them from associating with hearing persons of the opposite sex. In regard to the others, I think it would be much better to adopt what is known as the cottage system. Instead of having the pupils in dormitories, where they have nothing approximating to home life, I would rather have the living part of the institution in the shape of small cottages where you could have the little boys and the little girls and the elder girls arrayed more in a family relation. The cottage system I think would be infinitely preferable to the institution plan.

Mr. A. G. Bell.
26 June 1888.

The institution plan with its dormitories is subversive of the very basis of society the family relation. The family is the basis of society, and if we must take these children away from their homes, let us try to bring about a family relation as much as possible, and I think it would be advantageous to associate the elder girls, who would have a motherly disposition in little cottages with the younger children of both sexes making a little family group in each cottage.

21,972. Do you desire to say anything as to the desirability of having conventions of teachers?—In regard to suggestions for improving our methods of instruction, I think that the British Government should assist the bringing together of teachers for the purpose of discussing the methods of instruction. I cannot over estimate the benefit to America which has resulted from the periodical conventions of teachers which are held, where the most free discussions take place, teachers of the most opposite methods urge their views, and nothing but good comes from these teachers' conventions. The travelling expenses of some of the teachers and principals are sometimes paid by the States to enable them to attend conventions. Then, again, in America we have an organ of communication between teachers, and that I think is of very great importance. I need hardly direct your attention to the American "Annals of the Deaf," an admirable journal, admirably conducted, containing within its pages nearly the whole literature of the world in relation to the deaf. That is of enormous importance in stimulating and improving methods of instruction.

21,973. Is there any other point to which you wish to refer?—There is another point. A very great deal can be done for deaf children at a very much younger age than is ordinarily supposed, and in many cases parents, especially mothers, would devote time to the instruction of their little ones if they knew what to do. The diffusion among parents of information relating to methods of home instruction giving specific directions how they are to act, is of the very greatest importance.

21,974. Do you think that there might be any improvement in the mode of taking the census with regard to the deaf and dumb?—In the census returns I think it is of the greatest importance that we should study all the causes of deafness and the inheritance of the defect, and that to that end we should obtain not merely a census of those whom we may term deaf mutes, but that we should have a census of the deaf; we should know the adults who are afflicted with deafness as well as children, and if we ask for these two elements to which I direct the attention of the Commission, the amount of deafness and the age at which the deafness occurred, we can separate those that belong to the class deaf and dumb from the others. We want to study the whole subject. I would recommend that there should be a census of the deaf, and not merely a census of the deaf and dumb.

21,975. Can you suggest any improvement upon the existing schedule in the census relating to the deaf and dumb, which would be applicable to this country as well as to America?—I am not prepared just now to make very specific recommendations, but I brought that subject before the late convention of principals that met at Jackson, Mississipi, and I have been appointed one of a Committee to confer with the Committee of Congress on the census with the object of proposing modifications in the questions to be asked relating to the deaf and dumb; and if it would be of any value to the Commission I should be glad to forward to the Commission whatever recommendations that committee make to Congress, because we shall have a meeting very shortly after my return to America.

21,976. That, we think, would be very valuable?—The chief point that I have recommended so far is the insertion of the simple question "Are there any people "deaf or hard of hearing in this house, and if so at "what age did the deafness occur?"

21,977. (*Mr. St. John Ackers.*) Leaving entirely out the question "Are there any deaf and dumb?"?—I would put that in afterwards. Specialists can deduce from the answers to those two questions the number of deaf and dumb, but it would be safer to ask in addition after that question: "Are there any deaf and dumb?"

21,978. (*Sir Tindal Robertson.*) When will your next census be taken?—In 1890. The Federal Government takes a census every 10 years, and the different State Governments (or some of them) take a census every 10 years, and they are so arranged that the State censuses come midway between two Federal censuses.

21,979. Is the next census in America to be a Federal Census or a State census?—It will be a Federal Census in 1890, and then in 1895 some of the States will take a census.

21,980. (*Dr. Campbell.*) With reference to the dormitory system, I fully recognise the objections to it and have acted against it for many years, but do you find any ill effects from the deaf pupils being only say two in a room under the cottage system?—I am afraid that the Commission could not rely upon my testimony upon that point; but certainly I think that the cottage system is preferable to the dormitory system, and that home is preferable to the cottage system.

21,981. We all recognise that amongst the blind there is a great tendency to secret vices, and it is a growing evil, an evil which we must meet in some way. I wanted to know whether you have that in America amongst the deaf?—I do not know much about this subject. But I should think that exclusive segregation of persons of one sex is an unnatural thing, and would tend to produce morbid conditions.

21,982. (*Sir Tindal Robertson.*) I think that medical men generally would traverse that opinion?—I may of course be entirely wrong.

21,983. (*Chairman.*) Do you desire to say anything further in regard to sign language?—There are some points which I should like to enlarge upon a little in relation to signs and the sign language. I think it is very important that we should thoroughly understand what we mean when we use the word "signs"; and if I might be allowed to do so I should like to put in my testimony here my reply to Dr. Gallaudet in the discussion that we had upon this subject in Washington, because the main argument upon which he relied is universally used throughout America. It is that the sign language is the *natural language* of the deaf and dumb, and that therefore it *must* be used. I attempted to combat that, and this is what I said in reply to that point. *See* Annals vol. XXIX., p. 67. "There are signs *and* signs. There is the same "distinction between pantomime and the sign-"language that there is between a picture and the "Egyptian hieroglyphics. Pictures are naturally "understood by all the world, but it would be "illogical to argue from this that a picture-language "like that developed by the ancient Egyptians must "also be universally intelligible. Pantomime is "understood by all the world, but who among us "can understand the sign language of the deaf and "dumb without much instruction and practice? "Pantomime and dramatic action can be used, and "with perfect propriety to illustrate English expres-"sions, so as actually to facilitate the acquisition of "our language by the deaf; but the abbreviated and "conventionalised pantomime known as the 'sign "language' is used *in place* of the English language, "and becomes itself the vernacular of the deaf child. "All the arguments that have been advanced "respecting pantomime and pantomime language "are equally applicable to pictures and a picture "language. We may say, for instance, that a "picture language is more natural than any of the "spoken languages of the world, because pictures "are naturally understood by all mankind. We may "even arrive, by a further process of generalisation, "at the idea that picture writing in the wider sense "constitutes the only form of language that is

"'natural' at all, for all the other languages appear "to be entirely arbitrary and conventional. If we "pursue the parallel we shall arrive at the conclu-"sion that a picture language of some kind must "necessarily be the vernacular of our pupils, by "means of which the other more conventional "languages may be explained and taught. It is "immaterial whether such statements are fallacies "or not, so long as we do not apply them to "educational purposes But let us see how they "work in practice. No one will deny that the "exhibition of a picture may add interest to the "fairy tale or story that we tell a child. It illustrates "the language we use, and it may be of invaluable "assistance to him in realising our meaning. But "is that any reason why we should teach him "Egyptian hieroglyphics? Granting the premises, "is the conclusion sound that we should teach him "English *by means of* hieroglyphics? If such "conclusions are illogical, then the fundamental "ideas upon which our whole system of education "by signs is based are also fallacious and unsound."

21,984. Have you anything further to add with regard to the value of the sign language in social intercourse?—The sign language is not of any value whatever in promoting social intercourse with the hearing; its value as a means of social intercourse is with deaf mutes alone. It promotes their intercourse with one another, but hearing people do not know it. Now there is one very curious difference in the moral result of education by signs and education by oral methods. It is in the *amour propre* or self-respect of the pupil. A person who is taught by any of the oral methods comes to consider himself as the same as other people, and he desires to have as little difference as possible between him and other people. But a person who has been taught by a special language comes to look upon himself as belonging to a different race, of which he is proud. He comes to look upon himself as different from other people and glories in the fact. Now that leads to very curious results and misunderstandings. A sign teacher will misunderstand and misconstrue the conduct and actions of an orally taught person, because he does not realise that this feeling of *amour propre* or self-respect leads that orally taught person to avoid making a public exhibition of himself. So that an orally taught person will very often avoid conversation with a stranger if he cannot talk easily in company, because he does not like to have attention directed to his defect. You will find that in Dr. Gallaudet's speech before the National Educational Association at Madison, Wisconsin (1884) he makes a comparison between the public actions of persons taught orally and persons taught by the sign system. He says on page 47 of the Proceedings:—"I "have seen these two classes of persons mingling "in society. I have seen persons that depended "upon speech and lip reading entirely, without any "power of resorting to the manual alphabet or signs, "converse with strangers; I have seen the conver-"sation flag in a few moments after a few common-"places had been passed. I have seen strangers "striving to make themselves understood, and failing, "and I have seen these persons far more isolated in "society than others with whom I have been equally "familiar, who, having no speech, resorted to that "definite and complete means of communication "writing," and so forth. He does not realise that those orally taught persons could have communicated by writing also. Why is it that after a few common-places had been passed they did not resort to paper and pencil? It was the feeling of *amour propre.* They did not desire to advertise themselves in public as being deaf. They preferred in public not to speak to a person at all, rather than direct attention to their infirmity. Now I may give an illustration of that, because I happen to know the whole details of the case. A deaf lady of Washington, who is a good speech-reader, found herself one day on board of a steamer bound for Mount Vernon in company with a lady friend. She was very much distressed to find on board a party of deaf mutes headed by Dr. Edward M. Gallaudet, and became very desirous of avoiding their notice. But Dr. Gallaudet recognised her, and in the politeness of his heart he came forward to talk to her. In vain this lady tried to show him by her actions that she did not want him to talk to her in that public place, because it directed attention to her infirmity, and she did not want to be recognised as a deaf mute. But Dr. Gallaudet, like other sign teachers, had become habituated to the stare of the public, and he failed to appreciate her feelings or understand her motives for desiring to be left alone. In his Madison address to which I have already alluded (page 47), he describes the above incident, and this is what he says:—"I call "to mind a trip that I made a short time ago "upon a steamer going from Washington to Mount "Vernon. On the steamer there were several "members of my own family. There were several "students from the college with which I am con-"nected. There was a lady who has had every "opportunity that any one could have for the acquisi-"tion of speech and reading from the lips. Social "intercourse, the free interchange of thought, the flow "of wit and repartee, went on where signs and the "manual alphabet were used freely; and I asked a "friend of this lady who had declined, during many "years, to use the manual alphabet, and who had "never learned to use signs, whether he thought "that that lady ever enjoyed such free social inter-"course in the social circle as did the young men "that were enjoying that day on the Mount Vernon "excursion with the manual alphabet and with signs; "and this friend of the lady who depended on speech "and upon lip reading, and who was a fine speaker, "and a fine lip reader, told me that he was certain "that she had never been able to enjoy through the "means of speech and lip reading such heart satisfy-"ing social intercourse as was being enjoyed by those "who used the manual alphabet and signs." Now in all this matter Dr. Gallaudet was sadly mistaken, and the "friend" to whom he refers was a gentleman who had rarely been inside her house, and who, on this occasion, simply acted as escort. Now I think I know a great deal better than Dr. Gallaudet what is the value of speech and speech-reading to the deaf. I have daily hourly experience of their value in my own home. I know something of the sign-language; I am expert in the use of all forms of manual alphabet, but I have no need for these artificial instrumentalities in my own home. "Social inter-course," "the free interchange of thought," "the flow of wit and repartee," "heart-satisfying social intercourse" are all possible without signs or manual alphabets. I know it from experience. I know it from observation. And the paper and pencil which would not be produced in public, I have seen freely used in the privacy of home to set the stranger at ease and welcome him to the family circle. And when the ice has been broken I have seen that paper thrown aside as unnecessary, and conversation carried on freely by word of mouth. I know what I am speaking about when I testify to the value of speech and speech-reading. There is no other means by which the deaf can be brought into such intimate contact with the hearing.

Mr. A. G. Bell.
26 June 1888

21,985. (*Rev. Mr. Sleight.*) It is curious that you did not refute it at the time?—I did not know at the time the details of the case or the name of the person to whom Dr. Gallaudet referred. By the way, in talking with a deaf lady recently upon this subject of *amour propre* she suddenly startled me by the queries:—"If you had false teeth, would you care to "exhibit them in public? How would you like, "when you go into society, to have people stare at "your mouth and take notice of your teeth? What "would you think of the delicacy of feeling that "would prompt a stranger to congratulate you upon "the way in which art had supplemented the "deficiencies of nature? Can you wonder then that

Mr. A. G. Bell.

26 June 1888.

"I should seek to conceal my infirmity in every way "I can?" I have brought forward the above story to show you how the feeling of self-respect, of *amour propre*, which prevented an orally taught person from making an exhibition of herself or directing public attention to the fact that she had an infirmity, can be mistranslated and misconstrued by one who is accustomed to a system under which the deaf glory in being deaf. Now, I think that is a very proper spirit, and I think the spirit of the oral system is to make the deaf persons feel that they are the same as other people, to make them object to exhibit their infirmity to the world; whereas on the special language method they glory in the defect, they glory in being deaf mutes, they glory in being distinct from the world. These two radical tendencies are very important to consider, and our object should be, I am sure, to create the former feeling rather than the latter.

21,986. Do you approve of the Grëenberger system, which like some of the French and German systems, in teaching simple words, teaches the words all at once, instead of spelling them to the deaf and dumb?—I do. I will go further and take the complete sentence. It is my belief that sentences and phrases are of more use to deaf children than words. They will understand from the mouth a phrase better than they will understand a word, and they will understand a word better than they will understand an elementary sound.

21,987. (*Sir Tindal Robertson.*) Is that because they guess to a certain extent?—Yes, they have more to guess at. A sentence also is expressive of a concrete idea. What a child wants to express is an idea. A word does not do that as a general rule; it is a complete phrase or sentence that is wanted.

21,988. (*Chairman.*) Have you found or heard of any difficulty in giving religious instruction to the deaf and dumb by means of the oral system or by language, because it has been contended that the only way in which such instruction can be given to the deaf and dumb is on the sign and manual system?—I think that may be perfectly answered by directing your attention to the list of schools for the United States at the end of this volume—"Facts and Opinions relating to the Deaf," page 194. You will see that one of the denominational schools started especially for the purpose of giving religious instruction where religious instruction is the first and foremost and most prominent thing in the minds of the teachers, and where everything gives way to religion is a pure oral school. That is the German Evangelical Lutheran Institution for the Deaf and Dumb. The fact that they do not use the sign language, but use the pure oral method, shows that it is suitable for religious instruction. I may say that I have great pleasure in presenting the Royal Commission with 100 copies of this book.

21,989. The Commission thank you for your generous gift. Have you heard that in the United States those who are deaf and dumb, and who have been taught on the oral system attend the ordinary places of religious worship rather than the places of worship where the deaf and dumb talk on the sign and manual system are congregated together?—I have no statistics upon that point. I may say that Mrs. Bell finds no difficulty in following the Episcopal service where there is a regular service, although she cannot follow the sermon.

21,990. (*Rev. Mr. Sleight.*) Why is she not able to follow the sermon?—Partly because she is very short sighted, and secondly, because it would involve a very great strain upon her attention.

21,991. I see, mentioned here, Whipple's Home School for Deaf Mutes, and Whipple's Natural Alphabet, what is there peculiar about that?—I have already directed your attention to the origin of Whipple's school. Mr. Whipple established a school, he died, and one of his sons carried on this school, and this son devised an alphabet for the purpose of teaching speech that is very akin to visible speech, and it is a remarkable alphabet as having been developed for this special purpose of teaching the deaf. It is crude, of course, compared to a scientific alphabet like visible speech, but it possesses very great interest, and as Mr. Whipple, junr., is himself dead, it should be preserved and studied. The school still exists among the private schools.

21,992. I see that you mentioned the schools for the deaf in Canada; have you ever visited them, and can you give us any opinion about them? I think they are mostly either combined or manual, and that there is no pure oral school there?—No, I think there are no pure oral schools there. I believe I have visited them all with the exception of the New Brunswick Deaf and Dumb Institution, and the Fredericton Institution. They are mentioned on page 195, and the replies are given on page 167.

21,993. Are they generally superior or inferior to the schools in the United States?—I think they are about the same. The same methods are adopted, and indeed, although they come under another political government, we always include the Canadian schools with the American schools.

21,994. In your conferences?—In our conferences we make no distinction between American and Canadian. The principals of these institutions meet our principals, and they have a vote in our conventions of principals. The teachers from those institutions meet the teachers of the deaf, and vote exactly in the same way. There are no political lines of demarcation regarding the instruction of the deaf. They are to all intents and purposes American schools.

21,995. (*Mr. St. John Ackers.*) Are there no private schools in Canada?—I do not know exactly the status of these schools. The New Brunswick Institution and the Fredericton Institution I know nothing about. The Mackay Institution comes more under the designation of a private school; it is now supported by a fund, but it is denominational. In Montreal there are two Roman Catholic Institutions, one for males and the other for females, and the Mackay Institution grew out of that as a Protestant school. It was started as a private school, and is now largely supported from a fund left by Mr. Mackay. It does not follow that none of those are private schools because they are not so designated in this report, because we do not go into that classification of Canadian schools; we simply lump them together as Canadian schools.

21,996. (*Chairman.*) I think you advocate that every child's hearing should be tested when it first enters a school, and that its education should be more or less guided by the amount of hearing that it possesses?—Yes.

21,997. Would you explain to us these instruments which you have been good enough to bring with you?—Certainly. [*Mr. Bell then exhibited to the Commission in operation the two forms of audiometer he had brought from America.*]

21,998. Can you state shortly the general recommendations which you would desire to make?—The chief points I would lay stress upon are the following:—

1. Decentralisation as the policy to be adopted by the Government in dealing with the deaf.
2. Non-interference with methods of instruction.
3. Certificated teachers whose qualifications shall be tested by the Government.
4. Governmental inspection of schools, and payment by results.
5. Government aid to apprentice the deaf when their education is completed.

21,999. Have you anything further to say with regard to the answers you have received to the queries which you sent to the institutions?—I shall simply direct your attention to the very cordial way in which the superintendents and principals have responded to my queries. I have printed their replies in full for your information; but I regret that I have been unable to include in the volume the many kind expressions of interest in your work that have

reached me from all parts of America. I am sure that the teachers of the deaf in our country, one and all, unite with me in expressing the hope that your conclusions will result in a unanimous report. A division would seriously weaken the value of your recommendations and be detrimental to the best interests of the deaf. A unanimous verdict, on the other hand, will carry weight throughout the whole world, and profoundly modify the destinies of the deaf in every civilised land.

Mr. A. G. Bell.

26 June 1888.

SIXTY-NINTH DAY.

6, Old Palace Yard, S.W.

Tuesday, 17th July 1888.

PRESENT:

THE RIGHT HON. THE LORD EGERTON OF TATTON IN THE CHAIR.

ADMIRAL SIR E. SOTHEBY, K.C.B.
SIR TINDAL ROBERTSON, M.P.
B. ST. JOHN ACKERS, ESQ.
EDMUND C. JOHNSON, ESQ.
THE REV. W. BLOMEFIELD SLEIGHT, M.A.
THE REV. CHARLES MANSFIELD OWEN, M.A.
L. VAN OVEN, ESQ.

CHARLES E. D. BLACK, ESQ., *Secretary.*

GENERAL F. J. MOBERLY examined.

General Moberly.

17 July 1888.

21,999*a*. (*Chairman*) You are chairman of the Sub-committee for the instruction of the blind and the deaf and dumb under the London School Board?—I am.

22,000. Are the blind and the deaf and dumb the only afflicted classes for whom you make provision?—Yes; we make no special provision for any other.

22,001. Your committee does not make provision for any of those who are classed in a return before us which has been prepared by the School Board, (Table C.) as "permanently disabled" except the blind and the deaf and dumb?—No, the School Board does not.

22,002. Who does?—We have not seen to them at all; they have not been looked after by us in any way.

22,003. Is not it the duty of the School Board to see to the education of all children?—Yes.

22,004. And if they are unable from any cause to attend, to see that a certificate is given of the cause of their non-attendance?—Yes, that is done.

22,005. Is it the business of your committee to see that that is done?—That would be the business of the byelaws committee.

22,006. I see in this Table C. you have got these heads, "Blind," "Partially blind," "Deaf and dumb," "Crippled," "Idiots," and "Other cases." We are more specially concerned with the blind, the deaf and dumb, and educable idiots. With regard to the blind, you have 73 attending schools or centres?—Yes.

22,007. And 48 absent?—Yes.

22,008. Why are they absent?—Many of them are under medical treatment.

22,009. In all those cases are there medical certificates produced to show the cause of absence?—I believe so; I am not clear about that.

22,010. Who could tell us positively whether that is the case or not?—The byelaws committee is the committee whose duty it is to see that all children attend school unless cause is shown why they cannot; the sub-committee for the instruction of the blind and deaf and dumb classes has to see to the administration of the education of those classes.

22,011. If the children do not attend you have nothing to say to it?—Not beyond reporting if I know of a case of absence, and bringing it to the notice of the byelaws committee.

22,012. Can you say that those not attending have produced medical certificates?—I cannot say they all have, but to exempt a child from attendance, the production of a medical certificate is necessary.

22,013. You cannot say positively whether in all such cases a medical certificate has been forthcoming?—It is the duty of the visitors to see every case coming under these different heads, and to test the cases; whether they do so I do not know.

22,014. Will you furnish us with positive information on that point; that is to say, whether in all those case; of non-attendance of blind or deaf and dumb children medical certificates have been given by medical men or what is the reason they do not attend?—Yes.

22,015. Then what does "partially blind" mean; does it mean those who can see with spectacles?—No, they would be generally in the ordinary schools; but they would be those who are very nearly blind, who can distinguish objects, but cannot read.

22,016. What course do you pursue with them; do you put them in a class by themselves?—No, we have only classes for the blind.

22,017. Do they go into the classes for the blind?—Yes, if they are so blind as not to be fit to be put with ordinary children.

22,018. Am I to understand that those "partially blind," "attending schools or centres," are attending blind classes?—The 40 put down in the table under the heading "partially blind" are attending blind classes.

22,019. Then there are 141 not attending; what excuse have they got?—They are under medical treatment, and are not allowed to attend school.

22,020. Have you a certificate in each of those cases, signed by a medical officer, that so-and-so is excused from school?—No.

22,021. How are those cases brought before the Board?—If the attendance committee had any doubt about these cases, the children would be summoned before them by the visitors, and the matter would be examined by the managers of the school.

222,02. Are those cases brought before the Board on the report of the attendance committee?—On the school visitors' report.

22,023. We may take this return as absolutely accurate, then?—That I could not answer for.

22,024. Have you any reason to believe that there are children left out of account altogether?—There are cases, no doubt, which slip through the meshes.

22,025. Children have been brought to your notice who have not been reported by the school officers?—Such cases are very rare; they have occurred certainly; they do slip through the meshes of inquiry.

General Moberly.

17 July 1888.

22,026. "Deaf and dumb children" "attending schools or centres 240," does that mean school board classes?—"Centres" are our classes; they may be attending private schools; the centres would mean our classes.

22,027. "Not attending 191"; are there medical certificates in those cases?—No, in most cases I think the absence is owing to the difficulty of access for the children to get to a centre.

22,028. (*Mr. Johnson.*) There are 431 deaf and dumb that you know of altogether?—Yes.

22,029. (*Chairman.*) Then with regard to idiots, you have 20 attending schools; are those ordinary schools and ordinary classes?—Yes.

22,030. Those are children of weak intellect?—Yes.

22,031. And 435 not attending; are those excused in the same way?—Yes.

22,032. Are any of them at Darenth?—Those at Darenth would not be included in that figure.

22,033. Why is there so large a number not attending school at all?—Because they are not capable of being taught in an ordinary school.

22,034. But then ought they not to be taught if they are educable idiots?—We have no means of teaching them.

22,035. You have the means of sending them to Darenth, have you not?—The guardians must do that.

22,036. Could you not apply to the guardians to send them to Darenth?—The parents must do that; we cannot go over the heads of the parents; they can refuse to let them go. The School Board have not moved in the matter as a board.

22,037. Do you think it should be the business of some one to see that those who are capable of education are educated?—The question is whether they are capable.

22,038. Assuming they are capable of being educated?—There is nobody to do it.

22,039. Is not it desirable that that should be the business of someone?—Yes, certainly.

22,040. I see of the "permanently disabled" under 13, there are 596 attending school, and 2,358 not attending school?—Yes.

22,041. We have heard from Dr. Francis Warner, who is a physician in London, that five per cent. out of 10,000 school children in London are not being educated. I want to see whether that corresponds with your statement?—Our figure is very much smaller.

22,042. Adding together those not attending under this head of "permanently disabled," and those attending, what figure does it come to. Something under 3,000; 596 attending and 2,358 not attending.

22,043. Out of how many children would that be; what is your present total number of children?—The number scheduled is 605,337, and the number on the rolls of the schools is 588,124.

22,044. (*Mr. Johnson.*) I do not exactly understand what the 605,337 and the 588,124 are?—The 605,337 is the scheduled number, that is to say, the visitors have counted those in their different homes, then the 588,124 are on the rolls of the schools; their names are on the rolls of some school or other; many of those do not attend. The 605,000 are the children the visitors know of, that is the number in their census taken from house to house.

22,045. (*Chairman.*) Dr. Warner says that out of 10,000 school children, five per cent. of the class to which he refers are not being educated, that is to say, the idiot class, or children of weak intellect. According to your table only 20 idiots and 27 "other cases" are not being educated?—In one school that I was at the other day a child was being taught to fetch and carry as a dog might be; not being educated at all; he was in school.

22,046. In special schools for idiots very much the same kind of education is given, but given in a systematic way; is it possible in board schools to give that special education which idiots require?—No, certainly not.

22,047. Dr. Warner says in a school of 1,000 there would be something like five per cent. of children of weak intellect, which would come to 50; is it your opinion that that is so, that out of 1,000 children in your board schools five per cent. are not capable of being educated under the present arrangements and conditions, such children requiring exceptional methods of education?—That is not my experience.

22,048. Dr. Warner includes in this five per cent. children suffering from diseases of various kinds, St. Vitus' dance and so on?—My experience is exceedingly limited in investigations of this kind. There are four schools I am constantly watching, and I cannot imagine that there is anything like one per cent. of the children in those schools who are not capable of receiving and who are not receiving some education.

22,049. That is to say, who do not require an exceptional method of treatment?—Yes, there are in fact none in the four schools, that I know of.

22,050. Will you explain the middle column of Table C.; what are the 21,898?—Those are children who are exempted because they are between 13 and 14.

22,051. Dr. Warner is asked at question 19,089, "Are children suffering from those defects now excused "from school attendance?" and he says, "Certainly, "they are often absent from school, a large number "of them being absent apparently without any certi- "ficate at all." That is the statement made; we want the School Board either to confirm or refute that?—The visitor (a School Board officer) sees the child, and if not satisfied with his personal observation calls for a medical certificate.

22,052. Then he goes on, "Only a few get certifi- "cates from me when they are my patients. (One "hears at the East End of London they can buy then "at 2*d.* a piece") ?—I will inquire about that.

22,053. "It is only in a few cases that patients of "mine, who according to Act of Parliament ought "to be in attendance and who are absent, have asked "me or any of my assistants for any certificate, and "from inquiries that I have made in the schools I "believe that they are often absent without any "certificate at all." That is a statement I want the School Board to take notice of?—The School Board have not gone into the matter; they have left it to the visitors, and they have accepted the reports of the visitors, whether those visitors have procured certificates or not, I cannot say; that is the byelaws committee's business.

22,054. Do you or either of the other members of your committee visit all the School Board classes for these deaf and dumb and blind children?—I have not seen all the blind classes; I have seen all the deaf and dumb classes. In the case of the blind classes the teacher only attends half-a-day in the week at each school, and it is difficult to hit upon that time; the children are in the ordinary school the rest of the time.

22,055. Are you able to express any opinion as to the success of the teaching of the deaf and dumb and the blind under the School Board in London?—I have no expert's experience of the matter; I have merely gone round as an outsider, and certainly I find that it is most difficult for us to distribute them in classes; there are almost as many classes as there are children in many schools.

22,056. Do you think that system is a good one?—No, not at all.

22,057. Do you think it would be an improvement on the present state of things if the School Board had the power of establishing large schools, say, for instance, schools like the Darenth school under the Metropolitan Asylums Board, to which children of the defective classes could be sent?—A huge institution is a thing I have always deprecated.

22,058. I will say one or more institutions?—I should think the institution system would be better.

22,059. Have you visited Dr. Stainer's homes?—No, I have not.

22,060. In your opinion is it not almost necessary, in consequence of the distance the children have to come to these schools, to have a home where they can live, if not altogether, at least from Monday to Saturday?—It would facilitate their education very much; many of these children who are not in our schools are kept away because of the difficulty of access.

22,061. If such homes are necessary to the day school system, would not it be better that they should not be in the hands of outsiders, but that they should be under the direct control and supervision of the School Board?—I do not think the School Board would care to undertake it.

22,062. You admit that the School Board under the present conditions fail to give these children as good an education as they ought to have; is not it the duty of the School Board if it finds that one system does not answer, to supplement that system by homes in certain centres where the children could be properly looked after?—It would be putting a new duty upon the School Board, because their duty is purely educational.

22,063. If the education is not carried out properly without some such scheme as that, does it not necessarily follow that the School Board ought to take it up?—Individually I should think that the providing of education and the providing of such homes were two distinct things.

22,064. Are you prepared to suggest any alternative scheme in order to provide a convenient means of education for these unfortunate children?—I should think the providing of homes for them was not the work of the School Board at all.

22,065. You would leave it to voluntary effort to provide for this class, would you?—No, I do not say that. The children of persons who can afford to maintain them are sent to private institutions, but as regards pauper children and the children with whom we have to deal, generally the guardians are supposed to be their proper protectors.

22,066. Is not it the fact that there is an unwillingness on the part of the parents to apply to the guardians?—There is a very great unwillingness, no doubt.

22,067. It has been suggested to us that the school authority, in preference to the guardians, should have the power, which they at present have not, of sending these children to institutions if they cannot conveniently educate them in day classes?—That is a power which they have never possessed in the smallest degree of sending such children to such institutions against the will of their parents.

22,068. You make them come to school against the will of their parents?—We try to; I am afraid we do not succeed; they are taken up before the magistrate,—it is a long process to go through,—and after all the magistrate will say is, "Oh! poor child "he is afflicted; strike him off, exempt him at once."

22,069. Do you think it would be possible to get together in a special class room in the board schools, under a carefully trained teacher, all those children who would require an exceptional method of treatment from various cases, that is to say, children of more or less defective organisation—children suffering from chorea or epilepsy or other kindred disorders?—It has never been brought to my notice; but I think there would be very great difficulties in mixing sound children with children suffering from such diseases as you have mentioned. Many of those diseases would be produced among the children from imitation, unless you had separate rooms and separate classes.

22,070. I asked Dr. Warner this question as to the difficulty of picking out these children suffering from these diseases: "To make that diagnosis, would not "you require a medical man in every school?" and his answer was, "Certainly not; the teachers can be "taught to distinguish such cases." Do you think that it would be possible for a teacher to diagnose the diseases of these children to determine how they could be classified?—No, I should think not; it is difficult enough to distinguish between epilepsy and catalepsy; it is difficult enough to diagnose ordinary diseases—measles and scarlet fever and such like.

General Moberly.

17 July 1888.

22,071. (*Mr. Johnson.*) There the master or the mistress gives the first intimation of the disorder?—Yes; if they find an eruption of any kind in a child they take steps to have the child removed.

22,072. (*Chairman.*) With regard to idiots, you say all the teachers can do in most cases is to keep them occupied, to teach them some simple occupation?—Yes.

22,073. They do not attempt to teach them to read?—No, I have not seen any of them being taught to read.

22,074. Are they in a class with the others?—Yes.

22,075. Simply looking on?—Yes, and exceedingly kindly treated, so far as my experience goes, by the other children.

22,076. Do you not think that for those children it would be desirable that there should be some special school like the Darenth school, or one or two other schools that there are in the north and the south of England?—Yes. In individual cases I have endeavoured to induce parents to send their children away.

22,077. In the cases of the idiots that are attending school, have the parents voluntarily sent them to school?—Yes.

22,078. You think parents would have an objection to send them a distance off?—Yes, the parent generally says, "I will not send the child away."

22,079. Do not you think that unwillingness might be got over if you could have a school in the neighbourhood of London, in which case the parents would not feel that their child was being sent off to a considerable distance?—It is a sentimental idea; they think the child is better at home. I have succeeded in some cases in getting the parents to send their children away, but I find great difficulty in getting them to do so.

22,080. We have had witnesses who have advocated the compulsory sending of children of the idiot class to school as the only way of enabling them to get their own living to some extent in some cases, and of alleviating their lot in others?—I think compulsory attendance would be a very good thing.

22,081. You think that nothing short of compulsion would induce parents to send their children to a special school?—No, I think not.

22,082. We had a memorial from the School Board of London two years ago with reference to the deaf and dumb and the blind; do you know anything about it?—I do not know anything of it.

22,083. Is there any other point you would like to bring before the Commission?—A very great drawback that we have in London, I do not know how far it extends beyond it, is the want of teachers for the deaf and dumb. I think our teachers generally have taken to deaf and dumb teaching when they have failed in other work.

22,084. (*Mr. Johnson.*) They become oral teachers?—Yes.

22,085. Without training?—They have had a training, I do not know what. I am not expert enough to know the difference between good and bad training.

22,086. Do the board school require a certificate in the case of those teachers?—Yes, they get a certificate from Ealing or Mr. Van Praagh.

22,087. (*Chairman.*) Is there anything with reference to the education of the deaf and dumb or the blind that you would wish to lay before the Commission?—I have sent the Commission a copy of Mr. Schöntheil's Report, which he presented to our committee, we having asked him to examine the 13 centres established by the School Board for the instruction of the deaf and dumb.

22,088. Have the School Board considered any of the suggestions in that report?—No, it has not come before the Board yet.

General Moberly.

17 July 1888.

22,089. I see Mr. Schöntheil states, "The attend- "ance is so irregular as in itself to preclude satisfactory "results, but when we add to this the unwashed, "half-clad, and unfed condition in which the "children often come to school, we cannot marvel "that teaching them to any purpose is found impos- "sible"; is that your view?—I do not think the attendances are very bad; of course there is the drawback of their homes. I have been to Mr. Schöntheil's school, and there is no comparison between our classes and his, which I attribute to his institution being one, and a well-supervised one.

22,090. You say your classes are not equal to his in point of proficiency?—No, we cannot expect it.

22,091. Mr. Schöntheil says, "Day schools have "no doubt great advantages when the existing "conditions are favourable, but in London or in any "other large city, and with the class of children that "attend the London School Board centres, I unhesi- "tatingly say that the success of the oral method is "all but impossible, except in connexion with such "homes." Do you wish to say anything upon that?—I quite agree with Mr. Schöntheil upon that.

22,092. He calls attention to the fact that needle-work and drawing, which are taught in School Board classes for hearing children, are excluded from your centres for the deaf and dumb, have you any reason for excluding needlework and drawing?—My attention has never been called to it before; I do not know why they are not taught; the children must be taught to use their pencil to a certain extent for they write particularly well. My attention has not been called to that omission.

22,093. You think it very desirable that drawing should be taught in deaf and dumb classes?—No doubt the School Board will take notice of that when Mr. Schöntheil's report is before them.

22,094. And the same as regards the girls, you would think it desirable that they should be taught needlework?—Yes.

22,095. (*Mr. Johnson.*) Mr. Schöntheil says, "No "regular and accurate register is kept stating the "causes of deafness in the pupils"?—I believe that is because we found the causes of deafness that were stated were utterly unreliable. I went into one case. I forget what the version of the father was, but I was told on very good authority that he had kicked his wife on two occasions when she was pregnant, and the children suffered in consequence.

22,096. (*Chairman.*) Can you tell us why in the report of Mr. Schöntheil with regard to Great Wild Street and Surrey Lane, he says, "No big boys should be allowed there"?—I suppose there happened to be big boys when he visited the school.

22,097. Why should there be no big boys there?—He deprecates the attendance of those big boys whom he found there I assume.

22,098. What age do you call big?—Boys of 12 or 14.

22,099. You mean he deprecates their being mixed with small children?—Yes; there is only one teacher at Great Wild Street and Surrey Lane.

22,100. Do you think it desirable to have deaf and dumb children of different ages mixed up together?—It is not desirable no doubt; but if we had to classify them according to ages, we should be having as many teachers as we had children in many cases. We have an immense area to cover. Surrey Lane is miles from any other centre; then if we take Great Wild Street, we have nothing nearer than Islington. At Islington we have them classified, boys in one place girls in another, and infants in a third.

22,101. Against Farrance Street, Mr. Schöntheil makes this remark: "The class rooms being in the "infant department of the schools, the big boys are "out of place there and should be provided for in a "boys' school." Is not that the solution of the difficulty, that there should be separate big boys' schools in various parts of London for the deaf and dumb?—We should not get the attendance; children will not come beyond a certain distance.

22,102. Why would not they come?—We find practically they will not.

22,103. We found at Berlin that children came from all parts of the town; they were sent labelled in tramcars or even by railways, and there was no difficulty in Berlin; why should there be in London?—Berlin is a good deal smaller than London.

22,104. There are over a million of people in Berlin?—Still it is a much smaller place than London. For instance, I have three children at Highgate, and I cannot get them down to any school.

22,105. (*Mr. Johnson.*) Which would be their nearest school?—Paddington; they would have to change twice probably in tramcars, and they would require somebody to come with them.

22,106. Those are exceptional cases, though?—There are others I believe in Hackney, which is an enormous district; we are putting down one school there; Farrance Street is supplying the need of Hackney and Tower Hamlets; but it is most difficult to get children to come a great distance. In the case of a child who would have had to come no very great distance, the parents declined to send it because of a crowded thoroughfare it had to cross.

22,107. (*Chairman.*) At present there is a three-miles limit of distance within which you can compel children to go to school; do you think it desirable in the case of deaf and dumb and blind children to alter by legislation that limit, and to give power to the School Board to bring them beyond that limit, and also to pay for the carriage of children to and from schools and centres in large towns?—Yes, it might be of great service to us to have that power.

22,108. Can these afflicted children get efficient education in any other way?—No, I do not mean to say that they would get it when we got that power.

22,109. All you can do is to offer every facility for children attending school. At present you do not offer those facilities, because in some cases you admit they are beyond the limits and they are excused attendance?—Yes, the distance is the bar to their attendance in many cases.

22,110. If it is desirable to educate these children, this is one of the ways in which it could be done, is it not?—Yes, it would be helpful, no doubt.

22,111. (*Mr. St. John Ackers.*) Does the School Board for London consider that it has the power of compelling the attendance of the defective classes?—Yes, under the Act it has the power, of course nominally.

22,112. Why do you say nominally?—Because we do not find that the magistrates support us even in the case of hearing children.

22,113. How long have you been on the School Board?—Nearly three years.

22,114. Perhaps you would rather not answer for the earlier action of the School Board?—No.

22,115. Have you gone into the question of the number of uneducated children of ripe school age of defective classes in the School Board district at the time of the passing of the Act of 1870 as compared with the number at the present time?—No, I have not.

22,116. When did the School Board begin to have classes for the defective classes?—I do not know.

22,117. Will you tell the Commission what in your opinion are the practical alterations in the law, if any, which you would desire to see carried out in order to ensure a thoroughly good education for the defective classes?—I am not prepared to say that any alteration of the law is required; the enforcement of the law is the principal point, I think.

22,118. How would you propose to deal with that point of enforcement of the law?—In some way or another the magistrates should be compelled to do their duty. I speak as a member of the byelaws committee; we have great difficulty in getting the magistrates to inflict fines for non-attendance.

22,119. You are a member of the byelaws committee also?—Yes.

General Moberly.

17 July 1888.

22,120. I understood you to say in the early part of your evidence that we ought to apply to the byelaws committee for certain information; as a member of the byelaws committee, cannot you yourself give us that information?—I am a member of the byelaws committee, but I do not know that I could give the details that the chairman asked for.

22,121. With regard to the teachers, you have stated that one of the great wants in regard to the deaf and dumb is the want of teachers, and you further said that you thought that the teachers who have taken to this work are teachers who have failed in other ways. What are the salaries which are received by teachers of hearing children in your board schools on the average?—Deaf and dumb: male, 80*l.* to 120*l.* by 10*l.*; female, 70*l.* to 90*l.* by 5*l.* Ordinary: male, 60*l.* to 155*l.*; female, 50*l.* to 125*l.*

22,122. Have you ever compared those with the salaries which are given to the teachers of the deaf and dumb under the School Board?—No, I have not; but speaking generally, I think they are very much the same to beginners.

22,123. That is to say, the teachers under the School Board for the deaf and dumb treated as beginners?—We have only had them lately; there is a certain scale for them; I have not it by me.

22,124. Salaries as high as 300*l.* or 400*l.* a year are given to certain teachers for hearing children?—Yes to head masters of large schools, 400*l.* I should think would be the highest.

22,125. In the case of one of those large schools where you pay 400*l.* to the head master, what would be the average salaries of the assistant masters and mistresses (I am not of course speaking of pupil teachers)?—They vary according to the length of service, position, and different gradings; there are a large number of classifications, but I think 75*l.* or 80*l.* is the salary that an assistant teacher begins with.

22,126. Do you know whether it is the fact that 75*l.* or 80*l.* is the highest salary under the School Board for London for a teacher of the deaf and dumb?—I do not know.

22,127. Is there any one of them getting 100*l.*?—I think there is one; I am not sure though.

22,128. Does it require a longer time and does it cost more to train teachers of the defective classes than it does teachers of those who have got all their senses?—I have no experience of that; I should think ours have not had that longer or more costly training.

22,129. I am rather asking what is desirable rather than what is the fact?—No doubt.

22,130. We have the fact that teachers of the deaf and dumb are treated as beginners, and are receiving salaries equal to beginners in the case of teachers of hearing children; but it is desirable, I suppose you would admit, that in the first place the teachers of those defective classes should have the general training which you require for other teachers?—Yes.

22,131. And in addition that they should have the special knowledge which is required for teaching the deaf and the blind?—Yes.

22,132. That special knowledge must be paid for by them somehow or other before they come to you?—Yes.

22,133. If they are properly educated?—Yes.

22,134. Is it not therefore reasonable that they should receive more and not less than other teachers when they come to you?—Yes.

22,135. We have it in evidence that in Germany not only are teachers of the deaf and dumb required to have an equally good education with that of teachers for ordinary children, but those who become teachers of the deaf and dumb have larger salaries than those who are teaching ordinary children. If teachers of the deaf and dumb were treated in the same way here, do not you think a very superior class to that which you are now having as teachers of the deaf and dumb in the board schools in London would be attracted to the work?—I think that if before a certificate for a deaf and dumb teacher were granted he was obliged to have a certificate of ordinary training it would be an immense advantage, and no doubt the School Board would pay for it accordingly. At present we know nothing about their previous training.

22,136. Take for instance the advertisements which are put in the papers with regard to teachers wanted for the School Board, do you in those advertisements offer a larger amount for teachers of the deaf and dumb than for teachers of the hearing?—No.

22,137. Is it not the fact that certain of your teachers have been trained at special training colleges for teachers of the deaf?—I believe pupil teachers have been sent to Mr. Van Praagh.

22,138. And to Ealing?—And to Ealing.

22,139. But only pupil teachers?—Only pupil teachers, I think.

22,140. With regard to those pupil teachers how have they been sent; have they been sent on full time?—I think they were half-timers.

22,141. Then up to the present the School Board has depended for its supply of teachers of the deaf and dumb upon half-time pupil teachers?—Yes.

22,142. And the very lowest class of teachers, though they may be very able?—I do not think they are very able.

22,143. They are the lowest class of teachers that you have?—None of our teachers who think themselves capable of any ordinary elementary teaching have taken to teaching these defective classes.

22,144. In your opinion a different state of things must exist before you can expect satisfactory teaching of the deaf and dumb?—I think so.

22,145. Do you pay for any children that are not educated in your own schools, I am not speaking of defective classes only, but any children?—No.

22,146. The School Board do not at present make any payment to any schools except their own schools?—Not that I am aware of.

22,147. Do you consider that such an arrangement would be advantageous?—I am not prepared to say; I have not considered it at all.

22,148. Has the action of your Board indirectly caused a very considerable number of children to be sent to special schools for the blind and the deaf?—I do not know.

22,149. I mean have the school authorities found children uneducated and pressed the parents of those children to send them to school, and has the result of that pressure been that the parents instead of sending them to the board schools have sent them to other institutions?—I am not aware of anything of the kind.

22,150. Going back to the figures supplied by the Board, there are apparently 2,954 of the defective classes that you know of, that is adding together the 596 and 2,358?—Yes.

22,151. Do you know how many more there are that are children of parents living in the School Board district who are in schools, but not in your own schools?—These figures would include all that the visitors returned on their house-to-house visits.

22,152. In what time of the year is that census taken?—Easter.

22,153. (*Chairman.*) Out of that number how many blind and deaf and dumb and idiots are there in the board schools?—

22,154. (*Mr. St. John Ackers.*) You say the census is taken at Easter?—Yes.

22,155. Is it always taken the same time of the year?—Yes.

22,156. There are 14,259 children roughly speaking not accounted for in any way, that is to say, after you have taken from the 605,337 the children scheduled on the rolls of the schools and the defective classes there are 14,259 remaining; can you tell us whether in your opinion any of those who are disabled from coming to school?—I do not know.

22,157. You have no knowledge of how that residuum is composed?—No.

General Moberly.

17 July 1888.

22,158. Has the School Board not taken into consideration very carefully the question of the residuum that does not attend?—I do not know that they have any facts to go on, there are a great number of vagrant children, the children of people constantly migrating from house to house.

22,159. (*Admiral Sotheby.*) Do you consider that those 14,259 are the only children who are not educated or is there a large mass of others?—I think that is all.

22,160. That includes what is commonly called the Arab class?—Yes.

22,161. Is it your province to find out if there are any blind or deaf and dumb children at the workhouses?—No. The guardians have to do with them.

22,162. Are you aware that there are many blind and deaf and dumb children in workhouses?—I do not know anything of them.

22,163. (*Chairman.*) Your return includes those in workhouse schools if there are any?—I do not know whether there are any in London. I do not know whether the visitors schedule those in the workhouse schools.

22,164. (*Admiral Sotheby.*) Your visitors do not go to the workhouses to find out?—I never heard that they do.

22,165. I gather from what you said that the present teachers of the deaf and dumb in the schools are very incompetent?—I should not say, perhaps, incompetent, but not as able as one would wish they were; they have great drawbacks I must say, they have to contend against the drawback of the children going to their own homes, which are very poor homes, and their parents are generally very uneducated.

22,166. With regard to those pupil teachers who were sent to Ealing, were they at all, do you consider, superior to the teachers you already had?—No, I think not.

22,167. They were not very competent, though they had been brought up at a deaf and dumb institution?—Of course they were experts in that particular line, but they would not compete with the ordinary elementary teachers that we had in the schools.

22,168. Do you know whether the salaries of deaf and dumb teachers have increased at all since the system has been adopted?—I do not know.

22,169. (*Mr. Van Oven.*) Following on what Mr. Ackers put to you as regarded pupil teachers who are sent to Fitzroy Square and Ealing for special training, has it ever occurred to you, as a member of the School Board, that in order to produce something like a good result you ought to have at any rate one or two of the very best of your teachers trained for the purpose of supervising the classes, if for nothing else?—No doubt it would be a great advantage; it has never been thought of. We are entirely in Dr. Stainer's hands, as far as that goes.

22,170. But has the School Board in any way considered what amount they would feel inclined to spend upon such an experiment?—I do not think so.

22,171. Do not you think it desirable that we should follow, in the attempt to establish day schools for the deaf in this country, something of the principle that is carried out in Germany where the best of the elementary teachers are selected for the purpose of teaching the deaf, in which work superior intelligence is required, the inducement being that the salaries for the teachers of the deaf commence at the point where the salaries for the teaching of the hearing leave off, that is to say, a teacher who has passed a certificate examination and gained his certificate receives the highest salary as assistant teacher when he enters for the teaching of the deaf; whereas really the London School Board are taking the worst of their teachers to teach the deaf. It appears that if they are not good enough for teaching hearing children they consider themselves good enough for teaching the deaf; do you think that right?—No, it is not right; but actual experience has shown us that none of the teachers who are capable of teaching ordinary children have ever gone in for the special training.

22,172. Does not that arise from the fact that you do not give them an inducement to do so by offering them a larger salary?—We never heard of anybody to whom a larger salary should be offered.

22,173. If the inducement was held out to a pupil teacher that by making himself a good teacher of the deaf and dumb he would get 130*l.* a year, whereas if he only became a teacher of ordinary children he would only get 100*l.* a year, do not you think you would get good teachers to go through the necessary course to qualify them to become teachers of the deaf and dumb?—No; I think the openings to ordinary teachers are so very much greater, that is to say, the chance of being head master of one of the big schools, that they would not care to go to small schools for the deaf and dumb that we could send them to. There would not be the same openings in the future.

22,174. A good teacher might be appointed to the headmastership of a big school in time, whether he had learned the system of teaching the deaf or not?—I have no experience to enable me to say how that would be. I imagine the reason I have given is really the reason why they do not go into that line of work.

22,175. You admit you have never held out any inducement in the shape of extra salary?—That is so.

22,176. Is it not advisable that that should be tried?—It is rather reversing the order of things, it appears to me. We are advertising in the open market for teachers for the deaf and dumb. If we thought any teacher who offered was specially fit for the work, I have no doubt he would be employed in preference to others even at a higher salary.

22,177. If you wish to induce a good teacher to learn a special system you must give him some inducement to do so; why should he trouble himself to go into a special training when the result in the way of emolument in all probability would be less, as you yourself say, then if he went on with his regular work?—I must repeat that I think the future openings are so much better for the ordinary teachers that we should not get the best qualified teachers to go through the necessary training.

22,178. And I repeat that being the case, should not an extra inducement in the shape of salary be offered to induce a man or a woman to go through that necessary training?—So far as the Board have considered the question, they have not seen their way to doing that.

22,179. In Mr. Schöntheil's report he says the children are not taught needlework or drawing; it is admitted, I believe, generally, that the mixing of the deaf and dumb with hearing children is exceedingly desirable; why then should they not be taught needlework and drawing with the other children in the school?—We find it very undesirable to mix them from all we have heard from the teachers. I myself should be very anxious to mix them, but we have been told by Dr. Stainer and the teachers we have that it is very undesirable to mix the deaf and dumb with the other children, and they make their best efforts to keep them separate.

22,180. (*Chairman.*) Why?—I do not know; they say the hearing children ill-treat the deaf and dumb, though they are particularly kind to the blind.

22,181. Do not they play together?—No; those who are at Dr. Stainer's homes are carried away to the homes, and not left to play with the other children.

22,182. (*Mr. Van Oven.*) Mr. Schöntheil and Mr. Van Praagh say the more they mix with other children the better?—Our teachers think it is undesirable that they should mix with the others.

22,183. (*Chairman.*) If that is so, does not that afford an additional reason why the School Board should create special schools for the deaf and dumb at certain centres in London?—It is against my own view.

22,184. (*Mr. Van Oven.*) Mr. Schöntheil gives a summary at the end of his report of the number of children in attendance as 274, but I find in the School Board summary, Table C., there are only 240 deaf and dumb put down as attending schools or centres. You account for that?—I have not remarked it; if you add up my figures you will find that there are 344 on the books.

General Moberly.

17 July 1888.

22,185. Do you understand how that discrepancy arises?—It arises from the misunderstanding of a regulation by some of our visitors as to "scheduling children in institutions." Dr. Stainer's home has been omitted in certainly one case. By entering this amount, Table C. shows 128 instead of 32 in Finsbury, and 32 for 12 in East Lambeth, or 358 total, instead of 242.

22,186. (*Rev. Mr. Owen.*) If I rightly understood, you said that you did not consider that the average attendance of the deaf and dumb children a bad attendance. Mrs. Westlake, one of your Board, two years ago said that the average attendance was only 67 per cent.?—Then it has improved lately.

22,187. You think it is a better attendance than that?—Yes, most of the children come from Dr. Stainer's homes.

22,188. That has improved the attendance?—Yes.

22,189. We were told by teachers that the attendance was so bad that it did not give either them or the children a fair chance?—I have only the results sent in monthly to us by Dr. Stainer.

22,190. What made you call in the special services of Mr. Schöntheil; was it because the Board were not satisfied with the progress the deaf and dumb classes had made?—We have had examinations made of the deaf and dumb classes from time to time, and it was decided that we should have an examination of them this year as usual, and I took upon myself to choose Mr. Schöntheil.

22,191. You say you are not satisfied with the progress of the deaf and dumb pupils?—Comparatively speaking.

22,192. Do you feel yourself competent to give any opinion as to the methods?—No.

22,193. (*Rev. Mr. Sleight.*) With regard to the classes for the deaf and dumb, I understand you to say that the attendance would be nothing like so good as it is, but for the homes of Dr. Stainer?—I do not think it would.

22,194. Have the Board ever considered whether it would be possible for them to establish a school for the deaf and dumb, say a school of 50 or 60 pupils in some district, supposing the guardians could be induced to maintain a home close by in which these children could be housed and maintained?—We have never considered that. The School Board do not go beyond education; they have nothing to do with the children's homes.

22,195. Have the School Board never proposed to hold a conference with the guardians upon this question?—No.

22,196. But if the School Board see that classes would utterly break down but for these homes, would not they think it advisable to adopt any means to procure a good attendance at these classes?—My own impression is that they would feel it to be quite beyond the scope of their work.

22,197. (*Chairman.*) Assuming that it is at present beyond their scope, do not you think it desirable in the interests of the classes affected that it should be within their scope?—I think the guardians ought to take action with regard to providing such homes, not the School Board.

22,198. (*Rev. Mr. Sleight.*) Can you tell the Commission what action Her Majesty's inspector took with regard to these School Board classes for the deaf and dumb at the latest inspection?—He never looked at them; the inspector has nothing to do with them; I do not think we get any grant for them. I may be wrong in saying that. We got Mr. Schöntheil to make this inspection, because they were not inspected.

22,199. Did not the inspector inspect them to see whether they could be accepted as exceptions?—He does *not* inspect our deaf and dumb schools. The School Board declined in 1884 a grant from the Education Department, because the conditions on which it was offered did not outweigh the advantages of doing without it.

22,200. You have four schools under your special charge, as I understand?—Yes.

22,201. Will you give what per-centage of children in those four schools were treated as exceptions, distinguishing the deaf mutes from those who were treated as exceptions from other causes?—There are no deaf mutes in those schools; the per-centage of those who were treated as exceptions for other cases was

22,202. In your opinion, are the best of the deaf and dumb sent away to schools, such as to Margate or any of those other schools?—It is done purely by a private arrangement; if the parent can succeed in getting a child away to one of those schools, we have nothing to do with the selection.

22,203. You say the Board take no notice of Dr. Stainer's homes?—No, not officially.

22,204. (*Mr. Johnson.*) Are there any medical officers connected with the Board schools?—We have generally a medical man on the committee of managers; we endeavour to get a medical man on every committee of managers.

22,205. Whose duty it is to advise the committee, but not to inspect the schools?—He is on the managing committee.

22,206. I understood you to say, with reference to idiots, that there was no reference to medical men in order to ascertain what was their condition. You have at the present moment a certain number of children in your schools who are called idiots by your masters, but not by a medical officer?—That is the case, so far as I know.

22,207. Do you think it would be desirable to have an inspection of such children by a medical man?—I do not know what would be gained by it.

22,208. You would have the state of the child indicated by medical authority instead of the thing being left in uncertainty, as it is now?—If a child is at school it is easy to see what the condition of the child is; it is the children not at school that we do not know of.

22,209. I am talking of those in the school. You have a certain number in school that you cannot teach; who determines what is the physical condition of those children—is it the master or a medical man?—The master.

22,210. And you would have no medical certificate in such cases?—No.

22,211. Do not you think that is a great want?—I do not know what would be gained by a medical examination of each child. The master judges of the educability of the child.

22,212. You say, first of all, there is a certain number that cannot be educated, and those are classed among the idiots; who settles the question whether a child is an idiot, is it the schoolmaster or a trained medical man?—Most of those children are at home, and the visitor who schedules a child in his census is informed by the parents that they have been told that the child is not fit for school by a medical man or other authority, and he accepts that: but where there is doubt, in some cases a medical certificate is called for.

22,213. He accepts it on the *ipse dixit* of the parents, without any production of a medical certificate?—I believe so.

22,214. Is there any supervision of the blind and the deaf and dumb in the playground?—There is supposed to be; there is the caretaker of the school.

22,215. Is it the duty of the caretaker to see that deaf and dumb and blind children are not roughly treated by the seeing children?—No doubt it would be; but this man has to look after 2,000 children.

22,216. What is the size of the playground?—It is not very large.

22,217. I think I understood you to say that you approved of the institution system for the deaf and

General Moberly.

17 July 1888.

dumb, rather than the day-school system?—I think it of great advantage to children that they should be at an institution.

22,218. Would you apply the same remark to the blind?—No, that does not seem to apply to the blind so much as to the deaf and dumb.

22,219. You prefer an institution for the deaf and dumb?—Yes.

22,220. How would you suggest that children of very poor parents should have the advantage of the institution system; do you think the board of guardians might be approached by the School Board?—No, I do not think the School Board is the right channel.

22,221. Do not you think it would be possible for the School Board to have one or more institutions for these afflicted classes?—No, I think not; I think we have quite enough to do.

22,222. The School Board have never moved the boards of guardians to send deaf and dumb children to an institution?—No.

22,223. They are passive on the question?—Quite.

22,224. Do not you think it a desirable thing that some authority should take up the case of these afflicted children in the poorer classes, and consider some means by which institutions for the reception of them could be established?—Individual members of the Board might do it

22,225. Do not you consider it is the duty of the Board to take up the question?—My own feeling would be that it would be rather resented by the guardians if the School Board tried to induce them to take action in the matter.

22,226. Has it ever been tried?—Not that I am aware of.

22,227. Have you large experience with regard to the unwillingness of parents to send their children to institutions?—Yes, I have been working amongst the poor for the last eight years; I have been a guardian, and a vestryman, and hon. secretary of a branch of the Charity Organization Society.

22,228. The objection is to part with the children from their homes?—Yes.

22,229. Not from any ill-feeling towards institutions?—No.

22,230. With regard to the blind; we have been told in evidence that at present the number of blind coming to these centres is decreasing, and it is not likely to increase, because if the statistics are fully gone into, it will be found that the Board schools have got pretty well all the blind that it is possible to get within their walls; do you agree with that?—This return shows that we have 73 blind in school, and 48 not in school, and 40 partially blind in schools, and 141 not attending.

22,231. Are you aware whether the salaries of the teachers of the blind are larger than the salaries paid to instructors of the deaf and dumb?—I do not think they are; I do not know; I have not looked into that particularly.

22,232. You are aware that a very large sum of money is spent upon the teachers who conduct these centres for the blind?—We have not got many.

22,233. You have a certain number of blind who are under instruction, and a certain amount is paid for the teachers; what I want to know is, whether you pay your teachers for the blind the same as you pay your teachers for the deaf and dumb?—I cannot tell you.

22,234. Have you any experience with regard to special teachers for the blind?—No, I have no experience beyond visiting the blind classes in the schools.

22,235. Under whose supervision do the teachers of the blind come?—Miss Green's.

22,236. Does anybody supervise Miss Green as regards the teaching of the blind, and does anybody supervise Dr. Stainer as regards the teaching of the deaf and the dumb?—No; they report to us every month.

22,237. They are your subordinates?—Yes.

22,238. You have no experience with regard to systems?—No; Miss Green and Dr. Stainer are our advisers.

22,239. And you have no one to supervise them but yourselves?—No.

22,240. And you have no knowledge of the subject?—No; we regard Dr. Stainer and Miss Green as our expert advisers.

22,241. Whatever they tell you and whatever they recommend, you adopt?—Yes.

22,242. You have now called in Mr. Schöntheil as a specialist, because your committee have not the requisite knowledge to supervise those people?—Yes, but only as an examiner on this one occasion.

22,243. Have you called in any specialist with regard to the blind?—No, only with regard to the deaf and dumb.

22,244. Then you have entire confidence in Miss Green as regards the blind?—Yes.

22,245. Whatever Miss Green tells you with regard to the system to be pursued in teaching the blind you adopt?—Yes.

22,246. Do you think that is a desirable thing, seeing what an important question this education of blind children is?—I do not know how we can act otherwise; we must have someone to advise us.

22,247. Who appointed Dr. Stainer and Miss Green?—The Board.

22,248. On whose recommendation?—I do not know; it was before I became a member of the Board.

22,249. What was done a few years ago, you allow to go on without question. You take for granted what Miss Green and Dr. Stainer tell you?—Yes.

22,250. If I asked you whether you think it is possible that the instructors of the blind and the deaf and dumb might have more special training than they have now, I suppose you could not answer that question?—No.

22,251. (*Sir Tindal Robertson.*) Has the broad question of the comparative advantage or disadvantage of the blind and the deaf and dumb being educated with sighted and hearing children ever been brought before the Board?—I think not.

22,252. Or discussed at the Board in any way?—No, not at all.

22,253. Has that question ever been discussed at your special committee that has charge of these classes?—We have no person on the Board who has the smallest experience whatever of the matter.

22,254. Has the question, whether it would be advisable to form a special committee to consider all these points ever been brought under the consideration of the Board or your committee?—I think not.

22,255. Looking at the matter, not as an expert or specialist, but from an ordinary point of view, do you think the education you are able to give to the blind in your School Board classes it as good as it ought to be?—I have no experience of the fruit of it.

22,256. Looking at it from an outside point of view altogether, having regard to the fact that the teachers are only able to give half an hour a week to particular schools, do you think that such a system as that can possibly be a good system of educatian for this particular class?—I think blind children get a great deal of education in an ordinary school; but I have never gone into the matter in detail.

22,257. Looking to the fact that these teachers of the blind under the present system cannot possibly give such special education as a blind child ought to have: do not you think a better system might be devised, such as the Chairman has intimated, viz., the formation of special centres where blind children might be congregated, and where they would have more regular supervision by teachers for the blind?—Our blind classes are under the charge of teachers for the blind.

22,258. What I am putting to you is this, instead of giving these blind children instruction for half an hour a week, as under the present system, would not it be better that you should congregate them in special centres where they might have regular teaching every

day of the week by competent persons?—That has never occurred to me.

22,259. Looking to the fact that the cost of the blind teachers at present is considerable, and to the fact that the results achieved are not so satisfactory as one might wish, do not you consider that it would be advisable to appoint a special committee to investigate that point, and see if some change could not be made?—I have never thought of it; I know the teachers are engaged all the week, and earn their money most fairly.

22,260. I do not say they are overpaid, I only say they cost so much under the present system, and can do so little?—By going to a greater expenditure we might probably do more good.

22,261. The question is whether with something like the same expenditure, if the system were brought to a focus in different centres, much more satisfactory results might not be obtained than on the present plan?—You mean by collecting several of the present schools into one centre?

22,262. Not one centre; several centres?—That has never occurred to me.

22,263. Suppose you concentrated into one focus several of your existing blind classes?—We have 31 blind classes.

22,264. (*Chairman.*) Suppose you concentrated those 31 classes into 10 large divisions?—I do not think it would be practicable. Take three schools as an illustration, High Street, Shoreditch, Bowling Green Lane, and Matthias Road, Stoke Newington, I do not know where you would make a centre for the three. That is an illustration of my difficulty.

22,265. (*Sir Tindal Robertson.*) That is a question of detail. I should like to have your view as to the principle of the thing, whether you think half an hour special education a week is a kind of system which it is advisable that the School Board should pursue in the future?—That question has not been considered.

22,266. To go to another point; Do not you think that the School Board would like to have some means suggested to them, by which instead of idiots being sent to Board schools they should be sent to institution?—No doubt the School Board would be very glad that they should be sent to some institution.

22,267. At present your difficulty seems to be that the School Board have only to deal with education; but supposing an Act was passed by which the School Board were empowered, in addition to providing education, to establish homes for the blind and the deaf and dumb, in different districts which would be superintended by their own inspectors and looked after by themselves, or by a committee such as your own; do not you think the School Board would willingly accept such a trust as that, if it were put into their hands; and would not that materially strengthen their power?—I have no authority to say anything about it; but I doubt whether the School Board would care to undertake the duty.

22,268. If they had the power conferred upon them?—I think they would prefer not to undertake it; we have no experts amongst us.

22,269. You would have the power to employ experts?—We are employing, or are supposed to be employing, experts; we ourselves cannot judge of a matter which is within the province of experts.

22,270. Then you said that the parents of these children have a great objection to their being sent as paupers to these different institutions by the board of guardians; but if such a power as I have suggested were given to your School Board, and your School Board exercised that power that would take away a great deal of the objection of parents to receiving assistance of that sort?—Yes, it might possibly smooth matters if others than the guardians undertook it.

22,271. Do you communicate with the other school boards in different parts of the country, as to the education of these afflicted classes?—No, I do not know that anything has been done in that direction.

22,272. Do not you think it advisable that the different school boards through the country should communicate with one another as to the best means of educating these classes?—I do not know what means the School Board have of communication except by letter; we have very little association with other school boards in the country.

General Moberly.

17 July 1888.

22,273. If the fact of a particular school board having done good work in a certain manner was brought to your notice, say, for instance, what has been done at Leeds, where, in consequence of the recommendation of the inspector, certain extra allowances have been granted, would not it be your duty to communicate with that school board and try to ascertain what were the facts, so that you might act somewhat on the same lines?—I will bring the matter to the notice of my colleagues; it is difficult for me to me speak for others.

22,274. (*Chairman.*) You have been a member of the School Board three years?—I shall have been a member of the Board three years in November next.

22,275. During the whole of that time have you been chairman of this committee?—I have served on it all the time; I have been chairman the last year and a half.

22,276. Have you made yourself acquainted to any extent with the systems of teaching the deaf and dumb and the blind; have you read any books on the subject?—Yes. I have read a good deal on the subject, and I have visited the Margate institution, and the institution at Brighton, which is conducted on the manual system. I did that on my own account.

22,277. Have you satisfied yourself that one system is better than another?—No, I think the oral system is not one that can be applied to all children. I should myself try to make distinctions between children of different capacities, and select some to be taught on the one system and some to be taught on the other; that the manual system can be much more largely taught is, I suppose, acknowledged by all. I mean to say, if you are limited in your time, in the course of two or three years you could teach more by teaching on that system than you could by the oral system.

22,278. As I understand the principle of the Board is to teach the oral system in all cases?—All cases.

22,279. Then as chairman of your committee you differ from the policy of your Board?—Yes.

22,280. Has there been any discussion upon that point?—No.

22,281. You have never raised your voice against the policy of the Board to which you object?—No, the system has been adopted by previous Boards.

22,282. You have accepted the thing as a *fait accompli*, and carried it out?—Yes.

22,283. (*Sir Tindal Robertson.*) Is there any intention on the part of your committee to bring the question before the school boards?—Everything has been put off for the present waiting the report of this Commission.

22,284. (*Chairman.*) The guardians who have the power of sending these deaf and dumb and blind and idiot children to institutions have nothing whatever to do with the education of the children?—No.

22,285. And the School Board have nothing to do with sending these children to institutions?—No.

22,286. And between the two the children are not educated?—Very possibly.

22,287. What is your objection, then, to the school authority, whose business it is to see whether children are sent to school or not, having the power which the boards of guardians have of seeing to the maintenance and education of these children in institutions?—I do not think it is in the scope of the School Board's work.

22,288. What is your objection to its being put within their scope; what is your objection to the school authority having the power which is now entrusted to boards of guardians of sending children to institutions?—I should prefer myself personally that we should be compelled to report to the guardians those cases, and that they should take action.

General Moberly.

17 July 1888.

22,289. You do not at present report such cases to the guardians?—No.

22,290. Then why do not you?—I do not know; it never occurred to me.

22,291. Between the two, the children are not educated?—The guardians cannot compel them to be educated, and the magistrates will not.

22,292. (*Sir Tindal Robertson.*) Suppose such a system as you suggest were established by the State, that you should send notice to the guardians of such cases, and that they should send such cases to institutions and provide the means for their maintenance, that would introduce a dual system which would almost inevitably lead to friction between the two authorities; would not the simplest and most effective means be to confide the provision of both the education and the maintenance of the children to one authority?—The maintenance of such children is not a proper function of the School Board, because the guardians are really the authorities to provide for it. I should prefer to leave it with the guardians.

22,293. (*Mr. Johnson.*) You say that your Board accept the dictum of those specialists for the deaf and dumb with blind confidence; do you know what was the course pursued when the School Board resolved upon the system for the education of the blind?—No.

22,294. You have no knowledge of a meeting of experts having been called some years ago?—No.

22,295. You never called in experts to meet together and recommend you the best system of teaching the deaf and dumb?—No; I do not know how Dr. Stainer was appointed.

22,296. I know in the case of the blind the School Board had a conference amongst experts; but whether they had a conference of experts in the case of the deaf and dumb, you do not know?—I do not know.

22,297. (*Mr. Van Oven.*) Has the School Board ever given its attention to the idea of boarding deaf and dumb children, attending day schools, in private families instead of in Dr. Stainer's homes?—No, we have nothing to do with Dr. Stainer's homes; the children are placed in Dr. Stainer's homes by their parents. The school authority has nothing to do with maintenance.

22,298. (*Rev. Mr. Sleight.*) Are you aware that the majority of those sent to Dr. Stainer's homes are paid for by the guardians?—I do not know.
